Proceedings of the

18th European Conference on Games Based Learning

ECGBL 2024

A Conference Hosted By

Aarhus University
Denmark

3-4 October 2024

Conference Proceedings Edited by

Dr. Kristine Kilså
Dr. Rajiv Vaid Basaiawmoit

Copyright the authors, 2024. All Rights Reserved.

No reproduction, copy or transmission may be made without written permission from the individual authors.

Review Process
Papers submitted to this conference have been double-blind peer reviewed before final acceptance to the conference. Initially, abstracts were reviewed for relevance and accessibility and successful authors were invited to submit full papers. Many thanks to the reviewers who helped ensure the quality of all the submissions.

Ethics and Publication Malpractice Policy
ACIL adheres to a strict ethics and publication malpractice policy for all publications – details of which can be found here:
http://www.academic-conferences.org/policies/ethics-policy-for-publishing-in-the-conference-proceedings-of-academic-conferences-and-publishing-international-limited/

Self-Archiving and Paper Repositories
We actively encourage authors of papers in ACIL conference proceedings and journals to upload their published papers to university repositories and research bodies such as ResearchGate and Academic.edu. Full reference to the original publication should be provided.

Conference Proceedings
The Conference Proceedings is a book published with an ISBN and ISSN. The proceedings have been submitted to a number of accreditation, citation and indexing bodies including Clarivate Web of Science and Elsevier Scopus. Author affiliation details in these proceedings have been reproduced as supplied by the authors themselves.

Since 2022 these proceedings are open access and freely available for all to read from https://papers.academic-conferences.org/index.php/ecgbl . The Conference Proceedings for previous years can be purchased from http://academic-bookshop.com

E-Book ISBN: 978-1-917204-20-0
E-Book ISSN: 2049-100X
Print version ISBN: 978-1-917204-19-4
Print Version ISSN: 2049-0992

Contents

The papers in these proceedings were presented at the conference in sessions organised by topics, but are presented here by type of paper and then alphabetically by lead author surname.

Preface **xviii**

Committee **xix**

Biographies **xxi**

Academic Papers

Game Designers' Experiences with Educational Game Design Elements:
From Practice to Conception!
Mifrah Ahmad 1-10

A Conceptual Framework for the Development
of Effective Serious Games for Learning
Zahara Al-Awadai 11-21

VR Simulation: Advancing Practical Skills in Computer Science Education
Reza Ebrahimi, Ali Al Humairi 22-30

A Preliminary Study of Context Integration as A Determinant
in The Effectiveness of Digital Mathematics Games
Selçuk Alkan, Ayça Akın, Zübeyde Er 31-39

Games in Mathematics Education: Trends and Methodological
Approaches in the Context of the Congress of European Research
in Mathematics Education (CERME) Review
Selçuk Alkan, Yasin Memiş, Ayça Akın 39-45

Cultural Game Jam Model: A Quadruple Helix Intervention
Filipe Luz, Wilson Almeida, Pedro Fernandes, Micaela Fonseca 46-54

The Influence of Social Competition and Maths Anxiety on Game Performance
André Almo, Maíra Amaral, Mariana Rocha, Attracta Brennan, Pierpaolo Dondio 54-63

Game at School? Italian Teachers' Perceptions of the Introduction
of Games in the Classroom
Massimiliano Andreoletti, Andrea Tinterri, Anna Dipace 63-71

From Designing Houses to Studying Architecture:
Did Those Who Study Design Share Any Similarities in Playing the Sims Game?
Yüzyıl Nevin Aydın 71-79

From Consoles to Classrooms: Preliminary Insights
About Pre-Service Teachers and Video Games
Masiar Babazadeh, Adrian Degonda, Bernadette Spieler, Luca Botturi 79-88

HeritageRoots: Developing Interconnected Immersive
Experiences for Cultural Preservation and Education
Dmitriy Babichenko, Tod Swanson 89-98

Developing Graduate Attributes Through
Competitive Gameplay and Learning Theories
Gavin Baxter, Thomas Hainey, Alan Williams 99-107

A Systematic Review of Examples and the Effectiveness
of Game-Based Learning Used To Teach History in K-12 Education
Thomas Bjørner 108-115

Cthink.It. A Board-game for Computational Thinking in Early Years
Tharrenos Bratitsis, Leonard Busuttil, Diane Vassallo, Iro Koliakou,
Maria Tsapara, Kiriaki Melliou, James Callus, Gonçalo Meirelles ,
Nabil Tarraf Kojok, Sofia Sousa, George Arnaoutis 116-123

Play Your Way Into Production: Game-based Skills
Development for the Screen Industries
Jude Brereton, Bethan Jones, Carlton Reeve, James Zborowski ,
Anna Bramwell-Dicks 124-132

Integrating Agile Methodologies and Gamification for Student
Engagement and Success
Cella Buciuman, Sabina Potra, Luisa Dungan 133-141

Play with Purpose: A Heuristic Approach to Evaluating Tabletop
Serious Games for Academic Integrity Education
Lance Bunt, Byron Bunt, Veruschka Pelser-Carstens, Gordon Matthew 142-152

CiteSaga: Conceptualisation of a Serious Game for Citation and Reference Styles
Lance Bunt, Veruschka Pelser-Carstens, Gordon Matthew, Byron Bunt 153-162

The Ludo-Learning Matrix: A Framework for Understanding Learning in Games
Peadar Callaghan 163-170

Empowering Neurodiverse Voices in Research Ethics
through a Playful Card-Based Approach
Cátia Casimiro, João Léste, Pedro M. A. Fernandes, Carla Sousa, Filipe Luz 171-179

谈判: Mega-games as Catalysts for Deep Experiential Learning in Higher Education
Mario Alberto Caudillo Melgoza, Aline Castillo Moreno 180-187

Advanced Gamification and Mega-games to Enhance Lifelong
Learning in Higher Education
Mario Alberto Caudillo Melgoza 188-196

The Open Data Newsroom: A Game Approach for Developing
Open Data Competencies in Elementary School
Alejandra Celis Vargas, Georgios Papageorgiou,
Rikke Magnussen, Birger Larsen, Ingrid Mulder 197-206

Escaping Online: Teacher Student Engagement in a Digital Escape Game
Caroline Cruaud 207-214

The use of Educational Escape Rooms in the Lifelong
Training of Mathematics Teachers
Peter Vankúš, Mária Čujdíková 215-222

Exploring the Affordances of Vernacular Digital
Games in Developing 21st-Century Skills
Dima Dayoub 223-228

Exploring Current Challenges and Opportunities in Media
Literacy Skills for Youth: Stakeholders' Perspectives
Ceci Diehl, Oksana Tymoshchuk, Ruth S. Contreras-Espinosa,
Alessandra Carenzio, Maria João Antunes, Jose Luis Eguia-Gomes, Nelson Zagalo 229-236

Game-based Learning Assessment: Quantifying
Educational Efficacy of the EDURINO App
Ning Ding, Nastassia Sidarto, Irene Klemm, Franziska Meyer, Nicola Clayton 236-245

Analysing Game Data to Evaluate Children's Learning Progress
with the EDURINO App
Ning Ding, Katherine Chen, Max Van Radecke, Irene Klemm,
Franziska Meyer, Nicky Clayton 246-254

Real-World Geopolitical Influences on In-Game Financial Behaviour
Raghav Dwivedi, Kavita Vemuri 255-265

Rights Quest: A Game for Child Rights Awareness
Suzanne Ensmann 265-274

Board Games and Entrepreneurial Skills Acquisition:
A Mixed-Methods Study on the Efficacy of the EntreComp
Framework in Higher Education
Marta Ferreira Dias, Cristiana Alves, Marlene Amorim 275-280

A Literature Review: Which, How and What for the Use
of Artificial Intelligence in Gamification
lanlangao Gao 281-288

Leveling Up Learning: Game Based Learning Initiatives
in Canadian Higher Education
Jordana Garbati, Nicole Skrepnek 289-296

Serious Games for Vocational Training
Stefan Göbel, Elisabeth Rotter, Wolfgang Brabänder,
Angelika Maier, Birgit Ziegler 297-303

What is "Learning" in Serious Game Jams?
A Systematic Literature Review
Maria Gonçalves, Inês Nunes, Pedro Fernandes, Conceição Costa 304-311

Design and Development of an Immersive Virtual Reality Serious
Game With Biofeedback for Physiological Regulation: Alice, Beyond Reality
Henar Guillen-Sanz, Itziar Quevedo Bayona, Gadea Lucas Pérez 312-319

Tiers of Engagement: Achieved Learning From Business Simulations
Reflected in Economics Students' Experiences
Martin Guttormsen, Jørn Weines 320-328

Integration and Promotion: Integrating Sustainability
Research into Computer Science Teaching through

Serious Games Assignments
Sean Haddick, Helen Puntha, Matthew Harris, David J Brown 329-336

Fun and Functional: Using Non-Digital Games to Promote
Maths Engagement in Pre-service Teachers
Andreia Hall, Sónia Pais, Paola Morando, Maria Luisa Sonia Spreafico 337-346

Playing to Collaborate: Using Cooperative Board Games to Experience
and Reflect on Collaboration in Upper Secondary Education
Thorkild Hanghøj, Jonatan Kolding Karnøe 347-356

StaffsVerse: Building a Metaverse Campus
Utilising the Unreal Editor for Fortnite
Chris Headleand, Davin Ward, Kieran Hicks,
Stuart Butler, Danni Threlfall, Benjamin Williams 357-368

What Matters to Patients: Community-Engaged Design
for Healthcare-Related Serious Games
Pat Healy, Andrew Xu, Angeline Pho, Kai-Lin You,
Dmitriy Babichenko, Isabelle Malizio, Teresa Hagan Thomas 369-377

Game-based Learning for History: Student Perceptions and Preferences
Andreas Hellerstedt, Peter Mozelius 378-384

Primary Education's Stakeholders Behavioural Intention to use
Prospective Game-based Learning for Waste Awareness
Ima Kusumawati Hidayat, Francisco dos Santos Rebelo, Paulo Noriega 385-394

Community, Socialisation, and Empowerment in Cultural
Game Jams with Youth Citizens
Kim Holflod, Rikke Toft Nørgård, Eva Eriksson 395-402

Harnessing the Power of Gaming to Influence Policies
Addressing Climate Change
Paul Hollins, Paul Watson, Anchal Garg, Jude Ower,
Joost Schoor, David Griffiths, Barabara Kieslinger,
Katharina Koller, Jane Yau 403-413

The Impact of Language and Social Communication
on the Sense of Belonging among International Students
Using ScLINGO Application
Nashwa Ismail, David Sherlock, Rebecca Rylance-Graham,
Stephen McKinnell, Mark Pountney 414-425

Games Design Frameworks: A Novel Approach for Games Design Pedagogy
Chris Headleand, David James 426-431

Comparison of two Different Game Mechanics Applied to Learning of Electromagnetism
Ladislav Janiga, Viera Haverlíková 432-439

Breaking Math Anxiety: A Success Story From an Indian Government School
Vidya Jayaraman, Nirmala Sundar, Uma Balaji Shankar 440-447

Repositioning Vulnerable Youth Through Educational Esports Programmes
Erik Ottar Jensen, Thorkild Hanghøj, Peter Bukovica Gundersen 447-454

"Open World" Texts: A Framework for Analyzing
Recombinatory Writing Games (RWGs)
Allen Jones 455-464

Embedding Psychology Themes in University Induction
Using a Digital Escape Game
Jenny Josephs 464-470

Enhancing Team Cohesion Through a Custom MOBA Game:
Development, Implementation & Impact
Magdalena Svecova, Juraj Kovalčík, Michal Kabát 471-479

Digital Educational Escape Rooms as E-courses Using D-EER4SmL:
Investigation of Motivational Affordances
Vasiliki Karampa, Foteini Paraskeva 480-489

Design and Evaluation of the Digital Algebra Game for Children
Kubra Kaymakci-Ustuner, Effie Lai-Chong Law, Frederick W.B. Li 490-498

The Ideological Dilemma in Using Games in Global
Citizenship and Development Education
Paul Keating 499-405

Engagement Strategies in a Peer-quizzing Game:
Investigating Student Interactions and Powergaming
Nafisul Kiron, Mehnuma Tabassum Omar, Julita Vassileva 506-515

New Age Mages: An Interactive Way to
Explore and Subvert Gender Biases
Kavya Kolli, Shubhangi Dutta, Kavita Vemuri 516-524

Cybersecurity on the Move: Investigating the Efficacy of a Movable
Escape Room as an Educational Tool for Healthcare Employees
Jan-Willem Bullee, Luka Koning 525-533

A Platform of Serious Video Games Co-built for the General Interest
Bertrand Laforge, Thomas Planques, Florian Delcourt, Fanny Barnabé 534-540

Game-based Training of Cognitive Functions:
An Exploratory Study Involving Seniors in Switzerland
Sara Levati, Massimo Bortolamei , Lucia Morellini,
Jessica Demarchi, Matteo Metaldi, Alessandro Puiatti, Masiar Babazadeh 541-550

Gaming the Industrial Revolution. Participatory
design with historical data for classroom learning
Juan Hiriart, Alexis Litvine, Nathan Bowman 551-560

Design Insights for Developing Deepfakes Awareness Games for Adolescents
Clara Maathuis, Samuel Derous, Ebrahim Rahimi 561-570

Design Framework for VR Games in the Police Domain
Clara Maathuis 571-579

A Child-Centred Design Evaluation of a Learning
Game to Improve Children's Legal Capability

Dimitra Magkafa, Dawn Watkins, Suzannah Hemsley,
Charlotte Mills, Ann George, Clare Wood 580-589

A Pilot Study: Engineering Students Use Generative
AI to support the development of playful educational technology
Gunver Majgaard 590-597

Understanding Stakeholder Perspectives:
Towards the Design of a Serious Game for Positive Energy Districts
Giada Marinensi, Brunella Botte, Sara Brancifiori, Nicolas Caballero 598-606

The Game of Dominoes as Teaching-learning
Method of Basic Concepts of Differential Calculus
Luis Miguel Méndez Díaz 607-614

Bending Rules, Telling Stories:
Convivial Game Design Approaches for Engaging With Futures
Anna O. Meshcheryakova, Fabian Hemmert 615-622

[ai] Explore!: An Educational Game for Developing
Programming Skills and Algorithmic Thinking
Vedrana Mikulić Crnković, Bojan Crnković,
Ivona Traunkar, Martina Holenko Dlab 623-633

Game Lab Innovations in Education:
Insights from a Board Game Design Project
Robin Isfold Munkvold, Helga Dis Isfold Sigurdardottir 634-639

Beyond the Digital: Analogue Games´ Creative
Potential in Deepening Data Literacy
Ingunn Johanne Ness, Fride Haram Klykken,
Rosaline Barendregt, Sofie Steinsund, Barbara Wasson 640-647

What Educational Escape Rooms can Learn
from the World's Best Rooms
Céline Neubig 648-657

Game-Based Learning as a Tool for Teaching Ethical
AI to Youth: Insights from the CHARLIE Project
Nidhi Nidhi, M. Begoña Arenas, Andreia Morgado,
Adrian Solomon, Maria Moreira, Rute Ferreira, Elise Raittila 658-667

Game-based Learning for Science Education in Institutional
Care Settings in Northwestern Mexico
Elsa Catalina Olivas Castellanos, Ana Lourdes López Oliver,
Brenda Valle Sepúlveda, Eduardo Rodríguez Álvarez 668-676

Game-based Pedagogy in Teacher Training: Results of a Pilot Course
Sonia Palha, Anders Bouwer, Kristin Webb,
Daan van Smaalen, Desiree Agterberg 677-684

When Games get in the way: Gamification Approach for Teaching Maths:
A Case Study With Undergraduate Tourism Students
Sónia Pais, Andreia Hall 685-694

Abuzaharen's Challenge: Building Sustainability Competencies
through Science-Fiction Narratives and Game-based Learning
Stathi Paxinos, David Robertson 695-704

Sustainable Sip: Learning Concepts of Business
Sustainability Through A Hybrid Game
Russell Richards, Shakira Moss 705-714

Mastering the Game: How Level Structure
and Game Elements Shape Competency Acquisition
Katharina Richter, Michael Kickmeier-Rust, Dominik Tschirky 715-722

Escaping the Bondage of Bullying:
A Game-based Learning Approach
Georgia Mavroudaki, Katerina Roumpidou,
Eleni Palla, George Manganas, Eleni Christodoulou 723-733

Idea Generation Game Design Tool
for Health Behavior Change Games
Karen Shanks, Mike Mannion, Julie Campbell,
Karen Thomson, David Gerouville-Farrell 734-742

Renewing Systems Analysis:
The Impact of Game-Based Learning on Repeating Students
Imelda Smit 743-754

Gamified Networked Learning Environments in Higher
Education: A Study on Student Engagement and Value
Creation in Computer Science
Ali Soleymani, Taico Aerts, Maarten De Laat, Marcus Specht 755-765

Reaching Student Engagement by Balancing
Gamification and Challenges in the Minor Serious Gaming
Ton Spil, Peter Hagenaars 766-771

The Expert, The Novice, and The Skeptic:
Game Literacy and Pedagogical Practice
Tobias Staaby 772-779

Training for Board Game-based Learning:
Evaluation Model and Preliminary Results
From a National Program in Italy
Andrea Tinterri, Alessandra Carena,
Francesco Tommaso Piccinno, Michele Masini 780-788

Examining the Efficacy of a Physical Board
Game for Geometric Transformations
Ming Yan Tsui, Oi Lam Ng, Yeuk Pan Lee 789-798

Do Video Games Enhance Competencies & Skills?
Study Case: Civil Engineering Students
Rodrigo Urcid Puga, Romeo Ballinas-González,
Jorge-Arturo Rodríguez-Vázquez 799-807

Talking to Machado de Assis: Generative Artificial Intelligence
to Simulate Dialogues with Prominent Figures
Adilson Vahldick, André Luiz Cordeiro Gomes,
Marcelo de Souza, Scheila Patrícia de Borba Curry 808-817

Media at a Crossroads:
Where Streaming, Games, Culture and Learning Meet
Laura Vawter 818-828

Unified Effort: Developing a Mixed Reality Serious
Game for Collaborative Crisis Management Training
Geir Ove Venemyr 829-838

Limes (the Roman Frontier):
Developing a Video Game for History Learning
Amedeo Viccari, Richard Göllner, Jens-Uwe Hahn, Lisa Bardach 839-847

Exploring Play as the Nexus of Games and Playfulness
Nicola Whitton, Alex Moseley 848-854

Design of a Serious Game to Teach Esports Concepts and Career Pathways
Alan Williams, Gavin Baxter, Thomas Hainey, Elizabeth Boyle 855-862

Designing Games for GDPR: Negotiating Understandings of GDPR in EU Schools
Emanuela Marchetti, Claus Witfelt, Andrea Valente,
Daniel Amo-Filvà, Alicia García-Holgado, Lucia García-Holgado,
Elisabetta Vidotto, Maria Elena Garzotto, Francisco Josè García-Peñalvo ,
David Fonseca Escudero, Tihomir Orehovački ,
Marjan Krašna , Igor Pesek, Ivana Ružić 863-871

Rekindling Connections to Languages through Socio-Cultural
Immersion Using Game-Based Learning and Virtual Reality:
Cipher VR Case Study
Liang Xu, Haoyang Du, Songkai Jia, Cathy Ennis,
Elaine Uí Dhonnchadha, Monica Ward 872-877

Progress Visualisation, Competition, and Collaboration in Digital
Game-based Learning as Audience (DGBL-AA)
Dongjie Xu, Janet Read 878-886

Monopoly Reimagined: Cultivating Gaming
Literacy for Tackling Real-World Complexities
Sarit Youdelevich, Adeline Hvidsten 887-893

Learning from Designing a Board Game for Policy
Thinking in Computer Science
Shuyin Zheng, Victoria Fischer,
Naemi Luckner, Peter Purgathofer 894-901

PhD Papers

Construction Education through Virtual Reality:
A Game-based Approach for Interior Architecture Students
Arda Çalışkan 903-911

Acceptance and use of Video Games for
Education by Secondary School Teachers
Caitlin Cole, Roberto Parada, Erin Mackenzie 912-918

Impact of Digital Game-based Learning Experiences
on Reasoning Skills and Science Engagement
Spreeha Debchaudhury 919-928

A Simulation-based Education Platform for Security
Investments Through Culture and Knowledge Convergence
Adam P. Filippidis, Constantinos S. Hilas, Anastasios Politis,
Konstantinos Rantos, Haralambos Mouratidis 929-938

Gamification Powered by a Large Language Model to Enhance
Flipped Classroom Learning in Undergraduate Computer Science
Kathleen Kelly, Bo Wu, Christine Liebe 939-946

An Antibullying and Therapeutic Interactive Visual Novel: TheraBuddy
İsa Özgür Özer, Mehmet Bilgin 947-956

Unleashing Creativity Through Paidia:
Free Play in Learning and Work
Jacinto Quesnel 956-963

Impact of LEGO® Based Therapy on Skills
Development and Quality of Life in People
with Neurodevelopmental Disorders
Chloe Schmidt-Dhonneur 964-970

Investigating the Role of Adaptivity in Video Games for Attitude Change
David Šosvald, Lukáš Kolek 971-979

Integrating Learning and Serious Game Design:
The Development and Application of the Learning and Game
Integration (LGI) Framework using the 'Blackout' Serious Game
Stella Stefany, Ling Mei Cong, Jessica Helmi, Rickman Roedavan 980-989

Children's Expressed Emotions During Playful Learning Games
Thomas V. S. Volden, Paolo Burelli 990-997

Game-design Workshops with Co-creation Toolkit
to Support Game-based Learning for Heritage Museum
Wenying Lu 998-1008

Masters paper

Fostering Inclusivity and Creativity:
A Card Game for Color Perception and Inclusion
Paula Escudeiro, Márcia Gouveia 1010-1016

Work in Progress

Exploring the Relationship Between
Challenge and Reward for Game Based Learning
Phillip Benachour, Zesen Zhao 1018-1022

Educational Gaming and Situational Interest
for Higher Education Students
Marissa Berk, Marcel Stalenhoef, Winnifred Wijnker,
Koen VanTurnhout, Bowie Derwort 1023-1025

WeAreEurope SD : A playful Sustainable Development
Education Approach for Primary School Level
Tharrenos Bratitsis, Gonçalo Meireles, Iro Koliakou 1026-1030

Gamification for Sustainable Management Education:
Prosper Management Edition's Role in South Africa's Climate Policy Engagement
Lance Bunt, Byron Bunt, Deon Van Tonder 1031-1033

Viral Sphere: Fostering Healthy Social Media
Practice Through Playful Simulation
Jacob F. Davis, Hannah G. Gaudesen, Nina Genster,
Simone L. Rasmussen, Johan K. Sørensen, Emanuela Marchetti 1034-1038

A Virtual 3D Chemistry Escape Room for Exam Preparations
Michaela KRÖPPL, Georg Yvon 1039-1042

The Circular Game:
The Impact of Gaming on Sustainable Behaviour
Sonia Marcos, Esther Quevedo-Puente,
Clara Pérez-Cornejo, Blanca López-García 1043-1046

Boardcraft: Learning the Art of Strategic
Decision-Making Card by Card
Sonia Marcos, Blanca López-García 1047-1051

Digitising a Card Game for Teaching Pragmatic Markers
Jonathan Marquez 1052-1057

Reflecting on Current State and Future Research of Empathy
Assessment and Development within the Game- Based Learning Community
Ekaterina Muravevskaia 1058-1060

Indie Games for Ethical and Socioemotional
Development in Secondary Education
Jorge Oceja, Julia Vilasís-Pamos, Jesús Salinas 1061-1064

Bridging Theory and Practice in Military
Education Through Advanced Technologies
Ondřej Pekař, Jiří Novák, Jaroslav Varecha,
Jiří Šotnar, Jan Drábek 1065-1069

Young Gamers Outside Education, Employment or Training:
Translating Computer Gaming Skills to Job Relevant Competencies
Øyvind Ibrahim Marøy Snipstad, Ingrid Bårdsdatter Bakke ,
Julie Sikin Bhanji Jynge, Håvard Vibeto 1070-1073

Late Submissions

Didactic and Psychological Principles
of Successful Design of Serious Games
Wolfgang Becker, Maren Metz 1075-1081

Serious Games in EDI Education:
A Preliminary Discursive Literature
Thomas Hainey, Gavin Baxter, Beth Cross,
Khadija Mohammed, Joanne Lawrie, Jan Smith 1082-1090

From Boring Tests to Engaging Adventures:
A Game-Based Learning Approach in LMS
Christopher Könitz 1091-1098

Virtual Simulation Games in Entrepreneurship Education:
Status Quo and Prospects
Hongmei Sziegat 1099-1106

Towards AI-assisted Board Game-based Learning:
Assessing LLMs in Game Personalisation
Andrea Tinterri, Federica Pelizzari, Giordano Vignoli,
Francesco Palladino, Marilena di Padova 1107-1115

Utilizing a Digital Escape Room to Improve Students'
Grasp and Understanding of Qualitative Research Methods
Souad Dr Slyman 1116-1121

There's More than One Way to Skin a Game:
Templating Game-Based Learning
Edward Morrell, Ville Kankainen,
Annakaisa Kultima, Tomi Kauppinen 1122-1125

A Serious Game for the Digital Transformation of Organizations
Luuk Collou, Guido Bruinsma 1126-1134

Exploring Mars: An Immersive Survival Game for Planetary Education
Alastair Howcroft, Gail Hopkins 1135-1144

Design of a Conversational Adventure
app to Promote Argumentation in Science
María del Mar López-Fernández, María José Cano-Iglesias,
Antonio Joaquín Franco-Mariscal 1144-1154

Serious Games for Education and Training in the
Humanitarian Sector: State of the Art
Pragya Mukherjee, Emmanuel Guardiola 1155-1162

Enhancing Digital Game-Based Learning Through Reflective Game Design (RGD)

Anjuman Shaheen , Panagiotis Fotaris

1163-1172

Mr. Tumbles' Maya and the Multiplicity of Personas:
Leveraging Illusion and Reality in Educational Game

Design for SEN Language Learners
Subhangi Namburi 1173-1182

Enhancing Algorithmic Thinking Skills through Phygital Games:
The Case of Space Codyssey
Sotirios Georgiou, Tharrenos Bratitsis 1183-1186

Traditional Quizzing with a Twist:
Involving University Students in the Development Process
Souad Slyman 1187-1190

About the 18th European Conference on Games-Based Learning, 2024

The European Conference on Games-Based Learning (ECGBL) is a well-established academic conference, held annually since 2007, that serves as a hub for scholars, educators, and practitioners interested in the design, development, and application of games and gamification in education and training. The conference proceedings are published each year, contributing significantly to the research on how games can foster learning, engagement, and motivation across diverse educational settings.

ECGBL has been instrumental in advancing research on how games can transform education, offering a space for interdisciplinary collaboration between academics, game designers, and educators. It has significantly contributed to the understanding of how games can support learning in a variety of contexts and for diverse learner groups. By publishing its proceedings annually, the conference disseminates state-of-the-art research, case studies, and theoretical discussions that help shape the future of games-based learning. The conference is recognized for encouraging innovation in education and for highlighting the potential of games to engage learners, enhance motivation, and improve learning outcomes across all age groups and educational sectors.

The Proceedings of the 18th European Conference on Games-Based Learning, 2024 includes academic research papers, PhD research papers, Masters Research papers and work-in-progress papers which have been presented and discussed at the ECGBL 2024 conference. The proceedings are of an academic level appropriate toa professional research audience including graduates, post-graduates, doctoral and post-doctoral researchers. All papers have been double-blind peer reviewed by members of the Review committee.

Aims and Scope

ECGBL focuses on the intersection of games, technology, and education, aiming to advance knowledge and innovation in the field. The scope is comprehensive, addressing both the theoretical foundations and practical applications of games in various learning environments, and offering a venue for discussing new challenges and future directions in games-based learning.

Topics Covered

The call for papers for the ECGBL conference asked for contributions that considered the following topics. In addition, the committee welcomed papers o a number of specialist mini-tracks which can be seen at the end of this list.

Games-Based Learning (GBL) Theories and Models

- Exploration of theoretical frameworks underpinning games-based learning.
- Models that explain how and why games enhance learning.
- Cognitive and motivational theories related to gameplay and learning outcomes.
- The role of experiential learning and constructivism in game-based environments.

Game Design for Education

- Best practices in the design and development of educational games.
- Principles of gamification and how they can be applied to non-game contexts.

- User experience (UX) and user interface (UI) considerations for educational games.
- Collaboration between game designers, educators, and subject matter experts.

Serious Games for Skill Development

- Use of serious games to teach complex skills such as problem-solving, critical thinking, and teamwork.
- Case studies of games developed for professional training, including sectors like healthcare, military, and business.
- Games for soft skills development, including communication, empathy, and leadership.
- Assessing the effectiveness of games for skill acquisition and retention.

Gamification in Learning

- Application of gamification techniques to enhance motivation in traditional learning environments.
- Analysis of reward systems, leaderboards, badges, and progression mechanics.
- Gamification in corporate training and adult education.
- Balancing gamification elements with educational objectives.

Assessment and Evaluation in Games-Based Learning

- Methods for assessing learning outcomes in game-based learning environments.
- Use of analytics to measure engagement, progress, and knowledge retention in games.
- Adaptive learning and personalization through games.
- Challenges in standardizing assessment methods for GBL.

Games for Social and Emotional Learning

- Role of games in developing social-emotional skills, including empathy, resilience, and cooperation.
- Multiplayer and collaborative games that foster teamwork and communication.
- Addressing bullying, inclusion, and diversity through games.
- Games designed to build emotional intelligence and self-regulation.

Technology and Innovation in Games-Based Learning

- Emerging technologies in game-based learning, such as virtual reality (VR), augmented reality (AR), and artificial intelligence (AI).
- Use of mobile and tablet games for education.
- Integration of interactive simulations and immersive experiences in learning.
- Exploring the potential of mixed reality and AI-driven adaptive learning systems.

Games for Specific Learner Groups

- Games designed for early childhood education and primary school students.
- GBL approaches for secondary and higher education.
- Accessibility considerations for learners with special needs.
- Games tailored to adult learners and lifelong learning contexts.

Games-Based Learning in Formal and Informal Settings

- The role of games in formal education environments, including schools and universities.
- Use of games in informal and non-traditional learning settings, such as museums, libraries, and after-school programs.
- Community-driven game-based learning initiatives.
- Games for public awareness campaigns and societal impact.

Cultural and Ethical Aspects of Games-Based Learning

- Exploration of cultural contexts and their impact on game-based learning design and reception.
- Ethical considerations in the use of games for education.
- Addressing biases, stereotypes, and representation in educational games.
- Discussion of privacy, data security, and the digital well-being of learners in game-based environments.

Experts in the field proposed mini tracks on the following topics. Papers accepted to these tracks after the double-blind peer review process were presented as mini tracks at the conference and are also published in these proceedings.

- Citizen Science Games
- Games Promoting Critical Thinking, Scientific Communication and Literacy in STEM
- Educational Escape Rooms
- Game-based learning for lifelong learning
- Educational Non-Digital Games

The programme from the 2024 conference can be downloaded from here and full details about the conference can be seen from the conference website: https://www.academic-conferences.org/conferences/ecgbl/

ECGBL Preface

These proceedings represent the work of contributors to the 18th European Conference on Games Based Learning (ECGBL 2024), hosted by Aarhus University, Denmark on 3-4 October 2024. The Conference chair was Dr. Kristine Kilså and the Programme Chair was Dr. Rajiv Vaid Basaiawmoit

ECGBL is now a well-established event on the academic research calendar and now in its 18th year the key aim remains the opportunity for participants from around the world to share ideas and meet the people who hold them. The aims and scope of the conference is to be a forum for encouraging innovation in education and for highlighting the potential of games to engage learners, enhance motivation, and improve learning outcomes across all age groups and educational sectors. The scope of papers will ensure an interesting two days.

The opening keynote presentation was given by Pietro Michelucci from the Human Computation Institute, USA whose topic was *Gamified World: Blurring The Lines Between Education, Work, And Leisure*. The second day of the conference will open with an International Educational Games Panel Discussion on the topic of *Industry-Academia collaboration in Gaming and the future of Gaming in Education*. The panel was moderated by Rajiv Vaid Basaiawmoit, Head of Sci-Tech Innovation & Entrepreneurship, Aarhus Univeristy, and the panelists were Rikke Toft Nørgård, Aarhus University, Luke Savage, Head of Education Epic Games, UK, and Professor Deb Polson: Director of Centre of Digital Ecosystems (CODE) at RMIT University, Australia.

With an initial submission of 213 abstracts, after the double blind, peer review process there are 101 Academic research papers, 12 PhD research papers, 1 master's Research papers and 13 work-in-progress papers published in these Conference Proceedings. These papers represent research from Australia, Austria, Belgium, Brazil, Canada, Chile, China, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hong Kong, India, Ireland, Italy, Japan, Mexico, Netherlands, Norway, Oman, Poland, Portugal, Serbia, Slovakia, South Africa, Spain, Sweden, Switzerland, Taiwan, Turkey, UK and the USA.

We would like to thank everyone who participated in this conference.

Rajiv Vaid Basaiawmoit and Kristine Kilså
Aarhus University

October 2024

ECGBL 2024 Conference Committee

Dr Anis Hasliza Abu Hashim, University of Twente, Netherlands; Dr Minoo Alemi, Islamic Azad University, West Tehran Branch, Iran; Jimmy Andersson, Högskolan i Skövde, Högskolevägen, Sweden; Stavroula Andreopoulos, University of Toronto - Toronto, ON, Toronto, ON, Canada; Dr Sylvester Arnab, Coventry University, UK; Prof Lina Artemenko, National Technical University of Ukraine Igor Sikorsky Kyiv Polytechnic Institute, Ukraine; Nafisa Awwal, University of Melbourne, Australia; Dmitriy Babichenko, University of Pittsburgh, USA; Afsaneh Bagheri, Faculty of Entrepreneurship, University of Tehran, Iran; Dr Samira Bakr, Ministry of Education, Egypt; Dr Ana Barata, Instituto Superior de Engenharia do Porto (ISEP), Portugal; Nathalie Barz , Saarland University, Saarbruecken, Germany; Dr Gavin Baxter, University of the West of Scotland, Paisley, UK; Francesco Bellotti, University of Genoa, Italy; Dr Phillip Benachour, Lancaster University, UK; Dr Andrew Blake, University of Brighton, UK; Dr Peter Blanchfield, Nottingham Trent University, UK; Dr Melania Borit, UiT - The Arctic Univeristy of Norway (University of Troms), Norway; Dr Tharrenos Bratitsis, University of Western Macedonia, Greece; Sara Brinch , Norwegian University of Science and Technology (NTNU), Norway; Dr Cyril Brom, Charles University in Prague, Czech Republic; Prof Anthony Brooks, Aalborg University, Denmark; Tina Helene Bunæs, Østfold University College, Norway; Michael Callaghan, Ulster University, Coleraine, UK; Dr José Ramón Calvo-Ferrer, University of Alicante, Alicante, Spain; Dr Thibault Carron, LIP6 - Paris, Université de Savoie, France; Dimitris Charalambis, University of Athens, Greece; Dr Darryl Charles, University of Ulster, UK; Dr Ming-Puu Chen, National Taiwan Normal University, Taiwan; Dr Velma Chen, Lynn University, USA; Dr Lee Cheng, Anglia Ruskin University, UK; Dr Fabio Chiarello, CNR (Italian National Research Council), Italy; Dr Luuk Collou, Saxion university of applied sciences, Enschede, Netherlands; Dr Conceição Costa, Universidade Lusófona de Humanidades e Tecnologias, Portugal; Mario Cruz, Escola Superior De Educacao, Porto, Portugal; Dr Sara Cruz, Polytechnic Institute of Cávado and Ave, Portugal; Dr Ioannis Deliyannis, Ionian University, Greece; Helga Dis Sigurdardottir , Nord-Trøndelag University College, Steinkjer, Norway; Heiko Duin, BIBA - Bremer Institut for Produktion und Logistik GmbH, Germany; Dr Ronald Dyer, University of Sheffield, UK; Dr David Edgar, Glasgow Caledonian University , UK; Dr Nour EL Mawas, Université de Lorraine., France; Lars Elbæk , University of Southern Denmark, Odense, Denmark; Marta Ferreira Dias, GOVCOPP, DEGEIT, UA, Aveiro, Portugal; Georgios Fesakis, University of the Aegean, Greece; Prof Ana Paula Figueira, Faculty of Psychology and Sciences of Education, University of Coimbra, Portugal; Micaela Fonseca, COFAC, Lisbon, Portugal; Marta Fortunato, Universidade de Aveiro, Aveiro, Portugal; Dr Panagiotis Fotaris, Brighton University, UK; Prof Sonja Gabriel, KPH, Vienna/Krems, Austria; Dr Marco Gilardi, University of the West of Scotland, UK; Dr Lisa Gjedde, Aalborg University, Danmark; Dr Stefan Goebel, Technical University Darmstadt, Germany; Pedro Pablo Gomez-Martin, Universidad Complutense, Madrid, Spain; Dr David Guralnick, Columbia University and Kaleidoscope Learning, New York, USA; Dr 0 Hainey, University of the West of Scotland, UK; Dr Sara Hasani, London South Bank University, UK; Suzaan Hughes, University of Johannesburg, Johannesburg, South Africa; Assc Roslina Ibrahim, Universiti Teknologi Malaysia, Malaysia; Alf Inge Wang , Norwegian University of Science and Technology (NTNU), Norway; Dr Marina Ismail, Universiti Teknologi MARA, Malaysia; Dr Nashwa Ismail, University of Liverpoool, United Kingdom; Dr Dinesh Jain, Sage University Indore , India; Ruben Jans, Limburg Catholic University College, Belgium; Dr Diane Jass Ketelhut, University of Maryland, College Park, USA; Dr Sotiris Kirginas, University of Athens, Greece; Prof Maria Kordaki, University of the Aegan, Greece; Evangelia Kourti, University of Athens, Greece; Dr Konstadinos Kutsikos, Business School, University of the Aegean, Greece; Maria Lopez, University of Huddersfield, Huddersfield, UK; Dominic Mahon,

Coventry University, UK; Dr Christos Malliarakis, University of West Attica, Greece; Bertil Marques, Instituto Superior de Engenharia do Porto (ISEP), Portugal; Prof Helena Martins, ISCAP, Porto Polytechnic and Instituto Politécnico de Setúbal, Portugal; Dr Bruce Mitchell, Monash Univeristy, Australia; David Moffat, Glasgow Caledonian University, UK; Atefeh Mohseni Ejiyeh, University of California, Santa Barbara, USA; Dulce Mota, Instituto Superior de Engenharia do Porto (ISEP), Portugal; Peter Mozelius, Mid-Sweden University, Sweden; Prof. Doutor Pedro Ribeiro Mucharreira, University of Lisbon, Portugal; Dr Ekaterina Muravevskaia, Amrita Vishwa Vidyapeetham University, India; Dr Rob Nadolski, Open University of the Netherlands, The Netherlands; Brian Nelson, Arizona State University, USA; Dr Annie W.Y. Ng, The Hong Kong University of Science and Technology, Hong Kong; Dr. John O'Mullane, University College Cork, Ireland; Jorge Oceja Castanedo, Valencian International University, Valencia, Spain; Prof Elsa Catalina Olivas Castellanos, Tecnologico de Monterrey, Mexico; Prof Sónia Pais, Polytechnic of Leiria, Portugal; Dimitra Panagouli, Hellenic American Educational Foundation, Greece; Dr Stamatis Papadakis, University of Crete, Greece; Dr Marina Papastergiou, University of Thessaly, Greece; Paul Peachey, University of Glamorgan, Treforest, UK; Dr Carmen Perez-Sabater, Universitat Politecnica de Valencia, Spain; Alexander Pfeiffer, Danube University Krems, Austria; Prof Carvalho Piedade, GILT-ISEP, Porto; Prof Selwyn Piramuthu, University of Florida, Gainesville, USA; Mr Trygve Plohn, Nord-Tr ndelag University College, Norway; Dr Maria -Magdalena Popescu, Carol I National Defense University, Romania; Dr Reihaneh Rafizadeh Akhavian, Kharazmi University, Iran; Prof Pedro Rito, Polytechnic Institute of Viseu, Portugal; Gregory Rogers, Causeway Studios LLC, USA; Dr Eleni Rossiou, University of Macedonia,Thessaloniki, Greece; Prof Joze Rugelj, University of Ljubljana, Slovenia; Dr Etienne Schneider, University for Information Science & Technology Saint Paul, Macedonia; Dr Markus Siepermann, Technische Universität Dortmund, Germany; Martin Sillaots, Tallinn University, Estonia; Dr Gavin Sim, University of Central Lancashire, UK; Dr Julie-Ann Sime, Lancaster University, UK; Chrysanthi Skoumpourdi, University of the Aegean, Greece; Dr Souad Slyman, Business Roehampton School, UK; Dr Heinrich Soebke, Bauhaus-Universit t Weimar, Germany; Prof Ana Sousa , Polytechnic of Leiria, Portugal; Prof Bernadette Spieler, Zurich University of Teacher Education, Switzerland; Martin Steinicke, University of Applied Sciences HTW Berlin, Germany; Dr Ian Stewart, University of Manchester, UK; Dr Philippe Tamla, Multimedia and Internet Applications, Germany; Assc Anastasios Theodoropoulos, University of Peloponnese, Greece; Andre Thomas, Texas A&M University, USA; Stina Thunberg, Luleå University of Technology, Luleå, Sweden; Dr Tiago Trancoso, IPVC, Portugal; Prof Tuna Uslu, Istanbul Gedik University, Occupational Health and Safety Program, Türkey; Dr Aristides Vagelatos, Computer Technology Institute, Greece; Dr Michael Vallance, Future University Hakodate, Japan; Dr Herre Van Oostendorp, Utrecht University, The Netherlands; Dr Carlos Vaz de Carvalho, GILT - Graphics, Interaction and Learning Technologies, Portugal; Harko Verhagen, Stockholm University, Sweden; Dr Iro Voulgari, National and Kapodistrian University of Athens, Greece; Dr Charlotte Lærke Weitz, Technical University of Denmark, Lyngby, Denmark; Thomas Westin, Stockholm University, Sweden; Dr Misbahu Zubair, Manchester Metropolitan University , United Kingdom.

Biographies

Conference and Programme Chairs

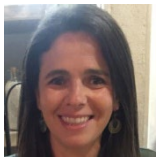
Dr. Kristine Kilså graduated from the Dept. of Chemistry at University of Copenhagen and continued her research while obtaining a PhD degree in Physical Chemistry at Chalmers University of Technology in Sweden. After a long career in academia, bringing her from California to Copenhagen, she dedicated her career to education at the Swedish University of Agricultural Sciences, as the Head of Education and Management Support, as well as being the Coordinating Director of Studies and Assistant Faculty Director. As of 2020, she has the strategic responsibility for education at the Faculty of Natural Sciences at Aarhus University, as the Vice Dean for Education.

Dr. Rajiv Vaid Basaiawmoit graduated from the Dept. of Biotechnology at Madurai Kamaraj University in India and then completed his PhD in Biophysics from the Dept. of Biotechnology at Aalborg University in Denmark. He has been at Aarhus University since 2008 doing a series of post-doctoral stints at the Department of Nanoscience and then a business degree (MBA) from the Business School at Aarhus University. Combining his science and business knowledge he has been teaching entrepreneurship, especially to science and technology students since 2013. Since 2016 he joined the Faculty of Science & Technology and has continued his role as Sci-Tech Head of Innovation and Entrepreneurship where he designs and embeds entrepreneurship into science courses at a master's level across various disciplines. As an award-winning educator, Rajiv has pioneered the use of games in entrepreneurship education and is a big proponent of game-based learning in the higher ed space

Keynote Speakers

Pietro Michelucci is the director of the Human Computation Institute, an innovation center that develops crowd-powered systems to address societal problems. He is founding editor of the journal Human Computation. Michelucci received a joint-PhD in cognitive science and mathematical psychology from Indiana University and spent ten years advising federal research agencies on Artificial Intelligence. He currently leads several citizen science projects, including Stall Catchers, which engage 60,000+ public volunteers to tackle Alzheimer's disease, related dementias, and stroke. Michelucci has appeared on PBS, Science Friday, BBC World Service, and been covered by the Wired, Fast Company, and MIT Technology Review.

Mini Track Chairs



Stavroula Andreopoulos is a Professor, Teaching Stream, in the Department of Biochemistry at the University of Toronto. In 2017, she was recognized by the Temerty Faculty of Medicine for her multi-year contribution to undergraduate teaching with the Sustained Excellence and Innovation in Life Sciences Education Award. More recently (2023), she was awarded the provincial Ontario Confederation of University Faculty Associations (OCUFA) Teaching Award of Distinction.

Panagiotis Fotaris is Principal Lecturer at the University of Brighton, UK, specialises in Game, Narrative, and User Experience Design. As a seasoned educator and researcher deeply passionate about game-based learning, Dr Fotaris champions the pedagogic potential of escape rooms, generative AI, and immersive technology in higher education. His diverse background, fusing computing with arts, games, and music, enhances his innovative teaching methodologies. Leading projects on educational escape rooms for cybersecurity awareness and information literacy, Dr Fotaris is at the forefront of shaping a future marked by immersive and impactful game-based learning experiences.

Nour El Mawas is a Full professor at Université de Lorraine and CREM Laboratory (Pixel team). Her research is in the Technology Enhanced Learning (TEL) Field. She coordinates with J.M. Gilliot the "TEL for lifelong learning" working group supported by ATIEF and is also member of Ikigai scientific committee. The Ikigai consortium gathers operators in education, cultural mediation and research aiming at revitalizing teaching and mediation through gamification. It builds and distributes educative games, provides large scale usage datasets and is involved in the development of new digital data interoperability standards in education, essential for assisting learners throughout their life.

Sónia Pais, PhD in Education, is an Associate Professor at the Polytechnic of Leiria. She is a researcher at CiTUR - Centre for Tourism Research, Development and Innovation. Her research interests are in educational sphere, including how best to teach math subjects. She has interest in Mathematical Education, Educational Technology, Pedagogical Innovation and Game Based Learning.

Workshop Facilitators

Luuk Collou finalized his PhD in 2020 at the University of Twente during which he developed and tested a simulation model and serious game for strategic human resource management (HRM). Currently Luuk is working as an associate lector for the research group strategic HRM of Saxion University for applied Sciences in Enschede, the Netherlands. In addition to his work for Saxion university, Luuk is employed as managing consultant research & data at BMC/Randstad.

Guido Bruinsma With a background in work- and organizational psychology Guido finished his Ph.D. at the University of Twente on a simulation model on the orchestration of complex multi-organization collaborative work. Building on his passion for research methodology, technology and human behavior Guido's research focusses on the development and implementation process of gamebased interventions (serious games) and the development of health, performance, and data driven systems for esports performance enhancement. Guido was one of the founders of the esportslab at the University of Twente and Gamelaboost in the municipality of Enschede. Guido furthermore is involved in several startups and organizations in the field of organizational improvement, applied gaming, and esports.

Ton Spil teaches in the area of Business Information Systems for MBA and Management of Risk Management and Business and IT. He did his PhD thesis on the effectiveness of information strategies and after that he specialized in the application area healthcare and professional organizations. He is track chair e-health in main conferences and published on ISI A level. He was (guest) editor of JSIS and associate editor of several health journals. In 2017 his main topics are adoption of IT, business modeling, serious gaming and digital strategies applied on (tele) health, music and banking. He creates digital strategies for (social) media & health.

Game Designers' Experiences with Educational Game Design Elements: From Practice to Conception!

Mifrah Ahmad
Design and Creative Technology, Torrens University, Melbourne, Australia

Mifrah.ahmad@torrens.edu.au

Abstract: Educational game (EG) designing processes have adopted various processes and approaches over the last decades. While many articles report EG design elements that can potentially assist in effective EG design, not much research exists on whether game designers use/agree with those elements. In considering the aforementioned, the questions arise with game designers' practices: *how do they approach EG design elements in their process? Are there any core elements they include in their EG designing practices? Are there any other aspects that influence their EG designing process?* Therefore, this paper reports on the above-addressed questions and how game designers and their experiences in designing EGs can present insightful gaming elements associated with EGs. Based in Australia, a phenomenological approach was adopted to conduct semi-structured interviews to gather the *essence* of their experiences. Seventeen game designer participants attended two-hour interview sessions. Interpretive thematic analysis was used to identify emerging themes until saturation was achieved (Braun and Clarke 2012). The analysis was concurrently grounded through the concepts of the *theory of experience*, including *continuity*, *interaction*, *situation*, *freedom*, and *desire* which drives the purpose to apply and contextualize the *growth* of experience (Dewey 1938). In conclusion, an "Essential" Educational Game Elements (EGEs) framework is proposed with design elements collating all relevant elements/factors, necessary theories, and mechanics suggested by game designers for consideration in the design process as they have practiced. Lastly, researchers in educational/serious games are encouraged to consider the application of the proposed framework in designing EGs to further expand its limitations.

Keywords: Educational Games Design, Design Process, Game Elements, Framework, Experience, Serious Games

1. Introduction and Relevant Literature

The game design process varies in complexity across different genres, and the creative abilities of game designers in approaching such complexity are intriguing. Australian Game Development report demands for highly skilled employees have sufficiently increased, including programmers, artists, and game designers (Williams, 2021, Curry, 2021). Previously published research indicated that the Australian video game field has relied purely on economic and industrial metrics, often overlooking the interrelation of lived experiences of those within the field or the prior experiences of experts (Keogh, 2021, Sotamaa and Svelch, 2021). The emphasis on game designers (GDs) is to ensure that the *balance* is maintained in the system between the realistic and imaginative context of design (Kalmpourtzis, 2018, Schell, 2008). The need to conduct more empirical research that involves GDs' lived experiences, practices, and reflective thought-processes is essential for a growing industry. Still, there is niche research on GDs' thought-processes for designing games and educational games.

GDs are the artists, who direct and conceive game-making processes across various fields as discussed above (Koster, 2013, Darchen, 2017). GD roles, their skills, and the education that is needed to 'design the designer' suggested that there is an expectation and a particular skill level that is required within the gaming industry (Potanin and Davies, 2011). GDs take on multiple personalities to visualize what a game design should have and strive to create interactive narratives with meaningful experiences as they are play-testing to address the boundaries between imagination and reality (Garner, 2013, Kalmpourtzis, 2018, Schell, 2008). As Kalmpourtzis (2018, p.44) states, "*They challenge our way of thinking and help us grow. In this aspect, games are only limited to their designers' imagination*". GDs also experience a continuous play experience across various genres to adapt to a new and playable game with meaningful play (Ahmad, 2022, Ahmad, 2024).

The next section lists and discusses existing EG design elements, principles, factors, and also quality factors that have been prominently considered by other gaming researchers in the field over the past decade.

1.1 Existing EG Design Elements Review

Educational games designed for learning take both play and fun into account. Definitions by (Ogar et al., 2014) in (Ibrahim et al., 2010) defined game design as a learning system, that realizes some or all components of the learning process (learning theory, gaining skills and experience, and estimation of knowledge level) in a game context. EGs have been specifically designed to teach people about certain subjects, expand concepts, reinforce development, understand historical events or cultures, or assist them in learning a skill as they play (Singh et

al., 2008). Generally, EG is a game that combines both game design principles and learning theories with the integration of learning content of specific subjects or learning outcomes purposely to enrich learning for intended audiences.

It has been highly discussed over the past few years that educational games are designed for learning. Stenros (2017) discusses ten (10) principles that are required for an efficient instructional design, which include theory classification, learning out classification, the assessments of serious games, and four different types of learners. Pedagogically designed games are based on learning outcomes as stated in the course syllabus to match with the authentic syllabus as suggested (Fisch, 2005, Lepper and Cordova, 1992). As educational value through games has been systematically researched, it has been suggested that the cognitive consequences and learning outcomes reflect the player's prior actions to further progress in the assessments towards goals (Mayer, 2014). The learning outcomes should be based on the first three levels of Bloom's taxonomy (Forehand, 2010): knowledge, comprehension, and application. Another concept is scaffolding which requires feedback to be provided in the form of learning material to enhance students' learning process (Fisch, 2005, Graci, 1992). Finally, EG designed for self-learning purposes is used by students to enhance their understanding and assess their learning performance. These concepts were integrated into the game model proposed in (Garris et al., 2002). Theorists other than Prensky also identify key elements. Van Staalduinen and de Freitas (2010) listed 12 game elements from the literature and grouped them into four dimensions of their proposed 4-Dimensional framework. Some of the game elements appearing in the four dimensions are also mentioned in the core elements of a well-designed game and elements of an effective game (De Freitas and Jarvis, 2009, De Freitas and Oliver, 2006). This framework is used to choose an appropriate EG and learn to earn knowledge correctly (De Freitas and Jarvis, 2009, De Freitas and Oliver, 2006). The list of elements of learning specifics, pedagogy, representation, and context can be grouped with game elements as elaborated in (van Staalduinen and de Freitas, 2010).

Games motivate learners to take responsibility for their learning, which leads to intrinsic motivation contained by the method itself (Rieber, 1996). Four characteristics of games that contribute to an increase in motivation and eagerness to learn new knowledge are, namely, challenge, fantasy, curiosity, and control (Malone, 1980, Malone and Lepper, 1987, Snow et al., 1980). Challenges in a game tend to fight students' boredom and keep them engaged with the activity by utilizing adjusted levels of difficulty. Fantasy in a game increases enthusiasm by providing an appealing imaginary context, whereas curiosity offers interesting, surprising, and novel contexts that stimulate students' needs to explore the unknown. Finally, the control characteristic gives learners the feeling of self-determination. The requirements/guidelines for effective EG design. Due to various researchers proposing game design elements, this study combined four different game design elements into one Figure 1 to have a more visual representation of the game design elements proposed.

Games deliberately designed for education require some degree of effectiveness in order to be accepted by stakeholders. Researchers suggested that effective games should combine good game design and good pedagogy (Amory and Seagram, 2003, Klopfer et al., 2009b). Games design has similar concepts applied in entertainment games that should be adapted into EGs so they can offer certain degrees of engagement as it is in entertainment games. Game design with a fun aspect includes challenges, goals, feedback, and game stories. These elements derive the concepts of the game as described by various authors(Garzotto, 2007, Novak, 2011). These elements are said to be crucial in a game to really behave as a game (Grassioulet, 2002, Klopfer et al., 2009b, Owen, 2005, Prensky, 2003, Sauvé et al., 2007). Without those elements, games cannot be claimed as a games, but rather similar to edutainment concepts as suggested by (Klopfer et al., 2009a). See Figure 2 for a summarized list of existing EG elements.

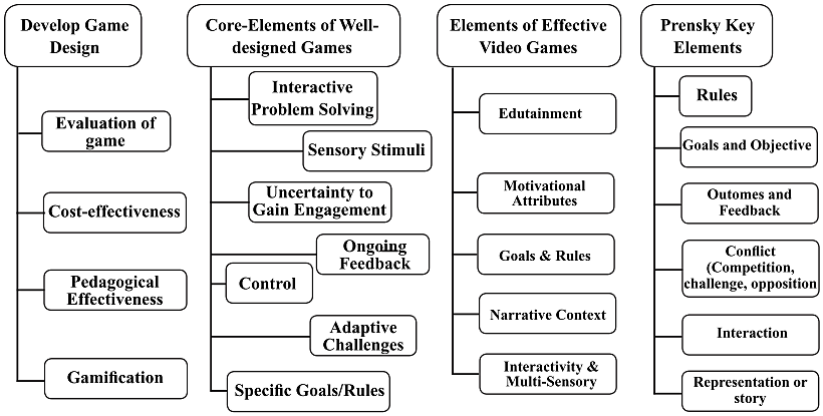


Figure 1: Adapted from various studies: Elements of developing a game design (Moreno-Ger et al., 2008, Holland et al., 2003, Whitton, 2007, Whitton, 2012), Core-elements of well-designed games (Shute and Ke, 2012), Elements of effective video game (Dondlinger, 2007), and Key elements of game (Prensky, 2003)

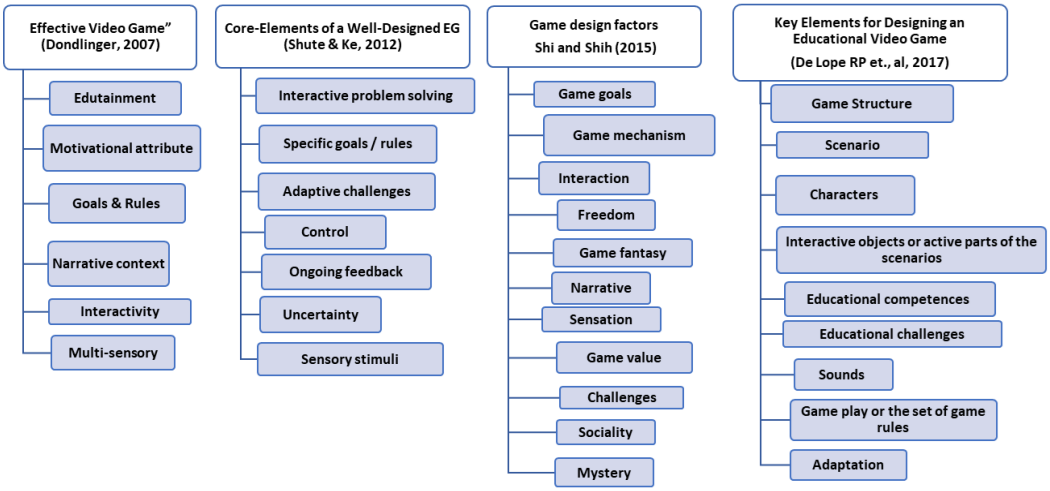

Figure 2: Adopted from Elements of an effective video game (Dondlinger, 2007), Core-elements of well-designed games (Shute and Ke, 2012), Game design Factors (Shi and Shih, 2015), and Key Elements for Designing an Educational Video Game (De Lope et al., 2017).

When the quality of EG is discussed, the quality characteristics must be also highlighted. Calderon & Ruize (2015) proposed 18 quality characteristics of EG for assisting in evaluating the process. A study analyzed primary studies (102) assessing learning outcomes through the application domains in which the assessments took place, the categories of serious games assessed, and the main features considered to assess the educational effectiveness of serious games (Calderón and Ruiz, 2015). Consequently, the procedures followed for assessing the learning outcomes of serious games and show that a key quality to be assessed is the effectiveness of EGs in terms of knowledge acquisition (Calderón and Ruiz, 2015). Usability and experience are also frequently assessed. Among the published research being reviewed, the methods for assessment being used are limited to testing the games after the games are fully developed. Other reviews on EGs for providing educational aspects do not analyze in detail how these EGs are evaluated. A non-systematic literature review presenting 41 games used for teaching different computing knowledge areas (Gibson and Bell, 2013). Besides characterizing the games, the authors also present some guidelines on how to determine if the use of a game is promising for computing education. Moreover, the Elemental Tetrad (Schellm 2008) was evolved by Kalmpourtzis (2018) as Elemental Pentad which includes Pedagogy in the center for educational purposes in the games. This was further used to develop categorization on sub-elements within the EGs design (Ahmad, 2022, Ahmad, 2023), which shed light on more clarity on aesthetics, mechanics, the storyline of the game, and technology. Petri & von Wangenheim (2017) reported that they have observed a diversity of quality factors evaluated but they did not identify a clear pattern. Frameworks such as MEEGA (Savi et al., 2011), use quality factors (e.g. Attention, relevance, competence, satisfaction) and the ARC model by (Keller, 1987); that decomposes the motivation concept. According to Keller

(1987), motivation is viewed as an unpredictable and changeable factor, and it can be influenced by teachers or a designer as they have no control over it. As a result, designers and teachers tend to ensure that their responsibility is to provide a good quality instruction, and they tend to assume that it is learner's responsibility to decide whether they take this opportunity to learn or not.

The explosion of EG design elements in research has clearly created duplication of some existing elements proposed previously, though some criteria changes in terms of the way type of game design, or using the terms effective, efficient, quality factors, and core elements. Not only does this lead to confusion but also leads to a misunderstanding of many other elements and their importance in EG. Therefore, there is a need to comprehend the reflective practices of game designers who have used and tested EG design elements in their design processes.

2. Theoretical, Conceptual, and Methodological Approach

The conceptual and theoretical frameworks adopted in this paper relate to Dewey's experience theory (1938): growth of experience, purpose, and continuity. Since these concepts are related to research epistemology and ontology, constructivism is used as a model for constructing new knowledge that welcomes the subjectiveness of individual experiences (Dewey, 1938b). The growth of experience is how a person develops in his or her career, experiences everyday activities to gain knowledge, learns to achieve his or her objectives, maintains his or her understanding of phenomena, and continues to develop in his or her experience. The aspects of "growth" are driven by the desire to formulate a "purpose" that returns to the growth of experience with the intelligence of the individual mind. In this context, adults who combine work and study, theoretical and practical exposure, are very well-known and productive in their expertise. The *purpose* is simple when a desirable quality *"…which identifies freedom with power to frame purposes and to execute or carry into effect purposes so framed. Such freedom is, in turn, identical with self-control; for the formation of purposes and the organization of means them are the work of intelligence"* (Dewey 1938, p.67). Dewey's description of an actual purpose is that it begins with an impulse. It is always equipped with *"end-view"* – *which is involving "the foresight of the consequences that may result from acting upon that impulse"* (p.67). Teachers create their meaning through their actions, and when games are played or tested, they reflect constantly through their actions, while game designers have similar ideals. Therefore, the creation of an enhanced experience shows the individualized aspect of learning by playing games, learning by doing, and adjusting the experience throughout the process.

The principle of *Continuity* is each experience taken from the past affects the future experience of the individual. In contrast, interaction refers to the situational and teacher's influence on student's experience. He believes that the elements of interaction and the situation in which they occur are *"inseparable from each other"* (1983, p. 41). Despite the importance of experience, some challenges may be encountered, such as *"that all experiences are genuinely or equally educative"* (1938, p.13). Thus, teachers must first understand the nature of human experience and explain how the value of this experience affects the person's present and future, and the ability to contribute to society. This is directly related to the way teachers in their classrooms interact with the needs of each person to support his or her cultural and social differences and enable them to learn equally and freely. Similarly, game designers help design EG design experiences by emphasizing and understanding players', designers', and game design processes. It is therefore crucial that teachers and game designers position the changing experiences in order to understand their perspectives, which may be enjoyable, but they cannot contribute to personal growth or experience without consistency, a situation that does not necessarily lead to a cumulative learning basis for future learning.

2.1 Participant Recruitment Criteria, Data Collection Method, and Analysis

Based in Australia, with criterion and snowballing recruitment procedures, semi-structured qualitative interviews with 17 game designers participated in this study. The criteria set for the recruitment process are shown in Table 1. Each interview session is approx. 2 hours and 30 minutes. This paper interprets one central theme (from six themes) emerging through the coding analysis. Consequently, the phenomenological approach is adopted to allow the researcher to uncover the *essence* of lived experiences described as the qualitative researcher pursues to identify the phenomenon of human experience and then derive a description representing the nature of experience (Kafle, 2011). The *essence* should not be viewed as a vague idea but rather the ability to identify the meaning embodied in the lived experience (Merleau-Ponty and Smith, 1962). Please note that all names are pseudonyms in the analysis.

Table 1: Participant recruitment criteria in this study

Criteria	Participants Details
Location	Within Australia (Victoria, New South Wales, Queensland, South Australia)
Years of Experience	Between 5 years – 15 years
Type of experience	Game designing and Developing (all types of genres).
Types of Players' Demographic	All Demographics. Primary school players' demographics are beneficial.
Participants in the study	17

2.2 Data Analysis and Interpretation Approach

The interviews were audio-recorded, transcribed, and time-stamped. An initial hand-coding approach was adopted before an in-depth thematic analysis using NVivo 10 software. This research adopted a six-step thematic analysis approach (Braun and Clarke, 2006). This analysis aims to allow game designers' perspectives discussed through reflective experience, their experience designing both types of gaming systems (its *growth* and *continuity*), and the way they criticize the conceptualization of games before they are designed (framing the purpose of designing games). Interpretive results are discussed through the interpretivism approach, where hermeneutic analysis is adopted to allow the subjectivity of game designers' experience. Interpretive thematic analysis was adopted to code emerging themes until saturation was achieved (Braun and Clarke, 2012). The analysis was concurrently interpreted through the concepts of the *theory of experience*, including *continuity*, *interaction*, *situation*, *freedom*, *intelligence*, and *desire* drives the purpose to apply and contextualize the *growth* of experience (Dewey, 1938a). Interpretive data analysis of GD's perspectives established six main themes and the *theory of experience,* and its concepts are deeply embedded within contexts where games are centered. Additionally, GDs demonstrated their preferences, attitudes, beliefs, desires, and purpose in using and designing games. By contextualizing the experiences of GDs, designing EGs corresponding to their beliefs shows potential towards what is essential, core, and what factors are considered in designing practices. Please note that all participants are addressed as pseudonyms to maintain anonymity(ethics approved).

3. Findings and Interpretive Results Discussion

Understanding how game designers approach the design of EGs is crucial to contextualize their experiences and practices that have transformed over time. Due to its generalization and adaptability of game designing processes, this theme explores a prompt question: *How do they consider designing elements for designing EGs, and based on your experience of designing EGs, what were the necessary factors to consider during designing processes?* While this question was open-ended, all game designers immediately acknowledged it as they reflected and (re) iterated their game designing approaches (Ahmad, 2023).

While all game designers indicated their preferences to begin designing EG with the way they approached 'games', two out of seventeen mentioned specific additions in the EG designing processes and altered their approach to accommodate EGs. As evidenced [**Raymond and Charlie**] justified how their designing processes were altered based on their previous experiences reflected with the ***bottom-up approach*** [Raymond] and using the ***Verbs*** in the curriculum to help guide the design process of EG [Charlie]. For instance, [Raymond] explained:

> *"..bottom-up approach works for me with educational games because the smallest interactions need to be considered in the beginning and defining all the necessary educational terms beforehand needed to be established…I know the biggest issue is that no other models have helped this process and this contains the essentials as I already know the game mechanics but I just need to define gameplay with a verb to complement with appropriate setting, content, and story relations to centre the core of the educational game…".*

As emphasized by a game designer their understanding of the designing process involves the relation of game designers' cognition to enable such designing processes that are institutively used and understood by themselves (Kuhnen, 2007). The *verb* layer consists of actions that players undertake during play and enforces the low-level micro-decisions to enable an immersive and memorable gaming experience. A good example presented and explained (Kuhnen, 2007) for the Grand Theft Auto game is that if "in-car" is a game state, then "accelerate" and "brake" might be good game verbs. In an EG like Minecraft, if "create" is a game state, then "build" and "break" might be a good game verb. This is then related to mechanics, the player's action, core features, and context.

Similarly, [**Charlie**] emphasized on the use of '*verbs'* in the designing process but there were no specific models/processes that were mentioned. However, the description of designing EG in the extract presented shows similarities with the bottom-up approach to an extent. She acknowledges that the core of the game is organized around *doing,* which is agreed with (Squire, K 2006). As shown:

> "*Unfortunately, I don't think there is a specific designing process for educational games because I usually tend to use the idea from game designing, as they are about playing and learning and not necessarily about knowledge, but players get knowledge by doing/interacting with games. What worked for me was using terms of verbs, listening, and brainstorming what we needed the students to understand and do in the game with some mechanics or actions. This is sometimes the first process I begin with…verbs can also be relevant to curriculum or learning objectives*".

With that, other game designers' participants explained how they have designed EGs and what were the necessary features, elements, and processes, that were undertaken in their experiences. Therefore, there are four emerging themes: Core features/necessary considerations, for whom (player's psychology), Combining Leaning and Gaming elements, and Positioning Pedagogy and learning principles; discussed in the following sections.

3.1 Core Features and Necessary Consideration

As the game designers mentioned that their EG designing processes are transferred and adapted towards EG designing, I prompted a question*: In your opinion, what are the required game design elements/features you always consider in educational game design? Or the "Necessary" elements?* The core of the game (central role in the player's experience are the content and features) and the context that allows players to have a general impression of the game world and its *essence*. The concept occurs to ensure the content and gameplay are constructed simultaneously. The two sub-themes below are discussed in relevance with: Rules, and choices in play, and balancing player's experiences and expectations (classroom).

3.1.1 Rules and Choices in Play

The game designers believed that EGs require an explicit set of rules that allow the learners in the classroom context to 'feel' the serious setting, as [**Blaire**] mentioned, "*the set of rules for educational games are solid and refined, to match the seriousness of the setting*". Moreover, [**Ross**] added that "*rules also relate with player's experience and the reason why game's purpose is educational and how that is controlled appropriately within it*". This relates to the clearly formed *purpose* of designing a game for a specific *situation* as a classroom, where the *interactions* between players and the game system demonstrate its *continuous* form of learning (Dewey 1938). Another relevant point related to rules and their influence on a player's gameplay where boredom may occur, is evidenced below:

> [**Anne**]: "*But one thing I know is a big hurdle for using educational games in the classroom is the rules and learning rules, along with introducing the rules because rules are so boring. Yet, students don't want to listen!"*
>
> [**Paige**]: "R*ules are core and essential, but they are tedious to finalized because it is a constraint on educational use! making the rules understandable to ease the 'figuring out during play' while being in a classroom and to get some fun and engagement together is difficult…rules control them [players] which isn't true. Rules control gameplay for fairness*".

Here, the concept of *freedom* and *social control* was observed in their description which I agree as rules are designed within the game to enable various play/learning experiences in a 'standardized' manner, however, players/learners neglect. In addition, adaptable rules within the games may encourage more interactive gameplay, as [**Nora**] mentioned, "*Once I designed an educational game with rules that were relevant to certain game elements and changed according to their [players] actions and interactions, which was successful!"*

Another point relevant to rules was the demonstration of 'instructions or 'guidance' provided to players through the gameplay are interconnected. Game designers advocated that the instructions "*need to be precise and not like an essay!*" [**Max**], and "*the rules should be differently displayed and the instructions of how to finish a level or activity should be separately presented to players*" [**Warren**]. This suggests that the players/learners make their choices based on what they understand through the play, but teachers act as 'external guidance' to boost their confidence during play or accomplish a sense of mastery. Mastery is when playing a game where the player's choices and actions can lead to a successful outcome, hence, "feeling of mastery that helps remind you that you can succeed…have control" (Schell, 2008, p.442). Here, the *freedom* of choice provided to players allows their abilities, *social control* as rules and guidance, and *interactions* are ideally necessary within EG.

Dewey believes that *freedom* allows one's mind to freely explore the possibilities without being restricted to taking actions or assuming it as a careless act as the players evaluate their own choices without complete guidance (Dewey, 1929).

3.1.2 Balancing Player's Experience and Expectations (Classroom Situation)

This sub-theme expands on players as learners who play games within the classroom context. Game designers highlighted that there is a need to *balance* the play expectations and experiences to ensure that they are memorable. In terms of memorable experiences, game designers advocated that EGs fail due to the play experiences and memory of playing games in the classroom. For instance:

> [**Zack**]: "*if the game being played in the classroom isn't designed in considering the expectations of experiences that the players will have, then the game will fail, and players will hate educational games because that is what they played in the classroom!*".

> [**Cathy**]: *"…memorable experience is so crucial, and I usually design it alongside any fun element or animation in the design, so I don't miss it!".*

With the fun element, another feature associated with memorable experiences was integrating problem-solving tasks/activities that can trigger memorable experiences, emotions/feelings, and affirmation beliefs (winning /losing), as shown below:

> [**Raymond**]: "*You need to engage players with some problem-solving tricks where they get into the play and show their emotions like excitement or anger if they fail*"

> [**Betty**]: "*Usually I find that players remember how they solved a problem or challenge they faced during their play and I think that's a memorable experience shared! I think when they win or lose, it helps them understand what they did wrong and master their choices, redo, and win!*"

Another feature influencing a player's experience is the level of difficulty that reveals appropriate pace and instruction, [**Anne**] added, "*the division of difficulty levels is so crucial in players' experience because if they fail too much, they will get frustrated!*". GD participants believed that a gradual transformation between levels positively affects the progress of learning and forms a *continuous* pace that enables *freedom*, "*they need to feel that they are progressing with some challenges, of course! But the challenges should level with how they progress and make choices. You can't design a game with full freedom, but you need to show that through a progression*" **[Tia].** Here, they asserted that challenging tasks and difficulty levels can be designed separately and are sometimes highly complex (Arnab et al., 2015, Schell, 2008, Kalmpourtzis, 2018). For instance, [**Tia**] pointed out, "*the difficulty level can be controlled one task at a time, but the challenges could be mini ones that pop up during one of the levels… so that's slightly hard to balance because it needs to be universally understood by the players, otherwise I don't add in design*". On that note, [**James**] added that, *"…challenging tasks are highly required because it triggers their mind, and they make choices which they sometimes speak out as reactions especially when they win! So, it encourages memorable experiences*".

With game levels, challenges, and choices, game designers mentioned the need to allocate the appropriate amount of time, that is required to complete the task in the classroom.

> [**Timothy**]: "*I usually design the task and difficulty levels differently to ensure that it can be completed in a certain amount of time… the threshold is to avoid players getting irritated!*"

> [**Terry**]: "*I just don't know how much time a classroom session has these days…my experience didn't let me have the luxury of knowing or being in the classroom to observe but I design based on the challenges that one task can encompass and make them mini so they can feel they completed a challenge.*"

With challenging tasks, some participants emphasized the need to 'communicate concepts appropriately' through design and they encourage curiosity and surprising features, [**Raymond**] added, "*there's something about the experience of communicating concepts and making a way to develop surprising elements, which lets the design level to speak directly to the players*" and this was paired with the interactivity of the player with the game, as [**Ross**] added:

> "*The way in which we [game designers] think that levels and challenges may evoke curiosity or surprise them with a new character or rule, it can directly communicate with players through play, but it can't assure us that it worked… it's a complex thought to anticipate about*."

As Schell (2008) emphasized that "*it is the root of humor, strategy and problem-solving […] random sprays considered the experience much more pleasurable*" (p. 26-27). In relevance with memorable experiences and surprise elements, [**Anne**] expressed that:

> *"One of the most significant elements in game design is surprising. Basically, introduces randomness, or 'gotcha' mechanics, so that your friends figure out what you have in your hands. Then, they can steal a bunch of cards off you because they figured out exactly what you have. So, those are examples like surprises are memorable."*

With surprises and experiences, communication between players and the game world (game as a system) is crucial to address as, "*it's an art... communicating what I want to design as challenges and levels and how they[players] understand it…and then, if they play with their friends in the class, you can hear what they understand too!*" [**Timothy**]. Moreover, game designers also believed that achieving communication and competition within EG design is relevant to the game mechanics that may be selected at the beginning of the designing process. For instance, [**Nora**] added, "*the communication of game elements and learning in the design and how players understand that is also related to how well the mechanics delivered what I meant!*". In addition to that, [**Anne**] suggested that EGs need to accommodate player's experiences through experimentation or trial-and-error based tasks which are aided by communication between their peers, "*it is crucial to let them experiment continuously to achieve the goal, explore, and communicate what they have done to allow their creativity, and collaborative learning within the classroom*". Here, ***Anne*** also mentioned that the goal drives their experimentation, communication, and collaborative learning and creates memorable experiences. It indicates that Dewey's *interaction* and *situation* concepts advocate their intimacy by positioning experience that occurs in a setting(*situation*) and formation of the *purpose* of the EG design that relates to how game mechanics aid with communicating EG design.

4. Concluding Remarks and "Successful" EG Design Elements

To conclude, the game designers experienced in EG designing processes were able to discuss and reflect on their successful EG design elements that enabled a more effective EG. These suggestions were enlightening to some existing literature discussed while others were connected with other elements that represent a successful combination to deliver memorable gameplay. Therefore, Figure 3 proposes the summarised interconnectedness of EG design elements as "essential"; which are practiced by GDs in Australia.

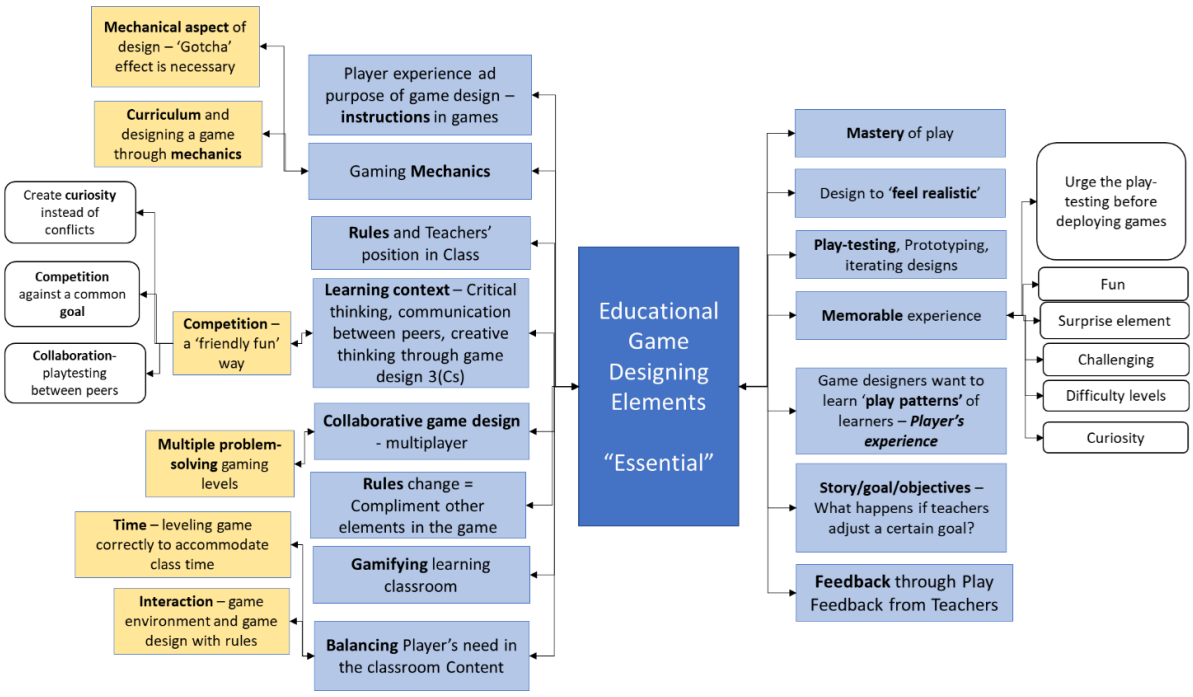

Figure 3: The "Essential" Educational Game Elements (EGEs) for designing EGs

A Conceptual Framework for the Development of Effective Serious Games for Learning

Zahara Abdulhussan Al-Awadai
Department of Computer Science, Technical University of Munich TUM, Munich, Germany

alawadai@cit.tum.de

Abstract: Currently, the interest in using serious games as a tool for learning and teaching in traditional educational processes has increased significantly. Therefore, serious games for learning are gaining increasing attention from researchers and domain experts (educators), as they are both looking for methods and tools to improve the quality of learning. Even though there are many existing design frameworks, models, and methodologies that offer valuable insights into the possibilities and limitations of serious games for learning, they focus mostly on high-level aspects and requirements of these games. Therefore, they do not fully help in understanding how such aspects can be concretely fulfilled. In this research, we investigate, characterize, and categorize the functional requirements and aspects needed for developing effective serious games for learning. This investigation aims to construct a conceptual framework to fill the gap in the current design frameworks. The proposed conceptual framework is used to understand the game´s structure and behavior with a focus on both aspects of serious games (educational and entertainment aspects), in other words, providing a way to think about the relationships between serious game components and the learning objectives of the game. The main contributions of the proposed conceptual framework are to facilitate and support the design and development process of these games as well as to enhance the collaborative work within a multidisciplinary development team. Finally, to show the feasibility and applicability of the conceptual framework, a practical example is presented to demonstrate the use of this framework. Furthermore, we conducted an evaluation process for implementing the conceptual model. The evaluation shows promising results in helping participants, particularly those with gaming experience, to understand and identify the roles of each component in the game and recognize the game's learning objectives. This will eventually lead to design and develop effective learning games in a flexible and easy-to-use way.

Keywords: Serious Games for Learning, Serious Games Development, Serious Games Design, Conceptual Framework, Design Model.

1. Introduction

Designing an effective serious game for learning is a challenging task, which requires a lot of knowledge and diverse skills. Development teams don't only have to deal with the inherent technical complexity of the game design but also have to be able to integrate learning activities in a way that is educationally effective and enjoyable at the same time (Silva 2019; Zarraonandia et al. 2015). Furthermore, the complexity and development of current computer games, in terms of representation, interaction mechanisms, and rules, might prevent domain experts from being capable to develop their serious games or even from participating in their design due to the lack of technical knowledge and the domain vocabulary (Avila-Pesantez 2019). Therefore, the development process of a serious game must be entrusted to a highly professional game development team, which is typically associated with high costs. Thus, the challenge here is to facilitate the development of an effective serious game for learning in a flexible, easy-to-use way and adapt the game's learning content, thereby helping reduce the effort and costs associated with the development process. To address this challenge, we develop a conceptual framework that facilitates the design and development of effective serious games and helps collaboration among stakeholders. This is achieved by investigating various requirements across serious games and highlighting the important components to develop a conceptual framework. The proposed framework is developed in three separate stages: first, analysis of existing methodologies and models for designing serious games; second, identifying the functional requirements across serious games; and finally, providing a conceptual framework. The Proposed conceptual framework consists of three models: one for describing the game structure, another for describing the behavioral dynamics of the game, and a third aims at enhancing user experience within serious gaming environments.

In our research, the framework and its models encompass high-level concepts for expressing games and pedagogical aspects to provide the development team with access to high-quality and up-to-date components. Finally, to evaluate the framework's applicability, it was used to design a serious game that aims to learning children how to read the clock. The aim is to demonstrate how effectively the model can be employed to design an efficient serious game for learning. Furthermore, we conducted an evaluation process for implementing the conceptual model. The evaluation shows promising results in helping participants, particularly those with gaming experience, to understand and identify the roles of each component in the game, and recognize the game's learning objectives.

Therefore, as a first step towards this goal, we introduce in this paper a conceptual framework that is organized in a modular way and with different design perspectives. In order to help the development team, the requirements that are often considered in the literature as significant in producing engaging, fun, and educational game experiences, have been included in the model through a set of design components. Furthermore, the components of the framework offer support in the reuse of their foundational building blocks to produce different forms of the same game, which can be used to match different learning purposes, in a quick and flexible way. Moreover, it enhances the collaborative work within a multidisciplinary team.

The paper is structured as follows: in the second section, we provide a brief overview of existing literature related to serious games, with a specific focus on those, which introduce methodologies, frameworks, and models for designing serious games. In the third section, we introduce the conceptual framework, and we discuss and evaluate the applicability and feasibility of the proposed conceptual framework in the fourth section. Finally, we present the conclusions of the work in the fifth section.

2. Literature Review

To uncover the factors influencing the success or failure of serious games for learning and to address their design issues, researchers have developed models, frameworks, and methodologies for investigating and analyzing these games. Examining these frameworks helps in comprehending how serious games achieve their both aspects and also in revealing the connection between the game's design process and the underlying pedagogical aspects, as well as how the game is played. Understanding this issue is crucial as it allows for examining the components of serious games, providing insights into their mechanisms, and ultimately contributing to the development of better serious games for learning.

The six-facet framework proposed by Marne et al. (2012) outlined a conceptual framework for serious game design by assigning specific types of expertise to each facet. It aimed to resolve design challenges and enhance stakeholder communication using a design pattern library. However, while the framework clarified the roles of team members, it lacked a proper methodology for the actual game design process. The Activity Theory-based Model of Serious Games (ATMSG) was introduced by Carvalho et al. (2015) to understand the relationship between serious game components and educational objectives. This model applied activity theory, dividing a serious game into three components: gaming, learning, and instructional, each with corresponding actions, tools, and goals. The ATMSG was implemented in two phases: activity analysis and action analysis, further broken down into four steps. Although the model offered valuable insights for serious games, it was more suited for analysis rather than design. Lope et al. (2017) introduced a comprehensive five-phase methodology (startup, design, production, testing, and post-production) for serious game design. The iterative cycle of Salen and Zimmerman's design process (2003) was incorporated in the design, production, and testing phases. Furthermore, they identified components during the design phase, such as scenarios, characters, educational competencies, and challenges, using a theater metaphor (acts, scenes, actions, dialogues). Their methodology clarified the tasks of various roles in the design process, but it still required more specificity in translating learning content into the game. Pesántez et al. (2017) systematically reviewed serious game design approaches, identifying eleven methodologies. They structured the design process into four phases: analysis, design, development, and evaluation. Each phase is identified with factors, with emphasis on pedagogical and didactic aspects important to serious game design. However, it lacked detailed guidance on integrating these aspects into a game's design. Spyridon and Refanidis (2019) outlined a conceptual methodology based on a task repository that defined task dependencies and skill requirements. Their approach featured an adaptive schema using artificial intelligence to adjust learning tasks based on the player's prior knowledge. Rather than being a design methodology, this framework focused on creating an adaptive learning process for serious games. Continuing the goal of facilitating the design of serious games for learning, several authors have introduced libraries, models, and frameworks for serious games for learning, such as Arnab et al. (2015); Roungas & Dalpiaz (2015); Lope et al. (2017); Moya et al. (2016); Robson et al. (2015). These efforts aim to offer more structured approaches to designing serious games; however, there remains a need for clearer methodologies that effectively integrate educational content.

In conclusion, while numerous frameworks and models for serious game design exist, there is a general need for clearer methodologies that explicitly detail how educational content should be integrated into the game design. Each of the frameworks and models contributes unique insights into the analysis and structure of serious games, yet they often fall short of providing comprehensive design processes. For this reason, there is a need for means and models that bridge the gap between theoretical frameworks and technical designs. This bridging is necessary to alleviate the cost of developing serious games for learning by providing tools that facilitate the design process

easier and quicker, producing high-quality designs, to making the benefits of game-based learning available to a wide audience.

3. The Conceptual Framework

In the process of this research, and as part of my PhD work, an investigation is conducted to address the functional requirements for developing serious games for learning. The aim is to identify common requirements across serious games of various genres and topics to enhance reusability and leverage their potential applicability across different learning domains. This identification aims to derive components that contribute to both the effectiveness of serious games in learning and their potential for reuse in similar game genres based on these identified requirements. The criteria for identifying requirements are (i) relevance to the learning effectiveness and (ii) reusability across various games and learning domains, at least within the same genre of the game. The investigation resulted in a list of functional requirements for serious games that directly or indirectly affect players' motivation and learning success.

Table 1: The List of Functional Requirements

Category	The functional requirements	References
Pedagogy/Learning	FR1: A serious game should provide interaction mechanisms focused on objects, feature task-centered goals, and offer the opportunity for learning or playing within social groups. FR2: A serious game should provide the ability to present learning objectives through repetitive tasks. FR 3: To incorporate learning objectives, a serious game should offer interaction mechanisms. FR 4: A serious game should be designed in a way that supports the progressive introduction of new skills during the play.	Carvalho et al. 2015; Kazimoglu et al. 2010; Annetta 2010; Riedel et al. 2015.
Rules	FR 5: The design of a serious game must adhere to a set of game rules.	Carvalho et al. 2015; Batko 2016.
Interaction & Communication	FR 6: A serious game should enable communication and interaction with other components and/or players.	Carvalho et al. 2015.
Assessment	FR7: In a serious game, there should be the capability to offer feedback on the user's behavior. FR8: A serious game should offer the ability to display information. FR9: A serious game must have an assessment component	Arnab et al. 2015; Annetta 2010; Boyle et al. 2016; Shoukry et al. 2014; Bellotti et al. 2013; Gardner 2012.
Goal	FR10: A serious game has to include tasks that can be solved. FR 11: A serious game should have to be clear and understandable goals.	Bellotti et al. 2013; Gardner 2012; Paraskeva & Mysirlaki2010; Kickmeier-Rust & Albert 2012.
Adaptation	FR12: A serious game must have an adaptive component to measure the performance of players' learning progress, thus adapting the game to the ability and the current skill level of players. FR13: A serious game should have various levels of difficulty in solving tasks.	Silva 2019; Chandler 2020; Prensky 2001; Kickmeier-Rust et al. 2008; Soflano & Connolly 2015; Cox et al. 2012; Lomas et al. 2013.
Representation	FR14: A serious game should have the ability to display at least videos or to play audio. FR15: A serious game should have a user profile component to identify the player in the game. FR16: In a serious game, there should be both objects and characters, allowing players to interact with them.	Lainema & Henriksen 2015; Kazimoglu et al. 2010;

These requirements serve as the foundation for designing the conceptual framework, which is organized into clusters of components within seven functional categories: pedagogy/learning, rules, interaction and communication, assessment, goals, adaptation, and representation. These categories have been analyzed, resulting in the extraction of 16 functional requirements for developing serious games. Table 1 presents the complete list of derived functional requirements.

These functional requirements are used as the foundation for constructing components within the models of a conceptual framework. Consequently, each requirement has been analyzed individually, and hence, model components supporting the fulfilment of these requirements have been derived.

The outcome of this process is a conceptual framework of serious games for learning. It allows the design of the structure and the behavior of a serious game. Table 2 presents the components of the framework and the corresponding requirements, from which the component has been derived.

Table 2: The Framework Components of Serious Games

Model Components			Derived from requirements #
The Game-Root			No derivation needed
Serious Game	Instructional Content		FR2, FR4, FR5, FR10, FR11.
	Player Profile		FR14, FR15
	Learning Motivation		FR9
	Repetition		FR2
Game Content	UI Manager	GUI Manager	FR8
		Media Manager	FR14
	Objects& Character		FR15, FR3
Game Design	Reward Manager		FR9
	Feedback		FR7
	Game Mechanics		FR1, FR6
	Challenge, Level, Learning Outcomes		FR2, FR12
State			No derivation needed
Activity (Actions)			FR3, FR10
Event			No derivation needed
Assessment (Task)			FR7, FR9

3.1 The Conceptual Model of Serious Games Structure

The first model in our framework is a conceptual model, describing the primary structure of a serious game for learning. The model identifies the roles of all components and achieves the desired educational goals. This structure describes how a serious game is constructed, detailing the layout of the game world, the inclusion of objects and characters, and the dynamics of player interaction. Figure 1 offers an overview of the serious game structure model, illustrating the components and their relationships. This model adheres to the familiar concept seen in UML class diagrams.

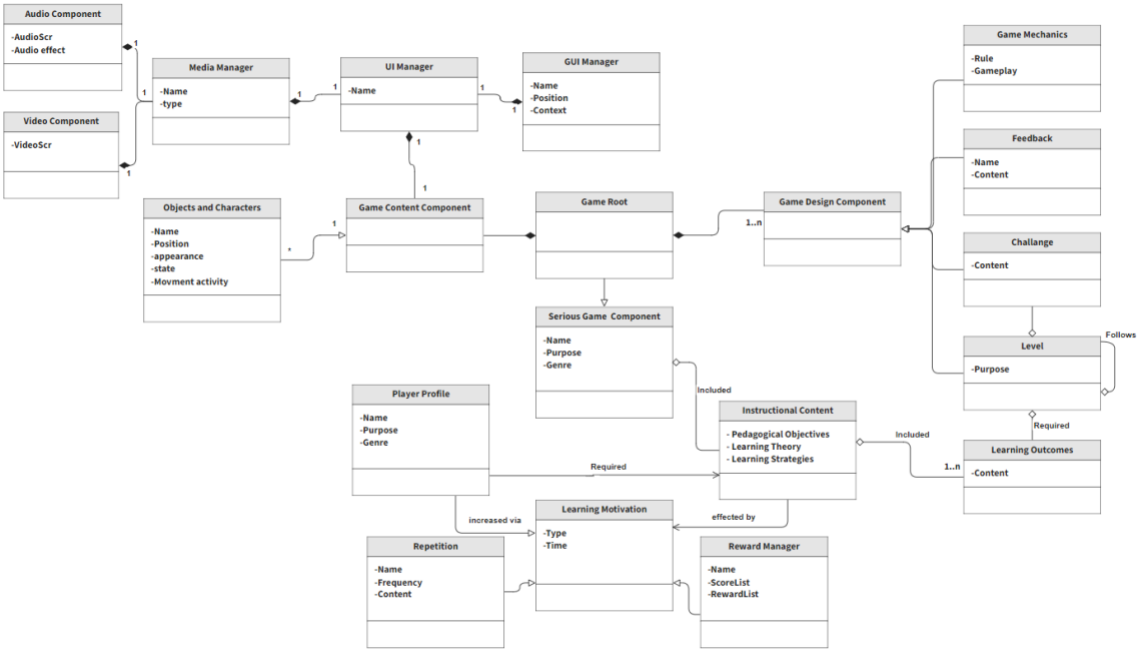

Figure 1: Structure Model of Serious Games for Learning

The Game Root is the central point for all other components. It includes the Game Design Component, representing development decisions regarding game mechanics and feedback; the Game Content Component encapsulates the structural elements. A serious game, considered a sub-component, inherits one or more characteristics from computer games but it is designed for educational purposes. Learning objectives are achieved through instructional content defined in terms of learning outcomes, outlining the knowledge players are expected to gain.

The Game Design Component includes objects and characters to represent interactive or decorative elements within the game. The UI Manager, which has two subcomponents, GUI Manager and Media Manager, controls the display of information for players. Game design identified the necessary to coordinate components into games: mechanics that dictate behavior, challenges that keep engagement of players during the gameplay, levels that break goals into tasks, and feedback that responds to player actions. A serious game component specifies the components that affect the learning process, such as player profile and instructional content defined in terms of learning outcomes. Learning objectives, strategies, and curriculum are critical aspects of learning structure. The Learning Motivation, Repetition, and Reward Manager components manage player motivation, repetition to reinforce learning, and rewards for successful behavior.

3.2 The Behaviour Model of Serious Game

The second model in our framework describes the behavioral dynamic of serious games. Behavioral dynamics refer to the interaction between game components, outlining the expected functionality of a game. This model describes the interaction design, thereby facilitating the analysis, design, and development of software interfaces. This, in turn, enhances the productivity and effectiveness of the serious game and simplifies the design process. Figure 2 illustrates the dynamic model of a serious game.

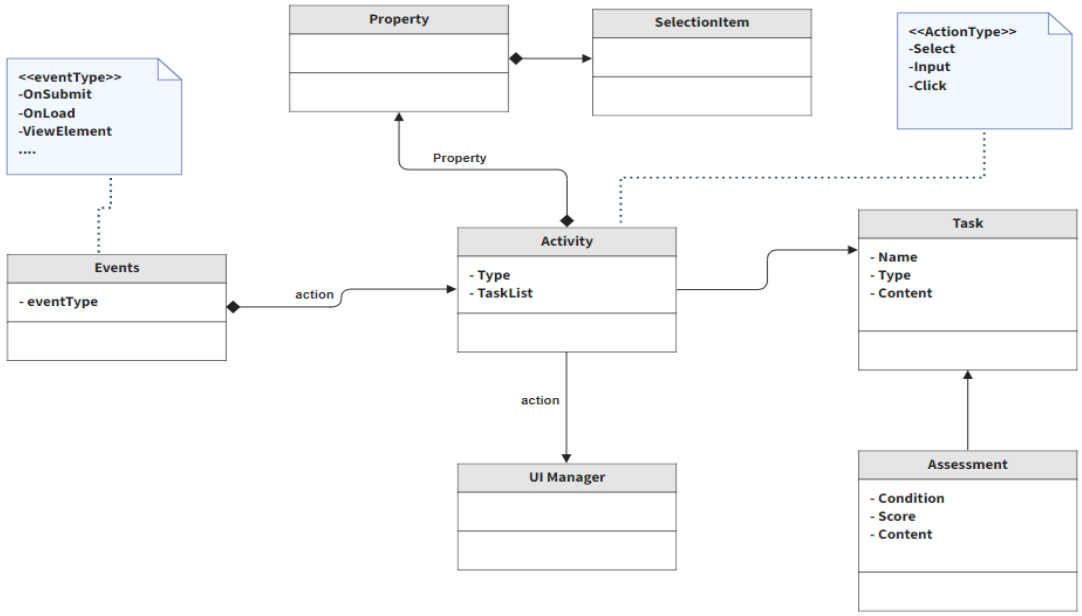

Figure 2: The Serious Game Behavioral Model

The dynamic model captures the structure of the serious game, describing the user interface (UI) and its components. The UI Manager includes all elements of the game's main functionality. Activity representing user actions such as input, selection, and interaction. Each activity has an Action-Listener that triggers events based on user actions. Events are used to express the interaction between Activity and the GUI. Task elements, like multiple-choice questions, are linked to assessment elements that evaluate results and provide feedback or rewards.

The adaptation method in the game monitors players' learning progress and adjusts content and difficulty accordingly. Players can initially choose their desired difficulty level, with predetermined game content tailored accordingly. Alternatively, the game can offer tasks of varying difficulty, dynamically selecting the appropriate task based on the player's previous performance.

3.3 User Experience of Serious Games

User experience (UX) is a psychological concept focused on users' emotions, thoughts, and reactions when interacting with a system (Hassenzahl, 2018). In serious games, UX is crucial as it deals with players' immediate responses and helps developers create more effective games.

Several models provide insights into UX for serious games. Sin et al. (2014) conducted a study on the UX of serious games, highlighting five motivating factors that encourage players to engage with these games: control type, updates, challenge, content, and fun. Similarly, Engl and Nacke (2013) proposed a three-layer abstraction game experience model, including the game system's playability, the player experience that emerges from interaction with the system, and the gameplay experience formed by external and internal factors. Law and Sun (2012) introduced a framework with four key dimensions-gaming experience, learning experience, adaptivity, and usability- characterizing the essential attributes of UX in adaptive serious games.

For describing a UX of serious games, it is important to identify the elements that shape the effective design according to players' motivation. Therefore, the game should be fast, adjustable and provide rich affect-based interactions that enhance the connection between the game context and player input (Yannakakis & Togelius, 2015). To obtain a positive effect on the learning process, the game should consider three design aspects: learning, entertainment, and motivation; by aspects stated in our work.

- Firstly, the learning aspects are based on the learning mechanics. For example, questions and answers, action/task, repetition and reflection, and (self)-assessment.
- Secondly, the entertainment aspect (gaming) should be designed to entertain and amuse players with the game mechanics while learning (goals, rules, and challenges).
- Finally, the motivation aspect includes the elements that take players to play the game, like rewards and feedback.

4. Evaluation of The Conceptual Framework as A Design Tool

4.1 Application of the Conceptual Framework

To provide an initial assessment of the conceptual model, it is applied in the design and development process of a game for teaching children how to read the clock ‘learning Clock game'. The conceptual model can be utilized independently and contribute to the creation of a serious game using any programming language. Consequently, individuals can reuse the conceptual model to develop their serious games. The game developed as a mobile app using Flutter, it could also be implemented as a web application. Figure 3 shows screenshots of the Learning Clock game.

(a) The main screen (b) The learning task

Figure 3: Learning Clock Game

To gain a better understanding of how the learning aspect takes place in the game with the conceptual framework models, we identify steps that guide the development team in applying the model for game design. These steps involve moving from a high-level understanding of concepts (concepts of what needs to be done) to the concrete components that implement those concepts.

- The first step is describing the game concepts: the multidisciplinary team development discusses the main aspects of the game and their subjects, such as the general objective of the game, the target group, and the learning aspect of the game. This step helps to highlight the main concepts of the game and allows to observe the game from different and complementary aspects. For our game 'Learning

Clock Game', is a mini-game designed for children aged 5-10 years to learn how to read and tell the time.

- The second step represents the game sequence: to help in the identification of the game components. The purpose of this step is to establish a reference point that helps uncover how the components of the game are connected throughout the game. The game sequence representation adheres to the UML activity diagrams notation, employing shapes connected by arrows to represent the flow of game aspects. The outcome of this step is a blueprint of the game structure that reflects the essential form of the game components, figure 4 presents the game sequence of the learning clock game.

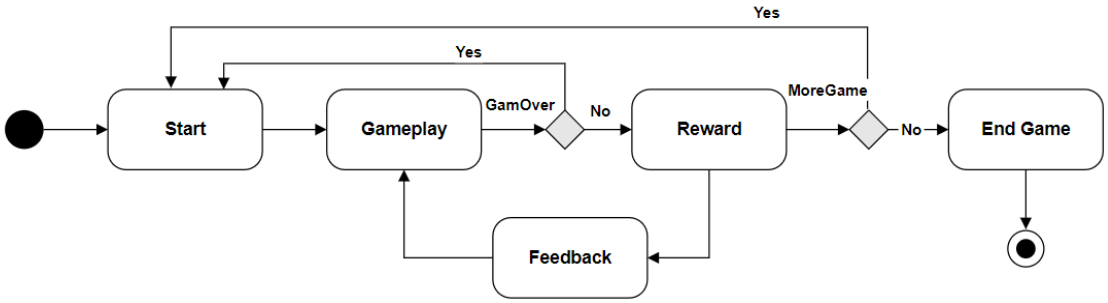

Figure 4: The game sequence of the learning clock game.

- Third step, description of the implementation: this step groups each set of actions and goals that belong to the same type of aspects and are related to the same components of the game sequence. It provides a more detailed description of the implementation of each block or component and explains what occurs at that point in the game, table 3.

Table 3: The Learning Clock Game Components

Components	Description
Mechanics	Rules: Multi choices
Challenge	The player should select the correct answer.
Level	Task: Gameplay screen
Feedback	Check the player's answer and provide information about their answer whether it is correct or not.
Reward Manager	To Calculate and update the player score after every corrected answer, and also update the game state
Object and Characters	To represent the objects within the game.
UI Manager	View: Levels and tasks (scene), display the feedback
Activity (action)	Interaction: Mouse, Keyboard Control: select the answer, button

Figure 5 demonstrates a screenshot of this game as a mobile app, a) represents the gameplay screen (Level), and b) shows the feedback that is given to the player when he chooses the correct answer.

a) The gameplay b) Feedback

Figure 5: The Gameplay and Feedback of the Learning Clock Game

Combining these steps offers a comprehensive view of the structure of the game, from its high-level purposes and general characteristics to its concrete implementation. Furthermore, they provide insights into the level of integration between gaming and learning components, thus highlighting possible weak points in the design.

4.2 The Conceptual Framework Evaluation

We performed an evaluation study in which investigating the users' perception of the framework's usability and usefulness. In this study, participants used the framework model and its design approach to design the “Senior PM Game”, a simple simulation game aimed at teaching project management to university students. Using an online survey tool with a proper set of questions, the experience of the participant in using the framework to develop the serious game is thoroughly evaluated and reported.

4.2.1 Participants

Participants of this evaluation totaled 17, aged 23-36 years (M = 28.76, SD = 4.024). The participants are master students of software engineering at the University of Babylon, Iraq. The participants are asked to use the conceptual framework model to design the 'Senior PM Game' and based on their practical experience, they evaluate the framework by answering the questionnaire. Participants first received an explanation of the framework, and then asked to apply the framework to design the game, using either templates or paper. After completing the game design, they are asked if the conceptual framework contributes to improving their perception of the game and if they have any suggestions to enhance the framework. They were also asked whether the framework was easy to apply and understand, and if it provided them with a better understanding of the game characteristics.

Furthermore, they were asked about their experience with the framework using an adapted version of the System Usability Scale (SUS) questionnaire (Brooke 1996). SUS is a simple, ten-item Likert scale that provides a global view of subjective assessments of usability, which yields a single usability score on a scale of 0-100 (100 is the best achievable score).

4.2.2 Qualitative Data Processing

In addition to the usability scores, we also collected qualitative data on the participant's experiences with the framework through open-ended questions on how the model affected their perception of the game if it was easy to apply and understand, and if it gave a better understanding of the game characteristics. To process the comments of participants, we coded answers to identify general statements about the framework. Each answer could contain one or more general statements. These general statements were grouped, and the results were presented subsequently.

4.2.3 Results

In general, participants considered that using the framework helped them better understand the characteristics of the game. It was positively evaluated by a large number of participants: among the 17 participants, 16 (94%) mentioned that the framework was helpful for them. It was considered simpler and easy to apply by ten participants, four of them non-gamers. The framework perception noted in qualitative data in the SUS usability scores was apparent. For the non-gamers group (N = 10), the average usability score was 71.25, and for the gamers group (N = 7), it was 68.93. While the average usability score for both groups of participants (N=17) was 70.29.

5. Conclusion

A conceptual framework is presented to facilitate the design and development of serious games for learning in a flexible and easy-to-use way. It identifies the main components for learning that could be incorporated into the game to aid the design process of an effective serious game. It links the mechanics that serve as learning mechanisms and those solely associated with gameplay to maintain the game's entertainment value. This linking provides the development team with a "dictionary" for adjusting the game mechanics to the learning objectives of the game. Additionally, the conceptual framework is easily understood and used because it employs vocabulary derived from the serious game domain itself, hence supporting the collaborative work among multidisciplinary development teams. Since it is possible to reuse design components of its model, it can serve as a guide throughout the development process, potentially reducing the time and effort required to complete the development compared to designing and developing serious games from scratch.

Finally, we demonstrated the feasibility and applicability of the conceptual framework by developing a serious game as a web application according to our proposed models. While this confirms the contributions of our conceptual framework, further evaluations are needed to demonstrate its utility in terms of productivity improvement. This could involve developing design methods and tools based on the model that can be compared with other design approaches. Additionally, further research could explore the conceptual model to identify any missing core components of serious games for learning.

Abstract: This study presents the successful integration of Virtual Reality (VR) tools as an element in computer science curriculum at German University of Technology, Oman. The research study investigates the use of MyScore, a VR application developed by RWTH Aachen University - Teaching & Research Field Engineering Hydrology as an environment for computer hardware assembly and troubleshooting exercises. The VR simulation utilized in this study acts as a gamified environment, incorporating elements like scorekeeping and interactive challenges to enhance practical learning in computer science, akin to game-based strategies that engage and motivate students. Over of some weeks, the project involved seven students and one tutor in immersive learning sessions to develop applied skills computer hardware assembly with VR technology over conventional teaching methods. Structured surveys and direct observations were used for data collection through students' interactions with the VR sessions. We also evaluated the students learning experiences as well as the usability of technology. The results showed that the user-friendliness of the VR interface and its ability to accurately simulate real-world tasks associated with computer assembly received both positive and negative reactions. While some students praised the technology for being pretty cutting-edge, some criticized it as unrealistic or non-interactive. We also received complaints that ranged from actually moving around in the virtual space to navigating only through teleportation spark points. Specifically, two students gotten motion sickness which is a well-known obstacle associated with VR environments and consequently left the sessions prematurely. The feedback of the instructor pointed towards that setting up the VR equipment is straightforward and described some potentials methods. Still, a call for more reliability in simulations and better interfaces began to surface as nevertheless less controversial agenda items. However, the instructor saw how VR has the potential to revolutionize educational practices. Providing interactive views between the VR device and students that can act as new learning methods. The present study extends the discussion on educational technology by providing empirical evidence of benefits and challenges experienced in deploying VR for technical education implementation. These findings thus support the continued development and validation of VR technologies in pursuit of improved commitment, cost-effectiveness, immersion, environment quality that may maximize learning outcomes in future educational applications.

Keywords: Virtual Reality, Computer Assembly, Educational Technology, Immersive Learning, Student Engagement, Motion Sickness, Technical Education, Usability, VR Simulation, Learning Outcomes

1. Introduction

To develop and evolve learning processes and outcomes, technology is evolving at a smart accelerated pace which keeps on revolutionizing educational horizons (Tang et al., 2022). Virtual Reality (VR) is one of the growing educational technologies to generate an immersive, interactive and multi-sensory experience which simulates real world environments (Luo et al. 2021; Frontiers in Psychology, 2018). This is invaluable for subjects such as computer science, where practical experience can sometimes be the most important part of understanding an idea.

But the broader deployment of VR in education still faces obstacles, such as the realism and fidelity of simulations on one hand, defy health and comfort concerns for its users. Studies have emphasized the ability of VR to increase student engagement and skill mastery, problems including motion sickness (LaViola 2000; Luo et al. 2021; Talespin, 2023).

As we directly address the trend of virtual learning environments in this project, particularly in relation to technical education using technology, it has become increasingly important for us to understand how VR technologies are changing conventional teaching methods. Perhaps this discovery is more about exploring new technology trends, but in this project we asked ourselves how the use of this technology would contribute to the learning experiences of our students at GUTech. This paper presents a research on "MyScore VR Simulation" adopted by the German University of Technology in Oman (GUtech) for computer science education using the MyScoreVR application. This project leverages VR technology to teach computer hardware assembly and troubleshooting, utilizing virtual components to minimize resource dependency and enhance scalability and

interactivity. While VR is an established method, recent advancements have made it more affordable and realistic, expanding its practical applications in educational settings.

To investigate how VR impacts educational outcomes in computer science - specifically around engagement, learning performance and system usability, this study qualitatively captures the experiences of seven students and one instructor during their use of the VR sessions. Their findings are part of a conversation about the role and scalability of VR in education more broadly, which helps to inform just what makes it worth adopting, if comparisons with traditional learning experiences weren't enough.

2. Literature Review

Virtual Reality (VR) is being widely acknowledged for its capabilities in computer science education and even the larger perspective of technical training. In fact, recent research has shown that VR can have comparable outcomes to traditional apprenticeship methods (such as in laparoscopic surgery) while providing a safer and more standardized training environment (Portelli et al., 2020). Moreover, VR has indeed been shown to enhance gait in individuals with cerebral palsy (Ghai & Ghai 2019) such that its applications can meet medical rehabilitative purposes. There are also claims that VR may improve college education, and particularly the effectiveness of vocational skill training (Simonova et al., 2021).

In the case of military training, VR is used succeeding on some fronts based upon 4th industrial revolution innovations. al, 2021). Moreover, due to the potential benefits of VR for sectors including surgical training (Palter & Grantcharov, 2010), and procedural skills that demand exact technical proficiency within surgery, (Bjerrum et al., 2013) a risk-free opportunity can be offered in these areas. Similarly, the enhanced VR environment have been also proven to be effective in rehabilitation where they accelerated executions on mental representations of actions and motor functions (Rodrigues-Baroni et al., 2014).

VR has also been used in sports. It was evaluated in a research on soccer skills (Fuller et al., 2019). VR has also been used in various training programs such as navigation training ("Using VR Virtual Reality in Navigation Training", 2018) in firefighting instructions and stress management module, which is an idea that is applicable worldwide (Zhang & Tsai, 2021).

Not only has virtual reality been considered to be a safe and affordable training environment (Jones et al., 2013), it also enables more interactive communication between trainees and instructors, offering improved learning outcomes for both groups of different study cases (Ahmed et al., 2012; Balistreri & Casile, 2019). Additionally, being able to use them in a pedagogical scenario and with intelligent tutoring systems only adds its ability to bring about changes that improve the efficiency of training by fostering knowledge transfer virtually (Corre et al., 2014) .These great benefits and similar studies have made interest in working in the field of virtual reality in the GUTech sector. However, the need to study and carry out similar and ongoing projects are needed in order to better adapt VR programs to individual educational. We strive to create a deeply interactive learning environment despite challenges such as motion in this project. We hope to continue to use these learnings and improve our use of VR in education as a benchmark for future considerations. In addition to these applications, simulation games in VR have become a significant component of game-based learning, providing immersive environments that enhance educational experiences. These simulation games offer dynamic and interactive learning opportunities, allowing students to develop critical thinking and problem-solving skills in a virtual setting, thus complementing traditional educational methods.

3. Methodology and Implementation

3.1 Study Design

The study used a case-study method to assess the incorporation in the computer-science curriculum at GUtech of Virtual Reality (VR) technology using MyScore application. This approach was selected because traditional case study provides a detailed holistic analysis of how VR experiences influences education in real classroom settings (Yin, 2014). For several weeks, students participated in both VR-enhanced and traditional hands-on activities during computer science courses allowing for a direct comparison of student engagement and skills development through the two different educational methods (Clark et al., 2016).

The primary aims were to evaluate whether VR employed in this manner would facilitate educational performance and potentially identify barriers (e.g. technological problems, user discomfort such as motion

sickness) (LaViola 2000). This data was collected through surveys and observations for usability, student experience(s)and general educational values [Bailenson, 2018]

These comparative experiment findings are meant to contribute to the continued intellectual dialogue on VR-specific pedagogy use-cases and indicate where improvements must be made if we want VR as an entity inside educational scaffolds in entirety.

3.2 Participants

Nine undergraduate students and one instructor from a computer science course (using Virtual Reality) were enrolled in the research. Seven students (4 male, 3 female ages between 19 and 24) took part at the VR sessions during that day that made a variety of experiences in relation to perspective on VR.

The instructor served as the facilitator of the VR sessions, and she had a background in computer science and an interest in innovative teaching methods. Her direction was instrumental in managing the VR learning curve and administering & collecting of survey data, which added to a better yield as well.

Full participation was voluntary and all participants provided written informed consent before and after being fully briefed on the aims of the study and their rights, including that at any time they could withdraw from this protocol without penalties.

Having participants with different levels of experience, and diversity in their demographics helped us to assess differential effects if any across a wide range of users within an educational setting.

3.3 Setup of the VR System

For this study the researchers employed an open-source tool named MyScore from RWTH Aachen University's Teaching & Research Field Engineering Hydrology Department of Virtual Reality (VR) application, intended for avatar-based education. In a number of instructional scenarios, the learners work through avatars in different types adopting various educational modules in virtual environment. The system was supplied with VR headsets and controllers, to ensure high performance of the 3D educational experience shown in Figure 1.

Prior to the start of this research, VR systems were thoroughly tested and calibrated for reliability and ease-of-use. The classroom, too, was rearranged to accommodate how students would be seated using the VR setup so that an announce of floor space could permit their bodies to freely engage.

MyScore goes beyond the constraints of traditional or hybrid approaches, which have been further underscored by recent teaching modality changes. Compared to video teaching tools that provide 2D only interactions, MyScore allows for a more engaging and enriched three-dimensional teacher-student interaction. However, this functionality is important when it comes to simulating and displaying real-world complex tasks like computer assembly so the learning experience would be richer.

Figure 1: Inside the MyScore app: A virtual workspace where students assemble and diagnose computer components.

MyScore application boosts engagement between participants, provides gamification elements with more interactive learning moments and also saving extra travel cost and environmental impact. VR settings were

modified over the course of study based on feedback to optimize performance while providing comfortable experiences for users that would fit smoothly into educational workflows.

For the project, a dedicated learning space environment was designed to provide an immersive VR setup. The setup introduced two central VR stations, labeled as VR Rack 1 and VR Rack 2, loaded with VR headsets and necessary equipment. These stations were supported by computer 1 and computer 2 support the stations, acting as control centers for the VR software running.

Figure 2: Displaying the VR setup for the activity, featuring VR racks, main and backup computers, and a spacious area ensuring at least 2 to 3 meters of distance between each student workstation.

In addition to the primary computers, two backup computers were kept on standby. Such redundancy was a necessity in order to handle any disruptions that might undermine the learning process. Strategic positioning are necessary to reduce interruptions and improve the functioning of the learning architecture, strengthening them against student engagement (Dodevska & Mihic, 2018).

3.4 Data Collection Methods

We mobilized information about the performance of VR configuration and utilization results achieved by MyScore app in facilitating computer science learning using a dual-method technique. The primary ways data was collected were through structured surveys and on-the-ground observations.

The surveys aimed to collect feedback on the general process through engaging in VR, its effectiveness as an educational tool, how user-friendly and intuitive was it interact with the interface of VR. Finally, any points need improvement could have been gathered. The aim of using the above approach was to evaluate subjective educational results and track student satisfaction with VR learning.

Observational data was recorded by the instructor in all VR sessions, specifically focusing on how students engaged with VR technology and their behaviors during each task. The instructor also noted any challenges or issues that arose. These observations were vital for understanding how students navigated and deployed knowledge in the VR-based setting. The instructor also recorded any incidents of motion sickness and how it affected student engagement. The instructor actively supported the students during the survey process and VR sessions and make sure that students understood the questions

3.5 Procedure

The study process was designed meticulously to measure the efficiency of VR technology in educational settings. A detailed illustrating the steps that were taken along with a comprehensive and systematic evaluation was performed in this study.

The classroom, shown in Figure 3 below was initially set up to accommodate the VR hardware so that students could move freely within the virtual space. The MyScore software was installed on the central computers and all equipment tested to confirm full operation.

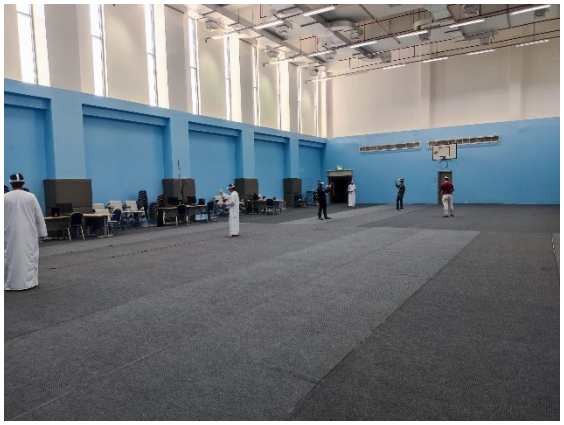

Figure 3: displays students engaging in the VR activity, spaced safely apart to ensure a secure and interactive environment.

The orientation session for the students familiarized them with both equipment and application (MyScore). The instructor spoke the goals of VR activities, showed how to use controls and answered any possible doubts from participants in order for them be able to understand very clearly what tools they would have at their disposal.

Students endeavored to perform emulation tasks corresponding to everyday examples in computer hardware assembly and diagnostics essentially giving them a hands-on experience within a safe virtual environment.

After the VR activities, students were provided with structured surveys by their instructor. These were aimed at capturing the more specific feedback factors such as experiences.

The instructor took notes and assessed the students' engagement with VR technology during each session. The instructor documented how the students strategically navigated, paid attention and adapted to their new tasks, as well as any difficulties they encountered like motion sickness.

Students were then brought together to discuss their experiences in a concluding open feedback session. Such a debate provided additional perspective from students and complement the quantitative data collected.

The last step is to compile and organize all the data collected (survey responses, observational notes, feedback from a discussion). In addition to human notes, any technical issues experienced during the sessions were recorded by the instructor and used for future planning of refinements within VR.

4. Data Analysis

Data from the structured surveys were quantitatively analyzed to identify trends in students' experiences with the VR system. Basic descriptive statistics were utilized to summarize the data.

The qualitative data from observational notes and open responses in surveys were reviewed to extract common themes regarding the VR learning process, technical issues, and the overall user experience.

Special attention was given to the feedback concerning motion sickness, with the aim of understanding its prevalence and impact on student participation. These insights were crucial for assessing the practicality of VR in classroom settings.

5. Results

5.1 Detailed User Feedback

Opinions about the VR experience itself amongst the students were divided, with both excitement and criticism overall. In particular, five of the seven students were impressed by the engaging interactivity and immersion facilitated through the VR environment; they believed that experiencing computer hardware components in 3D had greatly enhanced their learning on how to troubleshoot equipment. 3D-immersive experiences resonated particularly well with these students, allowing them to more easily grasp abstract concepts.

But there were some challenges too. One limitation they identified was that the VR simulations could be unrealistic at times, which may detract from their authenticity if not comprehensive or advanced enough to represent real-life tasks as realistic (as reported by four students). Three students encountered issues in VR

navigation that impaired their learning as well. Two additional students had ongoing system connectivity issues that impacted their participation and engagement with the VR tasks.

5.2 Instructors Note

Indeed, comments from the instructor were aligned with this feedback stating that it was easy to get VR up and running in session for both students as well as how much more engaged they found their class became. Though, she noted that more accurate simulations would need to simulate how physical hardware interacts. One of the students also faced miseries with motion sickness which was an issue that brought down the functioning and comfort level during VR usability.

5.3 Motion Sickness Concerns

Among the issues flagged up were intense motion sickness, which affected two students. A student described the sensation as being like motion sickness to an intense and extreme degree. This feedback does point that possibly before beginning the experiences themselves, there may need to be more preparatory sessions and even setting adjustments for those new going into VR due to individual sensitivities.

Unfortunately, this experience drove both students to leave the VR sessions midway. It underlines the increasing significance of introducing more robust user orientation and safety nets for beginners to adverse impacts as well privilege ease-of-use.

Despite initial testing sessions aimed at student preparation, the persistence of motion sickness represents an area that requires further research. This brought the idea that the future research should focus on developing more personalized VR experiences that are adjusted to individual thresholds for motion sickness and examine comprehensive pre-use orientations.

6. Performance Metrics

The data revealed that students using VR notably improved their understanding and retention of computer hardware concepts compared to those engaged in conventional learning settings.

6.1 Learning Outcomes Comparison

Quantitative assessment: Students who used the VR app learned academic theories quicker and applied them through practical exercises with more confidence. Pre-and post-test comparisons revealed a dramatic increase in test scores, with the average score regarding hardware assembly and troubleshooting tasks improving by 20% for students using VR. Indeed, it indicates that being in a VR environment drives better comprehension for challenging topics - leading to increased cognitive retention and applicability.

6.2 Skill Acquisition

5 Students out of 7 indicated an increased confidence in recognizing, installing and troubleshooting computer parts within the VR environment. The VR system offers hands-on computer assembly and real-time feedback which is much harder to ghost in the classroom than it is on VR. Using the VR, students could practice their skills multiple times in a safe environment with less errors and gain better understanding of standard operating procedures when building computers.

The conclusion is well supported by the data that VR can indeed make education far more interesting and informative which simply means a hands-on learning experience. They can learn by doing, which enhances skills and increases readiness for performing real-world job functions in contrast to other passive learning methodologies.

7. Comparative Analysis

This project highlights distinct advantages and challenges associated with each methodology.

7.1 VR vs. Traditional Methods

The major advantage of using VR in education is that it can provide an immersive, interactive learning experience where students are able to interact with 3D content as opposed to reading about these subjects on paper. This

allowed students to interact with computer components as if they were putting components together in person, demonstrating how such an assembly process works. The novelty and high-tech factor of VR made it fun for students to use, leading to better engagement and more motivation.

At the same time, it raised some issues with VR too. The single most important challenge was the high cost of initial investment and ongoing support for stably functioning VR equipment. A potential barrier to entry in deployment within institutions. Furthermore, the learning curve to learn how to use VR technology comfortably was high. For a few students, the new interface did not suit them and would only hinder their learning if it was not solved through proper orientation and training.

7.2 Instructor Observations

While VR can mimic many of the steps in the computer assembly process, the instructor noted that the process was not perfect and had limitations. Traditional methods, in contrast, are about hands-on experiences with hardware and are still important to many educators when deeper learning is crucial. However, instructors reported that students made the most of their class time and were not afraid to venture into an unproductive VR environment.

Comparative analysis shows that VR is suitable for basic learning and practice, but weak against more advanced skills, where traditional methods are better. Therefore, like the similar research of Cai et al. (2022), we think that combining both VR and traditional learning in one approach provides the best learning environment and allows students to benefit from the immersive experience of VR and the hands-on practice of traditional methods. This combination increases the overall learning results by using the strengths of each method together.

8. Challenges and Improvements

Overall, a number of key concerns emerged from the student and instructor feedback that may improve upon both VR platform learnability as well effectiveness.

One of the many problems identified were that some VR simulations lacked a sense of realism. Students however remarked that the simulations were not true to life when it came to computer assembly and lacked complexity while also lacking tactile feedback which is very important in learning hardware assemblies. Several students had direct difficulties even just getting around within the VR space itself, and others experienced system crashes that booted them out of the experience. On top of all that, we found the motion sickness for two students who were unable to continue through a full session.

To address these challenges, several improvements are suggested:

- **Enhance Simulation Realism:** Improving the VR to have higher resolution and more complex simulation scenarios especially in real-world conditions would make a significant difference. For example, this could integrate tactile feedback mechanisms that give a physical sensation of the virtual actions.
- **Improve User Interface and Stability:** Making the VR interface more user-friendly could allow students to navigate easier, which in turn minimizes learning curves for users. This could be with application support such as frequent software updates and bug updates that can improve stability, performance, which in turn make the VR experience smoother and more reliable.
- **Address Motion Sickness:** Some students may develop motion sickness when using VR, so the introduction of pre-session orientation and acclimatization tasks would allow students to adapt themselves. Furthermore, these staple VR experiences should at least introduce adjustable settings within the system that would allow users to tailor their experience based not only on what input paradigms they prefer but how likely they are to endure motion sickness in a given application.
- **Feedback Mechanisms:** Enabling feedback mechanisms that can alert instructors to student difficulties during VR sessions in real-time to provide immediate intervention and support for a better learning experience.

9. Future Prospects

The current study lays the groundwork for significant advancements and broader applications of VR in education and beyond. Here are some key future prospects:

- **Scalability and Future Applications:** The early success of the VR application in computer hardware assembly teaching can be a template for similar difficult subjects. The project is not limited to covering

only computer-science-related topics, as the VR curriculum could be expanded upon different kinds of simulations (e.g. networking setups or software engineering processes), addressing a wider variety of disciplines making it even more useful and accessible for other courses hours per week. Additionally, testing whether VR training could be further scaled to fields of study (e.g. medical students/architects/industrial engineers) would take advantage of its immersive and hands-on learning environment.

- **Research and Development:** Obviously, more R&D is needed to improve the VR learning experience. This can be the incorporation of technology to enhance how realistic and interactive VR simulations feel. Research can also centre around the pedagogical issues of VR learning, such as creating curriculum-specific content in VR for effective teaching and way to teach using a 360-degree game. Further research into the long-term impacts of VR learning on student outcomes will provide a more complete overview of its efficacy and potential areas for growth.
- **Integration of Advanced Technologies:** The integration with other advanced technologies could make the learning environment more efficient and effective through VR. For example, integrating artificial intelligence (AI) will enable adaptive learning environments more able to personalize an individualized experience of the same simulations according to different student needs. Hybrid models that combine AR & VR further extend the virtual simulations with interactive elements and contextual information.
- User Accessibility and Comfort: Future projects should look to the user-accessibility and comfort of VR technologies as well. This includes solutions for motion sickness, and better VR design so that equipment is more ergonomic. Being able to adjust VR setups for different physical needs and preferences will make the technology more inclusive, making it appealing on a larger scale.

10. Conclusion

The research conducted on the integration of Virtual Reality (VR) technology into the computer science curriculum at GUtech has provided valuable insights about VR as an educational tool. The results illustrate how VR can enhance the teaching of activities like computer hardware assembly and troubleshooting by providing immersive simulations that actively engage students in intricate subjects; for instance, 5 out of 7 participants reported that VR significantly improved their understanding and engagement. But the study also highlights where further improvements are necessary, including in simulation realism; user interface design and usability; and user comfort - health issues around VR such as motion sickness.

Encouraging results for VR, being engaging and motivating hardly surprising that this is a successful approach when it comes to teaching complex technical content. However, increase realism and stability of VR environments for learning purposes have been suggested. Also we discussed that virtual reality situated as a means to aid in traditional forms of practice but not replace them. This is why educators suggested to combine the power of VR with conventional teaching methods to deliver a more holistic learning experience that works.

Collectively, this research contributes to wider discourse in educational technology by demonstrating that VR can enhance learning. This underscores the importance of ongoing efforts to better design and optimize VR learning environments. Further endeavours could be featured on advancing VR technology for educational uses in terms of accessibility and usability as well effectivity located in different scholastic surroundings. Furthermore, a limitation of this study is the relatively small sample size, which may affect the generalizability of the findings; future research should involve a larger and more diverse group of participants to validate and expand upon these results.

Abstract: Contexts in the digital learning environment are one of the crucial components regarding students' motivation and positive attitude development toward content. Although there is not enough guiding information in the literature about how contexts should be, previous research has shown that even digital game contexts are effective in developing students' environmental awareness. To reveal the impact of contexts in the digital learning environment, it is necessary to consider the variables regarding the socio-economic and cultural status of the students. Therefore, it can be envisaged that the effect of digital game contexts may differ depending on students' experiences and social environments. For this purpose, digital games were designed in two different contexts in this research. In these digital games, two opposite contexts were selected. The first context was focused on saving nature and green energy. This context includes different levels of digital games on topics such as solar energy, reforestation, and clean water sources. The second context was focused on unregulated industrial development that negatively affects nature by ignoring it. This context includes different levels of digital games such as building thermal power plants, building chemical factories, and turning forests into fields. Apart from the contexts, the other variables in both games (i.e., gameplay, artistic structure, levels of problem parameters) are the same. At each game level, students were asked to solve mathematical problems regarding ratio-proportion. In this study, the preliminary findings, which were derived from a large experimental study, were presented. The participants of this study were 15 gifted eighth-grade students from Turkey. Among the participants, eight students played the digital game regarding the context of green energy, and the remaining seven students played the digital game regarding the context of unregulated industrial development. Preliminary findings showed that students were more interested in the digital game regarding the context of unregulated industrial development as it included interesting and beneficial topics such as energy generation and economic development. The resident perception of the citizens regarding the acute need for energy generation and economic development rather than saving nature and green energy since Turkey represents a developing country may explain this finding.

Keywords: Digital Game, Mathematics, Context, Problems, Environment Awareness

1. Introduction

Story (i.e., context) is presented in brief intervals to ensure that players understand essential concepts as the game progresses (Lim et. al., 2013). It is known that contexts (i.e. stories) are important in the learning process and have a positive effect on students' motivation and academic achievement (Hao, 2023). Moreover, contexts in the digital learning environment are one of the crucial components regarding students' motivation and positive attitude development toward content. Although there is not enough guiding information in the literature about how contexts should be, previous research has shown that even digital game contexts are effective in developing students' environmental awareness. To reveal the impact of contexts in the digital learning environment, it is necessary to consider the variables regarding the socio-economic and cultural status of the students. Therefore, it can be envisaged that the effect of digital game contexts may differ depending on students' experiences and social environments.

It is crucial to evaluate the effect of contexts on learning outcomes in terms of cultural differences in the digital game-based learning environment (DGLE). Previous research has shown that contexts related to environmental education have a positive effect on learning outcomes such as environmental awareness and attitude (Van Harskamp et al., 2023). Moreover, it was seen that the past studies conducted on environmental education positively and significantly improved students' awareness of the environment. (Ardoin et. al., 2018). It is also known that digital games related to environmental education are effective in developing positive attitudes in students (Janakiraman et. al., 2021). However, the most basic feature of digital games in these past studies (Ardoin et. al., 2018; Janakiraman et. al., 2021; Van Harskamp et al., 2023) is that the researchers focused on providing environmental awareness education rather than investigating the effect of contexts on learning outputs. While it can be argued that previous research underestimates the impact of digital game contexts on

learning outcomes, it may be useful to focus on the impact of digital game contexts on learning outcomes in terms of socio-economic and cultural norms through the country example.

In this study, Turkey has been selected as a country example. Turkey is a developing country and represents more Asian culture. Asian countries (e.g. Turkey) have a collectivist culture in which the decisions and value judgments of society are more important than those of individuals, whereas in European cultures individuality is at the forefront and individuals can make decisions on their own, their opinions are considered, and their self-constructs can be continuously developed. At this point, while Asian culture is resistant to change, European culture is change-oriented. (Klassen, 2004). Moreover, it is known that the environmental awareness of students in Turkey is not at the desired level (Savaşçı, 2020). Many researchers emphasize (Buldur et. al., 2018; Vural & Yılmaz, 2016) that Turkish national education is insufficient in terms of environmental education (Buldur et. al., 2018; Vural & Yılmaz, 2016). With the increasing need for energy in Turkey, citizens are concerned about foreign dependency on energy and the quality of life is decreasing due to expensive electricity bills (Ekşi et al., 2019; Clean Energy Foundation, 2022). As Turkey is a developing country, the resident perception of the citizens regarding the acute need for energy generation and economic development rather than saving nature and green energy is dominant (Clean Energy Foundation, 2022). It is also emphasized that there is an urgent need to ensure the information and active participation of citizens in Turkey in terms of social acceptance, especially regarding renewable energies (Demir & Ataöv, 2021). Therefore, exploring students' learning outcomes by focusing on environmental contexts (i.e., green/clean environment versus industrial environment) may reveal authentic, different, and in-depth findings, as Turkey represents a developing country with acute and resident perceptions of energy needs. At this point, it is thought that it would be useful to examine the effect of different contexts under GBLE within the scope of environmental education on learning outcomes in terms of socio-economic and cultural norms through the case of Turkey.

For this purpose, digital games were designed in two different contexts in this research through the case of Turkey. In these digital games, two opposite contexts were selected. The first context was focused on saving nature and green energy. This context includes different levels of digital games on topics such as solar energy, reforestation, and clean water sources. The second context was focused on unregulated industrial development that negatively affects nature by ignoring it. This context includes different levels of digital games such as building thermal power plants, building chemical factories, and turning forests into fields. Apart from the contexts, the other variables in both games (i.e., gameplay, artistic structure, levels of problem parameters) are the same. At each game level, students were asked to solve mathematical problems regarding ratio-proportion. Moreover, the digital games used in this study indirectly focused on environmental pollution through different contexts while teaching mathematical concepts.

In this study, the preliminary findings, which were derived from a large experimental study, were presented and it was aimed to reveal students' thoughts about different contexts within the scope of DGBLE. Moreover, the educational aspect of digital games was also examined. Therefore, the cognitive process of students while solving problems was observed.

2. Method

Since it was aimed to reveal the students' thoughts about different contexts in detail within the scope of DGBLE, the case study was chosen as the research design from qualitative research methods for this study. The case study design was chosen as it provides more in-depth analysis and findings from its natural environment through a situation or a case without any intervention (Yin, 2009). This research, which constitutes part of a larger experimental study, was conducted during the spring semester of the 2023-2024 academic year.

2.1 Participants

The participants of this study were 15 gifted eighth-grade students from Turkey. The age range of the students varies between 12 and 14. Eight of the students are boys and seven of them are girls. Participant students classified as gifted exhibit elevated scores on cognitive assessments, demonstrating superior intellectual capabilities in comparison to their age-matched peers. Consequently, these gifted students tend to display exceptional aptitude in domains such as visual arts, music, and academic pursuits (Bıçakçı & Bakırcı, 2021). The National Association of Gifted Children posits that subjects scoring within the top decile of the standard cognitive distribution are typically designated as "gifted". However, this threshold may fluctuate between the 1st and 25th percentiles, contingent upon the adopted theoretical framework or model of intelligence. A gifted student is characterized as one whose capacities in intellect, artistic expression, creativity, leadership, or general and/or

specialized abilities have been empirically determined by experts to significantly surpass those of their cohort (Ministry of National Education [MoNE], 2016).

For the purposes of this research, giftedness was operationalized as achieving a score exceeding 130 on the Anadolu Sak Intelligence Scale (ASIS), an instrument employed by the Turkish Ministry of National Education. The ASIS is an individually administered cognitive assessment comprising seven subtests, designed for children aged 4-12 years. Its verbal and visual components evaluate comprehensive cognitive functions, including reasoning, perceptual abilities, and working memory. The ASIS is regarded as one of the most robust individual intelligence measures globally, boasting internationally recognized psychometric properties (Sak et al., 2016; Sak et al., 2019; Tamul et al., 2020). The rationale for selecting participants from the 8th-grade level is that these students are in the formal operational stage and possess the necessary mathematical readiness in terms of the required learning outcomes related to proportional reasoning skills. Moreover, the participating students have previously taken many courses related to new-generation technology on Industry 4.0, augmented, virtual reality, and digital game design. Given the potential of gifted students to significantly influence future technological advancements and next-generation industrial developments, this study deliberately focused on 8th-grade gifted students as participants. The selection criteria were based on two primary factors: voluntary participation and the ability to articulate thoughts clearly. This deliberate sampling strategy was employed to ensure that the study population comprised individuals who are not only at a crucial stage of cognitive development but also possess the capacity to contribute meaningfully to the research objectives. The choice of 8th-grade students aligns with the developmental hypothesis that this age group has reached a level of cognitive maturity conducive to engaging with complex concepts and expressing sophisticated ideas, which is paramount for the study's investigative aims.

3. Data Collection Tools

3.1 Digital Games

In line with the purpose of the study, the digital games in this research were designed by the researchers. To explain the research environment in more detail, one of the contexts in digital games was the environmental context. In the environmental context, students were asked to organize the city by saving the city from environmental problems. In the industrial context, students were asked to develop the economy of the city and industrial development by damaging nature. In this respect, two different contexts were defined as opposite to each other. At the same time, in both contexts, students can visually observe the changes in the city. The problems presented in each context in GBLE, and the problems used in the game at each level were identical. To explain in more detail, the objects, animations, and mathematical problems used in both studies were the same. Only the context of the games was different.

This study focused on the possible advantages for gifted-students when utilizing a game-based learning environment for mathematics concepts and skills (i.e., rate/ratio and proportional reasoning). To select the problems used in the digital games in this study, past studies were analyzed to evaluate the concept of ratio-proportion from all aspects. In this study, the digital game was designed by considering the ratio-proportion problem types defined by Lamon et. al. (1993) and Van Dooren et. al. (2005). The problems at each level correspond to the problem types defined in these studies.

Gifted students played the digital games in the study individually or in groups of two or three. Among the participants, eight students played the digital game regarding the context of green energy, and the remaining seven students played the digital game regarding the context of unregulated industrial development. Eight of the students played the digital game individually (see Figure 1). The remaining seven students played the game in groups of two-two-three (see Figure 2 and Figure 3). In this way, both individual and group play of the game were evaluated. These digital games, each of which consisted of five levels developed for two different contexts (i.e., green/clean environment and industrial environment) varied between 15 and 45 minutes for each level. Meanwhile, the researchers were able to observe the behaviors and errors of the game-students interaction in detail. The digital gameplay was also recorded using Movavi Screen Recorder software. Then, focus group and individual clinical interviews were conducted with the students about the digital games they played.

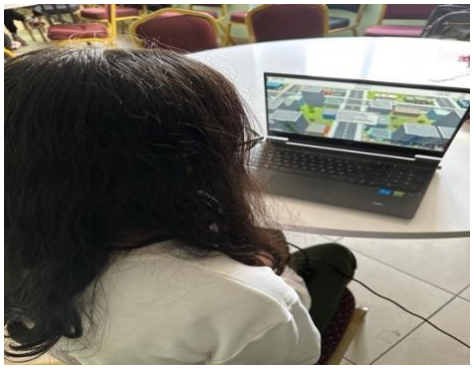

Figure 1: Individual digital game playing

Figure 2: Playing digital games with a group of three students

Figure 3: Playing digital games with a group of three students

3.2 Researchers' Observation

Researchers' observation was made under the recordings of student digital game-playing videos with two main purposes. The first one is to examine the digital game from an educational point of view and to observe the effectiveness of the game. In other words, the difficulties experienced by students while solving problems and the strategies they use were examined. In this respect, the educational effectiveness of the educational digital

game was examined in terms of educational effectiveness. Moreover, researchers' observation was made to determine the missing and faulty parts of the digital game design. Since this research is part of a large study, researcher observation is crucial in determining the gameplay and in-game errors of the digital game at the design stage. However, the design phase of the digital game was planned to be discussed in another study.

3.3 Clinical Interviews

The purpose of the focus group and individual clinical interviews was to evaluate the students' views on the contexts (Koichu & Harel, 2007). In these interviews, students were asked about the shortcomings of digital games and the aspects of digital games that they like or dislike. The questions asked to the students during the clinical interviews are as follows:

1. Can you explain what are your general thoughts and first impressions about these digital games you played?
2. What do you find interesting about these digital games you play?
3. Can you list what are the most important features of these digital games?
4. What are your thoughts on the shortcomings of these digital games you play?
5. What are your criticisms, if any, about these digital games you have played?
6. Can you explain in detail how you solved the problem in this digital game you played?

In order not to guide the students, direct questions about the digital game context were not asked. In this way, students were asked to express their views on the digital game context themselves.

4. Data Analysis

During the research, the data collected was analyzed simultaneously. To do this, the transcripts were processed by selecting which of the collected data would be used, open, axial, and selective coding were performed, and appropriate themes were interpreted (Strauss & Corbin, 1990). In this study, a thematic analysis of the qualitative data was conducted. During the analysis process, the transcripts containing the raw data were read several times, and the data were divided into conceptual categories. Themes were reached by establishing relationships between the codes. Open coding was used as the first step of the thematization effort. Themes at a low level of abstraction were reached through open coding based on the research questions, concepts in the literature, terms used by students, and their thoughts on the environmental contexts. Axial coding was carried out by making a second pass over the superficial abstractions obtained through open coding. In this second pass, all the initial codes were related to each other. Thus, many closely related concepts were combined under a more general concept. Therefore, with axial coding, the codes were organized and related to discover the basic analytical categories. With the final coding, selective coding, the data were gone through for the last time and certain themes identified during the previous coding were reorganized. Thus, the main themes of the research were reached (Strauss & Corbin, 1990).

Preliminary findings

In the clinical interviews, the students were asked to identify the most important feature that interested them about digital games. The students tried to describe the most interesting aspects of digital games according to their features (see Table 1).

Table 1: Student views on the most interesting features of digital games

Student's view	*f*
Power plant building industrial factory	5
Training for a budget economically	3
Gamifying mathematics	3
Contains mathematical problems	3
Tree planting	1

Based on Table 1, it was revealed that student's views on the most interesting features of digital games were related to the industrial context. The students emphasized that in the game regarding the industrial context, power plant building regarding industrial factory and training for a budget economically were given. In this respect, gifted students stated that the digital game associated with the industrial context was more interesting

and valuable as it provided energy generation and budget management training economically. Gifted students also indicated that the digital games in both contexts were interesting and enjoyable since they included mathematical problems and gamified mathematics. On the other hand, only one gifted student mentioned that planting a tree was the best part of the digital game in the context of a green environment.

When asked about the missing parts of the digital games used in the research, it was observed that the students made critical comments on the gameplay of the digital games. In these digital games, especially the inability to determine the position of the tasks on the map and the lack of information on how to move the camera were emphasized by the students. However, only one student stated that since digital games are interesting, it would be better to have more levels in digital games and thus, they could try to complete these games for a longer time. In addition to all the findings, it was observed that these game levels were challenging even for gifted students and that the game was compatible and suitable even for group work. It was also observed that these digital games can be played with groups of one, two, and three players.

It was observed that most of the gifted students were able to determine the task related to the digital game, such as finding the type of solar panel, without performing mathematical operations. Although these students focused on the relationship between two different variables (i.e., money and energy), they stated in the interviews that they only chose the type of solar panel according to the dependent variable, namely energy. This situation reveals that students focus more on the dependent variable instead of the quantitative relationship. The following sample excerpt demonstrates the aforementioned situation.

> S1: *"Since the C solar panel produces the most energy in this problem, we should choose this panel."*

On the other hand, it was observed that a few students initially ignored the data in the questions and the relationships between variables and chose solar panels randomly. These students tried to reach the answer by using a trial-and-error strategy among the options. These students used trial and error strategy only in the first digital game. In the other digital games, they were able to complete the tasks successfully by focusing on the problem situation and the relationships between quantities. Moreover, it was seen that almost all the gifted students used the proportional relationship while solving the mathematical problems in the digital games and they were able to use proportional reasoning easily. The example excerpt below shows the mentioned situation.

> Researcher: *"Do you comprehend the problem?"*
>
> S2: *"Yes, I try to find the answer by choosing randomly. Let me choose solar panel B and see what happens." "Oh, it didn't work, then I chose solar panel A. That didn't work either, so the answer is solar panel C (laughing)."*
>
> S3: *"We aim to increase our money and, in this way, to do other tasks. Therefore, I should choose the panel that allows me to spend the least amount of money." I have to focus on the relationship between money and energy."*

5. Discussion and Conclusion

This study showed that the adaptation of the digital game environment based on mathematical problems regarding the concept of ratio-proportion in the literature drew the attention of gifted students and that they played this game with enjoyment and motivation. In these digital games, gifted students were able to determine the parameters as in mathematical activities and solve the problems based on these parameters. However, at the beginning of the game, some students tried to reach the result by just clicking the buttons without thinking deeply about the questions. It can be inferred from this that these students did not perceive the game environment as a mathematical problem at the beginning of the game. In their study, Alkan and Ada (2023) observed that in digital educational games, students did not read the instructions at the beginning and guessed the answers. From this point, it can be revealed that these students are not familiar with this kind of digital educational game environment. At this point, it can be deduced that these students generalize their usage habits related to digital games focused only on entertainment to educational digital games.

Preliminary findings showed that students were more interested in the digital game regarding the context of unregulated industrial development as it included interesting and beneficial topics such as energy generation and economic development. The students highlighted that the digital game related to the industrial context was particularly useful for learning how to build power plants regarding industrial factories and manage budgets efficiently. Gifted students found the game even more interesting and valuable as it provided training on energy generation and budget management economically. However, only one gifted student mentioned that planting

a tree was the best part of the digital game in the context of a green environment. Therefore, it can be claimed that gifted students are not very interested in the digital game related to the green environmental context and their attitudes towards this context are low. The reason why digital games related to the environmental context are of little interest to students may be associated with the lack of sufficient level of green environmental education in Turkey (Savaşçı, 2020). However, it is known that digital educational games are important in raising environmental awareness (Janakiraman et. al., 2021). However, both contexts aimed to develop environmental awareness in students. Even in the industrial context, the negative impact of unregulated industrial development on the environment can be observed. Similarly, the problems in the environmental context are related to rehabilitating the environment. However, it was observed that both digital game contexts caused students to focus more on energy production and energy needs instead of environmental awareness. At this point, it can be argued that both digital game contexts regarding the green/clean environment and industrial environment remain neutral in terms of encouraging students in terms of environmental awareness.

Based on these preliminary findings, it was revealed that the student characteristics of Turkey, which represents a developing country, were dominated by the view that contexts such as the economy and industrial development, that was, the industrial context are more interesting and useful than the green/clean environmental context. Moreover, the resident perception of the citizens regarding the acute need for energy generation and economic development rather than saving nature and green energy since Turkey represents a developing country may explain this finding (Clean Energy Foundation, 2022). The findings of a recent survey indicated that adolescents aged 15-17 in Turkey consider the high cost of energy and dependence on imported energy resources as the two biggest problems. This survey also showed that among Turkish citizens, adolescents are the cluster that is most concerned about energy external dependence and the cluster with the highest tendency to see oil as the main source of Turkey's energy external dependence (Clean Energy Foundation, 2022). On the other hand, the adoption of renewable energies is crucial for a sustainable future, and Turkey is no exception. To achieve this, it is imperative to ensure that citizens are well-informed about the benefits of renewable energy and actively participate in its social acceptance. As highlighted by Demir and Ataöv (2021), urgent action is needed to make this a reality in Turkey. Therefore, it is recommended that future studies on both environmental and academic learning outcomes of students at all educational levels through digital educational games focusing on mathematical concepts regarding various environmental contexts (i.e., green/clean environment versus industrial environment) be conducted especially in developing countries such as Turkey.

Abstract: This study aimed to examine the studies on digital games presented in The Congress of European Research in Mathematics Education (CERME) using a systematic analysis approach in terms of research method, data collection tool, and how they define digital games. Sixteen studies related to games were selected from the proceedings. The findings of the research revealed that the number of studies on games has increased in recent years, and the interest of the mathematics education community in this subject has gradually increased. It was seen that qualitative research approaches were used in most of these studies. As a data collection tool, a semi-structured or clinical interview form was mainly used. To reach more comprehensive results, it is necessary to give importance to quantitative research approaches and even to prefer the use of both approaches together. It was indicated that the tendency towards mathematical reasoning and puzzle games has continued predominantly in recent years. Although it was seen that the number of studies on digital games has increased in the last five years, only six studies in total were presented at the CERME. Moreover, three digital games developed by using the tools in the context of dynamic geometry environments were found. Another significant finding was that most of these studies did not define games. Only a few studies that defined the game considered the game as a tool used to acquire a mathematical concept or knowledge. Based on the findings, it can be argued that digital games are not among the interests of the mathematics education community. Finally, it was observed that mathematical theorems and approaches were central to the studies reviewed. Games were generally defined as tools within these studies. Therefore, future research should particularly consider fundamental game features such as game mechanics to create more integrated research environments with mathematics education.

Keywords: CERME, Digital Game, Non-digital Game, Mathematics Education

1. Introduction

Games have long been a subject of research in mathematics education. Non-digital games are known to have a positive impact on students' academic achievement, communication, and critical thinking skills (Russo et al., 2024). Similarly, digital games are also known to develop students' cognitive skills such as creative thinking, critical thinking, and problem-solving, as well as their affective skills such as attitude and motivation (Rodriguez-Aflecht et al., 2018; Lin and Hou, 2016; Brezovszky et al., 2019). These studies demonstrate that games have an important place in mathematics education and will continue to be used in the future. In this light, it is important to present a framework for how mathematics educators approach games as a research topic.

In recent years, rapid adoption of educational games in classroom settings for diverse purposes has been observed, emphasizing their potential to enhance learning and instruction. During this period, several literature reviews have addressed a broad spectrum of disciplines, including science, technology, engineering, and social studies (Cheng et al., 2015; Peterson et al., 2022), as well as focusing on mathematics education (Byun & Joung, 2018; Hussein et al., 2021; Joung & Byun, 2021; Pan et al., 2022). Since mathematics education often requires different skill sets compared to other disciplines, games intended for teaching mathematics may necessitate specific attributes (Pan et al., 2022). Furthermore, a crucial step towards effectively utilizing games in educational settings is understanding their potential and evaluating learning outcomes. This enables educators to conscientiously select games that align with their pedagogical goals and contribute effectively to learning environments. Therefore, it is imperative to analyse the findings of these reviews, as this analysis facilitates a comprehensive understanding of the potential benefits of educational games and their impact on learning outcomes in educational settings.

In this study, the papers presented at the Congress of the European Society for Research in Mathematics Education (CERME) were examined. CERME is a conference that has been ongoing for over twenty-five years, sharing significant research in mathematics education. The knowledge accumulated during this time has reached

a level that can be analysed in different review research (Herfort et al., 2023; Donevska-Todorova and Trgalova, 2017). Therefore, we believe that examining the papers from this conference and presenting the studies within a framework of various perspectives over 25 years will provide valuable insights into the role of games in mathematics education.

2. Method

This study employed a systematic review method. To achieve this, all full-text articles published in the CERME symposium were examined, including those presented at 12 CERME conferences held since 1999. The full texts of CERME papers were accessed through the website http://erme.site/cerme-conferences/. Initially, papers related to games were identified by scanning for the keyword "game" in their titles. These texts were then examined in greater detail. An initial review of the abstracts and titles identified 32 full-text papers. During the subsequent detailed examination, several key criteria were considered. Studies that were not available as full texts were excluded from the list. Additionally, papers that were not research articles and did not involve the use of a game were excluded from the study. Furthermore, only studies that investigated the impact of a game on a specific variable were selected. After applying these criteria, 16 out of the 32 studies were excluded from the list, leaving 16 studies for detailed analysis. The criteria for excluding full-text papers in this study are summarized in Table 1 below.

Table 1: Criteria for excluding studies

Criterion	Frequency
The study is not related to games.	6
The game is not central to the study.	3
Not a research study.	2
Related to game design instruction.	5

The remaining 18 studies were examined according to specific criteria. The year of the study, its purpose, target audience, research method, assessment tool, mathematical subject area, name and type of the game, the purpose of using the game, theoretical framework used, and how the game was defined were all analysed. The details of these studies are listed in Table 2 below.

Table 2: Details of the examined studies

3. Findings

Initially, the years of the conducted studies were examined. Table 3 lists the years in which the studies were conducted.

Table 3: Year of the studies

Year	Frequency
2002	1
2007	2
2013	1
2015	2
2017	3
2020	6
2022	3

Upon examining Table 3 above, it can be observed that research involving games has remained relatively stable over the years. However, a notable increase in game-related studies occurred in 2020. In other periods, the number of studies remained balanced. This surge in 2020 can be attributed to the post-COVID era, during which interest in tools like games, especially digital games used by individuals or small groups, increased significantly.

Table 4: Target groups

Target Group	Frequency
Teachers	2
Ages 7-10	1
Prospective Mathematics Teachers	1
Kindergarten Students	3
Ages 11-14	7
Ages 15-18	3
disabled student (Middle School)	1

When the studies are examined, it is seen that the majority of the studies are aimed at secondary school students (see Table 4). There are no studies regarding university education. However, apart from this, there are studies for all target groups.

Table 5: Objectives of the studies

Objective	Frequency
Cognitive development	8
Emotional development	5
Teacher development	3
Assessment	1

Upon examining the objectives of the studies, it is evident that cognitive development takes precedence (see Table 5). Cognitive development encompasses areas such as knowledge, reasoning, geometric reasoning,

strategic thinking, mathematical thinking, and mental tools. Emotional development focuses on aspects like attitudes and motivation. The remaining topics include teacher development and the investigation of games as an assessment tool.

Tablo 6: Methods

Research method	Frequency	Research design	Frequency
Qualitative	13	Case Study	4
		The teaching experiment	2
		The teaching intervention	1
		Discourse Analysis	1
Quantitative	4	Experimental	1
		Descriptive	3

The analysis of Table 6 reveals a dominance of qualitative research methods, employed in (13) of the studies, compared to a smaller number of quantitative studies (4) employed. Furthermore, a closer examination of the qualitative methods suggests a preference for case studies (4).

Table 7: Data collection tools

Data collection tool	Frequency
Observation and Interview	6
Observation	3
Survey	3
Scale and Survey	1
Think-Aloud	1
Observation and Game Score	3

Upon reviewing Table 7, it is observed that the combination of observation and interview is the most frequently used data collection method. Additionally, observation, survey, and observation-game score studies are equally the least used, whereas think-aloud and scale-survey approaches are used to a lesser extent.

Table 8: Subject areas

Subject area	Frequency
Numbers	5
Geometry	4
Measurement	3
Algebra	3
Probability and Statistics	2

Upon examination of Table 8, it is observed that the most studied subject area is numbers. Within the realm of numbers, the topic most frequently explored is number sense (in four studies). Only one study pertains to problem-solving. There are four studies related to geometry. Regarding measurement, two studies focus on the concept of area, while one study addresses the topic of money.

Table 9: Game types

Game Type	Frequency
Didactic Games	2
Puzzle Game	5
Dynamic Mathematical Software	3
Board Game	2
2d Platformer	1
(Non-Digital) Puzzle	1
Sandbox Game	10
Chance Game	1

Game Type	Frequency
Life Simulation	1
Combinatorial Game	1

Table 9 demonstrates that digital puzzle games are the most favoured choice for research. Additionally, didactic games are prominent, especially in the early 2000s. Over time, while the usage of digital games increases, the number of non-digital games decreases. Only one entertainment digital game, Sims 3, is utilized in the studies.

Table 10: Theoretical framework

Theoretical framework	Frequency
Didactic Situation Theory	2
Constructivism	3
Jaakko Hintikka Theory	3
Polya's Problem-Solving Steps; Downs and Mamona-Downs (2007) Mathematical Problem	1
Realistic Mathematics Education' ('RME') and 'Inquiry Based Learning' ('IBL')	1
Deci & Ryan's (1993) Self-Determination Theory	1
Dörfler's Theory Meaning, Hejny's Theory the "Motivation"	1
Deci & Ryan's (1993) Self-Determination Theory	1
TPACK	1
Combinatorial Game Theory	1

Upon examination of the theoretical frameworks in the studies, three theories stand out: didactic situation theory, constructivism, and Jaakko Hintikka's theory (see Table 10). Particularly, games hold significant importance in the didactic situation theory. However, this theory has been predominantly utilized only in the 2000s. Hintikka's theory, on the other hand, has been employed within the framework of dynamic mathematical software. Overall, theories of mathematics education take precedence in the theoretical framework.

Table 11: Definition of games

Game Definition	Frequency
Research that does not define games	13
Research that defines games	1

It is observed that most of the research does not provide a definition of the term "game" (see Table 11). However, among those that do, games are defined as follows:

"Epistemic games are about knowledge, but they are about knowledge in action - about making knowledge, applying knowledge, and sharing knowledge." (Shaffer & Gee, 2005, p. 16).

In another paper: *"Strategic games within Dynamic Geometry Environments (DGEs): these are games in which players have to make strategic choices meant for setting up and coordinating actions aimed at the achievement of a goal"* (Soldano & Arzarello, 2017).

From these two studies, it is evident that action is central to the definition. In another study, a distinction between games and didactic games is emphasized in defining games:

"The main differences between the normal meaning of children's game and between the didactical game are:

1. *Children's game is totally free, in didactical game all pupils have to participate.*
2. *Didactical game is used to realize chosen educational goals; the main aim of children's game is just fun and pleasure.*
3. *The didactical game has its external management (teacher)."*

In this definition, as in the others, the focus is on the objective.

4. Discussion and Conclusion

It was observed that the interest in the game was particularly high in the studies conducted in 2020, but then decreased in the last conference. One of the main reasons could be attributed to the increased interest in digital tools during the COVID-19 pandemic (Vargo et al., 2021). Additionally, while non-digital games were

predominant in the initial symposiums, there has been an increase in the number of digital games over time. This can be attributed to the rise of independent digital game development, leading to an increase in the number and variety of games produced by various independent institutions (Josef et al., 2022). Consequently, the number of educational digital games may have increased as a result.

The research predominantly employs qualitative research methods, reflecting a broader trend in mathematics education research (Maamin, et al., 2020). This preference is also notable in research concerning games. Contrary to the findings, studies related to games predominantly focus on quasi-experimental designs (Hussein et al., 2021). Another significant finding pertains to the types of games utilized. While non-digital games were prevalent in the early 2000s, digital games have been increasingly employed in recent years. This can be attributed to the accessibility of Dynamic Geometry Software and various digital games, particularly those developed by independent developers or companies, with puzzle games being prominent. The dynamic geometry approach has become popular in mathematics education, especially since the 2010s (Ondes, 2021). This situation can be observed in these academic congresses. Among all the studies, only a single entertainment digital game (The Sims 3) was utilized, indicating that entertainment digital games are not widely perceived as valuable from a mathematical perspective by researchers. Dynamic Geometry Software (DGY) games constitute the second most utilized type of game. However, games developed using DGY may have certain mechanical limitations, making it challenging to classify them as digital games. Studies utilizing DGY tend to prioritize action in their definition of games, emphasising the active engagement of students with the tools (Zengin, 2022). The absence of purely dynamic action and fundamental mechanics such as rewards or penalties in DGY complicates its classification as a game (Arnab et al., 2015). In the context of games within mathematics education, importance is also placed on the roles of teachers (Alkan & Ada, 2023; Fujita et al., 2018). This emphasis is particularly evident in non-digital didactic games. Therefore, it can be argued that studies made by mathematics educators, especially within the framework of mathematical theories and tools, differ from educational digital games or game-based instructional theories.

5. Implications

Upon analysis, the primary objective of the studies was to utilize theorems and approaches related to mathematics education within a game environment. Consequently, future research should aim for greater integration of these theories and approaches with game-based methodologies. Specifically, studies that examine the impact of fundamental game features, such as game mechanics, on mathematical development should be prioritized. This focus on transferring mathematical theories and approaches to the game environment is expected to enhance the effectiveness of educational games. Additionally, it has been observed that mathematics educators often interpret games differently, sometimes categorizing activities using software like GeoGebra as games. However, GeoGebra and similar software are not inherently designed for game development as they lack many essential game mechanics. Therefore, conducting a theoretical investigation to delineate when an activity qualifies as a game versus an educational activity could significantly benefit future research in educational games.

micaela.fonseca@ulusofona.pt

Abstract: The EPIC-WE Cultural Game Jam: Óbidos UNESCO City of Literature (CGJ) was a purposeful game jam, and part of the EPIC-WE Horizon-Europe project. CGJ empowers youth to participate through ideating cultural worlds, by creating and exchanging cultural values and heritage through game-making (game jams experience), within the Quadruple Helix (QH) Cultural Innovation Ecosystem. The study is focused on the specific presence of jammers at the game jam venue, within the cultural spaces and cultural agents. Describing the development of unique Game Jams applying the QH model, linking a municipality region, a games company, university researchers, and a youth focus group to foster the production of games for culture and games through culture. With extensive experience in organising game jams since 2014, the researchers confronted the literature review study focused on youth empowerment and cultural game jams (Costa, *et al.*, 2024), ensuring the project research protocols to define a model for 4 game jams to be held from 2024 to 2025. The ongoing research demonstrates the creation of a research protocol for the 1st CGJ model: student recruitment; Pre-Game Jam with the theme reveal and ideation; Game Jam activities and conditions; Reflection Day; Data collection; Post-Mortem analysis; CCIs games evaluation; and future outcomes. 8 games produced on the 1st CGJ demonstrated the effectiveness of the CGJ model for cultural purposes. Besides the cultural theme limitation, participants (N=26) evidenced a high level of satisfaction evidenced in the final survey. Several recommendations for improvement were given (survey reflection 2) and outlined so that future CGJs can produce games that delve more deeply into the topics covered.

Keywords: Game Jams, Cultural Games, Quadruple Helix, Cultural Game Jam

1. Introduction

Game Jams have gained a lot of prominence in recent years, being events where the gamedev community and other enthusiasts from a wide variety of fields come together in a playful environment to create games. It's an experimental space for ideas and rapid prototyping where people participate freely under a specific theme within a predefined time frame (Kaitila, 2012).

Jam sessions are a spontaneous, unrehearsed gathering of musicians who don't have prior history as band members, often having very diverse backgrounds, value systems, and musical ability but nonetheless being able to come together as a unit capable of achieving a successful music performance (Katz & Longden, 1983). Similarly, in a game jam, people with know-how from diverse disciplines, traditionally programming, game design, art, and sound, convene to collaborate (Grace, 2016) and playfully develop games, adhering to a predetermined theme and time limit, commonly set at 48 hours (Kultima, 2015; Goddard, 2014).

These types of events have officially existed for over 20 years, starting in March 2002 with the Indie Game Jam, closely followed by Ludum Dare, in April 2002 (Lai *et al.*, 2021). The latter event remains popular and active to this day. According to Lai *et al.* (2021) we can categorise the earlier game jams in different waves in order to better understand the evolution of the format: 1st generation - events were mostly held online with a technical focus and games being developed by a single programmer; 2nd generation - began in 2006, events were in-person and the focus shifted to games created by a team with varied skill sets. Another important highlight from this generation is the appearance of the Nordic Game Jam, responsible for introducing the game jam model most commonly used today; 3rd generation - started in 2009 with the advent of the most popular game jam to this day, Global Game Jam (GGJ), an internationally synched game jam that takes place worldwide at the same time, across different countries and locations such as schools, universities and companies that welcome professionals, amateurs, students and everyone who might want to participate (Kultima, 2021). Since it began, the growth of locations, participants and games resulting from the GGJ has been exponential (Fowler *et al.,* 2015), with the trend continuing. What began with 23 countries and 370 games, has since expanded to 131 different participating countries and more than 79182 games created just in 2024 (Global Game Jam, n.d.); lastly, 4th generation - introduces the concepts of moving game jams, such as the Train Jam (hosted on a moving train), and unique locations such as castles or more remote locations. These new formats introduce additional constraints, such as limited internet access or power sources just to name a few, and offer singular experiences to participants.

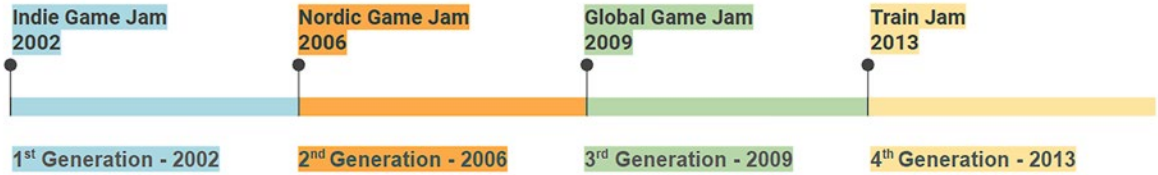

Figure 1: Game jam generations timeline.

Today, multiple game jams are taking place around the world at any given time, as can be attested through Itch.io, the most popular platform used to host and track many of these events.

Nordic Game Jam's model, first designed and applied in 2006, remains to this day the most widely used game jam format. The Global Game Jam, as the biggest and most popular game jam in the world, contributed significantly to the popularity of this model.

According to Lai et al. (2021) the most common agenda for this type of event is defined by: (1) a 48-hour duration; (2) starting with an Ice-breaker activity to involve all participants and jam organisers; (3) being followed by a Theme reveal; (4) a Pitch session, (5) Group forming and (6) Game presentations. Between steps 5 and 6, the games are developed during the event and disseminated on the game jam's website page at the last minute.

1.1 Meaningful Game Jams

Given the success, proliferation and recognised creative potential of game jams in creating and testing speculative ideas on specific themes, various game jams have been created for specific purposes. Goddard *et al.* (2014) propose guidelines to facilitate the design of game jams, providing means to balance between playfulness and gamefulness in relation to desired outcomes such as innovation in games or participant experience. Game jams oriented towards inclusion, the dissemination of meaningful themes, cultural themes and others, are today a very useful tool for participants to express themselves culturally through games (Wirman & Rhys, 2019) while at the same time being challenged to reflect on particular themes (Kultima, 2015).

In this context, when a game jam is developed in a specific environment, with a presentation of the Jam's theme and ongoing support by facilitators, the participants become fully involved and free to express themselves artistically (Kultima, 2018; Park et.al, 2023). When jammers are challenged with meaningful themes, the empathy generated and understanding of others' perspectives, such as different cultures, cultural heritages, people's feelings, climate change, health and others, are evident (Preston, 2014; Goddard, Byrne & Mueller, 2014), and the results of the games developed by teams of facilitators (educators), game designers, programmers, artists and sound designers, demonstrate the additional value of these "Serious" Game Jams (Ramzan & Reid, 2016; Abbot et al., 2023).

The present research is the culmination of a recent experience organising a cultural game jam, supplemented by prior involvement in numerous game jams dating back to 2014. Noteworthy among these are game jams focusing on neuroscience (Neuro Game Jam 2018), understanding the Sustainable Development Goals (SDG Game Jam 2021), and social impact (Games for Good 2017, 2018, 2019). These past experiences highlighted the extreme relevance of having facilitators in the game jams, both to guarantee an enriching approach to the topics covered and to ensure openness and a playful jamming experience (Goddard, Byrne & Mueller, 2014). This study introduced a fresh perspective to the team responsible for orchestrating an event that involves various stakeholders, including government officials, representatives from cultural and educational institutions, and industry professionals, all coming together to host a cultural game jam.

2. EPIC-WE Cultural Game Jam: Óbidos UNESCO City of Literature (CGJ)

The CGJ is one of the first outputs of the Horizon Europe EPIC-WE project, which aims to empower young people with social and cultural values through the development of games in cultural Game Jams. The project is being carried out by 13 European institutions from different fields of intervention (research/education, cultural heritage/museums, governance/citizenship/public, and game/creative industries), and presents a participatory framework based on the Quadruple Helix (QH) model which involves omnidirectional interactions of knowledge and technology (Aggarwal and Sindakis, 2022), for creating methods and a specific format for cultural game jams for culture and value-sensitive game-making. Since EPIC-WE engages in CGJs to create games through and for culture inspired by cultural heritage, the present project demonstrates how the QH empowers three EPIC-WE

partners, namely the Óbidos' Municipality, the Battlesheep games company, and Lusófona University, to converge in cultural research and innovation.

Regarding previous experiences where research included societal-based innovation through the QH, identifying key themes and future agendas requires a proper integration between different stakeholders (Wilson, 2012). This process will intensify existing challenges but also promote new ones (Miller, McAdam & McAdam, 2016). The QH interventions are an innovation-push model through the interaction of local and regional stakeholders into economic and technological development (McAdam, *et al.*, 2012; Bercovitz and Feldman, 2006). This collaboration enhanced the movement between stakeholders toward the most valuable societal aspects (Höglund & Linton, 2017). Thus, EPIC-WE's QH model fostered these diluted borders between public authorities and organisations, industry, academia, and citizens (Nørgård & Holfold, 2024).

The EPIC-WE project has three cultural Hubs: (1) Aarhus - contributing to societal challenges of young people feeling foreign to, disempowered in, or excluded from game-making and culture; (2) Hilversum - centred on societal issues like the impact of colonial legacies and online anti-democratic threats; and (3) Óbidos - exploring the cultural heritage awareness of young people within European Union values of inclusive quality education and sustainable economic growth.

In the context of this research, EPIC-WE Game Jam was the initial result of applying QH to create games with cultural significance. The Municipality of Óbidos suggested the theme of Óbidos Literary Village, due to the fact that Óbidos is a UNESCO-certified mediaeval literary village, and therefore, it is on the political agenda to disseminate this cultural mission. Battlesheep, the company from the creative sector with the role of providing inputs from the games industry, suggested that the game jam be oriented mostly to digital games, to foster this games' sector within the Portuguese game ecosystem.

Focused on research activities, Lusófona University contributed to the organisation of the event throughout the introduction of meaningful themes in the games to be developed. Thus, this educational perspective aims to raise the students awareness and reflection on the impact of their work as a form of artistic expression, as a form of design activism, and as game development educational empowerment. Finally, the participants were able to choose what game they wanted to develop within the scope of digital games through culture, giving them a voice to reflect on the particularities of the game jam's location site and express themselves artistically through digital games.

3. Game Jam Methodology and Procedure

This study adopted different methodologies and processes to: (1) produce games that relate to the culture of Óbidos; (2) guarantee the involvement of students in the creative process; and (3) analyse the games developed and student questionnaires. Quantitative methods were used with individual questionnaires being conducted before and after the game jam. For qualitative methods, face-to-face interviews during the game jam, and a final post-mortem at a round table with all participants and facilitators. These processes guarantee different levels of evaluation, whether it's recording the participants' perception of the game jam or using conceptual models to formally analyse the games created (Lankoski & Björk, 2015).

Thus, the CGJ methodology and procedure are summarised as follows: (1) student recruitment; (2) Pre-Game Jam; and (3) Game Jam, discussed below. Since the EPIC-WE project requires the qualitative evaluation of the games created, the researchers disseminate to students with experience in game development, namely at Lusófona's Master studies in Game Design and Playable Media and at the Videogames undergraduate studies. To recruit those students (1), sessions were held to present the EPIC-WE project and the CGJ in face-to-face informative sessions with the Videogames classes at Lusófona University. Registration forms (Google Form), a digital booklet with information about the project, the themes of the CGJ and the Game Jam Discord channel, were made available.

Held at Lusófona University site, the Pre-game Jam (2) happened three weeks before the actual EPIC-WE CGJ in the main University's campus, with the duration of four hours. The jam's theme was presented by a facilitator from the Municipality of Óbidos, and an ideation process model was carried out by two facilitators from the university while five observers assessed the effectiveness of the activities and classified the ideas generated. 27 participants (aged between 18 and 25) individually filled in informed consents and an individual survey with demographic and theme evaluation questions.

The EPIC-WE game jam (3) was attended by 26 students (one withdrew for health reasons), counting four observers and seven facilitators. As the aim was to make games through culture for culture, all students were

transported to the environment of the mediaeval village of Óbidos. Installed in four houses inside the castle, they could be among peers, experiencing the local atmosphere, and accidentally discover creative elements for their games. Because traditional 48-hour game jams require more intense game development activity, which is usually conducive to crunch time, the team of researchers decided to expand the development phase of the jam by one additional day (56 hours) to provide a cosier atmosphere and give the students the opportunity to also experience the village of Óbidos. Thus, a fourth day was dedicated to research activities, namely to the necessary "serious" load of the EPIC-WE research project (completing questionnaires, pitch evaluations, and post-mortem sessions). As illustrated by figure 2, the colour cells highlight those 'serious' moments (observation/research activities).

	Jam First Day:	Jam Second Day:	Jam Third Day:	Jam Forth Day:
10:00 AM	Visit to Cultural Institutions	Morning Pitch Session and Jamming	Day 3 Team Check In and Jamming Status report	Game delivery and submission
12:30 AM	Lunch	Lunch	Lunch	Lunch
3:00 PM	Jamming	Jamming	Jamming	Round Table Post-Mortem Survey
7:00 PM	Day 1 Team Check In Game Ideas Pitch	Day 2 Team Check In Participant Interviews	Showcase Game Presentations	
8:00 PM	Dinner	Dinner	Dinner	
9:00 PM	Jamming (Optional)	Jamming (Optional)

4. Results

A qualitative analysis targeted participants' answers to the pre-jam questionnaire, along with their opinions regarding the jam's ability to meet their expectations and additional comments made about different aspects of the jam. A quantitative analysis was also conducted to assess the participants' grading of several aspects of the game jam. All the participants of the game jam (N=26) answered the questionnaires.

4.1 Pre-Game Jam Survey (Vox-Popping)

Before conducting the game jam, participants were given a survey with two open questions where they were asked about their motivations and expectations for the game jam.

4.2 Motivations

The participants' main motivations could be separated into three main categories. One of these was to learn more about how to develop digital games. 14 participants stated their ambition to create a project they could add to their portfolio and gain experience while developing games as part of a team with their classmates and friends. Another common motivation for participants (n=15) was their stated interest in 'new experiences', referring both to the uncommon plan of the game jam, involving the visit to the village of Óbidos (see section 3), and to the opportunity to participate in a game jam in general - as several of the participants (n=16) were first-year students who had little to no experience with game jams. Lastly, 10 participants specifically highlighted the possibility of visiting and learning about the village and exploring it with their classmates and friends while experiencing the local culture. A frequent comment about the visit to the village was its direct connection to the theme of the game jam ("*I want to learn about Óbidos culture and get new experiences*", participant n.14) as it allowed them to encounter a "*unique cultural experience that actually relates to the theme*" (participant n. 18) of the game jam.

4.3 Expectations

Regarding expectations for the game jam, participants shared similar ambitions for a playful experience and a learning environment. While there was a small number of participants that highlighted the possibility of improving their soft-skills and creating new contacts (n= 4), a large group of participants (n= 14) stated their expectations for a fun, and entertaining time developing games with other people. Comments such as "To learn and have fun. Also leave with a cool game for the portfolio." (Participant n.6) were common answers; Participant 11 mentioned a similar answer and specified that they were interested in the possibility of making a "functional" game, indicating that they might have been one of the first-year students for whom the game jam was their first game-development experience. The third popular answer was that participants were excited to learn more

about game development (n= 9). These three elements - learning how to (better) make a game, making a game, and having fun doing it - are common for participants in game jams (Meriläinen & Aurava, 2018; Reng, Schoenau-Fog & Kofoed, 2013) and can also be observed in these results. Lastly, while these were the majority of the answers, there was still a minority of participants that stated expectations directly related to the specific program of the game jam, including the opportunity to explore the village of Óbidos, having fun and learning while doing so, and then making a game about the culture surrounding it.

4.4 Did the Game Jam Meet the Participants' Expectations?

Participants were asked to answer whether the game jam underperformed, met, or surpassed their expectations, also having an open-text space to further explain their answers. The answers provided by the participants reveal that the game jam appears to have generally matched or exceeded participants' expectations. Specifically, 12 participants (46%) felt that the game jam exceeded their expectations, while another group of 12 participants felt that the jam successfully delivered on their expectations. Two participants answered that the jam's experience underachieved, considering their expectations, although one of them explained it was because most of the work they did was not included in their group's game. Participants who felt their expectations were matched by the event, mainly highlighted the learning opportunity that the game jam provided. Some of these, being first-year students, stated that they were not expecting to complete a functional game but instead learn how they might make one in the future. On the other side, this group also featured comments regarding the residences where the participants were housed - which may have tempered their overall assessment of the game jam. For the 12 participants for whom the game jam exceeded their expectations, the main highlights they gave were the possibility to have fun while making - or learning how to make - games. Some also specifically referenced the possibility of visiting the village of Óbidos and learning about its culture: *"Initially, I wasn't really captivated with the idea of basing our project in Óbidos' culture and thought it would be limiting in the ways we could develop this project, but after this experience I not only got to know new cultures and get new experiences but also I found my initial thoughts to be wrong." (Participant n.9)*

4.5 Participants' Assessment of the Game Jam

Having been given the opportunity to grade the game jam on a variety of factors from 1 to 7, the results indicate that the participants regarded the game jam and the program surrounding it as highly positive. The average score given to their overall experience at the game jam was 6.12 (*SD = 0.71*). Similarly, the venue of the event (*SD = 0.63*) and its conditions (*SD = 1.23*) were graded at 6.35 and 5.65, respectively. The lowest grade was given to the residences where participants were allocated: 3.81 (*SD = 1.55*), as participants complained that the homes were not fully prepared to host the number of participants allocated to them and that there was a lack of proper internet connection. Regarding the meals afforded by the event for the participants, similar positive evaluations were given for lunch (6.27, *SD = 0.72*) and dinner (5.54, *SD = 1.30)*. Participants scored the overall organisation of the event at 6.19 (*SD = 0.63*). Lastly, participants were asked through a 5-point Likert scale how likely they were to recommend the game jam to friends and classmates, and the result was 4.77 (*SD = 0.51*).

4.6 The Developed Games

Participants developed a total of eight games as part of the game jam. As most participants consisted of first-year students in the Videogames BA, they generally had little experience developing digital games. In some groups, this meant that successfully developing any game at all was the main priority, attempting to deliver a playable product by the end of the game jam - with the topic of the jam applied on top of it, as was the case with "Literature Defense: Guardian of Óbidos".

Table 1: Games developed at EPIC-WE Game Jam.

	Name of Game	Genre	Game Engine
1	Literature Defense: Guardian of Óbidos	2D TopDown Tower Defense	*Unity*
2	Lost in Words	3D First-Person Adventure	*Unreal*
3	Tsundoku	2D Sliding Puzzle	*Game Maker*
4	storyteller	2D TopDown Stealth	*Game Maker*
5	In Search for Words	2D Puzzle Platformer	*Unity*
6	BookDweller	2D TopDown Roguelike	*Unity*

	Name of Game	Genre	Game Engine
7	Puss in Book	2D Puzzle Platformer with Typed Commands	*Unity*
8	Paredes de Cor	2D Arcade	*Unity*

One aspect some groups of participants highlighted was how the theme of their games was directly inspired by their stay at the village of Óbidos. “In Search for Words” revolves around a typography workshop, being inspired by one such workshop that they visited as part of the jam’s program. “Puss in Book” stems from its developers' own observations that there was an uncommonly high number of cats living in the village. Lastly, “Paredes de Cor” references a highly specific and local concern surrounding tourists finger-painting on the outside walls of the houses in Óbidos by using the specific paint that coats them. These games are direct results of the participants’ stay at the CGJ’s location, and had it been hosted at the university campus, it would have been highly unlikely that such specific - authentic - topics could have emerged. The immersive experience of being there was undoubtedly an essential element for the creative trigger.

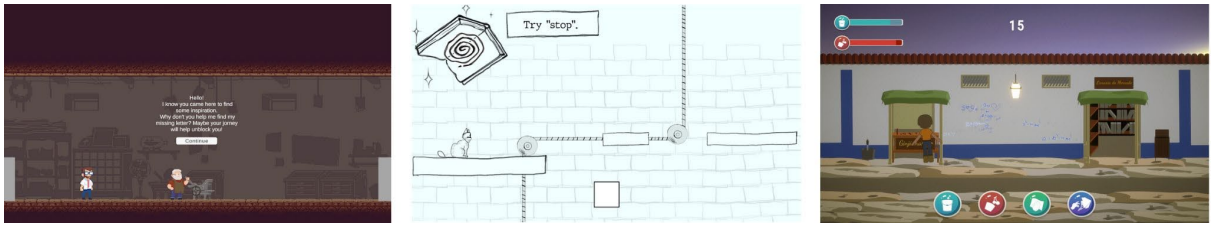

Figure 3: Games “In Search for Words”, “Puss in Book”, and “Paredes de Cor”.

5. Conclusions

The EPIC-WE Game Jam was a cultural game jam (CGJ) that utilised the cooperation of the Quadruple Helix (QH) model with the aim of providing a jamming experience that allowed participants to improve their skills and develop games immersed in the cultural setting of a mediaeval village. The results showed that the collaboration between the relevant parties (QH cooperation) allowed for a game jam where participants were able to fulfil their learning and playful goals of making their games while being in contact with the source of the jam’s theme (cultural topic). This effort allowed for the creation of culturally specific games that reflect and emulate the cultural village of Óbidos, leading to results that would not have been possible without the program of the jam and the collaborations behind it.

The game jam successfully provided a standard jamming experience while integrating the cultural goals it set out to support, with the participants’ projects reflecting the culture of the village and participants being satisfied with the overall experience.

During the CGJ, a group of facilitators (n=7) from Lusófona University provided constant game dev support, which ensured the event's goal of producing 6-8 games. Besides in the pitching sessions, the facilitators were not featured in the participants' answers to the questionnaires. However, participants were only supported with regards to the jam’s main theme - Óbidos City of Literature - during the first day, which inevitably led to the games not focusing on the subject matter. The developed games featured a more superficial approach to the topic, which should be more closely monitored in the future to incentivize greater engagement with the theme of the jam. The role of cultural facilitators, among the Game Jam facilitators, should always be reinforced when a game jam targets games with a specific cultural or meaningful impact.

6. Future Research

The discussion introduced here, based on the experience of the 1st CGJ that integrates various agents through the QH model, serves as a reflection for the planning of three more game jams expected in this project (scheduled for May 2024, December 2025, and May 2025), which could allow for evaluation in the medium term. Regarding the fact that some of the participants will be taking part in the next game jams, a lot of information will be gathered about the students' involvement in the process of designing these games, how they reflect on the cultural themes of each Game Jam, and how the various QH agents perceive the games created. The valuable data that will be collected will allow researchers to evaluate the perspectives generated by these cultural game jams through active participation with the QH model.

Abstract: Digital Game-Based Learning (DGBL) uses serious games to deliver educational content. DGBL has the potential to aid children's development of maths skills, providing educators with alternatives to traditional mathematics teaching. However, the efficacy of serious games can be affected by their attributes, including whether they are single or multi-player. While competition in a multi-player environment may enhance players' interest and motivation, potential social pressure may lead to anxiety and affect performance. In maths education, there are additional challenges. Mathematics Anxiety (MA), the negative emotional response to mathematics, may interact with game features and impact players' experience. This study assesses players' performance in a digital maths game called 'Seven Spells' across two different game modes (*vs. Human* and *vs. CPU*), and it also investigates whether MA levels impacted players' performance. 43 children from two classes in an Irish primary school participated in this study. Each class played a different game mode of the 'Seven Spells' game, one group playing against computer-controlled characters (*vs. CPU*) and the other playing against their classmates (*vs. Human*). The game mechanics were identical between the two competition game modes. The children completed the modified Abbreviated Mathematics Anxiety Scale (mAMAS) and a mathematics questionnaire before participating in the intervention, which included 4 sessions. They also participated in a focus group session at the end of the intervention. Data on their gameplay were collected throughout the first three sessions and analysed through multiple linear regression models to investigate possible connections between MA, maths knowledge, game modes and game performance. The results of the multiple linear regressions indicate that game performance was positively influenced by the duration of gameplay and the complexity of moves — measured by the number of moves and cards used — while being negatively affected by MA. However, a significant interaction between MA and the competition game mode was observed, suggesting that MA had a more pronounced negative impact on players in the *vs. Human* game mode compared to the *vs. CPU* game mode.

Keywords: Digital Game-based Learning, Primary School, Mathematics Anxiety, Competition.

1. Introduction

Digital Game-Based Learning (DGBL) is an active, student-centred problem-based learning approach in which digital games are used as tools for teaching and learning (Theofylaktos et al., 2018; Vanbecelaere et al., 2020). DGBL has been shown to optimise learning, positively influencing concentration, information assimilation and retention (Moyer-Packenham et al., 2019; Vanbecelaere et al., 2020). Additionally, DGBL mathematics interventions are perceived as more enjoyable than traditional paper-based mathematics exercises and typically show positive effects on arithmetic performance (Castellar et al., 2015, Vanbecelaere et al., 2020).

Games have several design elements that may influence learning (Moyer-Packenham et al., 2019), including whether they are single or multi-player. Playing against a human opponent or against a computer can affect immersion, flow, enjoyment and presence, all of which are relevant for digital learning and player motivation (Weibel et al., 2008). Among other factors, competition is indeed experienced in different ways when a player is facing a human opponent or a computerised one (Cagiltay et al., 2015). Even though competition can enhance a player's motivation and lead to better learning outcomes (Cagiltay et al., 2015), this game element can also reduce performance and increase anxiety (Cagiltay et al., 2015). In the context of mathematics, Mathematics Anxiety (MA), which is defined as a set of negative feelings such as nervousness and dread associated with mathematics learning, could indeed negatively affect mathematics performance (Buratta et al., 2019, Carey et al., 2017, Krinzinger et al., 2009). To investigate the relationship between different game modes, MA levels and game performance, this research investigates the connections between gameplay characteristics, maths knowledge, MA levels and player performance within a digital maths game ('Seven Spells') in two competition modes: *vs. Human* and *vs Computer-Controlled Characters (vs. CPU)*. The research questions for this study are:

1. What factors influence player performance in the digital maths game 'Seven Spells'?
2. Do specific factors affect player performance differently depending on the competition game mode?

Given the negative effects that MA might have on mathematics performance, we hypothesised that MA would be a significant factor negatively associated with game performance, while the complexity of the moves executed by players would significantly increase game performance. Moreover, due to the potential difference in the way competition is perceived in the two different game modes, we expect that the effect of MA could vary according to the game mode played.

2. Methods

2.1 Research Design

This study recruited two 3rd classes from a primary school based in Dublin, Ireland, comprising students aged 9 to 10 years old. Only students whose guardians/parents permitted participation in the study were included. Classes were visited in four sessions; twice per week, during school hours. Each session lasted one hour. Table 1 details the experimental design, displaying the activities performed in each session.

Table 1: Experimental design

	Session 1	Session 2	Session 3	Session 4
Activities	Questionnaires	Game review	Game review	Focus group
	Game tutorial	Game session	Game session	
	Game session			

In Session 1, the students completed the modified Abbreviated Mathematics Anxiety Scale (mAMAS) (Carey et al., 2017) and a maths fluency test. Students were then introduced to the 'Seven Spells' game, which they played on tablet devices provided by the research team. The research team also delivered an in-person tutorial explaining the game and advising the students during their first gameplay. The two 3rd classes played the same game, but in different competition modes: one group competed against CPU (*vs. CPU* group) whilst the other group competed against their classmates (*vs. Human* group). During Sessions 2 and 3, the researchers reminded students of the game's rules through a guided game match and students played again. During Session 4, the students were invited to attend a focus group discussion on their overall game experience.

2.2 Participants and Data Collection

The total sample for this study comprised 43 3rd class students. Data on the students' MA levels and maths performance before playing the DGBL intervention were gathered and inputted into an anonymised dataset, in compliance with the General Data Protection Regulations (GDPR). Students played the 'Seven Spells' game using randomly generated usernames. Data cleaning was necessary to remove students who did not participate in all four sessions and/or did not answer questions on the mAMAS scale (incomplete data). The final number of students whose data was included in the analyses is shown in Table 2.

Table 2: Number of students included in the analyses of each variable (complete data).

Variable	vs. CPU	vs. Human	Total
Mathematics test	21	22	43
MA levels	21	20	41

Data was analysed to investigate possible correlations between the game's distinct competition modes, player performance, and MA levels. Data was password-protected, and only participant researchers could access it.

Maths fluency. The students' maths fluency was identified through a short mathematics test aligned with the content covered both by the 'Seven Spells' game and the Irish Mathematics curriculum for 3rd class. They were given ten minutes to complete the questionnaire. In the data analysis, the number of mathematics errors (ME) was captured with omissions (i.e. questions not answered) being counted as errors.

Mathematics Anxiety (MA). The modified Abbreviated Mathematics Anxiety Scale (mAMAS) (Carey et al., 2017) was used to measure the students' MA. In this questionnaire, the students answered nine questions about

situations involving mathematics learning. using a 5-point Likert scale to indicate their feelings: 1: 'Low anxiety'; 2: 'Some anxiety'; 3: 'Moderate anxiety'; 4: 'Quite a bit of anxiety'; 5: 'High anxiety'), along with a simple emoji to better illustrate that feeling. The minimum possible score for the mAMAS questionnaire is 9, which would indicate low MA. The maximum possible score of 45 points would indicate high levels of MA.

Focus groups. Students from each group were recruited to participate in 2 focus groups (one per group) in Session 4. These focus groups aimed to elicit the students' points of view, motivations and perceptions regarding 'Seven Spells'. To achieve this in a non-directive way, the moderator created a set of open-ended questions (Gibson, 2007). To make better use of the students' potential to generate rich debate, only five to six students were included in each focus group due to their age (9-10 years old). Gibson, 2007 recommends using small focus group numbers when working with younger children (6-10 years). The following questions were asked to both groups: "What did you think about the game?"; "What maths concepts did you learn while playing Seven Spells?"; "Did the game make you feel less anxious about maths?". One question differed depending on the group: the *vs. CPU* group was asked: "How do you feel about playing against the computer characters?", while the *vs. Human* group was asked: "How do you feel about playing against your classmates?".

2.3 The 'Seven Spells' Game

The digital maths game 'Seven Spells' was used to deliver the DGBL intervention. To play, the students needed to understand the concept of even and odd numbers, prime numbers, multiples, intervals, symbols (such as less-than and greater-than ("<", ">")) and intervals. The aim of the game is to capture the opponents' cards by using the players' own cards. Cards can be classified as 'number cards' (the blue and red cards in Figure 1) or 'spell cards' (the yellow cards in Figure 1). Spell cards are used to capture or modify number cards displayed on the board. To capture a card, a player must match cards that carry the same number. There are also 'special' number cards: the 'Total' card (capable of capturing multiple opponent cards, as long as they sum up to the number shown on the 'Total' card) and the 'Max' card (which captures any card whose number is equal or lower than the number shown on the 'Max' card). During their turn, players can use as many cards as they want, combining numbers, arithmetic operations, and number properties to capture the highest amount of cards. After completing their moves, players press the 'GO' button to earn points for their actions. It is then the opponent's turn to play next.

To win, players must reach or surpass 100 points. If the player who started the match achieves or exceeds 100 points first, their opponent has one more turn. If the opponent surpasses the starting player's score, they win; if not, the first player wins.

Although the rules and gameplay are similar, there are some differences between the two competition game modes. When playing *vs. CPU*, a storyline element is connected to a reward system. In the story, the player is part of a fictional martial arts academy where they learn the art of number fighting. They must face distinct characters to advance through different-coloured belts, with characters from the next belt being stronger than those having a belt of a lower rank. It is only when the players defeat an opponent that they can face the next opponent. After defeating all opponents in a particular level, the player is rewarded with a belt matching that level's colour. When playing the *vs. Human* mode, players have to choose an opponent within their class and create a match in an online lobby. The invited classmate can then join this match.

Figure 1: "Seven Spells" gameplay - *vs. CPU*.

2.4 In-game Variables Considered in the Study

By collecting and processing game logs, we computed various indicators of game performance. The variables were computed for each move that a player executed. The move-level in-game variables include:

- **Number of opponent cards -** The number of opponent cards that can be captured by the player in that turn.
- **Maximum achievable points -** The maximum number of points that the player can achieve in that turn. It is a theoretical number of points that the player can be awarded through the 'best' possible combination of moves.
- **Stack size -** The number of the player's own cards used to execute a move. A higher number of cards being used suggests a higher complexity of moves in that turn.
- **Total cards available -** The total number of cards available for the player to use in their moves in a turn.
- **Incremental move -** An incremental number for the moves of each player. The variable is introduced to control for a learning effect, where players execute more complex and precise moves as they play more.
- **Optimality score.** This score measures the quality of each player's moves performance and is equal to the number of actual points scored by the player in a turn, divided by the maximum achievable points. This measure ranges from 0 to 1, with 1 being perfect optimality, meaning that the player scored the maximum amount of points possible for that turn. Optimality represents a measure of game performance and it is used as the target outcome variable in our regression models.

$$Optimality = \frac{Number\ of\ points}{Maximum\ achievable\ points}$$

We also collected the game mode being played: *vs. CPU* or *vs. Human.*

2.5 Quantitative Data Analysis

Data analysis was carried out using R. Descriptive and inferential statistics were used to draw conclusions about the effect of MA and other variables on the players' performance in the 'Seven Spells' game in distinct game modes. Regarding the inferential statistics tests, a set of multiple linear regression models was carried out considering the optimality of each move as the target variable; as predictors, this study considered the players' level of MA and the in-game variables described in section 2.4, including the number of opponent cards, maximum achievable points, stack size, total cards available and incremental moves.

3. Results

3.1 Descriptive Statistics for Mathematics Anxiety & Mathematics Errors

MA values collected before the DGBL intervention were considered for both the *vs. CPU* (MA_{CPU}) and the *vs. Human* (MA_H) groups. The values of both groups together are referred to as MA_{CPU+H} (Table 3).

Table 3: Descriptive statistics of MA.

Variable	Description	N	Mean	SD
MA_{CPU}	MA in the *vs CPU* group	21	17.14	7.95
MA_H	MA in the *vs Human* group	20	21.75	7.09
MA_{CPU+H}	MA in both groups	41	19.39	7.80

Mathematics Errors (ME) collected before the intervention were considered for both the *vs. CPU* (ME_{CPU}) and the *vs. Human* (ME_H) groups. The values of both groups together are referred to as ME_{CPU+H} (Table 4).

Table 4: Descriptive statistics of ME.

Variable	Description	N	Mean	SD
ME_{CPU}	ME in the *vs CPU* group	21	12.43	9.38
ME_H	ME in the *vs Human* group	22	11.68	7.97
ME_{CPU+H}	ME in both groups	43	12.05	8.59

3.2 Multiple Linear Regression

A multiple linear regression analysis was conducted to identify the relationship between game performance (measured by optimality of moves) and a set of predictors represented by MA, the set of in-game variables described in section 2.4 and the game mode, represented by a categorical variable with two possible levels: *vs. Human* or *vs. CPU*. A total of 3875 moves were collected from the game logs.

Table 5 shows the results obtained. *MA* was a significantly negative factor, showing how a higher level of MA decreased the optimality of a player's moves. The variable *incremental move* was significant and positive, suggesting that players were getting better the more they played. *Stack size* was also significant and positively associated, meaning that larger and more complex moves increased game performance. Finally, the control in-game variable, *maximum number of achievable points,* was significant, suggesting how the optimality of a move increased when there were more points available to capture. The R-squared value for the model was 0.2406, suggesting a moderate level of fit for the model. The variable *game mode* was not significant, showing how there were no significant differences in optimality across the two game modes.

Table 5: Linear regression coefficients (both game modes).

Coefficients				
	Estimate	**Standard Error**	**t-value**	**Pr(>|t|)**
Intercept	0.5750435	0.0613538	9.373	< 2e-16 ***
ME	-0.0002430	0.0011195	-0.217	0.82817
Incremental move	0.0015602	0.0002552	6.113	1.21e-09 ***
MA level	-0.0036764	0.0012461	-2.950	0.00322 **
Game mode = Human	-0.0252745	0.0187479	-1.348	0.17780
Maximum achievable points	-0.0061532	0.0006561	-9.379	< 2e-16 ***
Stack size	0.0826504	0.0049369	16.741	< 2e-16 ***
Total cards available	-0.0060673	0.0038093	-1.593	0.11141
Number of opponent cards	-0.0014115	0.0071558	-0.197	0.84366

We then fitted the same model for the *vs. CPU* and *vs. Human* game mode data separately. In the *vs. CPU* game mode, MA ceased to be a significant factor, whereas the in-game variables - incremental move, stack size, and maximum number of points - remained significant, consistent with the model fitted using data from both game modes (see Table 6). The multiple R-squared was 0.1981, lower than that of the model fitted on all the data.

Table 6: Linear regression coefficients *(vs CPU* mode).

Coefficients				
	Estimate	**Standard Error**	**t-value**	**Pr(>|t|)**
Intercept	0.4520127	0.0896796	5.040	5.48e-07 ***
ME	-0.0002351	0.0013084	-0.180	0.857
Incremental moves	0.0014337	0.0002810	5.103	3.97e-07 ***
MA level	-0.0023759	0.0015327	-1.550	0.121
Maximum achievable points	-0.0066158	0.0008738	-7.571	8.14e-14 ***
Stack size	0.0857383	0.0067286	12.742	< 2e-16 ***
Total cards available	-0.0007567	0.0051220	-0.148	0.883
Number of opponent cards	0.0096095	0.0117563	0.817	0.414

In contrast, a model fitted only using game data from the *vs Human* game mode (Table 7) showed how MA was strongly significant, with a coefficient of $\beta_{MA} = -6.61 * 10^{-3}$, almost twice the size of the coefficient computed using the data from both game modes ($\beta_{MA} = -3.67 * 10^{-3}$, see Table 6). Once more, *incremental moves, maximum achievable points* and *stack size* were significant factors. The multiple R-squared was 0.2747, exceeding the values observed in the two preceding models.

Table 7: Linear regression coefficients (*vs. Human* game mode).

Coefficients				
	Estimate	**Standard Error**	**t-value**	**Pr(>|t|)**
Intercept	0.7195637	0.0903635	7.963	8.45e-15 ***
ME	-0.0009067	0.0022966	-0.395	0.693122
Incremental moves	0.0025835	0.0007225	3.576	0.000377***
MA	-0.0061942	0.0022159	-2.795	0.005350 **
Maximum achievable points	-0.0050291	0.0009919	-5.070	5.30e-07 ***
Stack size	0.0771627	0.0072745	10.607	< 2e-16 ***
Total cards available	-0.0143471	0.0056819	-2.525	0.011824 *
Number of opponent cards	-0.0122425	0.0094350	-1.298	0.194935

As MA showed significance in the *vs. Human* mode but not in the *vs. CPU* mode, we explored the possibility of a significant interaction between MA and game mode by performing a multiple linear regression to assess the interaction effect between these two variables. The results in Table 8 show a significant interaction between MA and game mode at a 0.05 confidence level. The direction of the interaction is shown in Figure 2, suggesting that MA had a stronger negative impact on performance in the *vs. Human* game mode. The multiple R-squared value was 0.2426, slightly higher than the model without interaction (Table 6).

Table 8: Linear regression coefficients (MA and game mode).

Coefficients

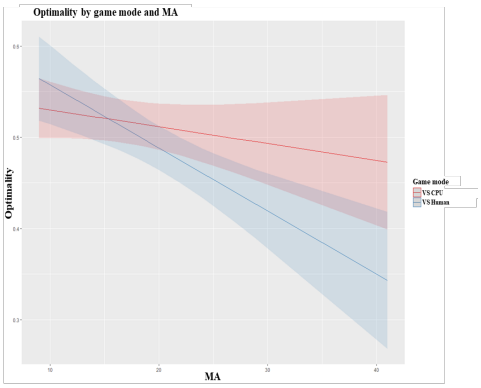

Figure 2: Optimality by game mode and MA.

3.3 Focus Groups

A review of the focus group feedback showed that the students provided positive remarks regarding their experience, describing it as fun and beneficial to their learning. They also mentioned various mathematics topics they practised during gameplay, such as multiplication, addition, prime numbers, and symbols.

In the *vs. CPU* group, the students expressed appreciation for the fantasy martial arts setting, particularly noting the progressive levels marked by different coloured belts: One student remarked; “I like the way there's a bunch of different belts, so it's like you are doing jiu-jutsu and you're fighting people and the more people you fight and win, the more you get a higher belt”. Another mentioned, “You started with an easy-peasy belt, and you got upper belts and it got harder”. Overall, students enjoyed this game mode, commenting: “I liked the way that people were robots, but they act like real people”.

Meanwhile, students in the *vs. Human* group emphasised the competitive aspect against their classmates. One student said; “I like the fact that I've been beating everybody whenever playing the game. I am really good at the game and I really like it”. Another student mentioned: “You are able to go against people and beat them because you are good at maths”. However, they also acknowledged a negative social aspect, with one student expressing: “but it’s also bad, because you don’t want to see them getting upset, but then you can cheer them up by helping them win against someone else”.

4. Discussion and Conclusions

This study investigated the relationship between different playing modes, psychological factors and students’ performance in ‘Seven Spells’, a digital maths game. The results of a linear regression analysis showed several in-game variables as significant predictors of game performance and indicated a distinction in how MA levels impact performance based on the game mode (*vs. Human* or *vs. CPU*) being played.

When considering both game modes as one group, the linear regression identified MA, incremental moves and stack size as significant coefficients for the target variable (optimality). Whilst MA had a negative effect on optimality, incremental moves and stack size affected optimality positively. Considering MA, this suggests that students who feel anxious about maths have lower performance in the ‘Seven Spells’ game. Regarding incremental moves, this result indicates that as the students played ‘Seven Spells’ for longer durations, their performance in the game improved. Finally, the positive correlation between stack size and optimality points out that players who use more cards in their moves have a better performance. In this analysis, game mode was not significant after controlling for all other factors.

When considering just the *vs. CPU* game mode, the linear regression produced similar results: incremental moves and stack size remained statistically significant and positively influenced optimality. However, MA was not a significant coefficient. When repeating the linear regression for the *vs. Human* mode, the results for incremental moves and stack size did not change, while MA showed a significant and negative effect on optimality, the strongest effect among the models considered. This difference suggests that MA had a different effect on players’ performance depending on the game mode, with a higher negative impact when students compete against one another (*vs. Human*), as opposed to playing against the computer (*vs. CPU*).

To further investigate the potential link between MA and the different competition game modes, we fitted a linear regression to examine the interaction between MA and game mode. The interaction was found to be significant, confirming that MA had a negative impact solely in the *vs. Human* competition game mode.

Given that MA encompasses the social experience of doing maths (Rooney, 2014), this study offers additional insights into serious games focused on maths. The presence of a competitive element, especially in scenarios involving two human players, may trigger anxiety, particularly related to MA within its social context, thereby negatively affecting performance (Cagiltay et al., 2015; Rooney, 2014). This highlights the need for maths games to consider MA and the experience of maths-anxious players (Dondio, Gusev and Rocha, 2023).

In the *vs. Human* focus group discussion, some players mentioned concern over potentially upsetting their classmates if they were to win a match. This hints at a possible increase in anxiety due to the competitive component/aspect of the game (Cagiltay et al., 2015).

Concerns about potentially irritating other players did not arise during the focus group discussion in the *vs. CPU* group, as these players were solely competing against computer-controlled characters. These results may suggest that players of the *vs. Human* competition game mode potentially experienced some attributes of social

anxiety, characterised by fear/apprehension of social interactions and negative social outcomes (Belzer et al., 2005). Since social anxiety can also impact students' concentration and academic performance (Leigh et al., 2021), this raises the possibility of an interaction between social anxiety and MA, with one potentially influencing the other and both negatively impacting students' performance.

This study has several limitations, mainly the low number of students involved in the experiment and the differences between game modes. The small sample - due to the number of available classes and students missing sessions and/or not answering all questionnaire questions - had an impact on data significance. A further issue with the present dataset is that students from the *vs. Human* group had a higher baseline MA than those in the *vs. CPU* group. Moreover, the two competition game modes evaluated in this study have additional differences other than having human or computer-controlled opponents. The *vs. CPU* mode incorporates a storyline element and a reward system. The inclusion of a reward mechanism, serving as a motivational tool, could potentially introduce a confounding factor. Furthermore, the two competition game modes have a fundamental difference in terms of the ease with which students could start a match. The v*s. CPU* players could start a match against the computer at any time, while the *vs. Human* players needed to set up a match with another human player. As a result, students assigned to the *vs. CPU* group engaged in more gameplay sessions. Additionally, games against human players tended to be longer as players took more time to execute their moves, and communication between the two players during the match was infrequent.

Further research should include larger sample sizes to better investigate how MA and different competition game modes, in addition to their potential interactions, influence students' performance in 'Seven Spells'. The current study establishes links between the aforementioned factors and highlights shortcomings in the existing experimental design, mainly regarding students' playtime. These limitations will be addressed in a redesigned version, informed by the findings of this study.

Game at School? Italian Teachers' Perceptions of the Introduction of Games in the Classroom

Massimiliano Andreoletti[1], Andrea Tinterri[2] and Anna Dipace[2]
[1]Dipartimento di Pedagogia, Università Cattolica del Sacro Cuore, Milan, Italy
[2]Università Telematica Pegaso, Naples, Italy

massimiliano.andreoletti@unicatt.it

Abstract: The growing awareness that games can be a very valuable training support, both as a resource to engage and motivate and to promote acquisition of disciplinary knowledge and skills, has not been accompanied by an effective diffusion of games in Italian schools. From primary school to university, an ambivalent behaviour is manifested: a widespread appreciation of games as a learning environment is contrasted with a limited application, often reduced to the use of games or online software of a behavioural matrix. An analysis of research on the use and diffusion of games in Italian schools and universities highlights the lack of recent studies on the basic didactic-pedagogical knowledge, level of acceptance and confidence of teachers regarding the introduction of games in the classroom. The goal of this contribution is to provide an updated understanding of Italian teachers' competencies related to the formative use of games. To this aim, we developed a survey adapting to the Italian context one of the most established competence frameworks for game-based learning (GBL): the Technological Pedagogical Content Knowledge-Games (TPACK-G), a variant of TPACK specifically modified for the analysis of games. This new tool extends to non-digital games and integrates the sections on aspects related to game-based instructional design, game scenarios, and the role of the teacher in the instructional activity. This research will not only provide an updated look at how the prevalence of play in the classroom is changing, beyond simple manifestations of interest and trends, but also reveal how the approach to games is changing in the design of educational activities and what is the degree of awareness of the game pedagogical-educational skills necessary for the introduction of games in education. This, in turn, is instrumental for the development of new and more focused teacher training programs to promote the use of games in classrooms.

Keyword: Game-Based Learning (GBL), Italian School, Quantitative Research, Teachers' Perceptions of Classroom Game; Teachers' Attitudes toward Classroom Games, Technological Pedagogical Content Knowledge-Games (TPACK-G).

1. Introduction

The relationship between gaming, teaching, and learning has developed over centuries. Just think of games such as Mancala, which has facilitated people in learning the best strategies for counting livestock and food for almost 4000 years, or Chess, which has challenged strategists for centuries (Laamarti et al., 2014; Parlett, 2018).

What has been witnessed in the last two decades is the increasing attention of educational research towards the characteristics and outcomes that play takes on in the educational setting. Games offer an engaging experience, providing essential features for effective learning (Marengo et al., 2018) and language acquisition (Quy, 2019); the integration of games as part of learning increases learner engagement when traditional teaching methods are used (Sanchez et al., 2011; Shute et al, 2017). Game-Based Learning (GBL) and its digital declination (DGBL) have become central to training programs targeting different sectors, such as education, military, transport, communications, and healthcare (Ongoro and Fanjiang, 2024; Ullah et al, 2022). GBL, in a narrow sense, is the use of games, analogue or digital, within the context of learning; in a broader definition, which is the one adopted in this study, it can also be understood as an approach in which learning goals and tasks are integrated into game activities with the aim of linking formative goals with playful objectives (Andreoletti and Tinterri, 2023), so that the pursuit of the latter promotes the achievement of the former.

Research has highlighted how within the school context games can be used to support learning (Beavis et al., 2014; Clark et al., 2016; Stufft, 2018; Stufft and von Gillern, 2021; von Gillern et al, 2022), to promote students' critical thinking and metacognition (von Gillern and Stufft, 2023), game analysis (Bacalja, 2018), multimodal composition (McClay et al., 2007) and collaborative problem solving and design work (Gerber et al, 2014). These different forms of implementation of play within the curriculum have been shown to have a positive impact on student learning (Nash and Brady, 2022): in all contexts, researchers have reported increased student engagement (Gerber et al., 2014), changes in approach to disciplines (Marlatt, 2018), complex analytical thinking (Beavis et al., 2015) and design thinking and multimodal composition (Nash and Brady, 2022, Nash, 2021; Stufft and von Gillern, 2021).

A second strand of investigation has focused on teachers' readiness, willingness and competence to introduce play within their instructional activities (Assaf et al., 2021; Bourgonjon et al., 2010; Chang and Tsai, 2014; Hamari and Nousiainen, 2015; Hayak and Avidov-Ungar, 2020; Hsu et al., 2013, 2017; Jesmin and Ley, 2020; Kaimara et al., 2021; Kenny and McDaniel, 2011; Koh et al., 2013; Lee and Tsai, 2010; Loperfido et al., 2019; Martín-del-Pozo et al., 2019; Matić et al., 2023; Palha and Matić, 2023; Rulyansah et al., 2023; Takeuchi and Vaala, 2014; Zhonggen, 2019). Teachers are the main agents of change in GBL (Bourgonjon et al., 2011; Li and Huang, 2016; Proctor and Marks, 2013). Therefore, their perceptions and beliefs have a crucial effect on their decisions on how, when and for what purpose to integrate GBL into their lessons (Andreoletti and Tinterri, 2023; Beavis et al., 2014; Ertmer, 2005; Ertmer and Ottenbreit-Leftwich, 2010). Several factors influence a teacher's predisposition to use GBL; for instance, when teachers perceive GBL as highly useful, their attitude towards digital games tends to be more positive (Sánchez-Mena et al., 2017). Other aspects include the level of play culture (game literacy), the presence of prejudices about the role and meaning of play in society and culture, the difficulty in translating curricular learning goals within the play activity and/or in the game, the difficulty in identifying and selecting the most appropriate game and integrating it effectively and efficiently within the educational activity, the difficulty in identifying the appropriate assessment methods for learning goals and play objectives (Andreoletti, 2023; Andreoletti and Tinterri, 2023; Hanghøj, 2013) and the limited availability of curriculum-aligned games is an obstacle that teachers identify as hindering the implementation of GBL in the classroom (Takeuchi and Vaala, 2014). Other factors that hinder the adoption of games are the rigidity of curricula, fixed class schedules and their short duration (An and Cao, 2017; Baek, 2008; Kaimara et al., 2021).

In general, what emerges is that:

- teachers' level of pedagogical experience in using games as a teaching resource seems to be a crucial factor in understanding their inclination towards game-based pedagogy (Andreoletti, 2023; Palha and Matić, 2023)
- teachers' attitudes towards new teaching methods such as GBL contribute to their subsequent implementation and influence students' learning motivation (Martín-del-Pozo et al., 2019);
- teachers use informal means to gain knowledge about ways of teaching with games, e.g. through trial and error, seeking ideas from colleagues (Takeuchi and Vaala, 2014) or suggestions, directions and online tutorials (Andreoletti and Tinterri, 2023);
- the chances of achieving educational goals and facilitating students' acquisition of any academic skills or knowledge increase if teachers consider games as legitimate teaching tools (Bonanno and Kommers, 2008; Kenny and McDaniel, 2011);
- games and GBL can only be effective in K-12 education if teachers and students regard them as valid teaching and learning tools (Andreoletti, 2023; Bourgonjon et al., 2010).

Overcoming these critical issues requires adequate training for future and in-service teachers (Andreoletti; 2023). However, there is a lack of professional development opportunities to guide teachers in the systematic use of games for teaching, learning and assessment (Matić et al., 2023; Martín-del-Pozo et al., 2019).

Equipping teachers with specific knowledge about the pedagogical activities involved in teaching with requires knowledge and skills that are not intuitive for most teachers (Nousiainen et al., 2018). Hébert and Jensen (2019) note that a comprehensive understanding of the barriers teachers face in implementing GBL is "important to ensure not only that the benefits of GBL are translated into practice, but also that teachers receive the support they need to make GBL a possibility within their classrooms" (p 308). It is thus essential to understand what these needs are to design meaningful play-based pedagogy curricula that meet the needs of (future) teachers.

I the Italian landscape, apart from the research by Alsop and Jessell (2015) and Loperfido et al. (2019), there is No. recent research investigating teachers' perceptions in relation to the introduction of GBL methods within their training practice.

2. Aims of the Research

The aim of this research is to understand in the Italian landscape the perception of GBL by teachers, both in training and in service, in relation to their teaching experience with GBL. Specifically, this study investigates teachers' perception of their competence in four key dimensions of GBL; to this aim, we developed and distributed a questionnaire aimed at in-service and in-training teachers at all school levels. The overarching hypothesis of this study is that teachers with less or more experience of play and GBL will view the implementation of GBL differently and have different concerns about aspects of the learning environment.

Understanding the concerns and the factors that encourage and hinder them can provide a valuable contribution to the development of a meaningful curriculum. Therefore, the following research questions were formulated:

RQ1: what are the perceived skills with GBL of Italian teachers?

RQ2: which demographic factors influence teachers perceived GBL skills?

3. Methods

The development of the survey started from the analysis of the literature, identifying the instruments that investigated the factors that influence the teacher in the adoption of GBL (Hsu et al., 2013, 2017, 2020; Loperfido et al, 2019); subsequently, on the basis of those identified, a new instrument was defined that integrated new areas and items to adapt them to the Italian context and, at the same time, extends the investigation also to non-digital gaming, aspects related to game-integrated instructional design, game scenarios and the role of teachers in teaching activities (Andreoletti and Tinterri, 2023).

3.1 Literature Analysis

Hsu, Liang, Chai and Tsai (2013), having focused on analysing pre-school teachers' experience with digital games and their attitudes towards game-based learning, derived the Technological Pedagogical Content Knowledge-Games (TPACK-G) from the Technological Pedagogical Content Knowledge (TPACK) framework (Mishra and Koehler, 2006), which is structured into four factors:

1. *Game knowledge (GK)*: knowledge about the *general use of games*: knowing how to play and possessing technical skills to play games effectively, e.g. 'I can learn to use games easily'.
2. *Pedagogical Game Knowledge (GPK)*: knowledge on the *use of games with various pedagogical features for teaching without specific reference to content knowledge*: knowing how to use a game with collaborative features to promote player collaboration during play, e.g. 'I know how to use the features of games to support teaching'.
3. *Game Content Knowledge (GCK)*: knowledge *about how the content can be represented by the game without considering the implemented pedagogy*, it is the combination of game and content knowledge and excludes the pedagogical element: using games specifically created for learning a certain subject, e.g. "I can identify games to use in my class that fit with the topics covered in the discipline/subject I teach".
4. *Knowledge of the Pedagogical Content of the Game (GPCK)*: knowledge of the *use of games to implement teaching methods for any targeted content*: if you have sufficient GPCK, you can select appropriate games to improve what you teach, how you teach and what students learn in class; e.g., "I can select games to use in my class that improve what I teach, how I teach and what students learn".

3.2 The new Tool

The new survey integrated and expanded on previous studies, to better fit the entire game context, to integrate with the findings of more recent research (Andreoletti and Tinterri, 2023, p 37), and extend the topic of the survey to the entire analogue gaming sector (board games, exergames, etc.). To this aim, the survey was structured in three sections: the first included questions linked to participant demographic information (gender, age, school level, years of teaching experience, etc.), a second section with the ADGBL questionnaire (not included in this study) and a reworked version of the TPACK-G. For the latter, several items were rewritten and the GC dimension, which was removed from the work of Hsu et al. (2013), was reintroduced. The initial formulation for the new TPACK-G questionnaire included 4 questions for each dimension (GK, GPK, GCK, and GPCK), each answered through a 1-4 Likert scale (Joshi et al., 2015). The survey underwent a series of preliminary tests using Cronbach's Alpha, a commonly employed measure to test consistency of the items within the same category (Tavakol and Dennick, 2011); this led to several iterations of the questionnaire before the version that was ultimately submitted to participants, which included 15 items (three items for GCK and four each for the other factors). The survey was administered in CAWI format, using Google Modules, to teachers undergoing training to achieve teaching qualification (DPCM 4 agosto 2023). Data was collected via Google Modules and analysed using R (R Core Team, 2023).

4. Results

4.1 Characteristics of the Sample

From April 9 to April 16, 2024, 2752 participants (83.1% females, 18.4% males, 0.3% unspecified) were recruited for the study. Mean age of participants was 44.6 (s.d. 7.81, N=2236). 49.2% of participants were curricular teachers, 48.8% were special need teachers and 2% of participants played different roles within the school system (e.g. pedagogist, school psychologist, educators). Out of all participants, only 2.5% were not actively teaching and were therefore excluded from current analysis (Table 1).

Table 1: Distribution of participants according to school level

School Grade	Frequency	% of Total
Not teaching	68	2.5 %
Kindergarten	99	3.6 %
Primary school	601	21.8 %
Secondary School (I grade)	1067	38.8 %
Secondary School (II grade)	917	33.3 %
Total	2752	100%

The participants differed in their teaching experience, which ranged from less than a year to more than 20 years; Table 2 shows aggregated values that has been used for analysis.

Table 2: Teaching experience distribution of participants

Teaching Experience	Frequency	% of Total
Up to 2 years	353	13.2 %
3 to 5 years	614	22.9 %
6 to 15 years	1144	39.2 %
More than 16 years	662	24.7 %
Total	2683	100%

4.2 Analysis of the TPACK Questionnaire

To validate the factorial structure of the questionnaire, we ran a Confirmatory Factor Analysis (CFA) (Harrington, 2009). The first CFA returned values within the limits that are considered acceptable in the literature for the questionnaire ((X^2(84 df)=894, p<0.001); CFI (0.976), TLI (0.970), SRMR (0.0346), RMSEA (0.058)). Still, based on the analysis of factor loads and our interpretation of the constructs, we decided to modify the factorial structure of the questionnaire. We removed item GK4 (“I can recognize the differences between games and other media like books, films, photographs, graphic novels…”) and item GCK4 (“I can distinguish game content from game objectives”) from it, reducing the revised version to 13 items. The revised questionnaire shows a better factorial profile; all factor loads are moderate to strong and statistically significant (Table 3). The new version, despite retaining significant chi-square value (X^2(59 df)=362, p<0.001), indicating a less than ideal fit, has better values overall for CFI (0.989), TLI (0.986), SRMR (0.0216) e RMSEA (0.0437) indicating a good correspondence between the data and the factorial structure of the questionnaire.

Table 3: Confirmatory Factor Analysis of the TPACK-G questionnaire

Dimension	Item no.	Item	Estimate	SE	Z	p
GK	1	I know the main typologies of games (analogue versus digital and their categories) in the market	0.597	0.015	38.9	<0.001
GK	2	I know how to search for and setup board games and/or install digital games.	0.771	0.015	52.2	<0.001
GK	3	I can recognize game mechanics (e.g. roll dice and move, area control, point and click, etc.).	0.697	0.016	43.2	<0.001
GPK	4	I can tell the difference between Gamification, Game-Based Learning, Playful Learning.	0.680	0.015	44.9	<0.001
GPK	5	I can tell the difference between Serious Game, Educational Game, and commercial game.	0.776	0.015	51.2	<0.001
GPK	6	I can tell the differences in how board and video games promote learning.	0.740	0.015	48.8	<0.001
GCK	7	I can identify knowledge related to my discipline in games.	0.774	0.012	62.7	<0.001
GCK	8	I can identify skills related to my discipline in games.	0.795	0.012	68.4	<0.001
GCK	9	I can identify competencies related to my discipline in games.	0.786	0.012	66.1	<0.001
GPCK	10	I can design learning activities that integrate appropriately games with the subject matter.	0.755	0.014	55.2	<0.001

Dimension	Item no.	Item	Estimate	SE	Z	p
GPCK	11	I can choose games to use in the classroom to improve teaching and learning processes.	0.768	0.013	59.9	<0.001
CPCK	12	I can choose game to represent real world situations.	0.724	0.014	53.3	<0.001
GPCK	13	I can modify the game experience to better fit the individual needs of the students.	0.756	0.014	53.6	<0.001

4.3 TPACK-G Values and Demographic Factors

Once the factorial structure of the questionnaire has been verified, we pooled individual answers to obtain the aggregate values for the four dimensions of the TPACK-G (Table 4). Overall, the self-attributed competence levels were tilted towards the average, with game pedagogical competencies having the lower mean value and game content knowledge the highest.

Table 4: Aggregate values of for the TPACK-G dimensions

N=2684	GK	GPK	GCK	GPCK
Mean	2.56	2.14	2.98	2.67
Median	2.67	2.00	3.00	2.75
St. Dev	0.755	0.792	0.800	0.782
Minimum	1.00	1.00	1.00	1.00
Maximum	4.00	4.00	4.00	4.00

All four factors positively correlate with one another, with correlation indexes (Spearman's Rho) spanning from a minimum of 0.459 for GK and GCK to a maximum of 0.636 for GCK and GPCK. All correlations were statistically significant at the <0.01 level. Next, we sought to understand which demographic factors influenced self-attribution of TPACK-G competencies. To this aim, we analyzed the distribution of answers according to teacher gender, to school level, and teacher experience, using nonparametric rank-based tests. We found that gender was a factor, as males declared higher competence values for Game Knowledge and Game Pedagogical Knowledge compared to female; however, No. statistically significant difference was observed for Game Content Knowledge and Game Content Pedagogical Knowledge (Table 5).

Table 5: Values of TPACK-G by gender

	Group	N	Mean	SD	U	p-value
GK	Female	2183	2.52	0.741	459591	< .001
	Male	493	2.72	0.796		
GPK	Female	2183	2.11	0.779	477088	< .001
	Male	493	2.27	0.834		
GCK	Female	2183	2.97	0.798	527469	0.475
	Male	493	3.00	0.810		
GPCK	Female	2183	2.68	0.781	521177	0.270
	Male	493	2.63	0.785		

We also observed that TPACK-G competencies tend to decrease with the increase of school level, indicating that, on average, teachers that operate with younger students tend to report higher GBL skills than their colleagues working with older students (Table 6). Nonparametric Kruskal-Wallis test reported significant effect of school grade for all dimensions (GK X^2(3 df)=22.0, p<0.001; GPK X^2(3 df)=15.1, p=0.002; GCK X^2(3df)=52.3, p<0.001; GPCK X^2(3 df)=87.4, p<0.001).

Table 6: Values of TPACK-G by school grade

School grade	GK		GPK		GCK		GPCK	
	Mean	St. dev	Mean	St. dev	Mean	St. dev	Mean	St. dev
Kindergarten	2.69	0.789	2.33	0.823	3.10	0.783	3.01	0.794
Primary	2.60	0.722	2.18	0.782	3.05	0.812	2.84	0.758
Secondary I grade	2.60	0.738	2.16	0.800	3.06	0.762	2.70	0.753
Secondary II grade	2.47	0.785	2.06	0.779	2.82	0.816	2.50	0.789

There is also a small, albeit significant, difference in TPACK-G competencies according to teaching experience of the participants for Game Knowledge (GK X^2(3 df)=12.32, p=0.006, Game Content Knowledge (GCK X^2(3 df)=8.97, p=0.03), and Game Pedagogical Knowledge (GPK X^2(3 df)=8.97, p=0.03; the significant pairwise comparisons (Dwass-Steel-Critchlow-Fligner test) are between group 2 (From 3 to 5 years) and group 4 (more than 16 years) for GK (W=-4.69, p=0.005) and GPK (W=-3.979, p=0.025), and between group 1 (Up to 2 years) and group 3 (from 6 to 15 years) for GCK (W=4.240, p=0.014). Overall, it seems that teacher with very little experience and those

with longer experience are those that report lower values for TPACK-G values compared to colleagues, with the notable exception of GPCK values (Table 7).

Table 7: Values of TPACK-G by teacher experience.

School grade	GK		GPK		GCK		GPCK	
	Mean	St. dev	Mean	St. dev	Mean	St. dev	Mean	St. dev
Up to 2 years	2.53	0.724	2.16	0.774	2.86	0.820	2.59	0.784
From 3 to 5 years	2.62	0.746	2.19	0.782	2.99	0.800	2.70	0.757
From 6 to 15 years	2.58	0.775	2.14	0.800	3.01	0.774	2.68	0.763
More than 16 years	2.48	0.744	2.07	0.795	2.97	0.826	2.68	0.830

5. Discussion

In this study, we developed and analyzed a new survey using the TPACK-G framework to explore the perception of competence concerning GBL by Italian in-service teachers at all school levels. The first research question concerned the perceived levels of skills in GBL by Italian teachers. We found that our version of the TPACK-G effectively captures the four key dimensions of the framework. On average, participants report average knowledge of games (GK), relatively low knowledge of pedagogical concepts related to games (GPK), while at the same time reporting good ability to identify learning content in games (GCK) and higher than average skills in incorporating games in their teaching activity (GPCK). The evolutionary structure of the TPACK-G framework suggests that a lower element (GK) is more general and fundamental and that the more specific knowledge factors (GPK, GCK and GPCK) build on this (GK). In other words, to develop a specific GPCK, one should first possess an adequate knowledge of the game in general (GK) and, subsequently, a pedagogical knowledge of the game (GPK) and the content of the game (GCK). Conversely, if one has no knowledge of games (GK), one might not have adequate pedagogical knowledge of games (GPK), let alone adequate knowledge of the pedagogical content of the game (GPCK). Hsu et al. (2013, p. 464) research also pointed out that, when it comes to using games to represent content (GCK), teachers might automatically incorporate this knowledge into teaching activities and might not have a clear idea of what (GCK) it is. Thus, these results suggest that participants might overestimate their ability to identify learning opportunities in games and incorporate them in their teaching practice despite lacking fundamental knowledge related to games, possibly due to a high and generalized belief in games' effectiveness as learning environments (Cantoia, Clegg and Tinterri, 2023). The second research question investigated whether perception of competence with GBL might be related to demographic factors. In this study, we observed that gender has an impact, as male teachers report significantly higher values for GK and GPK. Further analysis is required to understand whether this difference is linked to different gaming habits for male and female teachers, as a largely confuted but persisting social stigma in Italy sees games, and video games in particular, as primarily male occupation. Furthermore, we observed that all TPACK-G levels decrease with the progression of school level, i.e. teachers working with younger students tend to perceive themselves as more competent with GBL than teachers working with older students. Again, further investigation is required to verify whether there is a link between this perception and actual implementation of game activities. Finally, we observed a rather complex distribution of TPACK-G values according to teacher experience. For instance, the teachers that report lower game knowledge are the less experienced (less than 2 years of experience) and the most experienced (more than 16 years); it is plausible that the reasons might be different for the two categories, but a more in-depth analysis is required to identify potential explanations for the data observed. Currently, the study has a few limitations: First, despite the good sample size, which makes it the most extensive study on GBL in Italy to date, participants have been recruited from a specific subset (teachers training to change discipline or special need teachers switching to curricular teaching), which might not reflect the general population of teachers at large. Second, the survey only concerns self-reported attributions by teachers which might not accurately represent actual GBL skills. Taken together, this study presents a new tool to investigate teachers' perceptions of their GBL skills, built according to a well-established frameworks (TPACK) and starts to shed light on the perception of Italian teachers concerning the use of games in their teaching and learning activity, a crucial first step towards the building of evidence-informed teacher training programs to effectively (re)introduce games as proper learning environment in formal education.

From Designing Houses to Studying Architecture: Did Those Who Study Design Share Any Similarities in Playing the Sims Game?

Yüzyıl Nevin Aydın
Beykent University, Istanbul, Turkey

yuzyilaydin@beykent.edu.tr

Abstract: Wright's famous game The Sims, and its sequels; The Sims2 (2004), The Sims3 (2009), and The Sims4 (2014) are computer based digital games that provide digital settings to simulate virtual dollhouses (Martey and Stromer-Galley, 2007). They are one of the most played games of all time, which is why it has been the focus of academic studies since its first release. Within the scope of this research, a comprehensive survey was conducted. The first phase of the survey was conducted with 54 participants and the participants who graduated from different departments were asked whether there is a relationship between The Sims game experiences, interest in playing SIMS and choosing a profession. The following phase was conducted with the focus of architects, interior architects and industrial design graduates and students, who are called design faculty members. In this study, the effects of playing The Sims on the profession and their professional achievements were questioned.

Keywords: The SIMS, Playing Computer Games, Game-based Learning, Effect of Playing The Sims, Design Education

1. Introduction

Computer games are a significant component of most children's spare time, and they are also becoming an increasingly vital part of everyone's life. Adults frequently marvel as youngsters devote hours to playing different types of games. In the past, computer and video games were criticized as a distraction from more "useful" activities, often leading educators to overlook their potential. When teachers have discussed games, they have mostly concentrated on the social consequences of playing games, disregarding major educational possibilities (Squire, 2003). However, the perception of computer games has begun to shift as the educational potential of this medium becomes increasingly recognized. A growing body of research and scholarly articles explores how games enhance learning outcomes, cognitive skills, and engagement (Dale et al., 2020; Rebetez and Betrancourt, 2007; De Freitas and Liarokapis, 2011).

Combining the words "education" with "entertainment," the term "edutainment" first appeared in the 1970s to describe media that was intended to be both educational and entertaining. Walt Disney, whose early educational films and television shows sought to make learning fun for youngsters, has been linked with creating the idea. The phrase gained popularity in the 1980s, and companies began to create educational software and video games that combined gameplay, puzzles, and storytelling with learning objectives. With the introduction of CD-ROMs and personal computers in the 1990s, edutainment gained popularity as a means of distributing instructional materials both at home and in schools. The 2000s experienced a shift in internet and digital media that resulted in the growth of several online learning platforms and applications, expanding the possibilities and audience for edutainment (Aksakal, 2015; Mukherjee, 2019).

The importance of computer-based learning is further underscored by the rapid technological advancements that have transformed education. From the 1970s onwards, researchers like Papert (1973), Perlman (1976), Malone (1980), and White (1981) began investigating how computer-based technology could enhance education. Their work laid the foundation for what we now recognize as educational technology, where digital tools and platforms are integral to the learning process. With the advent of sophisticated computer games that incorporate educational content, students can now engage with material in a way that is interactive and tailored to their individual learning pace. This not only increases motivation and engagement but also helps in developing critical thinking and cognitive skills.

From the 1990s onward, academics, teachers, and learning resource designers began to explore how digital games and interactive media could be used to promote learning. Research studies were conducted to examine the cognitive and social benefits of these tools, and many educational institutions began incorporating computer-based learning modules and educational software into their curricula. By the 2000s, with increasing access to technology, there was a growing interest in harnessing the motivational aspects of games to support learning in formal and informal settings. This exploration has continued to evolve, leading to the development of game-based learning environments, simulations, and interactive digital content that are now widely used in classrooms and online learning platforms.

Educational researchers and teachers have begun to recognize the value of games like The Sims in fostering critical thinking, creativity, and strategic planning. By engaging with these virtual environments, players can develop skills that are transferable to real-life situations.

It's critical to emphasize how some video games, even those that aren't specifically made for educational purposes, may still provide an extensive amount of learning opportunities in order to connect the conversation about computer-based learning with the particular example of The Sims. The shift from a broad discussion of educational technology to the particular instance of The Sims entails realizing that many games have intrinsic educational value because of their design features, which promote problem-solving, investigation, and judgment.

While educational technology has historically concentrated on products specifically designed for learning, it is becoming increasingly clear that engaging students with games like The Sims may be done in a novel and efficient way. These games mimic actual events and give players a risk-free setting in which to try out various tactics and results. Even while these games' main objective is amusement, their open-ended design encourages creativity and critical thinking, making them useful educational resources. Among the games that best illustrate how a game meant for amusement may be adapted to promote educational objectives is The Sims. The Sims offers players the chance to hone skills in areas like resource management, design, and interpersonal relationships—all of which have real-world applications—through its simulation of daily living.

The Sims, a life simulation video game series, is an excellent example of how computer games can be harnessed for educational purposes, though it was not originally designed with education in mind. The game allows players to create and manage virtual people, known as "Sims," and guide them through various aspects of life, including building and designing homes, managing finances, developing careers, and navigating social relationships. The game emphasizes creativity, open-ended gameplay, and personal expression, allowing players to shape the lives of their Sims in various ways, from mundane day-to-day routines to more fantastical and extraordinary scenarios.

The game's appeal lies in its sandbox nature, where there are no strict goals or endings. Instead, players have the freedom to create and experiment within the virtual world, making choices that affect the lives of their Sims. This flexibility, combined with the ability to mod the game and add custom content, has made The Sims a popular and enduring franchise since its debut in 2000.

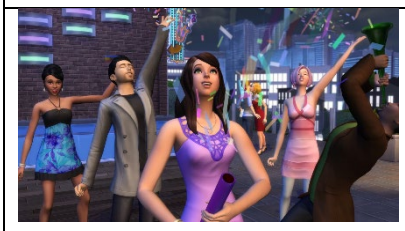
The Sims game has managed to attract attention since the first day it was released. Like any game that sells in huge numbers, it has been the focus of research. Despite its popularity, no academic studies have been published on the future career choices of Sims players when they were younger. There are limited studies on the game itself (Martey and Stromer-Galley, 2007, Sihvonen, 2009), gender differences in players' motivations and patterns (Jansz, Avis, Vosmeer, 2010), the simulation games genre (Lenhart et al., 2008; Nutt and Railton, 2003), and ideological and cultural features (Consalvo, 2003; Frasca, 2003).

In this study, which started from a personal inquiry, the past propensities of design faculty students in The SIMS game and professional acquisitions retrieved from The Sims were questioned. As part of this research, a comprehensive survey was undertaken. The initial phase of the survey involved 54 participants, who had graduated from various academic disciplines, and they were asked to explore whether there was a connection between their experiences with The Sims, their interest in playing the game, and their choice of profession. The subsequent phase of the survey specifically targeted graduates and students from architecture, interior architecture, and industrial design programs—collectively referred to as design faculty members. This phase focused on examining the impact of playing The Sims on their professional development and achievements. Individual experiences are included. Research questions are defined as: How does the practice of playing The Sims differ between those who are from design school and those who are not? How does engagement with The Sims game influence individuals' career aspirations and academic choices in design-related fields? What kind of practices do those from the design faculty demonstrate during the house design phase in The Sims game?

2. The Sims Game

William Wright is an American video game designer who founded Maxis and part of Electronic Arts (URL-1). Electronic Arts' The Sims is a series of life simulation video games. During the Oakland-Berkeley Firestorm, his house was one of the first to burn down. Wright became interested in the worth of belongings and the possibility of satisfaction when reviewing his losses and material demands after his home burnt down. Having always been

interested in architecture, he proceeded to create a concept for a game in which players would simulate everyday routines in a rural neighborhood, including the design of a home from the roots up: The Sims was born.



> "I started to wonder about all the things we have and how we purchased them for a reason. Why do we need x or y or z? Why do we think something will make me happier? It almost came down to Maslow's pyramid of needs," Wright says (URL-2).

The Sims and its sequels' gameplay The Sims 2 (2004), The Sims 3 (2009), and The Sims 4 (2014) include maintaining a digital setting simulating a virtual dolls' dollhouse (Martey and Stromer-Galley, 2007). According to Jeff Braun who founded Maxis with Wright, when Wright presented his proposal to the Maxis board of directors, "the board looked at The Sims and exclaimed, 'What is this?" Is he proposing an interactive doll house? 'This guy is insane.'" Girls didn't play video games, and doll homes were for girls (URL-3). All this time, The Sims has been called many things: a sandbox, a toy, a dollhouse, a story engine, and a virtual world, as well as a game (Gee and Hayes, 2010). The Sims game has been continued to grow rapidly.

As of August 2024, *The Sims 4* has released 13 expansion packs, 12 game packs, 19 stuff packs, and 15 kits. With the latest updates, more detailed basements, pools, modular staircases have been added to the game, such as never before. The Sims games sold more than 200 million copies in gaming platforms as of 2019 (URL-4).

Along with playing, The Sims needs a great deal of design (Hayes, 2008). The player can establish a life for virtual persons known as "Sims," by pre-built homes or create their own, interiors, and outfits, as well as controlling them in overall. They direct their characters to satisfy their emotions and demands. The goal of the game is to keep your Sim characters happy, fed, clean, and nurtured (Flanagan, 2003). Wright created a method for "measuring" the happiness of the characters in his doll home based on their status, popularity, and skill, but also the environmental quality provided by the player— Characters are happier when they are in a pleasant home. After purchasing the game, most new Sims players spend hours (and usually days) in non-stop manipulation of the simulated house (Flanagan, 2003).

Table 1: Stages of playing The Sims (URL-5)

Stages		Definition
	Create Unique Sims	A variety of Sims are yours to personalize, each with distinct appearances, dynamic personalities, and inspiring aspirations. Create yourself, your favorite celebrities, your fantasy, or your friends!
	Build the Perfect Home	Effortlessly build and design ideal homes for your Sims using Build Mode. Construct the home of your – and their – dreams by planning its layout, choosing furnishings, and altering the landscape and terrain.
	Explore Vibrant Worlds	Travel between locations, discover amazing and distinctive neighborhoods, and encounter captivating venues. Your Sims can visit new communities, hang out with friends, or throw unforgettable parties.
	Add New Experiences	Use the Gallery to find inspiration from a community of players just like you, where you can add content to your game or share your own creations. Download, like, and comment on your favorite Sims, homes, and fully-designed rooms. Join the community, join the fun!

The SIMS describe the game on their website (URL-5) as follows: Unleash your imagination and create a world of Sims that's wholly unique. Explore and customize every detail from Sims to homes–and much more. According to the game manufacturer itself, the game has 4 stages; Create Unique Sims, Build the perfect home, Explore Vibrant Worlds and Add new experiences (Table 1).

The first stage, "Create Unique Sims," emphasizes the customization of Sims, where players can personalize their virtual characters with distinct appearances, dynamic personalities, and individual aspirations. This stage allows for a high degree of creativity, enabling players to design Sims that represent themselves, celebrities, or fictional characters.

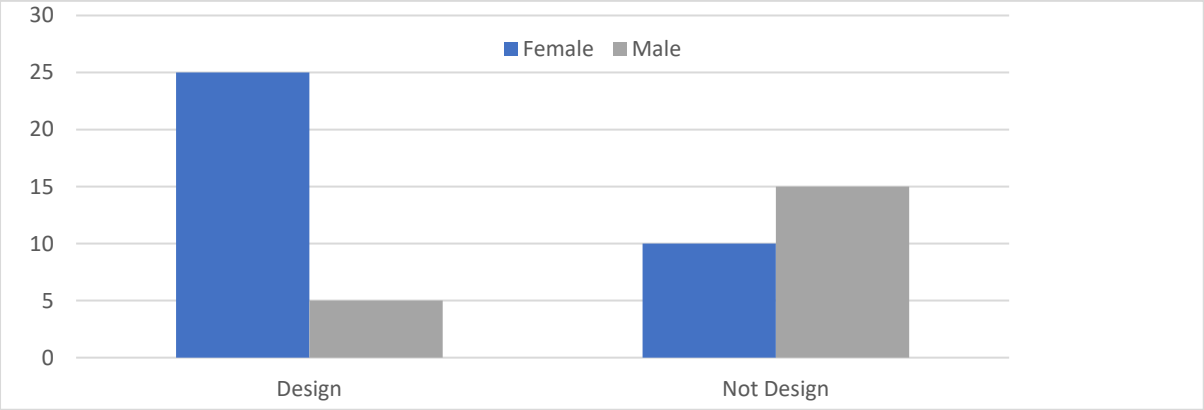
In the second stage, "Build the Perfect Home," players can design and construct homes for their Sims. Using the game's Build Mode, players can effortlessly plan and create dream homes, choosing layouts, furnishings, and even altering the surrounding landscape and terrain. This stage focuses on architectural creativity and home design. "Build. Buy. Live." is the tagline of the game, and building is, accordingly, its first priority. Once the property deal is finalized, the player has the option to either construct a new home for their Sims or modify the existing one to better match their preferences and the needs of their Sims. Although building a new house is more expensive, it offers greater creative flexibility. The game's "build" mode provides an extensive and remarkably intuitive architectural toolkit, allowing players to easily manipulate and place everything from landscaping elements to window treatments using a simple, icon-based interface. If a room requires a door, the player can simply drag and drop it into place. The main challenge the player faces at this stage, aside from budget constraints, is the overwhelming number of design choices available. As the player browses through these options, it becomes clear why Celia Pearce (2002) referred to The Sims as "the IKEA game." Furniture is presented in a catalogue-style menu, each item accompanied by a perfectly crafted description highlighting its advantages (Paulk, 2006).

Figure 1: Build mode in The Sims 4 (URL-6)

The third stage, "Explore Vibrant Worlds," involves Sims traveling between various locations and exploring different neighborhoods. This stage allows players to immerse their Sims in diverse environments, meet new people, and engage in activities such as attending parties or visiting new communities.

Finally, the "Add New Experiences" stage encourages players to engage with the broader Sims community through the Gallery. Here, players can find inspiration, download, share, and comment on user-created content, such as Sims, homes, and rooms.

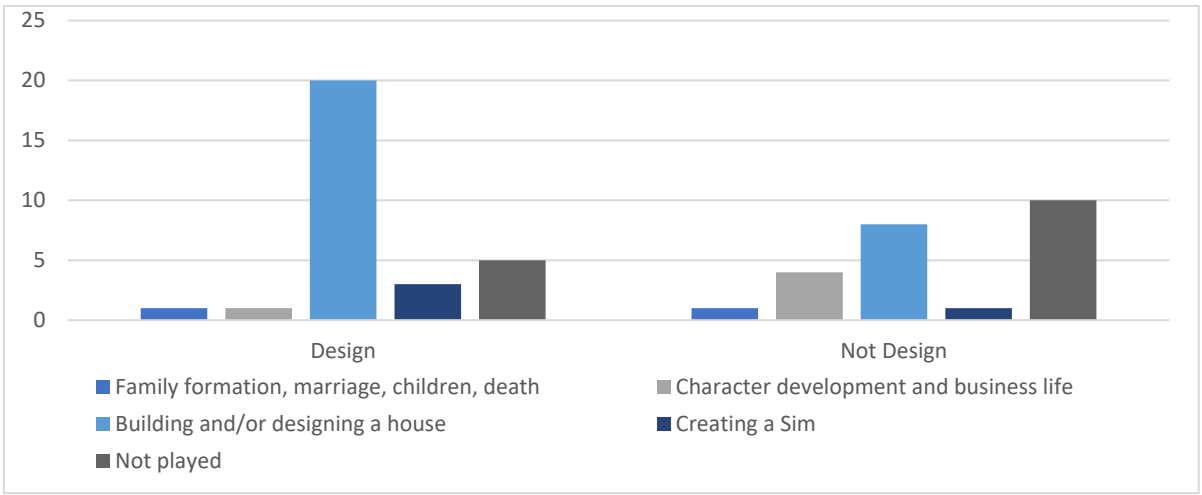
This stage fosters a sense of community, allowing players to enhance their game with content created by others and share their creations with the world. Together, these stages represent the core experiences of The Sims, combining personal expression, creativity, exploration, and community interaction.



3. Researching 'The Sims'

Survey studies are mostly used to understand the differences of players in various contexts (Jansz, Avis and Vosmeer, 2010; Steen, et al., 2006; Cotton, et al., 2001). In a study compares the gender differences in players' motivations and patterns of play in Sims by Jansz, Avis and Vosmeer (2010), and online study with 760 participants was conducted. Participants were attracted by placing an advertisement on the official Dutch The Sims 2 website (www.desims2.nl). The hyperlink forwarded them to an online questionnaire that consisted of two parts. The first part inquired about the demographic background of the participants, such as age, gender,

education, profession, and so on, and continued by asking about the participants' favorite games, access to computers and/or gaming devices, and the time spent playing games. Part 2 included 27 graded phrases or items aimed at detecting the various motivations for playing The Sims 2.



For this study, a survey with two phases was conducted, first with 54 participants and then with 40 participants, who were recruited through a hyperlink shared for a day on Instagram. In the first survey, 10 questions were asked to the participants. Of the participants, 19 were male and 35 were female. Among them, 25 female and 5 male participants were from a design profession, while 14 female and 10 male participants were not from a design profession (Table 2). In total, there were 30 participants from architecture, interior architecture, landscape architecture, and industrial design, which will be collectively referred to as "design professions" in this research. The remaining 24 participants were not from a design profession and came from fields such as engineering, medicine, law, communication, etc.

Table 2: Gender by Profession

During the game, players are first creating a character and a family if they want. Then they need to find a house, modify it or design from scratch. After that, they establish a family (marriage, kids, death), while developing their character, fullfiling their needs and advancing their careers. Participants are asked by doing which, they spent most of their time (Table 3). 71.8% of the participants spent most of their time by designing a new house and/or modifying an existing one. If the faculties are analyzed separately, these rates are 80% for those who come from design faculties and 57.1% for those who come from other faculties among those who play Sims.

Table 3: The part that participants spend the most time

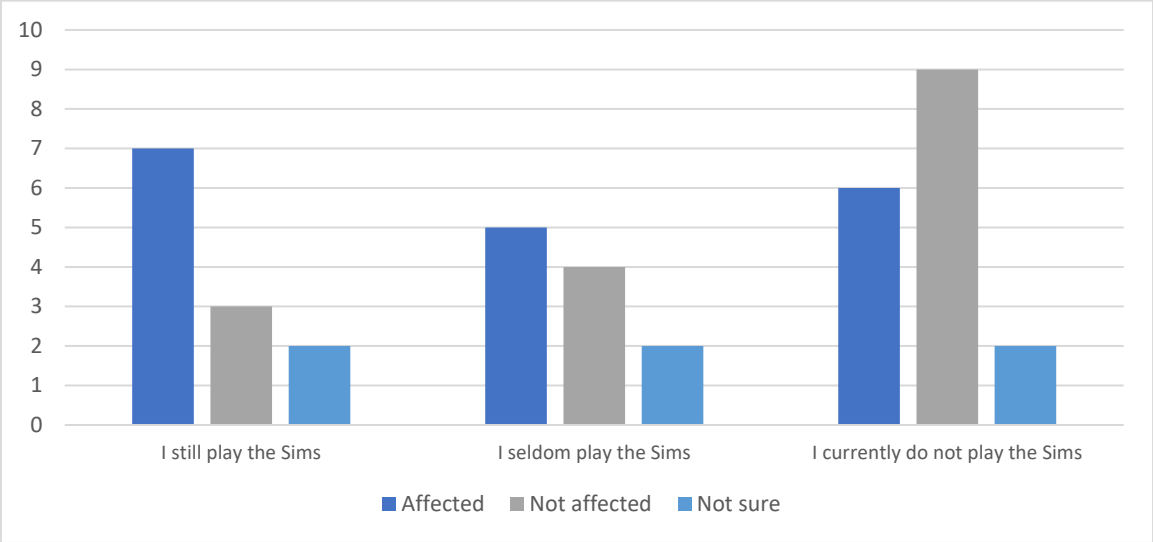
The last question of the survey is an open-ended question and asks; Were you interested in designing and/or modifying houses in The Sims game? Can you explain this process? The advantage of open-ended questions can be seen in this question. From the answers given, it is seen that the participants are very interested in designing a house while playing the game. Those who have both studied at the design faculty and are interested in home design, state that they are influenced by this game in their choice of profession.

> “Yes. Before I chose the department I was reading, I realized that I was interested in this subject with games like sims.” (Male, 1996, Interior architect)
>
> “Yes, it was interesting to me, even I would play sims only for the house part. I can't say that I enjoyed playing with the next people.” (Male, 1993, Industrial Designer)
>
> “Yes, I spent the most time and the most enjoyable part was designing the house. My purpose in playing the game was mostly to design houses.” (Female, 1990, Architect)
>
> “Yes. I was designing the house and playing the game in five minutes and closing it.” (Female, 1992, Architect)
>
> “I chose the interior architecture and environmental design department because I love and enjoy playing Sims a lot. In cases where the items in the base game and additional packages were not enough, I would download cc and decorate for hours. I witnessed the development process of the game and I played it from Sims1 to Sims4. I'm still playing. Since I did not know how to model in the first years of my undergraduate education, I did a similar modeling on Sims4 and obtained 3d visuals from the game. In short, I still play this game, which has greatly affected my professional life, and I learned many basic information (decoration, design, structure, English, etc.) thanks to this game.” (Female, 2000, Interior Designer)

Thematic analysis was used to analyze the open-ended responses. First, the responses were read carefully to understand the overall content. Important phrases and ideas related to designing houses were then identified and coded. These codes were grouped into main themes, such as "Career Influence" and "Design Skills." The themes were reviewed and refined to ensure they accurately reflected the participants' experiences. Finally, the findings were interpreted to reveal how The Sims influenced participants' career choices and design interests, clarifying the game's impact on their professional paths.

The analysis of responses to the open-ended question about participants' interest in designing or modifying houses in The Sims game reveals a significant connection between gameplay and professional aspirations in the field of design. The responses indicate that The Sims game has not only been a source of enjoyment but also a pivotal influence in shaping the career paths of those who later pursued studies in design-related disciplines.

Participants who have studied in design faculties, such as interior architecture, industrial design, and architecture, consistently noted that their engagement with The Sims played a critical role in developing their interest in these fields. The game served as an early platform for exploring their creativity and honing their design skills, which later translated into their academic and professional choices. For many, the act of designing virtual homes was not merely a part of the game but the primary reason for their continued engagement with it.



14 of the 24 participants who did not study at the design faculty stated that they played sims. 8 of these participants said "designing a house" for the part they spent the most time with. Here are some of the answers that are worth mentioning.

> “I would play with the enthusiasm of creating an order similar to the one seen at home.” -Male, 1994, Engineer
>
> “Yes. Because my dream was to become an architect or interior designer. But I didn't want to read it because I don't have drawing skills. I suppressed my dream of designing a house a little bit with this game. I was more into decoration.” -Female, 1990, International relations specialist “
>
> Designing the house according to myself and decorating it as if I was really going to live in that house was the process that interested me the most.” -Male, 1996, Medical Promotion Representative

It can be seen from here that these participants tend to design like their own houses and/or environments. however, those studying at the design faculty mostly refer to their professions.

Participants from design faculty were asked whether they still play The Sims or not. 30% of the participants still play The Sims, 27,5% seldom play The Sims, and 42,5% currently do not play The Sims. 18 out of 40 (45%) participants state that playing The Sims effected their choice of profession. When looked at the participants who still play The Sims, the rate increases to 59%. In contrary, participants currently do not play The Sims state playing The Sims didn't affect their choice of profession (Table 4).

Table 4: Playing preferences vs choice of profession

In conclusion, the survey's results and the open-ended questions highlight the strong correlation between The Sims participation and goals for design-related careers. The data shows that The Sims was not simply a source of enjoyment but also a formative platform for the development of design abilities and interests for many players, especially those with academic backgrounds connected to design. The impact of the game on career choices is especially noticeable among those who keep playing, since a significant portion of them credit their professional journeys to their gaming experiences. On the other hand, the perceived influence on their professional decisions decreases for those who stop using The Sims. This contradiction draws attention to how the game's impact changes depending on how much time is spent playing it, and it implies that creative, interactive platforms such as The Sims may have a significant impact on how people develop their careers in design fields.

4. Conclusion

The strong connection between gaming and career development, as evidenced by the responses from the surveys, underscores the educational potential of simulation games like The Sims. These games can inspire and nurture an interest in design from a young age, providing a practical and enjoyable introduction to concepts that are foundational in professional design education. The fact that some participants continued to use The Sims as a tool for modeling and visualizing designs during their studies further emphasizes its value as a learning resource, highlighting its profound and lasting impact on individuals interested in design. This influence extends to their educational and career trajectories, suggesting that video games can serve as both an inspiration and a practical tool in the development of professional skills, particularly in creative fields like design and architecture.

Wright's assertion that the design and organization of a player's [Sim] house can provide significant insights into their personality and character traits aligns with the survey findings. Many players create in-game representations that closely mirror their real lives, replicating their own identities, homes, and even their neighbors within the virtual environment (Breznican, 2004). This behavior further demonstrates the deep engagement and personal connection that players develop with the game, reinforcing its potential as a tool for exploring and refining design skills.

However, it is important to note the limitations of this study, which was conducted in Turkey with a limited timeframe and participant pool. The cultural and geographical focus may affect the generalizability of the findings. To validate these results, similar studies should be conducted in different countries and cultural contexts. Understanding how players from diverse backgrounds engage with The Sims could provide a broader perspective on its educational impact.

Video games vary widely in their social and complexity dimensions, as noted by Granic, Lobel, and Engels (2014). For example, games like puzzles and Tetris are simple and non-social, while Guitar Hero and Need for Speed are simple but social. On the more complex end, games like The Sims and SimCity are non-social, while Among Us and Minecraft are both complex and social. Interestingly, the upcoming release of The Sims 5, which EA revealed to be in development in 2020, is expected to introduce multiplayer online features. This addition would elevate

The Sims from a complex, non-social game to a complex, social one, potentially enhancing its educational value by enabling collaborative, online interactions among players.

With these anticipated developments, The Sims 5 is likely to attract renewed interest from researchers, particularly in terms of its educational applications. The game's evolution to include social and collaborative features may further solidify its role as a tool for developing professional skills in design and other creative fields. As the game evolves, it will also be important to consider how generational differences and the changing technological landscape influence player engagement and the game's educational potential.

Abstract: Integrating video games into the classroom is a promising way to enhance learning experiences, as the market of serious games is expanding. European schools are investing in digital equipment, and the use of educational video games is technologically viable. Nonetheless, actual experiences of video games in class are still rare. A key gap to be explored is understanding how pre-service secondary teachers perceive and are prepared to use digital games in their future classrooms. Do they think it would enhance their teaching and their students' learning? Do they feel prepared for it? To answer these questions, and possibly address future challenges, we conducted a comprehensive study with students at Zurich University of Teacher Education (PHZH). The research process began with the development and testing of a detailed questionnaire that focused on participants' personal gaming behaviour, preferences, and perceptions of the educational potential of video games. Key areas such as serious games, game design, gamification, game-based learning, and game culture were explored to assess the relevance and understanding of these concepts in an educational context. This paper explains the development and structure of the questionnaire as a measurement instrument as well as the underlying literature and methodological considerations. The first implementation and the preliminary survey with 48 PHZH students are presented, and the practicability and reliability of the questionnaire are evaluated. The result of the survey suggests pre-service teachers are generally positive about integrating video games and game design into the classroom, yet enthusiasm is not enough without additional support.

Keywords: Game Studies, Video Games, Primary and Secondary Education, Pre-Service Teachers, Game-based Learning

1. Introduction

In recent years, integrating digital technologies into education has become increasingly important as students must be equipped with the necessary skills to succeed in a digitally oriented world (Digital Competence Framework, 2021). This trend is particularly evident in expanding the market for serious games - video games developed explicitly for educational purposes (Statista, 2021). Video games have shown significant potential to increase student engagement, promote critical thinking and improve learning outcomes in various subjects. Research indicates that serious games can boost students' motivation and engagement, making the learning process more interactive and enjoyable. For example, the study by Arias-Calderón, Castro, and Gayol (2022) showed that 90.8% of students found serious games to be effective in improving their learning experience, while 87.9% stated that these games increased their motivation to study theoretical content. In addition, the literature review by Videnovik et al. (2023) has shown that game-based learning promotes critical thinking and collaboration by allowing students to apply their knowledge in practical, real-world contexts.

Despite the technological advancement and availability of educational games, their actual use in the classroom is still relatively limited. A systematic review of empirical studies by Oyelere et al. (2020) showed that this is partly due to the challenges associated with aligning game content with educational objectives and the need for more comprehensive integration strategies. Another critical evaluation of smart classrooms and the use of new technologies by Dimitriadou and Lanitis (2023) reveals that while many tools exist to improve student engagement, the actual implementation of these technologies faces several hurdles. These include inadequate teacher training, lack of resources and the complexity of integrating new technologies into existing curricula.

This discrepancy highlights the need to explore the factors that influence the use of digital games in the classroom. One crucial aspect is understanding the perceptions and readiness of pre-service teachers who will soon be at the forefront of educational innovation. Their attitudes towards digital games and their willingness to incorporate these tools into their teaching practices are critical to the successful integration of game-based learning (Meccawy, 2023). To find out more about this target group, this paper will tackle the following research question: "How do Swiss pre-service teachers perceive the opportunity to use video games in the classroom?"

This paper details the questionnaire's development and structure as a measurement tool, including the underlying literature and methodological considerations in Section 2. The selection and formulation of the questions as well as the theoretical framework on which the development of the questionnaire was based are discussed in Section 3. Following this detailed explanation, the first implementation and preliminary survey with a group of 48 PHZH students is presented in Section 4 and discussed in Section 5. This first test phase serves to evaluate the practicability and reliability of the questionnaire.

2. Literature Review

The origins of video games date back to the 1950s, with the first commercially successful video game, “Pong”, being released in 1972 (Kent, 2001). Since then, video games have evolved from simple arcade machines to complex interactive media encompassing a wide range of genres and game mechanics. In parallel with content innovation, technological advances have led to smaller and more powerful devices, making video games more accessible. In particular, the development of mobile tablets and affordable laptops has significantly lowered the physical and economic barrier to accessing video games. This accessibility increasingly allows schools to integrate video games as a teaching tool without having to rely on a computer lab, for example, which often has limited use and can be a major administrative burden.

Scientific studies show that the use of video games in an educational context can have a positive impact on students' learning and motivation. A meta-analysis examining the effects of digital games in STEM (Science, Technology, Engineering, Mathematics) showed significant learning effects in students who used digital games as a learning aid compared to those who used traditional teaching methods (Wang et al. 2022). Another study suggests that integrating games into the classroom can lead to increased student engagement and improved understanding of complex topics. In particular, games that emphasise active participation and problem orientation were found to be particularly effective in enhancing the learning process (Vlachopoulos and Makri 2017). However, results vary depending on the design of the game, the way it is integrated into the curriculum and the role of the teacher in using the games as a pedagogical tool. Games that are well integrated into the course and actively accompanied by teachers show the best learning effects. It is also important that the games are tailored to the specific learning objectives and educational level of the students (Vlachopoulos and Makri 2017; Smiderle et al. 2020). Overall, research confirms the potential of video games as effective teaching tools that, when used correctly, can increase motivation to learn and support the achievement of learning objectives.

Video games in the classroom can help to develop the subject-specific and interdisciplinary skills required by the curriculum. They promote critical thinking, problem-solving skills and collaboration. According to Curriculum 21 (D-EDK 2016), which is used in most parts of Switzerland, students should, for example, use games for research and learning support. The application competence, which is valid for all three school cycles (ages 7 - 16), reads as follows: “Pupils can use given media to learn and obtain information on a given topic (e.g. book, magazine, educational game, story, website).”.

The cross-references to the subjects German, media education, and informatics and STEM indicate that games can and should also be used in a wide variety of subject areas. A second application goal appeals to students' independence in selecting media for learning. “Pupils can independently select and use media for their own learning process (e.g. non-fiction book, magazine, RSS feed, social networks, e-book, subject-related software)”[1].

In today's world, where video games often play a central role in young people's everyday lives, it is obvious that schools should consider them as a learning medium and demonstrate the possibilities and limitations.

The Dagstuhl Triangle (Brinda et al. 1985), a framework for evaluating and designing educational technologies, emphasises the interplay of three critical perspectives: a technical, a socio-cultural, and an application-oriented perspective. When applying the Dagstuhl Triangle to the use of games in the classroom, it is important to ensure that each of these components is carefully balanced and integrated, see Figure 1.

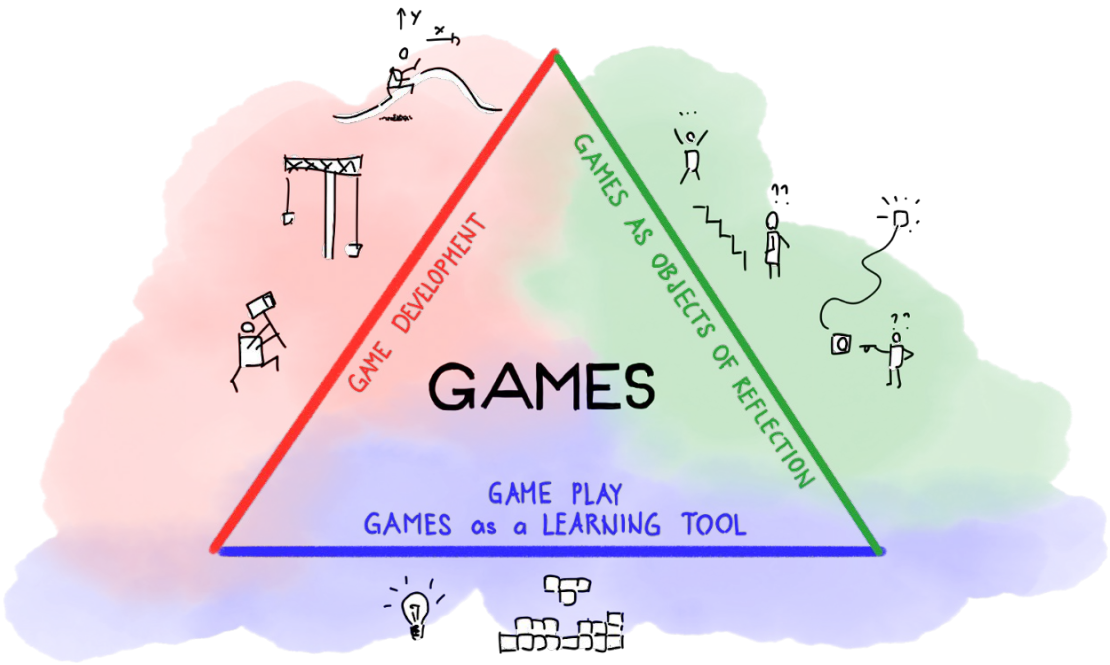

Figure 1: The Dagstuhl triangle can be used to combine games in education with different perspectives. Own illustration.

Game Development: This perspective involves students creating games, enhancing their skills in programming, design, and critical thinking (Clark et al., 2016)

Games as Objects of Reflection: Here, games are used to stimulate discussion and analysis, fostering critical thinking and deeper understanding (Boyle et al., 2016). This could include the media-psychological effects of games on young people, trends, and new developments that influence us as a society.

Games as Learning Tools: This involves using games to directly teach specific content, promoting engagement and retention (Plass et al. 2015).
Numerous research findings support the assumption that early exposure to digital games is associated with more positive attitudes towards these games in an educational setting. For example, research shows that teachers who played digital games in their childhood not only have a more positive attitude towards games today, but also have greater knowledge in this area. This positive correlation was highlighted in the work of Pozo et al. (2021).

Furthermore, this extensive knowledge of games often leads to a more nuanced understanding of their potential learning benefits, which is not readily apparent to those with less gaming experience. Studies by Sánchez-Mena et al. (2017, 2019) support this idea by showing a positive correlation between the frequency of game use by teachers and their positive assessment of the educational value of games.

Studies by Bourgonjon et al. (2013) and de Grove et al. (2012) also agree with these findings and show similar trends in teachers' intentions to use digital games educationally. The accessibility and thematic relevance of games are cited as the main reasons for their use in educational contexts, as a study by Belda-Medina and Calvo-Ferrer (2022) shows. They found that a wide range of games are used by teachers, suggesting that the choice of games does not necessarily depend on specific pedagogical skills, but rather on perceived ease of use and thematic fit with curricular objectives. This is also supported by Alberola-Mulet et al. (2021), who points out that while teachers see the potential of using digital games for learning, they also recognize significant challenges in effectively integrating these tools into the curriculum.

Our past research revealed several important findings about in-service primary teachers' perceptions and use of digital games in the classroom (Spieler and Degonda, 2022). Teachers associated both positive and negative aspects with games. On the positive side, they noted the usefulness of games for practising learning content, individualising lessons and introducing fun and innovative elements. Gamification and competitive aspects were seen as motivating factors. However, negative perceptions included the effort required to use games, the risk of

them being seen as time wasters and the potential to isolate students. Teachers also reported that games are a pervasive topic at break times and during free time. These findings suggest that targeted teacher training is needed to better integrate digital games into the educational environment and eliminate existing stereotypes and misconceptions.

3. Study Design

To understand the perception of pre-service teachers regarding the use of video games in the classroom, whether they believe it would improve their teaching and their students' learning, as well as if they feel prepared for it during their future classes, we designed and administered a questionnaire during the Spring Semester 2024.

We designed the questionnaire in a digital format with Survalyzer[1] to be completed online, ensuring accessibility and ease of data collection. The questionnaire presented a set of close-ended questions, with the exception of a final open-ended space for comments on the survey and was divided into three categories. The first category presented an introductory set of questions regarding data about the participants, such as gender and age. The following two categories presented Likert-scale questions to assess students' perceptions on a five-point scale from "strongly disagree" to "strongly agree". In particular, the second category of questions regarded the perception of participants on the possibility to learn while playing, while the third category focused on game design in the classroom. The questionnaire was designed to be anonymous, with no personal identifiers collected to maintain participants' confidentiality. Participation was voluntary.

The design of the questionnaire was based on the survey presented in Rüth et al. (2022), where multiple regression analyses were applied to investigate how the individual traits of pre-service teachers influence their plans to incorporate digital games in educational settings. The questionnaire identifies perceived usefulness and curriculum relatedness of video games as important factors for pre-service teachers' intention to teach with them. We applied the same multiple regression analyses approach used in Rüth et al., while adapting their questionnaire for the Swiss educational context and shortening it from the original 23 questions with 87 items to 12 questions with 46 items.

In the Swiss Curriculum 21 (D-EDK 2016), active media work, i.e., creating digital products and exploring programming skills, is becoming increasingly important. For this reason, it makes sense not only to use games as a learning tool and occasion for reflection, but also to create games on your own. Our questionnaire was thus supplemented with three questions of three items each on attitudes to game design at school. These were based on the content of the previous questions and collected data on the following topics:

- Perceived usefulness of game design in the classroom
- Perceived user-friendliness of game design for teachers
- Perceived user-friendliness for pupils

The questionnaire was pre-tested in advance with three students from the PHZH. In addition to minor shortcomings, it was also pointed out during this test that negatively worded items could be confusing. The two items to which this applied were reformulated. It was also noted that video games in the school context may only be understood as software that has been developed for teaching. For this reason, a brief definition of what is meant by and considered as video games was included in the introduction.

The students at PHZH who completed the survey are in their 8th semester and usually complete their studies in the following semester. The students surveyed have selected media education and informatics (MI) as an elective area and must obtain 18 ECTS credits in this area. Particularly noteworthy is the 7th semester, in which the Scratch programming language, and game design approaches were addressed in several module courses. These included a course dedicated to (paper) prototyping and several inputs on typical mechanics that are used in games and can be recreated with Scratch. As proof of performance, the students had to develop and implement a game idea with individual students within two double lessons. The topic of games was thus examined intensively from the perspective of game design. The perspective of using games as a learning tool in

[1] https://survalyzer.com/

the classroom was not actively addressed. We gathered 48 answers out of a total administration of 55 students during a self-organised phase of a module as a task.

4. Findings

Part 1 of the survey gathered general data about the population sampled and their experience with video games. The sampled population had an average of 28 years old, with 17 participants describing themselves as female, and 31 as male. On average, the surveyed population plays video games for 3-4 hours a week, while they used to play 11-12 hours a week when they were 15 years old. About 71% of the sampled population does not describe themselves as gamers, 61% does not think they play more video games than other people, about 45% mention they play different kinds of video games, 52% admits they don't play video games often, while 68% admits they like to play video games.

Part 2 of the survey was focused on their perception of the possibilities to learn by playing video games. The following tables presented in this Section show internal consistency, mean (standard deviation) and results of the one sample t-tests for the scales of the regression models' dependent variables. The one-sample t-tests were always computed to examine whether means differ from the scale's midpoint of 3.

Scale	α	M (SD)	t	p	d
Perceived benefits of games in the classroom ("By using games in the classroom, I can teach better.", "By using games in the classroom, I can teach students more.", "Using games in the classroom improves my effectiveness as a teacher.", "I find the use of games in lessons useful.")	0.84	3.24 (0.65)	t(44) 2.52	0.015	0.37
Perceived ease of use of video games for teachers ("The use of games in the classroom is clear and understandable to me.", "For me, interacting with games in class doesn't require much mental effort.", "I find it easy to use games in the classroom.", "I find it easy to use games in the classroom the way I intend to.")	0.83	2.84 (0.74)	t(37) -1.13	0.202	-0.21
Perceived user-friendliness of the use of video games for students ("The use of games in the classroom is clear and understandable for students.", "Interacting with games in class doesn't require much mental effort for students.", "Students find it easy to use games in class.", "Students find it easy to use games in class the way they intend.")	0.60	3.03 (0.58)	t(37) 0.41	0.68	0.067

Table 1: Perceived benefits and ease of use for teachers, perceived user-friendliness for students.

Table 1 shows the perceived benefits, perceived ease of use for teachers, and perceived user friendliness for students of video games. The degrees of freedom for the t-statistic varies from scale to scale, as not all the participants answered all the questions. Table 2 shows the results for the scale related to reputation.

Scale	α	M (SD)	t	p	d
Assumptions about the reputation of other people through the use of video games in the classroom ("People who have an influence on my behaviour think that I should use games in class.", "People who are important to me think that I should use games in the classroom.", "I think that the school management would support me in using games in the classroom.", "I think that the school management would generally support the use of games in lessons.")	0.76	3.13 (0.63)	t(28) 1.08	0.28	0.20
Reputation of teachers who use games in the classroom ("Teachers who use games in lessons are more highly regarded at school than teachers who do not use games in lessons.", "Teachers who use games in the classroom are well known.", "Using games in the classroom is a status symbol for teachers.")	0.45	2.92 (0.58)	t(34) -0.77	0.44	-0.13

Table 2: Teachers' assumptions about their reputation, or other teachers' reputation, in using video games in class.

Table 3 shows the results for the scale related to relevance for teachers to use video games in the classroom, their belief regarding the results of using video games in the classroom, and their subjective perception on the use of video games in class.

Scale	α	M (SD)	t	p	d
Relevance of video games for teachers in the classroom ("The use of games in the classroom is important in the teaching profession.", "The use of games in the classroom is relevant in the teaching profession.", "The use of games in the classroom is relevant for the various tasks in the teaching profession.")	0.78	3.17 (0.66)	t(43) 1.73	0.089	0.26
Conviction of results ("I have no difficulty telling other people about the results of using games in the classroom.", "I think I could teach other people about the effects of using games in the classroom.", "The results of using games in the classroom are obvious to me.")	0.76	3.30 (0.73)	t(42) 2.67	0.010	0.40
Subjective perception of using video games in the classroom ("I find it entertaining to use games in the classroom.", "The actual process of using games in the classroom is gratifying.", "I enjoy using games in the classroom.")	0.83	3.89 (0.51)	t(40) 11.15	< 0.001	1.74

Table 3: Relevance of video games in class for teachers, their belief on the results achieved, and subjective perception of the use of video games in class.

Figure 2 and Figure 3 show how in-training teachers replied to items of the questionnaire related to what opportunities video games offer, and how they could use a video game in class.

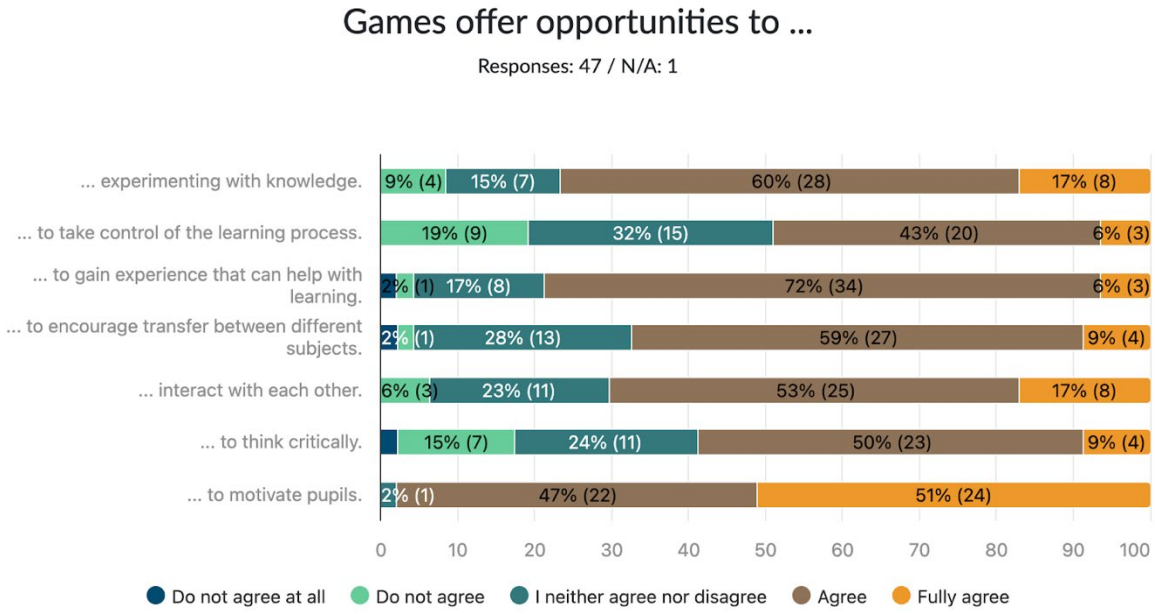

Figure 2: Visual representation of the results of the question on opportunities offered by video games.

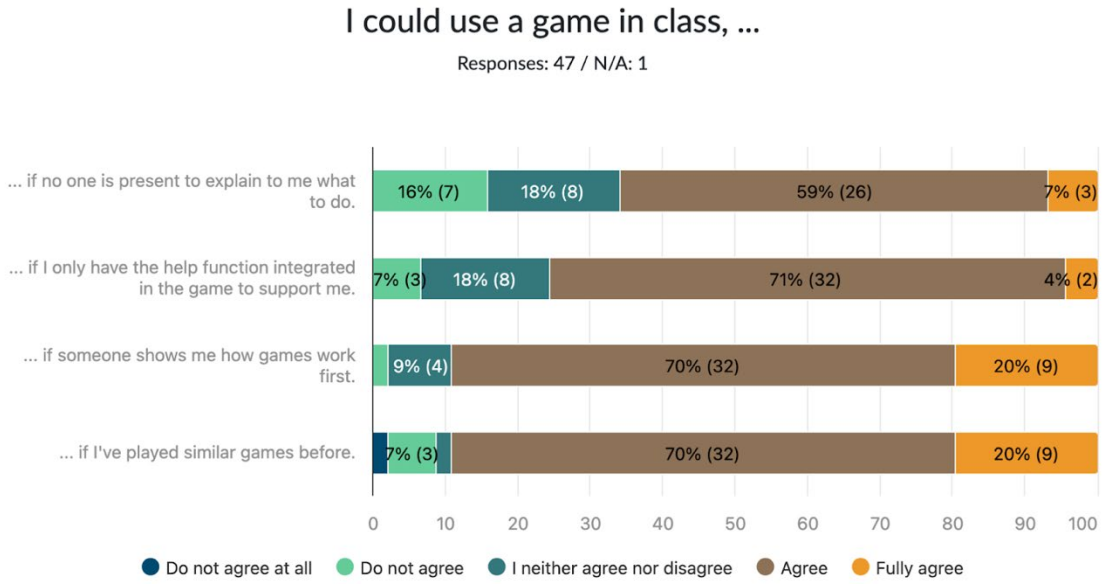

Figure 3: Visual representation of the results of the question on how pre-service teachers think they could use video games in class.

Part 3 was focused on the intention and perception of using game design in the classroom. Table 4 shows the results of the one sample t-test carried over the intention of using game design in the classroom.

Scale	α	M (SD)	t(44)	p	d
Intention to use game design in the classroom ("I intend to use games as a tool in the classroom as soon as I start working as a teacher.", "I can already think of specific game design content that I will implement with the students.")	0.65	3.33 (0.13)	2.45	0.018	0.36

Table 4: Teachers' intention to use game design in class.

Table 5 shows the results of the one sample t-test carried over the perception of usefulness and user-friendliness for both teachers and students of game design in the classroom.

Scale	α	M (SD)	t(42)	p	d
Perceived usefulness of game design in the classroom ("Game design is suitable for implementing the objectives of the curriculum.", "During the use of game design, the students' skills increase.", "Game design can be used to create productive lessons.")	0.8	3.93 (0.53)	11.47	< 0.001	1.75
Perceived user-friendliness of game design for teachers ("I have the confidence to do game design with my future classes.", "I can support my students profitably with questions about game design.", "I know a tool or a programming environment that can be used to develop games in the classroom.")	0.81	3.65 (0.90)	4.96	< 0.001	0.78
Perceived user-friendliness for students ("The students will be able to develop games without much help.", "There are tools and instruments that are suitable for game design at school.", "We will develop exciting games in the classroom without any major effort.")	0.66	3.19 (0.72)	1.74	0.08	0.26

Table 5. Perceived usefulness and user-friendliness from teachers' perspective on the use of game design in class, and perceived user-friendliness for students.

5. Discussion

The analysis of the survey results among pre-service teachers provides interesting insights into the perception and acceptance of video games as a teaching tool. Despite widespread recognition in the literature as an effective teaching tool, see Section 2, the data reveals a complex mix of agreement and reservations that merit critical examination.

5.1 Teachers' Perceptions of the Benefits, Ease of Use, and User-Friendliness of Video Games in Classroom

The perceived benefits of games in classroom showed a significant result (p=0.015), indicating a positive attitude towards the integration of games in the classroom. This suggests that teachers in education see the value of video games, which is consistent with existing literature highlighting the motivational and pedagogical benefits. However, this optimism must be viewed critically as the moderate effect size suggests that the perceived benefits may not be convincing enough to encourage widespread adoption without additional support.

Teachers' perceived ease of use (p=0.202, not significant) suggests that there is a need for targeted teacher training and resources. The moderate perception of usefulness compared to difficulty of use suggests that it may be difficult for teachers to effectively incorporate games into their teaching practice without adequate training.

The perceived ease of use for students (p=0.68, not significant) suggests that while teachers believe that students could potentially benefit from using video games, their confidence in this belief is not very strong. This highlights the need for better support structures and institutional readiness to facilitate the integration of video games into the classroom.

5.2 Teachers' Perceptions of the Reputation of using Video Games in the Classroom

The assumptions about the reputation of others through the use of video games in the classroom indicate that pre-service teachers believe that the use of games in the classroom is moderately supported by others. The mean of 3.13 (SD=0.63) with a p-value of 0.28 and a small effect size (d=0.20) indicate that although there is a slight tendency towards the perception of support, it is not strong enough to be considered statistically significant. This moderate perception may reflect cautious optimism among teachers about the acceptance and promotion of video games by colleagues and administrators, suggesting that further efforts to communicate the benefits and secure institutional support are needed to strengthen this perception.

The prestige of teachers using games in the classroom shows a mean of 2.92 (SD=0.58) with a p-value of 0.44 (not significant) and a negative effect size (d=-0.13). These results suggest that teachers generally do not perceive a significant improvement in their reputation through the use of video games in their teaching practice. The lack of a perceived reputational benefit suggests that the use of video games in the classroom is not currently viewed by teachers as a prestigious or noteworthy endeavour. This finding highlights the importance of fostering a culture that values and rewards pedagogical innovation, thereby encouraging more teachers to experiment with and adopt video games strategies.

5.3 Teachers' Perceptions on the Relevance, Effectiveness, and Enjoyment of Using Video Games in the Classroom

The relevance of video games to teachers in the classroom shows a mean of 3.17 (SD=0.66), with a p-value of 0.089, which is not statistically significant. These results suggest that while there is a general perception among teachers that video games are relevant to their profession, many teachers are still unsure of the importance of video games to their teaching practice.

The results regarding the use of video games in the classroom shows a mean of 3.30 (SD=0.73), with a p-value of 0.010, which is statistically significant. This significant result suggests that teachers feel quite confident discussing and teaching the outcomes of using video games in the classroom with others. Furthermore, the figures show that those who have used games see tangible benefits and are willing to advocate for their use.

The subjective perception of the use of video games in the classroom has the highest mean of 3.89 (SD=0.51), with a p-value of less than 0.001, which is highly statistically significant. These results show that teachers have a very positive attitude towards the fun and satisfaction of using video games in the classroom. The high mean score indicates that teachers find the use of video games highly engaging and satisfying, suggesting that personal and professional enjoyment of these tools can significantly motivate their integration into classroom practice.

This strong positive perception is crucial as it can foster intrinsic motivation to adopt and consistently use game-based learning approaches and contribute to a more dynamic and interactive educational environment.

The results of the questions on the opportunities of games (see Figure 2) and an overwhelming agreement in almost all areas (> 50% agreement, except for “take control of the learning process”-option) also show the positive attitude of teachers towards games in the classroom. The same picture can be seen in Figure 3 where a wide range of applications of games in the classroom is seen and here an agreement of almost 60% is recorded for all items.

5.4 Teachers' Intention and Perception of using Game Design in the Classroom

The intention to use game design approaches in the classroom is recorded with a mean value of 3.33 (SD=0.13) and a p-value of 0.018. These results indicate that the intention of prospective teachers to use game design as a teaching tool is statistically significant. This result emphasises the importance of continuously encouraging and supporting teachers to put their intentions into practice.

The perceived usefulness of game design approaches in the classroom has a mean of 3.93 (SD=0.53) and a p-value of less than 0.001. These results indicate a strong and statistically significant perception among teachers that game design can be effective in achieving curriculum goals, improving students' skills, and creating productive lessons which suggests a solid basis for further promotion of game design approaches as an integral part of the curriculum.

The perceived ease of use of game design for teachers is captured with a mean of 3.65 (SD=0.90) and a p-value of less than 0.001, showing that teachers feel confident in their ability to use game design in their future teaching and to support their students effectively. This positive perception of ease of use is crucial as it indicates that teachers are likely to adopt game design methods, provided they have access to the necessary resources and training.

Perceived ease of use for students has a mean of 3.19 (SD=0.72) and a p-value of 0.08 (not statistically significant). Although teachers believe that students can manage game development with minimal help, confidence in this belief is relatively low.

In general the practicability and reliability of the questionnaire showed good values, as evidenced by the successful implementation and high internal consistency for most scales (e.g. $\alpha = 0.84$ for perceived usefulness). However, some scales, such as the reputation of teachers who use games ($\alpha = 0.45$), need to be refined to improve reliability.

6. Conclusion and Outlook

To answer our research question, this study shows that pre-service teachers are generally positive about integrating video games and game design into the classroom. Teachers recognize the significant benefits of using video games in the classroom, particularly in promoting student engagement and achieving curriculum objectives. However, the moderate effect sizes and lack of statistical significance in some areas suggest that while enthusiasm exists, it may not be sufficient to achieve widespread adoption without additional support.

In conjunction with the literature, the discussion section illustrates that the integration of video games in the classroom is not only a question of the availability of the technology or the effectiveness of the games, but also of pedagogical attitude, institutional support, and practical implementation.

This study has several limitations that must be considered. The sample is relatively small and consists exclusively of pre-service teachers from a single institution, which limits the generalizability of the results. Therefore, future studies will include students from the Italian-speaking part of Switzerland (University of Applied Sciences and Arts of Southern Switzerland) and consider students from primary and secondary level and in various stages of their studies.

Abstract: In this paper, we present technical implementation details, describe the virtual world procedural generation pipeline, and discuss potential uses in cultural preservation, museum exhibits, and education of *HeritageRoots*, an innovative software infrastructure designed for preserving indigenous narratives and oral histories. *HeritageRoots* consists of two interconnected systems - (1) a web-based knowledge graph (KG) data collection and management system which stores, connects, and presents indigenous traditional knowledge (ITK) in the form of narratives, myths, and testimonies from multiple cultures and languages; (2) a virtual environment rendering pipeline which utilizes large language models (LLM), Unity3D, and Meta Quest software development kit (SDK) to procedurally generate virtual worlds from the KG data. Preliminary system evaluation with Ecuadorian Kichwa narratives showed promising results in (1) academic community interest and support, (2) the possibility of developing an infrastructure capable of connecting indigenous narratives with modern scientific knowledge via KGs and (3) procedurally generating virtual worlds from KG.

1. Introduction

Around the world, the traditional knowledge of Indigenous communities (Indigenous Traditional Knowledge, or ITK) is threatened by migration and the profound changes associated with globalization. Cultures that do not have a strong written tradition are especially threatened – as younger generations move away in search of education and jobs, and as globalization forces linguistic shifts to more "global" languages such as English and Spanish, rich oral traditions either disappear completely or become artifacts in university or library archives, accessible only to small groups of academics.

Indigenous communities, with relatively small populations concentrated in rural areas, are particularly vulnerable to the loss of traditional knowledge because globalization fosters mobility to jobs and increasingly requires that these jobs and the higher education needed to obtain them be carried out in international languages. The vulnerable native languages encode the indigenous populations' long and complex relationships with the land in ways that make each population unique. Their stories embody traditional knowledge of spirits, places, land uses, and ecology (Cajete and Williams, 2020; Corntassel, 2020; Lewis and Sheppard, 2005). Although indigenous populations value their traditions and strive to preserve them, the challenges they face are often overwhelming. There is thus a need for a virtual resource that helps preserve indigenous cultures not as artifacts in a museum but as living traditions of the populations who can transmit ITK to future generations.

One of the main problems for the transmission of oral (and even written) traditions is that native language-dominant elders often become disconnected from younger speakers who must move to cities for education and jobs. Like young people everywhere, their identities are increasingly complex, influenced by global currents from broader Latin America, Asia, Europe, and the US. Indigenous students who have to move away from their home communities to attend schools are more likely to lose their heritage language and identity (HUANG, 2024; Little, 2020). Typically, these more mobile members are able to spend some time in their territories with elders but often not enough time to really learn the traditions. We intend for *HeritageRoots* to be used as both a cultural preservation and an educational tool that could bridge time in school or in an urban setting with periods of time in the territories with elders.

Specific to our project's pilot, Amazonian Kichwa communities treasure their traditional knowledge, values, and beliefs that have been passed from generations through oral communication and shared experiences. This traditional knowledge establishes spiritual and cultural relationships with the land, the animals, and the plants. Those relationships are reflected in expressions, words, gestures, and practices specific to the Kichwa traditions. Characters in Kichwa narratives have complex similarities and differences across versions from neighboring cultures that cannot be easily captured by static documents or textbooks. Individual narratives connect to each other in complex ways, forming a network of interacting plots, characters, humans, animals, plants,

environments, and languages. While oral myth cycles have sometimes been linked to each other in master plots by the scholars who reduce them to writing, this imposed order is often too rigid to capture the fluid and multivalent way in which their characters evoke, presuppose, or relate back to each other. Furthermore, these collections almost never capture the ways in which stories of one language borrow from, adapt, or even playfully mock the stories of neighboring languages.

Many initiatives have been activated to preserve and revitalize indigenous cultures, traditions, and languages (Adlam et al., 2022; Ajani et al., 2024; Meighan, 2022; Peterson et al., 2021; Yeh et al., 2021). While a number of these initiatives involve the use of computational technologies and multimedia to document and archive indigenous languages and knowledge, much of what has been created to date is primarily designed to serve academic communities and does not provide access to either the broader public (e.g., anyone who wishes to learn about a particular culture) or to the indigenous communities struggling to maintain continuity of their ancestral knowledge across generations. Moreover, existing systems and frameworks tend to focus on a single corpus of narratives and do not provide possibilities to connect and map stories, characters, and concepts across neighboring cultures and languages.

Over the past few decades, a tremendous amount of work has been done on representing knowledge using graph structures. Knowledge graphs have been used to represent provider expertise in healthcare (Zhang et al., 2020), extend transparency of black-box models in machine learning (Gaur et al., 2021), map concept knowledge in adaptive learning systems (Shi et al., 2020), identify fake news (Hu et al., 2021) and represent linguistics constructs (Liu et al., 2020). There is, however, a surprising lack of both academic research and digital humanities projects that leverage graph-based concept representation in the area of ITK and cultural preservation. While Native communities would certainly not characterize their traditional knowledge as "folklore", the technical challenges in presenting ITK resemble those encountered by existing digital Humanities projects in that field. Two digital folklore projects at Tennessee State University (Bacon, 2011) and Utah State University (McNeill, n.d.) focus on tracking oral traditions on the Internet by creating collections of trending memes, hashtags, and urban legends, and analyzing and studying their prevalence in society. While their respective projects provide a tremendous amount of insight into modern folkloric trends, they do not show how these trends relate to or influence each other, nor do they allow for the exploration of the collected digital folkloric artifacts. Several prominent research projects used knowledge graphs to represent relationships between stories, characters, and concepts in corpora of Greek (Pastor-Sánchez et al., 2021), Kurdish (Ahmadi et al., 2020), Finish (Janicki et al., 2023; Kallio et al., 2020), and Danish (Davis et al., 2021) folklore, as well as provide insight into relationships between stories, political complexity, high gods, trade, cultural traits, gender roles, attitudes towards risk, and trust (Michalopoulos and Xue, 2019). However, none of these projects provide a user interface that would allow researchers or general users to interact with the graph data. James, Broadwell, and Tangherlini propose, implement, and describe a graph-based approach in the context of "computational folkloristics" (Abello et al., 2012; "Big folklore: a special issue on computational folkloristics," 2016), but their knowledge graph search and exploration tools are desktop application-based and are not available to broader audiences.

In the education and learning technologies domains, on the other hand, graph-based concept representation has received a lot of attention, and much work has been done in the areas of concept mapping (Tergan, 2005) and supporting cognitive behaviors in concept map-based learning environments (Wang et al., 2019). A number of companies have developed commercial products to support concept mapping for business purposes (most notably Mural ("Mural," n.d.), Obsidian ("Obsidian," n.d.), Figma ("Figma," n.d.), and Tinderbox ("Tinderbox: The Tool For Notes," n.d.)), and much research has been done in various areas of human-computer interaction (HCI) and natural language processing (NLP) to develop intuitive user interfaces to generate knowledge maps from text corpora (Krause, 2019; Zuo et al., 2021) and to manually map concepts identified in text notes or in domain-specific use cases (Huang et al., 2021; Tergan, 2005; Xiao et al., 2019).

And finally, we get to games. Serious games, or more specifically, educational games, usually focus on a single topic (or at best, a set of similar topics), such as algebra, physics, or second language acquisition (e.g., DuoLingo). These types of games rarely focus on creating immersive environments and usually put the majority of their development efforts into designing learner models (Emerson et al., 2020; Khenissi et al., 2015, 2014) and creating educational content. In the world of entertainment games, AAA game franchises such as Assassin's Creed invested tremendous resources to create immersive and reasonably historically accurate virtual worlds (Burgess and Jones, 2022). However, building such meticulously designed worlds involves a large investment of time and money, the latter being a rather scarce resource when it comes to academic institutions and, more importantly, indigenous communities.

Smaller indie game developers have done amazing work in creating serious games for cultural preservation. Never Alone (Kisima Ingitchuna) is a puzzle adventure game made in partnership between the Cook Inlet Tribal Council and E-Line Media is based on the traditional Iñupiaq tale, "Kunuuksaayuka" (“Never Alone - Homepage,” n.d.; “Never Alone - The Story of Kunuuksaayuka (Part One),” 2014; Parkinson, 2014). Mulaka, a 3D adventure game developed by Lienzo (“Lienzo,” n.d.) is based on the narratives and traditions of the indigenous culture of northern Mexico’s Tarahumara (Gonzalez, 2021; Horton, 2019). These are just two examples of a growing number of efforts to create collaborations between indigenous communities, designers, and developers to produce high quality immersive and engaging experiences that tell indigenous narratives and help preserve ITK.

However, even without the AAA-game-level graphics and assets, game development is a costly endeavor. According to a 2023 LinkedIn report, 43% of game development projects are halted during the development phase, and 38% of developers who actually publish their games do not release regular content or updates (“Report: 83% of mobile games fail in the three years after launch | LinkedIn,” 2023). One possible way to alleviate the high costs associated with creating high-fidelity virtual worlds is to procedurally (i.e., algorithmically) generate the environment and the content from existing assets. In recent years, a tremendous amount of work has been done, both in academia and in the game industry, to create pipelines and develop algorithms for procedural content and world generation (Balint and Bidarra, 2022; Grabska-Gradzińska et al., 2021; Liu et al., 2021; Raistrick et al., 2023; Smith et al., 2011; Yannakakis and Togelius, 2011). However, to the best of our knowledge, none of these approaches utilize large data stores and/or KGs to procedurally generate content and environments for serious or entertainment games.

To address some of the aforementioned shortcomings of existing systems, we have developed *HeritageRoots*, an open-access system for collecting, storing, connecting, and presenting ITK in the form of narratives, stories, myths, and multimedia from multiple cultures and languages. Moreover, *HeritageRoots* allows users to connect ITK narratives based on topics, characters, environments, storylines, and other criteria (e.g., a particular animal appears in X stories from X cultures and acts as a positive character in X of the stories and as a negative character in the remaining X stories). Lastly, *HeritageRoots* can leverage the knowledge graph data to partially procedurally generate immersive 3D virtual worlds using Large Language Models (LLM), the Unity3D game engine, and Meta Quest 2/Quest 3 headsets. These virtual environments provide immersive interactive representations of the environments, flora, fauna, characters, and interactions described in indigenous narratives.

The preservation and revitalization of ITK holds immense importance for Indigenous communities, the Indigenous diaspora, museums, and educational institutions worldwide. With globalization and migration trends, traditional knowledge faces significant threats, particularly in cultures reliant on oral traditions and languages. Indigenous communities, often residing in rural areas, are vulnerable as younger generations move away for education and job opportunities, leading to a disconnect between elders and youth. This disconnect risks the loss of rich oral traditions and spiritual connections to the land, animals, and plants unique to each Indigenous population. Museums and educational institutions recognize the urgency of preserving these living traditions, not merely as artifacts but as ongoing sources of knowledge and identity for future generations. We firmly believe that the development of platforms like *HeritageRoots*, focusing on narrative connections, knowledge mapping, and immersive experiences, bridges the gap between modern challenges and the knowledge embedded in Indigenous cultures, fostering understanding across diverse communities and audiences.

2. System Design

2.1 Knowledge Graph

A graph database is a specialized type of database where instead of storing data in the form of spreadsheet-like tables, the data is stored as a collection of nodes where each node represents an object (e.g., story, character, animal). These nodes are linked by edges - connections that represent physical or semantic relationships between pairs or groups of nodes (Figure 1). The example in Figure 1 illustrates that a nodes of type “Animals” (spider monkey and peccary) are connected to the “First mother…” narrative via “APPEARS_IN” relationship, indicating that both of these animals are mentioned in the narrative.

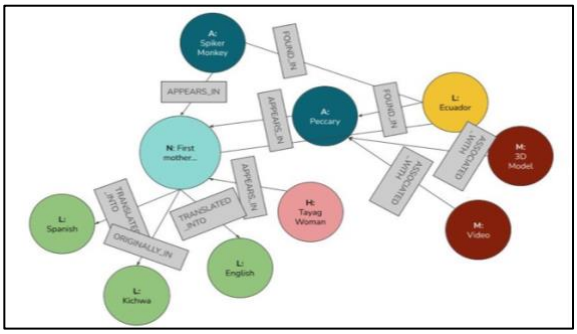

Figure 1: Example of representing semantic relationships with a graph.

This data representation allows a meaningful mapping of stories to concepts, physical objects, locations, characters, and to each other. To store the KG, we are using Neo4J, an open-source graph database. The current version of the knowledge graph represents concepts, objects, and relationships related to narratives, animals, plants, languages, geographic locations, physical objects, and multimedia objects (e.g., 3D models, 360 photographs, images, and videos).

2.2 Web-Based Data Management Module

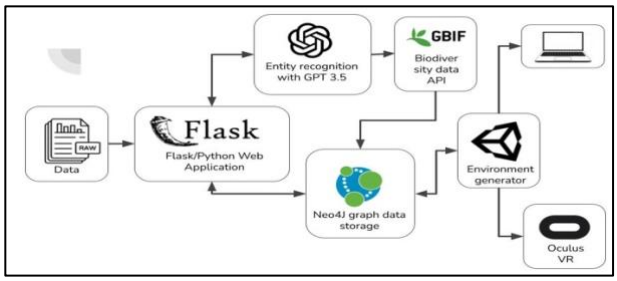

Figure 2: *HeritageRoots* system diagram.

HeritageRoots system consists of two primary modules - a web-based data processing, storage, and visualization module (Module 1), and a stand-alone virtual world Unity3D-based generation module (Module 2).

We developed Module 1 in Python using the Flask web server. The graph data is stored in a Neo4j database, and the graphs are visualized using the D3js Javascript data visualization library. There are two modalities for importing data into the system - a web-based user interface and a data import pipeline from comma-separated values (CSV) files.

To add a narrative to *HeritageRoots*, the user can either copy and paste the narrative's text into a web-based form or upload a file in text, PDF, or Microsoft Word formats. *HeritageRoots* uses OpenAI's Generative Pre-Trained Transformer (GPT) 4 application programming interface (API) to analyze the provided text to recognize the entities, activities, and dialogues described in Table 1.

Table 1: Entities, concepts, activities, and dialogues extracted from text via ChatGPT API.

Recognized Entity	Description
Semantic concept	A semantic concept refers to an ideas and inherent meanings of a word, phrase, or symbol as understood by individuals within a linguistic or cultural framework. Examples of concepts may include words like "mother", "queen", "leader"
Animal	Animals mentioned in a given narrative, including their Linnaean taxonomy
Plant	Plants mentioned in a given narrative, including their Linnaean taxonomy
Named entities	Proper nouns, names of people or places
Physical objects	Ex: house, bowl, blowpipe
Action Verbs	Action verbs represent actions that a character performs within a narrative. For example, a toucan [sits on a branch], [flies], [speaks], [complains]. *HeritageRoots* uses these action verbs to generate animation state machines for Unity3D to represent behaviors of corresponding NPCs.
Utterances	Utterances, monologues, speeches, and dialogues produced by characters within a narrative

Once *HeritageRoots* saves the uploaded narrative in the Neo4j database, the system redirects the user to an interface where identified entities, actions, and dialogs are highlighted and color-coded (Figure 3). The user interface (UI) allows users to make changes to connections, identify entities that were missed by GPT 4, and create additional entities and connections.

The current version of *HeritageRoots* also supports a search functionality that allows users to search by animal, plant, narrative, or geographic location. The result is displayed as an interactive graph (Figure 3) where users can explore connections between nodes, as well as to view the details of each node by and connections associated with each node by clicking on a node of interest.

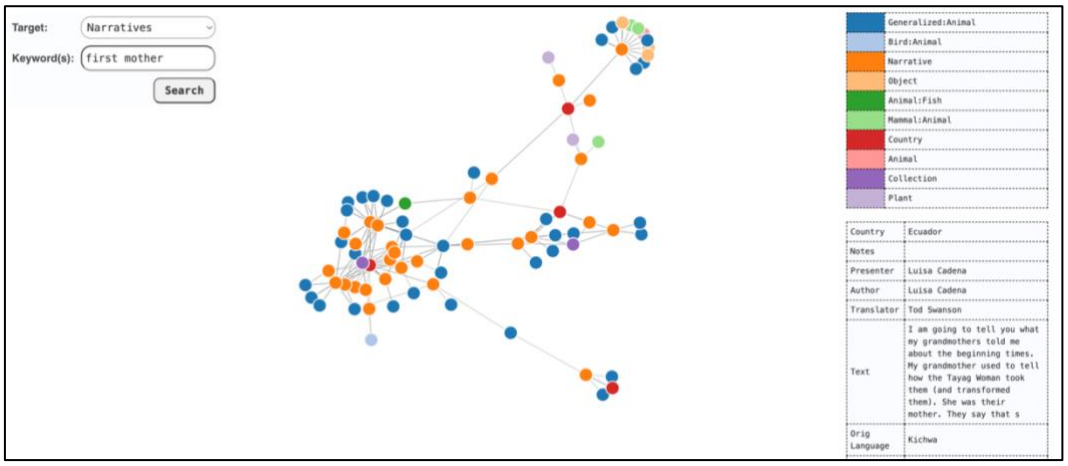

Figure 3: HeritageRoots search results as an interactive graph.

2.3 World Generator Module

The World Generator Module (Module 2) is a set of Unity3D editor tools designed to allow users to procedurally generate terrains, place vegetation and objects, and create animator state machines for NPC animation.

The web-based data management module (Module 1) provides users with the option to generate an API key for every narrative available in the system. The data can be accessed via a RESTful API endpoint, which returns narrative data as a JavaScript Object Notation (JSON) document. That JSON document includes all information available not just for a given narrative, but also on all animals, plants, objects, and media that are linked to it via the KG edges.

In Unity3D, the user can enter the API URL into the desired editor tool (Figure 4). The tool will download all relevant assets linked in the KG, generate a pattern of Perlin noise over the terrain (Burch et al., 2020; Emmanuel et al., 2019; Pop et al., n.d.), and place the assets (e.g. trees, plants, houses) onto the terrain according to user-specified parameters. In the current implementation, we download relevant assets using a standard HTTP request.

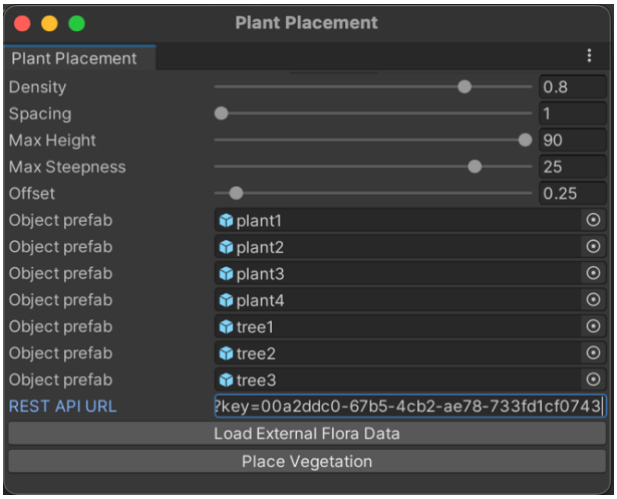

Figure 4: Unity3D module/tool for procedurally placing flora from KG / RESTful API data.

Let us consider the following example. A user (a VR developer) starts with a Unity scene that contains a blank terrain (Figure 9). In the "Plant Placement" editor tool, users can specify vegetation density, minimum required spacing between plants, maximum altitude and maximum steepness at which plants are allowed to be placed on the terrain, and an offset value to make the plan placement appear more random.

A narrative associated with the provided API key (in the REST API URL field, Figure 7) mentions six plants and is subsequently linked to each of these plants in the KG via a graph edge. Each of these plants, in turn, is linked in the KG to a media node containing a 3D model of that plant.

When the user clicks "Load External Data", the system will (1) read data from the *HeritageRoots* RESTful API, (2) download plant assets associated with the specified narrative, (3) generate a pattern of Perlin noise over the terrain, and (4) place plant assets onto the terrain according to the Perlin noise pattern (Emmanuel et al., 2019) and user-provided placement specifications (Figure 7). Perlin noise is a type of mathematical function that creates natural-looking patterns of randomness and is often used in computer graphics to generate realistic textures like clouds, terrain, or marble. Imagine looking at a bumpy surface where the bumps are smooth and gradual, not too sharp or jagged. Perlin noise is like a recipe for creating such surfaces, blending different frequencies of noise to produce a smooth, flowing pattern that mimics natural variations in the real world.

Lastly, the current iteration of Module 2 is capable of generating Unity3D animation state machines from the KG data. The current pipeline uses ChatGPT 4 API to identify animals in narrative texts, as well as to extract all action verbs associated with the animal's activities/actions within the narrative's context. Consider the following text: "*The **toucan** flew from branch to branch. After sitting for a few minutes, it flapped its wings and hopped to a lower branch and spoke.*" *HeritageRoots* will identify characters' actions and after stemming and lemmatization, return a JSON document accessible via *HeritageRoots'* RESTful API (Table 2). Our Unity3D editor tool parses the document and creates an animator state machine (Figure 8c) that can be used with any appropriately rigged 3D model.

```
{
    "label": "Animal",
    "name": "toucan",
    "states": ["idle","hop","fly","flapwings","speak","sit"],
    "transitions": [
        [ "idle", "hop" ],
        [ "idle", "fly" ],
        [ "idle", "flapwings" ],
        [ "idle", "speak" ],
        [ "idle", "sit" ]
    ]
}
```

Figure 5: Example of JSON generated from the identified entities and action verbs after stemming and lemmatization

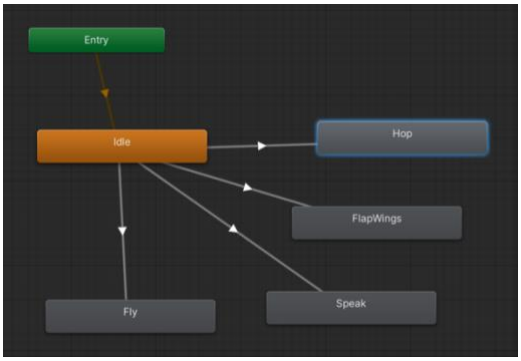

Figure 6: Animator state machine created in Unity3D from JSON shown in Figure 5

3. Technical/Feasibility Evaluation

Our team has evaluated the *HeritageRoots* data pipeline and world generation framework by building a KG with data from three different sources. First, we scraped Wikipedia data related to plants, mammals, birds, insects, and mollusks native to Brazil and Ecuador using a custom Python script. Once we imported flora and fauna data into the *HeritageRoots* KG, we imported narratives from a collection of Amazonian Kichwa language material recorded over the years by Dr. Tod Swanson in collaboration with the Iyarina Center for Learning run by

Fundación Cotococha, an indigenous-led foundation in Napo Province of Ecuador. An experienced team of Kichwa staff members from the Center worked in tandem with Native elders to translate and annotate narratives. A team of undergraduate students imported 12 translated and transcribed Kichwa narratives into *HeritageRoots'* KG. Lastly, our team has downloaded two publicly available Brazilian folklore collections (Albuquerque et al., 2007; Eells, 2008) from the Project Gutenberg website and imported a total of 15 Brazilian narratives into the KG. With all narratives, we verified that the system created appropriate edges and that ChatGPT correctly recognized appropriate entities (e.g., animals, plants, objects) in the narratives' text. This process created a total of 14,418 nodes and 29,452 edges. We checked the validity of relationships (edges) with a Python script to ensure that correct taxonomy had been created for all animals and plants. We manually checked the validity of relationships between narratives and other objects in the KG. The validation showed that 52 edges were not created (an animal or a plant did not get connected to an appropriate taxonomy) and ChatGPT did not recognize 7 animals and 13 plants in the uploaded narratives.

To evaluate procedural plant placement, we uploaded 3D models of three generic tropical plants and three trees (purchased from the Unity Asset Store) as "Media" nodes into the KG and connected them to a Kichwa narrative titled "The First Mother Turns Her Children into Animals.". In Unity, we created a blank scene with a standard first-person controller (FPC) and a simple terrain (Figure 7). We asked seven undergraduate university students with no game development experience in Unity or other game engines to use the *HeritageRoots* world generation tools to populate the blank terrain with flora linked to "The First Mother…" narrative (Figure 8). Every participant was able to populate the scene with flora without any instruction; the maximum time it took one of the participants to navigate the system was 1 minute and 45 seconds (mean time of 1 minute and 3 seconds).

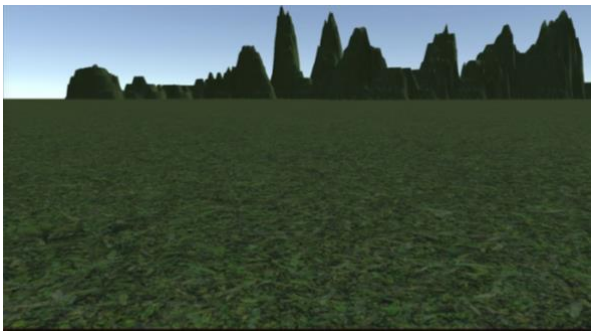

Figure 7: FPC view of a blank terrain in Unity3D, Game view.

Figure 8: FPC view of a terrain populated with flora using *HeritageRoots* world generation tools, Unity3D, Game view.

4. Limitations

In presenting this work, it is important to acknowledge its limitations. We would like to reiterate that this was not meant to be a research paper but rather a technical paper presenting and assessing the feasibility of an idea for a data pipeline that would allow procedural generation of immersive virtual worlds for cultural preservation and education.

One of the major potential limitations of this work is accessibility - the current iteration of *HeritageRoots* does not address potential barriers to access for indigenous communities, such as limited internet connectivity, lack of digital literacy, or availability of necessary devices like computers or VR headsets. To alleviate the impact of

this particular limitation, we ensured that the web-based part of *HeritageRoots* is accessible with 3G internet connectivity and works on older mobile device and desktop browsers, with Google Chrome version 52 (2016) and Apple Safari version 9.1.2 (2016). In addition to creating immersive environments builds for Meta Quest III, we are also working on MacOS and Microsoft Windows builds to ensure wider access.

Another limitation lies on the fine line between cultural preservation and cultural appropriation, especially when using advanced technologies like AI, machine learning, and VR. We acknowledge that in this paper we have not discussed or addressed ethical considerations and strategies to ensure respectful representation and collaboration with indigenous communities throughout the development and use of *HeritageRoots*. Lastly, given the sensitive nature of indigenous cultural knowledge, we have not yet developed robust protocols for data privacy, ownership, and consent.

5. Discussion and Future Work

The *HeritageRoots* system has the potential to address a critical need for the preservation and transmission of Indigenous Traditional Knowledge (ITK) in the face of globalization and cultural erosion. By leveraging advanced technologies such as KG, natural language processing, and procedural content generation, *HeritageRoots* aims to bridge the gap between traditional oral knowledge and modern digital tools. The system's design encompasses a web-based data management module for narrative processing and visualization, as well as a Unity3D-based world generator module for creating immersive virtual environments.

While our evaluation was admittedly shallow and only focused on assessing technical feasibility of the system, we were able to establish that the data pipeline in its current form is capable of representing complex relationships between narratives, characters, environments, and physical objects. This interconnectedness allows users to explore the rich tapestry of ITK in a holistic and interactive manner. Furthermore, the Unity world generation module in combination with HeritageRoots' RESTful API is capable of generating "starter" environments based on indigenous narratives for users with little to no game/VR development experience.

Moving forward, we plan on establishing collaborative partnerships with indigenous communities for co-designing and co-developing the *HeritageRoots*. Incorporating community feedback, cultural protocols, and traditional knowledge systems into the system's design and governance structures is paramount. We will also work on enhancing language support for indigenous languages. We plan on seeking partnerships with non-profit organizations such as *WikiTongues* to integrate tools for language revitalization, transcription, and translation within the platform to empower communities to preserve and promote their linguistic heritage.

Furthermore, we will work on establishing a robust ethical framework for data governance, consent management, cultural sensitivity, and respectful representation, as well as implement Implementing protocols for community-driven data ownership, access control, and data sovereignty to build trust and transparency.

Lastly, we have already begun working on conducting research and evaluation studies on the platform's effectiveness, user experience, learning outcomes, and cultural impact.

6. Conclusion

Based on preliminary evaluation, we believe that *HeritageRoots* has the potential to serve as a transformative tool for safeguarding indigenous cultures, promoting intergenerational knowledge transfer, and fostering global appreciation for cultural diversity. By embracing a participatory and ethical approach, the platform can contribute to the broader goals of cultural sustainability, social justice, and inclusive technology development.

Acknowledgements

We would like to thank the University of Pittsburgh Center for Latin American Studies and the Kenneth P. Dietrich School of Arts & Sciences Digital Narrative and Interactive Design program for providing seed funding for this project. We would also like to thank the amazing staff of Iyarina Center for Learning, a research center in the Ecuadorian Amazon dedicated to integrating indigenous knowledge and the academic arts and sciences. Belgica Dagua Toqueton, Elodia Dagua Toqueton, Elizabeth Swanson Andi, Cindy Sisa Andi Aguinda, Klever Vargas Andi, and Pamela Tapuy Grefa have made this project possible through sharing their knowledge, Kichwa narratives, cultural experiences, and supporting our team in field research.

Developing Graduate Attributes Through Competitive Gameplay and Learning Theories

Gavin Baxter, Thomas Hainey and Alan Williams
University of the West of Scotland, Paisley, UK

gavin.baxter@uws.ac.uk
thomas.hainey@uws.ac.uk
alan.williams@uws.ac.uk

Abstract: The term competitive gameplay or gaming is predominantly associated with esports. Esports, a synonym, or abbreviation for electronic sports is an industry that has a global outreach with a lucrative market. This is accentuated by the event driven, business model focus and organised competitive events, often involving sponsorship. These additional characteristics associated with esports is what distinguishes it from traditional or casual gaming. Though esports games can be played individually, they are predominantly viewed as a team activity. Beyond the debate as to whether esports can be classified as a sport, it is an area that has attracted a significant amount of academic research. Research areas have often included esports psychology, esports player health and nutrition and esports management. Some research studies have also reviewed how esports have the potential to e.0quip esports players with relevant 21st century skills such as critical and lateral thinking. One area where esports appears to be under researched is in the relationship between competitive gameplay and learning theories. It can be argued that this is an important consideration when delivering esports from an educational perspective. The aim of this paper is to provide a scoping review of the esports literature identifying empirical research associated with competitive gaming and graduate attributes. Esports game genres will be explored from a gameplay perspective demonstrating via learning theory examples how these games can facilitate graduate attributes in players. Exploring the domain of esports game genres, learning theories and meta-skills, the paper presents a conceptual model illustrating the interrelationship between these areas. The paper also has practical value to educators, who may be as yet unfamiliar with esports, informing them of the subject's educational benefits from a graduate attribute and employability perspective.

Keywords: Esports, Game Genres, Competitive Gaming, Gameplay, Learning Theories, Graduate Attributes.

1. Introduction

Esports is a global phenomenon that attracts wide ranging audience. It is estimated that by 2025, the esports market in terms of people engaged in esports events and competitions will be over 318 million worldwide. It has also been stated that 322.7 million people will become viewers of esports by 2025 (statista, n.d.). Esports, as a concept, has proved difficult to define as it is a discipline that emits multiple perceptions dependent upon perspective. In comparison to traditional or casual gaming, esports is sometimes perceived as competitive multi-player gaming. Whilst it can be argued that most games are competitive and provide a sense of challenge to the player, it is the organised, event and business model driven nature of esports that distinguishes it from traditional gaming. Regardless of their genre and application, the immersive qualities and engagement factor of video games are supported by the concepts of gameplay and game mechanics.

Whilst a game may be unique in terms of gameplay, game genres have certain universal game mechanics that define and distinguish them. There are various perspectives regarding what constitutes gameplay. Gregory, (2014, p. 847) defines the concept as *"the overall experience of playing a game"*. According to Adams (2014, p. 9) gameplay consists of *"The challenges that a player must face to arrive at the object of the game"* and *"The actions that the player is permitted to take to address those challenges"*. In contrast to gameplay, de Byl (2012, p. 206) states that the term *"game mechanic" refers to "designed game/player relationships that facilitate and define the game's challenges"*. The learning potential of video games and how they can prepare adolescents for learning relevant 21st century skills for employability success has been documented in the academic literature (Yanes et al., 2023). The work of Prensky (2006) articulates the concept of the "Digital Native" referring to someone who has grown up with digital technology. It has often been argued that video games have the potential to positively enhance learning through gameplay (Gee, 2007).

In the context of education and how digital natives learn, empirical research has shown that the application of game-based learning (GBL) and serious games have the potential to inform and educate students on a wide range of topics (Baxter et al., 2021, Yallihep and Kutlu, 2020). According to Videnovik et al., (2023, p.2) *"Game-based learning involves designing and incorporating educational content within a game format, where players actively participate and interact with the game mechanics to acquire knowledge or develop skills"*. For example, empirical research related to games-based learning has focused on how it can be applied to provide students

with critical thinking and problem-solving skills (Qian and Clark, 2016). GBL has also been used as an educational approach to inform students about skills required for undertaking academic research (Abbott, 2019), enhance communication skills (Bodnar and Clark, 2017) and the development of generic graduate attributes (Barr, 2020). Dörner et al., (2016, p.3), define serious games as *"…a digital game created with the intention to entertain and to achieve at least one additional goal (e.g., learning or health). These additional goals are named characterizing goals".* Research has also indicated that serious games can support the development of higher order thinking skills (Van Voorhis and Paris, 2019) and future skills (Gurbuz and Celik, 2022). It appears evident that educational games have the potential to assist students in learning relevant 21st century meta-skills for the world of work. The salient aim of this paper is to explore the applicability of esports in the context of competitive gameplay towards enhancing graduate attributes for employability purposes.

2. Defining eSports

Various definitions and perspectives of esports exist in the academic literature. According to Wagner (2006, p.3) *"eSports" is an area of sport activities in which people develop and train mental or physical abilities in the use of information and communication technologies"*. When defining esports, debates appear to be articulated around the use of the letter "e" in esports and whether esports can be considered a sport (Hamari, and Sjöblom, 2017). Various perspectives abound regarding this debate with esports considered to be a *"… manifestation of sportification"* (Heere, 2018, p. 21). The phrase esports emits different meanings to stakeholders associated with the industry. It is sometimes seen as a "polymorphic domain" defined by some as an "*intellectual exercise"*, as a *"physical activity"* or as a *"business activity"* (Chap et al., 2022). Esports is viewed as a multi-faceted activity also requiring a wide-ranging degree of skill sets in the context of competitive gaming. According to Zhouxiang (2022, p.1), when compared to traditional sports, competitive gaming necessitates *"…skill, strategy, tactics, concentration, communication, coordination, teamwork and intensive training".* The socio-cultural dynamics of esports in the area of competitive gaming are related to the structured approach of the discipline where competitions are organised in leagues and tournaments allowing for the engagement of individual and team competitions (Werder, 2022).

3. Competitive Gameplay and eSports Genres

Similarly to traditional gaming or when engaging with social, casual, and mobile games, esports games also encompass various game genres. In the domain of competitive gaming several popular esports genres exist that consist of differing elements of gameplay and mechanics. It has been articulated in the literature that when engaging in the playing of esports, there are various performance indicators that are taken into account. Examples include cognitive, sensorimotor, and physiological that may vary dependent upon different game genres (Toth et al., 2021). Esports titles, when played competitively, are divided by "tiers" where tier-level esports are associated with prize pool amounts, hours watched and impact of viewings via social media (Migliore, 2021). Hence the perception that esports are viewed as *"organized video game competitions"* (Jenny et al., 2016, p.4). It has been argued that what drives esports players are the gaming motivations of interactivity and competition. Interactivity is defined as *"… the opportunity to communicate and cooperate with other gamers in the online environment, and competition is the mechanism by which gamers can compare themselves to each other"* (Bányai et al., 2019). Esports game genres are predominantly classified into five types played globally in events running online and offline: fighting games, first person shooter games (FPS), real time strategy games (RTS), sport video games (SVGs) and multiplayer online battle arena games (MOBA), (Qian et al., 2020).

Table 1: Provides an overview of the some of the salient esports' genres and characteristics (table by authors).

Esports Game Genre	Definition/Description	Characteristics of Genre	Game Examples
Fighting Games	"… a fighting game is usually a one-on-one combat game, often themed with two humanoid characters punching and kicking each other, and usually seen from a side view" (Burgun, 2013, p. 117).	Player-controlled characters engage in combat in fixed-space, close-quarters setting, sideways, 2D viewpoint (Migliore, 2021).	Street Fighter 6, Tekken 8, Mortal Kombat 1
First Person Shooter Games (FPS)	"FPS games are played from the first-person (egocentric) perspective of a single protagonist who is generally charged with combating enemies while navigating through a three-	Played from subjective experience, camera becomes avatar, emphasises presence,	Counter-Strike 2, Tom Clancy's Rainbow Six Siege

Esports Game Genre	Definition/Description	Characteristics of Genre	Game Examples
	dimensional environment" (Dobrowolski et al., 2014, p. 60).	sensorially immediate, very immersive (Rehak, 2008).	
Real Time Strategy Games (RTS)	"… viewed as simplified military simulations. Several players struggle over resources scattered over a 2D terrain by setting up an economy, building armies, and guiding them into battle in real-time" (Buro, 2003, p. 1).	RTS' based on strategy, tactical decision making. Play can be turn-based or real-time, use of multiple avatars, resources collected to develop units and structures (Migliore, 2021).	StarCraft II, Warcraft III, Age of Empires II
Sport Video Games (SVGs)	Sometimes referred to as sports simulation games though viewed as "Games which are adaptations of existing sports or variations of them" (Wolf, 2008, p. 272)	Usually have various roles player can engage in (e.g., acting as a player, coach, manager over period of years), (Adams, 1999).	NBA2K, EA Sports FC, NHL
Multiplayer Online Battle Arena Games (MOBA)	"… MOBA games are a subgenre of real-time strategy games in which two teams, typically consisting of five players each, compete against each other with each player controlling a single character" (Mora-Cantallops and Sicilia, 2018, p. 128).	Focus on combat tactics, involves metagaming, individual character development, combat, cooperative team play ((Mora-Cantallops and Sicilia, 2018).	Defense of the Ancients (Dota), League of Legends (LoL)

4. eSports Genres and Graduate Attributes

There are various research studies that have been associated with esports as an activity that relate to developing learning and skills enhancement (Rusk and Ståhl, 2022, Zhong et al., 2022). Similar to traditional gaming, there are commonalities with competitive gaming in terms how game mechanics can facilitate esports players' skill sets for employability purposes and the world of work. Game mechanics such as game spaces, the aspect of time (e.g., turn-based or racing games), decision making through the use of objects in a game (e.g., characters, props, tokens), the embedding of basic and strategic actions, the rules of the game, the aspect of skill (e.g., physical, mental, social), (Burgun, 2013, Schell, 2020, Fullerton, 2019) are prevalent mechanics esports players engage in through gameplay. It can be argued that esports as discipline has a correlation to the graduate attribute and employability literature. Though there are differing definitions regarding the concept of employability within higher education, it can be perceived as *"… the development of a range of attributes and skills at university that can be transferred into situations beyond university study"* (Gunn, Bell and Kafmann, 2010, p.1). Despite at times being programme specific, graduate attributes can be transferable and generic (Green, Hammer and Star, 2009). Figure 1 provides a conceptual overview of some of the salient graduate attributes obtained through competitive gameplay and the engagement of game mechanics.

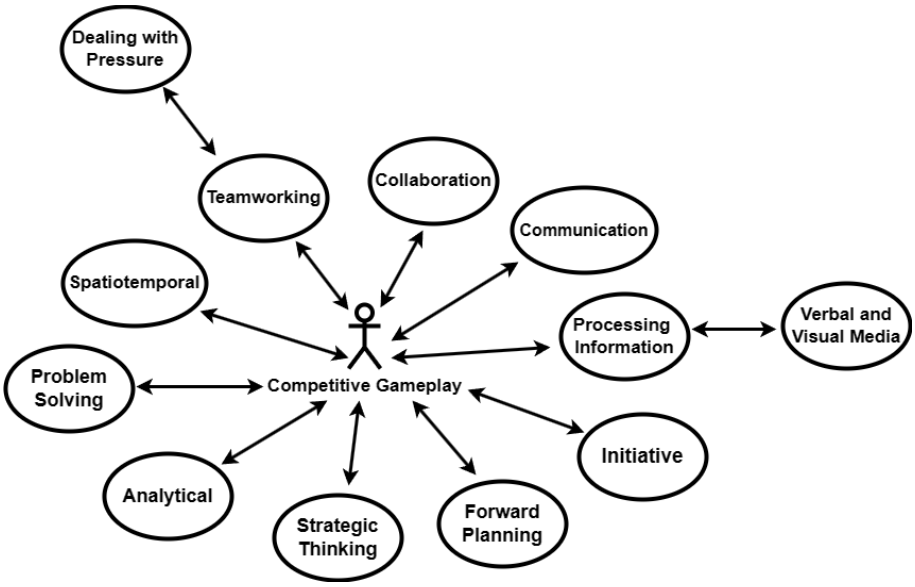

Figure 1: Graduate attributes examples gained through competitive gameplay (figure by authors).

According to Smithies et al., (2020, p.2), esports players possess a range of *"specialized skills and experiences*" with attributes that include: digital intelligence, experience in computer human interaction, communication and enriched cognitive capabilities. Success within an esports team is often dependent upon team members having proficient communication and teamworking skills. Esports players, in certain game genres, have predefined team roles. This is prevalent in MOBAs where teams are formed of five players with differing roles, sometimes consisting of a champion, with the intention of optimising team performance (Buchan and Taylor, 2016). FPS games can, through their unique gameplay, accommodate and support the ability to adapt and learn, metacognition and reflective practice in addition to skills such as *"… attention, visual short-term memory, spatial cognition, and decision-making"* (Neri et al., 2021). Tactical and strategical skills are also important in addition to the skill of sensory-motor control (Toth et al., 2021) such as skills of movement resulting in enhancement of player performance and actions. A study by Reynaldo et al., (2021) found that RTS players outperformed FPS players in relation to cognitive flexibility. RTS players often require skills associated with problem solving, decision making, tactical and reactive control which relates to macro and micromanagement. Marco management refers to *"…long term planning, like strategies conducted in the early game, technology upgrading, and scouting"*. Micromanagement, on the other hand, is associated with the player's ability to *"…control a group of units in combat or other skirmish scenarios to minimize unit loss and maximise damage to opponents"* (Liu et al., 2014, p. 1). From an employability and graduate attributes perspective, competitive gaming can provide students with a platform to learn, develop and enhance meta skills for the world of work.

5. eSports Genres and Learning Theories

Within the domain of esports, research into the area of learning appears to be *"…an immature research field"* (Ye et al., 2021, p. 363). Academic research has evidenced how esports can facilitate and support the development of meta-skills among esports players (Zhong et al., 2022). However, there appears to be little published research relating to how esports game genres and gameplay can accommodate different learning theories. Meta-cognitive experiential learning is one learning theory that has applicability regarding how esports players learn towards improving their abilities. Experiential learning theory (ELT) identifies learning as *"the process whereby knowledge is created through the transformation of experience. Knowledge results from the combination of grasping and transforming experience"* (Kolb, 1984, p.41). For example, the immediate or concrete experiences from having played a game can allow esports players and teams to reflect upon their experiences, conceptualise these and test the implications of these reflections to improve performance in future gaming scenarios.

Social learning theory (SLT), is associated with observational learning, learning from others and also from the direct experience of an individual's environment (Hong and Craig, 2023). The concept of social learning theory supports learning in esports teams especially when reviewing gameplay from prior tournaments, analysing their performance, collectively providing feedback and advice on how to enhance performance. The theory of social learning also involves cognitive processes where *"… learners internalise and make sense of what they see in order to reproduce the behaviour themselves"* (Horsburgh and Ippolito, 2018, p. 2). The learning theories of constructivism, cognitive and social, are also both directly relevant to aiding learning and enhancing meta-skills from an esports gameplay perspective. Constructivism is associated with the premise that learners devise or construct new knowledge or understanding by engaging through experience or social discourse. It can be argued that constructivism can be related to solving real-world problems through active learning in context. Constructivism also involves learners applying new knowledge to improve upon new or current scenarios with feedback and self-reflection part of the learning activity (Yoders, 2014). New knowledge acquired in mastering various techniques or roles in a game (e.g., a MOBA) through active learning can aid an esports players self-determination and self-efficacy.

Connectivism, a learning theory based on distributive knowledge, also has the potential to facilitate learning in an esports setting. In the context of connectivism, *"Connective knowledge is created by interactions with people who are linked to various networks and thus is distributed across a web of individuals"* (Jung, 2019, p.50). When engaged in MOBA games, esports teams, through network connectivity, can share new knowledge they have learnt through prior matches, this can sharpen decision making in real-time play and allow networked learning to collectively develop and enhance both player and team performance. Table 2 provides an example of five learning theories that can support the learning of meta skills in an esports concept.

Table 2: Examples of learning theories and how they facilitate meta skills through competitive gameplay (table by authors).

Learning Theory	Main Characteristics	Relation to Graduate Attributes and eSports
Experiential Learning (Kolb, 1984)	Learning through experience, learning can occur in any context, process of learning begins in a four-step experiential learning cycle: experiencing (concrete experience), reflecting (reflective observation), thinking (abstract conceptualisation) and acting (active experimentation).	Esports players or teams can learn something new when engaged in a particular game (e.g., a new technique that enhances performance), reflect upon this experience , make sense of it with a plan of action for improvement in addition to testing new ideas.
Social Learning Theory (Bandura, 1977)	Learning viewed as a cognitive process, occurs in social contexts through an observational learning process leading to imitation and enhanced self-efficacy.	Esports players or teams can observe and analyse their performance individually or collectively, learn and reinforce their learning from the behaviours of team members through positive feedback.
Constructivism (Piaget, 1964)	Learners actively construct new knowledge based on their previous experiences and interactions, individuals build a repository of experiences from which they learn.	Massively Multiplayer Online Games (MMOGs), via their design principles can provide scope for a constructivist learning environment (Muñoz Rosario and Widmeyer, (2009), Bonk and Denner, (2005).
Social Constructivism (Vygotsky, 1978)	Learning and knowledge is formed via social interaction through communication, dialogue with peers when engaged in real life tasks. Associated with 'Zone of Proximal Development', 'Intersubjectivity', and 'Enculturation' (Woo and Reeves, 2007).	Enhancement of player performance can be achieved through interaction with coaches, esports team members through collective peer and teacher inquiry, providing guidance through dialogue and feedback.
Connectivism (Siemens, 2005)	Learning viewed as a "network phenomenon", adheres to concept of distributed knowledge, impacted by technology and socialisation (Goldie, 2016).	Esports players can communicate and coordinate strategies through a network of knowledge and expertise, share instructions and enable quick strategic decision making.

6. Conceptual Model: eSports, Learning Theories, Meta Skills

The conceptual model presented provides a theoretical overview of the integration of learning theories deemed applicable to supporting the development and enhancement of meta-skills through the engagement of competitive gameplay. The model commences with the concept of self-determination theory (SDT) (Deci and Ryan, 1985) which encompasses two associated theoretical principles of intrinsic and extrinsic motivation. Intrinsic motivation results in the overall satisfaction and enjoyment of a particular task where the psychological requirements of competence (having the knowledge or skill to perform the task), relatedness (sense of belonging to others), and autonomy (ownership of one's behaviour and decisions), (Mills et al., 2018). Extrinsic motivation relates to when an activity is undertaken to obtain an outcome that is external to the activity being performed. In the context of competitive gaming, esports players can be intrinsically motivated to gameplay concepts such as immersion, challenge, improvement of skill, competing against other players, online engagement whereas extrinsic motivation relates more to entering tournaments to gain notoriety among players or for the aspect of tournament prize money. Via the five esports game genres exemplified in the model, some of the salient skill sets esports players can acquire through competitive gameplay are outlined. How learning is supported through competitive gameplay via salient learning theories applicable to esports leading to the acquirement of meta-skills and graduate attributes are shown as being interrelated.

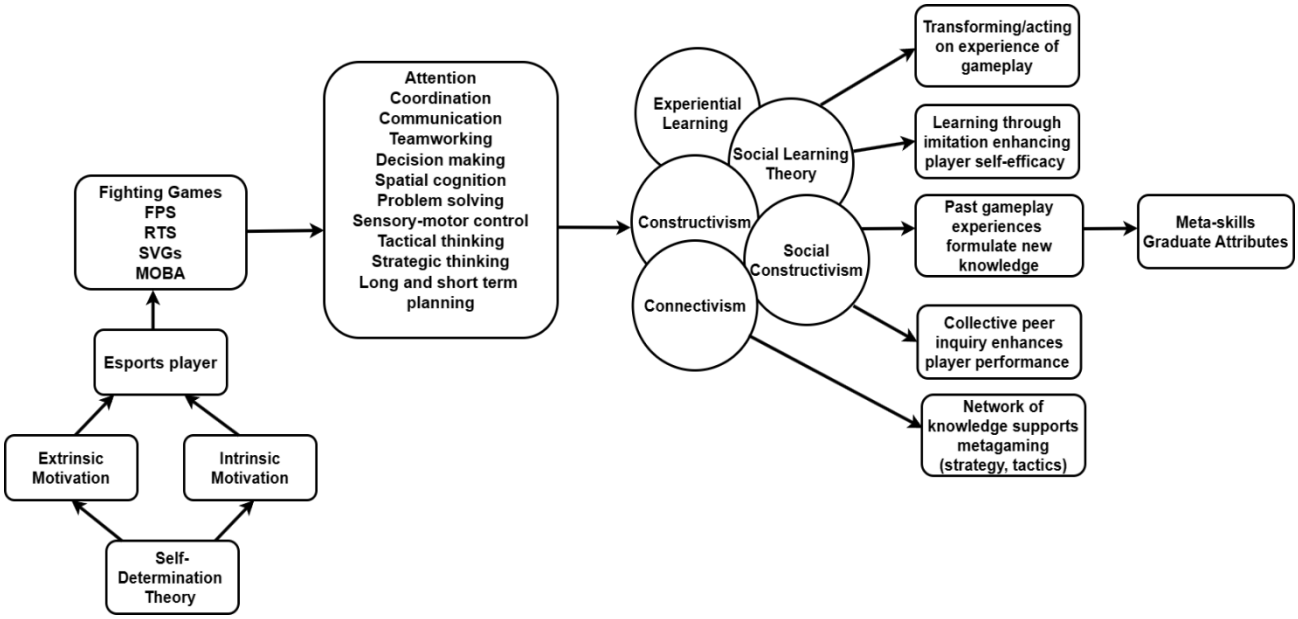

Figure 2: Interrelationship between esports, learning theories and meta-skills (figure by authors).

7. Limitations and Future Directions

The aim of this paper was to provide a preliminary scoping review of esports from a competitive gameplay perspective with a view to articulating how the underpinning of learning theories are naturally inherent in esports game genres. From a theoretical and conceptual standpoint, it has been argued that when utilised constructively and strategically, the learning and accumulation of knowledge that coincides with competitive gameplay can lead to the attainment of meta-skills, preparing graduates for the world of work. The theoretical foundations of the research are still at an early stage with more work required from an empirical standpoint to substantiate the ideas articulated in this paper. It is acknowledged that additional esports game genres in relation to additional learning theories accommodate competitive gaming require to be explored. Moving the research forward, a systematic literature review will be performed searching relevant academic databases that the authors have subscription to via their academic library. Preliminary search terms will include: ("esports" OR "electronic sports" OR "competitive gaming" OR "online gaming" OR "FPS" OR "RTS" OR "MOBAs" OR "MMORPG" OR "fighting games" OR "SVGs" OR "genres") which will be refined and expanded to include additional esports game genres. Terms impacting and influencing the acquirement of graduate attributes through gameplay will include: AND ("skills" OR "graduate" OR "meta-skills" OR "attributes" OR "learning" OR "education" OR "outcomes" OR "enhancement" OR "motivation" or "engagement").

At present, the primary limitation of the of the research is the lack of empirical evidence to substantiate the theoretical propositions proposed in the paper. Though still in the preliminary stages of the research design, it is intended that the research will adopt a parallel mixed methods design (Tashakkori et al. 2021) utilising data gathering techniques that will include questionnaires, semi-structured interviews and focus groups. The aim in doing so will be to obtain a breadth of opinion and perspective from various esports stakeholders (e.g., educationalists, esports players) to assess and evaluate viewpoints about the learning potential of esports as an academic discipline and if it can equip graduates with meta-skills. It is intended that the research will benefit the wider esports community and educators considering whether to introduce an esports programme within their academic institutions. The proposed conceptual model, which is in a very rudimentary stage of development, will also need to be refined. The dilemma is whether to focus on one specific learning theory as an amalgamation of several may be too wide ranging in academic scope.

A Systematic Review of Examples and the Effectiveness of Game-Based Learning Used To Teach History in K-12 Education

Thomas Bjørner
Aalborg University, Department of Architecture, Design & Media Technology, Copenhagen, Denmark

tbj@create.aau.dk

Abstract: This systematic review is intended to assess the examples and effectiveness of game-based learning (GBL) in teaching history in K-12 education. The review also aims to identify gaps in the current GBL literature and provide future research and development guidelines to improve learning outcomes when incorporating GBL in teaching history. This systematic literature search was conducted using Scopus, focusing on studies that utilized games to address historical teaching in K-12 education. The PRISMA methodology procedure was followed. A total of 688 studies were initially identified, and after the first screening, 360 studies remained. Twelve studies fulfilled the inclusion criteria. The systematic review concludes that games used to teach history in K-12 education vary considerably in content, users, contexts, teacher approaches, and technology. Most of the included studies reveal positive motivational factors when GBL is used. However, only very few studies can provide significant results on the learning outcomes. Most evaluations are based on self-reporting, primarily questionnaires and knowledge tests. Specific learning objectives are rarely included in the games. Future studies could include more participants and other methods to measure the learning effectiveness of GBL.

Keywords: Game-based Learning, History, Systematic Literature Review, K-12 Education, Evaluation, Learning Effectiveness

1. Introduction

Around the world, schools place a high value on teaching pupils and students about history. Through knowledge of countries' histories, pupils can understand their own and other societies. Reading history is a skill with many graduations of proficiency, and learning history is more than names and dates (Wineberg 2001), as it entails inquiry or historical thinking, which calls for using abilities such as perspective-taking, historical analysis, historical comprehension, and argument creation (Craig 2017). However, many pupils have difficulties in history, mainly because the subject can be rather text-heavy and based on the utilization of a teacher-centered teaching approach (Koutromanos et al, 2020).

The PISA 2022 results revealed that, on average, across OECD countries, 26% of students were low performers in reading (OECD 2023). One approach to supplementing the traditional analog reading in history is incorporating game-based learning (GBL). The aim of including GBL is often to improve pupils' engagement and learning about various historical subjects (Baxter et al, 2021; Oceja et al, 2022), making it easier to memorize and understand facts, concepts, time, and historical events. Using games to learn history subjects can also increase interest, make history seem alive, and use technologies such as VR and AR (Rammos and Bratitsis 2019; Ventoulis and Xinogalos 2023). However, history education suffers because the past needs to be demonstrated and experienced directly. Many aspects of games must be suited to history teaching. Games are very good at providing narratives, going back in time to show—and, not least, include—users in historical settings with various interactive elements, with the potential for enhanced experiences with personalized and immersive elements.

GBL can be seen as a teaching supplement to provide continuous motivation for learning, as opposed to motivation loss due to repetitive teaching formats. GBL can complement history teaching, in addition to a range of other established materials such as YouTube clips, film/cinema, documentaries, museum visits, field trips, and festivals. Most literature indicates that GBL can be used to engage and motivate pupils and students in the learning process (Al-Azawi et al, 2016; Bjørner et al, 2022; Bjørner et al, 2023; Chen and Chang 2020; Clark et al, 2016; Karakoç et al, 2022; Lampropoulos et al, 2022), making learning more fun and enjoyable. However, the effects of GBL on specific learning outcomes are diverse and inconclusive (Connolly et al, 2012; Fendt and Ames 2019; Roozeboom et al, 2015; Ventoulis and Xinogalos 2023).

There seem to be significant challenges in measuring the learning outcomes of GBL (Roozeboom et al., 2015). This systemic review will provide an overview of examples and the effectiveness of GBL in teaching history in K-12 education. The research questions are as follows:

1. Which methods are used to evaluate the learning outcomes of implementing GBL to teach history in K-12 education?
2. How effective is GBL for improved learning in teaching history in K-12 education?

Most previous literature revealed that pupils playing historical games are more engaged than pupils receiving traditional instruction. However, it is also important to emphasize that studies on using GBL to teach history have taken place in various contexts, including diverse user groups, school/teaching settings, cultural and geographic contexts, gaming technologies, and use cases, with a wide variety of historical content. This systematic review is intended to assess the examples and effectiveness of GBL in teaching history in K-12 education. The review also aims to identify gaps in the current GBL literature and provide future research and development guidelines to improve learning outcomes when incorporating GBL in teaching history.

The definition of learning outcomes also varies across the literature. For this review, learning outcomes are defined similarly to how Adam (2006 p. 2) describes it: "statements of what a learner is expected to know, understand and/or be able to demonstrate at the end of a period of learning." Learning outcomes are often valued in curriculum development. However, the definition also faces some challenges in defining the end of a learning period. Further complexity is involved in learning at various levels, including interpretations of what a learner is, what is expected, and what it means to understand and/or demonstrate.

2. Methods

2.1 Literature Search Strategy and Exclusions

The electronic bibliographic database Scopus was used for conducting this literature search. The search strategy was based on the following keywords: TITLE-ABS-KEY (game* OR serious game OR game-based learning), AND TITLE-ABS-KEY (history* or cultural heritage) AND TITLE-ABS-KEY (teach*) OR (learn) OR (learning outcomes). To collect the latest studies, each study's publication time was restricted to range from January 2009 to February 2024. The search filter was restricted to history and cultural heritage (by click boxes in Scopus). Further, the identification included that the search included only articles, conference papers, book chapters, and books in English. The search excluded reviews and notes. In case they were not identified during the whole search process, references from Google Scholar, reviews, and systematic reviews were also checked manually for further screening. The PRISMA methodology procedure was followed, with the overview in Figure 1.

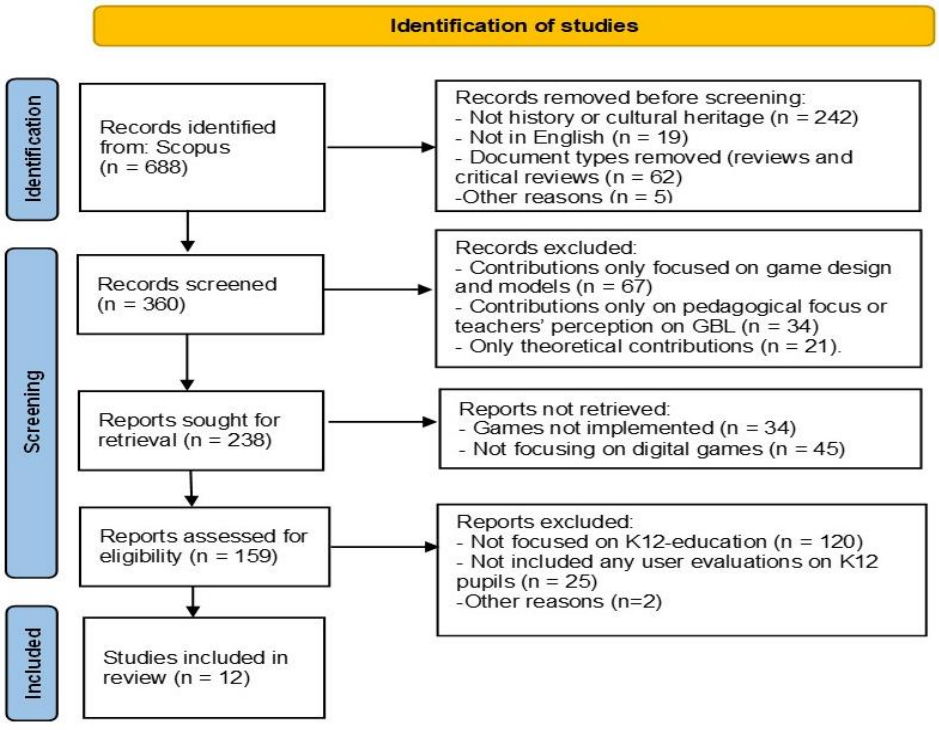

Figure 1: Literature Screening and Selection flowchart

360 records were screened but excluded in the further filtering because the contributions were only focused on game design and models (n = 67), pedagogical focus, or teachers' perceptions (n = 34); for example, the contribution from Andersen (2019), or only theoretical contributions (n = 21). By this filtering, most remaining records provided evaluations of games used in history teaching. However, it is interesting that a substantial

number of contributions (n = 67) include general game design aspects for teaching history but do not include focus on the evaluation. This included, for example, excluded studies such as Azzahra et al, 2023; Ghulamani et al, 2017; Hutson and Fulcher 2023; Ohyama et al, 2020).

For further screening, the educational games need to be implemented, excluding, e.g., contributions with only early-stage low-fi prototype testing (n = 34). This review focuses on digital games, and by that, board games (e.g., Humpire et al, 2022) or other playful learning (for example, roleplaying) were excluded (n = 45). Excluded are studies using simulations (e.g., VR and AR) without game elements, including e.g., the contribution from Efstathiou et al (2017).

The included studies had to be within games used for history teaching in K-12 education. K–12 education is a term that indicates the range of years of supported primary and secondary education, typically ranging from kindergarten to 12th grade. This means that some of the many studies within a high school or university context for teaching history are excluded (n = 120). This includes studies like Ekonomou and Vosinakis 2018. However, an essential aspect of this review was to focus on K-12 education and, within this, also the cognitive abilities for performing various evaluations within this group. Few studies are excluded (n = 25) for being tested at another target group than the game was developed for; this is e.g., the case with the study from Fernes et al, (2023).

2.2 Data Analysis

A predetermined grid was adopted to perform data extraction, including the following information: author, publication year, topic (historical content of the game), game technology (e.g., PC, VR AR), number of participants (sample size), grade and age, setting/ location (context), evaluation methods, and main outcomes. These categories in the grid are like other studies (Oceja et al, 2022), but this study follows more detailed and structured information. The extracted contributions for inclusion were quality assessed by a second reviewer. Because of the high heterogeneity of the studies' measures and the limited articles (n = 12), a narrative synthesis was performed. Meta-analysis was unfeasible to run as the measurement units of each study were not comparable. Therefore, a narrative synthesis was conducted, concentrating on the general characteristics of the included studies.

3. Results

3.1 Overview

As with many other studies in GBL, the number of contributions has increased dramatically (Figure 2). In the literature search for this review (before the screening, n = 688), there were 20 contributions in 2009 - but more than 60 in 2023.

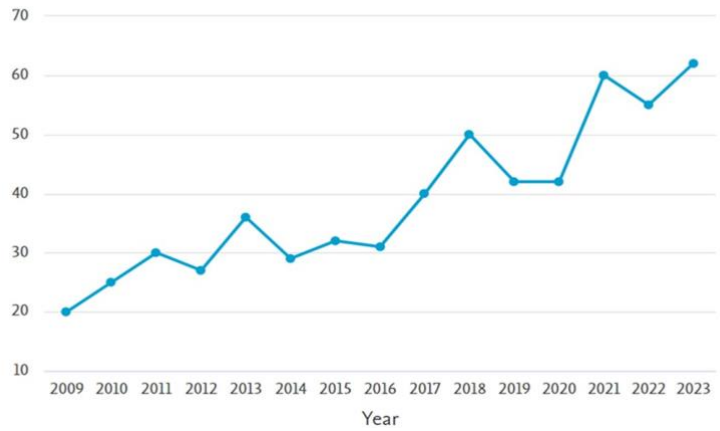

Figure 2: Identified numbers of contributions.

The studies cover various fields, perspectives, and game technologies. Interestingly, most of the contributions are from computer science (29.5%) and social science (24.5%), whereas the contributions from art and humanities are less present (9.5%). Most contributions (92 %) are from conference papers or journal articles.

3.2 The Included Studies

The studies included in this review are listed in Table 1 below.

Table 1: Studies included in the review (n = 12)

Study and Topic	Topic and Game Technology	Participants and Location	Evaluation Methods	Main Outcomes
Huizenga et al, 2009	Historical knowledge of medieval Amsterdam Mobile city game	458 pupils from 20 classes from five schools, Netherlands.	• A quasi-experimental design and grounded theory approach • A/B test, game vs. regular lesson. 10 classes played the game/ 10 classes regular lessons. • Oral reports provided by guides • 110 Observation forms • - 1550 game days were transcribed.	• Pupils who played the game gained significantly • more knowledge about medieval Amsterdam than those with regular instruction. • - No significant differences in the motivation for the history between the A/B group.
Sedano et al,, 2013	Local Finish history Hypercontextualized Game/ Storytelling game	101 pupils, Grade 7 pupils, aged aged 13 and 14, Finland.	• Questionnaires, including • multiple choice and composition questions measuring cognitive and affective engagement.	• significant correlation between (a) fantasy and (b) affective and cognitive engage-ment. • - affective and cognitive engage-ment, through the fundamental ele-ment of fantasy, in the game narrative is essential.
Tegos et al, 2014	The Balkan Wars, World War I, and World War II PC game	34 5th grade pupils. Aged 11 to 12 years old, Greece.	• -Pre/post test design. • Pre-questionnaire followed by (one week later) gameplay. • - Collaboration in dyads to compose a story based on cards from the game.	• Positive opinions about the game.
Chintiadis et al, 2018	Greek Mythology/ Trials of the Acropolis VR game	28 pupils, Greek Schools, Greece	• -Questionnaire, 23 items on a 7-point Likert scale, 3 items on perceived learning. • -Focus group	• Positive opinions about the game. • Making the learning environ-ment natural is essential. • self-reported faster learn
Drosos et al, 2018	El Greco's Travels and Artwork 3D game	20 pupils. Aged 6-15, primary and secondary school, Greece.	• - Questionnaire with 11 items - knowledge quiz for "El Greco" of 7 questions.	• - self-reported increased learning about El Greco – increased

		75 pupils, se-condary school. ? Spain ?
		
		Experiment 1: 25 pupils aged 12 years old. Experiment 2: 50 pupils, 25 pupils in both the experi-menttal group and the control group.
			• A quasi-experimental design.
			• Experimental group/ Control group.
			• Questionnaire, 5-point Likert scale
			  • - Knowledge test/ no. Of correct answers.
				• Increased interest in studying history
				• greater fixation on
				  • different concepts

Ventoulis and Xinogalos 2023	Greek Mythology.
	
	AR Mini games
		31 pupils, primary school. Greece	• Pre-/post-test design
			• Knowledge test
			• The game experience questionnaire was adopted using the MEEGA+ model.
			  • - Qualitative note-taking and think aloud during gameplay
				• improved perform-ance after playing the game, but no statistical significance.
				• Positively perceived the AR mini-game.
				  • A perceived "learn while playing".

Petersen et al, 2023	Bombardment of Copenhagen in 1807 PC game	22 pupils, aged 13 or 14. Elementary school, Denmark.	• A/B test, Game vs. regular lesson (text), • Experimental group (11 pupils)/ control group (11 pupils). • knowledge test • Questionnaire with engagement items • Semi-structured interviews • - No significance test	• Higher under-standing of specific learning objectives in the experimental gaming group compared to the control group • High perceived perceived intuitiveness and

Study and Topic	Topic and Game Technology	Participants and Location	Evaluation Methods	Main Outcomes
				clarity for the game. • - positive per-ceptions of clarity in the game's narrative.
Carrascosa et al, 2024	Historical events in relation to BC and AD AR game/ gamification	76 pupils. Intervention 1: 19 pupils, 5th grade. Intervention 2: 57 pupils, 2nd and 3rd year, secondary school, Spain.	• Intervention 1: Quasi-experimental pre-post design. Single treatment • group. • Intervention 2: Experimental pre-post design, with a control group and experimental group. Experimental group (29 pupils)/ Control group (28 pupils). • -Knowledge test pre/post • -Motivation and usability, 16 items, 5-point Likert scale. • - No significance test	• AR with gamification improves learning outcomes • - Positive impact on motivation and emotions.

Despite the relatively strict screening, the results from the 12 included studies are rather heterogeneous. The included contributions range from 2009 to 2024, during which there has been considerable technology development, with more recent (from 2018) included VR and AR studies. Notably, the contributions rarely do not include the novelty effect – with the potential that the pupils have the most robust response the first (or second) time they play the game, and by that, the studies can face potential bias for both the learning effectiveness and engagement.

Some studies involve games played at school, whereas others are outdoors on site (Huizenga et al, 2009; Koutromanos et al, 2020). Outdoor games can be affected by weather conditions, making them difficult or impossible to play at certain times of the year. There can also be problems with Wi-Fi connections, as already highlighted in the study by Koutromanos et al. (2020).

The topics in the contributions are very different, though a majority (8 out of 12) of the studies include ancient or medieval history. Most of the participants included in the contributions are between the ages of 11 and 14. Like other GBL research, the studies have very different numbers of participants. The highest number of included participants is 458 pupils (Huizenga et al, 2009), followed by 101 students (Sedano et al, 2013). 8 out of 12 studies are included with 20-35 participants.

Several studies are within an A/B test set up for measuring the differences in the game use and regular lessons with analog text read (e.g., Huizenga et al, 2009; Fendt and Ames 2019; Petersen et al, 2023). Six studies are included as a quasi-experimental study and have included both an experimental and control group. Questionnaires are often combined with qualitative methods (interviews, focus groups, observations, note-taking, think-aloud). Two studies are found with an only qualitative approach (Rammos and Bratitsis 2019; Koutromanos et al, 2020).

Interestingly, almost all studies found increased motivation and/or engagement by using GBL in historical teaching, except for Huizenga et al, 2019. Most of the studies also found positive effects on learning, but there were considerable differences in how learning is defined and how the teachers were involved in the learning. Only very few studies can provide significant results (Huizenga et al, 2009; Sedano et al, 2013) on the learning outcomes. Few studies also reported no difference in learning by using GBL (e.g., Fendt and Ames 2019).

4. Conclusion

As with many other studies in game-based learning, most of the studies included in this systematic review reveal positive perceptions about the included games used and an increased motivational factor for learning history. The novelty of this systematic review is a specific focus on game-based learning for teaching history in K-12 education and a focus on the methods used to evaluate the learning outcomes. The most common methods

used to evaluate learning outcomes of GBL in history for K-12 education are self-reported questionnaires and knowledge tests, often as pre-/post-tests. The knowledge test questions are often direct questions related to the learning content provided by the game, thus putting more emphasis on these exact questions. Most studies include rather few participants. Within the included studies for this systematic review, only two studies have more than 100 participants included. Longitudinal studies are absent.

The included studies highlight educational and learning objectives very differently. Analyzing the complex relations between topic, context of use, user groups, technological solutions, and number of participants is still a significant challenge for providing profound results in learning effectiveness via GBL in history teaching in K-12 education. Some studies reveal that pupils who used game-based learning gained significantly more knowledge about history than those with regular instruction. Other studies showed no increased learning effect by using game-based learning. However, it is complicated to compare these studies, and one should be careful not to conclude too quickly regarding learning outcomes across studies. Notably, specific learning objectives are rarely included in the games. The topics and the settings are also very different across studies, and even within the same studies, settings vary between the included experimental groups, making it difficult to repeat the studies.

For future works, it would be very beneficial if more studies included more participants to provide statistically profound results. It could also benefit if more studies used randomization, meaning that the participants are grouped by chance—either being randomly assigned to the intervention (game-based learning) or the control group (traditional teaching). It is also worth highlighting that studies should always be transparent in the research design and sampling methods.

When evaluating GBL for pupils in K-12 education, it is essential not to neglect the challenges of finding the right match between participants' cognitive abilities and a solid methodological approach. We need to challenge and reflect more on the methods used. For example, it is worth discussing if the suitable method is to use a 5- or 7-point Likert scale for kids aged, e.g., 11-12 years old, in terms of motivation and understanding the questions and scaling. Future studies could include more advanced and novel methods for incorporating improved methods to measure the learning effectiveness of GBL. Future studies could include more participants and variables such as gender, genre motivation, text expectations, and specific reading differences between analog and digital text.

Abstract: Computational Thinking (CT) refers to a specific set of mental skills used to formulate solutions to problems by converting given inputs to produce appropriate outputs while following detailed algorithms to perform this process. Essentially, CT is broadly defined as a combination of thinking processes which include abstraction, algorithm design, decomposition, pattern recognition and data representation.

Board-games can be used in the educational process as a learning tool while creating an attractive and authentic learning environment, providing an educational approach which is transdisciplinary, developing and utilizing multiple skills. Using board-games in Early Childhood Education (ECE) cultivates students' social skills, 21st century skills and cognitive skills, while helping them to increase their motivation and achieve the objectives of the curriculum framework.

In this paper, the aforementioned areas are combined through the presentation of a board-game that was designed within the CThink.it Erasmus+ project (2022-1-MT01-KA220-SCH-000086903) for cultivating CT competency in the early years. The backstory is a toy, lost in a museum and through a series of activities, it is to be returned to the child-owner. Prior to designing the game, a systematic literature review was conducted so as to provide foundation for the game itself and a set of associated lesson plans.

The produced materials were pilot tested in schools. The paper aims to provide preliminary data for the game evaluation, focusing on the issues of playability, age appropriateness, connection to curricula and the teachers' perspective on the usability of the game as teaching resource for ECE. For that, the research methodology will be presented, along with preliminary findings.

Keywords: Computational Thinking, Board Games, Early Years, Cards

1. Introduction

Computational Thinking (CT) refers to a set of mental skills, related to problem solving. According to Denning (2009), such skills are used to convert provided inputs for producing appropriate outputs through designing and following detailed algorithms for realizing this process, thus formulating solutions to the initial problematic state. Wing (2006) described it as a combination of thinking processes which include abstraction, algorithm design, decomposition, pattern recognition and data representation.

With the increased integration of technology in everyday life, the discussion about the so called 21st century skills emerged (Wing, 2006), bringing CT as an educational topic to the forefront (Grover & Pea, 2013). Holding CT competency provides an individual with the ability to deal with complex problems (Tang et al., 2020), allowing the characterization of CT being "a universally applicable attitude and skill set" which can be cultivated from young ages (Wing, 2006). Thus, CT is not only a skill-set but mainly a mentality.

Early Childhood Education (ECE) is a fundamental stage for a child's development during which acquired skills pertaining to the cognitive, social and emotional domain take place. For many researchers ECE is an ideal initiation point for cultivating CT and early exposure to CT is important to ensure young children master ideas and habits of mind to shape their learning (Su & Yang, 2023). In this age group, children transition between concrete and abstract processes and develop higher-order thinking processes. Active experiences provision to provoke thinking appears to support this transition. CT, often through programming, allows children to acknowledge the process of automation and understand that it results in a set of a clearly defined instructions which drive a device. This process may lead children to start solving real world problems through systemic steps, ultimately becoming technology designers rather than passive users.

Another pilar of the approach is educational board-games which can create a learning environment which is attractive for the children and is authentic (Ali et al., 2019), allowing the implementation of transdisciplinary approaches for the development of multiple competences (Strode, 2019). Moreover, board-games' utiliation in ECE fosters the development of social (Eriksson et al., 2021; Tsapara & Bratitsis, 2021) and 21st century skills (Ambarita et al., 2020; Bratitsis et al., 2021), positively impacts learning motivation and facilitates the achievement of curriculum objectives.

In this paper, a board-game called CTHINK.IT is described (Busuttil et al., 2023). It aims at introducing CT to ECE children (4-8 years old). The paper is structured as follows: first, the main outcomes of a conducted literature review is briefly presented. Then the board-game is described and some preliminary findings from its pilot testing are presented.

2. Theoretical Framework

Two main pillars guide the idea behind the project; CT and board-games in ECE. First a systematic literature review on both areas was conducted.

The literature reveals many divergent CT definitions (Haseski et al., 2018). They focus on problem-solving, technology, thinking, individual and social qualities or learning by doing, following Papert's (1980) approach of Constructionism. Although often CT development is supported by programming, Voogt et al. (2015) highlighted that it expands further than that. Wing (2006) first considered CT as a broader notion that involves problem solving, but also understanding and systematizing human behavior via computer science concepts, also involving systems design. In a revised CT definition Wing (2010) included thinking processes as a core constituent.

The review examined how CT is treated in ECE, also searching for classroom activity types (Bratitsis et al., 2024). Different approaches were followed. One major category is implementing unplugged activities separately or combined with a digital device (e.g. robot) or a programming platform, appropriate for these ages. Due to the connection of programming with Mathematics and Sciences, a connection between STEM and CT teaching can be noticed. Overall, the unplugged approach is portrayed as a good strategy for introducing CT to young students. This in fact emerged as an ideal pre-cursor to further programming and problem-solving tasks that include both robotics and programming, which both require complex thinking abilities to understand abstract concepts and solve problems. Unplugged activities have the potential to establish a foundation for educational methods based on problem-solving and constructive learning, which involve the learner's active engagement with the environment on both physical and mental level to construct and scaffold their understanding. Such activities include hands-on robot play (Storjak et al., 2020) or spatial movement (Sung et al., 2022), before moving to programming environments such as Scratch (Lee et al., 2020) or programmable devices (Metin, 2020).

Ultimately, unplugged approaches provide some sort of embodied cognition that allows the physical enactment of the CT concepts, which seems to be effective for children in understanding these abstract concepts. However, despite the perceived value of unplugged approaches to CT, there seems to be a dearth of unplugged resources which can be used for CT in early childhood education, and this calls for the need of further research in this area to create and develop more unplugged resources that can continue to help and support the acquisition of CT skills in early childhood education.

Several studies utilise coding in ECE. Games such as Kodable (Lennon et al., 2022) or game-like activities platform (Montuori et al., 2022) are utilized. Other studies utilize tangible programmable objects such as Osmo Coding Awbie (Liu & Iversen, 2022). Mainly, programming environments such as ScratchJr (Kyza et al., 2022) or Viscuit (Watanabe et al., 2019) have been utilized for coding-based CT approaches in the early years.

Another approach is using robotics. Overall, 51 papers were found, focusing on robotics CT approaches. Of them, 35 papers exclusively focus on robotics CT implementations, 11 combine robotics with unplugged activities, 3

combine robotics with programming, and only 2 papers explore the combination of all three methods. Several robotic devices have been utilised, including: KIBO (Bers et al., 2022), BeeBot (González & Muñoz-Repiso, 2017), Cubetto and Botley (Silvis et al., 2022).

The final conclusion of the review was that unplugged activities seem very effective in young ages as they allow some kind of embodied cognition, allowing CT concepts to be physically enacted and thus better acquired.

The second pillar of the review examined board-games utilization in ECE. Combining hands-on practice with complex knowledge, board-games seem to be a perfect fit for children's creativity, imagination, curiosity (Uribe & Cobos, 2014). For Tsai et al. (2021), board-games allow students to peer learn, focusing on interactivity and student-centered learning. Board-games have features such as rules, goals, tangible experience (e.g. through pawn movement or cards), turn-taking, interaction (also of a social nature), competition, collaboration and problem solving, to name a few of them. Thus, board-games within educational context can facilitate the cultivation of various competences (Tsapara & Bratitsis, 2024).

The review revealed that board-games are utilized for CT cultivation in ECE. Bratitsis et al. (2021) taught internet related issues through a board-game in Kindergarten. Machuqueiro & Piedade (2022) analysed several studies in which board-games acted as unplugged activities for CT teaching. Overall, 11 papers were found studying board-games utilization for CT in ECE (Bratitsis et al., 2023).

Finally, the official curricula of three EU countries were studied in order to identify existing approaches, both on theoretical and practical level, including proposed activities. This allowed the consortium to reach a conclusion about the CT model to be followed and consequently be treated through the board-game which was designed and is presented in the next section.

3. The CThink.It Board-game

The systematic literature review allowed to gain valuable insights on the current trends of CT approaches and board-game utilization in ECE. The conclusions derived from this study (Bratitsis et al. 2023, Busuttil et.al 2023) led to the decision to incorporate a 4-element approach to CT, including: abstraction, decomposition, pattern recognition and algorithms. This simplified model seemed to be a better fit for younger ages.

A board-game was designed, called "Mystery at the Museum". This game places the player in the role of a detective hired to solve a mystery. The player will have to use basic competencies of CT to: a) identify a lost item in the museum, b) discover its owner, and c) return it to its owner. It comprises 4 levels. The game is played collaboratively or competitively, with the facilitation of an adult (teacher/parent). Several combinations of collaborative vs competitive mode can be applied (e.g. pupil groups playing levels 1-3 in parallel and then come together to compete in level 4). The game includes variations that result in different experiences each time it is played.

Mystery at the museum was designed for children 4-8 years-old. Ii incorporates features that differentiate difficulty, according to game level and players' age. Depending on the players' ability only some levels might be completed, however for older players, all 4 levels with more difficult puzzles should be played.

The game starts with an invitation to the detective by the museum director to locate the owner of a lost item, a toy left behind by a child in the previous day. In level 1, a card is randomly selected from a deck, containing two images from a specific division of the Museum. One image depicts a time before the opening of the museum and one after the closing time, on the day the item was lost. By comparing the two images, the player should identify the lost item (Figure 1).

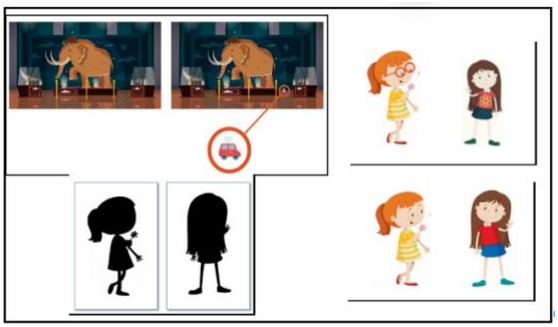

Figure 1: Level 1 and Level 2 image examples.

In level 2 (Figure 1), an introduction card explains that security camera footage is available for the player to identify the owner of the lost item. In the invitation it is noted that the lighting was not very good and shadows may appear in the footage. A card is selected from the Security Cam Deck, showing the shape/shadow of the toy owner. Having in mind the shadow in the card, the player has to look at other footage from the entrance camera with clear images to narrow down the possible toy owners. At this point, the player takes another card from the Testimonies Deck from people that were present at the Museum that day. This card provides new clues, such as whether owner wore spectacles, their hair colour, if they had a flower, etc. The player has then to identify the person from the deck based on these characteristics

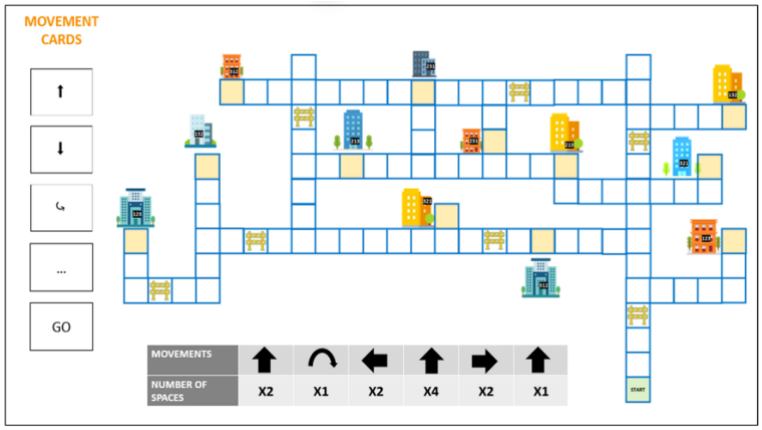

Figure 2: The city map and movement cards.

In level 3, the museum director provides a city plan to the detective who then has to identify the item owner's house and return it. The map includes 3 spots with a museum symbol which supplies clues for finding the owner's house. These cards are placed by the teacher in any space in the board (e.g. can make it to be closer to one another to make the difficulty level lower or make the game faster). The player also gets initial Movement Cards (Figure 2) which can be re-used in each turn. To move around the city, the player must compose algorithms representing the path they must take on the map. The algorithms created must be able to fit a pre-established grid, the Programming Bar (Figure 2 – bottom), representing a minimum of length. Player can create as many algorithms as needed to reach the final destination. The grid has 6 movements and it is not allowed to use less in each turn. There is also a jump card which can be used for jumping over obstacles, as an increased difficulty feature. For younger students, the algorithm can be designed on the city map directly.

The players must first visit all the spaces with the symbol "?". Upon landing on a space with the symbol "?" the player gets a Clue Card. There are two sets of Clue Cards, one with numbers and one with colours. The number cards form the door number and the order in which they are picked is the order by which the numbers are on the door. The teachers must take 2 cards from this set and place them on the board (museum cards). The colour cards represent the colour of the building – either Blue or Orange. One of these cards should be placed by the teacher on the board (museum cards). With the 3 clues gathered, the player must guess which is the correct building and visit it tolook for the owner's flat. This level can further be played/replicated in the classroom by utilizing robots (e.g. BeeBot) or by asking the students to move around a mat version of the map themselves.

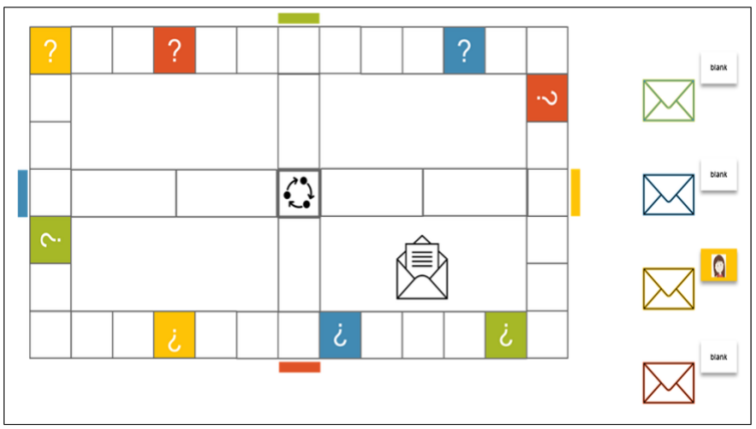

Figure 3: Level 4, inside the building.

In level 4, the player enters the building. There are 4 envelops with different colours (yellow, green, red and blue) representing the different doors/apartments in the building. Additionally, there are 4 character cards – 3 blank cards and one with a child. The teachers secretly puts one card in each envelope. The door with the envelope containing the character card leaads to the toy-owner (Figure 3). Then, players put their pawn in the centre of the board. Each player rolls a die in turns, moving around the board, in whatever direction chosen. This means that player can choose a new direction after rolling the die, but must follow it for that turn. If the player lands on "?" he/she picks a question from the respective colour pack. If it is answered correctly, the card is kept as a token, otherwise it is returned at the bottom of the pack. By rolling a "6" an additional die roll is earned. After collecting all 4 coloured tokens the player can "knock" at any door and reveal the corresponding envelope to try finding the toy owner. For that purpose, the player must go to that door, only after acquiring four tokens, one of each colour, by landing to the space in front of it. If the envelops reveals the child (character card), the payer wins. If not, the player loses the token of that door and needs to re-acquire a token set of 4 colours. To knock on any door, the player must always have the 4 coloured tokens. At any point in the game, the player may collect more than one card of the same colour, but to open a door they must have the 4 different colours. There is a special space at the centre which by landing on it the player is teleported to the door of their choosing.

The winner of the game is the player who finds the child and returns the lost item to them. A group of children may, of course, act as one single player and collaborate throughout the game. The questions in level 4 are all exercises directly connected to the 4-attribute model of CT and connected to the theme of the story (museums and toys).

A set of 11 lesson plans was designed to complement the game, serving as a foundational precursor to the board-game. These lesson plans are designed to introduce children to the major components and learning objectives addressed in the game, preparing them for gameplay by familiarizing them with essential concepts. Each lesson plan is structured to progressively introduce key computational thinking concepts in an engaging and interactive manner. The plans cover topics such as algorithmic thinking, problem-solving strategies, logical reasoning, decomposition and pattern recognition.

Through hands-on activities, group discussions, and guided exercises, students explore fundamental computational thinking skills. They learn to identify patterns, create step-by-step sequences, and analyse problems systematically. Moreover, the lesson plans emphasize the importance of collaboration and communication, encouraging students to work together to solve challenges and share their ideas.

By the end of the lesson series, students are equipped with the foundational knowledge and skills necessary to engage effectively with the board-game. They acquire a solid understanding of the core concepts and are ready to apply them in a game-based learning environment to further develop their computational thinking abilities.

4. Pilot Testing

The game is being pilot tested at the time this paper was written. Some preliminary data have already been analysed and discussed upon in the final section of the paper. It is to be noted that the game is being tested as a mock up and the final graphical design will be implemented after the completion of the pilots. The main aim of the pilot testing is to use the designed material (game and lesson plans) to collect feedback for improvements and refinement. The testing regards the following axes: a) The lesson plans, b) The game, and c) Learning assessment (optional).

The pilot studies are being conducted in three partner countries, namely Greece, Malta and Portugal. Prior to the pilots, teachers underwent training which focused on familiarizing themselves with the CT concepts and approaches, the game itself and the designed lesson plans. During the training sessions, the participating teachers actually played the game. Each of them is required to pilot test at least two lesson plans and collect feedback for the following aspects: a) Lesson plan clarity (steps, structure, guidelines), b) Goals (easy to meet, interdisciplinarity), c) Applicability in class (time required, class management, etc.), d) Perceived usefulness, and e) Perceived success (students learned – optional). For the game itself, it is to be tested with the students in order to collect two levels of feedback: student and teacher feedback. Regarding the students, the aspects for which data is collected are: a) Game concept and clarity, b) Game Mechanics, c) Game difficulty, d) Group playing and collaboration, e) Perceived Enjoyment (how much did the students like playing the game), and f) Positive & Negative aspects (1 thing they like or not). From the teachers' side, the requested feedback concerned is: a) Game concept and clarity, b) Game Mechanics, c) Applicability of the game in class (time required, class management, space required, ability to play in intervals, etc.), and d) Perceived usefulness. As an optional level

of feedback collection which is not examined in this paper, a learning assessment was proposed to be carried out.

For each set of data, appropriate templates were designed and distributed to the teachers. Regarding the process, at least 3 teachers from each country are required to test the game and material, implementing a different lesson plan with the participation of at least 10 children. A teacher's diary was proposed to be kept for keeping notes deriving from observations during the testing. The data collection templates are being filled in right after each pilot testing round has been completed.

5. Discussion and Future Plans

The initial findings from the pilot provided valuable insights. Notably, the study revealed that the collaborative version of the game was more effective than the competitive version in a classroom setting. In the competitive mode, students who completed their tasks quickly experienced extended waiting times compared to others. This led to challenges for some teachers in managing the class while ensuring everyone remained on task. Specifically, when played with larger groups, some teachers found it difficult to oversee each group's progress and provide necessary guidance while also progressing through the game explanation. Conversely, in the collaborative mode, where students worked together towards common goals, the game was more manageable, regardless of group size. In this mode, the teacher played a crucial role in monitoring group dynamics, ensuring everyone took turns and remained inclusive of one another.

Furthermore, subsequent runs of the game with the same students showed significant improvement, indicating that familiarity with the game mechanics led to increased focus on learning outcomes and enhanced computational thinking competencies. This suggests that repetition and practice are key factors in the effectiveness of using the game as an educational tool.

One noteworthy observation was the enthusiastic reception of the game by students, who exhibited high levels of motivation and engagement throughout gameplay. This positive response suggests the game's potential to effectively engage students in computational thinking activities.

However, several challenges and areas for improvement were identified during the pilot testing. Firstly, it was noted that the board and pieces were too small, indicating the need for size adjustments in the final design. Additionally, the introduction of a step-on mat as the game board was suggested to accommodate younger children and encourage physical engagement with the game.

The integration of a narrative backdrop was found to increase student engagement and provide context to the learning experience. Levels 1 and 2 progressed smoothly, emphasizing the importance of the teacher's questioning techniques in guiding students through the game and maximizing learning outcomes.

In contrast, Level 3 presented challenges, especially in competitive mode, where students struggled with the complexity of using the program bar to code actions. Some students had difficulty visualizing the outcomes of their actions and translating the code execution into movements on the board. This challenge was less pronounced in the collaborative version, as no program bar was necessary; instead, players directly placed the required sequence of commands on the board. After an initial adjustment period, students quickly adapted to effectively using commands in this mode.

Level 4, which involved chance elements with dice rolls, occasionally led to prolonged gameplay due to the requirement for specific combinations. In relation to game rules, for this final level, it was suggested that allowing movement both forward and backward in the same turn could be an improvement. Previously, the rules permitted movement in both directions but not within the same turn. This adjustment could lessen frustration, promote strategic thinking, and speed up gameplay.

In conclusion, the preliminary findings suggest that the board-game holds promise as an effective tool for teaching computational thinking skills. Addressing the identified challenges and implementing suggested improvements could further enhance the game's educational value and usability in classroom settings.

The pilot tests are still being carried out while writing this paper. More feedback from more countries will be received, including more structured analysis of observation journals and data collection instruments. The expected results will be utilized for improving game mechanics but also proceeding to the final graphical design of the game, addressing the recorded needs for size, colors, etc. Based on the teachers' feedback, the final version of guidelines for the lesson plans will be written.

Other future plans include quasi-experimental approaches for measuring the learning outcomes in order to assess the learning potential of the board-game further. Considering that there is limited availability of educational material for ECE, there is the intention of translating the material in more languages and further testing its connection to national ECE curricula which integrate CT.

Abstract: Screen industry employers report they are unable to recruit graduates with the right skills for entry level roles in film and television (e.g. runners or production assistants), citing a lack of business awareness and various 'soft skills' as barriers to employment (Grugulis and Vincent 2009; Carey et al, 2017; Jones, Swords and Brereton, 2022). Traditionally such knowledge and skills are obtained through in-person work experience on set, but work experience is usually unpaid and therefore inaccessible to many students and graduates. However, research in the use of applied/serious games and extended reality technologies for training purposes has indicated that situational skills training can be facilitated using these approaches (Ebner and Holzinger 2007; Connolly et al, 2012). This paper presents an analysis of the design process behind a game-based learning intervention, developed to enable players to experience a day working on a film set and to allow educators to open up discussions about working practices and employability/progression within the screen industry. The simulation gives players the opportunity to take on a junior role in a film studio, respond to typical requests on set, interact with other crew members and observe proceedings. The study draws on interviews with educators and an ethnographic account of playing the game and using the complementary educational resources. We argue that a serious game can function as a meaningful intervention allowing potential new entrants to the screen industry to understand the tasks and duties of job roles in the industry. This approach also improves access to the development of skills and knowledge which are traditionally gained through (unpaid) work experience.

Keywords: Serious Games, Educational Games, Skills Gaps, Screen Industries

1. Introduction

1.1 Skills Gaps/Shortages in Film and TV

Skills training and work-readiness in the UK screen industries has been a topic of concern, debate and research for many years (Creative SkillSet, 2014; Carey et al, 2017). From retaining skilled workers as they age to the freelance nature of many roles, skills gaps and shortages pose real issues to the success of the UK screen sector (Van Loo et al, 2001; Allen and De Grip 2007; BFI 2023). As film and TV production continues to grow it is estimated that the UK screen industry will require between 15,130 and 20,770 additional full-time equivalent employees (FTEs) by 2025 (ScreenSkills/Nordicity/Saffery Champness 2022), meaning the question of skills development is a growing concern.

Despite the many practical further and higher education courses and training programmes available, employers and the workforce state that these do not always provide the skills required (BFI 2017; Animation UK 2018; ScreenSkills 2019). In particular, training was criticised for not providing the professional skills required in the workplace, including team-working, communication and confidence. However, there are often barriers to developing these skills for under-represented groups, compounded by the prevalence of 'on-the-job' training, which is often obtained through unpaid work experience or internships which are inaccessible to many (Jones, Swords and Brereton, 2022). Research into film/media qualifications in the UK indicates that even those registered on formal programmes of study face difficulties in securing work placements (Allen et al, 2013; Mayne, Zborowski and Macrae, 2024).

1.2 Use of Applied Games for Training

Connolly et al, (2012) provides strong evidence of the benefit of computer games on knowledge acquisition, understanding and affective/motivational outcomes, while Ebner and Holzinger argue that "games are often closer to simulating real life experiences than more traditional educational media" (2007: 875). Further, game-style simulations are often-used in training contexts where 'virtual' mistakes do not have the critical impact that errors in the real world would, especially in medical and health research (Shorey and Ng, 2021; Chen et al, 2020).

Given the issues around accessing work experience and training in the film and TV industry, an educational game – Play Your Way into Production (PYWIP)– was developed, primarily for use in further and higher education settings. PYWIP offers a gamification and simulation of the experience of working on a TV or film set, together with some gamified elements, and was designed to help develop a range of professional and situational skills which might otherwise be traditionally gained through work experience.

2. Co-Creating the PYWIP Game

2.1 The Collaboration

Play Your Way Into Production[1] is a collection of digital educational resources to support skills development and employability for new entrants to the screen industry workforce and comprises:

- A scenario-based educational game based around a virtual TV studio for PC or Mac,
- An additional virtual reality (VR) experience that allows users to explore the virtual studio, with detailed information about the studio equipment and roles of crew members,
- Downloadable 'character cards' outlining the crew members, their skill sets, roles and responsibilities,
- Short films of interviews with both film/TV students and recent graduates working in the industry,
- An Educational Resource Package (ERP)[2] with learning activities focussed on the skills developed in the game.

The Play Your Way Into Production game was co-created through an interdisciplinary collaboration between academic researchers and an independent production company under the auspices of the skills and training workstream of the Screen Industries Growth Network (SIGN)[3] The production company One to One Development Trust[4] is an independent charitable arts organisation who use film, game and XR to break down barriers and increase opportunities and aspiration.

2.2 Research-led Design

An academic advisory board of researchers from UK Higher Education Institutions steered the development and design of the materials to ensure that it was underpinned by research on a) previously identified skills gaps in the screen industry and b) the design of educational games and active-learning pedagogies.

2.2.1 Identified Skills Gaps

Research conducted by the Screen Industries Growth Network (SIGN) drew on 27 semi-structured interviews with a range of screen industry stakeholders, including training providers, production companies and employers and identified several themes relevant to new entrants in the screen industries (Jones, Swords and Brereton, 2022; Willment, et al, 2024). The most salient of these were:

- *Attitudes* – Some new entrants refused to accept criticism or suggestions for further improvement as they had obtained an undergraduate degree and felt they knew all they needed to.
- *Industry knowledge* – There was a perception among training providers that graduates knew how to write, edit or operate a camera but didn't understand the industry as a whole or how different roles worked together.

[1] https://playyourwayintoproduction.com/
[2] https://subjectguides.york.ac.uk/PYWIP-ERP/
[3] https://screen-network.org.uk/work/skills-training/
[4] https://onetoonedevelopment.org/

- *Mental health and wellbeing* – The industry can be demanding with long hours and high expectations. The report identified that it was important to know about these issues as well as how to maintain a work-life balance and be resilient.
- *Professional skills (a.k.a. soft skills)* – Knowledge, and specifically technical knowledge, was seen as less important than being able to work in a team, communicate effectively or be assertive.

The skills gap areas identified here echo those identified in recent industry focussed research (e.g. Carey et al, 2017; BFI 2023, BFI 2017; Animation UK 2018; ScreenSkills 2019) and form the framework of skills that the PYWIP game addresses.

2.2.2 Game Design Principles

Games design theories are closely associated with the design and rationale for game-based learning. Gee (2003, 2007) purports that good games incorporate good learning principles, which are supported by current research in cognitive science. The PYWIP game was developed around a selection of design principles chosen to support and underline the overall aim of situational learning and skills development, as follows:

- *Probing* (Gee, 2003) – players probe the world through exploration, experimentation, testing and selecting options and various scenarios. They then form a 'hypothesis' (an object, skill, event or action) before reprobing the world with that hypothesis in mind. Depending on the consequent action or reaction, they then rethink their original hypothesis.
- *Stored simulations* (Gee, 2003; Reeve, 2011) – in games players form mental associations and make connections between "stored simulations" of previous experiences and adapt and apply these to new experiences. In cognitive terms, this is pattern recognition — the process of forming associations between objects. This applies to experiences and situations within a single game, as well as developing experience that translates to subsequent game titles.
- *Agency* (Murray, 1997) – the process of self-discovery and player autonomy. In good games, players are in control; they seek out tasks and decide how best to achieve them, and, when faced with conflict and combat, learn how to overcome them.
- *Reflection* (Iacovides et al, 2022) – an important first step for addressing attitudes and supporting behaviour change, but often overlooked in game based learning. Providing players with an opportunity to role-play within a relevant context promotes reflection.
- *Situated Cognition* (Brown, Collins and Duguid, 1989) – argues that knowledge is fundamentally linked to the activity, context, and culture in which it is developed and used. Comparisons between simulation-based training and lecture-based education in teaching situational awareness have also shown that simulations are more effective, particularly in improving perception skills essential for time-sensitive, critical decision-making roles (Chang et al, 2017; Zarraondia et al, 2015).

2.3 The Play Your way Into Production Game

The Play Your Way Into Production game is set in a virtual film/TV studio where Pink Sprout Productions, a fictitious production company, are making a CGI-rich dinosaur documentary. The game includes a film studio that is populated by 17 crew members with varied backgrounds and experience, a green room containing a kitchen area and office equipment, and an outside area with a catering van. Small details have been intentionally included to enhance the realism of the studio context including real posters on the corridor walls, changes to the weather, and the in-game camera monitor playback screen reflecting the scene being filmed (*situated cognition*).

During game play all technical equipment and other items in the studio can be explored by selecting to bring up a 365-degree view mode with text-based info (*probing*). While exploring the set, players can eavesdrop on conversations between other characters/crewmembers about different aspects of working in the industry **(***industry knowledge***)**.

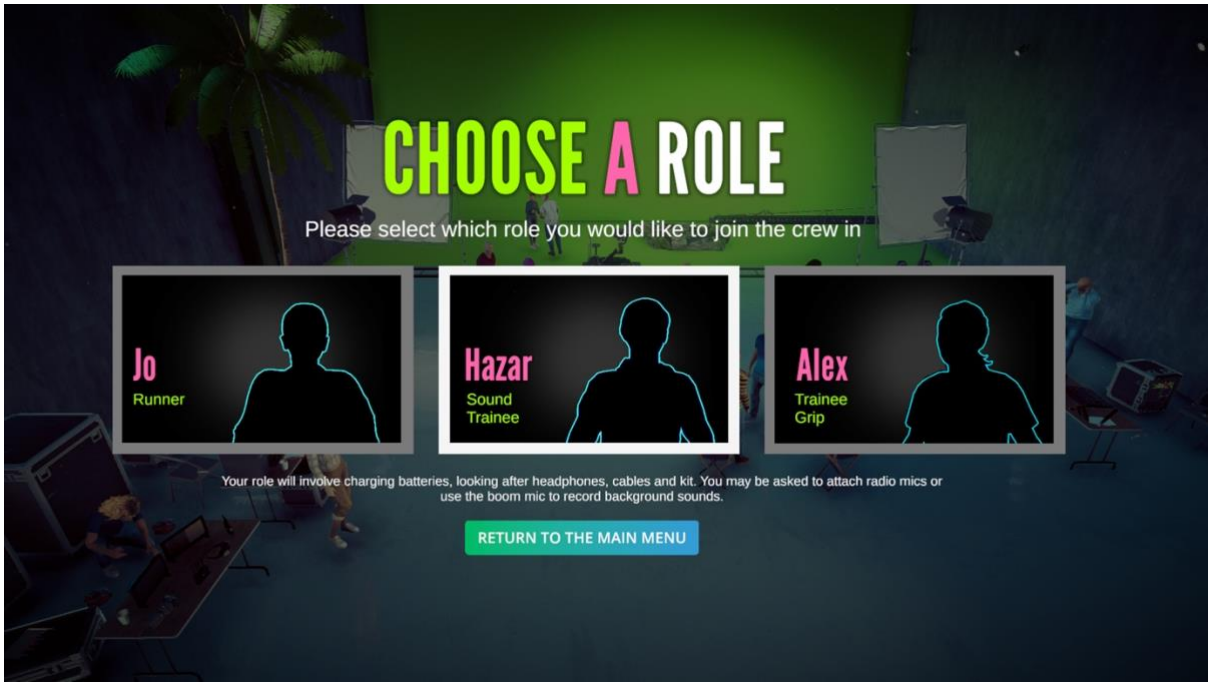

Figure 1: The three entry-level roles players can choose.

The game offers players a choice to play as one of three different entry-level roles – a runner, a sound trainee or a trainee grip (see Figure 1). Choosing a role encourages player *reflection* by a) providing relevant context for the role and the tasks they are likely to encounter and b) offering some distance from their own personal, subjective identity (Iacovides et al, 2022). Interactions with non-playable characters (NPCs) form the basis of scenarios in which the player is presented with a task and various options to choose from (*stored simulations*) – all scenarios are based on the lived experiences of people working in the industry. Some choices affect the story flow (see Figure 2) and trigger immediate feedback, whereas most result in gameplay continuing (*agency*). Feedback on player interactions, and their performance in all tasks and scenarios encountered are summarised in appraisal from their line-manager at the end of the game (*reflection, situated cognition*) (see Figure 3).

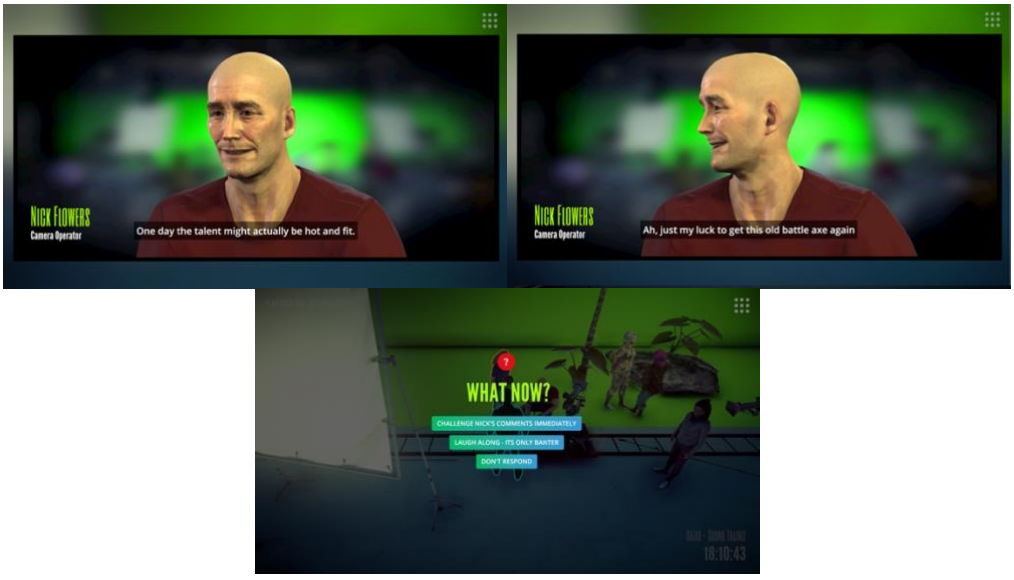

Figure 2: Example scenario players are faced with while playing as Hazar.

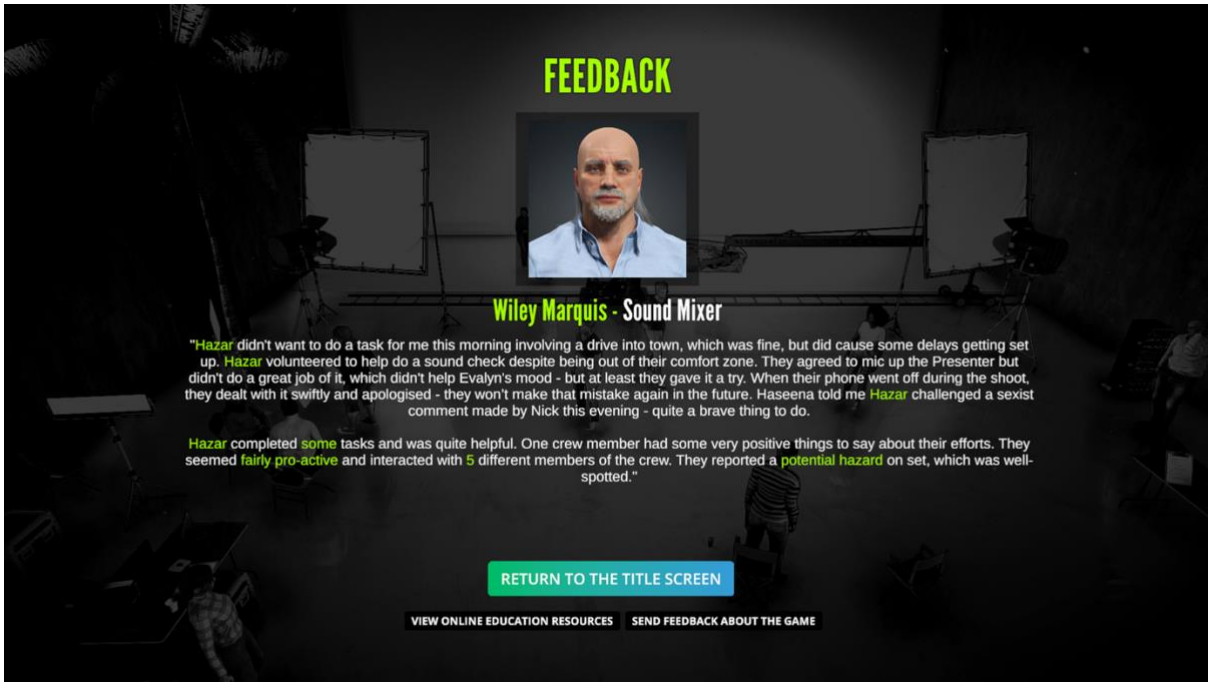

Figure 3: Feedback offered to players while playing as Hazar, dependent on scenario options selected.

3. Evaluation of the Play Your Way Into Production (PYWIP) game and Educational Resource Pack (ERP)

3.1 Methodology

The experience of students and tutors playing the PYWIP game on a PC and using material from the ERP in 2 UK higher education settings was evaluated, drawing on data from teaching observations, an auto-ethnographic account and interviews

Lecturers at two UK higher education institutions were asked to identify an existing module in which they could teach a 2-hour seminar based on the PYWIP resources as part of an existing undergraduate BA degree programme. Students were told they did not have to take part in the research, and if they did choose to participate there was no right or wrong feedback, or expectation that students would view the game and resources positively. Sixteen students took part in the study across 3 seminar groups, with the majority having had no previous work experience in the industry despite being enrolled on a media studies-related degree.

At the beginning of the taught seminar, the students were asked to complete an on-line skills audit [5]to provide each student with an opportunity to self-assess their own professional skills and knowledge of the Screen Industry. The PYWIP skills audit is based on the Worklink Skills and Values Assessment Tool (WLSVA) (Dershem, 2020), which is a validated tool designed to measure skills development among youth and young adults.

The lecturers were not given specific instructions on how to use the PYWIP game and ERP, and instead were told to use the resources however they felt best within their seminar.

3.1.1 Interviews

A week after one of the seminar sessions took place the lecturer who ran the session was interviewed (designated L1 below). Exploratory questions focussed on how they used the game, what they found useful, what ERP modules they used (if any), and if they thought the PYWIP game and ERP resources could help students who want to work in the industry.

[5] https://york.qualtrics.com/jfe/form/SV_78TLMCEcobjRdci

3.1.2 Analytic Autoethnography

Two of the three seminars were taught by the research associate involved in designing the game and ERP, and as such required an autoethnographic approach to data collection and analysis (designated AE below). Autoethnography, as Méndez notes, "can range from research about personal experiences of a research process to parallel exploration of the researcher's and the participants' experiences" (2013, 281).

As the researcher was both a member of the research team at the University of York and an hourly paid lecturer at one of the institutions taking part in the research, they were able to transcend "empirical data to gain insight into some broader set of social phenomena than those provided by the data themselves" (Anderson 2006, 387) – in this case the use of an educational game for teaching skills required by the screen industry. The researcher was also able to discuss the use of the game with the students during the seminar, making notes and recording comments made by those students who had agreed to take part in the research project.

3.2 Results and Discussion

The two data sets, interviews and autoethnographic, were analysed separately using an inductive/deductive hybrid thematic approach (Proudfoot, 2023) to identify themes. As a result, three broad inductive themes were identified: '*game efficacy', 'engagement with the ERP'* and '*contextualising the game'*. Deductive themes from the game design principles and skills gaps areas are highlighted in (*italics*).

3.2.1 Game Efficacy

Lecturers started the seminar by introducing the game and its development context to the students, who were then left to explore it on their own (*probing*). Both lecturers noted they gave no explicit instructions on how the game should be played, but both told students to play through the game as at least one of the entry-level roles. Once they had done that, the students were free to play as another character or explore other aspects of the game such as the crew profiles or interviews (*agency*). Students progressed at their own pace throughout the game, with the research assistant (AE) noting that the 3rd year students needed some more guidance due to the language barrier (the students who attended this seminar were solely international students). The other cohorts navigated the game with ease, although one third year student felt that a map should be included as it was difficult to find out where they needed to go to complete certain tasks (*agency*).

When asked how they used the ERP, the lecturer (L1) said:

> The short version is I went in and I picked the bits that I thought were the best and would work best with my cohorts. So I wanted something that would. That they would see was relevant but also was potentially kind of fun. So I was kind of going for balance and engagement and a bit of information. [L1]

Students appeared engaged with the game, with several 1st year students across both seminars viewing the additional resources after they had played the game once, and felt it was a valuable tool. L1 noted that "there wasn't any kind of cynicism towards the game or the scenario, you know, it seemed like people could genuinely see this is a good way of learning about the stuff that goes beyond the technical elements of a role" (*situated cognition, attitudes*) while AE highlighted feedback from a student who said "I like how even though I played it [the game] wrong I still learned stuff". This student deliberately chose scenario responses which were the least appropriate (*agency, reflection*), including refusing to get out of the presenter's chair, and ultimately being asked to leave the set. However, they still felt that the game was helpful in developing their knowledge (*industry knowledge*).

Feedback from students was broadly positive: the game was "useful", "interesting" and "good for seeing what it's like" (*stored simulations*), suggesting that the game could be an effective tool for addressing skills gaps identified by the research. Lecturers also felt that the scenarios in the game, coupled with the activities from the ERP could provide students with a bank of examples or scenarios that they could use in future job interviews (*industry knowledge*).

3.2.2 Engagement With ERP

Both lecturers chose elements from two different ERP modules, one covering communication and the other assertiveness, and adapted these for use in the sessions. As AE noted:

> I know the game really well and I had an idea of what scenarios might work in a session where I hadn't taught the students before and didn't know their depth of knowledge and experience. I went through the modules and decided I wanted to look at communication but I also really like the scenario between Hazar and Nick and used that to discuss different people you can communicate with if you're in that situation on set and don't feel comfortable about calling someone out. The communication and assertiveness modules had aspects I could choose to be able to include that scenario.

Students were able to highlight examples of good and bad communication (*reflection, attitudes*) within the game which were then used to facilitate discussion. Both lecturers used the "director's dilemma" exercise in which two lead actors have creative differences during filming an important scene. Students were asked to discuss how they would resolve this, what communication skills they might use and why. Students engaged with the activity, explaining why they might include the full cast and crew in the conversation, film two versions and decide which was best, or take the actors to a private room to discuss the scene, which for L1 led into a broader discussion about different management styles (*professional skills*).

Seminar tutors were also asked to reflect on their use of the ERP, particularly regarding whether they thought it was a useful resource to use alongside the game. L1 thought it was, not only because it was efficient and saved them time but because of the way it was structured, with high level practical skills and more in-depth scenarios (*industry knowledge*). L1 highlighted the reasons behind why they felt it was useful, saying:

> before the session it was actually quite useful, partly for, like, the hyperlinks for the consent, forms and stuff, I put them all on Canvas pages that they could navigate through. I copied and pasted sort of judiciously chosen bits of the text from the ERP pages, you know, that gives you sort of background and categories of different kinds of communication, and so on. And I put those on Canvas pages so that I didn't have to sort of go through it verbatim. But the students had it there and for sort of catering a little bit for neurodiversity, and so on. I wanted. I was sort of telling the students what we were doing, but also, if they needed it, they had it there on a page so they could go back and say, 'Okay, that's what we're supposed to be doing'. (*mental health and wellbeing*)

Both tutors felt the ERP was a useful resource which could smoothly be slotted into existing modules. L1, in particular, felt that the ERP was "a bit of a gift" because the resources "slide quite easily into sessions" while AE noted that having pre-written modules was helpful for teaching students they hadn't previously been engaged with.

Neither of the tutors used the additional resources – such as interviews or crew profiles – provided on the website in their seminars, however AE suggested them as a resource students could engage with if they finished playing the game as one character while L1 noted that some students watched the interviews without being prompted to (*agency*). AE suggested that time was a factor:

> I wanted the students to play at their own speed without rushing them. They've got the option to explore the set, pick up bits of kit and see what they're used for, as well as carrying out the tasks and while there is a timer in the game the point of it isn't to finish as quickly as possible (*probing*). Asking the students to look at the other resources once they'd finished playing one character meant they could do things at their own pace, especially because I was going to spend the second half of the session going through a module (or parts of two modules) that are suggested to take 50 minutes). Maybe I prioritised the module over what I thought could have been useful? But then the crew profiles and videos are more about getting into the industry and would work better with a module like getting your foot in the door or leadership (*industry knowledge*).

3.2.3 Contextualising the Game

Both lecturers discussed how they had contextualised the game in relation to the research carried out by SIGN, highlighting to students that they were testing the game and how useful it was. As AE wrote, reflecting on their session:

> It was important for me to make clear my role in the development of the game and to express that we were interested in their [students'] responses because we want to know if the game works. If not then that's a research finding in itself.

The background to the game is only briefly mentioned in the ERP introduction module, however, and isn't highlighted in any of the modules (*industry knowledge*). L1 suggested that including that either in the ERP or as a brief intro card as you enter the game could be valuable to highlight the game is grounded in what the industry needs rather than a generic skills exercise (*industry knowledge, professional skills*), making it more relatable to specific modules and to students' career plans.

Feedback from the first three seminars was therefore broadly positive from both the students and the lecturers who agreed that the game helped them address the skills gaps identified in the research. Indeed, L1 noted that was its major virtue:

> imagine if you've gone through your whole degree, and this is like your first working experience. And all of a sudden, like the ground would shift beneath you. It's like, okay, so I know all this stuff about editing and camera, but I don't understand the flow of working on a set. So yeah, I think, I think in that respect, that's kind of the game's USP for me in a way. (*industry knowledge, mental health and wellbeing*)

Further data collection is scheduled to take place with students, lecturers and industry professionals, but initial responses are positive.

4. Future Development of PYWIP

While the initial responses were positive, there are opportunities for improvement and further research. For instance, the underutilization of additional resources such as interviews and crew profiles suggest potential areas for enhancement in future sessions. Additionally, the integration of contextual information from other SIGN research into the ERP or game introduction could further enhance its relevance and application within industry settings.

Several areas of the game design have been identified for further development of the game such as: improving digital accessibility, producing similar games based on different working environments including live events, theatre or a Virtual Production studio.

Further data collection with students, lecturers, and industry professionals will provide valuable insights into the long-term impact and effectiveness of the game and ERP in addressing skills gaps within the screen industries.

5. Conclusion

A pedagogical approach to gamified simulation harnesses the cognitive benefits associated with gameplay situations. Play Your Way Into Production is designed to encourage users to probe and to store simulations that they can apply to future real-world situations requiring familiarity, confidence, agency, and choice-making. At the same time, a simulation environment encourages exploration and risk-taking that would be too costly in a real-world situation, potentially leading to loss of face, or even loss of earnings or future employment possibilities. Lowering the real-world stakes increases the space for reflexivity, and for learning.

Lecturers have played a pivotal role in framing the PYWIP game and ERP within the broader context of the screen industries and specific research objectives. The deliberate decision not to provide explicit instructions on gameplay allowed students to explore the game freely, promoting autonomy and curiosity. Despite language barriers faced by some students, the overall impact on student engagement was positive, with most cohorts navigating the game with ease.

Both lecturers demonstrated effective utilisation of the ERP by selecting relevant modules that underpinned a balanced approach that catered to various learning styles and the needs of their cohorts. This strategic selection process aimed to strike a balance between relevance, engagement, and the conveyance of essential information. The integration of ERP modules into the sessions facilitated meaningful discussions around communication and assertiveness, providing students with practical examples and scenarios to enhance their learning experience.

The combination of the PYWIP game and ERP modules proved to be an effective tool for addressing skills gaps identified by the research. Student feedback highlighted the game's value in providing insights beyond technical aspects of roles within the screen industries. The interactive nature of the game encouraged students to actively engage with scenarios and reflect on their experiences, contributing to a deeper understanding of industry practices and challenges. Lecturers also noted the positive impact on student learning, emphasizing the game's

unique selling proposition (USP) in bridging the gap between theoretical knowledge and practical industry experience.

Integrating Agile Methodologies and Gamification for Student Engagement and Success

Cella-Flavia Buciuman, Sabina Potra and Luisa Dungan
Politehnica University of Timisoara, Timisoara, Romania

cella.buciuman@upt.ro
sabina.potra@upt.ro
luisa.dungan@upt.ro

Abstract: The article highlights a flexible and adaptable approach for the development of game like activities for higher education students from Politehnica University of Timisoara, Romania. The approach embraces agile methodologies to guide the iterative development process of educational games and consists of several key elements. First, it underlines the importance of defining clear learning objectives and aligning them with the game's design. Second, it encourages multidisciplinary collaboration between teachers and instructional designers to deliver relevant information to students, but also appropriate to their learning styles and needs. Regarding engineering problems and methods, students frequently encounter several difficulties. For this reason, the article attempts to provide an organized and engaging learning environment that encourages active participation and information retention. In industrial engineering, most of the students' exposure is to theoretical materials; nevertheless, there are several ways to give them practical experience with the topics they are studying. Using a comprehensive review of the literature, the article explores the pedagogical benefits, challenges, and practices associated with the use of agile methodologies in education. Agile methods are very based on collaboration, teamwork, flexibility, and participation, and help create a more relaxed learning environment to support students' increasing need for control over their learning path. Throughout regular communication and feedback cycles, students can iterate on content and pedagogical approaches, resulting in activities and games that are more engaging and effective for learning. In the end, the paper presents the conclusions of the authors on the current advantages and limitations of using this approach based on agility and game-based learning in higher education.

Keywords: Agile Education, Scrum, Game-Based Learning, Iterative Development, Sprints, Continuous Feedback

1. Introduction

This article presents an approach used by the authors to incorporate gamification into training exercises for 4th year students studying Economic Engineering within the Electric, Electronic, and Energetic field at the Faculty of Management in Production and Transportation, Politehnica University of Timisoara, specifically for the Computer-Assisted Manufacturing course. The syllabus of the Computer-Assisted Manufacturing course contains a range of topics including Manufacturing Systems, Manufacturing Planning, Models and Modelling in Manufacturing, Artificial Intelligence in Manufacturing, Agile Manufacturing, and Flexible Manufacturing Systems. Typically, when students engage in the study and analysis of manufacturing systems, their exposure is predominantly limited to theoretical aspects, as is commonly observed in many industrial engineering courses (Yiming, 2021). This article focuses on Scrum, an agile methodology widely used today, and explores its potential applications in game-based education. The significance of examining this subject lies in the mutual advantages that it offers both students and professors. When Scrum is implemented, regular feedback can be obtained, allowing for continuous adaptation between students and instructors. The degree of student dedication and the educators' flexibility or agility both have an impact on the continuing learning process (Buciuman, 2020). Furthermore, the article investigates how game-based activities might be used to incorporate concepts related to product development, including Agile and Scrum processes. Agile development concepts encourage students' problem-solving and collaborative abilities in addition to supporting their learning and work methods. The course activities' adaptable format allowed students greater autonomy and the chance to get continuous feedback on their progress.

2. Literature Review

Agile can be viewed as a philosophy that embraces flexibility, adaptability, and innovation that extend beyond its roots in software development. Over the years, agile methodologies have proven their value in various domains. Agile project management techniques, often known as flexible product development methodologies, use strategies that enable affordable modifications in contrast to traditional project management approaches that strictly follow original plans (Buciuman et al., 2012).

Due to the successful application of Agile methodologies in the management of software development teams and projects, researchers recognised the potential to adapt them to the educational context (Dewi & Muniandy,

2014; Salza et al., 2019). Initially, El-Abbasy et al. (2010) proposed a framework for applying agile methods in computer science education. He created an analogy between software development and the educational process. Subsequently, it was discovered that Agile methodologies were equally effective in teaching other subjects, such as mathematics (Duvall et al., 2017). Given that every student has different abilities and learning styles, not all students in a classroom will be able to grasp concepts at the same pace or using identical methods. Considering this diversity, teachers must be aware of these varying learning needs and be prepared to adapt their approach accordingly, rather than following rigidly to a predetermined plan (Buciuman, et.al., 2012). Translating Agile values into the classroom involves aligning the principles of Agile with the dynamics and requirements of an educational environment.

Several studies have demonstrated the effectiveness of implementing Agile methodologies also in online courses, as presented in (Salza et al., 2019). The findings revealed that the integration of Agile strategies within project-based learning facilitated effective team coordination and project management. With this approach, the instructor took on the responsibilities of a supervisor and a facilitator, assisting the students while they worked on the project and guiding them through an iterative learning process that improved their learning outcomes over time.

The directions in which agile can impact the learning process are described below:

1. Iterative and incremental Learning: agile promotes an environment where students learn and progress in small steps. Instead of focusing on long-term plans or a rigid curriculum, an agile education approach encourages continuous improvement and feedback loops.
2. Flexibility and adaptability: teachers can adjust their strategies and content, based on student feedback and emerging trends. This allows the creation of personalised learning experiences that support the needs and interests of the individual student.
3. Collaborative learning: in an agile education setting, students work together on projects, solving problems, and sharing knowledge. Collaborative learning fosters communication, critical thinking, and collaboration between students. Especially in the Romanian educational system, teamwork and collaborative work skills are not adequately supported throughout learning activities, and an agile approach can help minimize this weakness.
4. Student empowerment: agile empowers students by giving them more autonomy and ownership over their learning process. Students contribute by setting goals, planning their learning activities, and monitoring their progress.
5. Continuous feedback and improvement: agile encourages a culture of continuous feedback and improvement in which teachers and students provide regular feedback collaboratively shaping the educational experience.
6. Agile tools and techniques: agile offers a variety of tools and techniques that can be adapted to education. For example, Kanban or Scrum boards can be used to visualize and manage learning tasks, retrospective sessions can be held to reflect on learning experiences and make improvements.
7. Learning from failures: agile education aims to encourage a growth mindset by embracing mistakes as opportunities for learning and improvement. Students are encouraged to experiment and learn from their experiences, fostering resilience and a positive attitude toward challenges.

By adopting agile principles and practices in education, teachers and students can create a more dynamic, adaptive, and student-centered learning environment.

When measuring the impact of Agile practices in education, several Key Performance Indicators (KPIs) can be used to assess the effectiveness and success of the implementation. A list of KPIs used to measure the impact of Agile on education is listed as follows:

1. Student Engagement: measures the level of student engagement by monitoring attendance rates, participation in class discussions and activities, and completion rates of assignments. Higher participation indicates that Agile practices encourage active student participation in the learning process.
2. Learning Outcomes: this KPI assesses the extent to which students achieve the desired learning objectives and acquire the necessary knowledge and skills. It can be measured through tests, exams, projects, and other assessments that evaluate student understanding and application of the taught concepts.
3. Student Satisfaction: conduct surveys or gather feedback from students to assess their satisfaction with Agile teaching methods.

4. Time Management: assess students' ability to manage their time effectively by comparing their ability to meet deadlines and complete tasks within given time frames.
5. Collaboration and Teamwork: evaluates the extent to which agile practices promote collaboration, teamwork, and communication among students. It can be assessed through observations, self-assessments, or feedback from students.
6. Adaptability: monitors students' ability to adapt to changes and adjust their learning approach based on feedback and evolving requirements. The KPI can be calculated as a ratio between the number of task adjustments the student team completed during a predefined period and the total number of adjustments required for that interval.
7. Continuous Improvement: measures the number and impact of improvements made to the curriculum, teaching methodologies, and learning materials due to the adoption of agile practices. This could include the incorporation of student feedback, improvements to learning resources, or changes to instructional techniques.
8. Innovation and Creativity: assesses students' ability to think creatively, generate innovative solutions, and apply critical thinking skills. The KPI measures the ability of students to approach problems from different perspectives and to propose new ideas (Elizondo, et al., 2010).

It is important to note that the KPIs must be tailored to the specific objectives and context of the educational institution or program. The selection of KPIs should align with the course goals, data collection should be carried out consistently, and insights should be used to make informed decisions and improve the implementation of agile practices in education.

2.1 Serious Games to use Agile in Education

Game-like activities have been widely used in Agile Engineering Education to improve learning outcomes and engagement. By incorporating elements of gamification, educators can create a more immersive and interactive learning environment. These activities often simulate real-world scenarios and challenges that students may encounter in professional settings. Through these game-like experiences, students can apply Agile principles, such as collaboration, iteration, or problem-solving, dynamically and enjoyably. Ultimately, game-like activities in Agile Engineering Education offer a practical and engaging approach to prepare students for real-world Agile practices in the field (Buciuman, 2021). There is a growing shortage of specialists in the labour market, and students need new approaches to learning activities that incorporate ways of how the industry approach works and offer an experience closer to what happens in real life. Gamification can vary depending on the perspective, but certain elements commonly exist. These include the presence of rules, goals, players (either individual or team-based), and often the use of physical or virtual artifacts such as cards, dice, or whiteboards. Games are designed to provide entertainment and can involve elements of competition, although they can also promote cooperation through team-based gameplay (Parson, 2014). Figure 1 presents the use of game-like activities in education as a comprehensive system made up of three interrelated pillars: learning and teaching, gaming, and simulation.

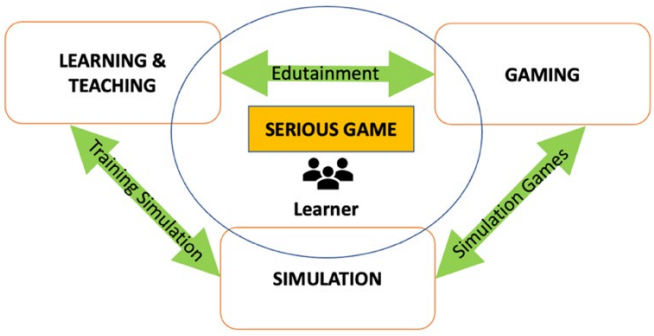

Figure 1: Serious game – a definition model (adapted from Buciuman, 2021)

In Figure 1 the focus is on the learner, highlighting the distinctiveness of training simulation, simulation games, and Edutainment as separate concepts. The Learning & Teaching component encompasses both the learner's perspective and the instructor's viewpoint, considering their respective roles and objectives (Buciuman, 2021).

Game-like activities in education are also known as Serious Games or Edutainment (Yiming, 2021; Laamarti et al., 2014). Edutainment is a term that refers to the combination of education and entertainment. It involves the

use of entertaining and engaging content and activities to facilitate learning and educational outcomes. The primary goal of education is to make the learning process enjoyable and engaging, thus increasing motivation and knowledge retention.

The model for defining and categorising serious games in Figure 1, provides a structured framework for defining and categorising serious games. It outlines key components and characteristics that contribute to the experience of serious games:

1. The Serious Purpose: Serious games have a clear educational or training objective beyond pure entertainment. They aim to deliver specific learning outcomes or impart practical skills.
2. The Game Element: Serious games incorporate interactive elements typical of traditional games, such as rules, challenges, and rewards. These elements engage the user and provide a pleasant experience.
3. Contextual Relevance: these games are designed to address real-world problems or simulate specific scenarios relevant to the learning or training context. The content and context are following the intended educational or training goals.
4. Active Participation: Serious games require active participation of the user, who makes decisions and solves problems.
5. Feedback and Assessment: Serious games provide immediate and constructive feedback on the user's actions and performance. Feedback helps learners track their progress, understand their strengths and weaknesses, and make improvements.
6. Progress and Challenge: Serious games offer a sense of progression and challenge by gradually increasing the difficulty level or complexity of the tasks.
7. Integration of Learning Content: Serious games can seamlessly integrate educational or training content into the gameplay. Instructional materials, simulations, and assessments can be included, providing a cohesive learning experience.
8. Learner-Centred Design: Serious games are designed with the learner's needs and preferences in mind. May include different learning styles and the ability to personalize the experience to meet specific learning requirements.

Serious games can be an effective tool to integrate agile principles and practices into education. They promote active learning, teamwork, problem-solving, and critical thinking skills. Additionally, serious games create a safe environment for students to experiment with agile practices and gain a deeper understanding of their benefits and challenges. Generation Z students are digital natives and focused on practical study methods with direct implications for real life (Iftode, 2019). By incorporating serious games into agile education, students can develop a practical understanding of agile methodologies and improve their ability to apply them in real-world scenarios.

3. Methodology

The main purpose of this research was to explore and describe the implementation of an agile approach using game-like activities for 4th year students from the Faculty of Management in Production and Transportation at Politehnica University of Timisoara.

The agile methodology used was Scrum, a project management technique that guided students through the planning, execution, and review stages of a manufacturing project. To comply with the curriculum, students should assimilate concepts related to planning, resource allocation, estimates, assigning tasks, manufacturing models, productivity, and problem-solving. Figure 2 shows the agile principles applied when using agile for engineering courses.

Figure 2: Agile principles embedded in engineering courses

Each of the steps in Figure 2 fosters the iterative and collaborative Scrum mindset, allowing students to develop their engineering projects efficiently and effectively, as follows:

1. Agile Project Planning:
    - Identify the engineering project or problem that students will work on throughout the semester;
    - Break down the project into smaller tasks or milestones that can be completed within shorter iterations (Sprints) and prioritize tasks based on their importance and dependencies;
2. Sprint Planning:
    - At the beginning of each Sprint, collaborate with the students to set goals for the duration of the Sprint (e.g., one week).
    - Assign tasks to students based on their skills and interests, considering the project requirements;
    - Discuss and estimate the effort required for each task using story points or other estimation techniques;
3. Daily Stand-Up:
    - Conduct short daily stand-up meetings in which each student briefly shares his progress, the challenges he faced, and the plans for the day;
    - Encourage students to communicate any obstacles or issues they encounter and collaborate to find solutions;
4. Iterative Design and Development:
    - Encourage students to apply iterative design and development processes, such as Agile Engineering Practices or Rapid Prototyping;
    - Break down larger engineering tasks into smaller subtasks that can be completed within a Sprint;
    - Regular review and evaluation of the progress and quality of the design;
5. Collaborative Teamwork:
    - Assign students to project teams, promoting collaboration, communication, and shared responsibilities;
    - Encourage regular team meetings to discuss progress, exchange ideas, and coordinate efforts;
6. Sprint Review and Feedback:
    - At the end of each sprint, conduct a review in which the students showcase their progress and outcomes;
    - Provide feedback on their work, highlighting strengths and areas for improvement;
7. Retrospectives and Process Improvement:
    - Conduct retrospectives at the end of each Sprint to reflect on engineering processes, teamwork, and project outcomes;
    - Discuss what worked well, and challenges faced, and identify areas for improvement;
8. Documentation and Reporting:
    - Encourage students to maintain documentation and progress reports, capturing their design decisions, challenges, and solutions;
    - Use project management tools or version control systems to track and manage project artifacts;

For the agile manufacturing project, students were asked to develop a solar power bank project, implemented in Autodesk Thinkercad, over a seven weeks period. Agile values and renewable energy scenarios were covered using the "Agile Penny Game" and the "Siemens Energy Island" game. This was an engaging and educational way to learn more about renewable energy and sustainable technologies used in manufacturing. The important aspects of the project were the game-like activities they had to carry out and the fact that the entire activity was developed based on agile principles. In line with agile principles, the project was developed iteratively, in Sprints of one week each. The first week was assigned to activities to learn about agile and renewable energy. Before the beginning of the first Sprint, the teacher explained the learning goals and how agile can help support the

achievement of these goals (Buciuman, 2020). For students, it was the first contact with agile methodologies, especially with Scrum. To facilitate understanding of the main concepts of Agile and Scrum, students played the "Agile Penny Game". The "Agile Penny Game" is a very popular agile game and is generally used to teach agile teams, the impact of large workloads on productivity, and the importance of self-organization. To play the game, the students used a Miro virtual board as the one in Figure 3.

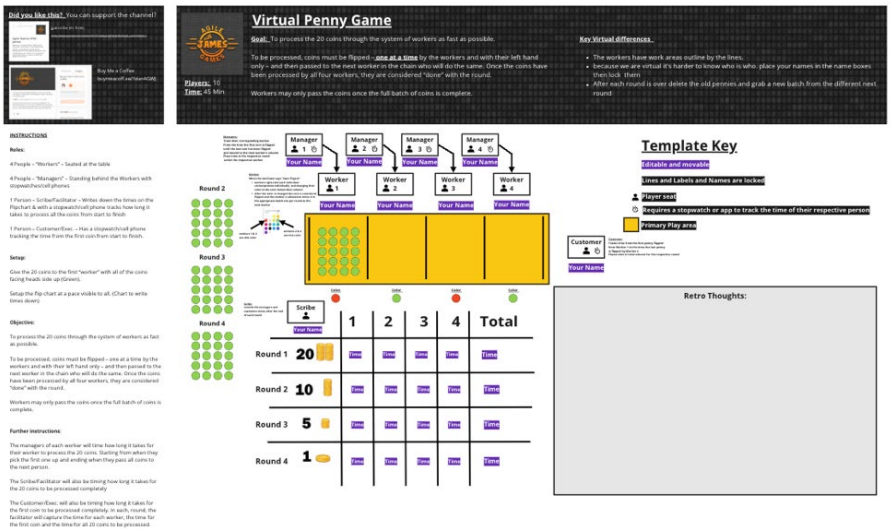

Figure 3: Virtual Agile Penny Game Miro board

Students were organized into teams of four members, with one of the members receiving the role of the Scrum Master. The teacher played the role of the Product Owner. She assumed multiple responsibilities in the agile framework, including defining learning objectives, specifying deliverables, and evaluating educational outcomes. The teacher was responsible for developing the list of tasks in the project. These tasks, also called user stories were used to organize the solar power bank features into a Product Backlog. Due to scheduling restrictions, each Sprint started with a planning meeting and included two daily meetings each week. To facilitate reflection at the end of each Sprint, Miro boards were utilized. Additionally, the teacher provided feedback and offered suggestions to improve the overall learning process.

To have a game-like approach when learning more about the context of the renewable energy sector, the students played the "Siemens Energy Island game". Students found it easy to understand the various ways of producing energy and their advantages and disadvantages. They were reminded that the game was intended to help them generate ideas to develop their solar bank project. It also explained how solar panels capture sunlight and convert it into electrical energy.

All the features of the solar power bank were organized in the Product Backlog, serving as a comprehensive list of requirements, enhancements, and bug fixes for the project. The items in the Product Backlog are typically described as user stories that capture the user's perspective and desired functionality. Each item in the backlog is assigned an estimate, often using story points, to indicate its relative complexity or the effort required. Some examples of tasks from the Product Backlog are shown in Figure 4.

PRODUCT BACKLOG						
User Story ID	User Story	Estimate (size)	Priority	Sprint	Task owner	Estimated effort
US001	As a user I need to be able to recharge wireless compatible electronical devices	Medium	5	2	Student 1	7
US002	A a user I need to be able to recharge the power bank with solar energy	Large	4	4	Student 2	21
US003	As a user I want to have a light and portable power bank	Medium	4	2	Student 3	13
US004	As a user I want to have a LED to report battery level	Small			Student 4	3
US005	As a user I want to have a USB port to connect other electronic devices	Small			Student 5	3

Figure 4: Solar power-bank sample Product Backlog

Each of the Sprints began with a Sprint Planning Meeting during which the students determined the amount of work they aimed to complete within the Sprint. The chosen educational tasks were converted into a Sprint

Backlog. Before the first Sprint, the teacher Product Owner instructed students on how to estimate work during a Sprint. Initially, students struggled with accurate task estimation, but this self-regulating process allowed them to gradually improve their ability to complete all learning activities in the Sprint Backlog after one or two Sprints. For task estimation, the students used the Planning Poker Game (Cohn, 2005) with a set of virtual cards.

During each one-week Sprint, students conducted two Daily Meetings. The decision to have only two such meetings and not every day was taken by mutual consent between the students and the teacher Product Owner. Everyone agreed that it was not feasible to have a meeting every day since the students had other subjects to deal with at the same time. Figure 5 shows a board based on a Miro template that the students used to run the retrospective meetings at the end of each Sprint.

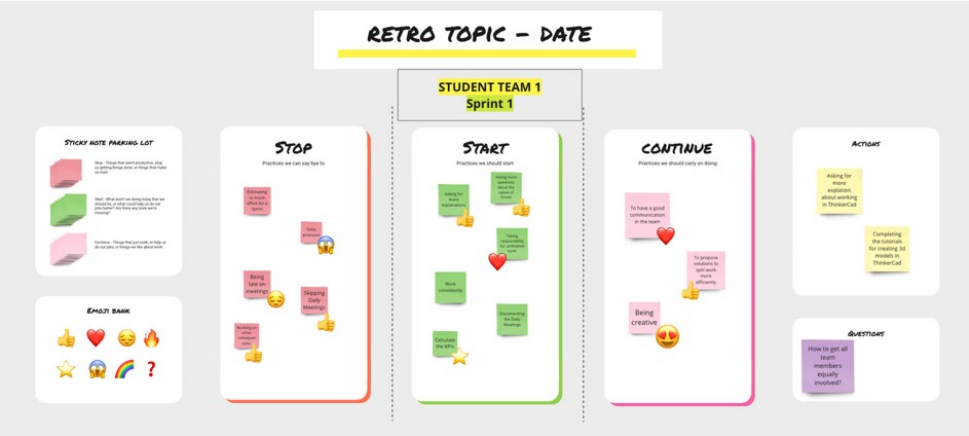

Figure 5: Miro Retrospective Meeting Board for Student Team 1

4. Results and Discussion

The activities described in the paper are intended to provide an overview of the experience of applying agile methods to an engineering course and to offer a perspective of using game-like activities to provide a more engaging learning experience for students. Following teacher observations and feedback received from students, the use of games such as “Planning Poker”, “Energy Island” or “Penny Game” allowed them to participate in the activities and embrace concepts more easily. It is important to mention that the balance between fun and education in serious games can be quite subjective and that the teacher is responsible for finding the right approach to fulfil the course learning objectives. There were quite significant differences between the teams' perceptions regarding the work they felt they could complete during a Sprint. Six out of eight teams failed in the first Sprint due to a lack of understanding of the fact that agile is based on an incremental approach and that every Sprint is relevant.

For the students, estimating the amount of work and organizing their approach for each Sprint represented their biggest obstacle. In the first two Sprints, the Scrum Master student struggled to keep the team respecting the principles of the Scrum methodology. They constantly needed to be reminded that the concept of “Done” for a task means that the project they were working on was not just a theoretical exercise to learn agile, but also had the goal of developing a possible viable product in a hands-on project in Autodesk Thinkercad. To provide a brief overview of the agile approach and to summarize the overall performance and engagement of students, the following KPIs were used:

1. The average task completion rate (%): measuring the average percentage of tasks completed by all student teams within each Sprint;
2. The average quality of deliverables (1-5): used to evaluate prototypes for each Sprint and the final product (solar power bank). Rated on a scale from 1 (poor) to 5 (excellent);
3. The average meeting participation rate (%): used to measure the average attendance at Daily Stand-ups, Sprint Planning, and Retrospective meetings by all student teams within each Sprint;
4. The average feedback incorporation rate (%): used to measure the ability to incorporate feedback from Sprint reviews and improve subsequent iterations for all the student teams within each Sprint;
5. The average team collaboration score (1-5)**:** used to measure the average level of teamwork and communication within teams, rated on a scale from 1 (poor) to 5 (excellent) for each Sprint;

6. The average learning outcomes (Quiz Scores %): measuring the average percentage of understanding of agile concepts and renewable energy principles, measured through quizzes for the students enrolled in the course within each Sprint.

Table 1 provides a clear numerical representation of the student performance and engagement over the seven weeks, showing how the student's work evolved over the seven Sprints.

Table 1: KPIs used to measure student performance during the Agile project

Sprint	The average task completion rate (%)	The average quality of deliverables (1-5)	The average meeting participation rate (%)	The average feedback incorporation rate (%)	The average team collaboration score (1-5)	The average learning outcomes (Quiz Scores %)
1	50	2.5	40	-	4	50
2	60	3	60	65	5	64
3	70	3.5	85	70	5	70
4	75	4	85	85	4	78
5	80	4	90	92	5	84
6	80	4.5	100	90	4.5	88
7	95	4.5	100	100	5	95

For the first Sprint, the average task completion rate was only 50%, as the students became accustomed to agile principles and did not realize in the first phase the importance of attending meetings and working constantly. The average quality of deliverables starts at 2.5, showing room for improvement. The average feedback incorporation rate could not be calculated in the first Sprint, because students received feedback only at the end of each Sprint. As the students understood their roles better, the average meeting participation rate and the average team collaboration score increased, which was reflected both in the quality of the tasks they completed in each sprint and the learning outcomes, reaching 95% at the end of Sprint 7. The steady increase in learning outcomes (Quiz scores) indicates a successful understanding and application of the concepts taught.

Agile methods are very based on collaboration, teamwork, flexibility, and participation. That was one of the main reasons why Student Teams with a good balance between creative thinking skills, communication, and organizational skills performed better than those with gaps in working as a team. It was a challenge that at the end of every Sprint they had to reflect on their participation during the Sprint, but also to offer consistent feedback on the activity of other team members. Another important aspect to mention is that Student Teams were randomly created, and students needed to work with colleagues with whom they had never worked before. It can be concluded that the agile approach was more easily assimilated by teams with well-developed soft skills, rather than teams with good technical knowledge. Keeping in mind that the project was developed using Scrum, the game-like activities that the students carried out implied a lot of decision-making, adaptability, and teamwork spirit. Based on student feedback, it was noticed that integrating gaming into their learning experience had a positive impact. They expressed that this approach made the learned concepts more tangible and accessible. However, some students faced initial challenges due to the limited time it took them to learn Agile and Scrum, which made them feel a bit overwhelmed, but this iterative approach ensured that the project path remained aligned with the needs and preferences of the target audience.

Furthermore, the agile gamified approach emphasized adaptability and responsiveness. Choosing this approach for the Computer-Assisted Manufacturing course enabled running regular retrospectives and feedback loops and incorporating new educational concepts or technological advancements from one Sprint to another.

However, even if agile methodologies offer numerous benefits, it is important to acknowledge that there are also some limitations and challenges associated with the implementation of an agile approach in education. There may be some limitations to the availability of some resources and curricula. Agile methodologies often require a significant investment of time and effort, and educators can face challenges in terms of training, access to technology, or availability of support systems. To enhance future experiences in using serious games for engineering courses, certain aspects will be considered to improve the measurement of student productivity and sustainability in developing manufacturing projects. These considerations aim to enhance the overall learning outcomes and assess student work. Nevertheless, it should be remembered that, for example, in manufacturing, teamwork skills and building strong work relationships with colleagues are extremely important,

and innovative teaching methods are no longer optional but rather a necessity for the development of students' professional skills. Engineering courses are still crucial for developing a technical education.

Gordon.Matthew@nwu.ac.za

Abstract: This article introduces a heuristic evaluation of CiteSaga, a tabletop serious game designed to enhance skills in referencing and citation, crucial for academic writing in higher education. We detail the application and outcomes of a novel heuristic evaluation framework tailored for tabletop serious games, dubbed "Play with Purpose." This framework is distinguished by its focus on eight essential categories: Learning Experience, Utility, Game Features, Social Dynamics, Adaptability, Learning and Feedback, Play Experience, and Accessibility, marking a significant contribution to the evaluation of non-digital game-based learning tools. Furthermore, we delve into the insights gained from participatory design sessions with students, aimed at evaluating CiteSaga's component appeal and game mechanics. The paper culminates in a discussion on how student feedback has informed subsequent iterations of CiteSaga, underscoring the critical role of heuristic evaluations in refining game-based learning experiences. Our findings not only advance understanding of empirical evaluation methodologies for tabletop serious games but also provide a valuable framework for future research and development in educational game design.

Keywords: Heuristic Evaluation, Game Design, Tabletop Serious Games, Academic Integrity

1. Background

The tabletop gaming industry has grown in the recent past due to advancement in technology and changes in consumers' preferences. This sector includes board games, card games, role-playing games, and digital-tabletop games, which are intermeshed with physical games, and target different groups of consumers (Thammavongsy et al. , 2020; Bolesnikov et al. , 2022). Tablet games are popular due to their ability to create social interaction and co-operative gameplay with new technologies such as augmented reality improving the game play and the convenience (Yuan et al. , 2021; Koukia, 2018; Thévin et al. , 2021). These games have spread their audience beyond the typical gamers, and such institutions as schools, libraries, and even psychologists pay attention to them. They are now employed in the teaching of different disciplines and have been crafted to accommodate different groups of people including the elder people as well as the visually impaired persons (Triboni & Weber, 2018; Bolesnikov et al. , 2022).

Thus, such an interest in the application of SGs in educational environments has required a proper assessment of their impact on learning. Heuristic evaluations involve the assessment of the usability, accessibility, and general usability of SGs, with a view of determining the areas that require some changes and confirming its compliance with the educational objectives (Desurvire et al. , 2004; DiNardo & Broussard, 2019; Slyman et al. , 2022). Both these assessments employ principles to assess the interface, interaction design and gameplay experience hence helping the educators and developers to improve the educational value of SGs and to foster the learning achievement.

2. What are Tabletop Serious Games, Anyway?

Tabletop serious games are defined as the interactive games which are meant for achieving certain educational, training, or persuasive goals beyond the realm of entertainment (Noda et al. , 2019). These SGs are mainly done on a flat surface as physical board or card games and give a real feel and touch of board and cards to the players which makes the player involve in the game more effectively and increase the level of team work, participation and interaction (Bonnechère et al. , 2016). They usually incorporate physical objects and multimodal tools to create engaging educational situations to support learner-centered approaches and establish positive learning contexts (Zhang et al. , 2021). Furthermore, tabletop SGs enhance the physical interpersonal relationships and social interactions and are thus ideal for use in learning and entertainment settings (Mccallum & Boletsis, 2013). Designing these games is focused on the principles of usability and accessibility which make the games appealing and beneficial to many users (Abbott, 2019).

The CiteSaga concept implemented at the North-West University's Library is a good example of how the students' engagement and the academic integrity can be promoted within the higher learning institutions. As a result of understanding the difficulties that students encounter in the correct citation and referencing styles, CiteSaga has come up with an interactive way of teaching students these important academic skills through the use of games. This way, the initiative strengthens the concept of academic integrity since the various tasks involve the correct use of citations. Also, CiteSaga enables group learning and peer to peer interaction where students are able to solve citation problems and share great experiences. This social dimension is important in helping students to foster their interpersonal skills through collaborative and group work to identify the most appropriate method of referencing thereby improving on their knowledge and performance.

3. The Purpose of This Research

Traditional academic integrity education is usually done in writing courses, research tutorials or workshops where students are taught about citation laws in order to avoid plagiarism (Obeso, 2023; Ramdhany, 2023). Citation management tools and bibliographic instruction help the students to reference the sources used in the right manner; however, many students fail to use citations in the right way thereby limiting their engagement in academic discourse (Iskandar & Patak, 2019; Okeji et al. , 2020). These conventional techniques fail to capture the various citation formats thus creating mistakes that affect the quality of the work (Romanowski, 2022). Citation instruction is only offered in the first and the third year at North-West University, which means that there is a necessity to find new ways to enhance the students' citation skills and promote academic integrity through the usage of serious games (SGs).

The focus of this paper is to describe the heuristic evaluation of CiteSaga, a serious game in the context of citation and reference styles at a South African university. The research involved the students in the design of the game, and their feedback concerning the usability, accessibility of the game and the extent to which it helped in improving citation skills and academic integrity. The purpose of the study was to confirm that the game is useful to students, make suggestions for the game design and assess how the game affects students' ethical decision making and academic integrity (Ifenthaler & Yau, 2020).

4. Literature Review

4.1 Serious Games and Their Potential for Education

This paper also analyze several literatures on the application of serious games (SGs) in the educational context. Educational value of SGs was discussed by Breuer & Bente (2010) whereas Khaled & Vasalou (2014) explained the significance of participatory design in learning through domain expertise. Medema et al. (2016) explained how SGs promote social learning and stakeholder participation in environmental management and Ampatzidou & Gugerell (2018) explained the aspect of having content in SGs while making them fun. Verschueren et al. (2019) proved that SGs can be effective in the management of psychological and health problems in children. Furthermore, Sharifzadeh et al. (2020) also identified that SGs are useful in health education and Hainey et al. (2022) also showed that SGs are helpful in formative assessment. The effectiveness of SGs was demonstrated in the real world by Putra et al. (2022) through an example of a COVID-19 social distancing game. Altogether, these studies point to the potential of SGs for use in educational and health-related settings.

4.2 Heuristic Methods for Evaluating Serious Games

These studies collectively highlight the significance of heuristic methods in evaluating the accessibility, feasibility, and effectiveness of serious games (SGs) across various domains: All these works in combination depict the role of heuristic approaches in evaluating the applicability and effectiveness of serious games (SGs) in various fields:

1. Tong et al. (2016) have described how SGs can be utilized for identification of cognitive impairments in the healthcare setting which makes it possible to apply the presented cognitive screening in the clinical practice.
2. Lau et al. , (2017) also did a systematic review and meta-analysis of SGs and they also concluded that SGs have a moderate effect in the reduction of symptoms of mental health disorders is vital since SGs are easily accessible and useful.

3. As stated by Ghoman et al. (2019), neonatal HC professionals are trained by SGs; the best way for this is through board and computer-based games which are also the most effective method of knowledge enhancement.
4. Salvador-Ullauri et al. , (2020) described the SGs design as non-inclusive because the designed SGs are not for everybody and called for inclusive design in the SGs.
5. Olgers et al. (2021) stated that SGs are useful in improving skills in medicine, though more studies need to be done so as to determine if they are efficient as well as accessible.

Table 1: Overview of Methodologies and Key Elements in Serious Game Research

Reference	Methodology	Key Elements
Bellotti *et al.* (2010)	Effective Serious Games Design	Cognitive aspects, theoretical foundations
Yoon & Park (2013)	Quality Evaluation Standard	9 main elements and 31 sub-elements
Kato (2010)	Serious Game Evaluation	Interactivity, Learning, Scoring, Scenario, Enthusiasm, User's traces
Hannig *et al.* (2012)	Collaborative Serious Game, Web-Based Collaborative Serious Game	Stimulation of conceptual thinking, Optimal design of a medical practice
Roungas (2016)	Model-driven Framework, Model-Driven Framework	Educational and entertainment game elements (twice listed)
Gordon *et al.* (2016)	Heuristic Evaluation	User Interface (UI), User Experience (UX), Serious immersive games and M-instruction
Lameras *et al.* (2016)	Serious Games Design, Linking Learning Attributes to Game Mechanics	Learning attributes and game mechanics
Salvador-Ullauri *et al.* (2020)	Accessibility Evaluation, Heuristic Evaluation	Heuristic method for evaluating accessibility, Accessibility in serious games, Accessibility issues, usability, effectiveness
Couret *et al.* (2020)	Risk-taking Behaviour Modelling, Operationalization, Heuristics evaluation strategy	Operationalisation of the availability heuristic, Avalanche accident victims, availability heuristic, Mobile game-based learning

Table 1 captures the methodologies and focal shifts in SG studies, illustrating the evolution from foundational theories to practical applications. Starting with Bellotti *et al.* (2010), it traces the development of cognitive frameworks and theoretical underpinnings in SGs, moving towards the critical evaluation of game effectiveness and educational utility through interactivity and user engagement, as emphasised by Yoon & Park (2013) and Kato (2010). It further explores the application of SGs in educational and other settings through collaborative and model-driven frameworks discussed by Hannig *et al.* (2012) and Roungas (2016). Notably, Gordon *et al.* (2016) highlight the importance of usability, focusing on user interface and experience, while Salvador-Ullauri et al. (2020) and Couret *et al.* (2020) reflect ongoing advancements in accessibility and heuristic evaluations, underscoring the increasing emphasis on making SGs both accessible and instructional.

Table 2: Heuristic Evaluation Elements in Serious Game Research

Reference	Heuristic Evaluation Elements
Desurvire *et al.* (2004)	Playability, game mechanics, aesthetics, user experience
Desurvire & Wiberg (2009)	Game usability, design, better games
Gordon *et al.* (2016)	User Interface (UI), User Experience (UX), software reflection
Hermawati & Lawson (2016)	Domain-specific heuristics, identification of specific issues, consensus on domain-specific heuristics
Tondello *et al.* (2016)	Motivational affordances, gameful design, usability
Yáñez-Gómez *et al.* (2018)	Mobility, multiplayer interactions, enjoyability, playability
Ishaq *et al.* (2021)	Usability, playability, game-based language learning
Lima *et al.* (2022)	Content validity, Cronbach's alpha, heuristics
Muhanna *et al.* (2022)	Usability, playability, Arabic mobile games
Slyman *et al.* (2022)	Learning elements, usability, design
Paneva-Marinova & Pavlov (2018)	Student motivation, learning, curiosity, skill development
Zaibon & Shiratuddin (2010)	Applicability, modular playability heuristics, health-enhancing games
Suhonen & Väätäjä (2010)	Core game elements, usability, health-enhancing games

Table 2 explores heuristic evaluation elements in SG research, detailing the evolution of criteria used to assess their usability and effectiveness. It starts with the foundational contributions of Desurvire *et al.* (2004) and

Desurvire & Wiberg (2009), who emphasise playability, game mechanics, and user experience, key to engaging and educational games. The field has since seen the development of more specialized heuristics, such as those by Hermawati & Lawson (2016) and Tondello *et al.* (2016), focusing on domain-specific issues and motivational affordances, indicating a shift towards more nuanced evaluation strategies. Recent research, including studies by Ishaq *et al*. (2021) and Lima *et al*. (2022), continues to refine these criteria, aligning them with specific educational goals and broader learning scenarios, while researchers like Lee & Lee (2021) expand the definition and applications of SGs by incorporating narrative and multimedia elements.

Table 3: Specific approaches and methodologies for conducting heuristic evaluations of SGs

Approach	Description
The Fuzzy Analytic Hierarchy Process (FAHP)	A technique employed to assess SGs, specifically in educational settings. This approach involves the use of fuzzy logic to prioritise and evaluate various dimensions of SG, including pedagogical, technological, ludic, and behavioural aspects (Omari *et al.,* 2020).
Participatory Game Prototyping	Involving stakeholders, such as students and educators, in the process of designing and developing SGs. This approach prioritises significant player involvement and the integration of local context, guaranteeing that the game design is in line with educational goals and user preferences (Desurvire *et al.,* 2004).
Usability Heuristics	A systematic method for assessing serious games, specifically in the realm of mobile games. This approach entails the creation and implementation of usability heuristics specifically designed for assessing serious games, guaranteeing that the games adhere to usability and playability criteria (Soomro & Ahmad, 2014 and Muhanna *et al.,* 2022).
Serious Game Evaluation Framework	A methodology to evaluate the efficacy and educational value of SGs. This approach prioritises the evaluation of SGs by considering their theoretical, technical, empirical, and external aspects, thus ensuring a comprehensive assessment (Wilson *et al.,* 2016).
Heuristic Evaluation to Assess Immersive Games	This approach expands the application of heuristic evaluation to encompass complex immersive games and mobile instructional platforms. The process entails the use of established heuristic evaluation techniques to evaluate the usability and educational value of SGs, specifically in immersive and mobile settings (Gordon *et al.,* 2016).

Table 3 shows the variety and depth of heuristic assessment methods for SGs. Omari *et al.* (2020) analyse SGs using fuzzy logic to assess pedagogical, technical, ludic, and behavioural characteristics using the Fuzzy Analytic Hierarchy Process (FAHP). Participatory Game Prototyping involves students and educators in SG design to correspond with educational aims and user preferences, according to Desurvire *et al.* (2004). SGs, especially mobile games, need usability heuristics to ensure usability and playability, according to Soomro & Ahmad (2014) and Muhanna *et al*. (2022). Wilson *et al.* (2016) evaluate SGs theoretically, technically, empirically, and externally using the Serious Game Evaluation Framework. Finally, Gordon *et al*. (2016) applied heuristic assessments to sophisticated immersive games and mobile teaching platforms, focussing on usability and educational value. This table describes the methods used to improve and evaluate SGs across dimensions and platforms.

Evaluating SG heuristics involves not only the game's functionality and playability, but also its ability to effectively communicate its educational or training content. Below are several frequently assessed heuristics for both digital and analogue SGs. **Heuristics applicable to tabletop SGs are marked with a ✅ symbol:*

- Educational Value ✅ : Assess the game's efficacy in achieving its educational goals, encompassing the acquisition of knowledge and the development of skills.
- Engagement ✅ : Evaluate the game's ability to effectively captivate and sustain players' attention.
- Usability ✅ : Evaluate the user-friendliness of the game, encompassing factors such as the design of the user interface, ease of navigation, and the clarity of instructions and feedback.
- Accessibility ✅ : Assess the game's capacity to be utilised by individuals with varying abilities, including those with disabilities.
- Responsiveness ✅ : Assess the effectiveness in delivering informative responses to the player and modifying its difficulty level to enhance the process of learning and participation.
- Narrative ✅ : Evaluate the efficacy of the storyline or narrative in augmenting learning by offering context and significance to the game's goals.
- Interactivity ✅ : Evaluate the extent and quality of the interaction(s) within the game, encompassing the level of control given to the player and the game's ability to promptly respond to the player's actions.
- Learning Analytics ⚠ : Analyse the methods the game employs to measure the player's progress and advancement towards the game's educational goals.

- Social Interactions ✅ : Assess the extent to which a game promotes cooperation, competition, and communication among players in games that have multiplayer features.
- Fidelity ⚠ : Evaluate the degree to which the game faithfully replicates real-life situations—a crucial aspect for training and simulation games.
- Flexibility ⚠ : Assess the game's capacity to be expanded or modified to suit various situations, player counts, or degrees of difficulty.Ethical and Cultural Sensitivity ✅ : Evaluate the degree to which the game demonstrates respect for cultural uniqueness and whether or not it refrains from endorsing detrimental stereotypes or biases.

The selection of these heuristics may differ depending on the particular goals and intended audience of the serious game. They are frequently employed in conjunction with conventional game design principles to ensure that the game is both efficacious in achieving its serious objectives and captivating as a game.

5. Research Strategy

The “Play with Purpose” model (Figure 1) is a comprehensive model for analyzing serious games, especially tabletop games such as CiteSaga, on different aspects of Accessibility, Utility, Learning Experience, and Social Dynamics. Therefore, these aspects make the game easy to play by any person, the rules of the game are well defined, players are able to learn easily through the game and the game fosters social interaction. Other factors like Play Experience, Feedback, Adaptability and game Features are added to the evaluation process which is consistent with literature on pedagogical affordances of serious games.

In this study, this framework informed a survey completed among education and economics students at a South African university to assess CiteSaga. Thus, despite the limited number of participants and the alpha-phase of the game, the present study was able to offer a focused analysis of the game’s design and educational potential. Subsequent larger scale testing on more universities will determine the validity of CiteSaga in more universities and improve on the current glitches to make it more versatile.

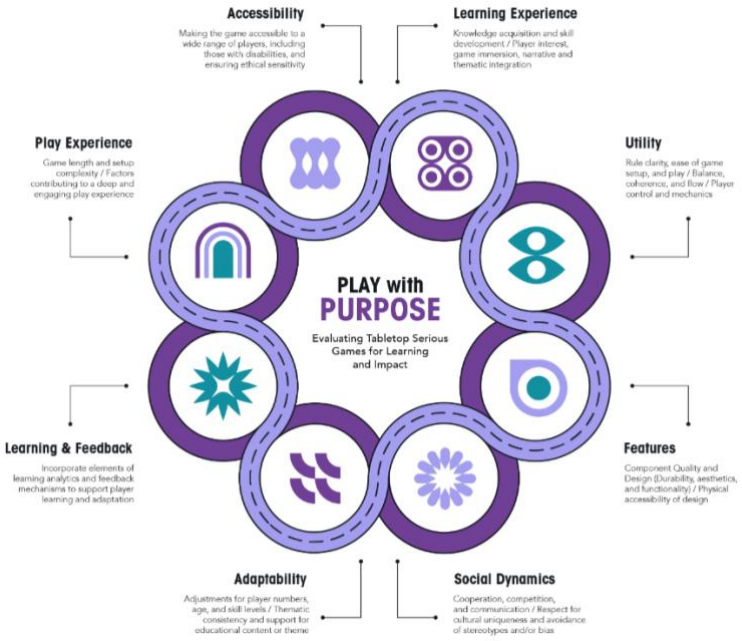

Figure 1: Play With Purpose framework for tabletop serious game evaluation (Source: Own conceptualisation)

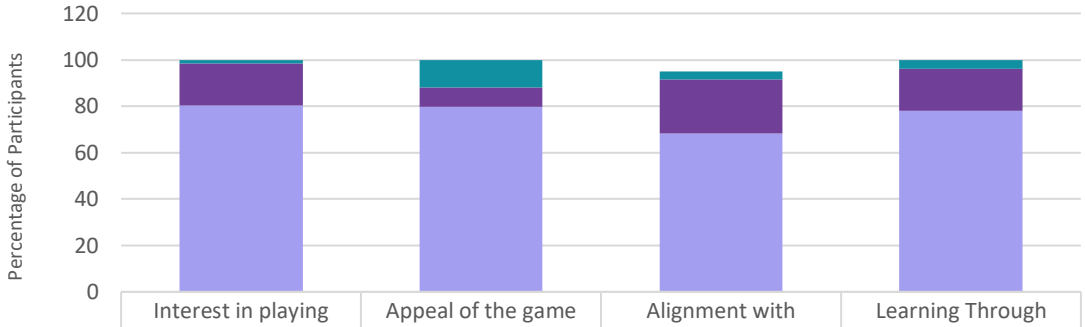
5.1 Framing “Play With Purpose”

In the evaluation of the tabletop SG *CiteSaga* using the "Play with Purpose" (PWP) framework, the study strategically focused on four specific elements of the heuristic wheel: Learning Experience, Features, Play Experience, and Learning & Feedback. This targeted approach was designed to provide a solid empirical foundation for these aspects prior to more interactive play sessions with students. The following sections explain how this strategic focus integrates into the broader discussion of the game's development and future testing.

5.1.1 *Strategic Focus on Selected PWP Elements*

The choice to limit the initial empirical evaluation to Learning Experience, Features, Play Experience, and Learning & Feedback allowed for a concentrated analysis of these critical areas. Each of these dimensions plays a vital role in the overall educational effectiveness of the game:

- Learning Experience: By assessing how well the game facilitates knowledge acquisition and skill development, the study ensures that the main educational goals of *CiteSaga* are being met.
- Features: Evaluating the quality and design of the game components provides insights into the physical and aesthetic appeal of the game, which are crucial to maintaining engagement.
- Play Experience: Focusing on game length and setup complexity helped determine whether the game's structure was conducive to deep and engaging gameplay, which is essential for sustained interaction and learning.
- Learning & Feedback: This dimension was critical to assess how effectively the game incorporates feedback mechanisms and learning analytics, supporting adaptive learning and ongoing player development.



5.1.2 *Future Testing of Remaining Elements*

The remaining four elements of the PWP framework—Accessibility, Utility, Adaptability, and Social Dynamics—were not empirically tested in the initial phase reported here. The rationale for this was to allow these dimensions to be explored during actual play sessions with students. This approach aims to observe and measure these aspects in a dynamic, interactive environment where real-time data and feedback can provide a more genuine and comprehensive assessment.

- Accessibility: Future sessions will specifically look at how the game accommodates diverse player needs, including those with disabilities.
- Utility: Observations will focus on the game's rules, balance, and flow during play to assess its practical utility and ease of understanding in a live setting.
- Adaptability: Testing will evaluate the flexibility across different player demographics, skill levels, and group sizes of players.
- Social Dynamics: This will involve evaluating how the game fosters interaction among players, including aspects of cooperation, competition, and communication.

6. Findings and Recommendations

The survey received 151 responses over the course of a two-week period. Figure 2 highlights the positive reception of *CiteSaga* among participants, with convincing interest, appeal, and perceived educational value. Such insights are crucial for refining the game and enhancing its effectiveness as a learning tool. The data, moreover, suggests that *CiteSaga* has the potential to significantly impact students' understanding and application of citation styles and academic integrity practices.

	Interest in playing the game	Appeal of the game experience	Alignment with university experience	Learning Through Playing
No	1.72	12.02	3.43	3.86
Maybe	18.03	8.15	23.18	18.03
Yes	80.26	79.83	68.24	78.11

Figure 2: Reception of various elements of the *CiteSaga* game concept.

The results reveal a strong positive reception of *CiteSaga* among research participants. A significant majority (80.26%) expressed interest in playing *CiteSaga*, indicating a strong initial engagement with the game concept. Furthermore, 79.83% affirmed the appeal of the game experience, suggesting that the design and concept resonate well with the target audience. In terms of educational alignment, 68.24% of participants agreed that *CiteSaga's* objectives align with their university experience regarding the need to reference sources correctly, with another 23.18% somewhat agreeing. This demonstrates the effectiveness in addressing relevant academic integrity skills. Furthermore, 78.11% of the respondents believed that they would learn more about citation styles and academic integrity by playing *CiteSaga*, highlighting its potential as an edifying tool. The data also reveals areas for potential improvement, as 18.03% were uncertain about the game's appeal and educational value, and a small fraction (3.86%) did not think they would learn more, suggesting opportunities for enhancing engagement strategies.

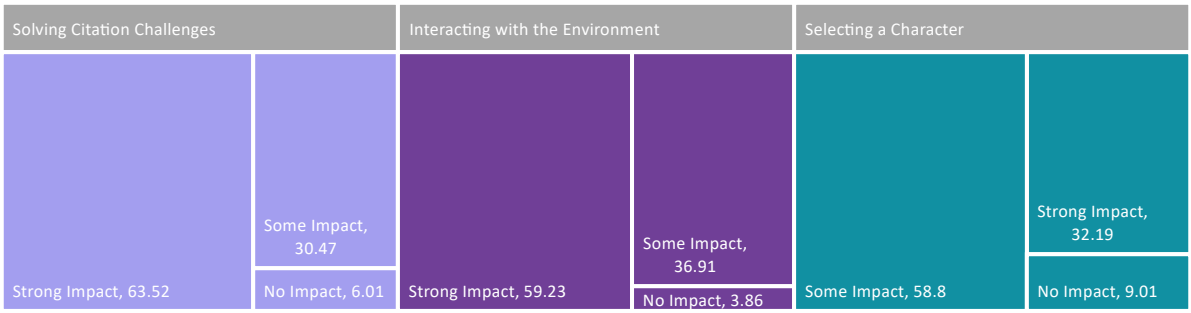


Figure 3: Reportage of various *CiteSaga* mechanics and their perceived impact on learning

The stages of gameplay in *CiteSaga* vary in their level of appeal. The most attractive aspect was the solution of citation challenges, which accounted for 26.45% of the overall experience. This was followed by interaction with the various environment cards at 21.76% and selecting a character at 20.66%. Understanding these preferences is crucial to optimising the design to improve player engagement and outcomes. The impact of these gameplay elements on learning is also significant. Solving citation challenges had the strongest impact, with 63.52% of participants indicating it as highly impactful, followed by interacting with the environment (59.23% strong impact) and selecting a character (32.19% strong impact). In terms of ease of the learning, 72.96% of participants found the *CiteSaga* game mechanics relatively straightforward to learn, while 13.30% found them extremely easy. However, a minority of participants (13.73%) encountered difficulties with the mechanics, indicating a need to streamline or clarify the game rules.

6.1 Learning Experience

The assessment of CiteSaga with regards to educational impact centred on the learning that it offered to the students. The survey questions (Q1-Q25) were about the level of participation, understanding of the learning objectives and the application of the in-game scenarios. As seen, relevance of content, goals, and learning as integral parts of the games were mentioned by the respondents, in accordance with the theory of good educational games (Gee, 2003; Plass, Homer, & Kimzer, 2015). Customer feedback pointed to the following primary goals of the game; citation (60%), integration (25%) and interactive learning (15%). However, some of the feedback feedback indicated that educational content should be integrated more deeply which is a problem recognised by Annetta (2010). Thus, the majority of respondents were inclined to think that playing CiteSaga would improve their knowledge about citation styles and academic integrity and thus recognized the potential of the game as a proper learning tool.

6.2 Features

Questions Q26-Q30 was related to the physical and aesthetic features of CiteSaga with regards to customizations (45%), gameplay (35%), and hardware (20%). Research-backed customisation and narrative-based engagement influence the level of player's commitment and willingness to replay the game (Salen & Zimmerman, 2004; Habgood & Ainsworth, 2011). The aspects which were important for 60% of students were high-quality components while 40% of students mentioned the character customization, which is in harmony with Adams (2014), who pointed out the significance of the esthetic aspects for educational games. According to 55% of the respondents, the storyline of the game had to be compelling and 50% said that the environment had to be well

developed, in line with Jenkins (2004) on the need for narrative integration. On the whole, the responses pointed out that CiteSaga is good in component quality and design, the aspects that are crucial to the game's appeal.

6.3 Play Experience

Questions Q31-Q44 asked to explore the participants' pre-play experience of *CiteSaga*, focusing on length of play, setup complexity, and structure of gameplay activities. Key issues were the high percentage of cooperative play (50%) and competitive aspects (30%), and scenario-based challenges (20%) that participants found yielded a high degree of educational value and required engagement. In this sense, the outcomes are consistent with Johnson *et al.* (2011): cooperative gameplay supports the development of collaboration and communication, while elements of competition might be engaging. They also value clear instructions (45%), balanced levels of difficulty (30%), and reward(s) for progression (25%), which were essential to ensure a certain degree of game engagement conducive to educational objectives (Gee, 2003). Character development (40%) and narrative contexts (35%) were also good indicators. The high rate of narrative-driven activities is explained by the fact that gameplay should be a challenge but also manageable, supporting the findings by Barab *et al.* (2009) that narrative contexts in games can promote deeper engagement and learning.

CiteSaga's length and complexity of the setup were seen as contributive factors to the learning experience, suggesting that these aspects provide a deep and engaging play experience as envisioned in the PWP framework.

6.4 Learning and Feedback

Questions Q45-Q49 were aimed at measuring the learning and feedback process applied in CiteSaga. While, 70% of the participants highlighted that they had access to self-assessment opportunities, 30% of them wanted to see some changes. Interestingly, 40% of the students wanted more frequent feedback, 35% wanted detailed explanations, and 25% wanted adaptive learning paths. These findings are in accord with Shute (2008) and Hattie and Timperley (2007) who stressed that feedback has to be formative and timely in order to promote self-regulated learning. The call for adaptive learning relates to literature for the personalized learning experiences (Plass, Homer, & Kinzer, 2015). In general, participants had a moderate to a good understanding of CiteSaga's educational objectives, which points to the effective use of learning and feedback functionalities.

6.5 Recommendations

The recommendations made to improve the *CiteSaga* concept are informed by data collected from the feedback of the respondents. These are presented below:

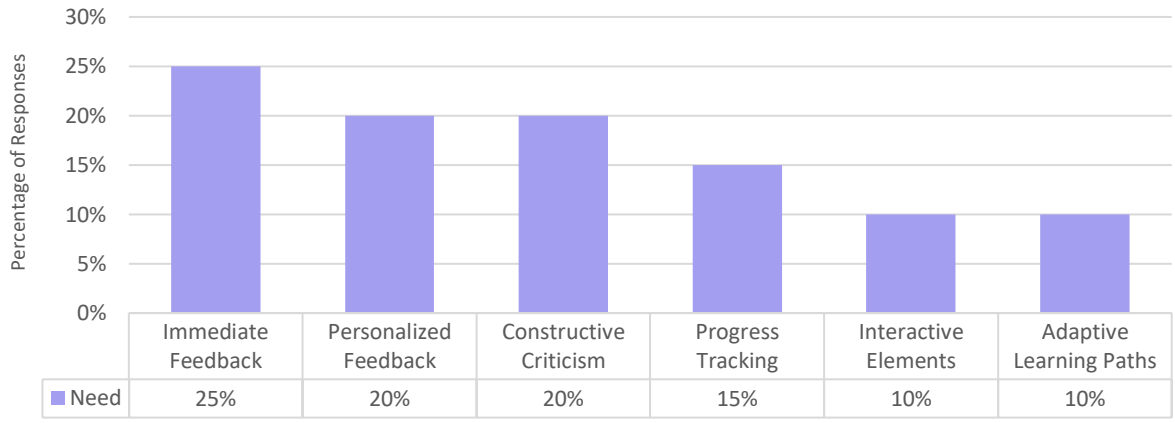

Figure 4: Reportage on the requirements to improve feedback in *CiteSaga*

In Figure 4, the most important aspects that could be enhanced for the learning experience in CiteSaga are stressed. The most important need mentioned by 25% of the participants is feedback which is helpful in learning from the results and correcting mistakes. Other aspects that were considered important included receiving feedback and critiques by 20% of the participants while 15% wanted to have their progress monitored. Also, 10% of the participants pointed to the importance of the interactive features and the opportunity for personalized learning paths. The following suggestions can be made for the improvement of the future iterations of CiteSaga; simplify the instructions, include difficulty levels, provide feedback to the user during the game and

enhance the visual aspect of the game for its accessibility. These changes are intended to improve educational effectiveness as well as levels of user comfort. More statistical analysis can also be conducted to support these findings and provide more information on how CiteSaga can be improved to better cater for different learning requirements.

7. Conclusion

This study addresses the research questions as follows:This study addresses the research questions as follows: *How can the principles of participatory design be included in the development of tabletop serious games for teaching academic integrity and referencing skills?* This information and feedback from the participants in CiteSaga design process was very active, thus it directly informed the changes in game play, story line, and educational content. Notably, 79. Out of all the participants, 83% said that the game was interesting while 69. Out of the total number of respondents 52% were able to demonstrate the knowledge of the education objectives. This feedback supports the use of participatory design in ensuring that the game is in sync with the educational goals and at the same improving on the fun aspect of the game.

Which heuristics are the most suitable in determining the accessibility and usability of educational tabletop serious games? User-based heuristic evaluation revealed the need for easy-to-understand instructions, good graphics, and ease of use. A majority, 72. 16% while 89% of the participants reported that the instructions were clear showing that clear guidelines are important to usability and accessibility. These findings implies that serious game designers should pay much attention to the quality of the visual interface, readability and the clarity of instructions to achieve the intended educational outcomes.

How effective is the design of CiteSaga in promoting academic integrity among the tertiary level of students? The study also showed that 78. 11 % of the respondents reported that they expected to gain more knowledge on citation styles and academic ethics by using CiteSaga. Additionally, 72. Ninety six percent of the respondents believed that the complexity of the game was beneficial to learning and thus the game has incorporated educational content in the right manner to boost academic performance.

In general, CiteSaga was considered to be a good system and participatory design was found to be an important factor in the design process. The integration of design in the material used for the teaching of academic integrity in the tertiary institutions makes it a relevant tool for the same.

Gordon.Matthew@nwu.ac.za

Abstract: This article asserts that serious games (SGs) are effective tools for teaching citation and referencing styles in higher education. The proposed SG aims to enhance students' understanding and application of these styles through an engaging, game-based approach. We use an agile design cycle combined with educational design and design science research methodologies. The SG's key elements include objectives, rules, mechanics, learning outcomes, and assessment strategies, all integrated into higher education curricula.

1. Introduction

Students must demonstrate their capacity to connect with current knowledge, prevent plagiarism, and contribute to academic debate through proper citation and reference (Duff, Rogers and Harris, 2006; Adhikari, 2018). However, students typically struggle to learn the several citation and reference formats (Lanning, 2016; Hamzaoui, 2021). To solve this difficulty, educators explore creative and engaging ways to teach and reinforce these abilities (Nilson, 2016). Serious games (SGs) can motivate and improve learning by combining enjoyment and teaching (Camilleri and Camilleri, 2019). Using SGs to teach citation and referencing styles can improve student understanding and application, motivation, critical thinking, and academic writing and research. This article describes the conceptualization of an SG to teach and reinforce higher education citation and reference styles. This method uses board games to make studying fun and improve students' citation and reference abilities.

2. The Reasons for Using Serious Games in Education

Over the past few decades, serious games (SGs) have been recognized for significantly improving learning outcomes across various courses (Yu, Gao, and Wang, 2021). They enhance student involvement, promote active and experiential learning, and foster essential skills such as problem-solving, critical thinking, cooperation, and decision-making (Westera, 2019; Rosa et al., 2021). Research indicates that SGs surpass traditional self-regulated learning by increasing participation and facilitating experiential learning (Power, Lynch, and McGarr, 2020). Their application extends to military, healthcare, and educational fields (Amod and Roodt, 2020).

SGs are employed in social marketing to boost engagement and learning outcomes (Dietrich, Mulcahy, and Knox, 2018) and offer unique educational benefits for dyslexic children (Bhatti and Shabbir, 2022). In healthcare, SGs aid novice professionals in understanding risk assessment and management (Mason and Loader, 2019) and promote learning and innovation in global health education (Smith et al., 2020). They also facilitate social learning in sustainable land and resource management by promoting collaboration (Den Haan and Van der Voort, 2018). Furthermore, SGs are effective in professional development, creating engaging environments for skill enhancement (Barnabé et al., 2017). Their growing integration into education and business training underscores their increasing importance and effectiveness across various domains (Cohard, 2019).

Incorporating SGs into higher education curricula, especially in research-focused modules, can significantly enhance student engagement, comprehension, and retention of complex subject matter and research skills. SGs can complement traditional instructional methods (Ferro et al., 2021) and provide dynamic platforms for students to apply theoretical knowledge in practical contexts (Barianos, Papadakis, and Vidakis, 2022). They promote active learning and problem-solving skills (Peña Miguel, Corral Lage, and Mata Galindez, 2020) and simulate real-world research environments, offering a controlled and supportive setting for experiencing academic research challenges (Leendertz and Matthew, 2022; Linderoth and Sjöblom, 2019). SGs also encourage collaborative learning and cooperation, mirroring the collaborative nature of academic research projects (Rodríguez-Rivera et al., 2023).

Aligning with constructivist learning theories like those of Vygotsky and Jean Piaget, SGs promote active engagement, reflection, and knowledge construction through experience (Young et al., 2012). They can motivate students to engage in self-directed learning by encouraging exploration and mastery. Strategically integrating SGs into research-centric topics can foster engaging and experiential learning, thereby enhancing students' research skills, critical thinking abilities, and overall academic performance. SGs prepare students for the rigorous research demands of higher education and beyond. Specifically, for teaching citation and reference styles, SGs offer practical and interactive learning environments that complement traditional classroom instruction.

3. Problem Statement

Students in higher education struggle with citation and reference formats. This makes it harder for them to interact with research, prevent plagiarism, and contribute to academic conversation. Traditional teaching techniques cannot address the variety of citation and reference types, making proficiency difficult. This poor teaching method can cause students to commit reference errors, which harm academic journals and raise expenses for publishers and universities. To address the complexity of referencing styles, educators should emphasise skills like as citation assistance and proofreading (Goodman et al, 2018; Kratochvíl et al, 2022; Rozell, 2022). In other circumstances, students only see reference modules in their first year, which is insufficient to develop and improve these abilities. North-West University (NWU) only teaches citation and reference in the first year (ALDE 111 and ALDE 121), and students first encounter it in their third year in a research methodology curriculum or module that needs a research report. The talent is still needed for postgraduate studies, but not all students have it because it's not part of their curriculum in other courses. These conditions highlight the need for new and interesting strategies to improve students' citation and reference abilities for academic success and postgraduate courses.

In addition to classroom education, an SG that clarifies and improves citation and reference methods may make learning fun and remembered. Integrating an SG into research-focused programmes allows students to effortlessly apply theoretical knowledge to practical situations, bridging the gap between abstract concepts and real-world applications. Since students actively participate in learning, this integration can also boost active learning. This engagement helps kids build problem-solving abilities by forcing them to think critically and find answers. This article suggests that strategically integrating SGs into research or other academic modules might increase students' research (citation and reference), critical thinking, and academic achievement (Ifenthaler and Yau, 2020).

4. Research Objective and Question

The objective of this research is to determine the best approaches to create and implement an SG to assist in learning citation- and referencing skills. The research question derived from that objective is "What are the most effective approaches for designing and implementing a SG to improve citation- and referencing skills among learners?"

5. Methodology

5.1 Educational Design and Design Science Research

The authors address the study question above by suggesting that project goals, context, and needs determine the appropriate SG design methodologies. Design science research (DSR) and instructional design are unique pedagogies. Their aims, techniques, and outcomes differ, although they have several traits (Fahd et al., 2021). Instructional design and DSR both promote problem-solving (Delaney, 2022). They examine and solve challenging educational issues. They aim to fix education. Second, both methods need iteration. Designers and researchers in these paradigms use feedback and assessment to refine ideas through iterative development (Ødegaard et al, 2021). Iteration promotes instructional flexibility. Educational design and DSR are interdisciplinary (Molle and Huang, 2021). Collaboration across education, instructional design, psychology, computer science, and other fields is common for these paradigms. Collaboration is essential to overcome complicated educational challenges. Educational design and DSR prioritise practicality and application (Han, 2022). They propose realistic, reasonable, and implementable ideas to enhance educational processes and outcomes using pragmatic educational practice. Combining education and research can improve results. Both approaches prioritise practical application, but their aims, techniques, and results differ. Educational design

focuses on successful learning experiences and products for varied educational contexts (McKenney and Reeves, 2018). It develops pedagogically sound courses, programmes, and material (McKenney and Reeves, 2021). DSR stresses practical application but also develops theoretical underpinnings (Vom Brocke, Hevner and Maedche, 2020). It creates and assesses new approaches, models, and frameworks to address educational difficulties and improve academic comprehension (Iivari, 2020). Thus, DSR integrates theory and practice (De Sordi, 2021). Educational design assesses learning outcomes (McKenney and Reeves, 2021). Formative evaluation improves design throughout development to achieve educational goals. DSR examines the theoretical and practical impacts of intentional artefacts beyond efficacy assessments (De Sordi, 2021). This multidimensional analysis shows artefacts' domain-wide consequences (Vom Brocke, Hevner and Maedche, 2020). The following were found based on each approach. Educational design that highlights pedagogical principles and learning objectives is essential for structured, successful SG education. However, DSR is effective when adopting a thorough and rigorous research technique to find a novel solution. Following features of these techniques support the claim: (i) DSR research solves educational problems and advances theory. DSR designs products and provides theoretical insights to increase academic comprehension. Educational design develops instructional materials, courses, and experiences for direct deployment in educational contexts to improve learning. Educational design improves learning with real products. (iii) Educational design and DSR share problem-solving, iterative methodologies, interdisciplinary cooperation, and practical emphasis, but their major goals, research-development balance, assessment focus, and outcomes differ.

Combining these two strategies requires choosing the most relevant characteristics. These methods may be combined with the agile design cycle's iterative and incremental reflections (Section 5.2) to create methodological variety and affect educational SG development.

5.2 Agile Iterative Design Reflection Cycle

Agile design, first employed in software development, is being applied in different sectors (Sutherland and Schwaber, 2010). The Agile Manifesto encourages flexibility, teamwork, and customer-centricity. Agile design involves cross-functional teams designing, building, and testing products or components in one- to four-week "sprints" or "iterations" (Sassa et al., 2023). Iterative design adaptation and modification based on end user or stakeholder feedback improves responsiveness to changing demands and market dynamics (Sassa et al., 2023). Agile design cycles encourage frequent communication, openness, and rapid MVP delivery, helping companies respond to changing consumer demands and competitive environments. Agile design works well for projects that need frequent input, fast prototyping, and flexibility to adapt to user needs and market conditions. This study advocates combining design methods to create a user-centered, technologically suitable, and purpose-driven SG (Figure 1).

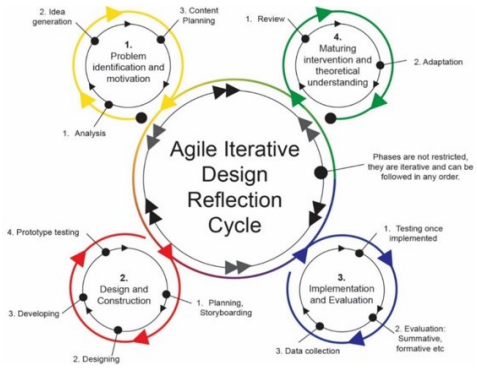

Figure 1: Methodological pluralism between educational design, DSR and agile design

(Source: Own research)

The authors used a mixed-method approach (methodological pluralism between educational design, DSR and agile design) (Figure 1) that encapsulate:

1. Educational design: Start by identifying the learning outcomes you want to achieve with the SG. Then, conceptualise and design the game mechanics and user interface to support these outcomes. This process should be iterative and involve prototyping and testing with users (Mor et al, 2015) at multiple stages of development.

2. DSR: Use DSR to develop new artefacts that can be used in the SG. For example, you could develop a new algorithm for generating game content or a new scoring system that incentivises certain behaviours in the game (Fahd et al, 2021).
3. Agile design: Use agile design to ensure that the development of the SG is collaborative in nature. This fosters a cooperative atmosphere between stakeholders and fosters an environment where the game is developed efficiently and team members work towards the same goals (Bunt, 2020).

6. Details of Agile Iterative Design Reflection Cycle for CiteSaga Serious Game

Effectively teaching citation needs detailed explanation and frequent rehearsal, which may be challenging and time-consuming (Andrianatos and Coetzee, 2023). The NWU Library in Potchefstroom, South Africa, started the Referella initiative to help students learn citations. An animated figure called Referella provides video courses on the university library website (Andrianatos and Coetzee, 2023). Referella assists students with Harvard, APA 7th edition, and footnote styles (Andrianatos and Coetzee, 2023). Thirty free Referella video tutorials on YouTube show how the developers evaluated and reframed the citation manual to make it more user-friendly and understandable (Andrianatos and Coetzee, 2023). Students can also take related quizzes (Andrianatos and Coetzee, 2023). The CiteSaga SG is a subproject of the Referella project. The following discussion covers CiteSaga SG's conception, design, and development. The SG development process iterated and incremented four phases (see Figure 1): problem identification and motivation, design and construction, implementation and evaluation, and maturing intervention and theoretical understanding. These phases are detailed below.

6.1 Phase 1: Problem Identification and Motivations

As with other problem-solving processes, several factors must be addressed before growth. These involve identifying and assessing the problem, producing and selecting solutions, and planning academic content for the answer. Phase 1 (Figure 1) shows several iterations of potential ideas until the most feasible and successful one is determined. We recognised the problem previously in the essay that higher education students fail to understand and use citation and reference styles. Academic writing follows rules like citations. This phase focuses on the stakeholders and target audience engaged in producing and assessing the SG, the learning results (matched with the curriculum and a roadmap for what the game seeks to accomplish), and the development outcomes (game design blueprint) needed to construct the SG. SG conversations and considerations should also include the resources (administration, finance, time, etc.) that would affect alternative solutions. Three NWU faculty members form the project's main development team. The stakeholder map below lists the stakeholders who should be involved in the development of an academic-related SG, along with their roles, activities, and specialisations (Table 1). These parties must collaborate to keep the game exciting, instructional, and produced and delivered.

Table 1: Serious game stakeholder roles, activities, and specialisations

Stakeholder(s)	Role	Activities	Specialisations
Educators	Content advisers	Curriculum alignment, learning objective definition	Subject matter expertise, pedagogy
Game designers	Game development	Concept design, rule creation, playtesting	Game design, mechanics, interaction
Graphic designers	Visual development	Artwork, component design, visual theme	Graphic design, illustration
Developers / Engineers	Production	Prototype creation, manufacturing coordination	Engineering, production
Project managers	Coordination & Planning	Timeline management, resource allocation	Project management, organisation
Students	End users	Playtesting, feedback provision	End-user experience
Investors	Financial support	Funding, investment oversight	Finance, investment
Publishers/ Distributors	Marketing & distribution	Marketing, sales, distribution	Marketing, sales, logistics
Regulatory bodies	Compliance oversight	Ensure compliance with educational standards	Educational regulations, standards
Accessibility experts	Accessibility guidance	Ensure the game is accessible to users	Accessibility design
Legal advisers	Legal oversight	Contracts, intellectual property, compliance	Legal regulations, contracts
Quality assurance	Testing & Quality control	Testing for quality and consistency	Quality control, testing

6.1.1 Learning and Development Outcomes

Most SGs are academic, therefore learning outcomes must be considered. The educational aims and learning results of SGs in an academic or instructional environment are their objectives (Fokides et al., 2019). These

objectives are tailored to the target audience's educational requirements and the content (Dimitriadou et al., 2021). Traditional games focus on amusement, whereas SG emphasises learning, skills, and attitudes (Altomari, Altomari and Iazzolino, 2023). Problem-solving, critical thinking, domain-specific knowledge, cooperation, and decision-making are common goals. Measurable and adaptable SG objectives enable educators and instructional designers to evaluate game effectiveness and optimise learning experience (Perna, 2022; Correia and Simões-Marques, 2023). SG goals show how to use games' immersive and engaging characteristics to create meaningful and purposeful learning experiences (Escudeiro and Gouveia, 2023). CiteSaga's learning objectives emphasise academic writing, citation, and honesty, helping players understand citation and its complexities. Table 2 lists the game's learning goals.

Table 2: Learning objectives of CiteSaga

Learning objectives	Delineation
Recognising citation styles	Teach players how to identify and apply the rules of the three citation styles (Harvard, APA, and Footnote) in a variety of academic contexts.
Academic integrity promotion	Develop an understanding of plagiarism, proper attribution, and the ethical principles that guide academic writing.
Improving critical thinking skills	Improve players' ability to evaluate and synthesise information from a variety of sources while also recognising the relevance and credibility of academic literature.
Improving research capabilities	Improve players' skills in locating, interpreting, and using academic articles, as well as fostering effective research strategies and information literacy.
Promoting collaborative learning	Promote collaborative problem-solving and peer learning while also developing teamwork and communication skills in an academic setting.
Putting knowledge into action	Allow players to apply their theoretical knowledge of citation styles to real world academic articles, bridging the gap between theory and practice.
Encouraging self-assessment and reflection	Encourage self-assessment and continuous improvement in scholarly endeavours by facilitating reflection on players' academic writing skills.

Source: Own research

These learning objectives lay out a path for what the game aims to accomplish, which includes not only the technical aspects of citation but also the broader competencies that contribute to effective academic writing and ethical scholarship. CiteSaga also aims to achieve the following learning outcomes: (a) Improved knowledge of reference styles and citation styles; (b) Enhanced problem-solving and critical thinking skills related to citation challenges; and (c) Increased familiarity with academic resources and reference materials. Educators and developers who follow this blueprint are enabled to create an engaging and educationally meaningful experience by aligning the game's design, challenges, and interactions with these objectives. In order to achieve the SG goals and learning objectives, the following development objectives are established (Table 3).

Table 3: Conceptualising objectives for the development of *CiteSaga*

Development	Delineation
Vision alignment	This ensures that all team members, stakeholders, and potential collaborators understand the concept, mechanics, objectives, and overall vision of the game, therefore aligning everyone's efforts.
Planning & organisation	It functions as a development roadmap, detailing the game's components, rules, mechanics, and more, allowing for efficient planning and organisation.
Communication tool	The game design document (GDD) facilitates clear communication between team members and other stakeholders, such as investors, publishers or subject matter experts. It serves as a common reference point that everyone can refer to and edit.
Risk mitigation	By outlining the game's requirements and constraints in detail, the document aids in the early identification of potential risks and challenges, allowing for proactive solutions.
Educational alignment	The GDD ensures alignment with learning objectives, educational standards, and pedagogical approaches for an SG aimed at education. It serves as a guide to ensure that the game is not only engaging but also effective in meeting its educational objectives.
Resource allocation	It helps to estimate the budget, resources, and time required for development, facilitating informed decision-making and resource allocation.
Quality assurance	GDD helps maintain quality control throughout the development process by defining standards, rules, and objectives.
Research tool	Provides guidelines for playtesting and collecting feedback, ensuring that the game evolves to meet the expectations of the target audience.
Documentation & archiving	The GDD serves as a historical record of the game's development, preserving decisions, designs, and insights for future reference or for use in other projects.

Source: Own research

After determining the stakeholders that are involved in creating and evaluating the SG, creating a path that is aligned with the curriculum and that indicates what the game aims to accomplish (learning outcomes) and creating a blueprint of how the SG is going to be developed (development outcomes), the next phase is to design and construct the components of the SG board game.

6.2 Phase 2: Design and Construction

The design and construction of an SG board game start with planning the design and storyboarding to determine how the game is going to look (e.g. components, look and feel, game setting, etc.) and be played (e.g. gameplay, mechanics, rounds, etc.). This is followed by designing, developing, and prototype testing of everything to evaluate what works and how it needs to be changed. Like the other phases in the agile iterative design reflection cycle, this phase can be iterated multiple times until a final agreement or satisfaction has been reached (see Phase 2 as indicated in Figure 1).

6.2.1 Serious Game Components

SG components serve a fundamental purpose in facilitating effective and engaging learning experiences within educational contexts (Moizer et al, 2019; Fitzgerald and Ratcliffe, 2020). These components, such as game boards, tokens, cards, rules, play pieces, and digital interfaces, should be designed to support and drive the educational objectives of the game (Huang et al, 2021). They provide a tangible or virtual environment that immerses players in a specific learning context, making abstract concepts more concrete and relatable (Van Beek et al, 2022). Components can represent real world scenarios, challenges, and resources, therefore promoting experiential learning and problem-solving (Beatty, Chen and Klein, 2021). Additionally, game components can be used to structure the gameplay, guide player actions, and create opportunities for interaction and collaboration, fostering a dynamic learning process (Wang and Huang, 2021). In essence, the purpose of the SG components is to transform learning into an engaging, interactive, and memorable experience, reinforcing the acquisition of knowledge and skills while aligning with pedagogical goals (Lamrani and Abdelwahed, 2020). Researchers posit that their use is essential in leveraging the potential of SG as effective tools for education, training, and skill development across domains and disciplines (Mittal, Scholten and Kapelan, 2022).

6.2.2 Board Game Design

With the recent emergence of AI and AI-generated content, the design team made use of ChatGPT to generate names for characters, factions, and environments that fit the genre of the game. The designers also used *Fotor* an online AI text-to-image generator where you can choose the style of your images and give a description of the environment you want to generate. The designers used *Fotor* to generate character profiles and different environments in which the players can play the game (Figure 2).

Figure 2: Examples of AI-generated images using *Fotor* text-to-image generator

(Source: Own research)

By using AI to help with the design of the characters and environment allows for multiple iterations of the designs in a short period of time. This also excels in the development process and gives more time to develop other, sometimes more important, aspects that need attention.

6.2.3 Gameplay Mechanics

SG mechanics, which regulate a game's behaviour and structure, impact player engagement and instructional content (Pelser-Carstens, 2022; Correia and Simões-Marques, 2023). The game's mechanics are intentionally developed to meet instructional aims (Platz, Jüttler and Schumann, 2021). Scoring, feedback, resource management, decision-making, and riddles are SG mechanics (Akhtar et al., 2020). These mechanics are carefully interwoven into the game's design for balance and engagement (Jost and Divitini, 2021; Escudeiro and Campos, 2023). Aligning SG mechanics with instructional goals is purposeful (Krath, Schürmann and Von Korflesch, 2021). A scoring system can reinforce right responses and foster mastery, while feedback systems can give quick direction and enhance learning. Prioritisation and allocation may be taught, and decision-making can imitate real-world events that need critical thinking and problem-solving. Players may learn and improve by making challenges and puzzles more difficult. SG use these mechanics to create a structured, dynamic learning environment that promotes active engagement, skill development, and information retention (Pelser-Carstens and Matthew, 2023). SG gaming must be interesting and educationally purposeful, therefore mechanisms are crucial (Czauderna and Guardiola, 2019). To ensure that a serious board game meets educational goals, learning outcomes must be carefully considered throughout design and development (Jääskä, Aaltonen and Kujala, 2021). Designers start by defining clear and measurable learning outcomes based on the knowledge and skills they want players to learn, which guide the game's development (Jääskä, Aaltonen and Kujala, 2021). The game's content, mechanics, obstacles, and situations are then designed to target these learning goals (Neset et al., 2020; Checa, Miguel-Alonso and Bustillo, 2021). If the aim is to increase citation and reference problem-solving, the game may include challenges that require players to accurately recognise and apply citation styles in diverse contexts (Zhang and Lu, 2021). The game progression system scaffolds learning by increasing complexity to help players learn (Plass and Pawar, 2020). The game's design and development incorporate learning objectives to provide a purposeful and engaging learning experience that motivates and entertains players (Jayalath & Esichaikul, 2022).

6.3 Phase 3: Implementation and Evaluation

After planning, designing, and developing the SG's objectives and components, the agile iterative design reflection cycle continues with combining and implementing all significant game elements into a prototype (see Phase 3 in Figure 1). To improve the SG till developers are pleased, this prototype must be tested and refined several times. In this phase, gather as much information as possible on gameplay, components, fun-factor, etc. Determine the game's flaws and what has to be changed to meet unmet learning objectives. Playtesting the game with a sample of the intended population is typical in SG development. Developers highlight issues during playtesting and ask players on what they liked or disliked. Before finalising or commercialising the game, concepts, mechanics, and gameplay may be tested in real life. Despite being the last, this step is crucial to SG growth.

6.4 Phase 4: Maturing Intervention and Theoretical Understanding

The fourth phase (Phase 4 in Figure 1) of the development process involves defined SG objectives and a thorough theoretical understanding of the key ideas and concepts. Based on the intervention aims and theoretical foundations, a high-level conceptual framework is created. Agile design techniques encourage iterative development, which requires a prototype to test conceptual design and theoretical understanding. The design is refined and iterated using playtest and user assessment input. User input is collected through regular testing and assessment, enabling design changes. After a satisfactory iteration, the SG is developed and deployed, with user feedback and intervention evolution informing improvements. SG designers use agile design concepts and a focus on intervention and theoretical comprehension to develop their designs and meet objectives and maximise learning outcomes.

7. Conclusion

In conclusion, the novelty of this work lies in its innovative integration of agile design principles with educational design and design science research (DSR) methodologies to develop a serious game (SG) specifically aimed at teaching citation and referencing styles. This unique combination ensures a dynamic and iterative development process, which is both user-centered and theoretically robust. Additionally, the rapid prototyping using AI tools, such as Fotor for character and environment generation, highlights a forward-thinking approach to educational

game design. This paper not only addresses a critical gap in current educational practices but also sets a precedent for the use of SGs to enhance academic writing skills.

Future research should extend into several key areas to fully realize the potential of the CiteSaga serious game. Firstly, a comprehensive evaluation of the game's impact on students' citation and referencing skills across diverse educational contexts is essential. This includes longitudinal studies to assess retention and application of these skills over time. Secondly, further development of AI-enhanced features within the game could explore adaptive learning pathways tailored to individual student's progress and learning styles. Thirdly, the scalability of the game for different academic disciplines and its integration with various educational technologies, such as Learning Management Systems (LMS), should be investigated. Finally, exploring the potential for multiplayer and collaborative features within the game could provide insights into peer learning dynamics and further enhance the educational experience. These research directions will not only validate the efficacy of CiteSaga but also contribute to the broader field of educational technology and serious games.

The Ludo-Learning Matrix: A Framework for Understanding Learning in Games

Peadar Callaghan
Tallinn University, Tallinn, Estonia

peadar@tlu.ee

Abstract: Games have been widely recognized as methods of making learning more engaging. This has proven to be very attractive to those attempting to get complex fields such as cybersecurity training to a wider audience. Unfortunately, there is a failure to understand that each type of game serves a different educational purpose, leading to the situation where the games are being selected incorrectly and are failing to fulfill their promise. To address this issue, key concepts in learning and games were identified from the literature and then operationalized into an analytical framework. The concepts of player agency, message broadcasting, the transfer of learning and the type of challenges present in the game were selected. This generated a framework that is player-focused rather than content-focused and could be applied to any potential learning game. To validate the framework, three cybersecurity games were selected and analyzed using a ludo-textual approach. *Cyberciege*, a single player game aimed at university students, *Spoofy*, a kids' web browser game and *Tallinn Soldier*, a seminar wargame, were selected to give as wide a sample as possible. The paper goes on to report on the results of the analysis and discuss how this may be used to examine and design learning games for cybersecurity in the future. Each of the selected games focus on different mechanisms for learning and engagement, highlighting the design tradeoffs that were made in the creation of the game. The proposed analytical framework can be applied not just to cybersecurity training games but theoretically to understanding any game that has learning as its objective.

1. Introduction

Complex fields like cybersecurity exist between multiple domains requiring not just technical training and skills but an understanding of how humans leverage these technologies for illicit purposes. In addition, with the wide range of people using the internet for everyday life, an understanding of the principles of cybersecurity has become essential. The combination of a complex subject area and heterogenous population has led to concerns about making sure that the education is engaging. Game based learning has been seen as a possible solution (Jin et al., 2018). It is hoped that the use of game-based learning methods will help to increase the engagement with and interaction between the students and the subject matter.

However, selecting games, as with selecting any content, to include in education is a difficult process. A incorrectly selected game may lead to the player internalizing incorrect assumptions or procedures. This can occur because not all games map to the same intended learning outcomes. While the focus of the content area may be the same for multiple games, the approach to learning that they take varies dramatically. This leaves an educator in the unenviable position of not knowing how to select the correct game for their context.

Existing frameworks tend to be focused on the learning content of the games. In many regards they see games as the delivery system for knowledge similar to how Clark viewed media for the purpose of education (Kozma, 1994). These frameworks to select and design games for learning often borrow heavily from instructional design frameworks such as A.D.D.I.E. (Drljača et al., 2017). This produces a very instructor-centric form of design, which may fail to understand what is engaging for the end user in the first place.

Katrin Becker provides her magic bullet model. It focuses on what must be learned to engage with the game, what can be learned through engaging and what external support is needed for the game (Becker, 2017). While this provides a useful method to analyse and understand a game, it ignores the action that the player is going to take in the game and underplays the different pathways that knowledge can be acquired through.

The research into how games promote learning and engagement, however, tends to be highly theoretical and as such not actionable. Gee (2007) proposes 36 learning principles that are embedded in games. Garris et al., (2002) identified 39 different game elements which were condensed to 18 different elements that were mapped to learning by Wilson et al. (Bedwell et al., 2012). Unfortunately, the sheer number of elements in these works make the production of an actionable mental model to understand how a game is promoting learning next to impossible.

This lack of clarity also produces problems for learning game designers. Without a clear mental model of how games are engaging the player in learning, it is difficult if not impossible to design a game to reach a specific objective. Equally, efforts to build off of preexisting games and to repurpose them are hampered by not having

a clear idea of the game from the players' perspective. This leads to situations where every designer is in effect designing in isolation and having to rely on just personal experience in design.

The validity of any framework is another consideration. The model must be capable of differentiating between the learning happening in a wide variety of games, even if they are in a similar genre or content area. The best way to ensure that any framework is valid and robust is to test it against actual games using a ludo-textual analysis (Booth, 2021).

This paper proposes a simple and robust matrix for the analysis and design of learning games. It identifies four key concepts taken from both educational theory and game design and operationalises them. It then shows through a ludo-textual analysis of three games from the same content area how the framework can highlight the different design decisions that have been made.

2. Methodology

Four key concepts found in both learning and games were selected from the literature. A discussion of why each concept was selected is included in the appropriate description in the results. The selection process was described in Callaghan (2022). The key concepts were: 1) the transfer of knowledge, 2) the type of challenge present, 3) the level of agency the player experiences and 4) the type of message being broadcast by the game. Each of these elements was found to have two sub-components, leading to eight operationalised questions to produce the Ludo-Learning Matrix (presented in Table 1).

To keep the matrix at a usable size, certain concepts had to be excluded from the framework. In general, elements were excluded for one of two reasons. One reason is that some elements focused too much on the content of the game rather than on what the player was engaging with. For this reason, elements such as Fantasy, Mystery and Surprise as found in Bedwell (2012) and mirrored in Malone (1981) were excluded. The second reason was that they were already being covered by the proposed labels. For this reason, concepts such as Flow (Csikszentmihalyi, 1991) and the Zone of Proximal Development (Vygotskii & Vygotskiæi, 2012) were rejected as discrete labels, since they were represented in the conceptualization of challenge (Denisova et al., 2020).

To validate the proposed matrix, a ludo-textual analysis, as outlined by Booth (Booth, 2021), was performed. Three games all from the content area of cybersecurity were selected to see if the framework could be used to examine the differences in approach used by their designers. Each game was played multiple times by the author and, in the case of *Tallinn Soldier*, a selection of Master's students in Learning Game Design. Data was captured using video recording and the think-aloud method, as well as notes taken during and after play. The metatextual elements around the game were also explored to ensure thorough understanding of the games and their principles.

2.1 Selection of Games for Analysis

The first criterion for selection was that the game was designed as a serious game: this excluded commercial off the shelf games from this current work. The next criterion for selection was availability: games like *Anti Phisihing Phill (Online Game Helps People Recognize Internet Scams, n.d.)* were rejected due to the cost of their license, and other games that were identified in the literature had to be excluded because copies of the game were not available. Finally, it was decided that as wide a sample of games as possible should be selected in terms of genre, target audience and themes. Three games—*Cyberciege*, *Spoofy* and *Tallinn Soldier*—were selected.

2.2 Cyberciege https://nps.edu/web/c3o/cyberciege

Cyberciege is a workplace simulator, which asks the player to take the role of an executive in charge of the cybersecurity of a small to medium enterprise. The player must decide how to spend resources (money and work tasks) to secure the network and prevent intrusions. It is aimed at an audience of university level students and includes a full 3D environmental representation.

2.3 *Spoofy* https://spoofy.ee/en

Spoofy is a point and click adventure game. The player is trying to gather the components of a spaceship that have been mysteriously scattered across several levels. They do this by interacting with the non-player characters and helping them to solve problems related to the issues around cybersecurity. The audience for this

game is primary school-aged children and the art style is a 2D cartoon style. Originally, there were four levels that a player could play, with a fifth level released in October 2023 (post the study).

2.4 Tallinn Soldier

Tallinn Soldier is an analog seminar-style wargame taken from the Handbook of Cybersecurity Wargaming (Curry & Drage, 2020). It is designed for a group of between 4 and 6 players. Players are presented with printed role cards of the character that they are playing and are then briefed on the situation that is occurring. Players discuss how they would handle the situation and come to an agreement on their course of action. After this, an escalation of the situation occurs and the players must respond again. This game was developed for university level or higher players and is focused on replaying the real-life events of the Bronze Night in 2007 in Estonia.

3. Results

The next sections provide an overview of how the framework was created (3.1) and the analysis of the games using the framework (3.2).

3.1 Transfer of Knowledge

For learning to occur, information must pass from one area to another. The recipient of the information should engage with it actively to help to retain it and to make it actionable. There are many forms of transfer identified in the literature, including positive and negative transfer (Baldwin & Ford, 1988), general and specific transfer (Gick & Holyoak 1987) and horizontal and vertical transfer (Patrick, 1992). It was decided to focus on the low road and high road transfer identified by Salomon & Perkins (1992) and that of far and near transfer as outlined by Ericsson (2010)

Low road transfer is when the context of use closely matches the designed transfer tool. This allows the player to practice for events that may happen in that context in a safe and controlled environment. It also allows for the automatic use of knowledge or skills in the new context.

Similarly, in near transfer the initial learning task is kept as similar as possible to the task to be learned. Examples of these styles of transfer in games are typified by the simulations, especially high end flight simulators.

The key element for near and low road transfer is fidelity of the training to the context of use. In the Ludo-Learning Matrix, this was operationalized into the question: “How closely does the game attempt to reflect reality?”

Far transfer, on the other hand, is where the initial task used to create the learning varies dramatically from the context in which that learning is going to be applied. This meshes well with the concept of high road transfer, which requires the player to make connections between the material that they are being presented with and their experiences of the real world. It requires an active reflective or discussion component for learning to occur. It is not as context-bound in that it is seeking to make connections across context boundaries. This type of learning tends to be more social in nature and practices softer skills.

This was operationalized into: “How much does the game require reflection on the world outside the game?”

3.2 Challenge

“The essence of gameplay is the challenge/action relationship” (Adams 2010).

Challenge has been seen as a primary component of games by many authors, with some going so far as to argue that it is the thing that makes a game a game (Adams 2010.). The challenges tend to map to the cognitive, affective and psychomotor domains of learning.

To operationalize the concept of challenge in games, the study drew on the CORGIS questionnaire on perceived challenge in games (Denisova et al., 2020). It defines four separate types of perceived challenges: 1. cognitive challenge, 2. emotional challenge, 3. performative challenge and 4. decision-making challenge. The concepts of decision-making and emotional challenges were excluded from the operationalization as it mapped very closely to the concept of agency, which was already being included in the framework (as discussed below).

A performative challenge is one which occurs when a game requires rapid and accurate action from the player (Denisova et al., 2020). This was seen as synonymous with twitch reactions and as complementary to the concepts of near and low road transfer.

This was operationalized into: "How much does the game rely on quick decision making?"

A cognitive challenge is when a game requires forward planning, preparation and multitasking. This can be likened to the cognitive load that a player experiences during play. It is also more likely to focus the game on strategic decision-making processes and contemplation in contrast to the quick accuracy required in performative challenges.

This was operationalized into: "How much strategizing is required in playing the game?"

3.3 Messaging

Games are inherently a communicative act. How they differ from other media, however, is that there are two modalities for this communication. Like books and televised media, the messaging can be explicitly encoded. Namely, the message from the sender is made as clear and upfront as possible to prevent polysemy (multiple meanings) and what Eco defines as aberrant decoding from taking place (Munteanu, 2012). This is very similar to the process in instructional design where the intended message or lesson is the end point of the experience. However, as Bogost has pointed out, games also contain a more subtle method of encoding messages through their procedural rhetoric (Bogost, 2007). This is the message that is encoded and transmitted by the way of the game mechanics or how the player interacts with the game artifact. For example, in the *Civilization* series, the mechanics of researching new technologies carries the implicit message that advancement is inherently tied to technological progress and that that progress is linear. It also could be seen as justifying the taking over of less technologically advanced peoples in the name of helping them progress. Procedural rhetoric is a form of encoding that is much more subtle and open to both polysemy and aberrant decoding.

The interplay between these two forms of messaging is complex and interrelated and, in cases one of the two encoding methods, may drown out the messages of the other. An example of this can be seen in the Gundam effect, named after the popular Japanese transmedia franchise, where the softer implicit message of war is bad (a major theme in all the incarnations of the franchise) is being drowned out by the message that giant robots are cool. This can also be seen in games which attempt to promote peace while still making violence appear fun (Dyer-Witheford & De Peuter, 2009).

This can therefore be operationalized into two separate features:

1. Is there an explicit message being promoted by the game? (Explicit messaging)
2. What if any implicit message is being encoded by the procedural rhetoric or rules of the game? (Implicit messaging)

3.4 Agency

Agency can be defined as "the capacity of actors to make practical and normative judgments among alternative possible trajectories of action, in response to the emerging demands, dilemmas, and ambiguities of presently evolving situations." (Emirbayer and Mische, 1998, p. 971)

Agency as a concept in games is similar to the use of autonomy as a component of intrinsic motivation as outlined by self-determination theory (Ryan et al., 2006). When a player has no means of influencing the outcome of a game or becomes aware that the choices that they have are devoid of meaning, the player will disengage. This makes agency an important element of games for teaching, as they are attempting to increase not decrease engagement. Multiple outcomes of the game state will increase the sense of agency, while, conversely, fixed endings decrease the sense of agency.

There are some games which have a fixed outcome or binary outcome that are still engaging in play. Take, for example, chess, where there are only three outcomes: win, lose or draw. However, in the case of chess, the agency is located in how the player chooses to attempt to reach those end conditions. The problem with chess is if a naive player is engaging with a grandmaster, the outcome collapses to a certainty. As the player becomes aware that the ending is preordained, agency falls off, culminating in the old question: why should I bother to play if there is no way for me to win?

This concept can be operationalized into two factors:

1. "Does the game allow for multiple potential endings?" (Agency Choice)
2. "Is the ending balanced between being too predictable or completely random?" (Agency Prediction)

Table 1: Outlines the concepts that make up the framework: a pair of factors for each of the four components.

	Concept	Description	Operationalization
Agency	Choice	The ability of the player to make choices that will impact the outcome of the game.	Does the game allow multiple potential endings that are achievable based on player choices?
	Prediction	The ability of a player to make informed predictions about the value of actions that they are taking while not being certain of the outcome of those actions during play.	Is the player aware of the outcome of the game during play before the outcome is reached?
Messaging	Explicit Message Broadcast	How the designer is encoding explicit messages that the game contains.	What if any message is explicitly stated in the game?
	Implicit message broadcast	How the game mechanics and paratextual elements carry a meaning in the game.	What if any message is being transmitted by how the game is being played?
Transfer of knowledge	Near/low road transfer	The skill and knowledge being transferred is context-bound. The situation in which they are trained is close or nearly identical to the context in which they are to be used. Focused on automaticity of skill use.	How closely does the context of the game mirror reality?
	Far/high road transfer	More context-independent. Relies on the reconceptualization of pre-existing knowledge to the new context in which the skills are to be used.	How much reflection or re-contextualisation is necessary inside the game?
Challenge	Performative challenge	Challenges that require accuracy and speed, often emphasizing fluency of play over thought.	How much does the game rely on quick decision-making?
	Cognitive Challenge	Challenges that require careful thought and consideration while balancing several demands.	How much strategizing is required in playing the game?

3.5 Ludo-textual Analysis

3.5.1 General Comments

The results of the ludo-textual analysis are summarized in Table 2. As expected from the different styles of the games, each displayed different results from the analysis. Some of the variables emerged as co-occurring. For example, games with low agency coincided with games that had stronger explicit messaging; conversely, games with a higher agency had more implicit messaging present. Cognitive challenges were more prominent in games that were attempting high road transfer, while performative challenges were more likely to be linked to efforts at low road transfer. Future work will be needed to establish if these co-occurrences are consistent across a wider variety of games.

Cyberciege: Of the three games, *Cyberciege* was the one which made the most effort to reflect reality. Its setting helped to situate the player in a believable context. It also displayed the most player agency of the games in that it was possible to make the "wrong" decisions. Possibly as a result of this, the level of explicit messaging was low inside the game. It required players to make timely decisions about the spending of resources, and during play there were few opportunities for strategic planning as the events unfolded, throwing up new challenges.

Spoofy: As a point and click adventure, *Spoofy* had an implicit prosocial message that problems can be solved through engaging with the people around you. Its level of agency was more limited than *Cyberciege* in that the player could only choose in which order to engage with the puzzles presented (who do I want to talk to first), but ultimately had to complete all the puzzles to finish the level. Also, the game has only two possible

outcomes—either the player completes the game or they abandon it—thus limiting the agency of the game. To create more of a sense of player agency, the game offers a rewards system of unlocking cosmetic items: hats for the characters to wear in and pets that could be kept in the loading screen area. However, this was separate from the main game and had no effect on its progression. The challenges in the game were more cognitive in nature, as they involved reading and engaging in the story with a high level of reflection on how these events may be similar to personal experiences.

Tallinn Soldier: As opposed to the other two games, *Tallinn Soldier* has a distinct explicit message, which is covered in the historical postscript of the game. The explicit message is that the Bronze Night of 2007 was an unexpected and major defining moment in the history of cybersecurity and cyberwarfare, comparable to watching the nuclear bomb explode in Hiroshima. It also implies that the creation of the NATO Cooperative Cyber Defence Center of Excellence (which is based in Tallinn) was in response to the attacks. *Tallinn Soldier* has the lowest level of player agency out of the three games: the decisions that the player makes have no impact on the outcome of the game or on what is presented next. During playtesting, players quickly realized this and started to pull back from engaging with the game. In terms of challenge, the game is all cognitive challenge, with the essence being the debate between players on what actions to take.

Table 2: Provides an overview of the results of the ludotextual analysis

	Transfer		Challenge		Agency		Message	
	Near low road	**Far High road**	**Performative**	**Cognitive**	**Choice**	**Prediction**	**Explicit**	**Implicit**
Instrumentalised	How close to reality?	How much reflection is required?	How much does it rely on speed and accuracy?	How much strategic planning is needed?	Are there multiple end states reachable by player choice?	Is the game solved or the outcome fixed?	What if any explicit message does the game contain?	What if any message is being transmitted via the mechanics of the game
Game Name								
Cyberciege	Very close to reality. Attempts to make the office environment believable.	Not during game play	Selecting the correct priority and spending resources on it in a timely manner is the essence of the game.	Seems to focus more on doing actions then in long term planning.	Yes. Player choices have direct and measurable impact on the resolution	Obfuscated by the coding	No direct explicit measaging.	You must spend resources to secure a network. The weakest link in a network are the people. You will only get feedback if you get it wrong.
Spoofy	Abstracted to a cartoon world to suit audience	Encourages players to examine situations from own experience	Encourages players to examine situations from own experience	Some planning as there are multiple steps to solve the presented problems	Limited to a binary state. Completed or given up on	Fixed outcome by the nature of the game	No explicit	Prosocial implicit messaging. Problems are solved through communication
Tallinn soldier	Very abstracted from reality	An essential aspect of play.	Accuracy takes second place to discussion	Discussion and debate as the key mode of play. Requires information from outside of the game world	No. fixed beginning and end point player actions have no ability to shape outcome	Readily transparent to the player after turn 2	Explicit messaging contained in debrief section of the game outlining the historic basis for the scenario	Low implicit messaging. Possibly communication as the key to dealing with a crisis.

4. Conclusion

The proposed Ludo-Learning Matrix offers utility to both teachers seeking to use game-based learning and for designers of those learning games. It offers a series of questions that a teacher must engage with before selecting the game for the context. For designers it provides them with insights about how to conceptualize their games before production or how existing games can be used as inspiration for the design of new novel products.

For teachers they must examine the intended learning outcomes of the lesson that the game is supporting. In the area of transfer, it is important to consider if these outcomes require a space to practice discrete skills? Or is it more important to engage the students in discussion? As these two methods require different design decisions in the game. The type of challenge that the teacher is seeking to give their student goes hand in hand with the transfer of knowledge. Physical challenges that require quick responses map to low road transfer. In contrast the more cognitive the challenge the closer it maps to highroad transfer considerations.

In addition, sometimes the learning objectives only require a message to be broadcast. Examples like “Tree” (*TREE*, n.d.) or “One of them” (*One of Them by Pierrec*, n.d.) show that social messaging games do not require as much agency in the player. The purpose of these games can be seen to encourage empathy through a shared experience. However, this may reduce their re-playability or their ability to discuss more nuanced messages

Other times the most important aspect of the learning in the game is the agency and decision making that a student is making. This is especially important for low road transfer games where re-playability acts as reinforcement of the skills that are being practiced. When looking at reinforcement of learning agency becomes a key concept to consider in the selection of the game.

For designer they must ask themselves similar questions because there are different design constraints for each different type of learning game. Low road transfer games can be improved by the addition of stress and time constraints that are anathema to more discussion-based games. In addition, the higher the explicit messaging that is being used in the game the more important story decisions and game mechanic integration have to be considered so that they do not contradict the intended message.

This research presents the first steps in producing a new framework to analyze serious or learning games. As such further research with a wider selection of games will be needed to critically assess the proposed framework and to check its applicability to other fields.

Abstract: Whenever carrying out research, all participants must know their rights, especially when those participants are perceived as being part of a vulnerable group; however, discussing ethics in investigation can be difficult. To solve this challenge, a playful approach was taken, as playfulness can make dull tasks – especially those that can cause discomfort and difficulties – more entertaining and help people approach them with an open mind. This study reports on four empirical approaches that used a playful process to raise awareness about ethical concerns when doing research with neurodiverse people. For this activity, 39 cards describing and illustrating several relevant and evidence-based ethical principles were created. Then, three case studies were developed, each based on a different focus group composed of ten neurodivergent self-advocates and one with professors and students from Brazil. Each neurodivergent group was also accompanied by three support workers from the partner associations (two of the groups were accompanied by the same individuals). In total, 56 participants engaged in a playful activity that consisted of a game of 'broken telephone' where the title of a card (representing an ethical principle) is read to one of the players who then has to whisper it to the next person in line, repeating this process until reaching the last person. The last person then says what they heard out loud, with the original message being revealed for contrast. The title of the cards was discussed by the groups to understand if it was clear and understandable or difficult and confusing. Although not all the cards were validated through the activity, 14 were flagged by neurodivergent people as "needing changes". The feedback was recorded and is presented here. This study set out to validate a set of cards in easy-to-read language that could introduce ethical concepts to participants in research projects through a playful activity. Future study will see the cards iterated upon through the feedback gathered along with the creation of a small guide on how they may be used in playful activities.

Keywords: Playfulness, Ethics, Neurodiverse People, Participatory Research, Card Games.

1. Introduction

Play is contextual and an expression of our individual and collective character (Sicart, 2017). As an indicator of well-being, play is fun (Bateson & Martin, 2013), and can be experienced outside of the game sphere, through a playful design of objects, actions, and personal experiences. Although playfulness "is the attitude of play without the activity" (Sicart, 2017, p. 21), such as a physical interaction, or a psychological, and emotional attitude toward a specific situation, playfulness can be also seen as a personality trait (Heljakka, 2023; Proyer et al., 2021). According to Proyer (2017), playfulness "allows people to frame or reframe everyday situations in a way such that they experience them as entertaining, and/or intellectually stimulating, and/or personally interesting" (p. 114), having a similar perspective, Barnett (2007) also states that playfulness is "the predisposition to frame (or reframe) a situation" (p. 955).

1.1 Playfulness in Adults

There are several approaches in the literature regarding playfulness, usually associated with children and their education, being seldom studied regarding adults (Fagundes and Menezes, 2021; Guitard et al., 2005; Jovanović, 2021; Leather et al., 2021; Shen et al., 2014), which lead to different conceptualisations or definitions of 'playfulness' (Guitard et al., 2005; Proyer and Wagner, 2015; Shen et al., 2014).

Studies have demonstrated that playfulness has had a comprehensive range of positive outcomes in adults (Proyer and Wagner, 2015) that are similar to those in children (Guitard et al., 2005). Some of these benefits are related to health and productivity indicators, job and academic performance, creativity, positive emotions, stress coping, interpersonal relationships, sense of humour and well-being (Barnett, 2007; Guitard et al., 2005; Leather et al., 2021; Pang and Proyer, 2018; Proyer et al., 2021; Shen et al., 2014).

Many studies involving game activities and mechanics (gamification) are more game-oriented and we want to dissociate from this analysis of playfulness. If we focus on product design, for instance, we see that many of the objects developed reflect the playful characteristic of the designer, a process of playful thinking, in which the form and function of the object are simply replaced by fun aesthetics. The “magic bunny” design by Alessi, is a clear example of when the “form follows fiction” (Legaard, 2020), validating that "the link of playful play to creativity and hence to innovation in humans is strong" (Bateson, 2014, p. 99). This playful play is outside the sphere of the game but within the realm of the creative process of playing with objects, processes, and ideas.

When using a playfulness approach with adults for learning purposes, we can take the case presented model of Nørgård et al. (2017) for a signature pedagogy in higher education that is constructed by three traits of teaching and learning, with a more gameful aspect: (1) the surface (game) structure, which encompasses the visible actions (e.g. game mechanics, adequate and flexible levels of challenge); (2) the deep (play) structure, relating with assumptions (e.g. collaboration, the conceptualisation of possibilities); but also with (3) the implicit (playful) structure, that corresponds to the values (e.g. accepting risk-taking and failure, internal motivation).

The last structure was constructed based on the theoretical lens of the magic circle that relates to playful learning (Nørgård et al., 2017). Simply put, the magic circle of play refers to the space where play happens, being outside reality and featuring its own rules (Huizinga, 1971). When applying the concept in the learning process, Whitton (2018) mentions that it is important to consider that the play space happens outside the real world constructed by the players and that it is safe, where the rules of the real world don’t necessarily apply - although they cannot be entirely forgotten as power relations and tensions are present. In this sense, Whitton (2018) identifies three pedagogical advantages for using playful learning approaches: “the positive construction of failure; support for learners to immerse themselves in the spirit of play; and the development of intrinsic motivation to engage with learning activities” (p. 3).

Playful activities help to create a safe space, but such does not happen immediately, players need time to construct it and develop trust and relationships with the rest of the players and teachers (Whitton, 2018).

Having these aspects in consideration, our main aim was to validate the ethics cards developed with neurodiverse people (PwID and autistic people) while at the same time raising awareness among them about ethical considerations that must be taken into account when participating in research.

Considering that the validation process and learning about ethics can cause emotions of boredom, we decided to take a playful (learning) approach to the activity by using the ‘Broken Telephone’ game mechanics to present the developed ethics cards. These cards are an easy-to-read version of the guidelines developed by Casimiro et al. (2023) surrounding the inclusion of PwID in research processes.

2. Methodology

2.1 Cards Development

The cards’ objective is to offer simple definitions of ethical concerns that should be acknowledged when conducting research with or about PwID. Their main goal is to be informative to this specific group about their rights and duties when participating in research, considering that many PwID have been research subjects many times throughout their lives while also being particularly uninformed about how this process is conducted compared to people without intellectual disability (McDonald et al., 2018). As a secondary objective, the cards have been designed to be easily manageable by facilitators who are not necessarily experts in the subject but want to conduct more inclusive research. This way, with minimal interaction with the cards, they can more easily understand their content and how to use them in a way that promotes the rights of PwID.

Initially, it was determined that the cards needed to include the following information: card title, explanation of the title, card code, ColorAdd code, card classification, illustrative image, QR code, financing agency’s logo, and the project reference. Some prototypes were made, until arriving at a layout for the card's front and back (Figure 1).

Figure 1: Beta version of a card's front and back layouts (The main title of the card in Portuguese language is "The final decision is always mine").

2.2 Participants

2.2.1 Study 1 - Portugal

In Portugal, the study was conducted in two different locations: APPACDM and CECD. In APPACDM, two groups of neurodivergent people participated. These consisted of nine (n = 9) and eight (n = 8) participants, respectively, and both were accompanied by the same three (n = 3) support workers (SW). In CECD, nine participants and three SW participated (n = 12). In total, the study in Portugal consisted of three sessions and a sample of 32 people (N = 32).

All neurodivergent participants were adults ranging from 19 to 54 years old (M = 29,23; SD = 8,69), of which seven were female (26,92%) and 19 were male (73,08%). Although SW participated in the activities, they were not the focus of this study, with data collection focusing on the neurodivergent participants.

2.2.2 Study 2 - Brazil

This study happened during two sessions, hosted by two Higher Education Institutions (HEI) in Rio de Janeiro, Brazil: first, at the Research Group of Identity and Teachers' Knowledge (GPIDOC), of the Higher Institute of Education of Rio de Janeiro (ISERJ) - free translation; and second, at the "Laboratory of Inclusion and Symbolic Mediation, development and learning" (LIMDA), from the Postgraduate Program in Education (PPGE) of the Federal University of Rio de Janeiro (UFRJ) - free translation.

The first was attended by 24 participants: 22 students in varying stages of their undergraduate degrees and two professors, all from the host institution (ISERJ). The second session was attended by one undergraduate student, one graduate student and one teacher from the host institution (UFRJ), and nine attendants from outside institutions, seven of which are postgraduate researchers, one professor and one industry expert, as demonstrated in Table 1.

Table 1: Specification of participants in Study 2

Title		Undergraduate	Graduate	Postgraduate	Professors

	Outside In.	–	–	–	–
UFRJ	Host In.	1	–	1	1

Title		Undergraduate	Graduate	Postgraduate	Professors
	Outside In.	–	1	7	1
Total		23	1	8	4

3. Procedure

3.1 Study 1 - Portugal

For each of the three sessions (two at APPACDM and one at CECD), neurodivergent people, along with the accompanying SW, gathered in the same room to be part of the activities. For the introduction, each moderator introduced themselves to the participants, with one of them explaining the research project's goals and the participants' roles as valuable contributors to the research. Once this introduction was finished, an icebreaker activity was conducted to incentivise interaction between moderators and neurodivergent people - also fostering interaction between themselves. After this activity, the moderating team introduced the ethics cards, explaining their general purpose and the activities that would be conducted with them. These activities were made to generate opportunities for participants to engage with the contents of the cards in a more playful context, making them more accessible and less daunting. The two activities were:

- **Broken Telephone Game:** A card was given to one of the participants who then had to whisper its title to the person sitting next to them. Once this was done, each participant had to whisper it to the next person in line, continuing in succession until reaching the last person in the group who would then have to say the supposed title of the card out loud. If any participant expressed difficulty in communicating their message, one of the moderators would provide support. After hearing the final result, the actual title of the card was revealed, with the participants and the moderators discussing its meaning.
- **Debating the Cards:** The participants received cards and read them to the rest of the group. Then, moderators encouraged the participants to debate the meaning of the card and attempt to come up with examples of how the guideline could be applied. The goal was for participants to discuss - and for the moderators to assess - how clear the meaning of the card was and how they thought it could be improved.

Throughout the sessions, the activities were adapted to tackle participants' needs and behaviour – such as speech impediments, illiteracy, etc. After conducting the activities, participants were asked what they enjoyed about them and what they thought could be improved - drawing attention back to the cards to see if there was any additional feedback the participants might want to give.

3.1.1 Revision of the Cards

Based on the feedback received during the three initial sessions, some of the titles and descriptions of the cards were edited to be more straightforward, switching some words to more common and simpler synonyms. It was also noted that some more complex words, such as "adaptations", were easier to understand than the research team expected. It was later discussed with the SW from APPACDM that this word, although a little bit more complex than their usual lexicon, was part of their day-to-day lives, especially during discussions about Individualised Education Plans.

This demonstrates that, while it is important to avoid needlessly complicated and uncommon words, we must also recognize that new and more specific words can and should be introduced to neurodiverse people, given the appropriate context, because they can make them better informed. In this specific scenario, the alternative word "change" does not carry the same subjective meaning of "adaptation", and, therefore, would result in them not being as informed as they should be.

Moreover, it was also noted that the participants chose cards mostly based on the colour of their favourite football team, which deviated from the intended purpose of the colour-coding of the cards and led the team to question how the colours were impacting the participants' contact with the varied types of concepts being introduced.

Lastly, we also observed that the explanation of the title on the front of the card sometimes led to confusion: literate participants were unsure whether to just read the title of the card or to also read the text. Upon review,

we also came to realise that the text offered an unnecessary cognitive load to all the steps of the activity and that by moving it to the verse of the card it would still be accessed when participants or facilitators chose to do so.

Considering the previous reasonings, the cards' content was re-evaluated with the intent of minimising cognitive load (removing elements that did not help conduct the activities at hand) and more explicitly separating the contents for participants to interact with (in the front) from the contents meant for facilitators to consult upon (in the back), as demonstrated in Figure 3.

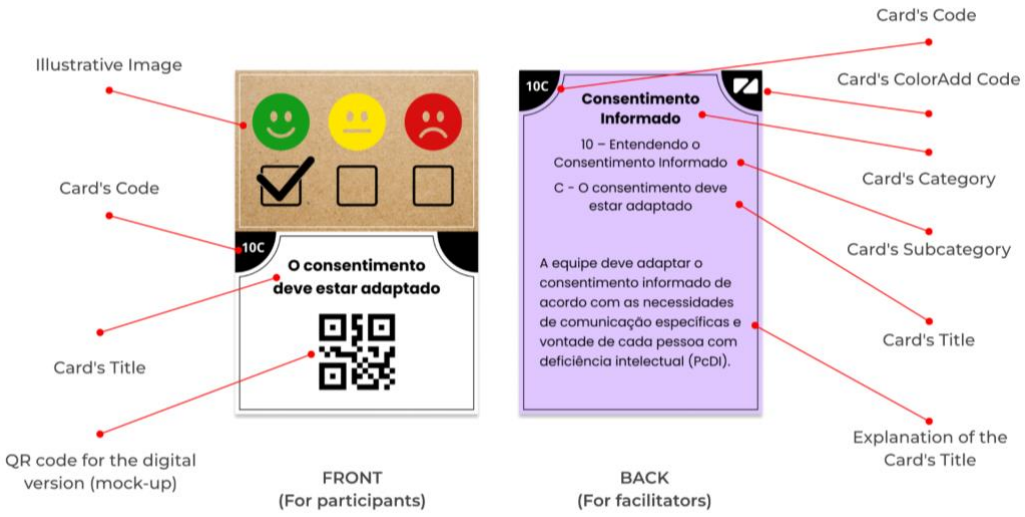

Figure 2: Example of a Card's front and back, with pointers to what's included in it.

3.2 Study 2 - Brazil

After the initial testing of the Ethics Cards with their target audience, we conducted further validations of the cards, this time among peers, during two sessions in two different host institutions: ISERJ and UFRJ. These institutions were selected due to being HEI with dedicated Departments, Postgraduate Programs and Study Groups involved in the research of education, having a particular focus on inclusivity and diversity. Both sessions consisted of the following schedule:

- 30-minute presentation of the GameIN Project, detailing the process behind the development of the Ethics Cards.
- 45–60-minute activity, during which participants formed groups of 4–6 participants, received a corresponding part of the Ethics Cards and needed to select one of them to be used as a guideline to adapt a project, service or activity of their choice, for it to be more inclusive towards PwID.
- 15–30-minute feedback session, during which all participants could ask questions and provide opinions to further develop the cards.

Each group was asked to write a proposal for their project adaptation, addressing which card they selected (and why), what project they selected, and the adaptations they proposed. All groups then presented their projects to the other groups, who then had the opportunity to offer feedback and commentary.

4. Results

4.1 Study 1 - Portugal

4.1.1 APPACDM (Session A)

As the broken phone activity was being presented at the start of the session, one of the participants informed the moderators that they were hard of hearing, giving them the opportunity to adapt the game to their needs. For this, the support workers sat next to two specific participants to facilitate their participation. This layout remained for the rest of the session.

One of the moderators only participated at the start of each round, either reading the card to the first participant or showing it to them so they could say it to the next participant in line. The participants seemed to be enjoying

themselves throughout the activity, interacting with each other and being amused by how different - and 'broken' - the final message was. The moderators believe there is the possibility that some participants were purposefully changing the message to a more humorous one; however, this was not seen as a complete negative as it contributed to the participants' enjoyment of the activity. Regarding the message of the cards, some participants had difficulty understanding the full meaning of the guidelines described in them and gave suggestions on what words to use to make them easier to understand.

During the feedback activity, four specific participants gave most of the comments. Nonetheless, other participants would also make statements that demonstrated that they understood the meaning of the message. When asked what was their favourite part of the session, most participants named the broken telephone activity.

4.1.2 APPACDM (Session B)

This session was affected by the participants being seemingly tired from the offset of the session, with one eventually asking to leave the session to rest and another falling asleep during the session itself, but that had chosen to stay. It is possible that this affected their performance during the activity, even though they stated that they enjoyed it. Same as the previous session, the SW were asked to sit beside the neurodivergent participants who might need more support to participate - one of these was a participant who informed a moderator that they were illiterate.

The participants seemed to have enjoyed the broken phone activity. When discussing the meaning of the cards, one participant, in particular, monopolised the discussion, also discussing them with the moderators and the SW; a significant part of the other participants specifically waited for moderators to ask them directly what they thought of the cards. The more active participant even offered themselves to explain the cards to the other participants, since most were having trouble understanding their meaning.

During the feedback activity, the participants would mostly state that they had no trouble understanding the cards while discussing them, though some would still only comment if explicitly asked to do so. Participants were equally split between which of the activities they enjoyed the most and if they would rather have played in smaller groups.

4.1.3 CECD

The SW were once again placed next to the participants who would have more difficulty in the activities - such as one illiterate participant. When the broken telephone activity was introduced they laughed together at the idea of what could be the final broken message.

As they played, they seemed to be in a good mood, entertaining each other by making exaggerated expressions when the message was passed onto them. Some of the neurodivergent participants also discussed the themes of the cards between themselves, at times discussing them with the moderators and the SW. The moderators, through their observations, suspect that some of them may have purposely changed the message to generate more humorous results, resulting in general laughter by the participants once they heard the final message; it was not possible to confirm this suspicion.

After some rounds, the participants were split into two groups playing the same broken phone activity. This appears to have also worked well, as participants had to wait less time for the message to reach them and some of them also enjoyed the added element of 'competition' as both groups tried to preserve the original message the most. Once the activity was completed, the moderators asked which of the versions they preferred the most, to which they generally answered the one where they all played together. Throughout the activity, on both variations, some of the neurodivergent participants would at times compliment each other for being able to pass the message to the next person in line.

During the feedback activity, some neurodivergent participants engaged in a discussion regarding how sometimes they are not treated as expressed in the cards. Others were reluctant to state that they did not fully understand the cards, but after being motivated by the moderators they would eventually express themselves. Once one of the moderators asked the neurodivergent participants to describe how they would explain the card to one of their friends, they began to open up more and talk to each other. Participants appeared to enjoy both activities.

4.2 Study 2 - Brazil

4.2.1 ISERJ and UFRJ

Both sessions consisted of a mixture of students and teachers from the host institution; however, at UFRJ, there were some outside participants, as well as a higher concentration of postgraduate participants.

These sessions intended to test whether the cards, as they were, acted as viable tools to be used by facilitators who wanted to conduct research activities in partnership with PwID. To assess if they achieved this goal, all participants were asked to respond to two questions: whether they learned something new about conducting research in partnership with PwID - of which most did (*n* = 35) and one did not (*n* = 1) -, and if they perceived the Ethics Cards as effective tools to facilitate activities in partnership with PwID - of which 28 said yes and eight said no.

5. Results and Discussion

Overall, in study one it was possible to see that the playful approach worked in terms of turning a task that could otherwise be boring into a more playful one. The participants, throughout the session, were engaged and liked the idea of the 'Broken Phone Game'. By implementing this strategy both groups of intervenients (research team and participants) could get to know and be familiar with each other. For instance, it was possible to note that there were several types of players: ones that liked to add a fun element to the game by inventing a new phrase and ones that liked to follow the rules.

Altogether, the participants from study one had a good time, were participative, gave their opinions and enjoyed the session. It was also noted that they preferred the game (the traditional version, not the competitive one) rather than just debating the cards.

Regarding the validation of the cards, based on the feedback received, it was concluded that the cards needed to be redesigned. Needing to be simpler on the front (for neurodivergent people) and save the more complete information for the back (for facilitators).

In this sense, the front will only have the illustrative image, the card's code and title, and the QR code (having eliminated the ColorAdd code and the explanation, and added the QR code). Additionally, it was also recommended to leave the background colour on the front of the card white, to help with readability. The back will have the card's code and ColorAdd code, the category, subcategory and title of the card, as well as its respective explanation (having eliminated the QR code, funding agency's logo and the project reference, and added the explanation of the card).

As for study 2, the validation of the cards among peers - professors and students - from Brazil, seemed to show that the cards taught them something new about doing research with PwID and that the cards were perceived as being an effective tool to help facilitate activities with PwID.

By validating with two different groups (neurodivergent people and peers) it was possible to understand if the cards could be useful for both, identifying their positive and negative aspects and their perceived effectiveness in the field.

6. Limitations and Future Directions

As learners need time to create space and to develop trust with the teachers, it is possible that because this session was made so early on in the project, the participants still needed to build a safe space or trust with the researchers. Additionally, due to their experiences with stigma, PwID typically avoid negative criticism (Esdale et al., 2015). Therefore, we noticed that the participants frequently responded, for example, 'No, everything is fine' when asked if they would change anything, although we noticed that they had some difficulties. Moreover, some only gave their opinion when directly asked so, in future studies, it should be considered how researchers might operationalise when such happens.

Considering this, we believe that the relationship established with the participants at a later stage of the project would produce different results.

Also, due to limitations of time, it was not possible to validate all 39 cards. Therefore, in the future, when all the cards are re-designed based on the feedback received, a new validation process is needed in which all cards must be included.

This activity aimed to validate the cards and assess how they could be more accessible for neurodivergent

people, not to assess if the approach implemented facilitated the learning process or if participants learned what was written in the cards. As such, future work could focus on the implementation of the cards with neurodiverse people, through the use of the 'Broken Phone Game' - or any other playful learning approach - and assess if it helped the learning process of this theme.

Lastly, it could also be helpful to translate and validate in other languages for a broader application and to understand how students perceive ethics and ethical research with PwID.

谈判: Mega-games as Catalysts for Deep Experiential Learning in Higher Education

Aline Castillo Moreno and Mario Alberto Caudillo Melgoza
Tecnologico de Monterrey, Estado de Mexico, Mexico

acastillo@tec.mx
mcaudillo@tec.mx

Abstract: The study deepens into the transformative potential of mega-games as an innovative educational tool, offering profound and enriching learning experiences across diverse educational landscapes. Mega-games represent a fusion of various elements, including role-play, social interaction, simulations, rule-based systems, economic dynamics, political scenarios, and decision-making processes, all woven into an immersive narrative fabric. Through experiential learning, these games provide a unique platform for students to engage deeply with complex subject matter. This research centres on the application of mega-games within the context of sixth-semester students pursuing a degree in International Business at the Mexico State Campus of Tecnológico de Monterrey. Specifically, the study focuses on the simulation exercise titled 谈判 Tánpàn, which aims to immerse students in negotiation scenarios regarding the final price of a digital device manufactured in China. Drawing upon foundational principles outlined in Jesse Schell's book on game design, the exercise is meticulously designed to emulate real-world negotiation dynamics. The integration of game design principles, coupled with positive student feedback, underscores the efficacy of mega-games as potent educational instruments. Through rigorous analysis, the study unveils the profound impact of experiential learning on students' comprehension and application of negotiation techniques. By simulating authentic real-world scenarios, students are empowered to develop critical problem-solving acumen, hone their analytical thinking prowess, and refine their decision-making aptitude. Moreover, the immersive nature of mega-games fosters a dynamic learning environment that transcends traditional pedagogical approaches, fostering a holistic understanding of intricate subject matter. The success of the 谈判 Tánpàn simulation exercise serves as a testament to the potential of mega-games to revolutionize educational paradigms. It signals a burgeoning opportunity to expand the horizons of mega-games across various academic disciplines and participant cohorts. This study advocates for the widespread integration of mega-games as educational resources within Higher Education, championing their capacity to engender profound learning experiences and cultivate essential skills, heralding a new era of dynamic, immersive, and effective educational methodologies in diverse educational settings.

Keywords: Higher Education, Educational Innovation, Professional Education, Experiential Learning, Mega-Games, Negotiation Techniques.

1. Introduction

This study focuses on the design and implementation of a mega-game conducted with students from the International Business program, aiming to provide a transformative educational experience and overcome the limitations of traditional teaching methods. In this context, the goal was to offer students a clear understanding of complex concepts, especially at a crucial point in their career where they are beginning to enter the business world and require a solid knowledge of these concepts and their practical application in a formal environment.

The exercise, titled 谈判 Tánpàn (which translates to "negotiation" in Chinese), was specifically named to be easily pronounceable in various languages, making it both accessible and engaging for a global audience. This choice was intentional to ensure that the name resonated well with participants from different linguistic backgrounds, aligning with the exercise's goal of facilitating cross-cultural negotiation scenarios.

The exercise was carried out through the implementation of a mega-game specifically designed for this class, with the collaboration of the course instructor and a game creation expert. Twenty-one students participated, organized into seven teams of three members each, with specific roles assigned to each team member. The main objective of the mega-game was to negotiate the final price of a digital device (assumed to be a mobile phone) manufactured in China for the United States market.

The design of this mega-game was based on principles proposed by Jesse Schell in his book "The Art of Game Design: A Book of Lenses" (2019), focusing on an experiential learning approach. During the game, students had the opportunity to apply negotiation techniques and make strategic decisions in a simulated context, leading to a deeper and more practical understanding of the concepts addressed.

In this context, this study seeks to analyze the impact and results obtained from the implementation of this mega-game in the educational process of International Business students, highlighting its ability to provide

meaningful learning experiences and enhance the development of key skills in a dynamic and participatory learning environment.

2. Context

In the context of International Business studies in higher education (HE), it is paramount for students to learn practical and experiential negotiation skills in a language other than their mother tongue. This necessity arises from the widespread use of different languages in international negotiations, where effective communication can significantly impact the outcome of business transactions. The mega-game presented in this study is founded on the premise of financial mindset: "You don't get what you deserve, you get what you negotiate."

Understanding and mastering negotiation techniques in a foreign language not only enhances students' language proficiency but also equips them with essential skills for navigating diverse cultural and linguistic landscapes in the global business arena. In international business settings, negotiations often require individuals to communicate, bargain, and reach agreements in languages other than their native language, making proficiency in these languages a strategic asset.

Moreover, the mega-game served as a crucial component of the students' final assessment, blending experiential learning with practical application as a learning activity. By immersing students in simulated negotiation scenarios, the game provided a platform for them to practice and refine their negotiation skills, applying theoretical knowledge to real-world situations. This approach not only reinforced classroom learning but also instilled confidence and competence in navigating complex negotiation dynamics.

2.1 Traditional Teaching Methods and Mega-games

In traditional teaching methods, topics related to negotiation such as bargaining power, negotiation strategies and tactics, ethical dilemmas, strategic alliances, intercultural communication, cultural mapping, conflict management strategies and tactics, negotiator profiles, negotiation dilemmas, negotiation strategy, planning, and pricing (anchor, reservation, minimum, maximum, walk-away prices) are typically taught through theoretical lectures, and case studies. While these methods provide a theoretical understanding of negotiation concepts, they often fall short in delivering immersive and practical learning experiences that mirror real-world negotiation scenarios.

The problem addressed in this research revolves around the effectiveness of traditional teaching methods in conveying complex concepts to students about international negotiation within the context of the International Business program. Researchers aimed to overcome the limitations of traditional teaching by implementing a mega-game as a learning activity. The objective was to provide students with a hands-on experience and a deeper understanding of negotiation techniques through immersive and experiential learning.

Mega-games represent a novel and evolving concept in the world of gaming, combining elements from traditional board games, role-playing games, and simulations to create large-scale, immersive experiences. Unlike typical board games or simulations, mega-games involve a significantly larger number of participants, often ranging from 20 to over 100 players, each taking on unique roles within a complex, interactive environment.

At their core, mega-games are multi-faceted events where players engage in collaborative and competitive activities, usually over several hours. These games are designed to simulate complex scenarios, such as geopolitical conflicts, economic systems, or historical events. Each player or group of players is assigned a specific role with distinct objectives, powers, and resources, contributing to an overarching narrative that evolves based on collective and individual actions.

Like board games, mega-games utilize structured rules and objectives, providing a clear framework within which players operate. Both formats often involve strategic thinking, resource management, and decision-making. However, while board games typically accommodate two to ten players around a table, mega-games scale up dramatically, encompassing many more participants in a much larger space, sometimes even utilizing multiple rooms or areas.

Mega-games share similarities with simulations in that they both aim to replicate real-world scenarios and systems. Both formats involve participants taking on roles and making decisions based on their understanding of the scenario. However, simulations often prioritize accuracy and educational outcomes, closely mirroring real-world processes and outcomes. Mega-games, on the other hand, blend realism with gameplay elements to

ensure a dynamic and engaging experience. While educational goals can still be a focus, the emphasis on player interaction and narrative development sets mega-games apart.

What sets mega-games apart from other gaming formats is their scale and complexity. The involvement of dozens to hundreds of players introduces a level of unpredictability and interactivity that smaller games cannot achieve. The roles in mega-games are often asymmetrical, meaning different players have different levels of power, information, and objectives, creating a rich tapestry of interactions and negotiations.

Additionally, mega-games are highly adaptable and can be tailored to fit various themes and scenarios, from historical battles to futuristic political landscapes. This flexibility allows for a wide range of creative and educational applications, making them suitable for diverse audiences, including educational institutions, corporate training sessions, and enthusiast gaming communities.

Mega-games represent a unique and engaging form of entertainment that bridges the gap between board games, simulations, and large-scale interactive experiences. By combining elements of strategy, role-playing, and real-world simulation, they offer a robust platform for exploring complex scenarios in an immersive and collaborative environment. Understanding and appreciating the distinct qualities of mega-games can enhance their application and enjoyment, providing participants with a rich, memorable gaming experience.

2.2 Mega-games in HE

Mega-games represent a unique approach to learning within HE, blending elements from role-playing games, tabletop games, and war games into immersive simulations. These large-scale simulations typically involve 20 to 300 participants in a single session lasting several hours, where players assume specific roles with tailored missions. The participants engage in cooperative and competitive interactions to achieve their objectives.

Educationally, several mega-games have been developed with educational purposes in mind. For instance, Darren Green and Liz Cable (Wells, S., 2019) created a mega-game centered around the climate crisis and simulated negotiations between countries regarding carbon footprint reduction. Although this activity was not mandatory for a specific subject, it yielded valuable insights for both participants and organizers from diverse perspectives.

This article is grounded in the financial mindset premise: "You don't get what you deserve, you get what you negotiate." The exercise was integrated into students' final grades as a learning activity. Mega-games trace their origins back to war games played since the 1970s, with the mega-game format conceived by designers Passy Griffith and Jim Wallman (Iparraguirre, A., 2022).

Tánpàn’s game design allows students to engage with various aspects of international business, including market analysis, strategic planning, and decision-making under pressure. Utilizing the lenses from Jesse Schell's "The Art of Game Design: A Book of Lenses" (2019), the game's effectiveness is significantly enhanced.

The lens of curiosity drives players to explore the complex international business scenarios presented in Tánpàn, encouraging them to uncover various negotiation strategies and outcomes. This curiosity is closely linked with problem-solving, as players are required to address intricate problems related to market analysis and strategic planning, thus honing their critical thinking skills.

Games that offer intrinsic value provide players with satisfaction beyond external rewards, and Tánpàn achieves this by delivering educational value that intrinsically motivates students. By engaging with realistic business challenges, students see direct applications of their efforts, which further fuels their motivation. The introduction of novelty through new scenarios and challenges ensures that the game remains fresh and engaging, preventing monotony and promoting continuous learning.

Secrets within the game simulate real-world uncertainties, compelling players to think more strategically and explore deeper into the game’s mechanics. Goals are clearly defined for each session, giving players a sense of direction and purpose, crucial for maintaining engagement. Well-defined rules create a structured environment where students can apply their knowledge and strategies without ambiguity, while competition drives students to perform better, fostering a healthy competitive spirit that mirrors real-world business environments.

Cooperation is also emphasized, as players must work together to achieve common goals, reflecting the collaborative nature of international business. Effective reward systems provide positive reinforcement, encouraging students to apply themselves and recognize the value of their contributions. Constructive feedback

and penalties for poor decisions, as part of punishment, help students understand the consequences of their actions, promoting better decision-making skills.

The elegance of Tánpàn's design lies in its simplicity and depth, avoiding unnecessary complexity while providing a rich learning experience. Balance is maintained to ensure that all players, regardless of skill level, can engage meaningfully with the game, fostering an inclusive learning environment.

By incorporating these lenses, Tánpàn not only enhances students' understanding of international business but also provides an immersive and effective educational experience as a Mega-game (Schell, 2019).

Mega-games serve as more than just entertainment; they serve as effective educational tools. Examples of their application in HE include ALLIANCE, a political science simulation mega-game by Shawn Mcmillan (2015), and the game "VIRUS: Bunny Apocalypse" by Ted Castronova, both played in the United States. Additionally, Linköping University conducted a Climate Change mega-game in 2020 as part of an ongoing research project, engaging players in real-life experiences and role-play to stimulate discussions around the topic.

Despite limited research on mega-games in Mexico, previous exploration of gamification in various studies, particularly conference proceedings, has laid the groundwork for innovative learning experiences. National creations such as Robledo-Rella's (et al., 2017) Cocogame and González & Montalvo's (2018) BluRabbits internet-based platform have also contributed to diverse learning experiences among Tecnologico de Monterrey's undergraduate students.

A mega-game implemented into our educational context, was created by Martínez (et al., 2023) and documented in the study titled "Kuxtal: Student Motivation Through Mega-games in HE Design Students," presents a significant opportunity. This implementation, carried out at Tecnológico de Monterrey, yielded positive results, showcasing the potential of mega-games as engaging and effective tools for addressing complex challenges. By incorporating educational innovations that enhance student motivation and involvement, mega-games such as Kuxtal foster collaboration, critical and creative thinking, and practical actions among students, impacting their immediate academic contexts and fields of study. This successful case serves as an encouraging call to educators aiming to develop immersive learning experiences and innovative teaching methods that empower students to think critically, learn actively, and take meaningful actions. Additionally, the paper advocates for further exploration of mega-game design and integration in HE environments, particularly in programs that emphasize collaborative problem-solving and research participation.

Mega-games, characterized by their large-scale, interactive, and multi-faceted nature, have been increasingly recognized for their educational value in higher education. These games facilitate active learning by immersing students in complex scenarios that require strategic thinking, collaboration, and problem-solving.

谈判 Tánpàn was selected for this study because of its potential to simulate real-world negotiation scenarios within a controlled educational setting. The game's design allows students to engage with various aspects of international business, including market analysis, strategic planning, and decision-making under pressure.

2.3 INCOTERMS Meaning

"The INCOTERMS® are a set of eleven individual rules issued by the International Chamber of Commerce (ICC) which define the responsibilities of sellers and buyers for the sale of goods in international

3. Methodology

The experiential learning exercise, 谈判 Tánpàn, was implemented with a focus on providing students with practical experience in international trade negotiations. The game's structure is designed to mimic real-world trading conditions, requiring participants to navigate the complexities of market demand, cost management, and strategic alliances.

This research employed a qualitative approach, utilizing a semi-structured group interview as the data collection instrument with all students. The researchers conducted a mega-game simulation titled "谈判 Tánpàn" with a group of 21 students divided into seven teams of three members each. Each team member assumed a specific role: the manufacturer, the exporter, and the seller. The objective of the mega-game was to negotiate the final price of a digital device manufactured in China for the United States market.

Before the negotiation session, teams were given time to organize and decide their roles in the negotiation. Subsequently, each role was provided with exclusive relevant information for their position. Manufacturers received the information first, followed by exporters, and finally sellers. All negotiations were conducted in English, based on the rationale that despite being part of the International Business program, the students lacked confidence in using languages other than Spanish This approach was chosen to provide students with the opportunity to practice and improve their English communication skills in a professional context, which is crucial for their future careers in international business. Conducting negotiations in English with their peers facilitated the potential for negative experiences and embarrassment to be overcome as the exercise progressed, and students had one hour to reach an agreement.

The negotiation time allotted for students was one hour, after which each team would present their results to the mega-game facilitator. The best results among the three-member teams would receive the highest grades, emphasizing that adherence to the rules was crucial for evaluation.

Following the general activity presentation, the activity commenced, and exporters and sellers were instructed to leave the negotiation space. Manufacturers were then provided with the following instructions:

- The cost of materials and labor for each digital device was $400 USD.
- If more than 5,000 devices were manufactured, this cost would decrease to $250 USD per unit.
- If more than 10,000 devices were manufactured, this cost would further decrease to $220 USD per unit.

The manufacturer’s objective was to maximize profits.

Manufacturers were then excused, exporters were called back, and they were given the following instructions:

- The cost for exporting under INCOTERM 2020 DDP per device was $100 USD.
- Exporters aimed to achieve profitability that was double their cost.

Finally, exporters were excused, sellers were called back, and they were provided with the following information:

- They had a capital of $5 million to purchase digital devices.
- The projected demand was approximately 8,000 units.
- They had to negotiate the quantity of units to purchase, considering that the maximum market value per unit was $650 USD.
- The cost of sales per unit was $25 USD.
- If they managed to have two more sellers within their team, their cost increased to $28 USD but generated a sales reach of 10,000 units.

This research employed a qualitative approach, utilizing a semi-structured group interview as the data collection instrument with all students. The interviews were recorded to ensure accuracy in capturing the students' responses and to facilitate detailed analysis.

The group interviews were conducted immediately after the mega-game session, allowing students to reflect on their experiences and insights while they were still fresh.

The interviews were transcribed verbatim, and the data was analysed using thematic analysis. This involved coding the data to identify key themes and patterns related to the students' experiences and the effectiveness of the mega-game as an educational tool. The thematic analysis enabled us to draw meaningful conclusions about the students' learning processes and the impact of the mega-game on their understanding of negotiation techniques.

This study followed an action research methodology, which involves a cyclic process of planning, acting, observing, and reflecting. Action research is particularly suited to educational settings as it allows for the practical implementation of innovative teaching strategies and their iterative refinement based on feedback and observed outcomes. In this context, the mega-game "谈判 Tánpàn" was designed and implemented as an educational intervention, and its effectiveness was evaluated through the collected data. The insights gained from this action research will inform future iterations of the mega-game and other similar educational activities.

Previously, the same class had been conducted without using "谈判 Tánpàn". After incorporating the mega-game, there was a notable improvement in student satisfaction, as reflected in the professor's evaluation results, which showed a 5% increase in overall group satisfaction. Students shared positive feedback about the experience, with comments such as, "it allowed me to practice my English without embarrassment and with the

help of my classmates", “I explored different alternatives to what others proposed and we negotiated for the future of the company", and “I learned that you cannot only think of yourself when negotiating".

4. Results

The utilization of mega-games in educational contexts demonstrated significant benefits compared to traditional teaching methods. Students employed diverse strategies during the negotiation exercise. While some adhered to the estimated problem parameters, others utilized divergent thinking to maximize their profits. Upon completion of the exercise, students expressed their interest in the activity as it provided experiential learning and allowed them to grasp topics that are typically taught in a theoretical manner. They found it enjoyable to negotiate with their peers to achieve mutually beneficial agreements.

Furthermore, negotiating in English helped them overcome previous fears and negative experiences with using a foreign language. Students reported that as the exercise progressed and they were in a trusted group, their fluency with the language improved significantly.

The name 谈判 Tánpàn was well received by the participants, who found it memorable and reflective of the game's focus. The choice of name also contributed to the game's international appeal, making it a relevant and engaging tool for students from various cultural and linguistic contexts.

The game rules for the negotiation exercise were that all discussions had to be conducted in English. There were no other constraints imposed on the students, which allowed them the freedom to think creatively and propose new deals. Students were encouraged to negotiate not only for a single transaction but also for long-term business arrangements. This flexibility enabled the emergence of innovative solutions and strategies that extended beyond the immediate scope of the exercise.

The dynamics of the game included fixed roles, with students not alternating roles to maintain confidentiality. Each role received specific information, and it was up to the individual to decide whether to share that information with others. This design was intended to simulate real-world negotiation scenarios where parties do not have complete visibility into each other's information.

Regarding the grading structure, innovative solutions conceived by students were not initially considered due to the simplicity of the game and its new introduction. However, one team designed a contract for a long-term relationship, which earned them additional marks. This demonstrates that while the grading structure was basic, innovative approaches were recognized and rewarded when they contributed to the game’s objectives.

Students were required to document their process and outcomes by calculating both individual and group profits. Following this, they analysed their results in comparison to others to understand how they could maximize profits for both them and the entire group. This analysis was intended to improve overall business success and encourage a strategic approach to future negotiations.

One team discovered that by minimizing the exporter's profits and "sacrificing" their own role, they could obtain higher profits and achieve the highest grade. An additional secret prize was revealed at the end: among the six teams that did not receive the highest grade, the team member who achieved the highest profits in each role would also receive the highest grade. Other participants would receive a 20% penalty if they achieved their role objectives but were not the best in their category, and a 60% penalty if they did not. Students who did not participate in negotiations would not receive a grade.

In addition to the evident results, this mega-game succeeded in incentivizing creative thinking among some teams, resulting in alternative negotiations with "out-of-the-box" proposals. Some of the negotiated deals involved strategic alliances with counterparts, offering additional accessories or services that, despite increasing the price, remained attractive for purchase or simply generating commitments for future transactions such as discounts or exclusive rights or primacy on new technological developments. These outcomes reinforced not only their knowledge of topics like intercultural negotiation but also concepts they have learned throughout their studies such as the supply chain, value chain, competitive advantage, and value creation for the customer, demonstrating their ability to create win-win scenarios and trust that such scenarios can be realized.

The innovative solutions devised by the students were varied and strategic:

1. **Forming supply chain integrations through alliances**: Some teams collaborated strategically to integrate their supply chains, optimizing efficiency and reducing costs.

2. **Negotiating current purchases with conditions but signing agreements for future contracts with better win-win conditions**: Several teams negotiated ongoing purchases while securing agreements for future contracts with more favorable terms, showcasing their forward-thinking approach.
3. **Including services or variables that were not initially considered in the mega-game's parameters**: Students demonstrated their creativity by incorporating additional services or variables into their negotiations, expanding the scope of the deals beyond the initial framework.
4. **Incorporating innovation themes with exclusivity deals for future models to be launched**: Certain teams proposed exclusivity deals for upcoming innovative models, leveraging anticipation and market demand in their negotiations.
5. **Considering changes to the INCOTERM to make the business more attractive or including accessories in the phone sales to enhance the negotiation**: Some teams explored altering INCOTERMs or bundling accessories with phone sales to add value and make their offers more enticing, showcasing their adaptability and business acumen.

One of the main limitations in this action research work was the limited time allocated to the mega-game due to the class's short duration. As a result, the mega-game was applied on a small scale. However, based on the results obtained, it has been proposed to create a longer-lasting version of the game. This extended version would involve adding nationalities and a cultural map to the negotiators, creating profiles tailored to different types of negotiators that remain secret to other players, and changing the ways negotiations occur among them.

The implementation of this exercise within the educational environment lays the groundwork for the creation of future mega-games involving a larger number of participants. Given that negotiation is a flexible skill applicable in various disciplines, this game could be expanded to encompass multiple fields. The results highlight the effectiveness of experiential learning in enabling students to understand complex concepts and apply them practically. By engaging in negotiations and facing real-world challenges, students developed a deeper understanding of negotiation techniques, enhancing their ability to negotiate effectively in the future.

The integration of mega-games in educational contexts provides a dynamic teaching approach that surpasses traditional methods. By simulating real-world scenarios, students encounter authentic experiences that improve their problem-solving skills, critical thinking, and decision-making abilities. The positive feedback from students regarding their participation and enjoyment suggests that mega-games have the potential to enhance the learning experience and facilitate a more comprehensive understanding of complex topics such as international negotiation.

Expanding the mega-game to include multidisciplinary teams with participants from different areas or departments of the company, as well as other supply chain stakeholders, could enhance the experience and provide a more realistic simulation of negotiation scenarios in diverse organizational contexts.

By creating a mega-game experience with more roles, actors, nationalities involved, and different negotiation strategies across disciplines, we continue to be amazed by the innovative capacity that new generations forge throughout their professional careers.

5. Conclusions

The mega-game 谈判 Tánpàn proved to be an effective strategy for teaching complex concepts of international negotiation. Through the experiential learning approach, students were able to actively engage in simulated negotiation situations and tackle real-world challenges.

The results obtained revealed that experiential learning provided students with a deeper understanding of negotiation techniques and enabled them to apply them practically. By assuming specific roles and negotiating as a team, students acquired problem-solving, decision-making, teamwork, and effective communication skills.

Additionally, the integration of the mega-game showcased a dynamic and enriching teaching approach. Students were engaged and motivated throughout the process, allowing them to learn more meaningfully. The positive feedback from students evidenced their enjoyment and perception that the exercise provided them with a rewarding and enjoyable learning experience.

These findings support the notion that mega-games can be valuable tools for the development of soft skills across different academic disciplines. They also suggest the importance of incorporating experiential approaches in education to enhance understanding and application of complex concepts. Ultimately, the 谈判 Tánpàn mega-

game exemplifies the potential of innovative educational methodologies, emphasizing the role of immersive and interactive learning experiences in fostering holistic student development.

Aline Castillo Moreno PhD candidate in Finance and Business Administration, is the CEO of CLEADERS with extensive experience in international business, finance, and education. She has a strong academic background, speaks five languages, and specializes in export development, risk mitigation, and global value chain improvement.

Mario Alberto Caudillo Melgoza Animation and Digital Arts B.A., Mobile Gaming MSc, and PhD in Educational Innovation, over 10 years of experience as professor. He researches game-based learning, AI in education and human flourishing. In his current role, as full-time professor at Tecnológico de Monterrey, he has successfully implemented educational interdisciplinary innovations using technology.

Advanced Gamification and Mega-games to Enhance Lifelong Learning in Higher Education

Mario Alberto Caudillo Melgoza
Tecnologico de Monterrey, Estado de Mexico, Mexico

mcaudillo@tec.mx

Abstract: This study investigates the effects of advanced gamification and Mega-games on student engagement and motivation within a rigorous semester-long course demanding 48 hours of weekly commitment. Conducted from February to June 2022, the research targeted sixth-semester students in Video Game Studies at Tec de Monterrey, with virtual classes for groups in Guadalajara and Querétaro. Using a mixed-method approach, the study employed participatory observation on the OASIS Discord server, incorporating gamification elements. Data collection also involved documentary research, online questionnaires, semi-structured group interviews, and faculty documentation reviews. Findings indicate that the integration of gamification elements effectively heightened student involvement and motivation, with positive feedback on instructor support and course content. However, challenges such as burnout, economic disparities, and varying engagement levels were identified. The study underscores the potential of gamification to enhance educational experiences while highlighting the need for careful management of challenges to prevent negative impacts on student well-being. Future research should focus on the psychological effects of continuous gamification and Mega-games, seeking to balance engagement with mental health considerations. Understanding these dynamics will be crucial for optimizing educational strategies and ensuring their sustainable application in diverse academic settings.

Keywords: Experiential Learning, Higher Education, Gamification, Mega-Games, Educational Innovation, Professional Education.

1. Introduction

Gamification has increasingly gained recognition within educational circles as a potent strategy to boost student engagement and motivation. While conventional gamification methods, typically featuring elements like storytelling, rewards, and leaderboards, have become widespread, they may not fully exploit the potential for more profound learning experiences. This paper aims to investigate advanced gamification techniques, particularly the incorporation of Mega-games, to cultivate lifelong learning in Higher Education (HE).

This research ventures into a more sophisticated gamification, defined by the application of less conventional game design elements within educational frameworks. It draws on the game design philosophies articulated by Jesse Schell in "The Art of Game Design: A Book of Lenses" (2019), with the intent of identifying novel gamification components that can positively influence educational environments. The academic focus is on exploring these elements more deeply to discover innovative methods of student motivation, while the professional interest, particularly within game and instructional design, lies in highlighting the advantages of integrating a game designer into the educational experience design team.

In recent years, the concept of Mega-games has gained prominence, offering a comprehensive approach to immersive learning experiences. Mega-games are an innovative and evolving phenomenon in the gaming world, blending aspects of traditional board games, role-playing games, and simulations to create expansive, immersive experiences (Iparraguirre, A., 2022).

For Digital Art majors in HE, it is essential that course design, implementation, and delivery are meticulously aligned with the intended learning objectives. These components must not only be appropriate for achieving the desired outcomes but also engaging and appealing to students. Furthermore, integrating real-world challenges that resonate with students can serve as a compelling motivator, driving them to actively engage in resolving contemporary regional, national, or global issues. This strategy not only enhances their educational experience but also instills a sense of purpose and relevance in their academic journey.

The central aim of this research is to evaluate the outcomes of implementing these strategies and to develop new gamification elements that can be leveraged in future studies. By exploring advanced gamification methods and embedding Mega-games within the learning process, this study seeks to promote lifelong learning among students.

Ernest Cline's *Ready Player One* serves as a vital source of inspiration for the storyliving element of the course, especially for a group of students who have directly felt the effects of a post-pandemic world. The novel's portrayal of an immersive virtual universe, where the boundaries between reality and virtuality are blurred,

aligns perfectly with the course's focus on exploring technologies that span these dimensions. This connection offers a relatable and visionary framework for students as they engage with cutting-edge technologies that mirror the book's digital oasis.

By integrating themes from *Ready Player One*, the course enhances its relevance and appeal, allowing students to deeply explore the spectrum between reality and virtuality. This immersive approach not only makes the learning experience more engaging but also equips students with the skills to innovate and navigate an increasingly interconnected digital landscape. Through this lens, students are inspired to envision and create solutions that reflect the transformative potential depicted in the novel, preparing them for future challenges in a digitally integrated world.

Also, this paper emphasizes the critical importance of cultivating soft skills such as communication, critical thinking, self-management, and collaboration. These competencies are vital for students to successfully navigate the complexities of modern and future careers. By embedding real-world issues into the learning experience, students are encouraged to engage actively in problem-solving, thereby enhancing the purpose and relevance of their educational journey.

2. Context

The educational landscape experienced a profound transformation in 2020 due to the COVID-19 pandemic, which necessitated a shift from traditional classrooms to virtual platforms like Zoom. This transition not only altered the delivery of education but also disrupted the social interactions among students, cutting off access to university facilities, advanced technological resources, and extracurricular environments. It became clear that learning extends beyond the physical classroom, prompting innovative strategies to facilitate education amidst these challenging circumstances.

Despite the challenges posed by the pandemic, important lessons emerged, demonstrating that knowledge acquisition is not confined to physical spaces. Creative solutions surfaced, enabling students and educators to collaborate and engage in learning experiences across geographical barriers. This period highlighted the limitations of telecommunication services while also showcasing the potential of video recordings to maintain educational continuity for all students.

The context of the activity takes place within the framework of the Tec21 educational model, specifically in a course module known as a "block." This block involves 24 hours per week of supervised class activities by the professor, spread over 15 weeks and divided into three periods with one week in between each. In addition to these supervised hours, students are expected to engage in 24 hours per week of asynchronous assignments, resulting in a total commitment of 48 hours per week.

The primary learning outcomes for this activity include the development of critical thinking, systemic thinking, project production in art and technology, project costing, and the management of human and technological resources for projects of varying scales. These projects utilize technologies within the spectrum of reality and virtuality, such as augmented reality, virtual reality, mixed reality, augmented virtuality, and integrated reality. Students will also gain insight into working within specific departments of experience creation, whether as producers, designers, developers, or artists. This activity is conducted for sixth-semester students in the Digital Art Bachelor's program, involving 35 students aged 20-22 from various cities in Mexico. They are divided into two virtual regional groups, each taught by three professors.

2.1 Student Motivation in Higher Education

Seifert (2004) underscores the importance of creating learning environments that encourage creativity, autonomy, inclusion, and active student participation in the learning process, all of which are key drivers of motivation at various academic levels.

The responsibility for enhancing student motivation often falls on educators, which can lead to passive engagement from students. However, intrinsic motivation, defined by a genuine desire to learn and active participation, is equally essential (Williams-Pierce, 2011). Although there is no universal formula for fostering student motivation, Williams-Pierce (2011) identifies key factors: 1) the willingness of students to learn, 2) effective rapport and guidance from instructors, 3) content that captivates student interest, 4) presentation in an engaging manner, and 5) the creation of an inclusive and innovative environment that nurtures both learning and creativity.

In higher education, maintaining student motivation is crucial and should be a priority for educational institutions. Rizkallah and Seitz (2017) stress the importance of strategic focus throughout a student's academic journey—from discovery and establishment to engagement and forward-thinking phases—with faculty support being pivotal for improving retention rates.

On a classroom level, student motivation is a complex challenge. Liu, Bridgeman, and Adler (2012) note that college learning encompasses more than just traditional assessment metrics; it spans a wide range of disciplinary subjects. They observe that motivated students tend to perform better in evaluations and acquire a deeper understanding of the material. Educators in higher education must value student perspectives, encourage active input, and cultivate creativity to drive motivation toward the desired learning outcomes.

Incorporating games, such as Mega-games, can be a valuable tool in this effort, offering innovative pathways for engagement and learning.

2.2 The Role of Gamification in Higher Education

Gamification, as conceptualized by Deterding et al. (2011), involves the application of game design elements in non-game contexts to enhance engagement, motivation, and behavior. This approach leverages the captivating and often addictive nature of games to influence and improve educational experiences (OIE, 2016). Games are designed to be engaging, encouraging persistence and creativity in overcoming challenges, which can foster problem-solving skills and a mindset conducive to learning (Teng & Baker, 2014).

Prominent figures in the field, such as Jane McGonigal (2011), emphasize that games create enjoyable learning environments by offering opportunities for trial-and-error learning, immediate feedback, and social interaction (Hertz, 2013). This immersive experience can lead to persistent engagement and strategic thinking beyond the game itself (Kiang, 2014). Historical milestones, from Thomas W. Malone's early work on intrinsically motivating computer games (1981) to Nick Pelling's coining of "gamification" (2003) and Jesse Schell's contributions in "The Art of Game Design" (2019), have shaped the evolution of gamification.

Despite its benefits, recent studies highlight the need for a critical examination of gamification's limitations. Li, Yang, and Hu (2024) identify a U-shaped relationship between competition in gamified systems and technological exhaustion, suggesting that excessive competition can lead to increased fatigue. This underscores the importance of balancing competitive elements to avoid adverse effects on users. Similarly, Prieto-Andreu (2024) reviews various negative impacts of gamification in education, such as the novelty effect and overjustification, and proposes an instructional model to address these challenges. Their insights emphasize the necessity of careful design and ethical considerations to prevent negative outcomes while leveraging gamification's potential.

While gamification has the potential to enrich educational experiences by enhancing engagement and motivation, it is essential to critically assess and address its limitations. Understanding both the positive aspects and potential drawbacks of gamification can lead to more effective and balanced educational strategies, ensuring that gamified approaches contribute positively to student learning and development.

2.3 Mega-games in Higher Education

Playing is a fundamental aspect of human nature, deeply rooted in our instincts. Huizinga (1955) notes that play predates culture, underscoring its essential role in human life. Play brings joy and fulfillment, embodying structured elements such as goals, rules, feedback systems, and voluntary participation (McGonigal, 2011).

Mega-games are an innovative and evolving phenomenon in the gaming world, blending aspects of traditional board games, role-playing games, and simulations to create expansive, immersive experiences. Unlike conventional board games or simulations, Mega-games involve a significantly larger number of participants, often ranging from 20 to over 100 players, each assuming unique roles within a complex, interactive setting.

At their essence, Mega-games are intricate events where players engage in both cooperative and competitive activities over extended periods. These games are crafted to replicate intricate scenarios such as geopolitical conflicts, economic systems, or historical events. Each participant or group is assigned a specific role with particular objectives, powers, and resources, contributing to a dynamic narrative that evolves with both collective and individual actions.

Similar to board games, Mega-games have structured rules and objectives that provide a framework for player interactions. Both formats require strategic thinking, resource management, and decision-making. However,

while board games typically involve a smaller number of players around a table, Mega-games significantly expand in scale, accommodating many more participants across larger spaces, sometimes extending into multiple rooms or areas.

Mega-games also share common ground with simulations, as both aim to replicate real-world scenarios and systems. Participants assume roles and make decisions based on their understanding of the scenario. However, while simulations often focus on accuracy and educational outcomes, closely mirroring real-world processes, Mega-games blend realism with gameplay elements to ensure a dynamic and engaging experience. Although educational goals can be part of Mega-games, their emphasis on player interaction and narrative development distinguishes them from simulations.

What differentiates Mega-games from other gaming formats is their scale and complexity. The involvement of dozens to hundreds of players introduces a level of unpredictability and interactivity unattainable in smaller games. The roles in Mega-games are often asymmetrical, meaning players have varying degrees of power, information, and objectives, creating a rich tapestry of interactions and negotiations.

Moreover, Mega-games are highly versatile and can be customized to fit a range of themes and scenarios, from historical battles to futuristic political landscapes. This adaptability allows for a wide array of creative and educational uses, making them suitable for various audiences, including educational institutions, corporate training sessions, and gaming communities.

Mega-games offer a distinct and engaging form of entertainment that bridges board games, simulations, and large-scale interactive experiences. By integrating elements of strategy, role-playing, and real-world simulation, they provide a robust platform for exploring complex scenarios in an immersive and collaborative setting. Recognizing the unique features of Mega-games enhances their application and enjoyment, offering participants a rich and memorable gaming experience.

Resource management is a key element in Mega-games, where players must make strategic decisions based on limited resources such as money, technology, information, or materials (Rycroft-Smith, 2016). While they are primarily a form of entertainment, Mega-games have also been recognized as valuable educational tools, as demonstrated by examples like Shawn McMillan's "ALLIANCE" (2015) and Ted Castronova's "VIRUS: Bunny Apocalypse," both implemented in the United States.

Moreover, Mega-games have been utilized in academic settings to engage students in real-world experiences and role-playing, such as the Climate Change Mega-game at Linköping University in 2020, contributing to ongoing research on interactive learning methods.

In contrast, as we explore the context of this paper, research on Mega-games in Mexico is still emerging. Notable contributions include the work of Mexican developers like Robledo-Rella et al. (2017) with "Cocogame" and González & Montalvo (2018) with the "BluRabbits" platform, showcasing innovative approaches to creating immersive learning experiences for students at institutions like Tecnológico de Monterrey.

The implementation of Mega-games in education, as highlighted by Martínez et al. (2023) in their research titled "Kuxtal: Student Motivation Through Mega-games in Higher Education Design Students," presents a significant opportunity. Developed at the same university in which the present work focussed, this implementation yielded positive outcomes, demonstrating the potential of Mega-games as a playful and effective approach to addressing complex challenges. By integrating educational innovations that boost student motivation and engagement, Mega-games like Kuxtal promote collaboration, critical-creative thinking, and real-world actions among students, influencing their immediate contexts and disciplines.

3. Methodology

The methodology for this research was shaped by the necessity to motivate students in a demanding course which spans through all semester long and needs a commitment of 48 hours of work per week. The research employed a mixed-method approach to measure student commitment and motivation following the implementation of advanced gamification elements during the February to June 2022 period in the New Realities course. The study targeted the sixth semester of Video Game Studies in the Digital Arts Bachelor's program at Tec de Monterrey, with two groups based at the Guadalajara and Querétaro campi, conducted virtually.

The research aimed to evaluate advanced gamification, Mega-games, and their impact on motivation and commitment to learning by assessing both student and faculty experiences. Data collection methods included:

Participatory Observation - took place from February to June 2022. The interaction occurred within a platform called OASIS, a Discord server configured with both groups' six implementing professors and a total of 35 students, divided into two groups of 16 and 19 students respectively. The MEE6 plugin was used on this server to incorporate many features and tools of the advanced gamification such as virtual currency, experience points, roles and secrets. The server included statistical participation data, and a leaderboard based on engagement levels within the OASIS.

Documentary Research - involved searching the Scopus database curated by Elsevier from 2019 to 2023, analyzing implementation data and results for each case to develop the best gamification and mega-game taking in consideration the results.

Online Questionnaire (Caudillo, 2022) - structured into three main parts:

Demographic Information: Collects data on age, campus, group enrollment, gender, pre-semester enthusiasm and motivation, and attitudes toward continuing in a virtual format. It also inquires about the participant's level in OASIS and their player type according to Richard Bartle taxonomy (1996).

Advanced Gamification Analysis: Evaluates participants' responses using a Likert scale to assess their perceptions of gamification elements, such as the impact of gamification, the effectiveness of storyliving elements, the utility of Discord, and the enjoyment and curiosity generated by the gamified experience. It includes open-ended questions about enjoyable and unenjoyable aspects, motivations, and the impact of gamification on participation and skill development.

Overall Experience and Future Improvements: Gathers opinions on whether the gamified experience enhanced motivation and commitment compared to other blocks and semesters, suggestions for improvements, overall motivation, and participation in additional activities prompted by the gamification approach.

Semi-structured Group Interviews - aimed to explore students' reactions to their previous semester's gamified experience, focusing on what they liked and disliked. It also assessed whether gamified courses increased their commitment compared to traditional formats, sought suggestions for improvements, evaluated the effectiveness of the implementing teachers versus others, and discussed the appropriateness of the challenges and grading methods.

Student Opinion Survey - evaluates the professor's expertise, challenge level, promotion of a supportive environment, adequacy of support, overall learning experience, and interactions within the virtual Tec model. It also seeks comments for future students considering the course with the same professor.

Documentation Review Interviews with Faculty Members - A meeting will be held with the implementing professors this semester to gather data on their observations of the semester, the design of the New Realities course, and the gamification elements integrated to motivate students in the game design area..

An inductive analysis method was applied to specific elements of the implementation to draw broader conclusions about the effectiveness of advanced gamification and Mega-games in higher education settings.

3.1 Course Design

The course design, developed by Carlos Astengo, Lorena Martínez, and Mario Caudillo, proposed an immersive experience integrating gamification elements and Mega-games to foster the cross-competence of collaboration. The design drew inspiration from the narrative universe of Ernest Cline's *Ready Player One* because of the relation of topics treated in class and in this science-fiction book.

The implementation spanned two regional groups, each guided by three professors. Mario Caudillo led one group, while Diego de la Mora led the other. These coordinators collaborated to utilize the platform for the Mega-game and conducted joint classes with students from both groups to explain its operation.

The course was divided into three modules:

1. The Creative Planet: This module focused on creatively publishing in reality-virtuality continuum, such as games and applications in augmented reality, extended reality, virtual reality, integrated reality, augmented virtuality and mixed reality, requiring students to implement at least two forms of these technologies. The title of the course "New realities" referred this reality-virtuality continuum as the "new realities".

2. The Video Game Planet: This module concentrated on the pre-production phase of the students' capstone projects, which they would continue developing over the next two semesters and deliver as their final terminal project of the Bachelor in Digital Arts.
3. Sector 18: Planet Doom: This module involved the Mega-game, simulating a professional work environment in which students need to participate with four different roles in four different projects, gaining Prestige virtual currency as if they are in real-life, mechanics as tax payments and freelance work negotiation were some of the activities experienced by students in this module.

Students were immersed in the following narrative, which set the stage for the course:

Mexico - Year 2045. Following misguided pandemic management policies since 2020, the world faces a bleak reality. Many people seek to escape this reality, and you will be their hero, showing them that they can go to another place without even moving. In this course, you will see the future and build it, giving people a place called OASIS, where the boundaries of reality are those of your imagination. You can go anywhere, create anything, like the Video Game Planet for your capstone project or the Creative Planet to publish and share new realities. Or face the challenges of professional life in Sector 12: Planet Doom. In OASIS, you can be anything or anyone, creating the reality you want. Welcome to New Realities. Ready Player One?

3.2 Gamification and Mega-game Design

In the first seven weeks, the platform, referred to as the OASIS, allowed students to accumulate virtual currency called Prestige, which governed the Mega-game's economy, this economy also has a 10% of the course's final grade. Participation earned students experience points, unlocking features as they progressed.

Students focused on wealth accumulation, logging their class hours using the "/work" command in the Mega-game and earning Prestige as payment, this could be seen as their work hours, when they use this command, admin roles got the notification and could ask for what they are working at, if the students lied about working when they are not working they got a fine in Prestige.

The final eight weeks simulated the professional work environment. Students worked on four distinct projects to meet course competencies, assuming various roles such as artist, developer, designer, and producer. The producer role was pivotal in ensuring the smooth operation of the OASIS, as they generated jobs to fulfill the roles of other students.

Producers selected projects from a Job Board, defined project scope, resources, budget, payment agreements, and timelines, and presented this to the simulation board, consisting of at least three of the six professors. Upon approval, the board allocated 50% of the necessary Prestige virtual resources. The producer then recruited a team and commenced work, followed by a project closure and post-mortem meeting to assess project completion and requirements.

4. Results

The central aim of this research is to evaluate the outcomes of implementing personalized attendance tracking within the Tec21 educational model and to develop new gamification elements that can be leveraged in future studies. By exploring advanced gamification methods and embedding Mega-games within the learning process, this study seeks to promote lifelong learning among students. Additionally, the study emphasizes the importance of cultivating soft skills such as communication, critical thinking, self-management, and collaboration, which are crucial for navigating the complexities of modern and future careers. By embedding real-world issues into the learning experience, students are encouraged to engage actively in problem-solving, thereby enhancing the purpose and relevance of their educational journey.

In analyzing the effectiveness of these strategies, we employed the categorization framework established by Williams and Pierce (2011) to assess student motivation and engagement. This framework was chosen due to its comprehensive identification of key factors that contribute to fostering intrinsic motivation, an essential element for active and meaningful student participation in academic settings. According to Williams and Pierce (2011), while educators bear the responsibility of enhancing student motivation, true engagement stems from a combination of student willingness, effective instructor-student rapport, captivating and well-presented content, and an environment that promotes inclusivity and creativity.

4.1 Willingness of Students to Learn

Quantitative data revealed that students felt challenged to develop new skills and concepts, with an average score of 8.9 and a standard deviation of 1.2. Additionally, initial sentiments and motivation data indicated that 64% of students reported positive sentiments and high motivation levels at the start of the semester. Qualitatively, this willingness was further evident in the use of gamification elements, such as rewards and constant challenges, which increased engagement and motivation. However, some students experienced burnout due to the continuous nature of these challenges, suggesting that excessive stimuli can negatively affect the willingness to learn.

4.2 Effective Rapport and Guidance from Instructors

Students rated their instructors highly, with an average score of 9.1 and a standard deviation of 1.24, indicating effective guidance and a strong rapport between students and teachers. The adequacy of support and feedback was also highly rated, with an average score of 9.0 and a standard deviation of 1.5, underscoring the importance of continuous and effective guidance. In the model of virtual education delivered by Tec de Monterrey, even remote interactions between students and instructors were positively evaluated, with an average score of 8.9. Peer and professor interactions were largely positive, though some students found the constant connectivity burdensome or had issues with the platform's interface.

4.3 Content that Captivates Student Interest

The overall learning experience was rated with an average of 8.1 and a standard deviation of 1.88, reflecting that, while the content was generally engaging, there was variability in how it captured students' interest. Gamification elements, such as Prestige virtual currency and a leaderboard, effectively captured the interest of many students. However, the competition and stress associated with these elements also led to anxiety and disinterest in some cases. The "Ready Player One" narrative elements integrated into the course also received mixed reactions, with 36% of students responding positively, 36% neutral, and 28% negatively, indicating varying degrees of immersion and engagement.

4.4 Presentation in an Engaging Manner

Students felt that the content was presented in a way that fostered a positive and respectful environment, with an average score of 9.1 and a standard deviation of 1.2. This positive environment was crucial for maintaining interest and engagement. However, some students reported that restrictions on how they could interact on the communication platform made the experience less enjoyable and more linear, negatively impacting the presentation and enjoyment of the course. Moreover, the overall enjoyment of gamified experiences was mixed, with 41.6% of students holding negative opinions, 41.7% neutral, and 16.6% reporting enjoyment, suggesting that the presentation's effectiveness varied.

4.5 Creation of an Inclusive and Innovative Environment

The virtual education model enabled inclusive interaction in a remote setting, with a score of 8.9, reflecting efforts to create an inclusive environment, though there is room for improvement. Qualitatively, the use of a Mega-game simulating a video game studio allowed students to experiment with different roles in a highly inclusive and creative environment. However, challenges such as economic disparities emerged, with issues arising from the rapid accumulation of virtual currency and wealth disparities by the 14th week. Additionally, the emergence of social classes within the OASIS highlighted limitations in the perception of inclusivity, necessitating thoughtful design and implementation to balance gamification with educational goals.

5. Conclusions

The research into advanced gamification elements and Mega-games within an immersive post-pandemic educational setting has yielded several important conclusions regarding their effectiveness in enhancing student engagement and motivation. The integration of these elements, particularly through platforms like Discord, has proven to be a significant factor in fostering student commitment, collaboration, and competition. The immersive nature of the OASIS platform, with its hidden surprises and dynamic challenges, effectively sparked curiosity and motivated students to actively participate in their learning. However, aligning these challenges more closely with project details could further optimize learning outcomes.

Random dynamics, requiring students to engage frequently with the platform, successfully increased their commitment. However, the research also highlighted the need for safeguards against potential negative consequences, such as the risk of gambling addiction, necessitating the implementation of limitations to mitigate harm. Additionally, the study found that preventive measures against "farming" experience points helped students focus on meaningful content, fostering a more authentic commitment to their educational experience.

The use of rewards to incentivize extra-academic activities was particularly effective in generating commitment and emphasizing the importance of continuous learning. This approach underscored the value of lifelong learning and the ongoing development of skills, particularly through platforms like MOOCs. However, the study also revealed the challenges associated with balancing assessment pressures with the overall educational experience, especially among students with scholarships. This finding underscores the importance of creating a supportive environment that maintains motivation and well-being.

In a global context, the research provided a comprehensive understanding of how gamification is implemented worldwide, identifying both well-established and novel elements. By comparing these elements with previous implementations, the study offered valuable insights into their effectiveness and potential to enhance student motivation. This research supports the hypothesis that advanced gamification elements can be successfully implemented across different educational contexts, marking a new frontier in gamification with the potential to improve student engagement and motivation.

The findings of this study offer valuable guidance for educators and practitioners interested in implementing advanced gamification. By exploring new elements and tailoring them to specific educational contexts, student motivation and engagement can be significantly enhanced. The study encourages continued innovation in gamification, suggesting that these advanced elements can lead to sustained motivation and improved learning experiences.

5.1 Implications for Future Implementation

Future research should focus on understanding the potential impacts of prolonged exposure to continuous stimuli from gamification and Mega-games, particularly in intensive implementations that demand up to 48 hours of weekly engagement. While these methods can significantly boost motivation and engagement, the nature of the challenges and the relentless demand for interaction may pose risks to students' well-being, including heightened stress, anxiety, and burnout.

Exploring the psychological effects of extended gamification is crucial, as continuous engagement may have unintended consequences on students' mental health. It's essential to identify the balance between healthy engagement and overexposure to avoid negative outcomes. Equally important is the need to critically examine the ethical implications of using such immersive and competitive methods. Educators and institutions bear the responsibility of safeguarding student welfare, ensuring that the intensity of these activities does not lead to harmful dynamics or compromised well-being.

A critical analysis of the effectiveness of these approaches is also necessary to determine whether the educational benefits justify the potential costs to students' health. It is important to question whether alternative methods could achieve similar outcomes without the associated risks. Furthermore, understanding the long-term effects of these educational strategies on students' learning perceptions, resilience, and sustained engagement is essential for assessing the sustainability of gamification and Mega-games in large-scale educational settings.

Addressing these concerns will provide a more nuanced understanding of the implications of these innovative approaches, ensuring they enhance student learning without undermining their health or well-being.

Abstract: Open Data refers to digital data that is made available to anyone with the legal and technical conditions to be freely used, reused, and redistributed. Although it has emerged as a new common with the potential to increase citizen participation and transparency, current literature suggests the lack of skills for managing data and participating in Open Data processes, as one of the main barriers to achieve these benefits. Integrating Open Data in school education has been recognized as key to fostering a larger community able to participate in Open Data ecosystems. This study showcases the design of a role-playing game grounded in authentic learning principles for the development of Open Data competencies in elementary school. The Open Data Newsroom is a game approach that immerses students in solving a mystery with data. In the game, students play Open Data Journalists engaging in a three-phase authentic process to get, understand and deliver data. The learning goal in the game is that students build open data competencies: data literacy and real-world problem solving. A design-based research methodological approach is applied to develop theory based and practically grounded educational designs. Two interventions in Danish schools have been conducted, each one with the participation of seventeen students in 7th to 9th grade and three teachers. Interventions are aimed at iteratively designing and testing the game. The discussion section elaborates on opportunities for redesigning and systematically developing the game as a learning design for Open Data competencies.

Keyboards: Open Data Competencies, Open Data Literacy, Authentic Learning, Elementary School Students, Game Design, Open Data Journalism

1. Introduction

Open Data (OD), which is data made freely available to anyone, has been stated as a new common available for all members of society (Morelli et al., 2017; Mulder et al., 2019). Although OD is leveraged to increase citizen participation and social value (Kassen, 2013), few citizens have the competencies for actually achieving these benefits (Janssen et al., 2012). Within the OD field the lack of skills of citizens for managing data and integrating in OD processes is a major concern (Van Loenen et al., 2021). This represents a challenge for achieving OD ecosystems (Van Loenen et al., 2021) where people engage and benefit from available OD to participate as active citizens, critically think about governmental performance and create novel products and services. OD is then an available resource but lowly exploited since the majority of people struggle to engage with it. Although integration of OD in schools has been established as one of the strategies for promoting inclusive and fair OD ecosystems (International Open Data charter, 2015), educational designs, tools and methods are still scarce.

Current OD initiatives in education mainly seek to equip students with essential skills needed for the current fast changing and data-driven society (Cook et al., 2018). Potentials of using OD mainly have been related to the connection of classroom activities to real facts, and secondly, to increasing teacher's and student's motivation (Coughlan, 2020). OD learning activities have ranged from using OD in regular school subjects such as chemistry and geography (Pence et al., 2015), engaging with local problems and data in undergraduate courses about OD (Palova & Vejacka, 2022), and extracurricular activities such as public hackathons (Davis & Shneyer, 2020). Previous research has shown that the learning goals of current initiatives in elementary school are often related to increasing awareness about OD and developing criticality (Celis Vargas et al., 2023). For example, Badioze Zaman et al. (2021) focus on preparing young students to use OD by using in the classroom pet robots and IoT, and Saddiqa et al. (2019) have related data literacy in schools with the ability to identify which types of data are needed for solving a problem, and the abilities to use visualisation technologies for exploring and presenting the data in greater detail and understandable way. Furthermore, research of Pellegrino & Antelmi (2023) has shown that OD initiatives in school level primarily are focused on the use of open datasets or data exploitation rather

than on their production. The development of OD competencies based on data literacy and real-world problem solving in elementary school students has been the focus of the development of learning designs that allow future engagement and current participation of elementary school students in OD ecosystems (Celis Vargas et al., 2024).

The current paper investigates how it is possible to develop a game-based learning design for students to develop OD competencies in elementary school. We present the design of a game approach and preliminary test results. Some of the main design considerations include making OD less abstract for non-technical users, and getting students engaged in the process of learning data literacy competencies for solving real-world problems.

2. Background

With the aim of developing tools and methods for building OD competencies in elementary school, a game approach was designed based on authentic learning principles and with the goal of building competencies for Data Literacy and Real-World problem solving. The goal was to enhance the authentic aspects, and theoretical and experimental practices by assigning students the role of Data Journalists in the game. According to Gray & Bounegru (2024) data journalism is a critical data practice including a reflexive work and considering not just the ways in which data is analysed, created, and used, but also the social, cultural, political and economic circumstances in which such practices are embedded. This perspective provides an authentic frame for learning OD competencies which are grounded in data literacy and real-world problem solving.

A game-based approach helps to make the knowledge that is abstract and common for experts more concrete and embedded in a situation (Greeno & Gresalfi, 2008) by acquiring new words and new forms of language for using OD for real-world problem-solving. Games are a form of active learning that enable the learner to have some control of the game activity and engage in interaction (Gee, 2004). Game-based learning (GBL) is grounded in active learning methodologies and encourages learning activities by building on engagement and challenges to achieve the intended learning objectives (Romero et al., 2015).

Essential elements of game design have been described by Costikyan (2002) as five: goal, struggle, interaction, structure, and endogenous meaning. In brief these can be described as defining clear goals for players to strive towards, creating a sense of purpose and direction within the game. Struggle and challenge in fostering players' engagement and satisfaction. The internal rules and systems, known as endogenous mechanisms, that govern players' interactions and outcomes. The importance of structure in organising gameplay elements and guiding player progression. Finally, the interaction refers to both within the game environment and between players.

2.1 Data Journalism

From Journalism's foundation, journalists have used a plethora of approaches to explore, detect, and uncover newsworthy stories. In our contemporary society, the plethora of data that is available to journalists led to the establishment of the term 'Data Journalism.' According to Veglis & Bratsas (2017), it involves the use of data at all stages of the journalistic process including the extraction of information, compilation, and visualisation in a comprehensive way. Furthermore, with the adoption of the OD movement by governments all over the world, new data sources have been made available to journalists. According to Papageorgiou et al. (2023), OD provides them a better insight into important social problems and government activities to create 'evidence-based' journalistic articles.

According to the Data Journalism handbook 1 (Bounegru et al., 2012), the data journalism process consists of three major moments: Getting data, Understanding data and Delivering data. Initially, the data collection step or *Getting Data* can incorporate gathering data from a variety of sources. This can include scraped data, data acquired from freedom of information requests, publicly available data, and OD provided by governmental or other institutions. After the data collection, the data that is of interest to the journalist have to be analysed. The *Understanding data* step requires the discovery of trends, patterns, and the extraction of insights. The next moment, *Delivering Data* requires thinking of different audiences and may include serving data with stories, data driven applications and data visualisations. The perspective of data journalism as a critical data practice emphasises on the process of inquiry with data (Gray & Bounegru, 2024).

3. The Open Data Newsroom

The Open Data Newsroom is a role-playing game for elementary school students to solve a fictional mystery with OD through engaging in authentic activities as real data journalists would do. The game is a simulation grounded in two authentic elements. On one hand, the game develops around a mystery which is relevant for students and close to a real-world complex challenge. On the other hand, in the game students act as data journalists engaging in a simulation of an authentic OD process.

The game builds a narrative where professional data journalists in a local newspaper receive a call from the *Global Investigative Open Data Network* to unravel mysterious events that they believe are connected. The *data journalists* (students) in the newsroom work on getting, understanding, and delivering data to explain the mysterious events to the community in a press conference. The *chief editor* (teacher or external facilitator) facilitates the game flow and challenges the data that the students' outcome is based on. Data journalists are divided in teams of 4 to 5 people trying to have a variety of interests and abilities. The game dynamic guides the players into a data journalistic process where activities relate to OD abilities such as finding and analysing data, assessing if some data is real or fake, creating visualisation and presenting a data-based story explaining a problem. Table 1 presents the game flow that consists of several phases guiding the players into the game narrative and data journalistic process to achieve the outcomes. Game phases are mainly five: (1) introducing the mystery and goal, (2) getting data and understanding data, (3) preparing a data story, (4) editorial meeting and (5) delivering data. First the mystery, game goal and dynamic are introduced to the players. Following this step, a phase of getting and understanding data immerses the journalists' teams in two activities supported by physical and digital elements. On the one hand, the players start defining storylines based on further information about the mysterious events. On the other hand, the players navigate open datasets presented through interactive visualisations to analyse the facts behind the mysterious events and identify data insights to unravel the mystery. In the third phase, the journalists receive instructions to prepare for the press conference where they will deliver a realistic and convincing story based on data to the local citizens. At the same time, each team works on building their final data story and presentation. An editorial meeting helps them to strengthen their outcome. During the editorial meeting, the chief editor meets each group to hear their hypothesis and challenge the storylines and the data behind. Finally, the phase for delivering data has arrived. Each team presents their story receiving questions from the critical audience. An official solution is presented by the chief editor. The game is finalised with comments from the chief editor to each team and an introduction to work on a future press release and to leverage the data generated during the investigation. Figure 1 shows the interaction and engagement of players during the different phases.

Table 1: Game flow

Game Phase		Description
Introducing the mystery and goal		The chief editor presents the mystery, game goal and dynamic
Getting and understanding data	Defining storylines	Players receive physical envelopes with news and social media posts about the mysterious events to build their own case
	Finding data insights	Player analyse OD trough visualisations in the platform
Preparing the data story		Players prepare for communicating their solutions to local citizens in the press conference
Editorial meeting		Each team meets the chief editor for max. 5mins
Delivering data: Press conference		Each team presents in max. 5 mins. The chief editor presents the case solution

Figure 1: Players engaged in different game phases (anonymised). From left to right: 1. Players creating a case board while defining storylines (Getting data). 2. Players interacting with the online tool during analysis of data and finding data insights phase (Understanding data). 3. Players presenting their data story in the final Press conference (Delivering data).

Considering that the expected learning outcome is the critical analysis of data for solving problems, OD activities in the game focus on the analysing of data visualisations rather than on the management of raw data. Players navigate different interactive visualisations in a digital and online platform. In the game, we have used two datasets in connection to the game mystery, one related to water quality and one related to teenagers' health issues. Firstly, the *Bathing Water Directive - Status of bathing water,* Denmark dataset (European Environment Agency, 2023) is used. Associated metadata is briefly presented in the game platform. This repository presents data from 2009 to 2022 and we created data for two more years 2023 and 2024 since the mysterious incidents are occurring in the current year. Secondly, we created a second dataset about skin disease cases in Denmark following the same structure of the previous dataset presenting data from 2009 - 2022.

4. Methodology and Test Design

The Open Data Newsroom has been tested in two Danish schools with students aged 14 - 16. The focus of these tests has been to investigate the following research perspectives: firstly, the study aims to understand how OD competencies for Data Literacy and Real-world problem solving can be developed in elementary school. Here we were particularly focused on understanding how the game strengthens students' skills for critically analysing data, distinguishing between real and fake data, solving problems with data, and building a story. Secondly, we aim to understand students' interests and motivations for engaging in solving a problem. These research perspectives have been tested in two cycles of research and development which will be described below.

4.1 Design Based Research and Interventions

A design-based research (DBR) methodological approach is applied to develop theory-based and practically grounded educational designs (Bakker, 2018). In DBR, design experiments aim to produce actionable knowledge that can be used to achieve some educational goal through design (Cobb et al., 2003). DBR develops in iterative cycles of problem definition, design, intervention, and redesign (Brown, 1992). Two cycles are aimed at iteratively developing and testing the game design with students and teachers. The first intervention was developed in January 2024 in a Danish school with 17 students in 7th grade. The second intervention was developed in March 2024 in a different Danish school with 17 students in 8th and 9th grade.

Figure 2 visualises the two cycles and iterative process.

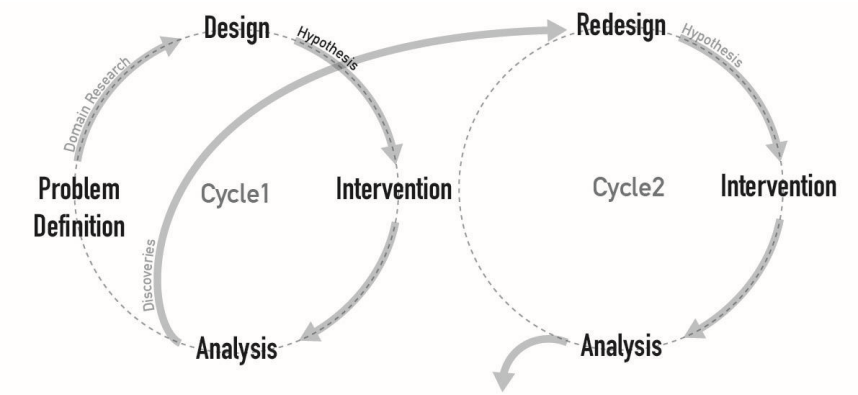

Figure 2: Design Based Research DBR cycles and iterative process.

In the first cycle of design and intervention with the game, the focus was on testing if the game created an authentic experience as data journalists for the development of OD competencies and the general engagement of the students with the mystery and the narrative. In the second cycle, the focus was on strengthening the experience of the students for using OD to solve an authentic challenge. Based on the results from the first intervention, the game was further developed to address areas of improvement such as the mystery being too simple (thus not sufficiently challenging and satisfying for students), the role of data journalist being loose (hence not contributing much to solving the mystery), and the data being highly abstract and in a rigid format (not facilitating deeper analysis).

Interventions were conducted in Danish schools during regular school time and with the presence of the teacher who occasionally engaged in asking critical questions to the students. Each intervention lasted 3 hours. During the intervention the researchers introduced the research aim, the game, and the role of data journalists to the class. Following the introduction, the test of The Open Data Newsroom was conducted during approximately 2 and a half hours. One member from the research team adopted the role of *Chief editor* to facilitate the game flow. Meanwhile a second member of the research team focused on making observations during the whole session. During the first intervention students were asked to create physical visualisation and several materials such as colour papers, markers and paper sheets were given, however two out of four teams opted for creating slides presentations for the final press conference. During the second intervention, students used their own laptops for the data analysis using the platform and preparing slides presentations for the final press conference. In both cases, students discussed storylines and hypotheses to solve the mystery. Table 2 summarises the main characteristics of each intervention.

Table 2: Description of interventions

Intervention	School 1	School 2
Participants	17 students in 7th grade aged 14 to 15 1 teacher	17 students in 8th and 9th grade aged 15 to 16 2 teachers
Game teams	4 teams (3 teams of 4 students and 1 group of 5 students)	4 teams (3 teams of 4 students and 1 group of 5 students)
Duration	3-hour session	3-hour session
Design tested	Physical game elements	Physical and digital game elements

Students' participation was documented using audio and video recording as well as photography. The class was asked to complete a written questionnaire with two qualitative questions "What did you like about the activity? Why?" and "What was the most challenging? Why?". In addition, semi-structured qualitative interviews (Kvale & Brinkmann, 2005) were conducted with the entire class for around 30 minutes, and with the teacher for 45 minutes after the test. During the interview, students answered qualitative open questions related to their game experience, the learning experience, and the game development, such as "How did you feel as Data Journalists solving the mystery? Was it interesting? Was it fun?" "What was different from everyday teaching?" and "How could the game be more interesting or fun for you?"

4.2 The Iterative Development of The Open Data Newsroom in School Interventions

The Open Data Newsroom was developed and iteratively modified with the specific focus of serving as a learning design for developing OD competencies in elementary school. The learning outcomes refer to competencies for the critical analysis of data for solving authentic problems. Examples of the iterative design are making the mystery more complex in relation to the data analysis and integrating a digital tool for the analysis of data. During the first intervention the students received two envelopes, one with printed news and social media posts about the mystery, and a second envelope with printed data in different formats such as visualisations and statistical reports about the mystery. During the game-playing session the students struggle to analyse the data in these formats, losing interest and motivation to dive deeper in the game. Later, during the second intervention we added a digital platform for analysing data through data visualisations. Figure 3 shows two groups of students during the interventions, firstly analysing the case physically and secondly, engaging with the digital tool included for the data analysis.

Figure 3: Students during the game-playing session (anonymised). On the left, the first intervention with a physical game. On the right, the second intervention included physical and digital game elements.

During the first interventions students concluded the solution without the help of the data, it was too obvious for them. Therefore, during the second intervention we increased the complexity of the mystery in relation to the data analysis. Students needed to discover hidden clues in the printed material about the mystery, and during the data analysis they had to consider several variables such as the time frame, the number of cases over time, and the age of the sick teenagers.

The digital platform was hired as a service (Juice Analytics, 2024). This solution was the only platform that we identified allowing users to immerse in interaction with visualisations for data analysis and data storytelling. The intended audience for the platform is a commercial audience, however, we found it highly useful and relevant also for educational purposes. This platform allowed us to create an online report as a landing page with our own images, narrative, and datasets. This online tool allowed the students to interact with several data visualisations by filtering, correlating variables, and capturing their insights. Figure 4 shows the final interface and the type of data visualisations presented to the students.

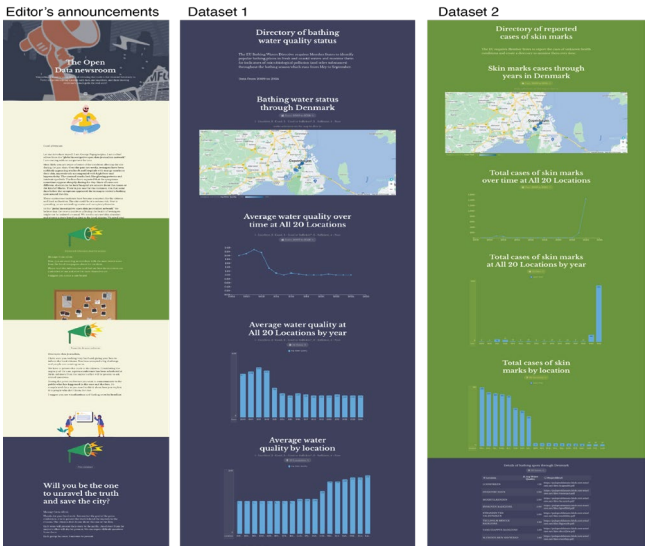

Figure 4: Final game interface in the platform

5. Results

5.1 Test in School 1

Students could solve the mystery in the game, however they did it very easily without the use of data. Their solutions and analysis lacked depth and were overly simplistic. These results show a lack of engagement with the game and a faulty demonstration of OD competencies. For example, one student commented that "The final product was hard to make, as only one other person did any work". We could observe that the mystery was overly simple and did not need data to be solved. For example, students commented in the qualitative interviews and the written questionnaire after the test that "the subject was kind of boring", "There wasn't anything difficult about the subject". During the final presentation, some of the teams created fictional narratives such as a team that elaborated on a lethal virus that was the cause behind the mystery. Even though this narrative helped them to personalise and differentiate their story from the other teams, it was not originated or supported by the data provided. During the press conference, all teams had the same conclusion, and the argumentation was insufficient. Furthermore, we observed that students were initially interested and motivated, but especially during the data analysis moment, some students began to lose interest. Results from the qualitative interviews after the test and written questionnaire indicate that the data was highly abstract and difficult to process. These results were discouraging, but it was a clear indicator of the need of a digital tool for the interaction with data, and for designing a more complex and engaging mystery.

Regarding the authentic experience as data journalists, students did not fully immerse themselves in the narrative. In the qualitative interview they expressed that they did not feel like data journalists. However, in the written questionnaire, students commented positively about the activity regarding the role and the goal. For example, "It was cool that we got to create a solution" "I liked figuring out by ourselves why people got sick" "It was cool doing role play".

5.2 Test in School 2

In summary, the results showed that the students displayed a high level of analytical depth and comprehension in unravelling the mystery. Their solutions and final presentations were characterised by thorough exploration and nuanced understanding. We could observe that students exercised OD competencies in the game such as the identification of a problem, critical analysis of data to solve a problem, assessment of real and fake data, creation of a data story to communicate their outcomes, identification of needed data to be collected, among others. A very interesting observation is that several teams of students questioned the veracity of the datasets in the game. For example, some teams discovered that the bathing water status open dataset was presenting data from 2024, however the bathing season has not yet started. This insight showed us that the students engaged deeply with the data and metadata. Students also identified that the social media posts given in the first envelope to contextualise the mystery were not providing relevant or useful information. One of the students mentioned "the social media posts are misleading and have no data". These reflections led discussions in the different teams about the veracity of the sources. Furthermore, during the final press conference, students were able to present their final data story using data for argumentation by referring to time frames, quality of the water, locations, and number of cases. The students used data visualisations to present their hypothesis. Two teams found additional relevant geographical open data on their own initiative to create hypotheses about other phenomena possibly related to the mysterious events such as rain levels or high temperatures. Figure 5 shows an example of an insight captured by one team during the data analysis and used as visual support for the final presentation.

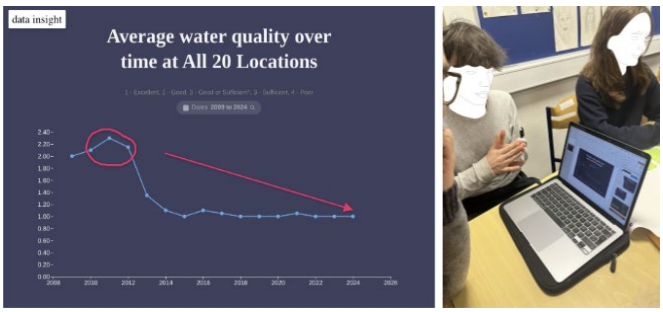

Figure 5: Data insight from the visualisation captured by a team of students during the game test in school 2. Student (anonymised) using the data insight during the editorial meeting.

The game and set up in the class provided a strong experience of engaging in an authentic OD professional use. For example, students commented in the written questionnaire that "It was an engaging story which actually made me want to find the answer. The website was well designed and helped with our research ", "It was fun because we got to be like journalists", "It was interesting to investigate and find reasons why our theory was or wasn't right", "I liked the topic about the disease, it was interesting". The authentic narrative helped the students to make decisions and focus on a storyline to build their narrative. For example, one student during the qualitative interview said, "The narrative helped me to think in my audience and decide what to say and how to present the story during the press conference". Regarding the engagement with the mystery, the teams deepened in their understanding. Two out of four teams explored different hypotheses beyond the one thought by the researchers' team. In addition, students identified the need for more data which could lead to a further development including data collection. Furthermore, results from the qualitative interviews and written questionnaire show that the challenge in the game or struggle was adequate and engaging for the students. Referring to what they liked about the game, students commented on "How interactive it is and how it easy to follow - but not easy to solve", "it got us to think, and analyse our information", "I liked the challenge that we got and the perfect amount of data for us to find out the problem". Finally, physical, and digital elements contribute to each other and enhance the experience, as a student commented "I liked that it was very interactive. It was both on the computer, but you also wrote stuff down. The website was very easy to use".

6. Discussion and Conclusion

The results presented in this paper show that a game approach increases students' understanding of OD, their awareness of what it is, how it is created and how it can be critically used, but also allows them to exercise OD competencies associated with Data Literacy and Real-world Problem Solving. Furthermore, the game approach contributes to understanding learning designs for the use of OD in elementary school. The results described in this paper indicate that a game approach integrating authentic knowledge close to students' interests offers new approaches to develop learning designs for OD competencies in elementary school. This approach might also be applied for understanding social issues in elementary school and create a reflection on the students about the need and assessment of data.

Results of the second iteration show that various design challenges remain to be addressed even further. This presents an opportunity for further systematic development of the game with students and teachers. Challenges to be addressed are related to several aspects of the game, for example the team formation was done by the teacher, however groups could be created according to the interests of the students in order to make the game experience more relevant to them. During qualitative interviews, students and teachers elaborated on the slightly unpleasant experience of presenting the same solution but from different teams during the press conference. In the future, teams could collaborate on different aspects, working together as a big newsroom. Students were constantly in need of feedback during the game which was addressed by the editor and during the editorial meeting, however feedback mechanisms on OD skills development could be explored in upcoming iterations. For the final press conference that at the same time is the end of the game, for some students it was not rewarding enough, perhaps including an authentic critical audience could enhance the authenticity of this final moment. Finally, regarding the OD competencies, an extension of the game could address more competencies such as the integration of data collection activities and simulation of the interaction between stakeholders, as it occurs in real OD ecosystems.

Further research could drive frameworks for the integration of this game approach in school curriculums and for the assessment of the learning outcomes.

Escaping Online: Teacher Student Engagement in a Digital Escape Game

Caroline Cruaud
Unit for Digitalization and Education, University of South-Eastern Norway, Drammen, Norway

caroline.cruaud@usn.no

Abstract: Escape games have become popular as a learning activity and are being used in a large variety of subjects (e.g., chemistry (Peleg et al, 2019), music (Babazadeh et al, 2022)). Research has shown that they are generally engaging for students (Veldkamp et al, 2020). However, the study of engagement is often limited to its observable aspect (e.g., the students are having fun; they are participating in the learning activity) or is not the focus of the analysis. Fewer studies are also investigating the use of escape games in fully online settings, when students are each playing from their own location. This research study is exploring engagement from the students' perspective, within a fully online course in a teacher education program at a Norwegian university. Teacher students were invited to play Radioaktiv, a digital escape game for natural sciences on the topic of radioactivity. Six pairs of students also participated in guided interviews after playing. Reflexive thematic analysis of the interview data with the students was conducted to investigate what characterised the students' experience of engagement while playing the online escape game Radioaktiv. Through this research question, the study is taking a closer look at what it means when the students say they were engaged in the game. Findings show four main aspects of the students' experience of engagement. First, the time pressure was found to be a double-edged sword. Students found the timer engaging, but some were also too stressed by its presence to the detriment of learning outcomes. Second, students were engaged in completing tasks for their own sake, independently from other game aspects. Third, students appreciated having a read thread, but were not engaged in the specific narrative of the escape game. Finally, students positioned themselves as teachers and it strongly defined their experience of engagement in the game. They saw the game through the potential it held for their own pupils. These findings raise questions about the selection of escape games for learning in online environments and when and how to use them (e.g., discover a new theme, repetition, focus on soft skills).

Keywords: Escape Game, Online Learning, Game-based Learning, Engagement, Teacher Education

1. Background

Escape games have become popular as a leisure activity, especially in the form of escape rooms, but also as boardgames or video games. They are "live-action team-based games in which players encounter challenges in order to complete a mission in a limited amount of time" (Veldkamp et al, 2020: 1). This trend has also been picked up by educators, who started using and developing their own escape games for the classroom to provide students with a more active way of learning. Educators have used either digital programs (Bisanti et al, 2022) or a physical paper format (Babazadeh et al, 2022) to adapt these games to the classroom and develop students' content knowledge or soft skills, and bring variation in learning through interactive and engaging activities (Botturi et al, 2020; Fotaris et al, 2022).

The interest in escape games for learning has also reached the scientific community, e.g., a special track in the *European Conference on Games Based Learning* (ECGBL), a special issue in the journal *Sciences du jeu* (2021: 16). Review articles (Veldkamp et al, 2020; Taraldsen et al, 2022) show that students are engaged while solving escape games. However, the study of engagement is often limited to its observable aspect or peripherical in the studies. Fewer studies also have digital escape games used in online learning as their research focus (see section 3 for a review of the field).

Through the example of one digital escape game, *Radioaktiv,* used in a distance learning course, this paper will investigate the students' experience of engagement while solving the game and answer the following research question:

What characterises the students' experience of engagement while playing the online escape game *Radioaktiv*?

2. What is Engagement?

There is a general agreement in educational research that engagement is a multifaceted construct (Reschly and Christenson, 2022). However, a review of research studies on engagement in online learning reveals no clear consensus on how to define student engagement. Firstly, engagement is defined as student investment in their learning, for example the energy that students devote to their learning (Heilporn et al, 2021). Similarly, Bolliger and Halupa (2018) describe it as the psychological investment in learning expressed through the effort students

are putting towards learning. Secondly, engagement is conceptualised in several dimensions: Behavioural, Cognitive and Emotional (Nkomo et al, 2021; Muir et al, 2019). Each of these dimensions is representing an aspect of engagement, e.g., the actions the students perform, the feelings and emotions linked to being engaged or disengaged in learning. This type of framework is closely linked to the literature on school research and dropout, where engagement is often divided in four dimensions, e.g. academic, behavioural, affective and cognitive (Reschly et al, 2020).

In the field of Game-Based Learning (GBL), where educational escape games can be placed, the understanding of engagement is more fragmented. Sometimes engagement is not even linked to learning but instead is understood as the use of the program or software and operationalised through frequency of use, quality, or duration of engagement (Looyestyn et al, 2017).

Engagement in learning, however, is sometimes defined as how much the students participate in their learning and sometimes analysed through one specific aspect of the engagement framework, e.g., academic engagement (Martín-Hernández et al, 2021). In their framework developed specifically for GBL, Ke et al. (2016: 1183) define engagement as "a collection of mindfully goal-directed behaviors and reflections" and propose four facets to develop this definition: affective, cognitive, content engagement, and gameplay relevance.

In their review of engagement in GBL, Jabbar et al. (2015: 741) focus on the emotional aspect of engagement and define it as the connection the students create with the activity and game features, as well as students' actions towards their goals.

In this study, although we want to acknowledge the complexity of this research field, we will take a pragmatic understanding of engagement in digital GBL and define it as the students' emotional and cognitive investment in the activity. We will now turn to empirical research and see how engagement relates to GBL, and more specifically educational escape games.

3. Empirical Studies of Student Engagement

3.1 Different Aspects of Engagement in Game-based Learning

Studies from the field of game-based learning (GBL) generally show that games and playful learning are engaging students. Engagement can be a direct result of using a game or gamified programme: e.g., Kahoot (Eltahir et al, 2021). In their systematic review, Yu et al. (2020) have found a positive relationship between student engagement and GBL. Studies found that student engagement was higher in GBL, or gamified learning activities, than previously used instructional methods (Zainuddin et al, 2020; Tsay et al, 2020). Similar findings were discovered in the use of games in online education (Dominguez et al, 2013) or in connection with flipped classroom (Huang et al, 2019). Students in gamified learning activities for foreign language learning were also engaged and completed tasks out of their own initiative (Cruaud, 2016).

Different elements in GBL can promote engagement. In their systematic review, Jabbar et al (2015) show that narratives and storylines are engaging elements, albeit not always recognized as important by the students, especially when using longer introductory texts. In the same way, videos and their content are often ignored by the students. Challenges are an effective engaging element, and they make students curious about the content (Jabbar et al, 2015). Some of the most engaging elements in Jabbar et al.'s (2015) review are pedagogical concepts: e.g., scaffolding, built-in learning tools.

However, Jabbar et al (2015: 767) also remark that "engagement is related to students' cognitive and emotional involvement in the gameplay" calling attention to the fact that student engagement is more complex and that other factors can come into play.

3.2 Escape Games: Engaged and Active Students

Research on escape games for learning is a growing field within Game-Based Learning research. The reviewed studies on escape games accord well with the previous section and reveal that most students find this type of learning activity enjoyable. Indeed, we can read in a central review that "in all studies [investigated] a vast majority of students enjoyed the activity and educators concluded that students were highly engaged and active during the activity" (Veldkamp et al, 2020: 8).

In their recent comparative study, Olombel et al. (2022) did not find any difference in learning outcomes between using the escape game for learning or the non-ludic learning activity. However, they do note that pupils

showed more engagement when using the escape game. The researchers report for example signs of excitement, joy, and positive behaviours. In the same way, Peleg et al. (2019) have found nursing students to be very engaged in the learning activity when using an escape room for learning chemistry. Many studies and reviews report similar findings: observations or self-report showed that students were engaged while playing an escape game for learning (e.g., Ho, 2018; Cain, 2019; Veldkamp et al, 2020).

However, in their study about grade 3 students' development of 21st century skills, Duncan (2020) found no significant difference in engagement between the escape game or the traditional learning activities, even though students said that they enjoyed learning in the game-based class. Differences in study duration and research methods might explain this contrasting finding and more generally differences in the literature (Taraldsen et al, 2022).

4. Escape Games for Learning: a Research Project

The research project Escape Games for Learning, funded by the Norwegian Regional Fund, aimed at investigating the potential and limits of digitalising escape games for use in the classroom. Three researchers (including this paper's author) investigated the use of one digital escape game: *Radioaktiv*.

4.1 Radioaktiv: a Digital Escape Game for the Classroom

Created by the Norwegian company Escape History, *Radioaktiv* is a web-based digital escape game. According to the developers, this game is aimed at first year students of upper-secondary school and has for theme radioactivity (science class – *naturfag*). In the version of the game that is investigated here, two players are solving collaboratively five consecutive puzzles while communicating over Zoom within a 45-minutes playtime.

After selecting their role (player 1 or player 2), students access two parallel webpages each with a map of the laboratory of Dr. Doppler followed by a long introductory text. The text narrates the situation in which the players find themselves: during a visit to a research laboratory an alarm starts ringing and Dr. Doppler is stuck with radioactive substances. The mission is then presented: save Dr. Doppler before the time runs out or he will die of radiation exposure. Each webpage contains a narrative text, often giving hints, a puzzle (e.g., fill in the blanks, finding a code, crossword) and sometimes a contextual video on the theme of radioactivity (e.g., biography of Marie Curie, the three types of radiation and their effects). Players have access to different information on their respective webpage and need to collaborate to solve the riddles. The answer to the puzzle is then entered in the form of a password or code, in a padlock on the next page. A correct code will open the padlock and grant the students access to the next page and puzzles.

4.2 Data Collection

To gain insight in both the experience of playing the game and a reflexion on its potential use in the classroom, teacher students from a Norwegian university were invited to try *Radioaktiv* during one of their courses. As students were taking the class from home, they played the game in pairs over Zoom. A total of six online game sessions and the following group interviews were recorded for the main project and used as data for this present study (a total of twelve participants). After playing the game, the students participated in a guided interview in a conversational form (Brinkmann and Kvale, 2015). Interviews were selected as a preferred data collection method to access the students' perspective of their experience of engagement. Reflection notes were considered but would have not given the possibility for the research to ask follow up questions.

The recordings of game time and interview were then transcribed with some detail of interaction (e.g., gestures, tone) and anonymised. The videos were reviewed alongside the transcripts during the analysis process to support interpretation. The extracts presented in this article were translated from Norwegian to English by the researcher.

5. The Students' Experience of Engagement

5.1 Methods: Reflexive Thematic Analysis

Reflexive Thematic Analysis (RTA) was used to interpret the students' experience of engagement through what they were saying about it and the latent meanings in their conversations (Braun & Clarke, 2006; 2019). RTA gives the researcher an active role in the analysis (Braun & Clarke, 2006; 2019). As this study is placed within a dialogic understanding of learning, where researchers bring their own voice to the interpretation process, RTA was a

fitting methodical choice. This methodical trait of RTA will be made explicit by the use of the first-person subject in the following presentation of methods.

As the author of this paper, I conducted the analysis of the interview data. However, another member of the research project was involved during the analytical process. We started with an early data-familiarisation workshop to go through all the recordings together and discuss first impressions, as different researchers had collected and observed different play sessions. Then I coded the data following an inductive (data-driven) approach. Extracts were marked with both semantic and latent codes (e.g., time pressure; distance from narration). I created initial themes, that were then presented and discussed in a workshop with both researchers. The themes were then revised, and the analysis was completed during the writing process.

The following thematic map (Figure 1) presents the four themes I generated through the analysis and their main strands of meaning.

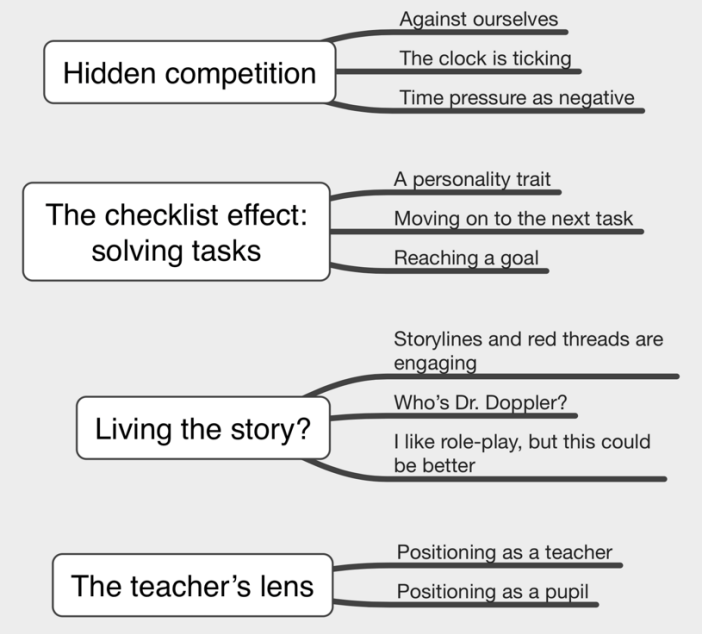

Figure 1: Thematic map of the four generated themes

5.2 Hidden Competition

Radioaktiv is not presented as a competitive game. Students are solving the tasks together and must collaborate to succeed. As they play over Zoom, they do not have contact with other teams, and thus no way of knowing how well (or bad) they are doing compared with other students. However, the students are trying to find ways to compete. In the following occurrence two students reflect on the competitive aspect of the game:

> Stefan: Yes, but was it the competition aspect that was engaging?
>
> Kjetil: Yes, without there being really any competition.
>
> Stefan: Yes.
>
> Kjetil: There was in fact no competition. We have not competed against anyone other than ourselves and the clock.

Competition is an engaging factor for most students, either against oneself or sometimes within the team. Another aspect students find engaging is beating the clock. The game must be finished within the time limit of 45 minutes and a timer is present at the top of the screen. The ticking clock is an image that comes back a lot in the interviews and students discuss its effect on them:

> Dan: yes so, it's just, it's the fact that you have a clock blinking, right? (blinks with his hand) just fuck, we have to make it!

> Malin: I think I felt more tension now [compared to another escape room] considering that you have this clock that counts down and, yes, like you said earlier that it's kinda oh I was stressed by this clock and we have so little time (laugh together)

Feeling the time pressure seems to be one way to keep students engaged on the tasks at hand. However, this engagement can border on stress and even turn into a negative experience when the pressure becomes too stressful. Group 6 did not manage to finish the escape game as they were stuck for a long time on the first puzzle. As the clock was ticking the minutes away, they began to question the usefulness of spending time watching the videos:

> Erlend: I think the video in and of itself is quite nice, but I think they should rather demand that we have to watch the video, and that the clock stops [while watching]
>
> Lise: Yes, I think so too
>
> Erlend: something like that. Because you're kind of sitting there and looking at the ticking clock, and then you start thinking, but what can I use of this here?

If the subject content is supposed to be presented through the videos, it might come in direct opposition to the time pressure effect of the clock: students will want to speed up and may pay less attention to the content presented to finish the tasks on time.

5.3 The Checklist Effect: Solving Tasks

If finishing the game within the imparted time is crucial, students find finishing each individual task also to be engaging. As in checking items from a list, students want to keep going to the next puzzle, advancing in the game, sometimes to the detriment of other aspects of the game:

> Kjetil: I wasn't thinking so much about the map and these other things. I was mostly concerned with moving on, moving on, moving on.

Some students also express being engaged by problem-solving in general, also in other contexts. They present it as a personality trait independent of the game, as something they enjoy:

> Malin: I think it was really engaging, I like this type of problem-solving tasks as I mentioned earlier […] so I like in a way that you get a challenge

Personal interest can explain why some students are particularly focused on solving the tasks. Some also find going towards a goal very engaging as it gives the tasks more meaning:

> Hanna: It's a different way of learning because you, you sit down. You have a goal. You must find information about, in this case, radiation and radioactivity and because you're going to use it for something. It's a really nice way of learning.
>
> Knut: yes, I think it was a fun way to work with this theme here. And the fact that you get to collaborate, to work towards a given goal.

Solving tasks is an engaging factor for students. Students do not seem to mind what type of tasks they are undertaking, if they can solve them and come closer to a final goal.

5.4 Living the Story?

The goal of the escape game is an important part of the narrative, and students find having a narrative, or storyline, engaging.

> Petter: I think it is smart of them that there is a kind of story. Well as I have said I haven't tried another escape room, so I don't really know how it is, but to have someone to save worked for me.

However, students don't seem to be particularly engaged by the storyline of *Radioaktiv*. For example, some students mixed up the storyline (saving Dr. Doppler) with the theme of the videos from the first puzzle (biographies of Marie Curie and Henri Becquerel):

> Hanna: You got a in a way a bit, you got a bit engaged by it in a way. That there was a theme throughout, that you understood, you understood the story. And understood what they were trying to do. Quite

> early. Considering that it was Marie Curie and Henri Becquerel. So there was a red thread and it was quite all right.

Hanna appreciates having a red thread, but she forgets all about the main character of the narrative: Dr. Doppler. Other students are directly expressing not caring about Dr. Doppler or his fate. They are not empathising with the main character and are generally more interested in the tasks and puzzles:

> Kjetil: yes. I wasn't really feeling, I wasn't really feeling like it was Dr. Doppler I was supposed to save. I just have to say it. I didn't get a great impression like 'oh, I have to save Dr. Doppler.'

The map showing in which room the two players and Dr. Doppler are in the laboratory at each stage of the story is an important way of inviting players in the storyline. But these elements are mostly ignored:

> Kjetil: You didn't have a map either?
>
> Stefan: yes, it was right at the start I think, let's see… No, I think I had several maps. […] But I forgot to pay attention along the way [to the maps]

Even students that are particularly interested in role-play express ways to improve this game and to make it more engaging, for example, by making it more multimodal:

> Dan: but I was about to say, you did have, I don't know how it would have worked, but if they could have played this voice then,
>
> Lene: yes
>
> Dan: like through the sound system, instead of having to read it then, that we get, that it becomes even more multimodal in a way
>
> Lene: yes [unclear, speak at the same time]
>
> Dan: it would have been cool, to have this kind of narrator's voice

Erlend's comment on *Radioaktiv* highlights what might be the challenge with the design of this game – the balance between tasks and story – and underlines the potential for engagement that was maybe untapped:

> Erlend: it was quite like focused on tasks in a way. It was less story, it was less escape room and more just tasks.

5.5 The Teacher's Lens

Students are taking a meta-perspective on playing the game. They do not only experience *Radioaktiv* as students conducting a learning activity, but also as teachers in training. Students discuss how they would use it in their own teaching:

> Petter: my immediate reaction was that this here, could be extremely instructive for the pupils.

This teacher's perspective comes back in all the students' answers in the interview, even when the questions were only directed towards their own experience of playing the game. When Dan and Lene discuss the possibility of making the game more multimodal, Dan links this topic to inclusive learning:

> Dan: it would have been cool, to have this kind of narrator's voice and then you would get, well you and I can read this, but if we're thinking about it in a school context, then we could also get to include pupils that are struggling with reading.

This positioning as teacher, or in the case of Dan special education teacher, comes back clearly in the interview. A secondary positioning appears also when the students are bringing imaginary pupils' voices in their conversation. They discuss how their pupils would react and experience the game:

> Sindre: Pupils like that, because it's digital and, yes, because it's cool

This metaperspective on playing the game is an important aspect of the students' experience of the digital escape game *Radioaktiv*.

6. Discussion

Time pressure is a central aspect of escape games. Solving the game within the given time limit is an engaging factor in the analysis of the students' experience. However, the effect of the timer can become too stressful for some students, and they start hurrying and paying less attention to the content. This relates to the concept of perceived cost of information learning as presented in Ke et al.'s (2016: 1192) framework on engagement in GBL. If students perceive the activity as not being in direct relation with the main goal of the game, for example watching a long video instead of solving the puzzle, they will consider it as wasting time and not bother with it. The presence of a timer turns then into a double-edged sword, useful for engaging with the game but sometimes to the detriment of learning engagement.

A second aspect of engagement is completing individual tasks for their own sake, independently of other aspects or goals of the game. This finding relates to need for a sense of achievement where players are receiving adequate challenge and level of difficulty as well as continuous stimuli in the form of new challenges (Ke et al, 2016:1187). This sense of achievement is closely linked to the player's affective engagement with the game.

The third aspect of engagement is linked to the presence of narrative elements. If the theme and red thread in the game were an important part of the students' experience of engagement, the narrative did not mark the players. Similarly to Jabbar et al.'s (2015: 757) findings, the story of Dr. Doppler was not recognised as important for the students. This finding is closely link to the previous one, where students clearly showed engagement in solving the tasks independently of the storyline. The lack of engagement in this specific story might have been improved by alterations to the design, e.g. more multimodal formats, or shorter texts. Jabbar et al. (2015: 755) found that longer texts were often ignored by students and in the case of Radioaktiv, the whole narrative was presented in writing.

A last aspect of the students' engagement is their positioning as teachers. Students took a meta-perspective and saw the game and its activities not only as players but also as educators. Their perspective was defining for their experience of engagement as it related closely to how they connected to the game emotionally and how they connected cognitively to the game's features (Jabbar et al, 2015: 741).

7. Implications and Conclusion

This study is limited to one class of teacher students and can only illustrate one example of the use of escape games in higher education. However, the findings presented in this paper have concrete implications for designing and selecting escape games for learning. On the question of narratives' roles in escape games we can ask if a digital educational escape game can focus equally on tasks and narrative. But also, if a good and engaging storyline is a must-have or a bonus. The presence of a time-limit can reinforce engagement, but also weaken the students' interest in the content. As timers are a central element in the design of escape games, teachers will need to think about how they want to use these games in their teaching. They might be good activities to train soft skills (e.g., collaboration, communication) instead of focusing on learning content. Escape games might also work best as an introduction activity, creating a common memory of a new theme that the teacher can build upon later in the course. The teaching unit becomes less abstract by anchoring it in the students' experience of the game. In the same way, the emotional connection with the game could make online learning a more humane experience, giving students an intimate experience of being engaged in the activity and in their course.

peter.vankus@fmph.uniba.sk

Abstract: Educational escape rooms represent an innovative and engaging educational approach, with a high potential for the development of problem-solving and collaboration skills. That is why it is important to familiarize teachers with them and support them for their use in the teaching practice. Our paper presents a case study investigating the utilization of two versions of digital educational escape rooms (DEERs) within the lifelong training of mathematics teachers. Thirty-two mathematics educators of pupils aged 10 to 19 participated in the research. DEERs were developed in two digital platforms: Room Escape Maker and Google Forms, offering an interactive adventure game and a story-based text game, respectively. The study aimed to explore teachers' perceptions of these DEER versions and their potential applications in teaching. Data collection employed observation and a questionnaire survey, followed by qualitative evaluation through thematic analysis. The research's limitations include the sample size and the specifications of the utilized DEERs.

Keywords: Mathematics, Teachers, Educational Escape Rooms, Design, Lifelong Learning

1. Introduction

Escape rooms are defined as live-action, team-based games in which players discover clues, solve puzzles, and accomplish tasks in one or more rooms to achieve a specific goal, typically escaping from the room, within a limited amount of time (Nicholson, 2015). Specific examples of the use of escape rooms in education are digital educational escape rooms (DEERs). These represent modern digital applications of game-based learning that offer engaging, hands-on learning experiences across various educational settings.

Educational escape rooms show promise as an innovative and captivating approach to supporting active learning. Numerous studies indicate that well-designed escape rooms can enhance pupils' motivation and improve their enthusiasm for learning (Fotaris & Mastoras, 2019; Fotaris & Mastoras, 2022; Manzano-León et al., 2021; Taraldsen et al., 2022; Veldkamp et al., 2020; Videnovik et al., 2022). Fotaris and Mastoras (2019) emphasize that educational escape rooms offer an enjoyable experience, engaging pupils as active participants in the learning process. By solving challenges within these rooms, learners gain insights into problem-solving from diverse perspectives, engage in collaborative teamwork, and develop social connections, all contributing to their educational experience.

Regarding pedagogy, escape rooms adhere to a social-constructivist framework (Vygotsky, 1978), where learners build their understanding by actively engaging with challenges presented in real-time within the escape room. These challenges consist of tackling novel and sometimes intricate problems, fostering collaboration among peers to solve them effectively.

Taraldsen et al. (2022) highlight healthcare, STEM fields, including science, technology, engineering, and mathematics, as prominent areas benefiting from DEERs. Similarly, Fotaris and Mastoras (2019) identify health, natural sciences, mathematics, social sciences, journalism, and ICT as common subjects integrated with DEERs. Although escape rooms find application across educational levels, higher education predominantly utilizes them.

As educators face evolving demands, continuous professional development becomes increasingly crucial. Educational escape rooms offer a novel approach to engaging participants in meaningful learning experiences, fostering collaboration, problem-solving, and critical thinking skills (Veldkamp, 2020). Consequently, they hold significant potential for integration into the lifelong learning of practicing teachers.

This paper investigates DEERs application in the lifelong training of mathematics teachers, aiming to explore their opinions on their use and their preferences for two different DEERs' designs. The goal of our paper is to share our observation from the use of two different DEERs during the lifelong learning session with the 32 mathematics teachers organized at the Faculty of Mathematics, Physics and Informatics, Comenius University in Bratislava and their opinions on the use of such pedagogical tools and on the preferences for design for each educational escape room.

2. Methodology

In our research, we adopted a qualitative approach (Creswell, 2012), specifically a case study, due to the aims of the paper, the nature of the research, and the research sample. Thirty-two in-service mathematics teachers participated in the research. Participants worked in groups of 2-3 while playing DEERs. Overall, we chose the research methodology to obtain information that will help us answer the research questions:

Q1: What was the activity and engagement of the players during the DEERs playing?

Q2: How did the participants like the given DEERs?

Q3: How did participating mathematics teachers rate the DEERs in terms of their appropriateness for their pupils and usability in the classroom?

Q4: How did teachers compare the two different versions of the DEERs and which design elements did they prefer?

Q5: What interest would the teachers have in other similar escape rooms?

We used several methods to collect the necessary data. We observed participants' reactions and their engagement and activity during the gameplay. After playing each of the games, participants completed an online form that included survey items to determine how they liked each DEER and their opinions about the applicability of the DEER in the classroom and its appropriateness for their pupils. After playing the two DEERs, the teachers used the online questionnaire to compare the rooms, which differed in their design and content. This questionnaire also asked whether teachers would like to have more of such games available.

We analyzed all the collected data qualitatively to answer our research questions. For the study of written data that we obtained through the online questionnaires, we used content analysis (Schreier, et al., 2019). We processed the data using open coding in MaxQDA and based on it, we identified several topics connected with our research questions.

Regarding the individual DEERs, in the following text, we provide the context of their application during the research and their characteristics. The escape rooms were used in the context of a lifelong learning session for mathematics teachers of pupils aged 10-19. This training is entitled "Activating Motivational Methods for Developing Positive Attitudes of Pupils towards Mathematics in Primary and Secondary Schools" and is offered by the Faculty of Mathematics, Physics and Computer Science at Comenius University in Bratislava. The training has online and face-to-face sessions and the meeting was the second face-to-face meeting with the participants. In the morning, the teachers attended a popularization lecture on the history of mathematics, and the use of DEERs constituted the afternoon program lasting about 3 hours.

First used DEER (Vankúš, n.d.) was implemented within Google Forms. It was a series of mathematical problems that were linked by a story in which their solution led to the players escaping the castle. By its nature, therefore, the first DEER can be characterized as a story-based text game. The theme and problems used were inspired by an existing escape room by Elizabeth Joyce, from Pinellas County Schools in Florida (Joyce, n.d.). As part of our used DEER's version, we adapted the task assignments, the graphic design of the escape room, and localized it into Slovak language. In this escape room, learners solve 6 contextually focused problems from different areas of mathematics, such as combinatorics, numerical operations, geometry, divisibility of numbers.

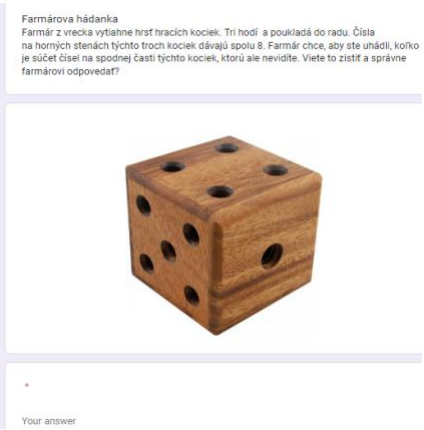

Figure 1: Sample from DEER Escape from the Castle

Second DEER (Terezkajesuper, n.d.) was created by mathematics education students in the Faculty of Mathematics, Physics and Computer Science as part of the online tool Room Escape Maker https://roomescapemaker.com/. This escape room can be characterized as an interactive adventure game. We have described the process of creating this escape room in our previous publication (Čujdíková & Vankúš, 2023). The game requires the use of several interactive elements such as a bolt cutter, a remote control, a battery, scissors, a crowbar, a hammer, and two lock keys. The escape room contains 4 coded locks, where in two cases the key is a word password and in two cases a numerical password, which is obtained by numerical operations with the data found during the game. In one of the problems leading to the numerical code, there is an error in the assignment where a parenthesis is missing. This fact could have potentially affected the participants' work to some extent.

Figure 2: Sample from Students' DEER

During the solving of both escape rooms, both authors of the article were available to answer any questions the teachers might have.

In the text that follows, we describe the results we obtained with the research instruments and our evaluation of the data in terms of each of the research questions.

3. Results

In this chapter, we present our findings. Sections 3.1 and 3.2 also present our answers to research questions Q1, Q2, and Q3. In Section 3.3, we present our findings for research questions Q4 and Q5.

3.1 Escape From the Castle

As the game Escape from the Castle took the form of a simple online form, we did not find it necessary to explain to the participants how to play it. Therefore, we only instructed them to form groups of two or three and start playing.

We could observe the excitement and commitment while playing this room. Participants read the story within their group with enthusiasm and discussed their ideas for solving each puzzle. The solving process was smooth and fluid, and it was not the case that any group could not figure something out for an extended period of time. Different groups took different lengths of time to escape, but in the end everyone managed to escape successfully.

Based on the observation of the participants during the course and their answers in the questionnaire, we can assess that they perceived this escape room very positively. As we can see in Figure 3, when asked to comment on how much they liked the room, up to 89.5% of the groups chose the values 9 or 10.

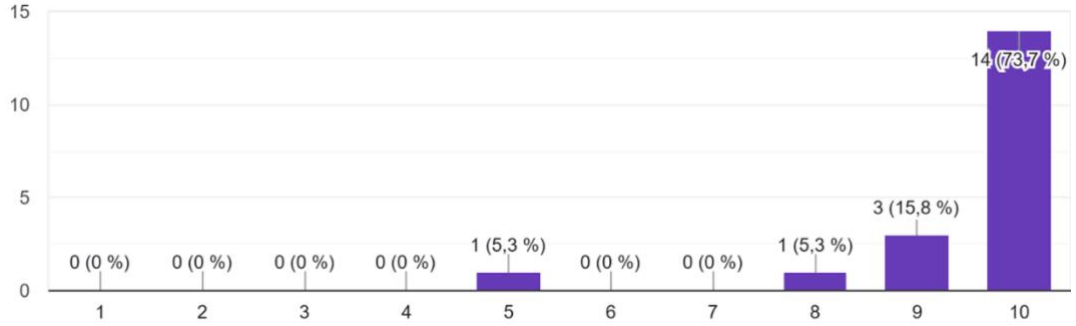

Figure 3: Participants' rating of how much they liked the Escape from the Castle escape room (1- I didn't like the room at all, 10- I liked the room a lot)

This room was also perceived by the participants as being very suitable for pupils. As can be seen in Figure 4, up to 89.5% among all groups rated its suitability for pupils as 9 or 10. No group rated it as unsuitable.

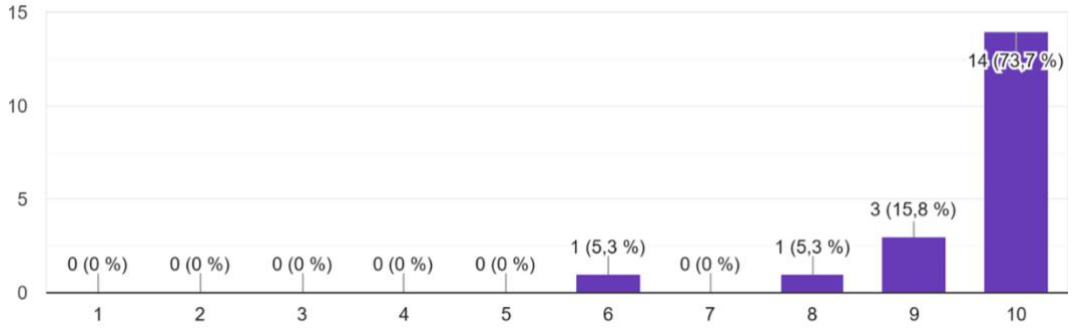

Figure 4: Participants' assessment of their perception of the suitability of the Escape from the Castle escape room for pupils (1 - I consider the room completely unsuitable, 10 - I consider the room very suitable)

Several groups indicated that this escape room is particularly suitable for pupils in the second year of primary school. The mathematical areas they identified in it included working with numbers, number theory, number operations, divisibility of numbers, geometry, combinatorics and logic.

Opinions varied as to how specifically they would use this escape room with their pupils. Some teachers could envisage its use within a regular mathematics lesson, particularly in revision. Apparently because they perceived that the room covered a wide range of mathematical topics, they indicated that they would use it for "practicing the material in all topics" or "for ninth graders as a general review." There was also a suggestion to use it as part of a motivational lesson. Other groups evaluated that they could imagine using it more in a substitute lesson or for a special occasion, e.g., "as part of a St. Nicholas celebration" or "to brighten up the classroom at the end of the school year." Other groups considered it appropriate only in activities outside the regular classroom, e.g. in an after-school club or mathematics competition.

3.2 Students' DEER

For the second type of escape room, which took the form of an interactive adventure game, we assumed that its rules might not be clear to all participants. We expected that teachers who had no experience with such games would be present at the training. For this reason, we selected two Students' DEERs. We wanted to run the first Students' DEER together with everyone to familiarize them with the rules of the game, and the second Students' DEER was to be played independently in groups afterward. However, to our surprise, all participants, after we showed them the first steps, had already started solving this first escape room on their own. Thus, we stopped presenting the solution and devoted ourselves to observing the participants and helping them when needed. Based on this situation, we spontaneously decided to change the plan and omitted the second Students' DEER completely, focusing only on this first Students' DEER. This is the room we introduced in the previous chapter.

We could also observe a great deal of enthusiasm when dealing with this escape room. Participants discussed in their groups and explored the game environment together with interest. They enjoyed every object they

discovered as well as finding a way to use it. They were also delighted if they managed to enter the correct code. However, after some time, the first problems started to appear in some groups and we could observe their growing frustration. In this case we tried to find out the reason and help them to overcome the problems. One of the problems was trying to solve a problem with a wrong assignment. We then revealed to them that there was a bracket missing in the example and this was mostly enough for them to go on to solve it successfully. In other cases, the group got to the point where they couldn't find a particular item they needed or figure out a way to use the items. In those cases, we tried to give them hints that would guide them to a solution but not completely give it away and rob them of the joy of their own discovery. In a small number of groups, we observed that they felt definitely lost and clicked helplessly on random objects in the hope of randomly carving out a room.

In spite of the problems mentioned above, based on the overall prevailing atmosphere during the meeting but also based on the answers from the questionnaire, we can assess that a large part of the groups perceived this room quite positively as well. As we can see in Figure 5, when asked to comment on how much they liked the room, up to 53% of the groups chose the values 9 or 10 and another 17.9% chose 8. At the same time, however, the number of groups that did not like the escape room at all or hardly at all increased compared to the first escape room. A total of 3 groups or 17.3% chose values 1 to 3.

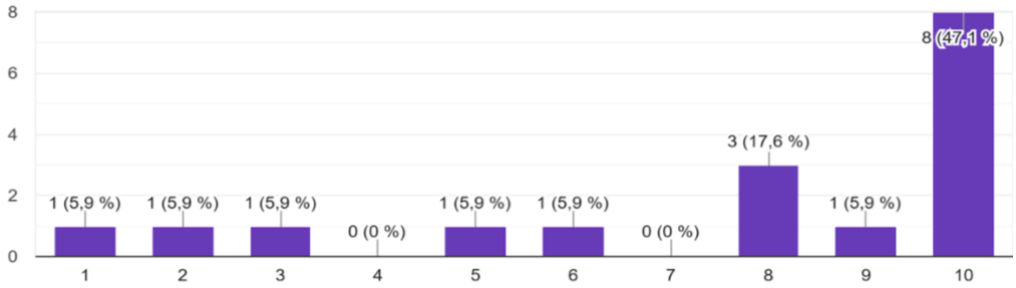

Figure 5: Participants' assessment of how they liked the Students' DEER (1- I didn't like the room at all, 10- I liked the room a lot)

This escape room also received an overwhelmingly positive evaluation from the different groups regarding its suitability for pupils. As can be seen in Figure 6, 64.5% of them rated its suitability for pupils as 9 or 10. This indicates that a larger proportion of the participants also perceived the escape room as a valuable tool for teaching. On the other hand, some groups (23.6%) rated it with grades 1 to 3, expressing doubts about its suitability for working with pupils.

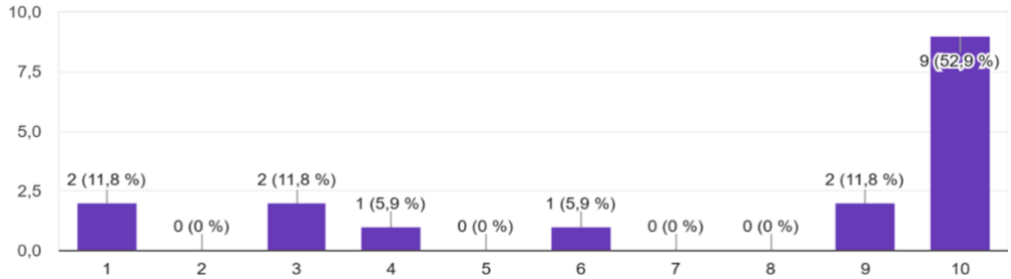

Figure 6: Participants rating of their perception of the suitability of the Students' DEER for their pupils (1 - I consider the room to be completely unsuitable, 10 - I consider the room to be very suitable)

Participants perceived this escape room as more suitable for secondary school pupils. The specific mathematical areas they identified included numerical operations, functions, equations, combinatorics, and logic.

Again, some of the groups could imagine using the game as part of their regular teaching, specifically in teaching the areas they directly identified in the game, especially equations or logic. Another part saw its suitability more in the context of substituted lessons or on a special occasion. Some groups expressed the belief that the game would be more appropriate for computer science lessons. However, there was also a statement pointing to the link between the two subjects: "I like the game as a reinforcement of cross-curricular links with computer science - pupils may be motivated to create such an escape game one day." Even with this escape room, several groups

perceived its use to be more outside the regular classroom, in clubs or competitions. In addition, there was a view from several groups that they would not use it at all with pupils.

3.3 Comparison of the Perception of Individual DEERs

Participants perceived the Students' DEER as more visually interesting and attractive to pupils. Compared to that of the Escape the Castle room, they appreciated that it contained more mathematical tasks. They described the mathematical tasks in this game as "more concrete" than in the Students' DEER. For the Students' DEER in comparison, some perceived that "more logical thinking and searching is needed." Other participants expressed the view that the Students' DEER did not contain enough mathematical tasks and emphasized more on "frantic clicking."

The two escape rooms also differed in that in the first case it was a linear game and in the second case the challenges could be solved in different order. Participants rated the linearity more positively. One group stated, "With the first one we liked the 'immersion' and that the line was clear, the problems came one after the other and you just had to solve them." The non-linearity in the second DEER may have contributed to some groups getting 'lost' and not knowing how to continue the solution. As the same group assessed, "With the second game, we felt more of that 'randomness' - at some point we didn't know what to use where and just clicked everything to everyone."

Participants also pointed out that the game Escape from the Castle contains more text. This was perceived positively by one group: 'The castle was more meaningful, it makes you read', but others assessed that this could be perceived by pupils as more of a disadvantage. In this regard, there were comments along the lines of, "The other one would appeal more to children because they do not have to read." Or that "there was more text in Escape from the Castle and sometimes pupils do not want to read." One group even speculated, "maybe the whole text would not be read by the children."

We also surveyed participants to see if they would be interested in more escape rooms like Escape from the Castle and Students' DEER being made available. As we can see in Figure 7, all participants agreed that they would be interested in DEER similar to Escape from the Castle. Up to 84.2% of all groups chose the value of 10, i.e. they agreed that they would be very interested in similar games. Participants were slightly less interested in DEER similar to the Students' DEER. As we can see in Figure 8, 64.7% of the groups chose a value of 10, i.e. they would also be very interested in this type of DEER. Another 11.8% chose values of 7 and 8. However, 17.7% of the groups would not be interested at all or hardly at all in a similar DEER.

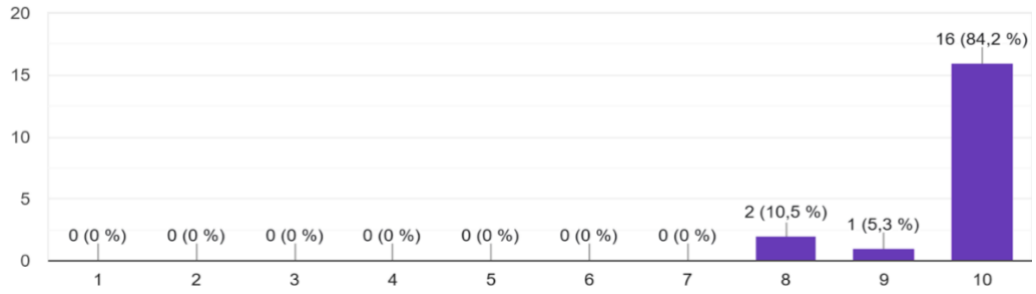

Figure 7: Interest in escape rooms similar to Escape from the Castle (1 - I would not be interested at all, 10 - I would be very interested)

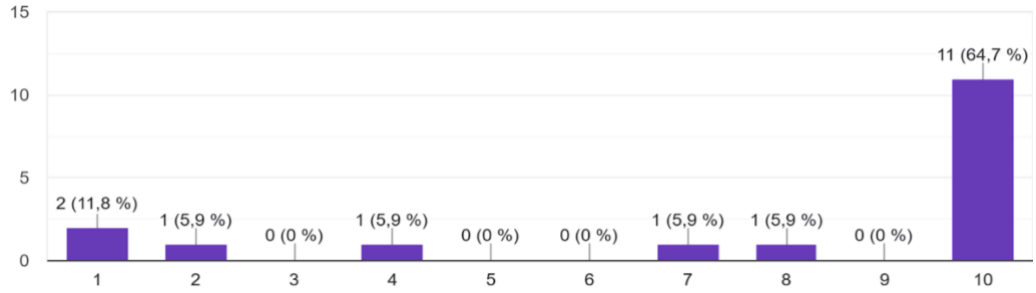

Figure 8: Interest in escape rooms similar to Students' DEER (1 - I would not be interested at all, 10 - I would be very interested)

4. Conclusion

In our paper, we present the findings of a case study in which we investigated mathematics teachers' perceptions of two DEERs and their appropriateness for pupils. We were also interested in what specific elements of game design they most valued in these DEERs. The first DEER, Escape from the Castle, was implemented using Google Forms; the second DEER was an interactive adventure game created by our students in the online tool Room Escape Maker. The research was conducted with 32 teachers in a lifelong learning session. During the meeting, the participating teachers played both DEERs in groups consisting of two to three members.

While playing both DEERs, we could observe mostly engagement and enthusiasm in the participants. The solution of the first DEER went smoothly in all groups without our help until the end. During the second DEER, some problems were encountered in some groups. One of them was related to an error in the assignment of the mathematical problem, which we were not able to correct due to environmental constraints (more details in (Čujdíková, & Vankúš, 2023)). Other issues were related to the fact that some groups could not find a certain needed game item or a way to use the items they had available. After a little help from our side, they were mostly able to continue successfully. However, some participants became frustrated with the problems encountered and the enthusiasm in their group waned. In a follow-up survey to assess how much they liked the given DEER, for the first one, a large proportion of the teachers rated that they liked it a lot. No group outright disliked this DEER. The second DEER was also liked by the majority of the groups, but a smaller proportion did not like it at all or hardly at all. At the same time, participants rated both rooms as largely suitable for pupils. They perceived the first DEER as more suitable. The main criticism of the Students' DEER was that it contained few directly assigned mathematical problems.

For both DEERs, participants appreciated several elements of the game design. For DEER Escape from the Castle, they positively perceived its linear design. They suggested that the non-linearity in the Students' DEER may have caused some confusion in solving it. For the Students' DEER, they particularly appreciated the eye-catching visuals. Several also considered the fact that this DEER contained less text to be positive for pupils. There was great interest among participants in other similar educational escape rooms, especially those such as "Escape from the Castle," indicating a demand for similar educational tools.

A limitation of our research is the small number of participants. We also suspect that the rating of the Students' DEER, and therefore the overall lower rating of this type of DEER, may have been influenced to some extent by the specific choice of the selected room and its particular shortcomings. The second room, which we had prepared and did not use in the end, was free of errors and also contained more directly assigned mathematical examples. Therefore, in the future, we plan to conduct another similar research with a different group of mathematics teachers using this particular room.

Exploring the Affordances of Vernacular Digital Games in Developing 21st-Century Skills

Dima Moain Dayoub
Sohar University, Sultanate of Oman

ddima@hotmail.com

Abstract: The past decade has witnessed an unprecedented surge in technological advancements and an exponential growth in mobile device ownership world-wide. Such transformations have intensified access to digital content, opening up new avenues for non-formal learning. This was particularly true during subsequent crises such as the COVID-19 Pandemic and natural and man-made disasters which have disrupted formal learning and left many learners immobilised. This paper contends that capitalising on the intersection of formal and non-formal learning experiences is integral to innovative planning and value-added education. To dismiss engagement in non-formal leaning transactions is to exclude a significant part of learners' cognitive processes, preferences and experiences. In particular, this paper focuses on vernacular digital games as an apt example of pervasive technology and a non-formal learning arena. Described as a popular culture text, vernacular games are originally intended for entertainment, as opposed to pedagogical, purposes. However, embedded in their designs are social and developmental affordances that render them potent tools for serendipitous learning and dynamic spaces for developing competencies. In the light of this, this paper proposes a move from gamification, i.e. adding a gaming layer to non-gaming contexts, to adding an educational layer to non-formal digital gaming contexts. To consolidate this proposal, it investigates the 21st-century competencies reportedly acquired and developed through digital gameplay. It also delves into possible design-related paradoxes. More precisely, the paper reflects on how key game design features such as multimodality, adaptivity, cultural narratives and affinity spaces can be harnessed to better cultivate much in-demand 21st-century skills. Although learning skills (in their metacognitive form of higher-order thinking) are part and parcel of 21st-century skills, literacy skills and life skills are equally important. The further longer-term aim is to map development opportunities and optimise learning in ways that are in harmony with today's changing scenarios, demands and objectives.

Keywords: Vernacular Digital Games, 21st– Century Skills, Non-formal Learning, Critical Thinking, Multimodal Literacy, Affinity Spaces

1. Introduction

Fast-paced technological advances have profoundly impacted the objectives, dynamics and operations of many sectors, including education. Disruptive technologies and disruptive crises – natural and man-made – have fundamentally altered socialization, communication and learning. Concurrently, the exponential increase of mobile device ownership has also contributed to initiating, and sustaining, new popular cultures such as digital gaming. The pervasiveness of technological tools has opened up new avenues of informal cross-platform individual engagement and knowledge construction. It is, therefore, counterproductive to overlook the interplay between this type of knowledge and formal education in any strategic organizational plans that aim to add value to individual experiences.

The influence of technology on learning is not new, although currently intensified. Back in 2001, Prensky emphasised the radical transformation in thinking and information-processing across generations, induced through engagement with interactive digital technologies. He coined the term "digital natives", setting a distinction between those learners who grew up surrounded by technology and immersed in its use and between "digital immigrants" – then teachers -- who had to adopt and adapt to technology at a later point (pp.1-2). More than 20 years later, however, this discrepancy in attitudes persists, as pronounced in recent studies (e.g. Gutierrez et al., 2023), even though one would expect the inter-generational gap to have narrowed. For example, vernacular digital games are still marginalised by some teachers, even as a supplementary text, or denounced as illegitimate (*ibid*.). Prensky succinctly sums up the dilemma: digital natives will be taught the old way or teachers should become acculturated to the new (2001, p.3).

Indeed, as a multitude of interactive tools and knowledge resources abounds, the effectiveness of rigid knowledge transmission, typical of traditional teaching, comes into question. The content mastery model, heavily reliant on the textbook culture, is no longer synonymous with 21st-century learning and job requirements (Jan and Jaydon, 2016, p.9). Rather, crucial to enhancing the value of contemporary education is recognizing and capitalizing on the intersection of non-formal and formal learning processes. In this vein, the concept of "edutainment" has emerged to emphasise the increasingly blurred boundaries between education and entertainment. Reconceptualising priorities in today's educational landscape is necessary to equip students with

what is relevant and empowering. As conventional notions of competency are no longer adequate to thrive or survive in a digitally saturated world, 21st-century skills become pivotal as will be next explained.

2. Definition of 21st-Century Skills

With the ubiquity of multimedia resources such as videos and digital games, "post-typographic forms of text production, contribution, and reception" (Koltay, 2011, p.211) have emerged. In other words, text has evolved beyond the two-dimensional print format into multi-dimensional multimodal variations. In parallel, the classical flat notion of literacy as an isolated practice of reading and writing is now overwritten by the concept of literacy as "social practice" and "critical interaction with text as intrinsic multimodal constructions" (Hanghøj, Kabel and Hannibal Jensen, 2022, p.4). This has necessitated the development of new competencies that are uniquely human and irreplaceable by artificial intelligence. Critical thinking, collaboration, technological literacy, emotional competence, multimodal and information literacy skills – are all identified as key 21st-century competencies and can be seen as affordances of vernacular digital games. They represent not only "learning skills" but also "literacy" and "life skills" (Ahmad, 2023).

It is not feasible to have a conclusive list of 21st-century skills as they are ever evolving and intimately interrelated. Neither is it realistic to claim that one technology or learning context can nurture such skills single-handedly. Rather, the development of 21st-century skills is a holistic process that involves utilizing the affordances of multiple contexts. It may also be worth noting that games do not uniformly nurture the same skills since game design, themes and components vary widely, as the following sections will elaborate.

3. Vernacular Digital Games

The term "digital games" encompasses a wide array of genres, features, play modes and contexts of use, among others. This paper is concerned with unpacking the potential of vernacular, also termed commercial-off-the-shelf (COTS), digital games in developing 21st-century skills. Described as "popular culture texts" (Guiterrez et al. 2023, p. 5), vernacular digital games are entertainment games that are not intentionally designed for pedagogical purposes (Reinhardt and Sykes, 2012, p.32). Nevertheless, it is contended that the cultural, social and educational implications of video games render them valuable learning tools in non-formal contexts (Cerezo-Pizarro et al., 2023). In theory, gameplay is seen to be conducive to incidental learning or learning "in the wild" (Reinhardt and Sykes, 2012, p.38). In practice, however, substantial attention is given to gamification, defined as utilising motivational affordances to create gameful experiences in non-gaming settings (Hamari, Koivisto, and Sarsa, 2014). What is yet to be crystalised is harnessing the educational potential of entertainment games in non-educational settings. Additionally, existing research into the effectiveness of digital games primarily focuses on consequences or adopts a "media comparison" approach. To portray a fuller picture, there is a need for a different line of inquiry that explores the interplay between game design features and learner characteristics (Schrader, 2023, p.1260). In other words, a move away from "proof-of-concept research (i.e., whether … games are effective) to the value-added research (i.e., how to design games to make them more effective)" (Gui et al., 2023, P.22) can inform future research and design directions. In alignment with this focus, the purpose of this paper is to reflect on design features that make such games impactful in developing 21st-century skills. However, the skills identified in the subsequent sections cannot be discussed in isolation from others as previously mentioned, so cross-reference to other skills will be made throughout the paper.

4. The Impact of Game Design Features on Developing 21st-Century Skills: Affordances and Inherent Paradoxes

4.1 Multimodality and Adaptability vs Multimodal Literacy and Critical Thinking

One of the significant by-products of digital gameplay is the development of "multimodal literacy". Multimodal literacy is cultivated through players' ability to critically select, orchestrate and process multiple semiotic modes of information -- visual, textual, aural and oral – in order to progress in a game (Toh and Lim, 2022).

A sophisticated multimodal experience that mimics the complexity of real-life tasks is also seen to heighten engagement and facilitate grasp of abstract notions (Dayoub, 2019, p. 803). Further, modelling rich and authentic scenarios and challenges that are inquiry-based and grounded in real-life research is considered a property of 21st-century games (Romero, Ott, and Usart, 2015; Jan and Jaydon, 2016). Such games have the potential to promote higher-order thinking and problem-solving skills that are more compatible with job market

demands than content mastery is (Jan and Gaydon, 2016, p.10). Shaffer et al. further argue that the very design of what they term “epistemic games”, i.e. games that are based on meaningful professional practice, presents an “alternative educational model” that is well aligned with the key competencies and insights pertinent to postindustrial societies (2005, p.12).

By virtue of the multimedia affordance, in-game models (e.g. simulations) can replicate real-life artefacts and systems. However, in-game models do not always comprehensively represent all the details of what they are modelling; rather, they can be simpler depictions of some of their features. In either case, their real value lies in facilitating and enriching problem-solving experiences (Gee, 2009, pp.72-75). Accordingly, the level of multimedia sophistication is not the sole catalyst for developing problem-solving skills. What actually cultivates problem-solving is the attention to problems that the model design enables and optimises. This is corroborated by Gui et al. who dismiss the significance of the “level of realism” in game design, concluding that it has no impact on learning in the domain of science and computers. They alternatively suggest the use of serious educational games to foster learning in such disciplines (2023, p. 22).

Additionally, designing multimedia involves careful consideration of the types of cognitive load embedded in the gaming experience. Effective design eliminates overwhelming distracting multimedia elements that serve no purpose other than creating verbal and visual noise (Clark and Mayer, 2016, pp.133-134). Another consideration here is whether multimodality hampers meaningful interaction. This is an issue of whether progression in a game is merely based on visual feedback and random selections or whether it requires the gamer to meaningfully connect and coordinate multimodal nodes of information.

Undoubtedly, multimedia elements add an entertainment value to vernacular digital games, which is associated with enhanced intrinsic motivation during gameplay, especially when coupled with an appropriate adaptable level of challenge (Hamari et al., 2016, p. 177; Stafford and Vaci, 2022, pp. 52-53). Adaptivity is an affordance of vernacular digital games that serves to create a flow zone, i.e. a “narrow zone between things being too hard ("I give up") and things being too easy ("I'm not challenged at all")” (Prensky, 2005, p. 26). Adaptable games gradually introduce problem-solving scenarios, progressing from initial “routinized, taken-for-granted” tasks and culminating into more complex problems that require higher-order creative thinking. As such, good games are “models for the production of expertise” (Gee, 2003, p.3). According to the flow theory, the right dose of challenge, elevated enjoyment and concentration are fundamental to experiencing flow and learning through immersion in a game (Hamari et al., 2016, p. 172).

4.2 Cultural Components vs Critical Cultural Awareness and Information Literacy

Games are perceived as “genuine cultural products” that can sharpen critical cultural awareness (Reinhardt and Sykes, 2012, p. 35). Cultural discourse, artifacts and storylines are interwoven in the design of many vernacular digital games. While some of these games promote cultural inclusiveness, others perpetuate stereotyped second-hand narratives of cultures, reinforcing thereby existing cultural biases. Ideally, gameplay provides users with “the abilities to explore, expand, subvert, reframe, intervene, restore, and rebuild historical and cultural realities, contexts, or settings” (Vairinhos, Costa, and Cardoso, 2021, p.5). In some instances, however, cultural models are deeply ingrained within the game’s design, content and characters.

In the context of formal education, it is argued that confining class text to the “historically validated” types of text, i.e. text that subscribes to normalised values, is detrimental to the formulation of multicultural societies and future skills. Interrogating cultural, gender, and race representations in games is a competency much needed in today’s curricula (Gutierrez et al., 2023, pp.7&9). Put another way, “checking facts” is integral to developing information literacy, a key 21st-century skill in an era when information and misinformation dissemination has never been easier (Koltay, 2011; Ahmad, 2023). In the same vein, research shows that gameplay sensitised players to cultural misconceptions and assumptions as players expressed the need to undo stereotyped distorted images of their cultures (Dayoub, 2019, p. 801), prompting a call to create meaningful shifts through participatory content creation. Central to this are play features that empower gamers to counter ideologically laden narratives that promote and re-produce “hegemonic ideals” and dominant cultures (Cerezo-Pizarro et al., 2023, p.3). This echoes Glas et al.’s research-informed criticism of media literacy games for failing to target “participatory, creative or socially oriented competencies” due to the “highly linear forms of progression, leaving little agency to the player to deviate or experiment” (2023, p.14). Role-playing games have been specifically identified as having a positive impact on critical thinking (Mao et al., 2023), which reinforces the link between player agency and cultivating higher-order skills. The role of player agency or player-centric design in promoting and disseminating culture is a question that is worth further investigation. Research

tangentially touches on or only broadly evaluates the cultural dimension in vernacular digital games. More research is needed to provide and analyse concrete examples of the cultural implications of such games.

On the other hand, vernacular games do not only portray existing cultures, but also generate cultural legacies. Vernacular digital games receive predominantly negative press (Prensky, 2005, p. 22) and are usually associated with violence, exposure to health issues and gaming addiction. This is approached in the literature as an opportunity to develop reflection and critical thinking through metacognitive activities in-class (Toh and Lim, 2022, p. 13). “Flipped gaming” is, for instance, a “fact checking” activity where students play a game prior to class and then judge the aspects of the game they deem unrealistic or controversial (Headleand, 2021). In this sense, the game is utilized to promote information literacy. Vernacular digital games are also stigmatised as isolating although this may be an oversimplification. A "value-sensitive approach" to game design would utilise adaptivity to make mainstream games accessible to players with disabilities. As such, games can be inclusive as they empower such players "to be on an equal footing with others, irrespective of disability" (Cairns et al., 2019). A more accurate question, therefore, would be: do vernacular digital games lead to isolation in real-life social settings, or do they foster socialisation during times of isolation (e.g. The Coronavirus Pandemic). In other words, is the notion of communicative competence context-confined, i.e. viable only in the same context in which it is born?

Overall, the above suggests that raising critical cultural awareness during gameplay can be achieved either through mediation and structured opportunities for reflection or through inclusive design of game features. Such design should enable the gamer to produce their own user-generated plots and co-create their own versions of the narrative. Player-enacted unique stories or trajectories is identified by Gee (2009, p.76) as an essential game property that can shape powerful and emotionally meaningful learning experiences. Controllability is often underlined in the literature in terms of adaptivity of difficulty level and flexibility to direct and customise game activities (Schrader, 2023, p. 1261). Deconstructing and reconstructing cultural narratives can extend this definition to reflect the contemporary notion of media literacy with its emphasis on production, as opposed to mere consumption, of media messages (Gee, 2003; Koltay, 2011, p.211; Hanghøj, Kabel and Hannibal Jensen, 2022, p.4). Indeed, the notion of a “prosumer” (producer-consumer) is considered a key competence of transmedia literacy (Scolari et al. 2018, p.810).

4.3 Affinity Spaces vs Collaboration, Emotional Competence and Technology Literacy

Particularly relevant to the question of participation is the gamer’s self-expression and interaction in online forums. Online communication is pivotal to understanding today’s concept of literacy. One of the “hallmarks of entertainment games” is complex collaboration, including choice, strategy and tactical characteristics. It is identified as one of the most effective game mechanics for developing 21st-century skills (Romero, Ott and Usart, 2015, pp. 166&170). Complex collaboration is not confined to the game world. Passion for games drives players to what Gee (2017) terms shared affinity spaces i.e. “fan-based, interest-driven Internet sites” or physical spaces for discussing, learning or teaching about games, especially in a multi-player configuration. He further argues that such places are “becoming prime spaces where people engage in 21st-century teaching, learning, doing, and being” (pp. 28-29).

Self-initiated interactions not just *in*-game but also *around*-the-game, can create fertile grounds for acquiring different skills, literacies and know-hows. Examples include emotional competence such as empathy (Toh and Lim, 2022), recruiting and connecting with fans (Gee, 2017, p.30), self-regulation and persistence (Kahila et al., 2019). Such interactions also enhance technology literacy skills such as multimodal content production, software use, social networking, and maintaining high traffic on Websites (Gee, 2017, p.30). Virtual affinity spaces are melting pots of gamers with shared interests but diverse cultures, social profiles, languages and levels of knowledge. Such dynamic spaces can develop the capacity to communicate effectively and purposively to construct collective knowledge: resolve a game-related problem or learn a strategy. Collaboration in massive multiplayer games, nurturing collective intelligence and co-producing “distributed and dispersed knowledge within a community” would appeal to “any contemporary high-functional-team-centered workplace” (Gee, 2003).

Another form of connecting and synthesising information afforded by vernacular digital games is transmedia storytelling where stories are no longer narrated through a single channel but rather dispersed through multiple media platforms, including classical novels, animation and digital games. Digital games that afford transmedia storytelling can develop the gamer’s “transliteracy” defined as “movement not only *across*, *through* and *beyond* multiple media platforms, but also *across*, *through* and *beyond* literacies” (Freire, 2020, p. 16). Stimulating the

capacity to actively link a game to "other games, media, texts, and the world" is described as "education at its best" (Gee, 2003, pp.1-2). Games, in this sense, trigger the player's curiosity to borrow a book, create a story or draw characters related to their themes. As such, they promote cross-platform engagement and competencies.

5. Challenges and Conclusions

A significant challenge to gaming research is to identify whether skills transfer occurs from in-game to out-of-game real-world contexts (e.g. the workplace or academic settings) or vice versa (e.g., Romero, Ott and Usart, 2015 p. 169; Toh and Lim, 2022). In Toh and Lim's study, for example, there was no evidence of transfer of critical thinking and empathy developed in-game to academic contexts. To facilitate transfer, the researchers propose introducing pedagogic mediation and metalanguage (2022, p.12). Other studies argue that metagaming activities in physical affinity spaces enable socialisation outside the gaming context (through turn-taking or watching the others play), even if the game itself is not social (Kahila et al. 2019). The question of whether players perform well due to skills acquired in-game or because of the individual backgrounds and repertoires they bring to the gaming space – is worth further investigation.

The above discussion underlines two points about gameplay: The design of vernacular games can present valuable affordances for developing 21st-century skills; however, it also harbours paradoxes. Such paradoxes give prominence to the role of mediation in harnessing the developmental potential of such games, reminding us again that the role of human expertise in indispensable in our technologically fuelled world. It must be reiterated, however, that the impact of vernacular digital games on competency acquisition cannot be generalised since games are too varied in their inherent affordances, levels of challenge, content, interactive features, underlying ideologies, and intended audiences, among others. This is compounded by the inconsistency of the population researched in current empirical evidence (Schrader, 2023, p. 1260). Longitudinal research, clear indicators of 21st-century competencies in-game and in real-life, homogenous participants and specification of game design features can inform methodological choices in future pursuits of rigorous and comparable research findings.

Abstract: The widespread dissemination of contradictory information through various media platforms can increase anxiety and confusion among younger generations. This highlights the need to promote Media Literacy (ML) skills, enabling them to evaluate online information's validity critically. Video game-based learning can be valuable in this context, fostering active learning and critical thinking. Therefore, developing and sharing innovative resources like interactive content and video games is crucial to enhancing young people's ML skills and resilience to disinformation. The YO-MEDIA project, involving three universities in Italy, Portugal, and Spain and a journalist association, aims to develop ML in young people during times of crisis (e.g., pandemics and wars) through game-based learning strategies and professional training. The project carried out 29 semi-structured interviews in the partner countries with various stakeholders to understand perspectives on media design practices and ML formulation for young people in crises. These interviews aimed to collect education and media professionals' insights on promoting ML and critical thinking among youth during crises. It also seeks to gather best practices and understand these professionals' challenges when fostering ML among youth. This study's findings suggest that the interviewees deem ML vital for distinguishing accurate information from misinformation during crises, especially relevant for young individuals. Essential skills for these young people include critical thinking, filtering information, and recognizing online threats. Effective strategies involve operating within digital environments frequented by young people, encouraging critical thinking, and nurturing collaboration. Professionals face challenges such as a lack of training, engaging young people's attention, and keeping pace with digital environments. The interviewees also emphasized the importance of ML training for informal educators and media professionals. They recommended Massive Open Online Courses (MOOCs) for their flexibility and accessibility. According to the interviewees, an ML game should involve research, interpretation, and decision-making processes and be accessible to young people with disabilities. They identified several ML projects and resources, including multimedia labs, youth parliaments, and critical thinking tools. This study contributes to developing games that promote critical thinking and ML in young people. It also aids in establishing ongoing professional training in ML for informal educators, teachers, media professionals, and other stakeholders.

Keywords: Media Literacy; Critical Thinking; Educators and Media Professionals; Game-based Learning; Professional Training.

1. Introduction

In the current digital era, the volume of online information available is growing unprecedentedly, as is the ease of accessing this information via the Internet (Majerczak & Strzelecki, 2022). The inability to distinguish between true and false information available on various media platforms can increase anxiety and confusion, especially among younger generations. This aspect demonstrates the urgent need to promote ML (Johnson et al., 2020; Pennycook & Rand, 2020), which is related to the ability to understand critically, question the reality and veracity of what we see, hear, read, and consume through the media (Buckingham, 2015).

ML has increased importance during crises such as pandemics and wars, as it is in these moments that the sharing of information and disinformation is particularly high (Johnson et al., 2020; Pennycook & Rand, 2020). Young people have daily access to a vast amount of information and digital tools, but there is a lack of knowledge in managing and correctly using this data (Buckingham, 2015). Therefore, it is essential to prepare these individuals for moments of crisis from an early age through the development of skills and competencies in ML, so that they have critical thinking, become consumers and creators of media, and know how to critically evaluate the validity of online information (Buckingham, 2015; Jones-Jang et al., 2021; Kellner & Share, 2019).

Several European Union countries present basic notions and limited content about media and journalism in their current educational models (Petranová et al., 2017; Qerimi et al., 2023), often preferring practical activities instead of active learning about the media. The lack of opportunities for critical reflection and skills development makes it impossible for young people to discern the veracity of information and dubious sources. For this reason, it is necessary to rethink strategies for promoting ML to educate young people with the skills to consume and produce media correctly. Video game-based learning can be valuable in this context as numerous studies highlight the practical implications of video games in fostering "active learning" (Saleem et al., 2022; Zeng et al., 2020). In games, it is possible to incorporate specific ML content (e.g., identification of false information, digital security and privacy issues, and media skills, among others) (Contreras-Espinosa & Eguia-Gomez, 2023), which provides players with new experiences that equip them for real-life problem-solving, particularly in crises (Moro et al., 2022). Moreover, video games can stimulate "critical learning" (Bunt & Grosser, 2020; Mao et al., 2022; Scheibenzuber & Nistor, 2019) by offering players a meta-awareness of these domains. This understanding helps them comprehend how media can influence them and how their environment affects their perception of a problem (Gee, 2003).

In this sense, the ongoing YO-MEDIA project focuses on leveraging game-based learning strategies and professional training to develop ML skills in young people during crises. It involves a mixed-method approach to assess the effectiveness of games in raising awareness about misinformation through interactive learning experiences. The project, which involves three universities in Italy, Portugal, and Spain along with a journalists' association, aims to achieve two main objectives: increasing awareness and knowledge among young people regarding the reliability of media information and enhancing the professional skills of informal educators/stakeholders, teachers, and media professionals in promoting ML during crises. To achieve these goals, the project involves various research activities such as literature reviews, stakeholder interviews, co-creation of hybrid games with young participants aged 16 to 18, and developing a MOOC to educate about ML.

This paper presents the results of 29 semi-structured interviews conducted in partner countries with teachers, journalists, and other stakeholders to understand the diverse perspectives on media design practices and ML formulation for young people in crisis.

2. Methods

In the initial phase of the study, the YO-MEDIA project team conducted semi-structured interviews in Italy, Portugal, and Spain with 29 individuals (10 interviews in Italy, 9 in Portugal, and 10 in Spain), including teachers, journalists, informal educators, and other stakeholders with experience in media studies, games, and crisis management. These interviews aimed to bring together diverse perspectives from education and media professionals on promoting ML and critical thinking among young people during crises. The project team chose interviews as a means of data collection, as the purpose of the study was to collect in-depth qualitative data. Although the focus group was considered as an option, this tool was disregarded due to the impossibility of bringing together the interviewees as they lived in different cities in each country and did not have available agendas.

Interviewees were selected based on experience working with young people and/or participation in ML-related projects to include individuals with diverse professional experiences to gather different perspectives on young people's ML. In this context, participants consisted mainly of (i) informal educators/stakeholders who should have professional experience working with young people in different contexts (e.g., libraries and youth associations involved in community projects or municipal departments promoting projects in the area of ML); (ii) journalists, from different news organizations and areas (e.g., video games, sports, or digital issues) and who work on research projects in the area of ML; and (iii) teachers, from public and privately-funded schools, who were involved in projects to promote ML in secondary education and universities and who have experience in research projects.

The interviewees provided informed consent, acknowledging the objectives, process, risks, and benefits of the research, and made a free and voluntary decision about their participation. The 29 in-depth interviews were conducted between April and June 2023 using the Zoom® video-conferencing application. The project team from each partner country interviewed participants in the country's official language (Italian, Portuguese and Spanish) and the interviews lasted approximately 100 minutes, were video recorded and transcribed verbatim. To facilitate the interviews, the Portuguese project team developed an interview guide that was followed in the three countries (Figure 1):

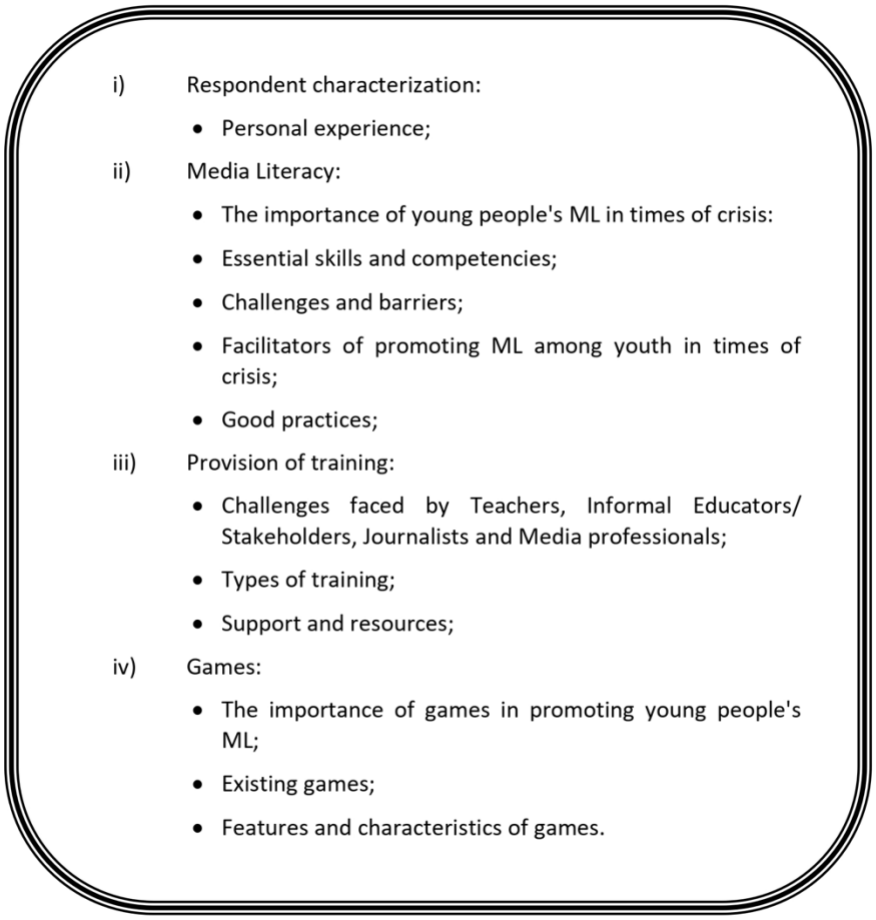

Figure 1: Interview guide.

Data analysis from each country was based on the critical thematic approach to identifying and examining patterns (Braun & Clarke, 2006). The analysis involved coding the text and identifying patterns, and repeated discourses. From the interview transcripts, the emerging patterns of the data were defined, namely: (i) ML in today's digital age, (ii) important skills and competencies, (iii) strategies and approaches to promote ML, (iv) providing teacher/journalist training, (v) games: features, and characteristics. The unique transcription corresponding to each pattern was collected and coding tables were then produced with the most interesting and pertinent quotes.

2.1 Participants

In total, 29 professionals were interviewed, being 14 women and 15 men with an average age of 46.4 (SD 5.2) years. The participants in the interviews had professional experience as informal educators/stakeholders (IESn=8, 27.5%), journalists (Jn=8, 27.5%), and teachers (Tn=13, 45%). Each interviewee presents a varied experience in ML. Some paved the way for digital media as a topic for young people in their community or in school training, finding students to talk and work on ML (e.g., teachers and informal educators in the three countries); others work in associations dedicated to promoting the well-being of young people through the media (e.g., Steadycam, Italy) or in projects focused on preventing disinformation (e.g., IBERIFIER project, Portugal and Forum against Disinformation Campaigns, Spain). Some have developed games to address hate speech and violence on social media (e.g., Gariwo, Italy). More detailed information about the participants (age, gender, role and experience with ML) from each country is presented in Annex 1.

3. Findings

Analysis of interview data conducted by researchers from each country identified the following common themes: (i) ML in today's digital age, (ii) important skills and competencies, (iii) strategies and approaches to promote ML, (iv) providing teacher/journalist training, (v) games: features, and characteristics. The results for each of the themes are presented in the following sections.

3.1 ML in Today's Digital Age

For the interviewed, ML in the current era is essential in times of crisis due to the dangers young people encounter in the media. As examples, professionals highlighted: the difficulty in distinguishing reliable sources of information and true or false information, the speed with which things are processed, excessive time that young people spend online, misinformation, multiple media stimuli, AI, information bubbles and social media as sources of unverified information, populism, radicalism and hate speech, among others. In this context, interviewees justified the importance of ML for young people for the following reasons (Table 1):

Table 1: Categories of the theme "ML in today's digital age", number of individuals who commented on each category, and citations supporting the categories.

Categories	Individuals, n	Citations (examples)
Socialization	• Italy:2 • Portugal:5 • Spain:6	"*Digital tools can be strong tools to support bonding and relationship, which in a crisis situation is even more necessary to maintain*" (Italy, IES2).
Frantic and disintermediated access to information in times of crises	• Italy:3 • Portugal:6 • Spain:6	"*We are talking about a high-speed consumption of information; there are many fragments of information on multiple subjects*" (Portugal, T4).
The different means of disseminating information, due to the increased use of new media (e.g., social media) compared to traditional media (e.g., television, radio, or newspapers)	• Italy:4 • Portugal:6 • Spain:7	"*We are living in a time of over-information that has nothing to do with traditional media because information reaches us through social media and many other channels that cannot be considered informative media. That is, a hyper-informed, hyper-communicated society, but poorly managed*" (Spain, J1).
New fears that arise from moments of crisis and can generate serious consequences for individuals (e.g., divisions in society and impacts on mental health)	• Italy:2 • Portugal:5 • Spain:6	"*It is important that they also create mechanisms and manage to defend themselves from fake news, which is very stressful, and even true news can also be very stressful. They must create those mechanisms, manage, and understand when it's time to switch off so it doesn't affect their mental health*" (Portugal, J2).

3.2 Important Skills and Competencies

For the informal educators interviewed, young people are often competent consumers, but they lack critical skills in media consumption and production. Respondents highlighted the following skills and competencies that young people need to develop (Table 2):

Table 2: Categories of the theme "Important skills and competencies".

Categories	Individuals, n	Citations (examples)
Critical thinking about media messages and assessment of their credibility and bias	• Italy:4 • Portugal:5 • Spain:8	"*I believe we should aspire to become a critical society, an educated and informed society. In this sense, ML is essential*" (Spain, J1).
Know how to access, analyse, and filter information and information sources effectively and ethically	• Italy:3 • Portugal:6 • Spain:9	"*Know how to navigate, know what they are looking for, know which sources are credible*" (Portugal, T1).
Ability to assimilate and understand information, as well as identify the veracity of facts	• Italy:3 • Portugal:6 • Spain:9	"*Even if students have a minimum ability to read the text, the evaluation is conditioned by incorrect prior information or what they heard...so I would work both on accessing and evaluating information*" (Italy, T3).
Understand artificial intelligence, with a combination of ML education, critical thinking skills, guidance from informal educators, and responsible use of technology	• Italy:2 • Portugal:4 • Spain:6	"*Figure out what's on offer, what's on your mind. What do they propose according to the algorithm and what do students really want to look for? What are the things that really interest you?*" (Italy, T1).
Respect the diversity of opinions, cultures, and perspectives, in addition to recognizing and combating stereotypes and prejudices in media messages	• Italy:1 • Portugal:2 • Spain:7	"*The issue of gender, inclusive language... we have worked on that. For instance, statements such as: 'A Moroccan man robbed a store'. They could have mentioned instead that 'it was a young person*" (Spain, IES1).

Categories	Individuals, n	Citations (examples)
Debating ability, so that young people can participate and give their opinion in conversations and debates	• Italy:1 • Portugal:2 • Spain:8	"*What should be strengthened in children and young people is their argumentative abilities and their critical thinking. Only with a good ability to talk to each other can they discuss social issues and develop the connection between them*" (Portugal, IES1).

3.3 Strategies and Approaches to Promote ML

Regarding effective strategies or approaches to promoting ML among young people, interviewees highlighted that it is very important to reason more *on how*, rather than *on what* to say to young people. And because ML is strongly related to critical thinking, one of the main practices suggested by interviewees is the promotion of activities that encourage thinking and questioning and give students a voice. Teachers considered that these practices should start early in student learning, and, for this, it is necessary to rethink the educational model, "*and, perhaps, to be closer to this reality of young people, to adapt to the platforms, the languages, the contents, and the contexts where they are*" (Portugal, T4).

Another fundamental point identified in the interviews is the effective collaboration between teachers, informal educators, journalists, and parents to share knowledge, training, and good practices to promote ML (e.g., "*Observe good practices with and on the media, bringing a different form of design and of mental and cultural approach*" Italy, T3). Respondents also consider it essential to work in gamification contexts, using digital games to promote ML, as games are a media extensively used by young people (e.g., "*students talk about things they know, where they feel recognized, so we talk about videogames as a cultural object. At the same time, we acquire skills in developing critical thinking*" Italy, IES4).

Some interviewees also suggested other good practices for promoting ML, such as: sharing concerns about crises with students, empowering informed decision-making, promoting changes in habits of sharing information online, exchanging intergenerational experiences between adults and young people, supporting empathy and identification in the information exchanged.

Furthermore, participants highlighted successful projects in their countries that aim to promote ML, combat disinformation, and promote critical thinking and transparency through fact-checking and data journalism: Open the Box (Italy), Fact-checking Spring School (Portugal), Fact-checking maldita.es (Spain), among others.

3.4 Providing Teacher/Journalist Training

In the interviews, participants pointed out the need for specific actions and courses that provide them with mastery of ML and the necessary tools to teach the subject to young people. Despite the lack of these practices, professionals face challenges in the process due to great resistance on the part of teachers in adopting media or video games as teaching tools in the classroom. Respondents consider it necessary for teachers and informal educators to use the platforms and content that students are consuming today, in order to create a connection between real life and school, establishing a balance between learning and the media (e.g., "*ML also means the ability for teachers to decode a TV series, to watch it, as students watch it and talk about it at school*" Italy, IES3).

Resistance on the part of education professionals to adopting new media may also be linked to the lack of training in ML and the difficulty in keeping up with constant updates to digital environments. According to one of the interviewees, in certain countries, such as Portugal, the teaching profession is ageing, with the average age of teachers being between 50 and 55 years old (DGEEC, 2023). These individuals have difficulties in following the development of digital technologies, as "*we are teachers who, when we took the course, the Internet was not a big reality in Portugal. We were doing training, etc. The most interested ones did much training. Those who are not so interested still have many difficulties in dealing with digital media. They don't understand social networks very well; for example, many of my colleagues don't understand*" (Portugal, T2). In Spain, the same scenario is also pointed out by one of the journalists, who always must be up to date with changes and the emergence of new digital technologies, as these are one of the main tools of his work: "*For example, when I started teaching in 2005... we learned to use email, later Google, and then came social media. From 2005, everything started to change with Facebook, Twitter, search engines, smartphones... and today, with artificial intelligence*" (Spain, J2).

Furthermore, another critical challenge highlighted by informal educators and teachers concerns the difficulty in capturing and maintaining young people's attention and interest during the learning process, especially in

times of crisis, when students' effort generally decreases (e.g., "*During the pandemic, the level went down, and we are seeing senior students with a shallow level that are used to giving the minimum; in that sense, it would be important to rescue the notion of effort*" Spain, T4).

Regarding the format of ML training, interviewees prefer that they are (i) in a MOOC format, because they allow greater flexibility in learning and do not require traveling to the training location; and (ii) that continuity programs are made available, as this allows them to deepen their knowledge.

3.5 Games: Features, and Characteristics

Gamification was one of the interviewees' suggestions to promote ML among young people. Comments pointed out that games can be valuable in the sense that they allow individuals to explore, understand and interact with media content actively and critically, in addition to challenging young people to make decisions, solve problems and critically evaluate information, thus promoting the development of critical thinking (e.g., "*The question of playing presupposes the interacting, the relating, the stimulating, the challenging, and the competing, be it with another player, be it against the machine*", Portugal T4).

Respondents consider that games, especially video games, work well among young people due to aspects such as: (i) the narrative dimension, which allows young people to explore and experience different stories, characters, and virtual worlds, which supports learning, motivation, student engagement and deeper understanding of media elements (e.g., "*and the game is an act, and it is an enjoyable media stimulus. If it has an environment, a narrative that engages me, I hardly leave that environment. So maybe that is a good space to work with young people and complicated topics, as such a crisis*" Portugal, T4); (ii) interaction and engagement, which can help young people develop communication, teamwork, and conflict resolution skills (e.g., "*their most exciting dimension is when it is a collective game, not an individual. So, I think that the game, if we want to follow this line of promoting ML, should promote dialogue and interpersonal relationships*" Portugal, IES1); and (iii) the possibility to start over from where you failed and reason about it (e.g., "*if you fail, you can start over or maybe from a certain point, you encourage a reflection on the cause and the effect of actions*" Italy, T2).

In interviews, participants consider that despite the valuable benefits that games can provide to young people, there is still a lack of use of gamification in classrooms. This deprivation of the use of games is mainly due to a lack of time on the part of teachers and informal educators, especially at higher educational levels, before accessing university, which again reinforces the need to rethink the educational model: "*I don't use board games during this History course because, as compared to last year, we have one hour less per week. Instead of three, now we have two, and I need to provide the same content as before. I don't think games are a waste of time, because they aren't, but if I apply games in the methodology, we just won't make it.*" (Spain, T5). A solution presented by most interviewees would be to implement games in project disciplines, which are very present in classrooms nowadays: "*We would include games within a project, as there is a tendency now to include project-oriented learning methodologies. For instance, in secondary school, there is a subject called Culture and Values, which is a complement to the mentoring hours*" (Spain, T3).

Regarding the suggestion of functionalities and characteristics for the game to be created, the interviewees suggested (Table 3):

Table 3: Categories of the theme "Games: Features, and Characteristics".

Categories	Individuals, n	Citations (examples)
Have a connection with real problems/stories to reinforce the emotional aspect of the game and enable young people to identify with the characters	• Italy:2 • Portugal:5 • Spain:7	"*It is necessary to use examples of concrete situations... to encourage thinking and discerning in a critical manner which options would they choose, and that consequences follow upon the decision taken*" (Spain, T5).
Possibility to evolve in the game, go through different levels of difficulty and challenges	• Italy:2 • Portugal:4 • Spain:8	"*I think the Game has to have this idea of the challenge, the difficulty and the conquest*" (Portugal, T3).
Purchasing rewards to keep young people engaged and keep them playing to win more prizes	• Italy:1 • Portugal:3 • Spain:6	"*A game where you put the acquisition of anything, be it points, gadget in the game, something that will allow you to evolve or your character or acquire another kind of characters or other kinds of pluses that they can use in terms of the game*" (Portugal, IES3).

Categories	Individuals, n	Citations (examples)
Involve research, interpretation and decision making, making young people question information and develop critical thinking	• Italy:2 • Portugal:5 • Spain:6	"*A research game that implied reading and interpretation to help decision making. In a logic of a reaction that is not a need for a quick decision, that implies "pondering, implies a collection of information or thoughtful interpretation and then decision making*" (Portugal, T4).
Promote healthy competition among young people through games that use an ethical component	• Italy:3 • Portugal:2 • Spain:7	"*I believe they should have the skills, the tools, the strength, and the self-esteem to thrive in a competitive world*" (Spain, J1).
Involve experts from different areas, teachers, and students in game development, because the exchange of ideas and experiences will contribute to the development of a game with greater usability and accessibility to the most varied types of users	• Italy:2 • Portugal:2 • Spain:7	"*I would take developers with me to work with my students to have a different look. So, developers don't work for us, but with us*" (Italy, T3).

4. Discussion and Conclusions

The 29 interviews performed with informal educators, teachers, and journalists in the three countries participating in the YO-MEDIA project (Italy, Portugal, and Spain) help to understand the different perspectives of these professionals on promoting ML and critical thinking among young people during crises. The points raised by professionals reinforce the indispensable role of ML in discerning true information during disinformation exacerbated in times of crisis. The need to develop skills on how to consume and produce media is especially pertinent for young people.

As essential skills for young people, improving critical thinking skills, adequate information filtering, and recognizing online threats are highlighted. These skills must be cultivated in individuals from an early age and as pointed out by interviewees, for this to happen it is necessary to rethink education models, which currently teach basic notions about the media and journalism (Petranová et al., 2017; Qerimi et al., 2023). If the academic curricula do not have courses focused on critical reflection and analysis of misinformation, young people will have difficulty achieving a high ML level. To try to reverse this situation in the educational scenario, teachers and informal educators suggest as effective strategies for promoting ML, immersion in digital environments frequented by young people, encouraging critical thinking and cultivating collaborative efforts between education and media professionals.

However, in addition to the challenge of training young people in ML, professionals also state that they themselves encounter barriers to learning and teaching about ML. The lack of training opportunities, the difficulty in capturing and maintaining the attention of young people and the difficulty in keeping up with rapidly evolving digital environments were some of the obstacles highlighted by those interviewed. For professionals, it is necessary to integrate ML training into the curriculum of informal educators and media professionals, suggesting MOOCs as a viable solution due to their flexibility and accessibility.

Furthermore, interviewees advocate the development of ML-based games that involve research, interpretation, and decision-making processes, while ensuring accessibility for young people with disabilities. The use of games in learning ML can provide positive results for young people, allowing them to develop critical thinking skills, decision-making and strategies to combat misinformation (Contreras-Espinosa & Eguia-Gomez, 2023; Glas et al., 2023).

The results of this study contribute to promoting the creation of educational games that aim to improve critical thinking and ML skills among young people, while also facilitating ongoing professional development and ML training initiatives for informal educators, teachers, media professionals, and other stakeholders.

Abstract: Assessing the potential and efficacy of educational apps is crucial for parents, educators and EdTech stakeholders. This paper presents evidence from two quantitative studies on EDURINO, a game-based learning app targeting children aged 4-8. It features seven subject areas and is designed to be used with an ergonomic pen that facilitates fine motor skill development and pen-holding gesture. In Study 1, parents (N = 45) used a validated index (Kolak et al., 2021) to evaluate the app's educational potential across 10 features. In study 2, a larger cohort of parents (N = 235) reported on their children's school readiness and fine motor skills. Specifically, we adapted the Brief Early Skills and Support Index (BESSI) to measure changes in behaviours and cognition. We also included items from the Child Development Inventory and Ages and Stages Questionnaire to assess fine motor skills. Study 1 results indicated high ratings for EDURINO's meaningful learning and social interactions, but lower for adaptive learning. Parents' evaluation of EDURINO did not differ by child gender, age, or subject area, but varied with parental education level (the higher the educational attainment, the lower the ratings). Study 2 found that there were statistically significant improvements in children's behavioural and cognitive development as well as fine motor skills after playing EDURINO. Changes in those areas were independent of children's age, gender, and subject area. Moreover, children's improvements were positively correlated with the length of playing. However parental engagement level influenced and was negatively associated with children's improvements in EDURINO targeted area. Overall, these studies provide evidence on EDURINO's efficacy while highlighting the necessity for improvement with personalised and adaptive learning. The importance of transparency and collaboration between academia and industry, along with the influence of demographic factors are discussed.

Keywords: Game-based Learning, Educational Technology, App Evaluation, Child Development, Fine Motor Skills, Efficacy Study

1. Introduction

Touchscreen mobile devices, such as smartphones and tablets, have become internationally ubiquitous for young children. There has been increasing effort and popularity in research and industry to understand, design and test digital games and activities (Kabali et al., 2015). Recommendations have also shifted from preventing screen time holistically to more constructive views of providing meaningful content to facilitate learning outcomes (Hirsh-Pasek et al., 2015). Indeed, educational mobile applications, shortened as 'educational apps', have witnessed an exponential growth followed by the rising concerns over their quality, efficacy, and influence on child development (Common Sense Media, 2013). Recent meta-analysis has reported clear learning benefits for early academic skills, particularly in young children's mathematics and literacy knowledge (Griffith et al., 2020). Moreover, non-app related factors have been shown to impact the efficacy of educational apps; in terms of demographics, preschool children and those from lower socioeconomic backgrounds seem to benefit the most (Common Sense Media, 2013; Kim et al., 2021). Research has also considered the way in which children engage with digital learning and highlighted the advantage of parent-child co-use of digital media (Taylor et al., 2023).

Children acquire, practice and perfect their cognitive and learning development through play and experts of game-based learning have argued that conventional educational principles can and should be applied to the digital environment (Bang et al., 2023). Notably, a key component in both traditional and digital learning is to support and adapt for children's 'zone of proximal development' (ZPD, Vygotsky, 1978) where task difficulty should be above their current capacity but within reach for progress (Plass & Pawar, 2020). In digital environment, open-ended play context provides the learning structure where children are able to explore content freely (Hatzigianni, 2018). Despite the differences in how learning materials are presented and communicated, educational apps should, in principle, provide similar experiences as to traditional pedagogy settings where there are opportunities for tailored feedbacks and interactions (Mulliner & Tucker, 2017).

EDURINO, developed by an EdTech start-up based in Munich, is an educational app for children aged 4-8 and it aims to support school readiness and fine motor skills. Currently, there are seven subject areas, namely Mathematics, Literacy, Nature & Science, Human Body Biology, Coding, Social Emotion Learning and Creative Arts, with content available in both German and English. A unique feature of EDURINO is the use of a stylus pen. Pen-holding gesture has been associated with early writing ability (Rowe, 2019), which inspired the development of EDURINO's 'magic pen' (Figure 1). The ergonomic pen supports different pen-holding grips and was specifically designed to train children's handwriting gesture and fine motor skills. In terms of learning content, EDURINO has holistic as well as detailed scope and sequences of learning objectives, which are in line with country-specific curriculum, for example the Early Years Foundation Stage (EYFS) statutory framework in the UK. EDURINO's content structure is also informed by pedagogical theories of learning trajectories (Simon, 1995) and mastery/competent-based learning approach (Plass & Pawar, 2020). More importantly, for better engagement and learning outcomes, all materials are presented in a playful and engaging digital platform with clear context and narratives (Fisch et al., 2012). After the initial steps of account registration and setting up parental control features, children can explore and play EDURINO games in a self-guided way without parental engagement and guidance.

The overarching aim of the current study was to investigate EDURINO's efficacy and quantify its educational benefits among the target audience (children aged between 4-8). It was also of research and industry's interests to examine the role of players' demographics on the app's efficacy. To this end, we selected a range of demographic and app-related factors that have been identified in the literature. Specifically, we included measures of child age group, child gender, parental education, subject area of EDURINO games, parental engagement style and length of playing. Given it was the first empirical research conducted on EDURINO, the study was exploratory with no specific and prior assumptions. In the current study, first we utilised a quantitative instrument to examine parents' evaluation of the app and content (Study 1); second, we administered a parent-reported survey focusing on the educational benefits of playing EDURINO (Study 2).

Specifically, we explored the following research questions:

1. What is the educational potential of EDURINO, and whether demographic and app-related factors influence parents' evaluation?
2. Do children show any developmental improvements after playing EDURINO, if so whether the educational benefits are affected by any demographic or app-related factors?

Figure 1: EDURINO played on a tablet (left), the magic pen(middle) and screenshot of a Maths game.

2. Method

2.1 Ethics

All procedures performed in Study 1 & 2 were in accordance with the ethical standards of the University of Cambridge Psychology Research Ethics Committee and have been reviewed by the senior author as an independent consultant on the project. All study materials including survey questions were initially prepared in English as the original source of research. The standard translation and back translation procedures were followed to generate the German version. Any discrepancies were resolved between two native German speakers who were fluent in English and had Education degrees (Erkut, 2010). Participants were provided with study information and gave consent online before answering survey questions. After completing the study, they were gifted with a 20% off discount code for EDURINO products.

2.2 Study 1: Assessing EDURINO's Educational Potential With Validated Research Index

2.2.1 Participants and Procedure

Participants were recruited by email invitation from the mailing list of EDURINO's online research community, where commercial users of the app take part in product and design testing. In total, 45 adults (Germany: *N* = 37; UK: *N* =8) completed the online survey which consisted of one evaluation questionnaire and several standardised demographic questions. Data collection took place in January 2024.

2.2.2 Measures

Parents were asked to rate EDURINO's design and content, and the questions were based on a research instrument that specifically developed for assessing educational potential for preschooler's apps (Kolak et al., 2021). The evaluation index included 10 items: learning goal, meaningful learning, solving problems, feedback, social interactions, opportunities for explorations, storyline, quality of language, adjustable content, and app design. Parents were provided with descriptions for each assessment area and rated EDURINO against a 3-point Likert scale (0,1,2) with higher scores indicating higher educational potential. The index was designed for a general audience including caregivers, educators, and researchers and has shown high content validity, internal consistency, and reliability. In terms of demographics (summarised in Table 1), we included questions of country, child age, gender, respondent's relationship to the child, respondent's educational level, as well as which EDURINO figurine(s) children own (each figurine represents one subject area, for example Mika for Maths). Data of some measures was collapsed and merged into one category due to the small number of cases, for example the category of father and grandparents. Other categories were decided based on previous research (age group of players: preschoolers and children of school age) and differences among EDURINO games in terms of learning content and game design.

Table 1. List and percentage breakdown of different categories for each demographical and app-related factor in Study 1.

Factors	Category	
Country	Germany (82.8%)	UK (17.8%)
Parental education	Below Bachelor (57.8%)	Bachelor and above (42.2%)
Relationship to the child	Mother (77.8%)	Father & grandparents (22.2%)
Child gender	Male (42.2%)	Female (57.8%)
Child age group	4-5 years (73.3%)	6-8 years (20.0%)
Subject area	STEM & Literacy (28.9%)	Mix* (71.1%)

*Note. The mix category included all figurines of the STEM & Literacy games, *plus* Yuki for Creative Arts. The Yuki subject is distinctive from the rest because it has the most open-ended play areas with less structured learning content and objectives. We did not list Yuki as a single category by itself due to the small number of cases.

2.2.3 Results

The total scores across 10 items were used to represent the educational potential of apps, and we further divided the questions to reflect two different dimensions, namely 'learning content' and 'app feature'. Specifically, learning content (possible score range 0 - 10) was measured and calculated by the sum of 5 items: learning goal, meaningful learning, solving problems, feedback, and adjustable content. App feature (possible score range 0 - 10) was assessed and summed across 5 items: social interactions, opportunities for explorations, storyline, quality of language, and app design. Table 2 represents the percentages of respondents' rating of EDURINO for each of the items in the evaluation index, as well as the descriptive statistics of learning content, app feature and the overall educational potential.

Table 2: Descriptive statistics of EDURINO's educational potential (N = 45).

Evaluation Area	Rating Scale		
	0	1	2
Learning goal	-	7 (15.6%)	38 (84.4%)
Meaningful learning	-	4 (8.9%)	41 (91.1%)

Evaluation Area	Rating Scale		
Solving problems	-	8 (17.8%)	37 (82.8%)
Feedback	2 (4.4%)	5 (11.1%)	38 (84.4%)
Social interactions	-	4 (8.9%)	41 (91.1%)
Opportunities for explorations	2 (4.4%)	7 (15.6%)	36 (80.0%)
Storyline	-	6 (13.3%)	39 (86.7%)
Quality of Language	-	5 (11.1%)	40 (88.9%)
Adjustable content	6 (13.3%)	12 (26.7%)	27 (60.0%)
App design	-	8 (17.8%)	37 (82.8%)
	Mean	SD	Range
Learning content	8.844	1.461	5 – 10
App feature	9.244	0.981	7 – 10
Educational potential	18.089	1.929	14 – 20

To investigate whether parents' evaluation of EDURINO would differ as a function of demographic and app-related factors, non-parametric Whitney U-tests were performed to examine the influence of country, child gender, child age group, parental education, and subject area of EDURINO. The results revealed that parents' evaluation of EDURINO's overall educational potential and app feature did not vary as a function of any demographic or app-related factors (all *ps* >.05, Table 3). However, when evaluating learning content, across both Germany and the UK, parents whose highest educational attainment were below Bachelor rated EDURINO's learning content more favourably (M = 9.307, SD = 1.049), than those who have completed Bachelor and postgraduate degrees (M = 8.211, SD = 1.718).

Table 3: Whitney U-tests statistics on the effect of demographic and app-related factors on EDURINO evaluation.

	Educational Value	Learning Content	App Feature
Country	*z = -1.119, p = .285*	*z = -.922, p = .405*	*z = -.904, p = .422*
Parental education	*z = -1.780, p = .075*	*z = -2.152, p = .031*	*z = -.053, p = .879*
Child gender	*z = -.048, p = .976*	*z = -.198, p = .857*	*z = .104, p = .928*
Child age group	*z = -.688, p = .491*	*z = -.172, p = .863*	*z = -1.158, p = .247*
Subject area	*z = -.840, p = .401*	*z = -.188, p = .851*	*z = -1.096, p = .273*

2.3 Study 2: Quantifying EDURINO's Educational Benefits for Child Development

2.3.1 Participants and Procedure

Participants were recruited using the same method as in Study 1. In total, 235 adults, all based in Germany, completed the online survey which measured parent-reported educational benefits of playing EDURINO across various developmental areas. Data collection took place in February 2024.

2.3.2 Measure

Specifically, questions used to assess children's behavioural adjustment and language/cognitive development were based on the Brief Early Skills and Support Index (BESSI, Hughes et al., 2015). The BESSI was developed to measure school readiness, therefore a suitable instrument for the current study. Research demonstrated that BESSI was of good reliability, longitudinal stability, and measurement invariance (Hughes et al., 2017). To examine fine motor skills, we further selected questionnaire items from the Child Development Inventory (Ireton, 1992) and the Ages and Stages Questionnaire (Bricker et al., 1999). Each item measured a specific aspect of fine motor movement appropriate for the study sample's age range, such as the ability to play with interlocking puzzles, colour and draw pictures with precise features. Overall, we included 25 questions to measure 3 separate areas of child development, of which 12 tapped into children's behavioural development, 6 measured cognition and language, and 7 focused on fine motor skills. Each question/statement described a specific child behaviour or trait, and parents were asked '*after playing EDURINO*, your child is better at _/show more progress in _?'. Responses were rated against a 5-point Likert scale (5-Strongly Agree, 4-Agree, 3-Neutral, 2-Disagree, 1-Strongly Disagree). Across the 25 questions, 10 were reverse items in which parents were asked "'*after playing EDURINO*,

your child is worse at _?/show more _ (problematic behaviours)' of which responses were reversely coded for analysis following Hughes et al. (2015) scoring instruction.

To measure demographic information, parents were asked to report child age, gender, respondent's relationship to the child, respondent's education attainment, how long the child has played EDURINO (in months), whether the respondent engage with the child while playing EDURINO, and which EDURINO figurine(s) the child own. Similar to Study 1, we further divided demographic information to specific categories, and Table 4 represents the list and percentages of each category.

Table 4: List and percentage breakdown of different categories for each demographic and app-related factor in Study 2.

Factors	Category	
Parental education	Below Bachelor (58.4%)	Bachelor and above (41.6%)
Relationship to the child	Mother (89.3%)	Father & grandparents (10.7%)
Engagement style	No (53%)	Yes (47%)
Child gender	Male (44.5%)	Female (55.5%)
Child age group	4-5 years (74.8%)	6-8 years (25.2%)
Length of playing EDURINO	< 6 months (67.6%)	> 6 months (32.4%)
Subject area	STEM & Literacy (33.3%)	Mix (66.7%)

2.3.3 Results

2.3.3.1 Quantifying the Educational Benefits of Playing EDURINO

Before conducting the formal analysis, we additionally created a composite measure, namely EDURINO targeted area, which was the total score across 4 items that asked about children's development in identifying letters of alphabet, recognising name in print, one-to-one numerical correspondence and song and rhymes. The composite score was a useful additional measure, since it holistically captured the behaviours and traits that the EDURINO app directly aimed at improving, therefore a suitable variable when examining educational efficacy.

In the survey, parents were asked whether children were better/worse for a range of behaviours after playing EDURINO, thus their exact responses on the 5-point Likert scale were taken as the post assessment of EDURINO's efficacy. Although there was no direct measure of the pre-assessment of EDURINO's efficacy, we were able to compute it because of the wording and design of the questions. Notably, parents would have selected the 'Neutral' response in the exact same item before children started playing the app. Therefore, we separately computed the baseline measure for each development area by summing scores representing the 'Neutral' response from corresponding items. As a result, we obtained the following scores as the *baseline* measure for educational efficacy: 36 for behavioural development, 18 for cognitive development, 12 for EDURINO targeted area, and 21 for fine motor development. Normality check was performed and there was homogeneity of variances (all *ps* >.05 for Levene's test). Also, data were normally distributed with no outliers, assessed by boxplot inspection, and comparing the Kurtosis and SE Kurtosis value against with the critical value of 1.98.

To quantify EDURINO's efficacy, we conducted paired t test to investigate whether playing EDURINO have introduced positive educational benefits for children, by comparing parents' initial perception of its efficacy (based on the neutral responses in the survey) with the post assessment of efficacy after children have played the app. Notably, *after playing EDURINO* games, parents reported significant improvements across children's behaviour, cognition/language, fine motor skills and EDURINO targeted area (all *ps* <.001, Table 5, Figure 2).

Table 5: Descriptive statistics of pre & post efficacy of EDURINO and results of paired t-tests with effect sizes.

Assessment area	Mean (SD) of post efficacy	Mean difference (SD) between pre & post	Paired t test
Behaviour	41.871 (5.193)	5.876 (5.193)	*t (233) = 17.309, p <.001, d = 1.132*
Cognition	21.449 (3.864)	3.449 (3.863)	*t (233) = 13.655, p <.001, d = 0.893*
EDURINO targeted	14.889 (2.730)	2.889 (2.730)	*t (233) = 16.185, p <.001, d = 1.058*

Assessment area	Mean (SD) of post efficacy	Mean difference (SD) between pre & post	Paired t test
Fine motor	25.026 (3.693)	4.026 (3.693)	*t (233) = 16.675, p <.001, d = 1.090*

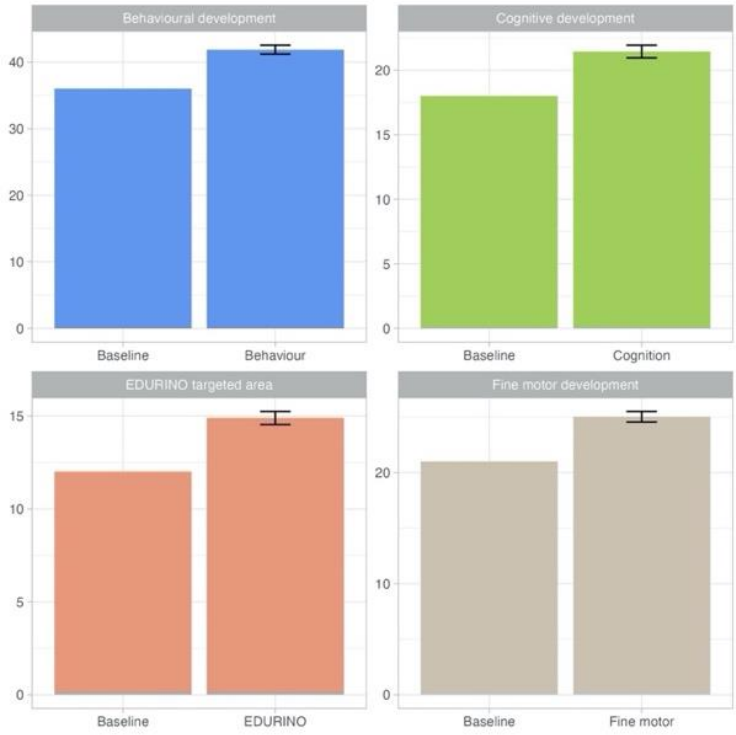

Figure 2: Mean efficacy scores of EDURINO *before* (baseline level, left bar) and *after* playing (right bar) with error bars represents standard deviations. There were no variations in the computed scores of baseline efficacy, thus error bars were omitted.

Second, independent-samples t-tests were conducted to examine the effect of demographic and app-related factors on parents' reported efficacy of EDRUINO across the 4 different development areas (Table 6). Notably, when quantifying EDURINO's educational benefits, parents who did not or rarely engage with children while they play the EDURINO app (*N* = 124) reported *higher* improvements in children's cognitive development (M = 21.99, SD = 3.723; t (232) = 2.305, *p* =.022, *d* = 0.299) and EDURINO targeted area (M = 15.28, SD = 2.649; t (232) = 2.363, *p* =.019, *d* = 0.307), compared to those who often/always engaged with their children (*N* = 110) during the playing session (Cognition: M = 20.84, SD = 3.943; EDURINO targeted area: M = 14.45, SD = 2.765). We also conducted exploratory analysis to test all possible combinations of interaction effects using one-way analyses of variance (ANOVA) and the data met all assumptions. There were no significant interactions between demographic and app-related factors on parents' perceived efficacy of EDURINO on children's development (all *ps* >.05).

2.3.3.2 Examining Correlational Trend of App-usage and Child Development

First, we tested the relationships between the different developmental areas; after controlling for age (measured in year with one decimal place) and child gender, all 4 areas were significantly correlated with each other (all *ps* <.001, table 7), suggesting convergent validity of the measures. Next, we explored the relationships Table 6. Independent samples t-tests on the effect of demographic and app-related factors on parent-reported EDURINO's efficacy.

Factor	Developmental area			
	Cognition	Behaviour	EDURINO targeted	Fine motor
Child age group	t (224) = -.806, *p* =.421	t (224) = .663, *p* =.508	t (224) = -1.018, *p* =.310	t (224) = -.763, *p* =.446
Child gender	t (227) = .914, *p* =.362	t (227) = -.340, *p* =.734	t (227) = 1.252, *p* = .212	t (227) = -.032, *p* = .974

Parental education	t (217) = 1.721, *p* =.087	t (217) = 1.243, *p* =.215	t (217) = 1.916, *p* =.057	t (217) = -.154, *p* =.878
Subject area	t (232) = .394, *p* =.694	t (232) = .044, *p* =.965	t (232) = .237, *p* = .813	t (232) = -.713, *p* =.477
Parental engagement	*t (232) = 2.305, p =.022*	t (t (232) = .311, *p* =.756	*t (232) = 2.363, p =.019*	t (232) = 1.559, *p* =.120
Length of playing	t (220) = -1.686, *p* =.093	t (220) = .600, *p* =.549	t (220) = -1.906, *p* =.058	t (220) = -.983, *p* =.327

Between children's overall improvement and specific skills, and demographic and app-related factors. The majority of the results were non-significant (all *ps* >.05), except for the following. Notably, parents' engagement style was significantly and negatively correlated with the perceived improvements in children's cognitive development (Spearman's correlation: *r* = -.159, *p* =.015) and EDURINO targeted area (*r* = -.165, *p* =.011), suggesting that the lesser parental involvement during the playing session, the greater improvements children demonstrated (as perceived by parents). In terms of specific skills, children's playing length (measured in month with no decimal places) were significantly and positively correlated with the improvement in print recognition (*r* = .145, *p* =.031), numerical one-to-one correspondence (*r* = .230, *p* =.011), the ability to draw precise human/body features (r = .142, p =.034), and hand manipulation of folding papers and using scissors (*r* = .133, *p* =.048), while significantly and negatively related to children's tendency to interrupt inappropriately at social interactions (*r* = -.141, *p* =.036).

Table 7: Partial correlations between different developmental areas after controlling for child age and gender.

	1	2	3	4
1. Cognition	-	.426***	.957***	.566***
2. Behaviour		-	.406***	.593***
3. EDURINO targeted			-	.564***
4. Fine motor				-

Note. *** indicate p <.001, ** indicate p <.01, * indicate p <.05.

3. Discussion

The current research was the first attempt to empirically assess EDURINO's educational efficacy. In Study 1, we adopted a validated evaluation index and EDURINO demonstrated great potential not only in learning content but also with its app feature. In Study 2, parents reported changes in children's school readiness, i.e., behavioural and cognitive development, as well as fine motor skills and the findings suggest that there were significant improvements and benefits after children playing EDRUINO.

In answer to the first research question (Study 1), EDURINO's top 2 strengths were 'meaningful learning' and 'social interactions'. Indeed, games in EDURINO were designed to meet specific learning objectives with clear context, instructions, and learning trajectories (Simon, 1995). The use of physical figurines to unlock the digital learning world is well-received among children. The characters also guide and interact with children during their learning journey, further enhancing the social experiences of playing EDURINO. On the other hand, EDURINO's most glaring limitation was 'adjustable content', also a common challenge across the industry (Callaghan & Reich, 2018). Yet, with the fast-developing AI tool, educational games that tailor content and pace to users' performance are more than ever promising and feasible. Notably, EDURINO's educational potential did not differ among specific user group or subject area, indicated by the non-significant effects of child demographics and app-related factor. Although the evaluation was based on parental ratings only, the findings were insightful and reliable considering the index was developed specifically to be used for a wider audience including parents (Kolak et al., 2021). However, parents' educational level did influence their evaluation of the app; this is important to consider when EDURINO enters markets where there are higher competitions and parents are more familiar with EdTech products. Future study on EDURINO should aim to adopt the multi-informant approach by including researchers and educators in the evaluation process.

Addressing the second research question (Study 2), we measured parent-reported changes in different child developmental areas using items from established instruments (Bricker et al., 1999; Hughes et al., 2015; Ireton,

1992). The results provided empirical evidence to first support and second quantify the efficacy of EDURINO. In percentage terms, children improved by 24.1% in EDURINO targeted areas, 19.2% in fine motor skills, 19.2% for cognitive/language development and 16.3% for behavioural adjustment. The findings suggest that there were holistic educational benefits across multiple developmental areas. Worth highlighting is that demographic and app-related factors did not influence how parents perceive children's changes in their school readiness and fine motor skills, suggesting the educational benefits were evident for all EDURINO users. Moreover, there seems to be some cumulative benefits for playing EDURINO for longer term, indicated by the positive associations between playing length and children's drawing ability, fine motor skills, print recognition and numerical knowledge. Interestingly, in contrary to existing literature (Taylor et al., 2023), parents perceived children's improvements (in EDURINO targeted area) to be higher when they did not engage during the playing session. Additionally, parental engagement style was negatively correlated with improvement in cognition and EDURINO targeted area. EDURINO was introduced to parents as a self-guided/paced app for children with educational games, and this may have influenced their judgment and impression. One possibility is that parents expected and were more likely to identify and report improvements when children engaged with the learning content independently. However, it is vital to recognise that in the current study parents were asked about *changes* in children's behaviour, which was prone to bias and demand characteristics. A more robust research design would use the same assessment items but ask parents to rate children's current level of development at two time points, then report educational efficacy based on the pre-post differences.

4. Strength and Future Research

To date, there has been no investigation on EDURINO's efficacy using research validated tools, therefore the current research adds a novel contribution not only to its internal stakeholders but also provides transparency to parents, educators and EdTech researchers. It also sets an example of collaboration between research and industry since to the best of our knowledge it is the first commercial app to utilise Kolak's educational index. Nevertheless, the current research has several limitations which point to fruitful directions for future studies. First, there was insufficient British respondents in the study sample and future research should aim to recruit equal number of participants from both countries where EDURINO are played. Second, instead of relying on parent report, it's more ideal for efficacy study to directly measure children's literacy, mathematics, and any targeted skills with standardised tasks outside the game context. Training study and randomised control trials would provide the strongest evidence for efficacy.

5. Conclusion

The current research provides first evidence that EDURINO, a game-based learning app for children aged 4-8, can significantly improve young children's school readiness of behavioural adjustment, cognitive and language development as well as fine motor skills. The app demonstrates strong and holistic educational potential with its meaningful and developmentally appropriate learning content and user-friendly app feature. On a broader level, the study not only highlights areas for ongoing refinements to EDURINO but also offers actionable insights to the EdTech industry.

Abstract: Game data offers a unique way to examine children's learning progress in a gameplay context. Despite its relevance in evaluating the efficacy of game-based learning, this area is less researched than engagement and usability study. This paper presents a quantitative investigation of EDURINO, an educational gaming app targeting children aged 4-8. We implemented learning metrics to track children's performance in EDURINO games. Specifically, the measurements included standardised variables from educational and experimental psychology, such as error count and duration. Here we reported data from a total of 18 EDURINO minigames in Literacy and Maths. Game data was collected by the learning metrics tracking system. A total of 66,463 players' data was analysed using generalised linear mixed models with the *lm4* package in R. Overall, children have shown improvements while playing the EDURINO app. We examined the relationships between children's game performance, player demographics and game-specific features and discovered different patterns. First, the significant main effects of age and gender indicated that EDURINO's educational content was developmentally sensitive and age appropriate. Second, children made fewer errors and spent less time when they were in the later rounds within a game or have played the same game more than once. Third, higher difficulty level undermined game performance. Worth noting is that the effect of game-specific factors varied among different educational content, and such discrepancy could be attributed to the nature of game design. When presented with engaging and interactive content, children may have chosen to deliberately make mistakes for fun effects. These findings are discussed in relation to game-based assessment for learning in EdTech research and industry. We also considered the interpretation of learning progress in EDURINO's gameplay context while highlighting the need for further efficacy research.

Keywords: Game-based Learning, Educational Technology, Game Data, Learning Progress

1. Introduction

The rapid integration of technology and digital devices into children's life has fundamentally transformed educational practices. With the EdTech industry estimated to reach $342 billion by 2025 (IQ Holon), there is an increasing emphasis on the development of digital platforms to enhance learning outcomes. The combination between engaging educational content and evidence-based pedagogical principles makes the field of game-based learning particularly promising (Behnamnia et al., 2022; Hirsh-Pasek et al., 2015; Tang, 2020). Indeed, cumulative research has demonstrated significant learning benefits of educational apps, with a meta-analysis revealing a medium positive effect size of +0.31, particularly in enhancing young children's mathematics and literacy skills (Griffith et al., 2020; Kim et al., 2021).

However, a critical gap remains in understanding the mechanism of specific educational apps. Traditional efficacy research predominantly employed methods of training study, survey, and randomised-controlled trials. However, few studies have conducted in-depth analysis of the educational tools themselves, specifically, to show how real-life player data can be utilised to assess and measure learning within the gameplay context (Bang, Li and Flynn, 2023; Fisch et al., 2024; Walsh and Bokhove, 2021). The current study aims to fill this gap by investigating real-life player data from the EDURINO's app.

EDURINO is an educational gaming app for children aged 4-8. There are nine subject areas covering STEM, humanities, and social-emotional learning in both German and English. Its unique features include a 'magic pen' stylus and haptic figurines that bridge digital and real-world learning (Figure 1). EDURINO's educational content has both holistic as well as detailed scope and sequences of learning objectives and the structure is informed by pedagogical theories (Plass and Pawar, 2020). In EDURINO's competency-based learning context, children are

given small activities to learn and practice specific knowledge. Also, all materials are presented in a playful and engaging digital platform with clear context and narratives.

To examine the gameplay data from EDURINO, this study was informed by different methodological frameworks of learning processes within digital games (Baker, Gašević, and Karumbaiah, 2021; Siemens and Baker, 2012). Notably, the entitative/reductionist paradigm has been the mostly widely adopted in research on educational apps (Fisch et al., 2024; Halverson and Owen, 2014). It focuses on breaking down complex phenomena, i.e., learning within a game, into their constituent components, e.g., game design and player behaviour, to understand relationships between these factors. Nevertheless, the uncertainty and noise in game-based assessment data require detailed examination of the game content and mechanics to establish reliable and meaningful learning metrics (Xu et al., 2021).

Figure 1: EDURINO's haptic figurines (upper left), game played with the "magic pen" on a tablet (upper right), screenshots of a literacy game (lower left), and a maths game (lower right).

The current study is the first empirical research utilising EDURINO's gameplay data. Firstly, we adopted the reductionist approach to define learning metrics while accounting for specific game design and mechanics. Second, we internally implemented the tracking system in the EDURINO app to collect data from real players. Given the exploratory nature of this study, we did not make specific and prior assumptions.

Building on the identified gaps and challenges, the current study explored two research questions:

1. Is there any evidence to suggest that children are learning within EDURINO's gameplay context?
2. What are the relationships between player features (demographics), game-specific features (design and content), and children's game performance in the EDURINO app?

2. Material and Methods

2.1 Participants and Ethics

Participants were active registered users of the EDURINO app (DACH version). The collection and report of children's game data did not violate the data privacy statement, since it was used only for research purpose, and all analyses were conducted by EDURINO's internal researcher with no third-party involvement. Furthermore, all procedures performed in the current study were in accordance with the ethical standards of the University of Cambridge Psychology Research Ethics Committee and have been reviewed by the senior author as an independent consultant on the project.

2.2 Data Source

The study utilised real-life player data of children's game performance, which was collected by the learning metrics tracking system and stored in a centralised cloud database. In EDURINO's learning world, there are 12 different episodes/subjects and each episode consists of numerous minigames which cover multiple learning

objectives of that subject. Within each minigame, there are at least two rounds of activities/tasks that children need to complete. Notably, the number of rounds for each minigame is fixed by design. This paper focused on a subset of EDURINO games, specifically 10 minigames from Episode 1 Mika Literacy in German (E1) and 8 minigames from Episode 2 Robin Mathematics (E2). The learning objectives of each minigame were outlined in Supplementary Material (Table S1). Data reported in this study was collected from 29th May 2024 to 1st July 2024. Data collection was conducted remotely through the implemented tracking system, in that player data was collected automatically while children were playing the app. There was no fixed duration for the study since children interacted with the app at their own pace and choice.

2.3 Measures

Multiple measures were first defined then tracked for each minigame (Table 1). The unit of collection is by round. Each round/minigame is designed to teach and test children's knowledge of specific learning objectives and they are given a task/activity to complete. In addition, we extracted information of age and gender for each player, which was entered by parents when setting up a child's player profile.

Table 1: Definition of measures.

Measure	Definition
Error	The total number of errors the child makes in a round, e.g., choose the wrong symbol/quantity to complete a mathematical equation.
Duration (in seconds)	The total length the child takes to successfully pass a round.
Round number	The specific, discrete and ordered segment of a minigame; the child needs to successfully complete certain task/activities in a round in order to move to the next round.
Difficulty level	The level of how difficult the learning content is in a round, set by curriculum and game designers. The higher the difficulty level, the more challenging the content.
Play count	The number of how many times the child has played a particular minigame, play count = 1 indicates first-play and so on.

2.4 Analytic Plan

To investigate how changes of children's performance in EDURINO games were associated with demographic variables and game-related factors, we fitted a series of Generalised Linear Mixed Models (GLMM) with the lm4 packages in R (Bates et al., 2015). For each response variable, we ran two models. Specifically, the first model only examined children's first play experience (play count = 1) while the second model utilised the full dataset (all play count included). In E1, we fitted models with fixed effects of age group (6 groups, 3-8 years), gender (male, female), round number, and play count (only for model 2), while participant ID was entered as a random effect. Based on market research, we extended the age range to include 3-year-olds to account for this customer group in the analysis. Notably, for E2, we included *difficulty level*, rather than round number, as fixed effects in the models. Minigames in E1 do not have varying difficulty levels whereas in E2 there are adaptable difficulty levels based on children's game performance. Taken the multicollinearity problem into account, we decided against fitting the models using both round number and difficulty level simultaneously. Therefore, the final fixed effects for all E2 minigames were age group (6 groups, 3-8 years), gender (male, female), difficulty level, and play count (only for model 2), while participant ID was entered as a random effect. Moreover, no interaction terms were included given the exploratory nature of the current study and the scarcity of relevant literature. Steps on data preparation are explained in Supplementary Material (https://figshare.com/articles/online_resource/Supplementary_Material_for_the_full_length_paper/26395765?file=48349339).

3. Results

Descriptive statistics of learning metrics measures in E1 and E2 were outlined in Table 2. The breakdown of player demographics was presented in Supplementary Material (Table S2). In GLMM, a significant estimate of fixed effect indicates that a particular independent variable, i.e., a game-specific factor, has a statistical meaningful impact on the outcome variable, i.e., error count and duration per round.

3.1 Children's Game Performance in E1

In children's first play, age group, gender, and round number were all significant main effects for predicting children's game performance (Table 3, 4). Older children made fewer errors and spent shorter duration to pass a round than the younger group. Also, children made fewer errors and spent less time with the later rounds than

the earlier rounds within the same minigame, except for Boss Fight 1 & 2, and Rhyme Wolverine. Moreover, female outperformed male in all minigames, except for Boss Fight 6 and Bridge of Word Holes.

Table 2: Descriptive statistics of learning metrics measures. *N* refers to the number of players.

Minigame	Round number	Difficulty level	Mean of error	Mean of duration
Episode 1 Mika Literacy				
Boss Fight 1 (*N* = 5869)	6	-	0.485	18.601
Boss Fight 2 (*N* = 4398)	5	-	0.194	21.482
Boss Fight 6 (*N* = 2284)	5	-	0.320	11.691
Bridge with Word Holes (*N* = 5427)	8	-	0.129	13.312
Burping Fish (*N* = 4098)	3	-	0.736	41.543
In the Head of Ava (*N* = 5414)	8	-	0.122	11.027
Rhyme Wolverine (*N* = 8077)	2	-	2.200	62.849
Wheel of Sounds 1* (*N* = 2957)	8	-	1.011	35.733
Wheel of Sounds 2* (*N* = 2308)	8	-	1.230	32.351
Wheel of Sounds 3* (*N* = 2118)	8	-	1.305	32.739
Episode 2 Robin Mathematics				
Bridge of Numbers (*N* = 2844)	4	2	0.427	35.227
Capture Shapes (*N* = 4270)	8	4	0.859	19.679
Construction Scale (*N* = 2486)	5	3	0.418	36.775
Put in Numbers (*N* = 3671)	4	2	0.359	30.346
Transport Building Material 1 (*N* = 3737)	5	3	0.206	42.124
Transport Building Material 2 (*N* = 2400)	5	3	0.229	42.749
Treasure Map (*N* = 2053)	6	3	0.095	27.557
Wheel of Fortune (*N* = 2052)	5	3	0.589	38.679

Note. There are three variants of the minigame Wheel of Sounds; each variant has the same learning objectives and game design but was separately tracked.

When all play counts were included, age group, gender, and round number were significant main effects in predicting the number of errors and duration spent in a round (Table 5, 6). Yet, the effect of play count differed among minigames. In Boss Fight 1 & 2, and Rhyme Wolverine, the number of errors increased with higher play count. Whereas for In the Head of Ava, children made less errors when they have played the minigame more than once. Similarly, higher play count was significantly related to shorter duration in all the minigames except for Boss Fight 6. To visualise the relationship between each main effect predictor and response variables, we generated graphs based on the GLMM models using the *ggeffects* package in R (Lüdecke, 2018). For instance, Figure 2 illustrates the marginal effect of how each predictor and duration was associated in Boss Fight 1. All figures for E1 minigames were presented in *Figshare (https://figshare.com/articles/figure/E1_marginal_effect_figures/26349118)*.

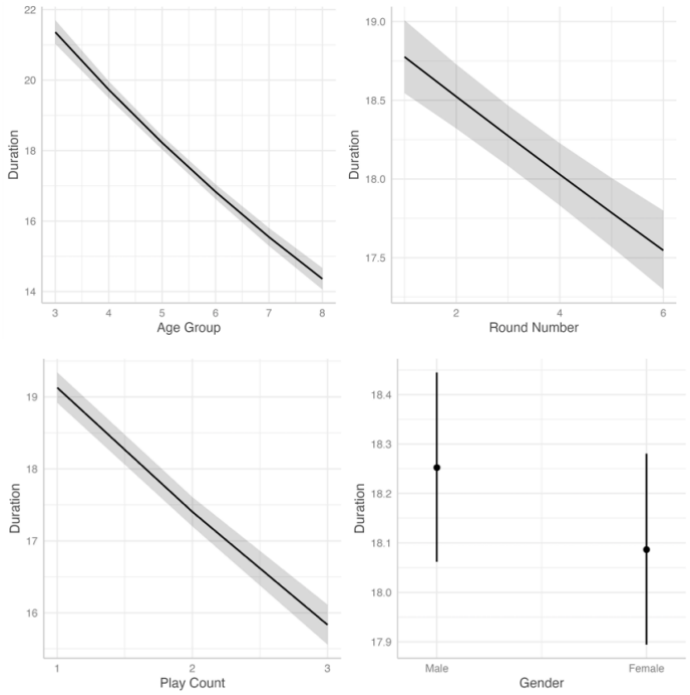

Figure 2: Predicted marginal effects of age group, round number, play count, and gender on duration spent for BOSS Fight 1, with 95% confidence intervals. Each chart illustrates how changes in a specific main effect are associated with variations with duration, holding the other main effects constant.

3.2 Children's Game Performance in E2

Irrespective of play count, age group was a consistent and significant main effect predictor for children's game performance, i.e., error count and duration, across all the minigames (Table 7, 8). Similar to E1, gender was the second most consistent main effect: female made less errors and took less time to pass a round. In terms of difficulty level, when play count = 1, higher difficulty level was associated with more errors or longer duration in Bridge of Numbers, Put in Numbers, Wheel of Fortune, and Capture of Shapes. However, we also found the opposite and less expected pattern: higher difficulty level was associated with fewer errors or shorter duration in Construction Scale, Transport Building Material 1&2, and Treasure Map.

When all play counts were included for analysis, higher difficulty level was associated with fewer error count in Put in Numbers and Transport Building Material 1 (Table 9). Yet, for Bridge of Numbers, Capture Shapes, and Wheel of Fortune, higher difficulty level was associated with poorer game performance, i.e., greater errors and longer duration to pass a round. Higher play count was a significant predictor for shorter duration for all minigames except for Wheel of Fortune. However, the pattern was less clear with the error count; higher play count was associated with better performance in Construction Scale, Put in Numbers, Transport Building Material 1, yet related to more errors in Capture Shapes and Transport Building Material 2. We followed the same procedure as in E1 to generate figures to visualise GLMM model results. For instance, Figure 3 illustrates the marginal effect of all fixed effects predictors of error count in Put in Numbers. All E2 figures were presented in *Figshare*

(https://figshare.com/articles/figure/_sup_E2_marginal_effect_figures_sup_/26349130)

Each plot illustrates how changes in a specific main effect are associated with variations with error count, holding the other main effects constant.

4. Discussion

The current study was the first investigation to utilise EDURINO's game data to examine children's learning progress in the gameplay context. First, based on standardised practice from educational and experimental psychology, we defined an array of measures for learning metrics. Then, we implemented the tracking system to collect data of children's performance in EDURINO's educational games. Overall, children demonstrated learning progress within EDURINO's gameplay context, and their performance was closely related to both player demographics as well as game-specific features.

In answering the first research question, interpretation of game performance between rounds and play count warrant discussion. Across all minigames in Episode 1 for literacy, round number was a significant main effect in GLMM. Specifically, children made fewer errors and spent less time to pass the later rounds than the earlier rounds within the same minigame. The findings indicate improvements within a very short amount of time, and therefore by themselves may not be seen as conclusive evidence of learning. Play count, which has been observed over a longer course of time, was also associated with clear improvements in children's game performance. Children continued the trend of making less mistakes and taking less time to pass when they have played the game more than once. Worth highlighting is that although rounds within the same minigame have the same game mechanics and learning objectives, children are presented with different content in each round,

for example detecting different quantities. Therefore, children's improvements could not be explained entirely by repetition or practice effect (Fisch et al., 2024).

Taken together, EDURINO's game data was indicative of learning progress within the gameplay context. Nevertheless, game data are at best, assessment of constrained skills on specific skills such as sorting shapes and counting, rather than an assessment of unconstrained skills of broader domain knowledge such as problem solving. As noted by Kim et al. (2021), educational apps show constrained learning benefits with a small and fixed body of knowledge. To address this gap, more research is needed to test EDURINO's efficacy with transferred contexts and broader materials to show unconstrained learning benefits (Aladé et al., 2016; Pearson et al., 2020).

To address the second research question, we fitted several main effects in GLMM models to elucidate the relationships between player and game-specific factors on children's game performance. Not only did the findings provide insights into EDURINO's game design, but also highlighted the challenges for game-based learning and assessment. First, across all minigames assessed in the study, older children consistently outperformed younger children. Additionally, there were also clear gender differences in that female exhibited better game performance than male, particularly in E1 for literacy games. The significant main effects of age and gender suggested that EDURINO's learning content and educational materials were developmentally sensitive and age appropriate, since it follows the universal age and gender-related patterns and trajectories (Eriksson et al., 2012; Bang, Li and Flynn, 2023).

Difficulty level, on the other hand, led to more mixed results. In some minigames, such as Capture Shapes, Construction Scale, Treasure Map, and Transport Building Material, children made fewer mistakes and spent shorter duration with content of higher difficulty level. There were also cases where children started to make more errors yet spent a shorter time when they have played the game more than once. Several explanations are possible. First, certain games' difficulty level might not correspond to children's ability and skills and need adjustment. Second, children might have already mastered the skills required for the games but started to play for fun by deliberately making mistakes. EDURINO incorporates the 'giggle factor' feature in design so that errors are presented and responded with fun and interactive effects. This posits a wider question and challenge of how to reliably assess game-based data for educational content when the content is presented in a gameplay context (Fisch et al., 2024; Walsh and Bokhove, 2021). Using data mining techniques, advanced tracking system and analytic approach would be powerful tools to account for the noise in game data (Baker, Corbett, and Aleven, 2008; Chen et al., 2020).

A particularly novel contribution of the current study was utilising game data from real players to examine game-based learning, a largely under researched field with very little literature (Behnamnia et al., 2022; Kiguchi, Saeed, and Medi, 2022; Kucirkova et al., 2014; Walsh and Bokhove, 2021). The clear and precise definition of more than one outcome measures (of error count and duration) allows for a richer interpretation of findings and could be adopted by other apps in the industry to establish comparable learning metrics (Siemens and Baker, 2012). The very large sample size and robust statistical analysis ensured the results are consistent with academic standards and practice, and we advocate that other commercial companies adopt inferential methods for research design. However, the study relied on game data which is naturally prone to errors and uncertainty (Xu et al., 2021). Most importantly, the findings indicate improvements within EDURINO's gameplay context, further investigation outside the gameplay context, for example longitudinal efficacy research, is essential before any conclusion is drawn about its long-term learning benefits for unconstrained knowledge.

5. Conclusion

The current research focused on game-assessment data to reveal that children shown clear improvements in EDURINO's gameplay context. Learning progress was evident within a single play session as well as across multiple play sessions. The app's engaging content was age appropriate and children's game performance followed universal developmental trajectory. We consider game-based learning as an important piece of the puzzle in understanding the holistic benefits of educational apps. Yet, the significance of traditional efficacy research cannot be underestimated.

Real-World Geopolitical Influences on In-Game Financial Behaviour

Raghav Raj Dwivedi and Kavita Vemuri
International Institute of Information Technology, Hyderabad, India

glgraghav@gmail.com
kvemuri@iiit.ac.in

Abstract: This paper explores how real-world geopolitics can influence financial decision-making in virtual environments. The study primarily focuses on trading dynamics in a pandemic simulation game. The players manage resources and trade with each other to save their population. We compared two groups: one playing with made-up country names (control) and another with real country names (test). The players were not permitted to communicate outside of the resources the game provides and were finally ranked based on the number of months survived and trade volume. Our findings reveal two distinct player archetypes, one focusing on maximising trade volume and a second focusing on resource conservation. Real country names compared to color-coded labels seem to delay the perception of competition and reduce overall trade volume, suggesting increased immersion and a more conservative approach towards resource management. Observations from gameplay footage reveal instances of potential bias, with players forming diplomatic ties based on national identities. The data collected suggests that real-world geopolitics can influence financial behaviour in virtual environments as hypothesised. It also explores virtual environments to study how political narratives and dynamics affect human decision-making. The findings offer practical insights for game developers regarding fostering player engagement, mitigating bias, and creating fair economies. While parallels with real-world resource trading and allocation during pandemics were noted, further analysis would be required to explore these connections.

Keywords: Polarisation, Game Design, Pandemic, Trade, Perception, International Affairs

1. Introduction

The convergence of the domains of video games, political polarisation, financial behaviour, pandemics and disasters is initially unexpected. Games themselves encompass a virtual microcosm where players engage in economic transactions and strategic decision-making akin to the mechanisms of real-world financial systems. Simultaneously, games often embed geopolitical elements, mirroring global political scenarios and introducing players to dynamic narratives that simulate real-world sociopolitical landscapes. These virtual economies can also be influenced by real-world events, such as pandemics and disasters, blurring the lines between the virtual and the tangible.

1.1 Political Polarisation and Cooperative Dynamics

The COVID-19 pandemic has revealed a remarkable confluence of global coordination challenges and political balance. During this period, the intersection of politics, media, and public perceptions has become evident (Chen *et al.*, 2020; Bobba and Hubé, 2021). The trading of resources between nations and the opening and closing of borders have become victims of internal strife, with each country adopting its approach to the pandemic. These decisions, often made without a template for collaborative legislation, reflect the paradox of a shared global challenge met with fragmented responses (Allam, 2020), but also underscore the interconnectedness of global economies. Nationalistic policies, supply chain disruptions, and collaborative efforts for resource sharing indicate how geopolitical decisions affect international trade and economic dynamics. Allam (2020) posits that the potential for global coordination could provide a more effective solution, without politicisation. Intriguingly, as markets and trade relations are scrutinised by citizens, they, too, become subjects of societal discourse, influencing public opinions, electoral politics, and mobilisation (Zürn, 2014). Consequently, instrumental questions about problem-solving and effectiveness intertwine with issues of legitimacy, fairness, rationality, and equity (Goggin, 2012; Caplan, 2011; Singer *et al.*, 2019).

Rationality often contends with group dynamics and polarisation (Singer *et al.*, 2019). The ability of rational agents to polarise after sharing evidence highlights the intricate interplay between individual rationality and group-level dynamics. This phenomenon resonates with the potential for player financial behaviours to diverge as real-world geopolitical elements are introduced into virtual game contexts.

Examining the intersection of game theory and financial behaviour within virtual environments provides a lens through which to understand the dynamics of player interactions. In cooperative games, a fundamental implicit assumption prevails - players form coalitions and establish agreements on how to distribute the proceeds of their cooperative efforts (Hart, Chinn and Soroka, 2020). Cooperative games strive to maximise collective profits and promote social welfare through collaborative strategies.

In contrast, non-cooperative games emphasise strategic interactions among players, where each participant makes decisions to optimise their individual outcomes. The pursuit of equilibrium, where no player has an incentive to unilaterally deviate from their chosen strategy, characterises the essence of non-cooperative games (Hart, Chinn and Soroka, 2020). In this context, price setting emerges as a pivotal determinant in the success of trading and the equitable redistribution of profits.

These game-theoretic principles resonate within virtual economies as players engage in financial transactions and decisions that mirror real-world economic behaviour. The interplay between cooperative and non-cooperative dynamics, and the significance of achieving equilibrium, underscores the intricacies of player financial behaviour within virtual worlds.

1.2 Game Design, Social Interaction, and Player Financial Choices

Studies on player experiences in multiplayer games reveal that higher player interdependence fosters more communication, leading to understanding the social dynamics, social well-being, and strategy discussions among players (Balicer, 2007; Emmerich and Masuch, 2017; Lofgren and Fefferman, 2007; Szell and Thurner, 2010; Martončik and Lokša, 2016; Zhang and Kaufman, 2017; Belaza *et al.*, 2020). Augmentation effects (Qin, Cho and Zhang, 2021) emphasise how players' social interactions impact their gaming experiences. This suggests that real-world geopolitical elements might lead to financial decisions shaped by players' social contexts.

Exploring finance within gaming through classroom simulations (Holt, 1996) underscores the relevance of supply and demand models in understanding virtual economies. Dynamic bilateral trading games (Athey and Segal, 2007) highlight the role of serial correlation and buyer incentives, which can be interconnected with game design elements to shape financial decision-making. The financialisation of everyday life, observed in virtual economies (Zürn, Binder and Ecker-Ehrhardt, 2012), emphasises the blending of real and playful economies, potentially affecting player perceptions of in-game financial choices (Snow *et al.*, 2015).

1.3 Research Significance and Implications

Using games, we seek to unearth whether the virtual worlds reflect real-world financial behaviours and political dynamics. Such a setup offers a novel perspective on how virtual environments can serve as laboratories to understand human behaviour, financial decision-making, and political polarisation. A game designed with a theme of the evolving dynamics of the world's response to the pandemic would capture accurate sentiments and behavioural responses to such an event.

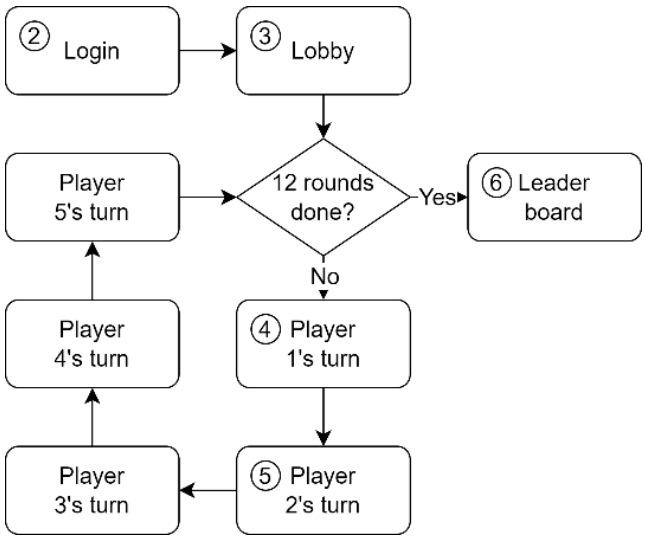

Figure 1: Flow of the game

In this paper, from the player behaviour data collected using an in-house developed unique game, we study decision-making under uncertainty (infection rates), understanding or awareness of real-world geopolitical relations and personal bias that manifests in-game behaviour. The game designed, developed, and play-tested during the pandemic (2020-2021), reflects the struggle for commodities and resources required by each country to save the population. The findings contribute to understanding the role of possible bias (personal and geopolitics) in trade partnerships and strategies applied to cooperate and save lives.

2. Methodology

2.1 Hypothesis

This study aims to investigate how real-world geopolitical contexts influence financial decision-making within a virtual environment. The methodology involves detailed observation of players' trading patterns, leaderboard performance, and qualitative insights gathered from game sessions. This multifaceted approach can provide insight into geopolitical biases and the manifestation of perceptions in virtual game economies.

The primary hypothesis of this paper is that in-game financial behaviour alters when the player represents a real country as opposed to a fictitious one. This hypothesis subsumes the premise of bias due to political polarisation that influences financial decision-making even in times of crisis.

2.2 Game Description

Figure 1 shows the block diagram for all screens of the game. It is a digital competitive multiplayer game that five people play simultaneously. The player assumes the role of the leader or policy decision-maker of the country being represented. Each game goes on for twelve rounds, each round being titled as a month in-game. Each round is turn-based, with players taking their turns in a fixed decided sequence. Once twelve months (sixty turns) have passed, the game ends, and the players are displayed on a leaderboard. Each turn is clocked to a one-minute maximum.

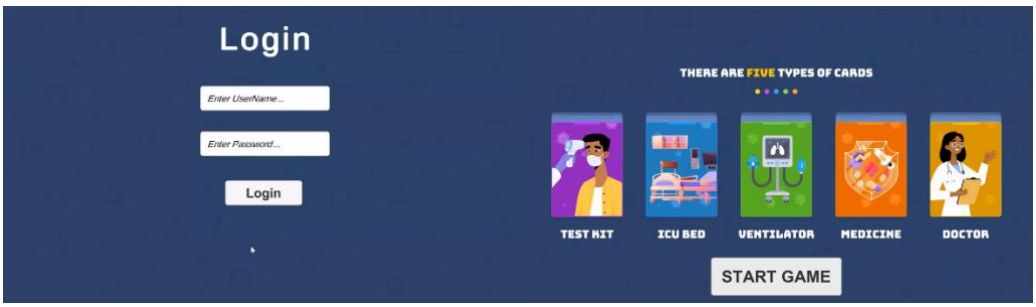

Figure 2: The login screen (left panel) where players enter their credentials. The screenshot of the lobby on the right displays the assets the players can trade.

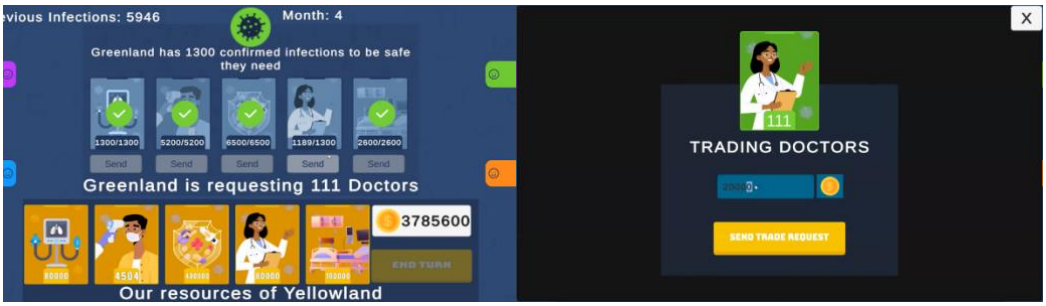
Each player enters credentials to the login screen (Figure 2) to access the game lobby. Once logged in, the player is randomly assigned one colour-coded country (in the control case) or a real-world country (in the test case) to represent the game's duration. The countries chosen are the USA, Russia, China, India, and Brazil. The player enters the lobby where a screen (Figure 2 right) is displayed till all five players are logged in and choose to start the game. The lobby displays the five resources that the player can trade with other players: test kits, ICU beds, ventilators, medicine, and doctors.

Figure 3: left: Player's dashboard during their own turn, right: pop-up when another player offers to sell a requested resource.

Figure 3 presents the main dashboard of the game. The bottom panel, in the colour of the player, displays the player's current available resources and current in-game money. The countries that each player represents have in-game starting money closely based on their real-world foreign exchange reserves, modified with the intent to balance the game. The number of infections each country will face is also based on the predictions hosted on

the world COVID-19 tracker (Worldometer, 2020) to provide a more realistic simulation. The game was designed in 2020 and hence uses predictions of infection rates till February 2021.

The panel on the top has on the left the number of infections that the player has on the centre of the current month, and on the right the clock displays the time left in the current turn. There are four tabs, two on each side of the screen, representing the other four players.



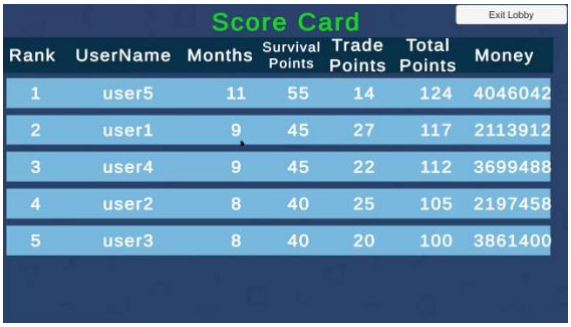


Figure 4: Left: Player's dashboard during another player's turn, right: modal to enter amount or sale price when offering resources to another player.

The centre of the screen is occupied by request buttons for the player to procure resources. Once the player requests a resource, the other four players can view the request and the number of infections in the land requesting the resources (middle area in Figure 4 left). If one of the other players decides to sell to the current player, they are displayed the modal (Figure 4 right) to enter the price for which they wish to sell the respective resource. When an offer is made by another player, it is displayed as a pop-up box next to the player who made the offer (Figure 3 right). The current player can choose to accept any of the offers.

Rank	UserName	Months	Survival Points	Trade Points	Total Points	Money
1	user5	11	55	14	124	4046042
2	user1	9	45	27	117	2113912
3	user4	9	45	22	112	3699488
4	user2	8	40	25	105	2197458
5	user3	8	40	20	100	3861400

Figure 5: Leaderboard shown at the end of 12 rounds.

Once a trade is accepted and the player's resources reach the sufficient minimum amount required to deal with the player's current infections, the player is said to have 'survived' the month. At the end of the game, the leaderboard (Figure 5) displays the number of months survived, followed by the number of trades done by the country. This is briefed to the players prior to beginning the game. The ranks are provided based on the months survived and then trade points, and intentionally not based on the money left with a player. The players are made aware of this information before playing the game.

2.3 Tools Used

The game was developed in the Unity game engine and targeted for Windows. It uses a GameSparks cloud back-end. All participants logged in via Zoom meetings in their isolated environments. To record all data and ensure no verbal communication between participants, all participants were placed in their own breakout rooms, with screen recording.

2.4 Participants of the Study

The participants of the study were undergraduate computer science students between the ages of eighteen and twenty-two, who all speak English fluently and had proficiency in digital games. Of the 30 participants, fifteen were assigned the control group, and fifteen were assigned the test group. Each game requires five participants, and hence this caused a total of six successful runs of the game. The control groups played a version of the game

that did not mention real country names. The names 'Orangeland', 'Yellowland', ‘Greenland’, ‘Purpleland’, and 'Blueland' were used. Real country names - India, Russia, China, Brazil, and the USA - were used with the test groups.

The participants were briefed for thirty minutes about the game before playing it, including a discussion segment. For the duration of the game, the participants were not allowed to communicate with each other. Once the leaderboard was displayed at the end of the game, the participants engaged in a second discussion segment.

2.5 Data Collection and Analysis Methods

Three types of data analysis have been conducted, the first being qualitative, the second being quantitative, and the third being anecdotal.

The first analysis is on the turn-by-turn log data. All the players’ trade offers and acceptances are recorded in a table. The data entered is each trade offer given, received, and accepted. All these data points are then line plotted. Since it is a five-player multiplayer game, each player interacts with four other players. This means that four graphs for twelve rounds, those of the interactions of a single player with four others, can be plotted as overlapping. These graphs are noted to be similar to quadratic graphs. When a best-fit quadratic curve is applied to the line graphs, the quadratic curve can be classified as either an upward or downward parabola, and the peak of the parabola (maximum for downward, minimum for upward) is noted. The peak’s averages and variances are then calculated for all control and test groups separately. This allows us to observe typical player archetypes.

The second analysis is on the final leaderboards of all six games and thirty players. Variances and means are plotted. This data is presented as aggregate and not individual. Since the game is granular, with only five players at a time trading five resources, it is challenging to balance the game. Therefore, it is only appropriate to study the difference generated between the control and test groups and not the difference generated between countries ignoring the control and test groups.

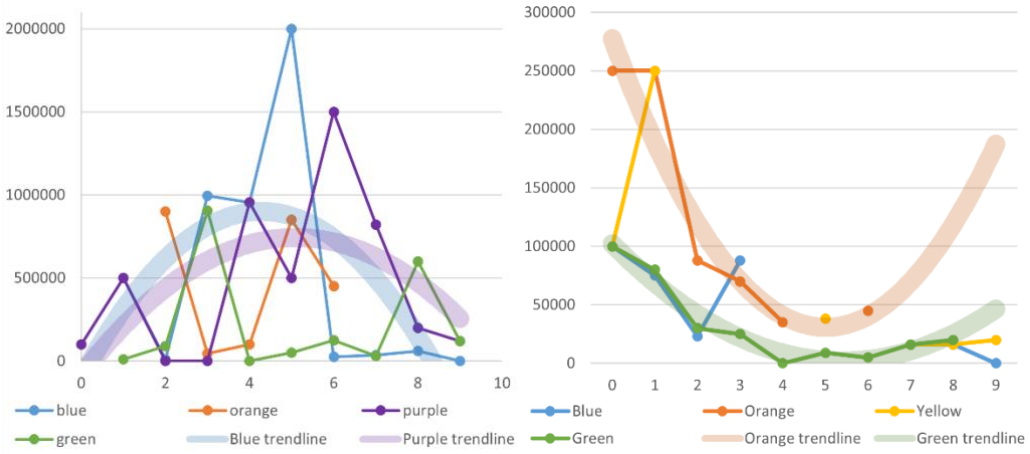

Figure 6: Representation of the two typical archetypes players show - upward and downward parabolas. The first graph (left) is for a player representing ‘Yellowland’, and the second graph (right) is for a player representing ‘Purpleland’. The X-axis represents months passed, the Y-axis represents in-game money traded, and the colours represent all other players.

The third analysis is on the footage captured during a few game sessions. It consists of audio quotes of players if they remark on other players while in the game or oral musings during decisions. It also goes through parts of the gameplay footage when an ’irrational’ decision has been made.

3. Results

The final leaderboard results are available from all thirty participants, while anecdotal evidence is available from only twenty participants. Complete turn-by-turn data is also available from twenty of the participants. The first two rounds are typically rounds with zero infections across populations, effectively the data is from ten of the twelve rounds.

3.1 Observed Player Archetypes and Shifts

Turn-by-turn trading data was recorded for twenty of the thirty participants of the study. There are two common archetypes observed from the players. One type of player's trading pattern trendline follows an upward parabola, while the other type follows a downward parabola (Figure 6). Fifteen of them, that is 75% of the player trajectories have been upward parabolas. It is reasonable to assume that if the number of players and rounds in the game is increased then the data will begin to look increasingly like its trend line. While most players follow an upward parabola, the downward parabola following players is not negligible.

The rationale behind following an upward parabola is that the player might care more for the trade volume aspect of the game rather than wealth accumulation initially, an expected but recognisable distinction. The prices continue to drop and trade volume continually increases (minima of the trendline), when the player realises that the increase in cases demands a more conservative approach to trading. Since the scarcity of resources is more abundant towards the end of the game, trade volume is typically reduced. Therefore, demand is less, and prices begin to increase.

The hypothesised rationale behind following a downward parabola is that the player keeps increasing prices for resources since they are in more demand initially. An increasing price however is more prone to rejection, as competition is still present within the game. At the maxima of the trendline, the player has accumulated enough rejections of trades to realise that more competitive pricing would be an optimal strategy. Beyond the maxima, trade volume has reduced since the typical player is in resource conservation mode. This causes rejection of trade at falling prices, further causing the trendline to fall.

Table 1: Average difference in peaks of all trade graphs

Scenario	Colours		Countries		Difference of means
	Mean	Variance	Mean	Variance	
Selling	4.2	0.8	4.7	1.2	0.5
Buying	3.8	1.6	4.4	0.8	0.6

Table 2: Average difference in peaks of upward parabola trade graphs

Scenario	Colours		Countries		Difference of means
	Mean	Variance	Mean	Variance	
Selling	4.3	0.8	5.0	1.0	0.7
Buying	3.3	0.5	4.5	0.8	1.2

In the control experiment where country names were hidden, the average peak (between 0 and 9) for selling by ten players was 4.2 with a 0.8 variance, while for buying it was 3.8 (with a 1.6 variance). In the test condition (country names displayed), the average peak for selling resources shifted forward to 4.7 with a 1.2 variance, while for buying it shifted forward to 4.4 with a 0.8 variance (Table 1). If the downward parabola graph interference is removed from this (considering that only 25% of the players generated a downward parabola graph), in the control condition the average peak for selling resources was 4.3 with a 0.8 variance, while for buying it was 3.3 with a 0.5 variance. In the test condition, the average peak for selling resources shifted forward to 5.0 with a 1.0 variance, while for buying it shifted to 4.5 with a 0.8 variance (Table 2).

3.2 Shifted Means and Variances in the Final Scores

From Figure 7, illustrating the difference in ranks between control and test groups, it is evident that players representing India received the most significant leaderboard rank boost as expected since the players were all from India. In the cases of Russia and China, there is an increase in the standard deviation of the data, reflecting that the participants possibly hold possible higher bias regarding them, causing a larger variance in gameplay outcomes. Brazil loses their leaderboard rank the most while maintaining consistency in deviation. The United States performs consistently poorly in both control and test cases but with no significant difference in trade volume.

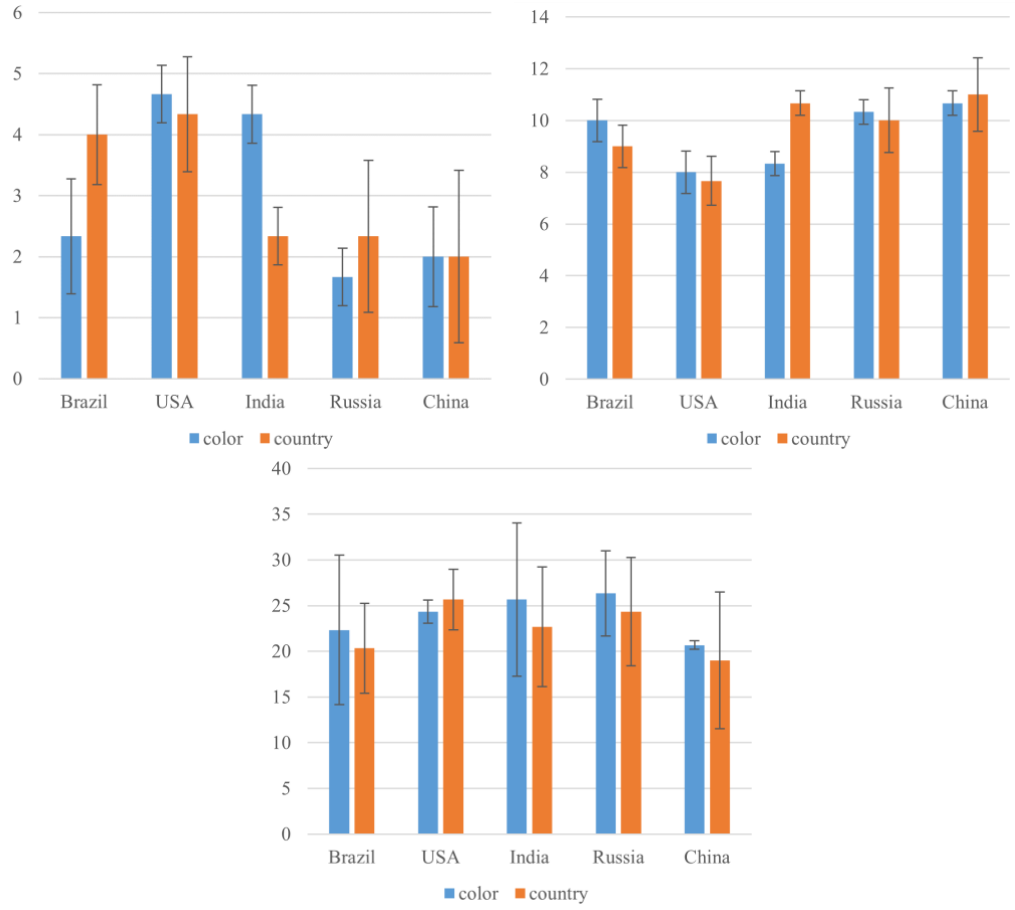

Figure 7: (clockwise from top left) Average leaderboard rank (lower is better) with standard deviation, average months survived (higher is better) with standard deviation and average number of successful trades with standard deviation.

3.3 Anecdotal Findings

Going through the footage of the game reveals the thought process behind a few of the choices that players have made.

In the eighth month of a game in the test group, the player of India, while requesting resources, chooses to trade with China for 8000 coins over the USA for 5000 coins, stating, “Let me give China the business for this round”. In the ninth month, the player repeats this ‘irrational’ purchase but with Russia for 1000 coins, over the 300 coins offered by the USA as well as China, stating almost the same thing, “Let's give Russia the business for this round”. It appears that the player wants to start building diplomatic ties with other players amidst the resource-deprived part of the game. This strategy, however, is not optimal, since the other players cannot see the options this player has, or access the player’s thought process, making the gesture useless. It is more reasonable and supported by this anecdote, for the players whose trades have been accepted to simply assume that they have made the lowest offer, which is why their trades have been accepted. The latter now becomes a mistaken assumption, offsetting the trendlines for the rest of the players.

In the twelfth month, the last round, the same player of India while trading, states, "USA, you were playing so good, but you screwed up in the end; I could try to help; I'm sorry." The player says this while not having offered any trade to the USA for months eight, ten, eleven and twelve. This statement might not reveal any non-optimum behaviour by the player; however, it does reveal the player's tendency to cognitively believe that they are playing not with other players like them, but rather with other countries. For months five to ten, the player of China ensures to accept the trade with Russia every time, either exclusively, or while accepting other trades as well. Three of these trades are not optimal trades, as better offers are available at the same time.

In month seven, the player from Brazil recognises that the player from China is playing well, based on their infection count. In month eleven, when prompted, the Brazilian player ranks the other competitors as "USA, then India, then Russia, then China" from best to worst. When the actual leaderboard is revealed, the order is China, then Russia, then India, and then USA for the round. Essentially the player initially correctly actively remarks that China is doing well, however still has an inherent bias towards India and the USA, which reveals itself when the player is asked to compare all their competitors to one another. This causes an inversion in a more accurate assumption about the situation.

4. Discussion

4.1 Interpretation of Findings

In terms of player archetypes, meeting the peak of the parabola has been delayed in trials where real country names were used. This can either be attributed to the presence of country names and involvement of prior perceptions of international relations, a distraction bias in the game strategies, or to recognition of the competition within the game as lesser than it actually is, since there is a greater self-identity when identifying as a real-world country as opposed to representing a colour-coded country. It is also important to note that, unlike the sense of uniformity perceived by colour-coding, identifying by countries makes the players consider factual data, such as perhaps the size of the economy, political stance, manufacturing prowess, etc. Hence, it is believable that there is a more non-uniform sense of competition perceived by the participants in the gameplay with country names, further delaying the perception of competition.

From the total volume of trades in the games, it is observed that, in general, trade between countries decreases in the test condition as opposed to the control condition. It can be hypothesised that there is a higher degree of immersion involved in the game once real-world country names are used. This makes the players more conservative since resource stockpiling seems to be felt as a more secure mechanism for dealing with the pandemic. The players are less dissociated with the identity of the countries they represent, making the consideration of more abstract ideas such as trading away resources slightly more discouraging. This could also be why the peaks of the round-wise trade data trendlines arrive later than they should in the test groups.

As per Figure 7, India has performed better in the test cases than in control cases. This can be attributed to the fact that all participants of the study have been citizens of India and therefore hold an implicit bias towards India. Brazil's poorer performance in the test case could stem from the fact that politics or trade with Brazil is far less covered in Indian media. USA's deficient performance across all participants while maintaining trade volume needs to be further analysed with respect to survey findings (Purushothaman, 2022; Fuchs and Thurner, 2014).

4.2 Theoretical Implications

The literature review highlights the parallels between the politicisation and polarisation observed in real-world geopolitics during pandemics and disasters and the potential for similar patterns to emerge within virtual environments. The findings from this study support the idea that introducing real-world geopolitical elements into virtual games can delay the perception of competition and influence player behaviour. This suggests that virtual environments can serve as a valuable testing ground for understanding how political narratives and dynamics impact human decision-making, both individually and collectively, supporting the findings from Belaza *et al.*, 2020.

4.3 Practical Implications

4.3.1 Game Design for Enhanced Engagement

Game developers can use these findings to design virtual environments that encourage player engagement and immersion. Incorporating real-world geopolitical elements while maintaining a balance to prevent bias or distortion can create more captivating and thought-provoking gaming experiences.

4.3.2 Mitigating Implicit Bias

The findings indicate that players may exhibit biases in favour of their real-world countries. Game developers should be aware of these biases and take steps to balance gameplay. Virtual games with economic components should prioritise fairness and transparency in their in-game financial systems.

4.3.3 Incorporating Real-World Relevance

Educational and serious games can benefit from incorporating real-world political and economic elements to provide players with valuable insights into the complexities of global issues. Educational institutions and policymakers can consider integrating virtual economic simulations into curricula to enhance students' understanding of economic principles, decision-making, and the impact of real-world events on financial choices.

4.4 Limitations of the Study

The primary methodological constraint of the study is the number of teams considered for the analysis and the lack of diversity among the participants. The generalisability of the findings is restricted to the age group and country of origin of the participants in the study. All participants were from India, the advantage of this being that the five countries within the game could be selected to maximise variance in perception and response as tailored to an Indian audience. The disadvantage here is that it makes inferences strong only for the Indian population. The same disadvantage goes for age restriction. The experimental data was captured entirely during the COVID-19 pandemic when a controlled lab testing environment to ensure physical uniformity was inaccessible.

5. Conclusion

The findings of this study provide intriguing insights into player archetypes and the impact of real-world country names on in-game decision-making. The presence of real-world country names appeared to delay the peak of resource trading patterns, potentially due to players' immersion in the geopolitical context and their consideration of factors like the size of the economy and political stances. This study sheds light on the complex relationship between real-world geopolitics and player financial behaviour in digital games. The methodology can be expanded to detect a difference in political polarisation across various ranges of people. One of the focuses in the future of this study is to detect a perceivable difference in political polarisation across age ranges, through children, young adults, as well as senior citizens.

Acknowledgement

We extend our sincere gratitude to Agastya foundation, Andhra Pradesh, India and especially Mr. Subramanium. This game was conceptualised as a learning tool for the Agastya Foundation, who work with children in science parks. Acknowledgements to the GoLive games team, Hyderabad and Mr. Ravikiran for the initial development of the game as well as maintaining the serverless backend and being available for further technical queries. Most importantly, our deepest acknowledgements go to all the volunteers who took out time to participate in our study, provided appropriate feedback, and enjoyed the process.

Rights Quest: A Game for Child Rights Awareness

Suzanne Ensmann
The University of Tampa, Tampa, Florida, USA

suzanneensmann@gmail.com

Abstract: The interactive video game "*A Way Home!*" is a serious game for promoting pro-social change by raising awareness of children's rights, as outlined in the United Nations Convention on the Rights of the Child treaty. All countries except the United States have ratified this treaty. Through a collaborative effort, faculty and students developed this game using an open-source platform to create an immersive first-person video game experience to disseminate crucial knowledge about children's rights and the need for ratification. Game design guides players through real-world comparative scenarios depicting environments that support or do not support those fundamental rights. Through engaging gameplay and storytelling, iterative development processes facilitated the game's effectiveness in conveying complex concepts, such as the distinction between rights and responsibilities. The significance of children's fundamental rights, such as access to food, a safe, clean home, the right to speech, and freedom of expression, as enshrined in the CRC, are emphasized by juxtaposing different environments and depicting the consequences of choices. Grounded upon the Diffusion of Innovations theory (Rogers 2010), the first step to adopting cultural change is education. Using gameplay elements, including rewards for positive choices and learner guidance instructions, *"A Way Home!"* rights quest motivates players to explore and understand the principles of children's rights. The player wins the game when they achieve the goal of being heard in a court of law. By combining education with entertainment, the game aims to inspire empathy and foster understanding, with the ultimate goal of teaching about the need for ratification of the CRC Treaty in the U.S. and empowering players to take action and advocate for children's rights. This paper depicts the methodology involving participants (n=17) from one southeastern university in the States to capture qualitative and quantitative feedback through a perception survey to evaluate the first demo model. Results support advancing data collection for the next version developed using virtual reality (V.R.) headsets to further immerse the learners in the experience.

Keywords: Game*, DGBL, VR, Child*, Rights, CRC

1. Introduction

Since the birth of the Convention on the Rights of the Child (CRC) in 1989, the United States (U.S.) remains the only United Nations (U.N.) member in absentia to ratify this human rights treaty. The CRC Treaty encompasses fifty-four articles centered around four key themes: survival, development, protection, and participation. Articles 12 and 13 articulate that children should have the equitable right to express themselves freely and that all legal proceedings affecting them count their voices (Patel et al. 2021). The challenge is that many may be unaware that a list of fundamental human rights exists for children to improve their well-being or that any children in the States may even be suffering and need the protection of fundamental human rights. The researchers, a small team of faculty and research assistants set forth to develop a prototype (Ensmann 2017) into an interactive video game called "*A Way Home!"* as a serious game to begin pro-social change by raising awareness of the CRC treaty and that the U.S. stands in absentia.

Serious games, crafted to educate and motivate action, have emerged as influential tools for tackling social issues, including children's rights. Examples include "*Ayiti: The Cost of Life,*" which allows players to manage a family in Haiti and deal with poverty, education, and health challenges (Oygardslia 2015). Although not explicitly marketed as such, this game engages players with the challenges outlined in the CRC, particularly the right to education and a standard of living adequate for the child's development. Jennifer Anne's Group offers several other examples of fostering an annual competition to raise awareness, education, and advocacy to improve social issues seen in teenage domestic violence (Crecente 2014), which largely supports communication, further aligning to articles 12 and 13 in the CRC. These examples illustrate the power of serious games to convey important social messages. At the same time, the gap in the literature reflects that no previous games demonstrated that the U.S. still needs to be present in ratifying the CRC treaty for equality amongst all children in the States. Oygardslia's study also suggests that game developers have the crucial role of guiding players from awareness to action, serving as a catalyst for social change (2015). Bacon suggests that "Knowledge is power" (García 2001, p. 109). Thus, disseminating this knowledge about the CRC and the need for ratification, with specific action steps for players, offers a step to begin this change.

1.1 Does This Matter Anymore?

According to the American Community Survey, 68% of children between the ages of 12 and 17 and 75% of children under the age of 6 lived with parents in two different households (U.S. Census Bureau 2023),

representing millions of children in the middle of a family law case between estranged parents. The courtroom determines the fate of many of these children. Only if that jurisdiction upholds children's rights will the children's voices be permitted. Even when the children are allowed to speak, their words are often discounted based upon engrained practices (Collins 2012). Whether their words are fairly weighted is left up to a judicial system that is often not trained in mental health issues to make these determinations (Lemon 1999). Examine the disparity within the court system. Criminal cases have acknowledged that children can credibly express their views, such as in the 1967 Gault Case (Federal Judiciary 2015). The Juvenile Detention division may deem children "fit to be heard." However, these same children may be considered "unfit" in the Family Law division (Taylor 2009) regarding where they feel safe to sleep and are nourished and protected. Likewise, children's rights vary by state and county. Forty states provide children a voice in their dependency cases, creating inequality for the children in the other states (Breger 2010; Rodham 1973). These rulings do not stem from research reflecting the children's ability to express themselves better in one court of law over another but from legislative traditions. LaShanda Taylor, a staff attorney with the American Bar Association Center on Children and the Law, summarized the need for children to have a fair voice:

> *Denying the child a voice in the lawyer's advocacy 'reinforces... lessons learned most thoroughly by abused*
>
> *and neglected children that he [she] should not expect to have any control over his [her] fate* (2009, p. 617).

To further support the need, a thirty-year study reveals that U.S. children continue to rate in the bottom percentile compared to adopters of the CRC (Vandenhole et al., 2019). UNICEF's "Report Card" series evaluates the well-being of children in economically advanced countries, focusing on various aspects such as education, health, and inequality. Since the first publication of *The State of the World's Children* in 1980, there has been a significant reduction in child mortality rates. At that time, 10% of children born that year died from preventable causes, but by 2018, this figure had decreased to 3%. Global milestones like the 1989 adoption of the Convention on the Rights of the Child contributed to this decrease, bringing children's rights to the forefront of global and national policy agendas, a previously lacking focus (UNICEF**,** 2019). Report Card 16 examined the worlds of influence to understand what shapes child well-being in rich countries and found that "Only Chile, the United States, and Malta are in the bottom third of rankings for each of the three well-being outcomes" (p. 10, 2020). This report included mental well-being, physical health, and social skills, as shown in Figure 1.

Overall ranking	Country	Mental well-being	Physical health	Skills
1	Netherlands	1	9	3
2	Denmark	5	4	7
3	Norway	11	8	1
4	Switzerland	13	3	12
5	Finland	12	6	9
6	Spain	3	23	4
7	France	7	18	5
8	Belgium	17	7	8
9	Slovenia	23	11	2
10	Sweden	22	5	14
11	Croatia	10	25	10
12	Ireland	26	17	6
13	Luxembourg	19	2	28
14	Germany	16	10	21
15	Hungary	15	21	13
16	Austria	21	12	17
17	Portugal	6	26	20
18	Cyprus	2	29	24
19	Italy	9	31	15
20	Japan	37	1	27
21	Republic of Korea	34	13	11
22	Czech Republic	24	14	22
23	Estonia	33	15	16
24	Iceland	20	16	34
25	Romania	4	34	30
26	Slovakia	14	27	36
27	United Kingdom	29	19	26
28	Latvia	25	24	29
29	Greece	8	35	31
30	Canada	31	30	18
31	Poland	30	22	25
32	Australia	35	28	19
33	Lithuania	36	20	33
34	Malta	28	32	35
35	New Zealand	38	33	23
36	United States	32	38	32
37	Bulgaria	18	37	37
38	Chile	27	36	38

Note: A light blue background indicates a place in the top third of rankings, medium blue denotes the middle third, and dark blue the bottom third. The rankings in the table were produced as follows: (1) We calculated a z-score for each indicator (reversed where necessary so that a higher score represents a more positive outcome); (2) we calculated the mean of the two z-scores within each dimension; (3) we calculated the z-score for each mean; and (4) for the overall ranking, we then calculated the mean of the mean z-scores for each dimension. This table includes the 38 OECD/EU countries which had data of sufficient quality across at least five of the six Outcomes indicators listed in Box 1. We were unable to include Mexico and Turkey due to low coverage rates in the Programme for International Student Assessment (PISA) 2018 survey (which provides three of the six indicators that make up the league table). We were also unable to include Israel as data were missing on two of the six indicators.

Figure 1: Innocenti Report Card 16. Worlds of Influence: Understanding What Shapes Child Well-being in Rich Countries Reproduced with Permission from the Global Office of Research and Foresight (UNICEF 2020)

Figure 2 defines the indicators used to determine these areas of well-being.

Box 1: Indicators used in the report

	Dimension	Components	Indicators	Source
Outcomes	Mental well-being	Life satisfaction	Percentage of children with high life satisfaction at 15	PISA, 2018
		Adolescent suicide	Suicide rate for 15- to 19-year-olds	WHO Mortality Database, 2015
	Physical health	Child mortality	Child mortality rate (all causes), 5–14	UN IGME project, 2018
		Overweight	Percentage of children overweight, 5–19	State of the World's Children, 2016
	Skills	Academic proficiency	Percentage proficient in mathematics and reading at 15	PISA, 2018
		Social skills	Percentage who make friends easily at school at 15	PISA, 2018
Activities	Play	Playing outside	Frequency of playing outside at 10 years old (days per week)	Children's Worlds, 2017–19
	Digital	Internet use	Average duration of Internet use by children	EU Kids Online, 2018–19
Relationships	Family	Family support	Level of family support reported by children at 15 years old	HBSC, 2017/18
		Family participation	Percentage of children aged 10 totally agreeing that they participate in decision-making at home	Children's Worlds, 2017–19
	Peers	Being bullied	Frequency of children being bullied at 15 years old	PISA, 2018
	School	School belonging	Sense of belonging at school at 15 years old	PISA, 2018
		School participation	Percentage of children aged 10 totally agreeing that they participate in decision-making at school	Children's Worlds, 2017–19
Networks	Parent–community	Parental support networks	Main sources of support for parents in looking after children	European Quality of Life Survey, 2016
	Parent–work	Work–family balance	Percentage of employees struggling to fulfil family responsibilities	European Quality of Life Survey, 2016
		Hours worked	Average weekly hours worked on main job	OECD based on Labour Market Statistics, 2017
	Parent–school	Relationship with school	Parents' rating of their relationship with school	European Quality of Life Survey, 2016
Resources	Household resources	School books at home	Percentage of children aged 15 having books at home to help with school work	PISA, 2018
	Neighbourhood resources	Local play facilities	Percentage of children aged 10 who agree that there are enough places to play in their local area	Children's Worlds, 2017–19
Policies	Family policy	Parental leave	Weeks of full-rate equivalent parental leave in early childhood	OECD Family Database, 2018
		Child poverty	Percentage of children in households below 60% of median income	Eurostat, HILDA, LIS and national statistical agencies, 2018
	Education	Early childhood education and care	Percentage of children attending early childhood education and care one year before school	UNESCO, 2017, *Report Card 15* and UNSTATS
		NEET	Percentage of 15- to 19-year-olds out of school, employment or training	OECD Family Database and Eurostat, 2018
	Health	Immunization	Measles immunization	WHO/UNICEF, 2018
		Low birthweight	Percentage of newborns weighing less than 2,500 grams	OECD Health Database and WHO, 2017
Context	Economy	Income	Gross national income per capita in international dollars	World Bank, 2018
		Jobs	Unemployment rate (percentage of active population)	World Bank, 2019
	Society	Social support	Percentage of adults who have someone to count on	Gallup World Poll, 2016–18
		Violence	Homicide rate	World Bank, 2017
	Environment	Air pollution	Mean levels of fine particulate matter PM2.5	Global Burden of Disease Study, 2017
		Water quality	Percentage of population using safe water	WHO/UNICEF Joint Monitoring Programme, 2017

Figure 2: Innocenti Report Card 16. Worlds of Influence: Understanding What Shapes Child Well-being in Rich Countries Indicators Reproduced with Permission from the Global Office of Research and Foresight (UNICEF 2020)

1.2 Disseminating the Knowledge

In the U.S., the Entertainment Software Association (ESA) conducts surveys to gather data on video game usage, and a recent report shows that approximately 190.6 million Americans play video games weekly, with the average player age (2024). The report further reflects those consumers spent $57.2 billion (including content,

hardware, and accessories) in 2023 (2024). Studies reflect that digital game-based learning (DGBL) is a motivational means to learn (Justice and Ritzhaupt 2015) and improves focus, learning cognition (Eichenbaum et al. 2014), and retention (Brent and Felder 2009; Gee 2008; Gordon 1970). Reasoning and critical thinking skills become by-products of problem-solving instruction (Gordon 1970), and systematic thinking and processing are vital parts of simulations (Prensky 2001; 2006). Gee posits that brain function embodies sensory involvement (2008). Video games, therefore, serve as a logical platform for learning based on how the brain works. Games provide a problem, and players select avenues of advancement to solve it. Players advance or retreat through game stimuli, learning through each experience (Connolly et al. 2012; Gee 2008; Hamari et al. 2016; Plass et al. 2015).

Gaming has been used to educate about other U.N. treaties. For example, in answering the call to promote sustainable energy, Ball State University initiated the Second Chance Game for Global Awareness and Responsibility development in collaboration with local partnerships. The outcomes of this DGBL initiative demonstrated that teaching social justice knowledge and getting buy-in from key players to develop innovative educational strategies go beyond governments creating treaties or passing laws (Pacheco et al. 2006). Moreover, gaming in education has far greater capabilities of influencing learners than traditional instructional methods, as highlighted in the article "Can a Video Game Make Someone Nice?" (Kapp 2012). In both instances, players who engaged with the game were more likely to influence others to make positive choices and were more inclined to help someone in need (Kapp 2012). Note that the terms *player* and *learner* are used changeably in this paper. Each term brings opposing entertainment, and educational positive or negative connotations based on readers' experiences. Therefore, to have the most significant impact on the broadest population, this instruction is designed for all adults who play games in an immersive, first-person video game. The goal is to shift the cultural paradigm to one where mindsets realize that players can learn and can be motivated to transfer knowledge uncovered by playing with others and using serious games for learning.

2. Research Question

The research questions this game set out to answer are:

Can the rights quest game, A Way Home

1. *inform people about the CRC Treaty and change their perceptions about the need to support children's rights in the U.S.?*
2. *motivate players to take action by sharing the game and/or information learned from the game?*

The long-term social impact goal is to ultimately encourage Americans to ratify the CRC in the U.S. to improve the quality of life for all children. For the short-term goal, we aim for users to consider "Never believe that a few caring people cannot change the world… indeed, that is all who ever have,*" Margaret Mead.*

3. Methodology

3.1 Game Design and Development

The primary investigator and research assistants embarked on creating a first-person video game using the Unity Engine, an open-source 3D game development platform. The development team selected this platform as a cost-effective means that provides ample free tutorials for educational institutions and independent developers to produce high-quality games without the significant financial burden often associated with game development. The game design facilitates gameplay with unfolding scenarios in which the player navigates the world through the eyes of a child. By leveraging narrative, interactive elements, rewards, and consequences, players move through each experience, highlighting the impact of children's rights, as listed by the CRC articles, as they are supported and when they are not. Scenarios include the fundamental right to play, nourishment, a safe environment, freedom of expression, and the right to equitable speech, the latter being the ultimate win the player can achieve at the end of the game. Scenes compare and contrast with music and imagery. For example, the first scene reveals an environment where the child has ample food and a safe home, as depicted by a caring parent who engages them in discourse about the difference between rights and respectfully communicating desires.

In contrast, the next scene offers an unsafe environment, denoted by barren land, hostile ambiance, lack of food, broken windows, and unsafe provisions for the toddler teetering on a slide alone. Rewards are embedded

based on players' game decisions whereby players can achieve collectibles for positive choices, such as being *kind*. A heart on the player's wrist, designed like a watch, grows points when the player selects choices to be kind, such as feeding a bird, picking up garbage, or looking after a sibling. Conversely, players lose points by making poor decisions throughout the game, such as disrespectfully speaking to the parent or making demands. The heart on the player's wrist that grows with positive actions serves as a tangible representation of moral choices, aligning with the concept of "serious games" that aim to provoke reflection and inspire action (Michael and Chen 2005). Imagery and audio continue to evoke emotion and changing attitudes.

Developers used ongoing iterations of formative evaluation to guide revisions and drive improvements to game performance. Advancing the instruction from the 2-dimensional prototype (Ensmann 2017) into a realistic video game takes ample time, expertise, and hardware capable of handling the graphics. Specific design decisions embedded into the first two scenes include beginning the game with common elements players are most likely to be familiar with (such as a soccer ball and a bird) to capture their attention (Gagne 1981) while moving into the fanciful and interactive elements (through user-driven exploration) to motivate gameplay (Gunter et al. 2008). For example, players may play soccer with their siblings to achieve more game points. Game controller navigation uses players' prior knowledge based on common prompts in the game industry. Still, detailed instructions also appear within the first scene for learner guidance before introducing complex concepts (Gagne 1981). The team designed the demo as a computer-based game and redesigned the next version for delivery using V.R. headsets. This experiential learning approach aligns with research showing that interactive digital environments can significantly enhance the retention of complex social and moral concepts (Gee, 2008; Prensky, 2003). The game taps into emotional responses by contrasting positive and negative environments to change attitudes and deepen learning (Bogost 2007).

3.2 Evaluation Instrument

According to the literature, survey methods offer the quickest response rate and cost-effective advantages for mid to large-sized populations (Babbie 1973; Creswell 2017; Fowler 2009). Therefore, the researchers used consensus agreement (Creswell 2017) to create a mix of closed- and open-ended survey questions to enhance numerical data and capture a rich perspective of participants' responses focused on the guiding questions:

Can the rights quest game, A Way Home,

1. inform people about the CRC Treaty and change their perceptions about the need to support children's rights in the U.S.?
2. motivate players to take action by sharing the game and/or information learned from the game?

The survey included instructions and three Likert scale questions regarding gameplay, each followed by open-ended questions for participants to elaborate qualitatively. Three additional open-ended questions offered participants the option to elaborate further. The nine-item survey inquired about the game's motivational aspects and specific facts about the CRC Treaty. Lastly, demographic questions consisting of four multiple-choice and two Likert scale questions captured the participants' gaming habits.

The content questions were distributed to two university students to test the instrument for interrater reliability and reflected a 78.78% agreement rating. Questions were revised based on consensus agreement to offer further clarity (Creswell 2017), resulting in 100% agreement. For example, raters found the first question confusing: *Did the game motivate you to engage?* Consensus agreement offered the modification: *How do you rate the game's features for motivating gameplay?* For the second question, raters found a misspelling corrected by revising a pronoun from "you" to "your."

Each survey began with informed consent, and the university's International Review Board approved the study protocol.

3.3 Participants

Faculty in the Communications department agreed to administer a voluntary pilot test to undergraduate student volunteers (n=17) enrolled in their classes as a convenience sample to gather formative evaluation for game improvement. Students who volunteered between the ages of 20 and 24 at a university in the southeastern region of the U.S. No one was excluded from the pilot test. Researchers did not gather any identifiable information, and the participants were anonymous. Due to the 3D game prototype being in the demo phase of development, the researchers had concerns about possible technical issues the participants could experience if they were to download and play the game themselves. Therefore, a brief video demonstration recording of

gameplay portrayed navigation through all scenes and showcased all the available game interactions. The protocol included having participants watch the video demonstration and then answer the short perception survey to gather information about user experience and knowledge gained about the CRC Treaty.

4. Findings

The first question inquired how the game's features motivated gameplay. Most students answered positively (n=12); some stated that it did not motivate them (n=3); and the rest had a mixed answer (n=2).

The second question inquired about the players' interest in staying in the game until the final scene. While three stated that they did not lose interest, the rest of the answers mentioned specific moments that varied across different stages of the game, from the opening credits to the last scene of the demonstration.

When asked, "What was the game about?" most participants described the contrasting quality of life between different children (n=11) and provided a general description of children's rights (n=4). Others stated that the game concerned high-risk behavior (n=1) and nutrition (n=1).

When listing one fundamental human right in the Convention on the Rights of the Child treaty, most (n=11) could recall at least one right, while some (n=6) did not remember any rights. The most common right mentioned in the answers was the right for children to have nutrition (n=4), followed by the right to love (n=3), to play (n=2), freedom of expression (n=1), and the right to own things (n=1), the latter being the only answer that was not accurate.

When prompted, "Which nation has not yet adopted the treaty?" Most participants (n=13) answered correctly that the U.S. is the only country yet to do this. A few (n=3) did not know the answer, and one responded that Venezuela had yet to adopt the treaty.

When asked about their motivation to take action, such as sharing this game with someone else, most participants (n=8) stated yes, some (n=6) stated no, and the rest of the responses were uncertain. Quotes listed below represent the range of responses:

Finally, regarding participants' gaming habit demographics, most of the sample did not identify as gamers. When asked, "Do you identify yourself as a gamer?" only one person selected "Definitely yes." One chose "Probably yes," two chose "maybe," seven selected "Probably not," and six chose "Definitely not." For the question, "How many hours a week do you play games?" two participants indicated that they play between 4 to 7 hours weekly, seven participants between 1 and 2 hours weekly, and the rest did not play games. Table 1 offers a range of direct quotes.

Table 1: Findings During Formative Evaluation to Improve the Game

Variable	Sample Range of Quotes
Did the game's features motivated gameplay	• *Yes the game motivated me to engage, it was very capturing for my attention* • *not really, I did not understand the point of the game and it was too boring* • *I was engaged, but at times was looking more at the content and missed some of the words on the screen, especially in the beginning.*
Interest in staying in the game until the final scene	• *Halfway thru because of the graphics* • *it was pretty interesting, but I know children are treated like that! so sad.* • *The dialogue needs to be improved, I feel like it's a small detail but would have encouraged*
What was the game about?	• *about solving some kind of escape room by showing the way children are treated in different areas of the world.* • *Provided a way to show people that many children are bless[ed], but others don't have as well made. With that being said at the end of the day the game showed me that no matter their circumstances all children deserve rights.* • *Raising awareness that children around the world or even two houses down from you are treated differently.*
Which nation has not yet adopted the treaty?	• the U.S. (majority)
Motivation to take action	• *yes I would definitely send this game to others* • *Yes since it will create conscious awareness!* • *no because the game looked too unreal.* • *Yes the second situation made me sad and I explained the game to my roommate* • *Yes, with educational school boards. Have children play the game and if a child's circumstance reflects or invokes familiar feelings of negative children's right then provide a prompt for the kids to click "I need help.".*
Do you identify yourself as a gamer?	• No (majority)

5. Discussion

The results indicate that the first game demo positively conveys the intended message and motivates most participants to take action. Most participants could recall critical information about the CRC Treaty and empathized with the disparity between children's quality of life. Many answered that they were motivated to

share information about this game and the topic. The two most common themes the participants recalled were that the U.S. is the only country that has not ratified the CRC and that children deserve fundamental rights. While most participants did not identify as "gamers," they did understand the overarching theme and the importance of raising awareness of this social justice issue. Participants also provided helpful insight regarding the usability of the game and the clarity of how the content unfolds in the game environment. For example, the game development team used participants' responses such as "the game looked too unreal," a need for "dialogue," or references to "boring" to move the game into the V.R. realm. Based on the literature and evolving technologies, future iterations were designed for V.R. headsets like MetaQuest 2 and 3 to improve graphics and motivation.

The transition from a 2D prototype to a fully realized V.R. game represents a critical technological and educational advancement in the project. V.R.'s immersive nature has enhanced empathy and understanding of social issues by placing players in the shoes of those experiencing these challenges (Herrera et al. 2018). This move to V.R. is a technological upgrade and a strategic decision to deepen the game's emotional impact and educational value.

Finally, survey responses revealed opportunities for improvement to clarify the rights listed by the CRC and how players can take action. See Table 2 for sample revisions.

Table 2: Sample revisions based on testing.

Scene	Survey responses and technical challenges	Final VR Version 1
Begin	Wordiness and scrolling across the screen made it difficult for players to read.	Developers truncated scripts to reveal one concept per canvas, and words are directly in front of the player to avoid scrolling.
All Scenes	Participants recommended more contrasts between fundamental human rights provided and not provided and dialogue to clarify concepts. See Figure 3.	Because cultures and experiences vary, the player is now provided with background information prompts to assist in recognizing the environment.
All Scenes	Game elements such as collectibles motivate players to collect treasures for random acts of kindness, such as a gem for admiring the crow rather than scaring him. Still, nothing aggregates the wins for further motivation.	The VR environment now includes a heart on the player's wrist, reflecting points that grow, or decline based on the player's actions. Points now accumulate to spark competition. See Figure 4.
Second Scene	To motivate gameplay, audio evokes emotion, such as in the scene that reflects an impending fall a child could take standing upon a highly misaligned structure. Responses suggested graphics could be more realistic.	The child now falls and cries, offering a more realistic experience than the fantasy created in the demo version. All scenes now have realistic characters. See Figure 5.
End	Users wanted to continue playing at the end.	This version offers Play and Exit options.
All Scenes	Testers suggested that gameplay include realistic graphics and dialogue to reduce player boredom and increase motivation. Still, character agents and assets with high poly counts caused glitching in the Meta Quest headsets.	Beautiful high-poly-count assets were added and then deleted due to the VR headsets' inability to handle them, and developers began using low-poly-count assets again. See Figure 6.

Figure 3 : The first scene was revised to include food and pleasant discourse, compared to the opposing scene with an empty refrigerator and grunts.

Figure 4: The game now includes a heart on the player's wrist, which grows or loses points based on positive or negative player actions.

Figure 5 *:* The game now offers a sense of realism repurposed for VR headsets. The computer-based demo version images are on the left, and the final Version 1 images are on the right.

Figure 6: Developers included revisions with high-poly assets to add realism but removed them to improve functionality in VR headsets. Revised high-poly version images are on top, and the final photos are on the bottom.

6. Limitations

Limited funding offered constraints of time and expertise. This project cost approximately ten thousand dollars, which falls short in the industry that produces sustainable games with millions for V.R. environments. Testing results of the game may also include variances due to participants watching a recording rather than playing the game as per the protocol referenced under Methodology 3.3. The sample may be biased due to a

lack of randomization because it only represents a small population, leading to limited generalizability of the findings.

7. Conclusion and Future Work

The initial testing phase of *A Way Home* demonstrates the potential of using a first-person video game to raise awareness about children's rights in the U.S. and educate players on the CRC treaty. Developed using the Unity Engine, this game provides an immersive experience where players navigate the world through the eyes of a child, encountering scenarios that illustrate the profound impact of acknowledgment of children's rights—both when they are upheld and denied. The game's design incorporates unfolding narratives, interactive elements, and moral choices reflected through a tangible in-game mechanism: a heart on the player's wrist. This heart grows or shrinks in response to the player's decisions, symbolizing the consequences of their actions in real time. By engaging with everyday scenarios—like playing soccer or interacting with family—players earn rewards for positive actions, such as kindness, and lose points for negative behavior, fostering a deep connection between gameplay and the moral lessons it aims to convey.

As the game transitions from a 2D prototype to a more immersive VR environment, it leverages advanced technology to enhance its emotional impact and educational value. VR's capability to evoke strong emotional responses by placing players in contrasting environments—safe versus unsafe, nurturing versus neglectful—is crucial for fostering empathy and driving attitude change. This experiential learning approach, supported by research, emphasizes the game's role as a tool for awareness and a catalyst for social change.

Ongoing iterative revisions, guided by formative evaluations, have refined the game's performance and effectiveness. Integrating familiar elements, such as soccer balls and birds, with complex social concepts ensures that players are gradually introduced to the deeper messages of the game, enhancing retention and comprehension.

This concept aligns with Rogers' Diffusion of Innovations theory (2010), which suggests that cultural change is a gradual process driven by early adopters. *A Way Home* seeks to participate in this cultural shift. By building on the historical context of U.S. support for international human rights—dating back to President Reagan's work on the CRC Treaty and continuing with strong endorsements from Presidents Carter and Obama—the game aims to influence public opinion and inspire action toward ratifying the CRC in the U.S. As the game moves forward, the next research phase will explore its ability to motivate gameplay (affective domain), educate players about the CRC (cognitive domain), and inspire civic action in the V.R. environment. By continuing to refine and expand the game's capabilities, *A Way Home* aspires to be a powerful tool in the fight for children's rights, ultimately contributing to a better future for all children.

Acknowledgments

During the 2023-2024, this project was funded by the University of Tampa Research Innovation and Scholarly Excellence (RISE) Award/Dana Foundation Grant.

Board Games and Entrepreneurial Skills Acquisition: A Mixed-Methods Study on the Efficacy of the EntreComp Framework in Higher Education

Marta Ferreira Dias, Cristiana Alves and Marlene Amorim
GOVCOOP, University of Aveiro, Portugal

mfdias@ua.pt
cris.ferreira23@ua.pt
mamorim@ua.pt

Abstract: The landscape of higher education has witnessed a paradigmatic shift towards methodologies that are more interactive and engaging. The integration of gamification and board games as active learning methodologies in higher education, as well as the instruction in entrepreneurial competencies, has garnered significant interest for its potential to engage and motivate students, thereby enhancing learning outcomes. Gamification, characterized by the incorporation of game design elements into non-game contexts, offers a captivating and novel learning experience that fosters intrinsic motivation and active participation among students. One of the main ways of applying gamification is through board games, providing hands-on opportunities for students to apply theoretical knowledge in practical scenarios. A critical aspect of this educational innovation is its contribution to the instruction of entrepreneurial competencies, a domain gaining traction within higher educational settings. The European Entrepreneurship Competence Framework (EntreComp) stands at the forefront of this educational endeavor, offering a comprehensive blueprint for cultivating entrepreneurial skills and mindsets. This study is anchored in the context described above, with a focused aim to delineate which entrepreneurial competencies, as outlined by the EntreComp framework, are most effectively developed through these novel educational interventions. To facilitate this investigation, the "Game It Away!" project was initiated, encompassing three pilot studies. These pilots innovatively employed board games as the medium through which participants could acquire and hone their entrepreneurial skills. A key component of the learning process within these pilots was the maintenance of a learning journal by the students. This journal, filled with various reflective questions, provided a structured mechanism for participants to document and reflect upon their learning journey throughout the project. In this way, by using qualitative and quantitative methodologies, it is possible to verify the evolution of certain competences. The integration of gamification and board games within educational settings, particularly through the lens of the "Game It Away!" project, represents a pioneering approach to fostering entrepreneurial competencies among students. This study, leveraging both qualitative and quantitative methodologies, has illuminated the substantial potential of these innovative pedagogical strategies to revolutionize the teaching and acquisition of entrepreneurial skills as outlined by the EntreComp framework.

Keywords: Gamification; Board games; Entrepreneurship; EntreComp; Active Learning Methodologies

1. Introduction

In the evolving landscape of Higher Education, the shift towards more interactive and engaging teaching methodologies has become paramount in addressing the dynamic needs of contemporary students. This paper explores the integration of gamification and board games as transformative educational tools within the framework of the European Entrepreneurship Competence Framework (EntreComp), a leading strategy in cultivating entrepreneurial skills in higher education settings.

The increasing recognition of gamification, defined as the incorporation of game design elements into non-game contexts, presents a novel approach to education that stimulates student engagement and motivation. This methodology extends beyond traditional learning paradigms by harnessing the intrinsic motivation of students through competition, achievement, and rewards, thereby enhancing both cognitive and emotional engagement in learning processes.

In parallel to the rise of digital gamification, board games have emerged as potent educational tools. These games are not only pivotal in simulating real-world challenges that require strategic thinking and problem-solving, but also in promoting social interactions and teamwork among students. Such interactions are invaluable as they cultivate a suite of soft skills, including effective communication, negotiation, and collaboration, which are essential for both academic and professional success.

Central to this study is the EntreComp framework, which outlines a comprehensive array of competencies necessary for entrepreneurial success across three core areas: Ideas and Opportunities, Resources, and Into Action. Each of these pillars focuses on different aspects of entrepreneurship education, from the ability to identify opportunities to the practical application of ideas into tangible outcomes.

To empirically test the efficacy of integrating board games and the EntreComp framework, the "Game It Away!" project was initiated, involving a series of pilot studies at the University of Aveiro. These studies aimed to provide hands-on experiences where participants could develop entrepreneurial competencies through carefully designed board games. A significant aspect of the learning process in these pilots was the incorporation of learning journals, which allowed participants to reflect on and document their experiences and the competencies they developed throughout the intervention.

This innovative approach not only addresses the theoretical and practical components of entrepreneurial education but also offers a blueprint for future educational practices aimed at developing the necessary skills for today's global economy. By detailing the structure and outcomes of these pilot studies, this paper highlights the potential of gamification and board games to revolutionize the way entrepreneurial skills are taught and learned in higher education.

2. Literature Review

2.1 Gamification in Education

The rise of gamification in educational settings is not merely a trend, but a significant evolution in pedagogical strategies aimed at enhancing student engagement and improving learning outcomes. This methodology employs game design elements in environments traditionally empty of such characteristics to create a compelling learning experience. Gamification involves integrating game dynamics such as competition, achievement, and rewards into the educational process to foster a more engaging and motivating environment (Deterding et al., 2011).

The effectiveness of gamification has been substantiated through various studies. For example, a comprehensive review by found consistent positive impacts of gamification on user engagement and motivation across different domains (Hamari et al., 2014). This includes educational settings where traditional teaching methods might not sufficiently capture or sustain student interest.

Beyond just engagement, gamification can enhance retention and deepen the learning process. It does this by leveraging the natural human tendencies for competition and achievement—elements that are often strong motivational drivers. This is further supported by research from Sailer et al. (2017), who observed that gamification promotes not only cognitive engagement but also emotional and social engagement, thereby enriching the educational experience from multiple dimensions.

However, the application of gamification in education must be approached with nuance and precision. As cautioned by Whitton (2012), poorly implemented gamification can risk trivializing the content or overwhelming the educational goals with too much focus on the game aspects rather than learning outcomes. To this end, Caponetto et al. (2014) recommend that educators design gamified elements that are inherently linked to educational objectives, ensuring that these elements serve to reinforce the curriculum rather than distract from it.

2.2 The Importance of Boardgames as Learning Tools

When we talk about gamification nowadays, we often think about digital contexts. This tends to happen given the importance of digital games in the education of young people. However board games have also been recognized for their educational value.

According to Qian and Clark (2016), those games often simulate real-world challenges that require strategic thinking and tactical planning. This kind of gameplay encourages players to engage deeply with the content, applying theoretical knowledge in practical scenarios, which enhances their understanding and retention of information. The cognitive demands of these games can vary greatly, ranging from simple pattern recognition in younger children to sophisticated resource management and long-term planning in older students.

One of the most significant advantages of using board games in education is their ability to foster social interactions among students. According to Whitton (2012), board games naturally bring players together, creating opportunities for face-to-face interaction and teamwork. During these interactions, players learn to communicate effectively, negotiate with others, and work collaboratively to achieve common goals. These social skills are invaluable, as they translate directly to real-world abilities necessary for teamwork and cooperation in both academic and professional settings.

Research by Boyle et al. (2015) supports the notion that board games not only stimulate cognitive development but also encourage the growth of social competencies through collaborative and interactive gameplay. These games effectively simulate complex real-world challenges within a controlled setting, making them ideal for educational use.

Other impacts that need to be addressed is that traditional board games have also inspired digital adaptations, which combine the physical interaction of board games with the dynamic capabilities of digital technology. These hybrid forms of board games can include elements like apps or online platforms that augment gameplay with multimedia content, real-time data, and interactive features. This integration of technology enhances engagement and expands the educational possibilities of board games, making them more appealing and relevant to digital-native students.

2.3 The EntreComp Framework

The European Entrepreneurship Competence Framework, known as EntreComp (Bacigalupo et al., 2016), has established itself as a vital tool to guide the embedding of entrepreneurial skills within educational curricula. This framework outlines a comprehensive set of 15 competencies categorized under three pillars (figure 1): Ideas and Opportunities, Resources, and Into Action (Bacigalupo et al., 2016).

The pillar “Ideas and Opportunities” involves the ability to identify and seize opportunities for personal, professional, and societal benefits. This includes creative thinking, vision development, and ethical and sustainable thinking, which are essential for fostering an innovative mindset (Bacigalupo et al., 2016). As for the pillar of “Resources” incorporates both tangible and intangible elements, such as mobilizing and managing time, finances, materials, and human resources. This area emphasizes the importance of self-awareness and self-efficacy as foundational competencies for lifelong learning and adaptability. Lastly, the pillar of “Into Action” focuses on the ability to act upon opportunities, turning ideas into action. This includes planning and management, coping with uncertainty, ambiguity, and risk, as well as working with others to achieve common goals (Bacigalupo et al., 2016).

Figure 1: EntreComp Framework

These competencies are designed to be applied across a variety of educational and professional contexts, promoting a comprehensive approach to entrepreneurial education. The framework not only facilitates individual skill development but also supports the creation of a more entrepreneurial society.

Aligning gamification, board games, and the EntreComp framework in educational settings represents a transformative approach that aligns with contemporary educational needs. Gamification and board games enhance student engagement, motivation, and skill acquisition through interactive and enjoyable learning experiences. The EntreComp framework extends this impact by providing a structured approach to develop entrepreneurial competencies essential for the modern workforce.

Together, these elements create an innovative educational landscape where students not only acquire knowledge but also develop the critical, collaborative, and innovative skills needed in today's global economy. This holistic approach ensures that education is not only about information acquisition but about preparing learners to navigate and shape the future effectively.

3. Study Case

This article builds on the work developed under the scope of the project "Game It Away!", which aims to develop and implement a new transdisciplinary and student-centred approach to teaching entrepreneurship, making it more effective in promoting an entrepreneurial mindset and skills and making entrepreneurship teaching more accessible to a wider and more diverse number of Higher Education students. That being said, the new approach is centered on learning entrepreneurship using gamification techniques, namely the creation of board games.

To put this new approach into practice, two pilot tests were carried out at the University of Aveiro in a makerspace under the SER+ project, a University of Aveiro project that allows students to get involved in teaching-related activities. In both pilots, a target of 25 participants was set, exclusively students from the University of Aveiro, and as a means of dissemination, publicity was carried out on social networks, by e-mail, posters were put up around campus and flyers were distributed.

3.1 First Pilot

In the initial pilot study, the participants comprised students from diverse academic levels: 61.5% were undergraduates, 23.5% were enrolled in master's programs, and 15.4% were doctoral candidates. Regarding nationality, the breakdown was as follows: 69.2% Portuguese, 15.4% Guinean, 7.7% Brazilian, and 7.7% Mozambican aged between 18 and 26. The pilot also highlighted a broad range of courses represented, including political science, psychology, public administration, tourism management and planning, economic and business sciences, engineering and industrial management, languages and business relations, physical engineering, and computer engineering.

3.2 Second Pilot

As for the second pilot, it followed the same pattern as the first pilot, i.e. a probabilistic sample, but only a total of 11 participants were obtained, all from degree courses and of Portuguese nationality, aged between 18 and 21. In terms of the courses they attend, the following were identified: quality management, electronic and computer engineering, quality management, marketing, and information technology.

3.3 Methodology

In the pursuit of this dynamic and innovative teaching methodology, it's important to highlight that the primary objective is to impart entrepreneurial skills to students using board games. This developed methodology combines theoretical learning with practical application, enabling students to engage deeply and reflect their understanding in a learning journal provided at the start of their participation. The methodology unfolds in five distinct phases: starting with an icebreaker, followed by a theoretical overview involving a presentation on EntreComp and game design, then progressing to the theme selection, prototype creation, and finally, the pitch presentation (figure 2).

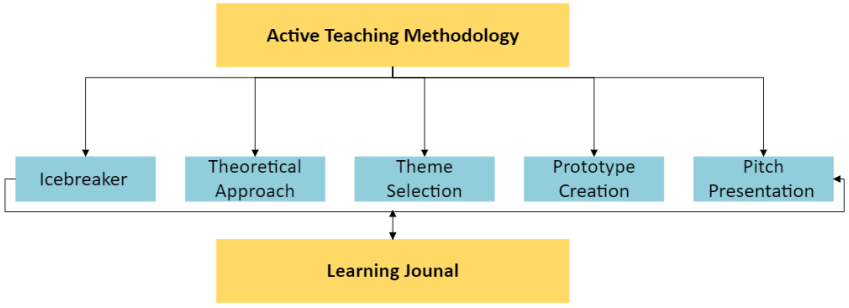

Figure 2: Active Teaching Methodology

Initially, considering that many students were unfamiliar with each other and recognizing that entrepreneurship thrives on network collaboration, an icebreaker was utilized. This was designed to focus on themes pertinent to the subsequent sessions, especially gamification. The activities might include simple games or mimics of popular games to facilitate easy understanding and prompt group formation, with groups capped at five participants.

Following the icebreaker, the session moves into a theoretical discussion that introduces various key concepts. This includes a literature review on EntreComp, which outlines essential competencies for entrepreneurial

success. Here, the facilitator uses captivating examples and encourages students to select, in groups, three competencies they wish to embody in their game design. Additionally, the segment on game design addresses the concept of game design itself, exploring different functions games can serve, common mechanics in board games, and practical examples, such as the mechanics used in Monopoly.

The subsequent phase involves choosing a theme for the game. This process includes guiding the students to consider factors such as target audience, cost implications, originality, the narrative of the game, and its cultural relevance. Creative themes are suggested to foster innovation.

Then, students move on to create a prototype, ideally in a makerspace equipped with all necessary materials. They are provided a worksheet to document important game aspects, including the game's name, theme, mechanics, rules, intended skills development, cost analysis for mass production, number of players, suitable age group, duration, resources needed, and the game's objectives.

The final phase entails a pitch where students present their game to other teams. This presentation strategically omits which skills the game aims to develop, challenging classmates to identify and justify these competencies. This ensures an evaluation of whether the game meets its intended educational objectives and skills development.

Throughout the process, students should be encouraged to reflect in their learning journal, which should then be handed in with an evaluation of the pilot.

4. Results

During the first pilot, students demonstrated a high level of satisfaction with the whole experience, averaging a score of 4.5 out of 5 on the Likert scale. They successfully identified desired themes and competencies to incorporate into their games, with nearly all games reflecting these competencies effectively. Additionally, students easily recognized the competencies in the games created by their peers. Notably, there was no repetition of themes, showcasing a broad range of creativity. However, reflections in the learning journal revealed that students desired more time for prototyping and less emphasis on theoretical content. Some also noted difficulties in reaching a consensus on the theme chosen by their group.

The second pilot maintained a high satisfaction level, with the same average score of 4.5 on the Likert scale. While the competencies chosen were clear in the games, students faced greater challenges than in the first pilot in selecting competencies and themes. The learning journals from the second pilot highlighted some frustrations, as several groups experienced significant discord regarding the choice of theme and competencies. Despite these challenges, students were proficient at identifying the intended competencies in the created games, and once again, there was no thematic repetition.

5. Discussion

The "Game It Away!" project was implemented through two pilot studies that utilized board games to instil and enhance entrepreneurial skills in students. Each pilot was designed to engage students from various academic programs and involved a multi-phased methodology that included an icebreaker, a theoretical overview, theme selection, prototype creation, and a pitch presentation. Feedback collected through learning journals indicated that while students enjoyed the interactive and practical aspects of the methodology, they expressed a desire for more time dedicated to the prototyping phase and less emphasis on theoretical content.

Across both pilots, students reported high satisfaction; however, they encountered challenges in theme and competency selection, with notable frustration and discord noted in the learning journals of the second pilot. These insights are crucial for refining the methodology, suggesting a need for improved guidance and support in the initial phases of the project.

Despite these challenges, the project successfully demonstrated that board games could be an effective tool for applying theoretical knowledge in practical scenarios, thereby enhancing the understanding and retention of entrepreneurial competencies. The absence of theme repetition and the ability of students to identify competencies in others' games underscore the creative engagement and depth of learning achieved.

6. Conclusion

The "Game It Away!" project has explored the integration of board games and the EntreComp framework in higher education to foster entrepreneurial skills, demonstrating a pioneering approach in pedagogical strategies. This study has highlighted the significant potential of gamification to revolutionize the way entrepreneurial competencies are taught and learned.

Through the deployment of two pilot studies, we have observed that board games not only make theoretical knowledge accessible but also engage students in a practical, hands-on manner that promotes deeper learning and retention of entrepreneurial skills. The learning journals served as a crucial tool in this process, allowing students to reflect on their learning experiences and providing valuable insights into the effectiveness of the methodology.

Students reported high levels of satisfaction across both pilots, underscoring the appeal of this interactive approach. However, challenges such as difficulties in theme and competency selection and the desire for more practical and less theoretical focus suggest areas for further refinement. The feedback from the learning journals particularly highlighted the need for better facilitation in the initial stages of theme and competency selection to reduce frustration and enhance the learning experience.

The absence of theme repetition and the successful identification of competencies by students in the games created by their peers demonstrate the project's ability to stimulate creativity and critical thinking. These outcomes affirm the value of board games as powerful educational tools that can effectively simulate real-world challenges and foster the essential skills required in today's entrepreneurial landscape.

Looking forward, we are planning to conduct a third pilot study. This next phase will incorporate the lessons learned from the previous pilots to further enhance our methodology. We aim to refine our approach to theme and competency selection and balance the theoretical and practical components more effectively.

Overall, the "Game It Away!" project contributes to the ongoing discourse on active learning methodologies by proving that well-designed gamification can significantly enhance student engagement and competency development. This initiative not only supports the acquisition of knowledge but also prepares students to navigate and shape their futures effectively, making it a valuable model for integrating entrepreneurial education into higher learning curricula. As we continue to refine and expand this methodology, it holds the promise of making entrepreneurial education more dynamic, accessible, and impactful for a broader and more diverse student population.

A Literature Review: Which, How and What for the Use of Artificial Intelligence in Gamification

Lanlan Gao
National University of Ireland Maynooth, Maynooth, Ireland

Lanlan.Gao@mu.ie

Abstract: Artificial intelligence (AI) is integrated into educational methods through game-like elements, including gamification and serious games, offering tools and approaches to enhance teaching and learning experiences. A comprehensive review was adopted in this study to generate an overall trend or effect on AI in gamification. The paper selection was based on the three databases. Related 22 articles were collected by searching through academic journals or conference proceedings that were published in English from 2019 to 2024. The findings present that machine learning is utilised in serious games, favouring AI that might support gamification and improve results such as enhanced learning outcomes. Some included studies discuss the direct and indirect connection between technologies and gamification, including personalisation, adaptive difficulty, feedback and motivation, predictive analytics, and data-driven Insights. Overall, those interested in the intersection of artificial intelligence and gamification, including researchers, practitioners, developers, educators, and policymakers, can benefit from the literature review.

Keywords: Artificial Intelligence, Gamification, Serious Games

1. Introduction

This research delves into the synergies between artificial intelligence (AI) and gamified elements, concentrating on facets like customisation, scalable complexity, interactive feedback, engagement enhancement, foresight through analytics, and insights informed by data. Its objective is to provide meaningful information for an audience comprising scholars, industry professionals, creators, teachers, and decision-makers eager to integrate AI in gamified learning settings.

1.1 Background

Deterding and colleagues (2011) describe gamification as applying game design elements in non-game contexts to enhance engagement, motivation, and overall user experience in activities beyond conventional gaming spheres. They highlight the use of game-oriented frameworks, designs, and methodologies in sectors not commonly linked with gaming. Fitzgerald & Ratcliffe (2020) support this definition by highlighting the significance of game-related structure, design, and methodology in serious games, which are a practical application of gamification. Furthermore, the core elements of gamification are detailed by Wood & Reiners (2015), who identify game dynamics (including player behaviours, interactions, and experiences), pedagogical or instructional design, and game mechanics (procedures and rules) as fundamental components. Additionally, common gamification tools, such as points, badges, leaderboards, and timed performance, are utilized to enhance user engagement and achievement recognition (Buckley et al., 2018; van Gaalen et al., 2021).

As discussed by Deterding et al. (2011), Serious games have been utilised across various non-entertainment domains such as education, healthcare, research, and marketing (Chicchi et al., 2018). In the field of education, gamification is widely implemented to enhance engagement, motivation, and active participation among learners by leveraging the inherent allure and interactive nature of gaming (e.g., Hamari et al., 2014; Dicheva et al., 2015; Landers & Landers, 2014).

Artificial intelligence technologies are employed in gamified educational frameworks to examine and understand the behaviours, preferences, and academic outcomes of students (Buckingham and Ferguson, 2019). This application provides tailored challenges, feedback, and rewards, thus making the learning process more effective and engaging (Zhou et al., 2020). For example, Buckingham and Ferguson (2019) explore how AI can dynamically adapt game elements in educational settings to match the individual learner's level, thereby optimizing the learning experience for each student. This adaptive learning approach ensures that tasks are neither easy nor challenging, keeping students in a state of flow and maximizing engagement. Zhou et al. (2020)' study discusses the role of AI in personalising learning paths within gamified education platforms. They propose that through data analytics and machine learning algorithms, AI can identify patterns in a learner's interaction with the content and adjust the difficulty, type of content, and rewards in real-time to meet the learner's specific needs and learning goals. Furthermore, Santos et al. (2021) highlight the potential of AI-driven analytics in gamified education to allow educators to monitor progress and optimise teaching strategies. These analytics help teachers

understand how different aspects of the gamified experience contribute to learning outcomes, enabling them to tailor the educational content more effectively.

1.2 Research Aims and Questions

This literature review Identifies and analyses trends from 2019 to 2024 in AI application within gamified education and its effects on learning interventions. Explore how AI technologies connect with gamification strategies, including Personalisation, adaptive learning, and data insights, to improve educational experiences. Offer insights for a broad audience including researchers, educators, and policymakers, highlighting the value and potential of AI in educational gamification. With the intended purpose of this study, the following Research Questions (RQ) to address the specific objectives are presented:

RQ1: In what specific ways is artificial intelligence utilized within gamified education systems?

RQ2: How does AI enhance gamification strategies to improve learning outcomes and engagement in educational settings?

RQ3: What are the primary objectives behind integrating AI with gamification in educational contexts, according to recent studies?

2. Methods

The study utilised a literature review methodology to investigate AI's integration strategies in educational gamification. This approach reviewed academic sources to map out the current landscape, pinpointing theories, processes, and existing gaps by critically evaluating pertinent literature, including books, articles, and journals (McCombes, 2021).

A qualitative data collection strategy was centred on “AI and gamification in education,” targeting research published from January 2019 to March 2024. Data were extracted using specific keywords within Summon 2.0 which includes various popular digital libraries (e.g., PsycINFO, PubMed and Web of Science), Scopus and IEEE Xplore, employing Boolean queries to refine the search: (Artificial Intelligence OR personalised OR adaptive OR machine learning OR AI-enhanced) AND (education) AND (gamification OR serious game OR digital game). The inclusion and exclusion criteria were meticulously designed to ensure the relevance and quality of the selected studies, which are presented in Table 1.

Table 1: Inclusion and exclusion criteria

Inclusion	Exclusion
1). Covers the period from January 2019 to March 2024.	1). Papers unrelated to gamification and AI.
2). Be published in English.	2). Study unrelated to digital games.
3). Study related to the utilisation of gamification and AI.	3). Redundant papers.
4). Study related to digital games.	4). Literature review.
5). Journal articles and conference proceedings.	
6). Full-text and open-access papers.	

3. Results and Discussion

From an initial pool of 1,163 studies (Summon 2.0 1020; Scopus 91; IEEE Xplore 52), 489 articles were evaluated against the inclusion and exclusion criteria, narrowing the field to 87. Upon detailed review, 22 studies were chosen for in-depth analysis. These studies span four key dimensions of AI application in gamified learning: Personalisation, adaptive difficulty, feedback and motivation, predictive analytics and data-driven insights. See Table 2.

Table 2: The examples involved the four dimensions

Five Dimensions	Intervention Status	Examples
Personalisation	direct	Castellano et al. (2023); Hassan et al. (2019); Oliveira et al. (2022); Sayed et al. (2023); Huber et al. (2024); Chen (2023); Nam (2021); Ahmad et al. (2022); Hare et al. (2023); Reshetov & Makarova (2023); Escolano et al. (2023); Blatsios & Refanidis (2019); Maher et al. (2020)
	indirect	Rodrigues et al. (2021); Sanchez et al. (2020); Zainuddin et al. (2020); Rodrigo et al. (2020); Duggal et al. (2021); Yang et al. (2023)
Adaptive Difficulty	direct	Nam (2021); Koravuna & Surepally (2023); Hassan et al. (2019); Oliveira et al. (2022); Sayed et al. (2023); Huber et al. (2024); Chen (2023); Duggal et al. (2021); Cascella et al. (2023); Escolano et al. (2023); Blatsios & Refanidis (2019); Maher et al. (2020)
	indirect	Duggal et al. (2021); Rodrigues et al. (2021); Sanchez et al. (2020); Zainuddin et al. (2020); Rodrigo et al. (2020); Yang et al. (2023); Castellano et al. (2023); Hare et al. (2023)
Feedback and Motivation	direct	Ahmad et al. (2022); Cascella et al. (2023); Hassan et al. (2019); Oliveira et al. (2022); Sayed et al. (2023); Huber et al. (2024); Duggal et al. (2021; Koravuna & Surepally (2023); Nam (2021); Castellano et al. (2023); Grammatikopoulou et al. (2019); Hare et al. (2023); Reshetov & Makarova (2023); Maher et al. (2020)
	indirect	Chen (2023); Rodrigues et al. (2021); Sanchez et al. (2020); Zainuddin et al. (2020); Rodrigo et al. (2020); Chen (2023); Yang et al. (2023); Ahmad et al. (2022); Blatsios & Refanidis (2019)
Predictive Analytics and Data-Driven Insights	direct	Huber et al. (2024); Sayed et al. (2023); Hassan et al. (2019); Oliveira et al. (2022); Sayed et al. (2023); Duggal et al. (2021); Cascella et al. (2023); Ahmad et al. (2022); Hare et al. (2023); Escolano et al. (2023); Maher et al. (2020)
	indirect	Rodrigo et al. (2020); Zainuddin et al. (2020); Rodrigues et al. (2021); Sanchez et al. (2020); Nam (2021); Castellano et al. (2023); Blatsios & Refanidis (2019)

The results highlight the symbiotic connection between AI technology and educational gamification, particularly in terms of Personalisation, adaptive difficulty, feedback and motivation, predictive analytics, and data-driven insights. These elements converge to craft learning experiences that are not only more captivating and efficient but also tailored to individual needs. Specifically, the following findings elucidate how AI is employed in educational gamification across four crucial dimensions:

1. Personalisation: AI can tailor challenges, rewards, and feedback to each user's individual preferences and abilities (e.g., Rose & Ferschke, 2016; Pardos & Heffernan, 2011; Settles, 2016). This is seen in the use of AI to provide answers that match students' questions or search online for solutions, suggesting a form of Personalisation in learning environments. This relationship is shown on direct and indirect sides. For example, Huber et al. (2024) highlighted the role of game-based learning in catering to individual learner needs by creating environments that allow for autonomy, competence, and relatedness. Although not explicitly named "Personalisation," the concept is embedded within the game design principles supporting individual psychological satisfaction and intrinsic motivation. This personalisation is central to the engagement and effectiveness of educational games. Grammatikopoulou et al. (2019) do not explicitly mention the term "personalisation" in the provided excerpts. However, the creation of game-like applications for ICH education inherently suggests a level of Personalisation, as these applications are designed to cater to the specific learning needs and cultural backgrounds of their users. The design module and customizable game-like applications mentioned could imply a degree of Personalisation in how content is presented and interacted with by users. Furthermore, the dimension, echoing the sentiments from Yang et al. (2023) and the discussion in Duggal et al. (2021), emphasizes the role of AI in creating personalised learning scenarios. This is achieved by analysing learner data to tailor educational content and challenges to individual needs and preferences.
2. Adaptive Difficulty: Research highlights AI's pivotal role in developing gamified educational systems that dynamically adjust the complexity and difficulty of tasks in line with the learner's performance. This adaptive difficulty approach, as outlined by studies such as those by Rowe et al. (2011) and

Heffernan & Heffernan (2014), aligns with our findings (e.g., Duggal et al., 2021; Cascella et al., 2023). While the reviewed articles may not explicitly mention adaptive difficulty, the concept is inherently linked to the Personalisation strategies they describe, especially within the gamified frameworks examined by Duggal et al. (2021). These frameworks evaluate student engagement and performance, with the potential to modify task difficulty levels to ensure they remain appropriately challenging for each student.

The discussion around multidimensional personalisation in these selected studies indirectly points to the utilization of AI for real-time difficulty adjustment, underpinning the effort to sustain an optimal learning trajectory. This demonstrates AI's crucial role in personalising educational content and enhancing the effectiveness of gamified learning environments through adaptive challenge levels.

3. Feedback and Motivation: firstly, according to Cascella et al. (2023), AI provides real-time feedback based on learners' actions, enhancing the learning process, and promoting quicker skill development. This immediate feedback loop serves as a motivational tool, sustaining high levels of engagement over extended periods. Secondly, Yang et al. (2023) and Duggal et al. (2021) emphasize the role of AI in creating personalised learning scenarios. This is achieved by analysing learner data to tailor educational content and challenges to individual needs and preferences. The aim is to increase learning effectiveness by aligning educational materials with the learner's specific learning styles and requirements. Additionally, such a study by Grammatikopoulou et al. (2019), does seem to consider feedback and motivation, especially when it discusses the engagement of learners and the promotion of extrinsic and intrinsic motivation through modern digital games. Feedback is an integral part of learning games, necessary for guiding learners and keeping them motivated. The positive response to the usability of the ITGD module and the intention to use the games alongside traditional teaching methods imply that the games provide motivating feedback to learners.
4. Predictive Analytics and Data-Driven Insights: AI's role in forecasting future behaviours within gamification frameworks is instrumental, enabling the refinement of strategies through predictive analytics. This approach leverages data-driven insights to tailor learning experiences more closely to the anticipated needs and behaviours of students, as illustrated by Castellano et al. (2023). Duggal et al. (2021) highlight the significance of machine learning in analysing student performance and spotting early signs of disengagement. They stress the critical importance of data quality and volume for accurate predictions, proposing a methodology that integrates key machine learning parameters with gamification to boost educational outcomes. This approach underscores the pivotal use of data-driven insights for enhancing gamification processes and results.

While Huber et al. (2024) do not explicitly address predictive analytics within the context of game-based learning, the foundational technology design and digital learning principles they discuss imply a data-informed approach to game design and learning experiences. Their emphasis on expanding Self-Determination Theory (SDT) research and analysing player engagement points towards an interest in using data to understand and elevate the educational value of games, albeit not overtly mentioned. The indirect mention of predictive analytics through the evaluation of virtual assistants and suggestions for performance enhancement suggests a reliance on data-driven insights for guiding learning strategies and decisions, reflecting the overarching theme of employing AI to analyse and predict learner behaviours and preferences efficiently.

Based on the selected studies, the primary objectives behind integrating AI with gamification in educational contexts can be summarised as follows:

3.1 Enhancing Personalised Learning Experiences

These papers—Yang et al. (2023), Duggal et al. (2021), Sanchez et al. (2020), and implicitly referenced works such as Castellano et al. (2023) and Nam (2021)—discuss the goal of integrating AI with gamification strategies in education. This integration aims to tailor learning content and challenges to meet the unique needs, abilities and learning paces of individual students. The Personalisation of learning experiences, as further explored by Rodrigues et al. (2021), seeks to enhance learning efficiency. It makes the learning process more relevant and engaging for students, as underscored by the practical examples and theories proposed in these studies.

Such personalisation, highlighted across diverse contexts from the detailed algorithmic approaches in Chen (2023) to the empirical evidence provided by Ahmad et al. (2022) and Rodrigo et al. (2020), underlines the transformative potential of AI in educational settings. Moreover, the insights from Zainuddin et al. (2020) and

Oliveira et al. (2022) illustrate how data-driven gamification can dynamically adjust to students' evolving learning journeys, thereby fostering a more immersive and interactive learning environment.

This body of research emphasizes the critical role of AI in diagnosing learning styles, predicting student engagement, and customizing educational content. This customization not only aims to align with individual learning trajectories—as discussed by Huber et al. (2024) and Sayed et al. (2023)—but also to significantly elevate the educational experience by making it more engaging and effective for each student.

3.2 Adaptive Difficulty

Duggal et al. (2021) and Sanchez et al. (2020) propose a transformative approach within gamified learning environments, where AI's role is pivotal in dynamically adjusting the difficulty level of challenges and tasks. Fine-tuning this modification according to the continuous performance of the learner guarantees that everyone consistently functions within their ideal developmental proximal zone. The essence of this notion is to establish equilibrium, avoiding tasks that are too simple and hence boring, or too complex, which could lead to frustration.

The adaptability facilitated by AI is designed to maintain an engaging and balanced level of challenge for each student, making learning not just a process of acquiring knowledge, but also an engaging journey of exploration and achievement. Such an approach underpins the integration of AI with gamification, seeking to personalize learning content and challenges to align perfectly with the unique needs, abilities, and learning pace of every student.

The intention behind this personalised learning experience is multifield: to enhance learning efficiency, to make the learning process more relevant to each learner, and to significantly boost engagement. This objective draws strength from a constellation of studies including Nam (2021), Koravuna & Surepally (2023), and Huber et al. (2024), which collectively underscore the potential of AI to offer bespoke educational experiences.

Further supporting research, such as that from Oliveira et al. (2022), Sayed et al. (2023), and Chen (2023), validates the efficacy of AI-driven Personalisation in fostering improved educational outcomes. This is achieved by ensuring that learning activities are not only aligned with each student's learning trajectory but are also adaptable to their evolving needs and capabilities, as discussed in works by Rodrigues et al. (2021).

In essence, the synergy of AI with gamification in educational settings promises a more effective, relevant, and engaging learning experience. The collective insights from these studies advocate for a future where education is not just about what is learned, but how it is learned, emphasizing the critical role of adaptability and Personalisation in meeting the diverse needs of learners.

3.3 Improving Feedback and Motivation

The research underscores the transformative role of AI in enhancing education by providing real-time, personalised feedback, which significantly boosts student motivation and engagement. This is primarily due to AI's ability to offer instant responses to student inputs, a feature critical for sustaining high engagement levels, as noted by Ahmad et al. (2022) and further corroborated by Cascella et al. (2023). AI's real-time monitoring of student progress and tailored feedback is pivotal for encouraging ongoing learning and improvement, a concept underscored by studies from Cascella et al. (2023) and Hassan et al. (2019).

Furthermore, the application of AI in gamified educational settings amplifies student motivation by fostering a dynamic and interactive learning atmosphere. This aspect is highlighted by Sayed et al. (2023) and Huber et al. (2024), demonstrating how the blend of gamification and AI-driven feedback can maintain and enhance student engagement and motivation over time. Practical implementations of AI for feedback, illustrated in case studies like Oliveira et al. (2022), offer a glimpse into how this technology can be effectively used to bolster student engagement and motivation.

Key insights from Duggal et al. (2021) suggest that AI's capability to deliver immediate, personalised feedback has wide-ranging implications for boosting student motivation and engagement across educational landscapes, indicating a profound potential impact on educational practices and systems.

3.4 Predictive Analytics and Data-Driven Insights

The collected articles in this study offer a comprehensive examination of how AI is utilized to forecast future user behaviours, particularly within educational environments that employ gamification frameworks. AI algorithms analyse extensive data from student interactions on gamified platforms. This analysis is pivotal in identifying

learning behaviour patterns and trends, crucial for predicting how students are likely to engage with future material. For instance, Huber et al. (2024) and Sayed et al. (2023) may have investigated sophisticated models predicting students' engagement levels, dropout rates, or task completion likelihoods.

The capability of AI to anticipate student needs is crucial. This encompasses not merely understanding where a student might face challenges but also recognizing their preferences and learning styles. Through the analysis of past and present behaviours, AI can recommend real-time content adjustments, thereby enhancing engagement and accessibility. Insights from Cascella et al. (2023) and Hassan et al. (2019) likely delve into how adaptive learning algorithms customize the difficulty level and content type to align with the learner's progress.

Gamification elements—such as points, badges, and leaderboards—achieve greater effectiveness when aligned with learners' motivations. AI-driven analysis, potentially detailed by Duggal et al. (2021) and Oliveira et al. (2022), enables the optimization of these elements based on individual and collective behavioural patterns. Consequently, rewards can be personalised, challenges can be aptly adjusted for difficulty, and feedback can be strategically timed to simultaneously motivate and educate.

Leveraging insights from AI analytics, educators can refine their teaching strategies. This refinement extends beyond modifying gamified content to include adjusting pacing, focusing on specific topics, and even altering classroom activities to better meet learners' needs. Research by Ahmad et al. (2022) and Rodrigues et al. (2021) may have explored how these insights contribute to more effective teaching methodologies and improved educational outcomes.

4. Conclusion

Integrating artificial intelligence into gamified learning platforms has notably enhanced educational practices between 2019 and 2024. Studies pinpoint critical utilization sectors of AI such as customization, adjusting complexity, encouragement, and feedback, forecasting analyses, and insights based on data, showcasing a broad spectrum of applications that uplift educational experiences. Gamification strategies augmented by AI have been shown to boost both learning outcomes and participation in educational frameworks by tailoring to the unique needs of each learner, providing feedback promptly, and encouraging students through customized challenges and incentives.

The primary goal of merging AI with gamified elements in educational scenarios is to foster more customized, dynamic, and immersive learning journeys that address students' varied requirements. This fusion seeks to utilize the extensive data generated in educational environments to uncover insights about learners' behaviours, preferences, and achievements, thus facilitating more impactful and streamlined educational programs.

In summary, the review of existing literature underscores AI's significant potential and value to educational gamification, offering perspectives for researchers, educators, and policymakers at the intersection of AI and education. The evidence points towards an increasing trend in employing AI in educational contexts, signalling a future where personalized, adaptive learning settings are commonplace, thereby making the learning experience more engaging and effective worldwide.

Leveling Up Learning: Game Based Learning Initiatives in Canadian Higher Education

Jordana Garbati and Nicole Skrepnek
University of Toronto Mississauga, Canada

jordana.garbati@utoronto.ca
nicole.skrepnek@mail.utoronto.ca

Abstract: Game based learning (GBL), the use of game design elements within non-game contexts such as education, became increasingly popular in the early 2000s, yet empirical evidence about the benefit of games on student learning remains inconclusive. The potential impact of GBL can be influenced, for example, by design elements, context, and discipline. In Canadian higher education, GBL may be housed within departments, the library, or centres for teaching and learning. At our institution, GBL initiatives have only recently begun to surface; for example, the Department of English and Drama has recently launched a games studies minor for undergraduate students, the library has an extensive collection of video games available to borrow, and the academic skills centre has a large collection of board games that are used primarily for social game cafés. While opportunities for curricular connections may exist, our academic skills centre currently lacks staff who have both capacity and expertise in GBL pedagogy. Exploring possibilities for expansion, we aimed to understand the landscape of GBL initiatives across Canadian post-secondary institutions. To achieve this aim, we conducted an environmental scan of over 100 Canadian post-secondary institutions, gathering data such as the existence of GBL programs, category and level of programming (curricular, co-curricular, or research), initiative types, research development, faculty involvement, and availability of additional resources. Findings indicate inconsistencies in definitions used to promote GBL and a concentration of GBL initiatives at the curricular and research levels. The majority of GBL in Canada is led by faculty through course and degree-level programs at both undergraduate and graduate levels. This research gives us insight into GBL program development, challenges, and opportunities for higher education in Canada and globally.

Key Words: Game Based Learning, Game Enhanced Learning, Gamification, Pedagogy, Higher Education

1. Introduction

Game based learning[1] (GBL), the use of game design elements within non-game contexts (Deterding et al, 2011) such as education, became increasingly popular in the early 2000s. GBL approaches have been suggested to positively transform student learning (Gee 2004). It has been argued that games—board games, video games, multi-player role-playing games—require players to use complex thinking skills and to develop argumentation skills (see Gee 2003; Steinkuehler & Duncan 2008). Further, GBL can be beneficial in promoting social interaction as students may be motivated to learn and can explore goal-driven challenges (DeLisi & Wolford 2002). GBL may also help encourage students to share, discuss, and apply knowledge within peer learning groups (Prensky 2006).

Recent research in GBL has focused on a multitude of topics, including use of augmented reality in language acquisition (Hung & Yeh, 2023); the use of games to promote mental health and well-being (Sort et al, 2018); and the use of GBL in flipped classrooms (Hung, 2018). Research has also shown that GBL is not limited to one discipline in higher education. Studies in GBL have been situated in fields such as pharmacy (Bangalee et al, 2021), theology (Oliver, 2018), and business (Emblen-Perry, 2018). Further, these studies have pursued the understanding of GBL through various theoretical frameworks including, constructivism (see e.g., Chan et al, 2017) and activity theory (see e.g., Ek-Ming, Mingfong, & Shao-han 2013). While there has been a plethora of published research, empirical evidence about the benefits of GBL on student learning remains inconclusive on account of influences such as learning context, discipline, and game design elements (see, e.g., Huang et al, 2020; Karakoç et al, 2020).

In Canadian higher education, GBL may be housed within departments, the library, or centres for teaching and learning. At our institution, GBL initiatives have only recently begun to surface; the Department of English and Drama has recently introduced a games studies minor, the library has a new collection of video games available for lending, and the academic skills centre has a large collection of board games used primarily for social game cafés. To determine the possibilities for GBL program expansion at our institution, we determined it was necessary to understand the context of GBL in general and, more specifically, in Canadian post-secondary institutions. Since GBL has not gained much attention in our own institution, we were curious about the

[1] Game based learning is used here, but other related terms include game enhanced learning and gamification.

existence of GBL programming elsewhere in Canada. We thought that by looking at Canadian higher education institutions, we would gain insight into the opportunities for GBL programming in our institution.

In this paper, we report our methods and findings from an environmental scan of over 100 Canadian post-secondary institutions. We then discuss these findings, paying particular attention to the opportunities for GBL program development and the needed support for such development. We end with a presentation of limitations and suggestions for future research.

2. Research Question

Given the lack of research about GBL programs in Canadian institutions of higher education, we were guided by the following research question: What GBL programming exists in Canadian post-secondary institutions?

3. Context

The first author—Jordana Garbati—is the director of the academic skills centre at our institution. As director, she oversees the academic programming of the centre. She began in this role in 2022 and prior to this time, one staff member was primarily responsible for initiating the development of the centre's GBL initiatives. With his retirement, there was a void in GBL programming. At the time of this research, the one initiative that the centre continued was the game café. Game cafés are primarily social in nature where students gather in a large community space for a few hours to play board games. One centre staff member coordinates about a dozen cafés throughout the academic year. While opportunities for curricular connections may exist, our academic skills centre currently lacks staff who have both capacity and expertise in GBL pedagogy. As we thought about GBL opportunities for our own institution, we thought it was important to learn from GBL initiatives across Canadian post-secondary institutions. The second author—Nicole Skrepnek—was completing a Master of Teaching at our institution at the time of this research. We previously completed a pilot study where we employed an environmental scan to identify GBL programs in one province only.

4. Methods

An environmental scan provides a means to identify and assess a given situation or context, so we used this method to identify current practices and programs in GBL across Canada. To begin our cross-Canada environmental scan, we adopted the methods that we used in our pilot study of one province. We identified all accredited post-secondary institutions in Canada (see UniversityStudy.ca). We documented and organized data by province and by institution. We collected information in two ways. First, we accessed the official websites of each institution. We then inputted keywords into the website's search bar to conduct a search of each institution's website. Keywords used were: game-based, game-based learning, gamification, gamified, game-enhanced learning, game-enhanced pedagogy, games, board games, video games, serious games, and jeux serieux and jeux de société (for French-language institutions in Quebec). Second, we used the Google Search Engine. Here, we inputted the full name of each institution along with keywords used in the first approach. This dual approach search method ensured comprehensive access to information online. With these two approaches, we gathered data from a range of webpages and documents. These included: webpages of the institutions; published faculty research articles; records from academic symposia organized or advertised by the institutions for faculty professional development; course offerings and syllabi; workshop resources; inventories of games; faculty-student projects; graduate student publications (e.g., thesis submissions); and links to external webpages published by the institutions for faculty professional development or to promote awareness of GBL initiatives.

We collected and organized our data in one, shared Google Sheet with one tab for each province and territory in Canada. We documented the following information for each institution: name of institution; website URL; identification of GBL programming; categorization of program: curricular (e.g., course, program, major/minor), co-curricular (e.g., game café, game night), or research initiatives (e.g., faculty research); existence of a related GBL definition (e.g., GBL, game-enhanced learning, gamification); type of GBL initiative (e.g., teaching strategy, research project, game night); research; stakeholder groups (e.g., faculty, undergraduate and graduate students, campus partners; and resources available (e.g., funding opportunities, technological infrastructure). We collected descriptive statistics about number of initiatives per category.

These methods allowed us to systematically capture and organize a large quantity of data collected from institutions' websites.

5. Findings

5.1 Higher Education in Canada

Canada has 10 provinces and three territories. Provinces and territories are responsible for all levels of education, including post-secondary education. In Canada, post-secondary institutions include universities and colleges. In universities, students typically earn a three- or four-year bachelor's degree, and in colleges, students typically earn a one- or two-year diploma or certificate. This study collected data from accredited post-secondary universities (see University Study, 2024). Table 1 shows the number of universities in each province and territory in Canada.

Table 1: Universities in Canadian provinces and territories

Region	Province	Number of institutions (n=108)	Number of institutions With GBL Initiatives (n=75)
West Coast	British Columbia (BC)	12	10
Prairie Provinces	Alberta	9	8
	Saskatchewan	6	4
	Manitoba	6	4
Central Canada	Ontario	34	21
	Quebec	26	21
Atlantic Canada	New Brunswick	4	2
	Nova Scotia	9	3
	Prince Edward Island (PEI)	1	1
	Newfoundland and Labrador	1	1
The North	Yukon	0	0
	Northwest Territories	0	0
	Nunavut	0	0

All 10 provinces have universities with number of universities ranging from one (e.g., Prince Edward Island/PEI and Newfoundland and Labrador) to 34 in Ontario. The three territories (e.g., The North region) have no universities. Provinces with the highest number of universities and GBL initiatives are Ontario (34 and 21, respectively), Quebec (26 and 21, respectively), British Columbia/BC (12 and 10, respectively), and Alberta (9 and 8, respectively).

5.2 Adoption and Integration of GBL

Provincial variation exists in the adoption and integration of GBL across Canadian post-secondary universities. The data collected from the environmental scan indicates a robust trend towards embracing GBL, with many provinces adopting game-based pedagogy within their teaching and research frameworks. British Columbia and Alberta are the two provinces that are leading in the adoption rates. In British Columbia, 10 out of 12 (83.33%) of institutions reported the existence of GBL initiatives, with projects ranging from curricular program integrations (such as the OMEGA+ program housed in Athabasca University) to game-based faculty research. Alberta showed a slightly higher adoption rate, with 8 out of 9 (88.89%) institutions reporting the existence of GBL initiatives, ranging from faculty integrating GBL pedagogy into their classrooms to internal grants being utilized to fund institution-based GBL projects, such as the Educational Gaming Fund housed in MacEwan University (MacEwan, 2024). Saskatchewan, Manitoba, Ontario, Quebec, New Brunswick, Nova Scotia, Prince Edward Island, and Newfoundland exhibit varying degrees of GBL adoption within their respective institutions

(see Table 1). As noted in Table 1, the latter provinces range in GBL existence, from 3 out of 9 (33.33%) institutions in Nova Scotia and 1 out 1 (100%) institution in Prince Edward Island.

5.3 Defining GBL and Gamification

The conceptualization of GBL across accredited Canadian universities is varied across the country. In provinces such as Ontario, Saskatchewan, British Columbia, and Alberta, universities explicitly separate GBL from gamification, with formal definitions underscoring the application of game principles to enhance educational experiences. These definitions commonly highlight the motivational aspects of games, such as their ability to captivate and sustain student interest, thus enriching the learning journey. For instance, in Ontario, the University of Waterloo defines GBL as "involving the design of learning activities so that game characteristics and principles are inherent within the activities themselves" (University of Waterloo, 2024). This is contrasted with their definition of gamification, which is described as "the integration of game elements like point systems, leaderboards, and badges into conventional learning activities to increase engagement and motivation" (University of Waterloo, 2024). In Saskatchewan, definitions also emphasize integration, but with a focus on the seamless inclusion of games in learning. The University of Saskatchewan defines GBL as "the integration of games into the learning experience. It includes a spectrum of approaches that range from high-fidelity simulation to gamification, which is the integration of classic game elements into traditional learning activities'' (University of Saskatchewan, 2024); it defines gamification as "the integration of classic game elements into traditional learning activities'' (University of Saskatchewan, 2024). In British Columbia, universities present a similar bifurcation in definitions. For example, The University of British Columbia defines GBL as "the integration of games or gaming mechanics into the educational experience" (UBC Blogs, 2024), highlighting a direct application of gaming elements in teaching. Meanwhile, Vancouver Island University provides a more detailed description of gamification, noting it as "the integration of game-like elements into the design of your course that integrate rewards for students as they engage with the topics of your course" (Vancouver Island University, 2024). In stark contrast to universities in these four provinces, universities in Quebec, New Brunswick, and Nova Scotia present a lack of definitions for GBL and gamification; in fact, none of the universities in these provinces provide a definition of gamification.

The environmental scan showed variances in the presence of GBL definitions amongst regions and institutions. For instance, in British Columbia, 1 out 12 (8.33%) institutions provided a definition of GBL and gamification. Similarly, in Alberta, 1 out of 9 (11.11%) institutions provided a definition of GBL, and 2 out of 9 (22%) provided a definition of gamification. In Saskatchewan, 1 out of 6 (16.67%) institutions provided a definition of GBL and gamification. Manitoba, Quebec, New Brunswick, and Nova Scotia, all lacked explicit definitions of GBL or gamification; none of the institutions in these provinces provided clear. In contrast, Ontario, of the 34 institutions, 4 (11.76%) provided a definition of GBL, and 8 (23.53%) provided a definition of gamification.

5.4 Curricular Applications

Data collected from the environmental scan show that the curricular integration and application of GBL can be understood through two perspectives: macro and micro. The macro perspective on GBL integration encompasses institutional-level efforts, including comprehensive curriculum design, structured program and course development, and overarching institutional support. This approach reflects a systematic incorporation of GBL into the educational fabric of the institution. Conversely, the micro perspective focuses on individual faculty initiatives and course-specific efforts. This includes the integration of gamification methods, such as the use of GBL platforms, game labs, and other innovative teaching tools within the classroom. This perspective largely highlights the contributions of individual educators and their localized applications of GBL to enhance student engagement and learning outcomes.

The application of GBL within curricular initiatives varies amongst institutions and provinces. Curricular integration is notably prominent in British Columbia and Alberta, where 66.67% of institutions in each province include GBL initiatives within their curricula. In British Columbia, the Advanced Game Development Program - Diploma (96 credits) at Kwantlen Polytechnic University (2024) gives rise to programs that directly support and encourage the use of GBL in academia and career advancement. This program not only teaches game development but also incorporates industry standard GBL practices and tools (such as game rendering, programming, etc.), preparing students for careers in the gaming industry (Kwantlen Polytechnic University, 2024). Data from British Columbia institutions, such as Simon Fraser University, show that faculty have reported that incorporating gamification within lessons enhances student learning and engagement, even when no academic grade is assigned (Simon Fraser University, 2024). Alberta's curricular integration is equally robust,

featuring programs such as game design minors and courses emphasizing game-based pedagogy to foster academic success. For instance, Athabasca University houses the OMEGA+ project, where students in the Master of Science in Information Systems program have created the platform to help other learners "develop their metacognitive skills through gaming" (Athabasca University, 2023). Additionally, in Nova Scotia, Saint Mary's University provides resources and instructional guides to faculty that encourage the incorporation of GBL and "Game Maps" directly into their course webpages via the Brightspace Learning Management System (Saint Mary's University, 2024).

In contrast, provinces like Saskatchewan, Manitoba, and Nova Scotia show lower rates of classroom integration, with many institutions lacking structured initiatives; instead, there exists individual faculty efforts and ad-hoc applications of game-based tools. For instance, in Saskatchewan, 66.67% of institutions have the existence of GBL initiatives, primarily emerging through isolated faculty-procured course descriptions and projects rather than institution-wide programs. For example, at St. Thomas More College, Dr. Saeed Moshiri (professor) integrated the MobLab online learning platform into his course ECON277.3 as a response to the COVID-19 pandemic drastically limiting in-person and face-to-face interactions that could take place amongst students (St. Thomas More College, 2020). This platform allows students, in various streams of social science, to run experiments to determine the cause-and-effect of variables, similarly to how "explorations" are conducted directly in the field (St. Thomas More College, 2020). Manitoba's integration efforts are similarly limited, also with 66.67% of institutions having the existence of GBL initiatives, with resources largely stemming from faculty research and serious game certificates, such as the one offered at the University of Winnipeg as part of Continuing Education (University of Winnipeg, 2024). Nova Scotia, having 33.33% of institutions with GBL initiatives, have yet to see a broad adoption or a systematic approach to integrating these methods into their educational framework, with initiatives largely consisting of co-curricular blogs, student research, and Brightspace Learning Management System toolkits.

5.5 Student Engagement

Student engagement within GBL initiatives varies across educational levels and provinces. In British Columbia, both undergraduate and graduate students are involved in GBL initiatives, with 58.33% of undergraduate students and 50% of graduate students participating. These initiatives range from graduate student research to faculty integrating gamification strategies into courses. Alberta shows similar trends, with 77.78% of undergraduate students and 55.56% of graduate students involved in GBL initiatives. Examples include GBL introduced within faculty of law classrooms at the University of Alberta (2020) and simulated field trips for students in the Department of Geoscience at the University of Calgary (2022). Ontario also reports good engagement with 52.94% of undergraduate and 23.53% of graduate students participating. For instance, WoodsworthONE courses at Woodsworth College at the University of Toronto, offer students the opportunity to engage with courses that are central around class discussions and participation, while integrating GBL strategies (University of Toronto, 2024). In contrast, Manitoba, New Brunswick, Nova Scotia, Saskatchewan, and Quebec report lower student engagement with undergraduate student involvement ranging from 0% to 57.69% and graduate student involvement ranging from 0% to 16.67%.

5.6 Co-Curricular Initiatives

Data show that GBL at Canadian universities extends beyond curricular applications. Co-curricular initiatives offer additional opportunities to engage with educational content in innovative ways. Co-curricular GBL initiatives are notable across several provinces, each showcasing diverse approaches to enhancing learning experiences. For example, in Alberta, institutions have implemented GBL within co-curricular settings. For instance, The King's University (2024) offers a recreational gaming club facilitated by the Students' Association (TKUSA), providing a platform for students to explore and engage with gaming as a learning tool. In Ontario, there are multiple co-curricular GBL initiatives. Carleton University has curated an academic library collection comprising over 400 video games and 50 board games, which primarily supports learning in computer game development and is accessible to students across various disciplines (Carleton University 2024). The Health and Wellness Lounge, housed within the University of Ottawa (2024) incorporates Virtual Reality (VR) and video games to promote student mental health and wellness. Additionally, the University of Toronto Mississauga (2024) offers an extensive board game inventory suitable for interdisciplinary study and hosts Game Cafés through the Robert Gillespie Academic Skills Centre (RGASC), fostering interactive and engaging learning experiences. In Quebec, the Université du Québec en Outaouais (2024) supports co-curricular GBL initiatives by maintaining a board game collection within its library, which students can access to enhance their learning

through gameplay. Conversely, provinces such as British Columbia, New Brunswick, Nova Scotia, Prince Edward Island, and Newfoundland exhibit limited co-curricular GBL initiatives. Institutions in these regions primarily focus on curricular or research based GBL applications.

5.7 Research Applications

Research applications of GBL, while less prevalent than curricular integrations, are notable within certain provinces. In Alberta, 55.56% of institutions engage in GBL-related research. Noteworthy projects include a Scholarship of Teaching and Learning (SoTL) study conducted by faculty at Mount Royal University, which investigates the impact of an online role-playing game on adult criminal justice students at a western Canadian university (Fantazir & Bartley, 2021). Additionally, research at the University of Lethbridge focuses on updating a web-based card game used for teaching programming, cybersecurity, and software development (Tareque, 2021). Ontario also demonstrates considerable research integration, with 35.29% of institutions involved in GBL-related research. For instance, Eunsik Kim, a researcher at the University of Windsor's Faculty of Engineering, applies gamification strategies to provide virtual rewards for social isolation competencies and tasks such as social distancing, handwashing, and self-isolation during and beyond the COVID-19 pandemic (University of Windsor, 2020). New Brunswick, where 50% of institutions engage in GBL-related research, also showcases faculty-led initiatives. At Université de Moncton, Caitlin Furlong and colleagues have highlighted the use of technology-based games to enhance student motivation within mathematics (Furlong et al., 2018). However, other provinces like Saskatchewan, Manitoba, Quebec, and Nova Scotia show little to no research development, with research engagement ranging from 0% to 22.22%. Most initiatives in these regions stem from graduate student research. For example, a graduate student at Acadia University in Nova Scotia authored a paper on the use of games as a tool for teaching programming concepts to fulfill degree requirements (d'Entremont, 2015).

6. Discussion

While all the Canadian universities in our data set included instances of GBL, their approaches varied widely from the definitions used to the programs offered. The lack of consistency in terminology or presentation of definitions is surprising as this could indicate weakness and uncertainty within the field of GBL. The number of terms used—GBL, game-enhanced learning, gamification, serious games—created some complication in our data collection approaches, which could also indicate a lack of clarity for students and administrators. A clearer description of the terms, their uses, purposes, distinctions could lead to a more unified approach to program administration.

Our environmental scan shows that GBL initiatives primarily exist in curricular and research endeavors led by faculty. Many readers may not be surprised by this. The possibilities, however, to work with other campus partners on GBL are great. Libraries, students' associations, and academic skills centres could be ideal partners and leaders in GBL, and it seems that their value has not yet been tapped. That said, if institutions wish to expand GBL initiatives, our data show that faculty involvement is likely necessary.

There is great variation in existence and type of GBL initiatives across Canadian provinces. British Columbia, Alberta, and Ontario, for example, show a variety of initiatives in our identified categories whereas there was more variation of offerings in other provinces. This may because these are the provinces with the highest number of universities and show high faculty participation. Further, universities in these provinces may have more GBL courses, programs, and research initiatives than in other provinces because of funding and student enrolment.

7. Limitations

There are two primary limitations of this research. First, in terms of data collection, we collected data solely from published information provided by the institutions. We recognize that the published information may not capture all GBL initiatives within each institution. In addition, since each institution adopted different ways to present their GBL activities, we may have missed information in our website search. Second, we were limited by the information available and accessible on public websites. This meant that if a website did not have a "search" feature, we had to try to locate the needed data by other means. We also encountered broken links or pages that were redirected incorrectly, which resulted in missing data.

There is value in extending this research by conducting qualitative research (e.g., interviews, focus groups) with those involved in GBL to learn more about their programs.

Second, we limited our search to universities in Canada. To get a better view of the landscape of GBL in Canada, it would be interesting to also include colleges. This might give researchers and administrators a more comprehensive view of the place of GBL in higher education in Canada. To begin, an environmental scan could be completed. This work could be extended through qualitative research approaches as noted above.

8. Conclusion

This research contributes to our understanding of GBL in Canada. There are several practical outcomes of this research. First, it is the first environmental scan of GBL in Canada that is publicly available. Faculty and administrators can now use this scan as they explore GBL opportunities in their institutions. Second, we have identified a need for those involved in GBL to increase awareness by defining GBL more explicitly and clearly. Third, we have proposed that to increase GBL initiatives, faculty involvement is necessary, but cross-campus partnerships would bring additional opportunities.

Abstract: The research project 'SG4BB' (Serious Games for Vocational Education and Training; abbr.: VET) has developed an integrated platform for the description, search, retrieval, integration, and utilization of educational games. This paper summarizes project outcomes, including platform concepts, software components, and – as focus – practical insights derived from a case study involving the educational game 'Corrugated' as simulation and training environment for service technicians. SG4BB has followed a user-centered design in an interdisciplinary project team: Two learning providers specified their requirements for VET in their specific application domains. Based on those requirements, game developers, learning solution providers and researchers for VET have conceptualized and prototypically implemented both an integrated learning platform (SG4BB platform) and two case studies of Serious Games for VET: 'Corrugated' for service technicians and an IT security game. The platform follows a process pipeline: For search and retrieval of educational games for VET, an application profile for VET based on the standardized 'Serious Games Metadata Format' (DIN/SPEC 91380) has been elaborated. This format builds the semantic basis for the metadata-based catalog system 'Serious Games Information Center' (SG-IC) with filter functionality for VET. Learning providers and developers can use the SG-IC portal to describe and promote their educational games, enabling users to identify suitable games for their learning needs and integrate them via learning infrastructure. Educational games can interact with the backend (Learning Management System and Learning Record Store) through a middleware based on the xAPI standard, allowing for personalized gameplay and data collection for game-based learning analytics. The final evaluation of the SG4BB project focused on the utilization of the educational game 'Corrugated', targeting problem-solving skills for service technicians in the corrugated cardboard industry. Data from 26 participants playing the game for 60 minutes, along with problem-solving tests and user experience feedback, were analyzed to validate game-based assessment and to assess learning impact. Initial results reveal insights into specific game missions, playtimes, and success rates, indicating that participant behavior during gameplay influenced perceived learning progress, leading to varied learning paths. This paper provides valuable insights and technical information for VET practitioners on using educational games for training. Game interactions and learning outcomes can be monitored via a dashboard within the learning infrastructure, offering visualizations for user behavior (during play) and (learning) progress.

Keywords: Serious Games, Vocational Education And Training, Metadata, Middleware, Case Study and Evaluation.

1. Introduction

Stakeholders in continuous vocational education and training are required to provide appropriate and suitable (digital) learning opportunities that can be used to develop the needed skills induced by technological change and thereto affected changes in type of jobs, skill needs, task content and other economic effects (Frey and Osborne, 2017). In light of this, serious games have enormous potential, as they can simulate complex real-life situations without disrupting operations, but in a playful and motivating way, and with adaption to the individual needs of the users. The problem is to find high-quality learning games for a specific job and skill level, and to integrate them in an existing learning management system.

In this contribution we investigated the practical question of which serious games exist for diverse occupational fields, what quality they possess, and how they can be integrated into professional development. We developed an innovative and standardized system to find appropriate games matching the skill needs, job tasks and interests of potential users/customers in continuous vocational education and training (Rotter et al, 2022; Göbel et al, 2018).

2. Project Description and use Case 'Corrugated'

Within the research project SG4BB (Serious Games for Continuous Vocational Education and Training) funded by the German Ministry for Science and Education, a platform has been developed based on existing components to discover, integrate, test, and evaluate appropriate serious games and playful learning offerings in vocational education and training: the Serious Games-Information Center (SG-IC, a classical web-based information system in form of a portal) and its underlying Serious Games Metadata Format (SG-MDF; DIN SPEC 91380, as semantic basis for the description and retrieval of serious games) are evolving into a search engine for target group-specific description and search for suitable learning games in VET on the level 4 to 7 of the European Qualifications Framework (EQF; European Union, 2017). Figure 1 illustrates the process pipeline for the usage of the SG4BB platform.

Figure 1: SG4BB process pipeline: Input parameters for application fields and user characteristics, search and retrieval of appropriate educational games based on metadata, integration of educational games into learning infrastructures, usage and evaluation of learning effects.

Through the search engine, educational stakeholders (e.g. teachers, coaches or trainers in VET settings, end users/learners etc.) can identify suitable game-based learning opportunities for their target groups in their specific occupational fields. Users as well as educational providers can download these educational games via a marketplace and integrate them into their own learning management system (LMS). The components of the platform, including the technical interfaces based on standards (xAPI) between the SG4BB middleware, the LMS, and the game, were tested through the collaboration of research, development, and practice using the serious game 'Corrugated'. The insights of the project are presented in the next sub-chapters.

2.1 Target Group Learner in Vocational Training

The goal was to develop a concept for the recommendation of relevant educational games in VET. Therefore, a literature review of established and well-founded national and international classification systems was conducted to identify fitting criteria and databases (Rotter et al, 2022). The research focus was on continuous vocational education and training in Germany, but with correspondence to international systems, such as International Standard Classification of Occupations 2008 (ISCO-08). Matching criteria were derived to propose appropriate educational games for VET, tailored to the potential users' professional context and educational aspirations. This process resulted in a collection of occupational fields as defined by the German Federal Institute for Vocational Education and Training (BIBB; Tiemann, 2018), and main activity as defined by the microcensus, the largest annual household survey of official statistics in Germany, annotated with metadata and a matrix, mapping occupation fields with educational games. Now, educational stakeholders (i.e. learning providers, coaches, or individual learners) can use the search engine to find appropriate game-based learning offerings tailored to specific occupations or job tasks.

As a result, we developed the application profile 'vocational education and training' as an added 'variant' of the SG-MDF. Hereto, serious games are matched with a database of occupational fields (or major occupational fields) as defined by the Federal Institute for Vocational Education and Training (BIBB; Tiemann, 2018), and main tasks and duties as defined by the microcensus.

2.2 Content Discovery via SG-IC

The Serious Games-Information Center (SG-IC, see https://seriousgames-portal.org/) is a web-based portal providing a free search engine that has been completely redesigned by the Serious Games research group at TU Darmstadt to incorporate the 'application profile for vocational education and training", tailored to the characteristics and needs in the field of VET. This profile is an extension of the underlying Serious Games Metadata Format (SG-MDF, DIN SPEC 91380), which serves as the semantic basis for describing and retrieving serious games via the SG-IC (Göbel et al., 2018) or other systems and portals.

The SG-IC can be used to formulate queries for serious games or educational games designed for game-based learning, applying filters such as specific occupational fields, primary activities, target age groups, or game genres. The retrieval process generates a list of candidates — educational games that meet the query's criteria

— presented in the SG-IC. Interested educational providers and individuals can then analyze these candidates in detail, accessing all available metadata information in the standardized SG-MDF format for each game.

2.3 Download and Integration via Middleware

Within the distribution section of the SG-MDF, users can access information on where the original games are available, including potential downloads from Skillfire.info or other platforms. Educational providers can integrate these games into their learning environments, provided they operate their own LMS and use the SG4BB plugin (middleware) developed in the project for integration. For example, in SG4BB, an interface has been established between the SG-IC and the 'Skillfire' platform, a 'steam-like' distribution platform for game-based learning and training material.

The Skillfire marketplace offers both free and paid (gamified) learning offerings for vocational education and training, facilitating integration into moodle-based LMS via SG4BB middleware with license management capabilities. Skillfire.info has transitioned to the new domain, serving as gamified learning platform in the Business-to-Business (B2B) sector. Additionally, a mobile app ('skillfire app') under the previous domain www.skillfire.io will focus on training personal and professional soft skills for end-users in the Business-to-consumer (B2C) sector.

MasterSolution, an IT service provider, has developed a middleware (SG4BB plugin) for connecting gamified learning applications to LMS using the xAPI standard. This middleware is freely available and can be accessed via MasterSolution's Git repository, linked on the SG4BB website. Detailed guidance on integrating and using the middleware by educational providers is available in project documents, i.e. 'Deliverable D4' (particularly Section D4.2 xAPI for the integration of learning games into LMS). Additionally, 'Deliverable D5' outlines the development process for development studios creating gamified learning offerings, emphasizing the design requirements for xAPI integration into the LMS.

2.4 Testing and Rating

The components of the platform, including the technical interfaces based on standards (xAPI) between the SG4BB middleware, the LMS, and the game, were tested through the collaboration of research, development, and practice using the serious game 'Corrugated': In the first development cycle, integration with the moodle-based LMS was tested; subsequently, the game was expanded and finally tested. Core activities of the SG4BB project focused on the development and testing of AI-supported (personalized, adaptive) playful learning offerings. Therefore, a requirements analysis was conducted in the first project phase to determine the needs of application partners and address open technical issues of technology providers. The outcome of this phase leads to a requirements specification, a concept for iterative and agile development and testing, which serves as the basis for networking and further development of the components of the SG4BB platform. The project proceeded iteratively in two development cycles following the paradigm of agile software development.

2.4.1 Use Case 'Corrugated"

In order to facilitate a deeper understanding of the individual components of the platform, including the technical interfaces and their interactions, 'Corrugated' ('SG4BB Corrugated Service Game') has been selected as a case study. This use case involves the examination of a prototype of a serious game, providing insights into the tested elements of the platform. . Initially, a target group-specific needs analysis was conducted to identify specific requirements and preferences of individuals within the target audience. The collected data, impressions, and requirements were integrated into the game's prototype conception, design, and content development. The prototype was developed iteratively in close collaboration with game developers (Nurogames), vocational education and training scientists, teaching staff, and subject matter experts from practice (UEBZO, BHS Corrugated) to ensure alignment with learning objectives and player experiences. The game concept is based on the theoretical framework of competence-based knowledge space theory (CbKST; Kickmeier-Rust et al, 2016) and evidence-centered design (ECD; Mislevy et al, 2003). A domain-specific competence model was created to enable personalization and adaptation within the learning game, structuring prerequisite relationships among learning content, competency facets, and gameplay behavior (learning progress). This approach should facilitate a non-invasive measurement of player actions within the game.

Corrugated is a single player 3D simulation game designed for the corrugated board industry, developed for mobile devices, and released in 2023 as a free app on common app stores (App Store - iOS and Google Play Store - Android). Players learn the game mechanics through a tutorial level at the beginning. Educational providers

can integrate the game into mobile devices via the SG4BB plugin integrated into their LMS interface, making it suitable for online training programs. This allows both learners and trainers to monitor learning progress and performance, even though the game can also be played independently without LMS integration. To effectively engage with the game, players require basic knowledge of corrugated board systems and manufacturing processes.

Players receive various missions simulating disruptions in the production process of a corrugated board system, requiring problem-solving skills for resolution. The overarching goal ('characterizing goal') of the game is to foster domain-specific problem-solving abilities in preparation for real-world training on corrugators. The game offers three difficulty levels, each designed in collaboration with training staff members to ensure appropriate challenge levels. Each mission is tailored to specific problem symptoms and appropriate maintenance tasks, reflecting real-world scenarios encountered by technicians in the corrugated board industry. The target audience for the game primarily includes inexperienced technicians specializing in maintenance and repair in the corrugated board industry. The game is classified within the domain of vocational training, specifically categorized under the VET application profile for technical occupations (main vocational field; Tiemann et al, 2018) focusing on monitoring, control of machines, plants, technical processes (activity field) (Hall and Rohrbach-Schmidt, 2020, 38).

2.4.2 Evaluation Studies

The system components and implementations of the SG4BB prototypes were tested in two iteration cycles. In the first cycle, an initial game version (version 1.5) was integrated into a training course on the moodle-based learning infrastructure using the SG4BB plugin and initial web services via xAPI standards and a learning record store (LRS) connection. This testing aimed to assess the correct functionality of all elements implemented in a test system environment from both a technical and user-friendly perspectives. Additionally, the study sought to identify gameplay barriers related to usability and playability issues, such as poor controls and interfaces, which can significantly impact the user experience (IJsselsteijn et al, 2007).

In a mixed method approach, representative participants (n=11) provided feedback on the game and its overall concept, including game design, selected content, and gameplay experience during a moderated test session. Participants played the game for 30 minutes while using the think-aloud protocol method, and their thoughts, feedback and interactions were recorded through audio and screen recordings. After gameplay, specific aspects of the user experience were explored in-depth through focused interviews to identify potential weaknesses and gameplay barriers. Finally, a semi-standardized questionnaire was used to collect data alongside demographic information.

Key findings highlighted the helpfulness of the tutorial at the beginning of the game, user-friendly game design, and ease of use as positive aspects. However, participants encountered significant difficulties with the first mission due to its non-intuitive nature, which required collection and evaluation a predetermined amount of information deemed relevant, not meeting user expectations. Participants expressed a desire for more supportive feedback on their performance during this phase. The feasibility of evaluating the test environment in a self-directed setting, where participants could download and test the game on their own mobile devices, was not examined due to technical restrictions of the test system.

Based on the results of the first iteration, the insights from these findings and potential improvements were deliberated and implemented. This involved rectifying bug fixing, adjusting incorrect content, expanding the player's scope of action when seeking information, and integrating additional educational feedback and assistance. Moreover, adjustments were made to refine the research methods used in the final evaluation study.

The final evaluation study emphasized user acceptance and learning effects, centered around the concept of a quality label for serious games (Caserman et al, 2020). Fundamental quality criteria encompass aspects related to the game itself (usability, user/game experience), learning outcomes, and the alignment between these aspects within integrated gameplay, utilizing suitable technology that is appropriate for the specific learning environment. Special attention was directed towards AI-supported algorithms for personalization and adaptation: Do these approaches function effectively, and are they perceived positively by users?

For the evaluation, a separate course was created within the productive learning management system of the training provider, where the evaluation tools and access to the game were integrated via the SG4BB middleware. Participation was possible in both German and English and was voluntary, with agreement from supervisors during working hours. Interested service technicians of the value partner were enrolled in the LMS course and

received all instructions and guidance for the testing process there. We offered two test conditions: a) moderated in-person at a scheduled time using test devices, and b) online self-directed at any time using one's own mobile device during the testing phase, whereby the last setting reflects the realistic depiction of digital training offered and conducted within the company. Each test session was designed for 90 minutes, including instructions and clarification regarding study participation, anonymity and data protection, completion of pre- and post-game problem-solving tasks, a 60 minutes gameplay, and completion of an online questionnaire. The collected data was assigned using a personal code. In addition, audio and screen recording were conducted in the moderated test session to aid in data evaluation.

In order to investigate learning effects, we created six single-choice problem-solving tasks corresponding to the tasks, difficulty levels and objectives in the game. Four of them were anchor tasks, which were included in both the pre- and post-game test. To evaluate participant's experience with the game and the perception of learning, we developed and used an 18-item questionnaire oriented on the serious game evaluation scale by Fokides et al (2019), a validated instrument to assess the players' experience and perceptions towards serious games. Participants responded on a five-point Likert scale, from strongly disagree (1) to strongly agree (5).

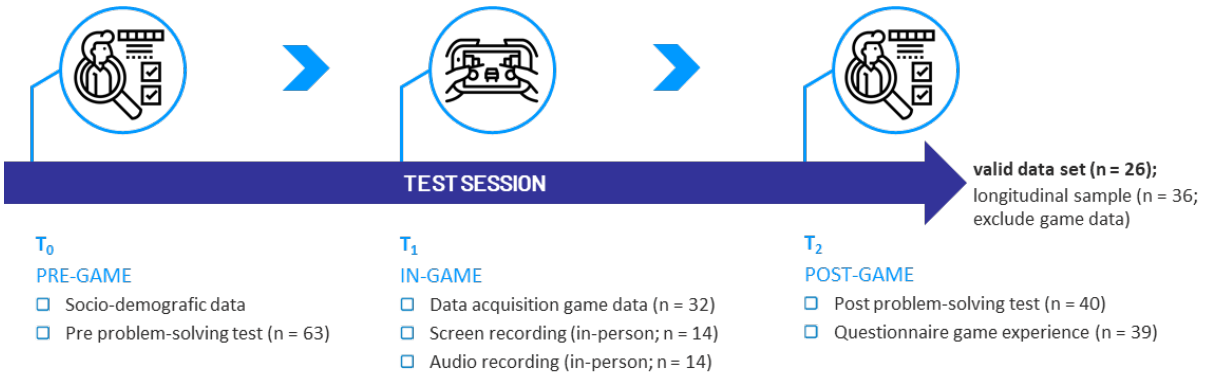

Figure 2: Data acquisition workflow and response statistics

Figure 2 depicts the workflow of the data acquisition and response statistics. We collected data from a longitudinal sample of 36 participants, predominantly male (n = 35), who played the game and completed both a pre- and post-game problem-solving tests along with an online questionnaire. The majority of participants (n = 22) engaged in the self-directed digital session, while the remaining 14 attended in-person. Over 50% of the participants were under 30 years old (n = 19), and 45% (n = 16) reported having no or less than one year experience with a corrugator plant, representing very well the target audience. However, 10 cases could not be included in the game analysis because these participants were not connected to the LMS during the gameplay despite receiving an alert message, resulting in no interaction data being transmitted to the LRS. For analyzing the game interactions, the longitudinal sample size shrinks to 26 participants.

The data analysis provides insights into specific in-game performances. We examined data related to the following: total number of missions (successfully) solved, total number of skill (facets) scores, playtimes and duration. These data form the basis for further investigations and calculations. Initial evaluation results support the assessment that the characterizing goal provides an enjoyable player experience for inexperienced professionals, with the game's progression positively impacting learners by offering varied learning paths across difficulty levels. This assumption could be supported by the results from the game experience questionnaire. In average, the computed mean scores for all questionnaire items were high ($M = 3.6, SD = 1.02, n = 36$), indicating that participants generally enjoyed the game. Additionally, we observed that many participants who engaged in online self-directed testing continued playing the game independently after the testing session. The comprehensive findings will be elaborated in a subsequent publication.

Figure 3 shows a dashboard with a learning analytics module enables user-friendly visualization of learning activities and outcomes. This allows displaying key metrics and information directly within the LMS.

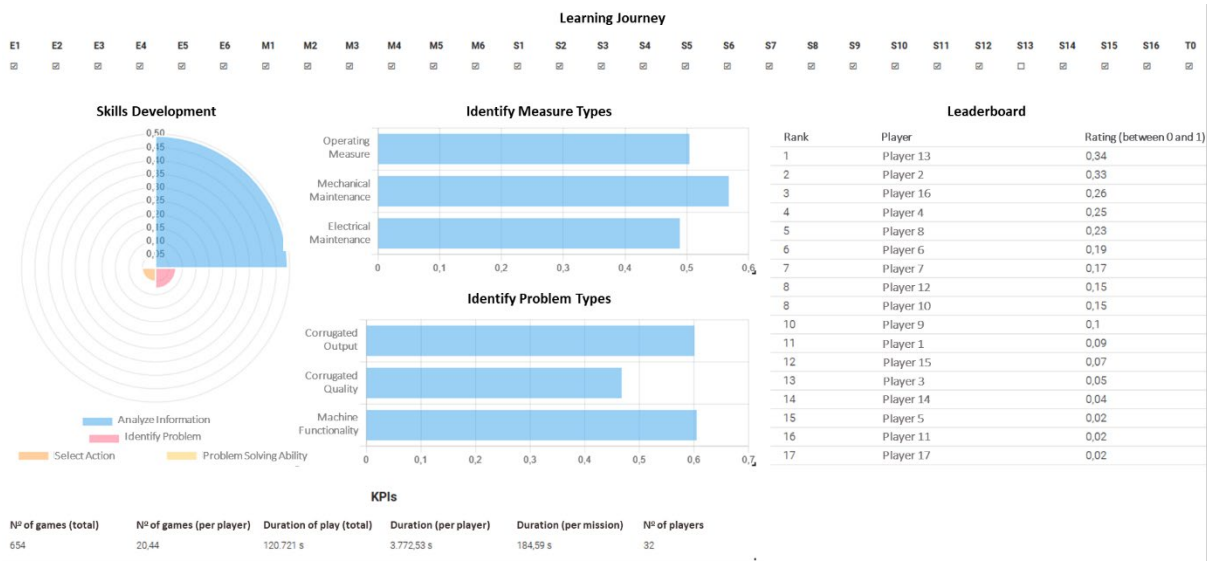

Figure 3: Dashboard with key metrics (i.e. gameplay results, learning progress).

The study also identified areas for improvement within the game, providing valuable insights for future development efforts. However, it was observed that the game's appeal may diminish over time and with increased experience if missions are repeated excessively.

Corrugated was acknowledged by the RAL Serious Games Quality Community as an exemplar of best practice in the field of a gamified learning offering for service technicians in the corrugated cardboard industry.

As a result, the game was described and classified in the SG-IC using the subject-specific application profile 'vocational education and training' of the SG-MDF. As the classification system enables a categorization between the dimensions 'occupational fields' and game-based learning opportunities, Corrugated can be located and found by potential users/educational providers according to its respective occupational field, main activity and industry focus.

3. Conclusion and Critical Reflection

The development and implementation of the Serious Games-Information Center (SG-IC) and associated Serious Games Metadata Format (SG-MDF) within the SG4BB project have successfully enabled the creation of a comprehensive search engine tailored specifically for vocational education and training. This novel platform facilitates the identification and integration of suitable game-based learning opportunities into VET settings, benefiting educational stakeholders by providing targeted, occupation-specific educational games. The platform's robust technical interfaces and middleware, tested through practical collaboration using the 'Corrugated' serious game, demonstrate its readiness for integration into existing learning management systems. The comprehensive analysis of the evaluation results appears to provide promising findings, suggesting valuable insights and implications for further research and practical applications in the field. Such advancements signify significant progress towards enhancing continuous vocational education and training through engaging and effective game-based learning solutions.

In reflecting on the outcomes of the game evaluation and development process within the scope of the project, several key lessons have emerged. Most relevant, these lessons underline the importance of methodological rigor, interdisciplinary collaboration and effective project management among learning providers, subject matter experts and game developers. Second, due to the small sample size, for sure the results of the game evaluation do not have statistically relevance and need to be cautiously examined and interpreted. With respect to the development of new educational games, two major lessons learned should be mentioned: First, it is crucial that the intended learning effects and evaluation/testing methods are clearly specified at the very beginning of a project. This enormously helps the game developers to design a game, and subsequently facilitates game and learning analytics at the end for testing and evaluation purposes. Second, more technically oriented, game developers (especially game developers which are typically focused on the development of entertainment games) need to be supported with practical information (technical specification, manual, 'cookbook') how to build the educational games. This considers both content-related aspects (e.g. knowledge spaces and logical

orders/sequences in the presentation of individual learning tasks and modules respectively educational game situations and game levels based on existing curricula etc.) and technical and conceptual aspects referring to the implementation of the game middleware and, practically speaking about the definition and frequency of interactions between a game and the backend of the system (LMS, Learning Record Store): when and how often should be passed 'which' information from the game to a LMS/LRS? Again, this underlines a strong collaboration among all involved parties in the collaborative, interdisciplinary educational game development process.

Overall, the project has established a comprehensive process pipeline and individual components for the development, provision, and utilization of gamified learning offerings in vocational education and training. The involved partners have gathered valuable experiences, particularly in the realm of gamified content delivery and integration with learning management systems, based on the xAPI standard.

Abstract: Game jams, events where participants collaboratively create games within a limited time frame, have gained popularity as engaging and educational activities. Numerous studies highlight learning as a significant motivator for participation, positioning game jams at the intersection of pedagogy, design research, and game studies. A systematic literature review (SLR) using the PRISMA 2020 method was conducted to explore the state-of-the-art in game jams and game-making co-creation practices amongst Cultural Heritage Institutions, Creative Industries, Higher Education Institutions, and Youth Citizens in the context of X project. Out of the 68 eligible sources, 10 explicitly addressed the learning goals associated with game jams and constitute the sample of this study. The present article focuses on exploring what conceptualizations of learning can be found in the sources and how that learning process was structured throughout the game jams; specifically, what participants are learning, the methodologies employed, and how the learning was measured. A comprehensive understanding of the educational potential of game jams is important for game jam organisers as well for formal, non-formal and informal Education. The results show that although some articles use game analysis or questionnaires to measure learning, these results are not analysed or presented in depth. Furthermore, it could be noticed that serious game jams, explicitly designed to teach something, usually featuring more time consuming, due to the specific nature of an added layer to game jam: a serious theme that needs to be learned by the participants but also reflected in a game for educational purposes. This underscores the potential use of (adapted) game jams to promote learning regarding social issues, culture, or science in an engaging and dynamic way. This article reflects on those processes and the different conceptualisations of learning that can be found in sources that tackle this topic with regards to Serious and Cultural Game Jams.

Keywords: Game-based Learning; Game Jams; Serious Game Jams; SLR

1. Introduction

Learning is a multifaceted process, shaped by several foundational theories: behaviourism, cognitivism, constructivism, humanism, and connectivism. Constructivism, particularly highlighted by theorists Vygotsky and Piaget, provides valuable insights when it comes to games. Piaget's cognitive constructivism focuses on the individual's construction of knowledge, asserting that humans must actively create their understanding (Piaget, 1953). In contrast, Vygotsky's social constructivism emphasises learning as a social activity, relying heavily on collaboration and interaction (Vygotsky, 1978). Recent research underscores the integration of game analysis and production in education, enhancing contemporary media literacy and other skills (Costa et al., 2020; De Freitas et al., 2013). Studies show that games can support multiple literacies (Gee, 2008; Buckingham & Burn, 2007) and foster creativity (Caperton & Sullivan, 2009). Parekh et al. (2021) explored how Systems Thinking and Model Building for Learning could engage young people in producing games on complex scientific themes. In a workshop with youth,, a board game about water pollution was developed. The ideation process involved participants using Model Building to grasp the scientific concepts before designing the game. They simplified the science behind water pollution and applied it to their game design, aiming to disseminate knowledge effectively. Considering this, the present study is part of a broader systematic literature review (SLR) on game jams and collaborative game-making practices across various sectors, including Cultural Heritage Institutions, Creative Industries, Higher Education Institutions, and Youth, within the framework of EPIC-WE project. The research aims to explore learning through Serious Game Jams (SGJs) by addressing these questions: 1) What are the conceptualizations of learning according to SLR sources? 2) How did organisers structure the learning process?

1.1 Related Literature

Game jams have been emerging as an innovative tool for learning, due to its potential for networking skills, adaptability, as well as the ability for innovation and creativity in game-making. These events are known for their time-constrained characteristics, ranging from 24-28h, where participants gather in groups to develop games relating to a specific theme (Kultima 2021). Kultima (2021) observes that for many jammers, the interest in

participating in game jams lies in the ability to expand the design and game-making process, a crucial skill in the context of commercial game development, not typically cultivated in traditional educational settings. Arya (et al., 2013) also emphasises that this flexibility is valuable not only in game development but also as an opportunity for jammers to develop innovative and more efficient methods of organisation and brainstorming that align with the time constraints faced. Beyond the development of game making skills, a new type of game jam, usually described as Serious Game Jam (SGJ), which has been organised by DiGRA JAPAN (Digital Games Research Association) since 2014, focuses on exploring the use of games as a tool for learning about social issues, such as gender inequalities (ref), cultural heritage (ref) or science (ref). Here, a 'serious' thematic constraint is added in comparison to events such as the Global Game Jam (GGJ), that also have a thematic constraint though normally unrelated to the topics approached by SGJs. When considering SGJs, which explore more complex themes, some studies, which will be further analysed in the present paper, emphasize the importance of preparing the theme with the participants, engaging them in extra educational activities and giving them time to internalise it.

2. Method

This article features a selection of sources stemming from the results of a Systematic Literature Review (SLR) conducted under the EPIC-WE project that followed the PRISMA 2020 guidelines (Paget et al., 2021). The review gathered sources from three scientific databases (ACM Digital Library, b-on, and JSTOR); declaring as 'external sources': items from four other digital libraries where the agreed upon search formula could not be used, and individual articles that were either selected from the project's original proposal or suggested by project partners. All the sources had to have been written in English. For the search time frame, the articles should be published between February of 2002 (since the first game jam had been organized) and February of 2023. The search formula used in the scientific databases is shown below:

- ("game jam*" OR "game mak*") AND ("youth" OR "young" OR "teen*" OR "adolesc*") AND ("culture" OR "cultural" OR "communit*" OR "innovation")

Exclusion Criteria	Name	Description
Ex.C. 01	Revision by peers	Not peer-reviewed
Ex.C. 02	Publication Date	Published before 02/2002 or after 02/2023
Ex.C. 03	Language	Not available in English
Ex.C. 04	Availability of Full Text	Full text is not available
Ex.C. 05	Document Duplication	Duplicate record
Ex.C. 06	Ongoing	Describes a project that is ongoing
Ex.C. 07	Not Related	Theme is not relevant to the review
Ex.C. 08	No Game Jam	Does not mention game jams
Ex.C. 09	No Game Development	Does not mention game development
Ex.C. 10	No Youth	Focuses on ages below 16 and above 25 years old or does not specify
Ex.C. 11	No Culture	Does not mention cultural themes and/or heritage
Ex.C. 12	No Innovation	Does not expore practices that are explicitly innovative

Figure 1: Exclusion Criteria for the SLR screening process

The first screening of the SLR (title and abstract) using Rayyan software identified 1,455 sources, including 87 from external sources. The exclusion criteria are shown in Figure 1. Cohen's kappa for this screening, calculated on 12% of the records, was 0.74, indicating "substantial" correspondence (O'Connor & Joffe, 2020), with an average agreement rate of 95.57% and a disagreement rate of 4.43%. The second screening (full text) was conducted with *NVivo 14*, resulting in 82 articles, with 68 included in the review. No automation tools were used. This screening's Cohen's kappa was 0.76, also indicating "substantial" correspondence, with average agreement and disagreement rates of 98.12% and 1.88%, respectively. From the SLR, 10 sources were selected to be analysed in the context of this paper, and were codified as "learning in serious or cultural game jams." This paper will analyse these sources regarding their conceptualizations of learning, descriptions of the learning process, and the logistics of the SGJs they report on.

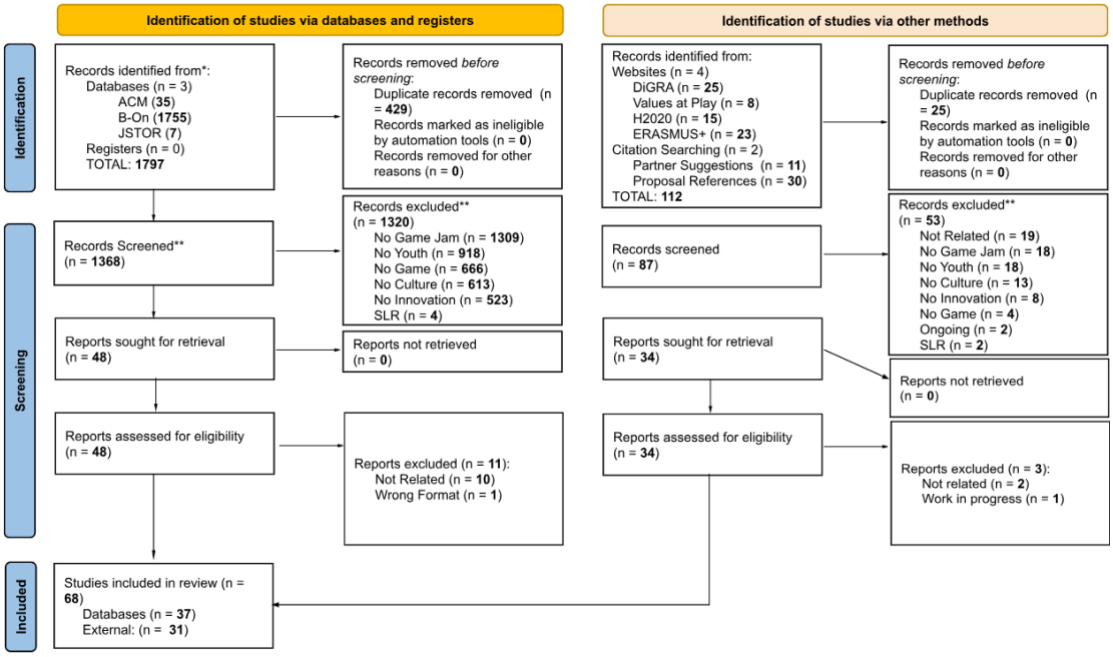

Figure 2: PRISMA2020 flow diagram including sources from both scientific databases and external sources.

3. Results

From the 10 sources selected and analysed in this article, represented in table 1, eight of them were codified as referring to conceptualizations of learning, but only one of them specified a learning paradigm, namely, the constructionist approach (Study 7). Most of the conceptualizations of learning found were related to game jams – for example, collaborative and cooperative learning (Study 4). Furthermore, seven articles were codified as "measuring learning", although this is not discussed or analysed in depth in most articles. The learning process and the logistics behind the serious game jams are described in five articles, focused mostly on the time of the jam, the learning activities prepared, and the relationship between facilitators and participants.

Table 1: 10 selected sources for analysis that address learning in game jams

Nº	Reference	Serious Game Jams Logistics	Main Ideas
1	Arya et al., (2019)	Pré-event workshops and educational activities Week-long game jams	The authors develop the "GGJ-Next Curriculum" adapted for educational purposes, focused on learning.
2	Aibara et al. (2022)	The SGJ operation organizes the logistic of the game jam in 3 phases: 1) the preparation phase 2) the lecture phase 3)the development phase	The authors present the SGJ operation manual, adjusting the game jam logistics to serious themes.
3	Aibara et al., (2020)	The 8th SGJ was divided into two sessions: a study session, with lectures about the theme delivered by specialists and a development session, focused on the game-making	The authors noted the difficulty in adapting the logistics of the GGJ to the specificities of the SGJs, given the different objectives of each. They highlight the importance of preparing a manual to guide the organizers of SGJs.
4	Contreras-Espinosa & Eguia-Gomez, (2022)	Four dimensions of learning in game jams: 1) cooperative; 2) project-based; 3) problem-based; 4) collaborative;	The authors highlight game jams as great opportunities for the cultivation of essential skills, embodying principles of co-creation, co-production, and co-design.

5	Danilovic et al, (2022)	A game jam aimed to explore the lived experiences of participants with opioid addiction, focusing on inclusivity for marginalised groups, by inviting these populations to take creative control of the game production process.	The authors highlight the transformative potential of game design in fostering community, resilience and self-insight among young-adults grappling with addiction.
6	Laiti et al. (2021)	A five day cultural game-jam had a cultural program of two days to get acquainted and involved with the Sámi culture. The theme of the jam was defined together with the participants. The game jam took place in a cultural center.	The authors shed light on the role game jams can have in passing down traditional knowledge, using the case of Sámi Game jam as a tool for the revitalisation of indigenous history in the context of Sámi culture.
7	Petri et al., (2019)	The article argues that game jams are well-suited for constructionist learning, providing a context where students can work as a team to solve challenges and expand their knowledge.	The authors introduce the constructionist approach, connecting it with game jams, advocating for an active and experiential way of learning.
8	Preston (2014)	Preparation on the theme and support began a week before the start of the jam. Experts were present throughout the last day to do follow-up sessions. Information leaflets on the subject were made available at the facility during the entire event.	The author recommends logistical specificities to be taken into account in the case of Serious Game Jams.
9	Ramzan and Reid (2016)	The NPJ benefited from a team of researchers working with developers, allowing for a diverse range of expertise to be shared. This collaboration allowed developers to utilise researchers' knowledge for prototype design and development, while researchers' work was translated into games through effective communication.Having key stakeholders may have generated a different breadth of prototypes due to the addition of new expertise, perspective, and agenda	The authors developed the noPILLS Jam (NPJ) focused on water pollution solutions. The games, targeting various audiences, reflected the potential of game jams in generating rapid prototypical evidence for research initiatives.
10	Schrier et al (2021)	The game jam aimed to enhance perspective-taking, identity exploration, and connection to others through game design, encouraging students to express themselves creatively.	The study discusses the implementation of a game jam in public schools in Nigeria, focusing on identity exploration and perspective-taking for students, teaching empathy and compassion.

3.1 Game Jams for Learning

In recent years, there has been a growing acknowledgment of the intertwined relationship between learning and enjoyment, a concept elucidated by study 1. The authors posit that the human brain is inherently wired to derive pleasure from the act of learning, suggesting that they are symbiotically linked. Many studies highlight game jams as valuable learning opportunities, with learning being a primary motivator for participants. Study 7 introduces the constructionist approach, connecting it with game jams, advocating for an active and experiential way of learning. According to this framework, learning is most effective when individuals construct personal knowledge through engaged participation, rather than passively acquiring information. This approach of hands-on experiences fosters creativity, independent thinking and problem-solving skills.

Study 4 states that the type of learning that takes place in game jams does not differ much from the one that occurs in typical educational environments, identifying four types of learning: cooperative, project-based, problem-based and collaborative. Cooperative learning happens through task division among participants, especially in teams with diverse skills, requiring autonomous work while maintaining team cohesion and collaboration. Project-based learning involves participants solving their challenges with facilitator support, fostering autonomy and frustration management. This aligns with problem-based learning, characterised by creative problem-solving for new challenges. Lastly, collaborative learning, one of the most identified types of learning in game jams, concerns the process of learning through collaboration between two or more participants

to achieve a common goal: creating a game. This process is present throughout all the game jam, and doesn't relate only to participants, but the facilitators, who also engage in processes of collaboration, particularly during pitch sessions.

When it comes to learning in SGJs, study 9, through the "noPILLS" game jam, explores the theme of water pollution, with three games produced. One of them, Sewer Seeper, focuses on water filtration, with the main goal being to shoot the micro polluting elements that appear and threaten the environment. Along with players learning about micropollutants as they eliminate them, a quiz is introduced between levels to test the knowledge acquired. This study introduces the concept of learning extending beyond the game jam, when games are made publicly available. Study 5 highlights the transformative potential of game design in fostering community, resilience and self-insight among young-adults grappling with addiction. Study 10 explores the use of a game jam to learn about empathy, with two games being developed: Forgiveness, which focuses on exploring conflicts and learning to forgive others, and Togetherness, which focuses on tolerance, acceptance and perspective taking. Another growing field explores game jams' potential to teach and produce culture. Study 6, involving the Sámi Game Jam, aimed at revitalising indigenous Sámi culture, produced six cultural games. For example, Lost Memories presents the player two conflicting worlds: the cultural traditions that represent the Sámi community and their heritage, and a new modern world, which implies leaving behind their memories, traditions and history. Another game, Rievssat, puts the player in the role of a Northern Finnish ptarmigan bird whose habitat, that used to provide safety and a home, becomes increasingly dominated by colonising forces, leaving it uninhabitable and the bird feeling alienated from his birthplace. The authors considered that the production of culture happened in a literal sense, reflecting the way Sámi Game Jam successfully served as a tool for cultural revitalization. Considering the sources analysed, it's possible to identify a common notion: that game jams have the potential to be dynamic learning ecosystems where participants engage in multiple learning processes – ranging from game making skills to learning about cultural heritage.

3.2 How was the Process of Learning Structured?

When considering the specific goals of SGJs, it's important to adapt the game jam format to the learning outcomes desired. Study 3 notices that the conventional framework for Global Game Jams (GGJs) is not a good fit for SGJs. When comparing the logistics of both, the authors call attention to the differences in theme and the games' design. While in GGJs the participants are free to interpret a general theme as they wish, and develop games for entertainment, in SGJs the theme is usually followed by lectures with specialists and the pressure of dealing with a real-world issue. This is reflected in the game design, as participants need to conduct research and share ideas and doubts with specialists to develop a game that is entertaining, but also educative, which makes it the key process of the entire event. While in GGJs there is a theme revealed to the participants at the beginning of the game jam, followed by the game design, in SGJs the theme is revealed through several means, and includes preparation such as live lectures on the topic. After knowing the theme, for the participants to start the game design, they need to research extensively about the theme, which requires a greater effort and time than in GGJ. Taking this into account, study 3, which implements the 8th SGJ, inspired by the SGJ operation manual (see study 2) was divided into two sessions: a study session and a development session. In the first stage, a workshop was organised by a specialist and a presentation of the theme was made, allowing participants six days to reflect on the theme and to do their own research and prepare for the game ideation. Study 8 explores the logistics of SGJs through the noPILLS Jam, which focused on health. A week before the jam, participants attended a lecture by a health expert, which allowed the participants to gather more knowledge about the topic, ask questions and autonomously do a follow-up of the theme. After the start of the jam, experts were also present on the last day to provide support. In addition, throughout the game jam, information leaflets on the subject were made available at the facility, which the participants found very useful. The author emphasises the importance of having experts present throughout SGJs to foster collaboration and enhance learning. Although follow-up sessions with experts were beneficial, most teams were focused on completing their games due to the time constraints, neglecting deeper reflection on the theme. Therefore, the author suggests preparation before the jam to allow for more time and dedication to the theme. Additionally, evaluating games based on their educational value alongside typical criteria encourages participants to focus on developing games with educational purposes, not just on design and playability. Based on the experience, . The author proposes a model for SGJs that includes extensive expert access before and during the jam, through workshops, information sessions, and participation in pitching and presentation sessions. The importance of facilitators is also explored in study 9, where the authors, through the lessons learned from the noPILLS game jam, already mentioned, emphasise the importance of collaboration and the benefits of having topic experts as facilitators. These experts transferred their knowledge to participants, who then expressed it through their games. Study 1 adapted game

jams for educational purposes, especially for youth, resulting in the "GGJ-Next Curriculum, that explores the learning outcomes that should be achieved during game jams. This curriculum targets cognitive outcomes (creativity, innovation, problem-solving, logical thinking), skill-based outcomes (programming, design, narrative, audio, visual arts), and affective outcomes (motivation, confidence, friendship, networking, fun). They found that adapting the GGJ for younger participants enhances learning by addressing their needs. For educational game jams, the authors also recommend pre-event workshops and activities weeks before the jam and suggest week-long jams to produce more games. Study 6 highlights the importance of preparing the theme and creating a learning environment in game jams, as shown in their game jam focused on Sámi culture. There was a focus on preparing the theme, enabling participants to get involved and take ownership of the topic, and fostering communication, sharing and learning with and from representatives and participants of Sámi culture. By the start of the jam, participants were expected to be familiar with the theme, allowing for greater exploration of Sámi culture. The event lasted 5 days, with the traditional 48-hour format, but with three important variations: before the start of the jam, a cultural program was held, which included two days at the beginning to get acquainted and involved with Sami culture, culminating in a day dedicated to Sámi culture. Throughout the event, it was a priority to include representatives of Sámi culture among the participants, as their lived experiences and knowledge were essential for the creative and narrative process, and for interpreting and using their culture in the games appropriately. The importance of “feeling” the culture reflected on the choice of the facility - the game jam took place in a cultural center (Áilegas), but at the same time there was a traditional Sámi tent (lávvu) which served as a place for daily reflections, pitching sessions and follow ups (ibidem). This approach shows that SGJs, which aim for educational purposes, need to meet different participant needs, allowing more time for internalising and learning without the typical 48-hour pressure.

4. Discussion

The learning process in SGJ’s must be adjusted to the needs of the theme and the participants. In this sense, study 2 presents the SGJ operation manual, which states the importance of going beyond the 48-hour format, preparing and evolving the participants on the theme. Study 8 advocates for pre-jam preparation through lectures and workshops to facilitate meaningful reflection and suggests evaluating games based on their educational value alongside traditional criteria. Similarly, study 6 emphasises theme preparation in a Sámi culture-themed jam, extending the event to include cultural immersion activities. In both studies, the extended format and expert involvement enhanced the participants' understanding and self-confidence in exploring the themes. These findings underscore the transformative potential of structured learning within serious game jams. When considering how learning is assessed in serious game jams, some studies measure it by the number of games created as a result of learning, while others conduct pre and post-game jam surveys to track changes in the awareness of the issue, but the results are never explored. For example, in study 6, with the Sámi Game Jam, the authors did follow-up questions throughout the event, to see if the participants were managing to familiarise themselves with the topic. These questions focused on the educational aspects of the game jam, especially regarding Sámi culture and the participants' expectations for the educational impact of their game – however, the results are not addressed by the authors. Subsequently, a textual analysis of the games was also carried out, with the aim of understanding the educational impact of the game and measuring the occurred learning. In the “noPILLS Game Jam” (study 9) the learning process stems from the way all games were "considered as successful demonstrations of the potential that serious game jams can offer in developing rapid prototypical evidence for research initiatives" p. 541. However, there is no measurement of learning, as the authors acknowledge that no research has been done to confirm the validity of this learning, and that this is only an assumed outcome of the project. This lack of measurement and description of the learning processes found in the articles reflects the need to reinforce the importance of this process when it comes to SGJs. Due to the complexity of organising, preparing and ensuring not only that the learning of the theme happens, but also that the game-making reflects that while contributing with new knowledge, a bigger and clearer communication of the process, challenges and achievements between different organisers may contribute to a stronger framework and outcomes related to SGJs. Furthermore, since the articles focus on learning, there should be a deepening and exploration of this thematic, given that some articles do not refer to any theory or conceptualization, using the term in a generalised way. For the future, to inform the learning process, this article suggests a bigger focus on measuring the learning outcomes beyond the number of games produced, and making those results available and discussed in the article. To talk about learning outcomes, one must know 1) what was the participants’ initial educational level on the subject; 2) what instruments must be used considering the needs of each team and subject; and 3) what are the expected outcomes.

Some limitations in this study can be found. The first limitation stems from the fact that the articles analysed come from an SLR with a more general theme, as part of a broader project, not taking into account other articles that could be relevant to discussing this thematic. The second limitation comes from analysing only 10 articles, which is not representative of the broader research done in the topic of learning in Serious Game Jams. For the future, it is recommended to create a framework adapted to SGJs, which considers specific educational approaches used in the context of these game jams, the expected learning outcomes, how to prepare the theme and the participants, and which methodologies should be used to measure the success of this learning process.

5. Conclusion

Considering the first research question, "What are the conceptualizations of learning according to SLR sources?", through the analysis of the sources, it was possible to conclude that there isn't a unique approach to learning applied to game jams – instead, the authors highlight the multiplicity of formats of learning and conceptualizations that can be thought of when talking about game jams. Study 7, for example, introduces the constructionist approach to game jams, highlighting how they provide a context for participants to construct their knowledge in collaboration and interaction with others. Furthermore, the results found that some articles referring to learning in game jams do not specify any educational approach or theory, reinforcing the need to define clearer specific approaches. Considering the second research question, "2) How did organisers structure the learning process?", when analysing the logistics of SGJ's, most articles reinforce the need to prepare the topic with the participants, extending the usual time-frame, introducing experts on the topic as facilitators, and doing educational activities. Given that it is expected that in SGJs participants will not only be able to present a playable prototype, but that this prototype will reflect a real social problem, there is an added responsibility to treat the topic with time and less pressure.

Abstract: The adolescence period is characterized by significant changes in individuals' lives, which can lead to various emotional and behavioural problems. Therefore, it is important for young adults to have tools for self-regulation, understanding, and controlling their physiological symptoms. Integrating these tools as gamified elements into new technologies is a way to engage a younger audience. In recent years, the effectiveness of immersive Virtual Reality has been repeatedly demonstrated in fields such as Psychology and Education. The combination of this technology with biosensors enables individuals to be aware of their real-time physiological states. This physiological monitoring can lead to adaptations in applications based on the individual's emotional state, for example. This work describes the design and development of an immersive Virtual Reality game whose main interaction is through biofeedback. The game is called "*Alice, Beyond Reality*", and its objective is to help young adults learn to self-regulate their physiological responses. The game draws inspiration from the well-known story of "*Alice in Wonderland*". In this story, the Queen of Hearts has transformed all the characters into cards, and the players must help them escape before it's too late. To achieve this, the players are guided by the White Rabbit through different levels where interaction through physiology is key. For instance, the players must learn to increase and decrease their heart rate to solve puzzles that allow them to progress to the next level. Throughout the game, gamification elements such as points, progressive difficulty, and various challenges are included to motivate the players to continue advancing in the game. Through the biofeedback system, the players become aware of their physiological changes to control them voluntarily. In the final screen, the players are shown their progression throughout the game so they can recognize their evolution. In the near future, an initial validation with users will be conducted to assess the usability and functionality of the game.

Keywords: Biofeedback, Heart Rate, Immersive Virtual Reality, Serious Game, Physiology

1. Introduction

The adolescent period is characterized by significant changes in individuals' lives: physical and psychological maturation, changes in social relationships, brain transformations, etc. (Crone and Dahl, 2012). These changes can lead to difficulties in attention management, emotions, and behaviour. Such difficulties may escalate into more serious situations such as aggression or substance abuse, among others (Iannattone et al., 2024). Therefore, it is important for young adults to have psychological tools like self-regulation to use when needed.

The self-regulation of physiological state serves as a valuable mechanism within the organism, facilitating the management of situations characterized by high levels of anxiety or stress or negative emotions (Goessl, Curtiss and Hofmann, 2017). This process entails the attentive monitoring of physiological signals, the comprehension and management of emotions, and the adjustment of bodily responses to achieve an optimal state wherein negative emotions, such as anxiety, do not become incapacitating (Gratz and Roemer, 2004). Biofeedback systems help individuals train the voluntary capacity to control some physiological functions such as breathing (Aritzeta et al., 2022). Heart rate (HR) variability emerges as the most frequently utilized parameter in biofeedback applications aimed at self-regulation, given its intimate connection with respiratory processes (Lehrer and Gevirtz, 2014). Deep breathing technique, for instance, increases oxygen levels in the blood and stimulates the vagus nerve, resulting in longer intervals between heartbeats (Toussaint et al., 2021).

Gamification is a technique that involves incorporating game elements into non-game contexts (Deterding et al., 2011). This technique has gained popularity in the field of mental health in recent years. The inclusion of game elements such as rewards or challenges in therapeutic situations encourages individuals to become more engaged (Khaliq, Fowles and Moore, 2018). Games that combine some form of learning with gamification are referred to as Serious Games (SG) (Carrión et al., 2020). Gamification elements such as trophies or scores can create a sense of challenge and excitement that boosts attention and enhances cognitive engagement. The use of these elements fosters positive emotions that improve learning rates and cognitive skills (Christie et al., 2019).

In the field of Psychology, SG can be designed to achieve various objectives, including promoting techniques to mitigate and manage symptoms related to mental health issues. Among these techniques are breathing exercises and meditation (Alqahtani and Orji, 2020).

Immersive Virtual Reality (iVR) can be defined as a virtual experience in which the individual is completely immersed thanks to a Head-Mounted Display (HMD) (Suh and Prophet, 2018). This sensation is enhanced by the sounds played on the HMD and the feeling of control over the application though controllers or trackers (Murcia-López and Steed, 2016). In recent years, iVR has become increasingly popular across various fields, not just in entertainment. For instance, its significant potential has been observed in the field of education (e.g.,Checa, Miguel-Alonso and Bustillo, 2021). Similarly, numerous benefits have been discovered in the field of Psychology.

For example, iVR can assist individuals in confronting their fears in a controlled environment (e.g., Bzdúšková et al., 2022) or promote anxiety reduction (e.g., Bozdogan Yesilot, Ciftci and Ozcelik, 2021; Ziegelman et al., 2021).

iVR has been combined with biosensors to monitor user physiology in real-time. For example, one study found that individuals had better stress resilience when their heart rate data was displayed to them while they played and interacted with the game through biofeedback (Maarsingh et al., 2019). In another study, researchers found that biofeedback in iVR was effective for learning breathing techniques (Blum, Rockstroh and Göritz, 2020). Besides, the use of biosensors enables application customization as it adjusts to the needs of each user. This customization facilitates task focus, enjoyment of the experience, and enhances results. Individuals also prefer customization as it offers them a greater degree of control over the application (Alqahtani and Orji, 2020).

The present work is structured as follows: Section 2 explains the methodology followed for the creation of the serious game. Subsequently, Section 3 outlines the design and development process of the application. Finally, in Section 4, conclusions are drawn from the work, and future lines of research are proposed.

2. Methodology

For this work, a methodology proposed for the development of serious games in iVR has been followed (Checa and Bustillo, 2020). This methodology proposes different phases for creating a serious game in iVR. In the first phase, Pre-design, the target audience and the needs and objectives that the game aims to fulfil should be identified. It is also necessary to decide on the technology that best fits the research proposal. In the second phase, called Design, all the necessary materials for the game, such as assets or environments, are created. In this phase, the narrative and level structure, interaction mechanics, game objectives, etc., are also decided and developed. Finally, during the Evaluation phase, a validation must be designed to check if the educational objectives proposed in the Pre-design phase have been met. This last phase will be carried out in future research.

The project has been developed under the framework of established theories. Firstly, the Flow Theory has been employed, which posits that individuals seek to achieve final goals when they are engaged and motivated in an activity (Csikszentmihalyi, 2014). For this theory to be effective, there must be a balance between difficulty and challenge. The Reinforcement Theory has also been employed, which explains that extrinsic gamification mechanics such as rewards or rankings positively influence learning outcomes (Berkovsky, Freyne and Coombe, 2012).

Furthermore, other research has been taken into account for making more specific decisions within each of the sections. According to a research, the duration of gameplay should be short so that individuals can quickly appreciate their progress (Khaliq, Fowles and Moore, 2018). Likewise, increasing their motivation and helping them stay focused on tasks helps them achieve better outcomes. This is also positively influenced by the customization of applications and their adaptation to the needs of each individual (Cheng and Ebrahimi, 2023b). A biofeedback system aids in this customization of the application in real-time, adapting to the needs of each user.

On the other hand, navigating through a fantasy world generates a state of flow and concentration that allows players to feel immersed to the point of losing self-awareness and track of time. This state of flow enables players to set aside real-life concerns and focus on the intervention to address, for example, their physiological symptoms (Cheng and Ebrahimi, 2023a). To prevent players from being distracted by the use of new technologies, it is advisable to include a tutorial level where they can learn the game mechanics and avoid the novelty effect (Miguel-Alonso et al., 2023).

Regarding relaxation techniques, deep and conscious breathing has been shown to have a positive impact on factors such as stress and anxiety. Additionally, it is an easy-to-perform technique that can be used across various populations of individuals (Toussaint et al., 2021).

3. Alice, Beyond Reality

A serious game in immersive Virtual Reality named "*Alice, Beyond Reality*" has been developed, featuring its primary interaction through users' physiology with a real-time biofeedback system. In Figure 1, the design and development process of the application is illustrated according to the parameters outlined in the Methodology section.

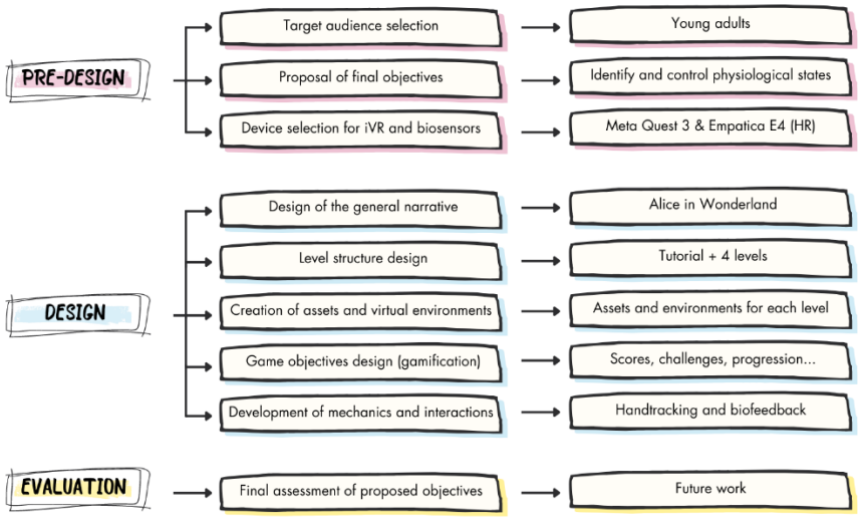

Figure 1: Summary of the game design and development process

The selected target demographic comprises young adults aged 15 to 20 years who lack understanding of how to manage their physiological state. On the other hand, the purpose of this study is to assist these young adults in becoming aware of their physiology and teaching them how to regulate it.

The game narrative draws inspiration from the story of *Alice in Wonderland*. As it is a well-known tale, the player is already familiar with the background from the beginning of the game. In this narrative, the Queen of Hearts has transformed all the characters into cards, and the player must assist them in escaping before it is too late. To achieve this, the player must overcome a series of levels with the guidance of the White Rabbit, where interaction through the player's physiology is the key.

3.1 Software and Device Selection

The game has been developed using the following software. Blender was employed for the creation of 3D assets. Photoshop was utilized for the creation of textures. Finally, Unreal Engine was used for the creation of environments and the programming of mechanics and interactions. These software tools were chosen due to their previous experience within the research group.

The game has been designed for use on the Meta Quest 3 device, although it could be utilized on any device that supports hand-tracking. Regarding the selected biosensor, the Empatica E4 wristband has been employed. The Empatica E4 wristband enables the collection of various raw physiological data, such as electrodermal activity or blood pressure volume, and can connect in real-time with the game engine. However, in this game, only the data related to heart rate is utilized.

3.2 Level Design

All the scenarios have been designed with a visual style that departs from realism. The textures evoke watercolour paintings, and the assets exhibit a slight fantastical character (for example, clocks that run backward). The scenarios have been designed so that the user can play within a real physical space of 2 square meters. This has been done to eliminate the need for players to move using controls, providing them with the sensation of actually moving within the virtual room. The interaction with virtual objects is accomplished

through a hand-tracking system integrated into the HMD instead of using controllers. Hand-tracking has been chosen as the main mode of interaction to make gestures such as grabbing and releasing objects feel more natural. Otherwise, the total duration of the game is approximately 25 minutes to ensure that the gameplay is sufficiently engaging, and that the player does not experience fatigue from the iVR device. In terms of audio, sounds have been incorporated to enhance the players' experience and immerse them further into the environment. Firstly, ambient sounds tailored to each level have been created to enhance the sense of immersion. These sounds align with the game's narrative, reflecting the tone and atmosphere of each level. Secondly, there are dynamic sounds related to the player's behaviour. For example, gratifying sounds play when actions are successful, and alert sounds signal if game objectives are not met. Additionally, these feedback sounds will be complemented with visual cues for individuals with hearing impairments.

The game is structured as follows: 1) a tutorial level for users to learn basic interactions and establish their individual baseline, 2) four levels with different environments and challenges where biofeedback plays a fundamental role, and 3) a final screen displaying the progress and results for each user.

3.2.1 Level Tutorial

The player emerges in a forest surrounded by trees, as can be seen in Figure 2.A. There is a picnic bench and various objects, including a key that opens a door located in one of the trees. The player has time to explore how the mechanism of picking up objects works and can practice with those placed on the bench. If the player is unable to do so independently after a few minutes, an off-screen voice will provide instructions on what needs to be done. When the player opens the tree door, the scenario changes as the player enters Wonderland.

As a transition between levels, a black environment will open up where cards fall around the player.

When the player enters Wonderland, a new level begins in a nearly empty room, as shown in Figure 2.B. In that room, there is a card with a printed white rabbit that can only move its eyes and mouth. The White Rabbit explains that "they are all trapped in Wonderland" and reveals the evil plan of the Queen of Hearts to turn everyone into cards. Subsequently, the White Rabbit seeks the player's aid in searching for and saving the characters throughout the different levels.

The White Rabbit warns the player that the rooms are aware of how people feel when they enter them: they use the player's heart rate information to alter the environment, making it more challenging to escape Wonderland. Additionally, the White Rabbit gives the player a gift: a watch that displays real-time heart rate. This watch makes it easier for the player to recognize a state of calmness or agitation. The purpose of using this watch is for the player to learn how to consciously regulate the physiological state. To achieve this the White Rabbit teaches the player what happens when body movement is increased (heart rate increases) and then demonstrate the effects of deep and conscious breathing technique (heart rate decreases). Following this brief introduction, the adventure through Wonderland starts.

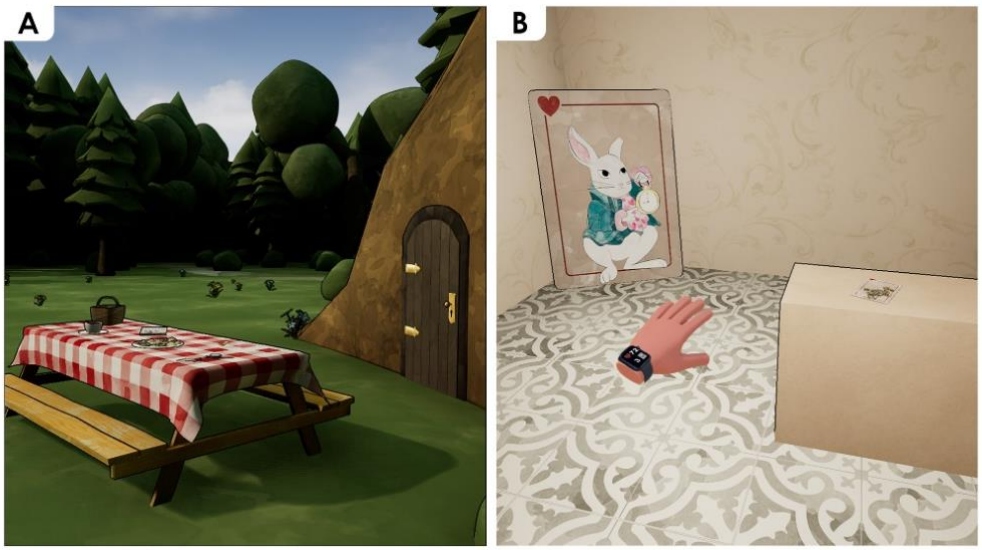

Figure 2: Overview of the tutorial level: the initial screen with the picnic bench (A); and the tutorial and first interaction with the White Rabbit (B).

3.2.2 Level 1

In the first level, the player appears in an exceedingly large room. Within this room, there is a tea table with various items on it: plates, cups, teapots, cookies, etc, as shown in Figure 3.A. The player needs to do exactly the same as in the tutorial level: increasing the heart rate to grow in size and be able to search for a key in the room; and breathing deeply to reduce the heart rate, become small again and exit through a small door.

Apart from searching for the key, the player is also able to find some character cards hidden in the room. Each time a character card is found, the number of cards collected throughout the game will appear on the watch. The White Rabbit's card is present in this and the other levels to assist the player in case they are unsure of what to do or need some form of help.

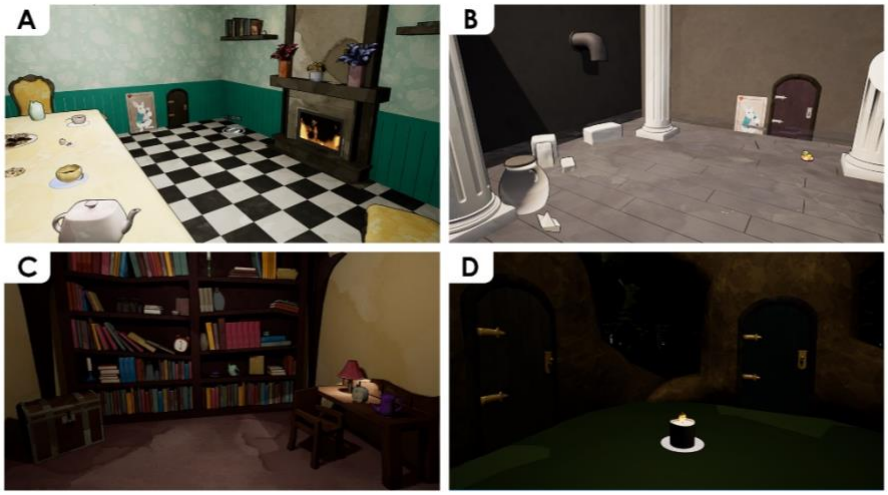

Figure 3: Overview of the game levels: initial level (A); level 2 (B); level 3 (C); and final level (D).

3.2.3 Level 2

At the beginning of this level, the player appears in a room with water on the floor, as can be seen in Figure 3.B. In the background, the sound of falling water is heard. The water level on the floor rises as time passes. The player must search the stage for some cards and a key to exit before the water reaches head level.

To successfully complete this level, the player must stay calm to slow down the rising water. If the heart rate increases, the water will rise rapidly, giving the player less time to play. If the water reaches the player's head, the level will restart, giving the player the opportunity to practice controlling their physiology despite the stress of the situation. The player can request assistance from the White Rabbit whenever necessary so they can successfully complete the level.

3.2.4 Level 3

In a room filled with objects and numerous keys, the player must search for the correct key to unlock the door and exit the room. The player won't have any clues; there will only be a timer clock with a countdown, and the sound increases with each passing second, as shown in Figure 3.C.

The player must maintain a state of calm despite the countdown timer to ensure that time does not run out. If time runs out, the level will restart, providing the player with the opportunity to learn how to control their physiology in order to progress to the next level. As in the other levels, the player can also search the environment for character cards and ask the White Rabbit for help at any time.

3.2.5 Level 4

The player appears in a clearing in the middle of the forest at night, surrounded by trees with doors, as can be seen in Figure 3.D. In the middle of the clearing, there is only a candle that slightly illuminates the surroundings. The candle's appearance is influenced by the player's HR: if it remains steady, the candle will shine brightly. In case the HR fluctuates, the candle will lose intensity, and the player won't be able to see the surroundings clearly.

The player must maintain balance while searching for the exit. Only one of the doors contains the clue on how to exit the adventure to the final screen.

3.2.6 Final Screen

The player reappears in the initial forest with the picnic bench, as if the adventure never existed. On this screen, the player's progress in the game, the saved character cards, and the number of times help has been requested are visible. Additionally, the White Rabbit running through the forest and disappearing among the trees can be observed. When the player wishes, the game and the adventure will be concluded.

3.3 Gamification Elements

Throughout the game, various gamification elements have been incorporated. Below is a list of these elements.

3.3.1 Points and Badges

Players must search for character cards throughout the levels. These cards are badge-shaped and collectible. The more cards they manage to obtain, the higher their score will be.

3.3.2 Levels and Difficulty

Levels increase in difficulty as the player progresses through the game. The first level replicates the same interaction as in the tutorial level, while the last one requires the player to figure out what to do on their own.

3.3.3 Narrative and Challenges

There is a narrative that drives the progression of the game. Additionally, various challenges are included to prevent the game from becoming monotonous.

3.3.4 Progression

In the final screen, the players are shown their progression throughout the game so they can recognize their evolution. Specifically, the relationship between the stressors in the game and the player's physiological control required to overcome them will be displayed.

The difficulty of the levels and the various challenges can induce stress in players. Although these situations might seem counterproductive, it is essential to include challenges where players can apply what they have learned throughout the game. For instance, in Level 2, the rising water will likely make players anxious, leading to an increase in their heart rate. However, the challenge in this level is to try to reduce their heart rate despite the stressful situation. These types of scenarios mirror real-life situations, where the true effectiveness of this application in teaching users how to regulate their physiology will be tested.

3.4 Biofeedback System

For the creation of the biofeedback system in this game, the Empatica E4 wristband has been utilized. The wristband transmits real-time data and connects to the computer via Bluetooth. An application programmed in C# has been developed, serving as an intermediary between Unreal Engine and the Empatica data acquisition service in real-time. The code of this application implements a TCP/IP socket client connecting to a remote server (E4 Streaming Server) and also acts as a server to receive data from Unreal Engine. This code utilizes the official documentation of the wristband (https://developer.empatica.com/windows-streaming-server.html).

Within the Unreal Engine project, a blueprint has been created that requests information from the wristband. Specifically, it instructs the wristband to acquire only heart rate data. The heart rate data is obtained from the Blood Volume Pressure measurement (BVP) provided by the wristband at a frequency of 64 Hz and is acquired using a photoplethysmogram. To calculate the HR value, the application uses the interval between peaks of the BVP signal, also known as the Inter-Beat Interval (IBI). The formula for calculating HR is as follows: 60/IBI (in seconds). The result is the number displayed to the player on the virtual smartwatch and used by the application. The tutorial level's duration will be utilized to establish each player's physiological baseline, serving as a reference throughout the game because it is assumed that during the tutorial level, players are in a neutral state between relaxation and arousal.

Throughout the levels, an average of the most recent HR values is calculated, to create a *dynamic baseline* for each player. The biofeedback system compares the current HR with the dynamic baseline value to determine if the goals set for each interaction are achieved. These goals have been programmed as percentages to adapt to each player's baseline. For example, if the HR is more than 110% of the dynamic baseline, the goal is considered achieved. This system for obtaining HR from BVP data using the Empatica E4, and its classification of emotional states through various percentile thresholds, is similar to that used in a study aimed at detecting real-time stress by exposing individuals to both stressful and non-stressful situations (Campanella *et al.*, 2023).

4. Conclusions and Future Lines

A serious game in immersive Virtual Reality, functioning through biofeedback, has been designed and developed. This serious game called "*Alice, Beyond Reality*" aims to teach players to regulate their physiology through gamified educational content. In this way, by incorporating a familiar narrative and engaging gameplay mechanics, the players can learn to understand and control their own physiology, specifically, their heart rate through breathing.

In the game, various gamification elements have been included, such as scoring, diverse objectives, progressive difficulty, and a summary of progress during gameplay. Additionally, a tutorial level has been created to mitigate the novelty effect of the Virtual Reality device.

In the near future, an initial validation with users will be conducted to assess the usability and functionality of the game. Following this validation, any identified areas for improvement will be addressed, leading to a subsequent large-scale validation to gather data on the learning outcomes related to self-physiology management. The validation will be conducted with a large group of young adults, specifically university freshmen, divided into three groups. One group will use the VR application with real biofeedback, another group will use the VR application with a fake or placebo biofeedback system, and the third group will receive lessons on the relationship between the use of breathing techniques and their physiological state. All three groups will undergo several tests to determine which group has learned the most about physiological control, with the expectation that the group using VR with real biofeedback will show the most improvement.

In the future, the possibility of incorporating additional physiological data into the biofeedback system will be considered to enhance the complexity of the game. With this data, complex algorithms can be trained to learn from users' physiological responses, enabling the prediction of user behaviours.

jorn.weines@uit.no

Abstract: This article investigates the impact of a business simulator in an online economics course, focusing on the relationship between student engagement and reflections on learning. Utilizing a mixed-methods approach, our study analyzes responses from 328 students who used the "Hubro Business Simulator" in a flexible online bachelor's program in economics and administration. Students provided reflections on the simulator as a learning activity, application of theoretical concepts and practical relevance. Qualitative analysis of 1640 responses further explored the depth of students' reflections, categorized into different tiers of engagement based on their responses. This analysis builds on Self-Regulated Learning (SRL) and motivational theory. The study sought to determine whether students reporting higher levels of engagement exhibited deeper metacognitive reflections compared to their less engaged peers. Findings support a link between the level of engagement and the depth of reflection. Students with higher engagement levels were more likely to reflect on specific ways in which the simulator had supported their learning and understanding of theoretical concepts. This paper discusses the limitations and implications of these findings for enhancing game-based learning interventions, emphasizing the need to foster higher engagement levels to improve educational outcomes in online learning environments. The study contributes to the literature on game-based learning by providing a large empirical study on how business simulators can foster higher-order thinking and deeper learning reflections among economics students. It also highlights the role of engagement in using business simulators as learning tools, offering insights that could improve the learning design and implementation in similar online and flexible learning program contexts.

Keywords: Game-based Learning, Engagement and Motivation, Self-regulated Learning, Online Education, Business Economics Education, Business Simulators.

1. Introduction

In recent years, especially after the pandemic, online education has received more focus in Norway (Breiby et al 2022). Our case is an online bachelor program in business economics and administration. Our students participate through online platforms. The students have a need for flexibility. As a result, activities such as groupwork, discussions and internships are not feasible.

This necessitates alternative activities for student-engaged learning. We therefore use the "Hubro Business Simulator" where students manage a startup company. Throughout the simulation, students were also given custom made narrative assignments. These were made by the course instructor to fit the narrative of the simulation. The assignments were closely linked to the course curriculum, and the normal course work. The reasoning for this was to see if the students could connect the practical tasks in the simulator to the theoretical assignments. To further integrate the simulator into the course, students were given an assignment to reflect on their learning process.

In this article, we analyse the data, looking at students' level of engagement with the simulator and their displayed level of reflection on their own learning.

Our research question is: Are the students that report a high level of engagement operating on a higher taxonomical level when they reflect on how the simulator has impacted their learning, compared to students that report low levels of engagement?

2. Theoretical Background

2.1 Game-based Learning

Games for learning is a potential way to promote increased learning through higher levels of engagement (Schwartz and Plass, 2019). There have been some studies on the Hubro Business Simulator at Norwegian universities. Baksaas and Nygård (2021) find that it can provide deep learning in accounting courses. Hovland et al (2023) find no cognitive effects on quantitative measurements of grades and knowledge tests, but that

students express increased term- and method learning, and positive experiences and motivation. Skjelbred and Daus (2022) presents an RCT that found no evidence that high satisfaction corresponded to game effectiveness.

The use of games in economics education has seen an increase in recent years. Platz (2022) is the first systematic review of learning with digital games in economics programs and synthesizes the results from 20 intervention studies. It examines the effect games have had in comparison to other mediums, and which elements have had an impact on learning. Platz remarks that there is a large variation in effect sizes but concludes that evidence supports that games can be an effective form of learning for economics. She draws attention to results for content knowledge and higher-order thinking skills. An interesting finding is that the effects of GBL on motivation are unclear, but motivation as a factor for learning is supported. Platz points at this dilemma, as motivation is central in GBL-literature. She points out potential in relation to increased challenges to drive engagement and flow, or fostering intrinsic motivation through autonomy.

2.2 Engagement

In higher education, engagement often means engagement with the university, course or program. Our focus is on students' engagement with the simulator as a learning activity, that takes place in the overall context of their scholarly activities.

Kuh (2009) defines engagement as a *"term usually used to represent constructs such as quality of effort and involvement in productive learning activities".* Lu (2020) states engagement is important for online students' course connection and learning. He points out that the course instructor plays a role in facilitating engagement through substantive feedback. Martin and Bolliger (2018) state that student engagement can lessen the feeling of isolation in online courses and improve academic performance, and that engagement is critical for success and reducing the drop-out. Meyer (2014) describes an indicator of engagement from the National Survey of Student Engagement: The level of academic challenge that requires effort to overcome. Sub-categories to this indicator include higher order learning, reflection, integrative learning, learning strategies, and quantitative reasoning. This means engagement is important in online education to ensure student success, learning and completion of the education.

We focus on engagement in the context of a simulation game. According to Plass et al. (2015), engagement occurs inside the context and rules of a game setting. Engagement is also affected by the participation of the user (Salen & Zimmerman, 2004, as cited in Plass et al (2019)). Engagement comes from the individual that is engaging with a game, created by interest and motivation when interacting with the game (Schwartz and Plass, 2019). However, the most important element of engagement is defined by activity. Engaged users are actively taking part in a process of making meaning of the game and tasks therein. (G4LI, n.d., as cited in Schwartz and Plass, 2019). Schwartz and Plass conclude that engaged individuals are exerting some kind of effort and based on this define engagement as *"the active and focused investment of effort in a game environment"* (Schwartz and Plass (2019, pp 55). In the context of our study, we consider engagement to be the active effort, and quality of this effort, students have put into making meaning out of, and make use of the business simulator in their learning processes.

2.3 Motivation and Self-Regulation of Learning

Our approach for analysing the collected data builds on theories of motivation and self-regulated learning (SRL).

Deci and Ryan (2000) examine the motivational causes for actions. They distinguish between intrinsic motivation (doing what is inherently interesting or enjoyable) and extrinsic motivation (doing something because of an outcome or external factors). Furthermore, they say that intrinsic motivation can be seen as residing inside a person. Although, intrinsic motivation can also be seen as residing between a person and a task. This means that someone can be intrinsically motivated for certain tasks, but not for others. Finally, Deci and Ryan (2000) state that intrinsic motivation, in self-determination theory (SDT), cannot be created directly, but be facilitated or catalysed by providing situations where people can express it. We focus on intrinsic motivation relating to engagement with the simulator.

To closer examine how students' engagement with the business simulator impacts learning, we turn to SRL as a conceptual framework. Efklides (2011) concisely refers to SRL as "the setting of one's goals in relation to learning and ensuring that the goals set are attained". Panadero (2017) states SRL is central to "understand the cognitive, motivational, and emotional aspects of learning". His review examines the major models of SRL that have gotten traction in research. He finds that, in general, the models group the different subprocesses students perform

into phases: Preparatory, performance and appraisal. Our study focuses on appraisal aspects, which in the various models involves processes of how students regulate and adapt, (self-)reflect and apply metacognitive strategies in their regulation of learning. Miele and Scholer (2018) conceptualize two metamotivational process-loops in which learners monitor or control their task motivation.

Our survey was not an explicit instrument to measure SRL, but the qualitative data offers a view of how students reflect on the business simulator as a learning activity. Drawing on the SRL literature, we have looked for statements that deal with themes related to the appraisal phase of SRL to assess the level of reflection.

3. Methodological Design

Our study combines quantitative and qualitative data in a concurrent triangulation design. This approach uses complementary data on the same topic to get a deeper understanding of the studied problem (Almeida 2018). Because the aim of our study is to explore the relationship between engagement and level of reflection, we consider this design to be appropriate for our data collection.

Our data was gathered through an online survey. The survey was framed as a reflection assignment for students to complete after finishing the simulator. The first part recorded demographic variables (age and gender). Respondents could answer "other" on gender, but there were no such responses. The second part consisted of four quantitative questions where the students rated the simulator's usefulness in achieving four learning outcomes on a scale from 1 (low) to 5 (high).

The final part consisted of five open-ended questions asking respondents to reflect on the simulator as a learning activity (reported in Table 1). By allowing the student to formulate their answers freely, we aimed to collect data that represented their actual experiences with the simulator. In total there were 1640 comments. These comments make out the main part of our data analysis.

There were 365 responses, with 328 consenting to being used in research. The quantitative data was analysed by measuring the mean, and standard deviation (SD) in the answers.

A large part of our study involves analysis of the qualitative reflections. Based on the theory outlined above, we attempted to identify signs of engagement and motivational type. We used SRL to guide our analysis of the level of reflection. In doing this we aimed to illustrate the tiers of engagement and corresponding reflection on learning in the context of game-based learning and simulator games. Finally, we analysed the quantitative data of each tier to determine if students on higher tiers of engagement and reflection reported higher scores on the learning outcomes.

As our data is self-reported, there are risks related to validity. Based on Gonyea's (2005) criteria for validity of self-reported data, we consider the data to be generally valid for our study. In the context of the simulator, the questions are clearly phrased and unambiguous, and relate to a recent experience and context familiar to the respondents. The open-ended questions gave opportunities to provide feedback related to their individual experience at their preferred level of detail. The survey is anonymous with a long response time, preserving privacy and avoiding pressure. Respondents also had to explicitly give consent for their responses to be used for research. We will further discuss possible limitations of the data later.

4. Empirical Findings and Analysis

Table 1: Categories in reflection assignment

Category	Query
Reflection	Write what you liked/disliked with the simulator. What could we have done to make the simulator more useful for your learning?
Collaboration	The simulator can also be used in groups where several people take part in each company. 1) Would you have preferred to use the simulator in collaboration with other students? 2) Do you think collaboration in groups would improve the learning outcomes?
Learning outcomes	What do you think you learned by taking part in the simulation?
Practical relevance	1) Did you gain an increased understanding of how theory and practice are connected in business economic analysis? 2) How could the simulator be improved in this regard?
Simulation as a learning activity	What do you think about this activity as a way of working?

4.1 Summary of Aggregated Findings

The qualitative comments were analysed by categorizing what we could interpret as the meaning of the comments and performing a frequency analysis. A significant number of respondents appreciated the simulator, noting the engaging and realistic nature, although some expressed concerns regarding time demands, oversimplification of real-world scenarios, and lack of clarity. A preference for traditional assignments was noted by a small minority. The simulator enhanced reported understanding of business concepts such as accounting and market dynamics. While the simulator was used individually, opinions on hypothetical collaboration were mixed. Many recognized potential benefits of collaboration and discussion, but few wanted to work in groups, citing concerns about coordination or a preference for working alone. Comments highlighted requests for guidance and feedback. Some also wanted integration with other courses. Positive remarks were made about the interactive elements of the simulator, the ability to observe the consequences, and comprehensive understanding of business, aligning well with the course curriculum.

4.2 Analysis of Engagement, Motivation, Reflection and Learning

Drawing on the theory presented on engagement, motivation, and reflection, we defined criteria and indicators for our categorization of the variables, shown in the tables below.

Focusing on the appraisal aspects of SRL, we applied the concept of metamotivation. Scholer et al (2018) describe "metamotivation as the processes by which individuals monitor and control their motivational states in order to achieve their goals". Miele and Scholer's (2018) metamotivational model of motivational regulation builds on SDT. It attempts to illustrate the process of students' awareness of their level of motivation (i.e. motivated "enough" or "in the right way"), arguing that motivation regulation is tied to tailoring the level of motivation to the demands of the task. They suggest that extrinsically driven students might be as highly motivated in tasks as their intrinsically motivated peers but find the tasks less engaging thus with less complex, creative and flexible effort. Furthermore, they provide a list of relevant feelings that signal high or low levels of different motivational components (e.g. confidence/frustration for self-efficacy, or enjoyment/boredom for intrinsic value).

We categorized engagement as low (1), medium (2), and high (3). We used the same scale for assessing level of reflection. We categorised motivation as extrinsic (1) or intrinsic (2). As classifying motivation can be challenging, we assessed if there was a considerable intrinsic component present in the response, or if it was strictly extrinsically motivated. We reiterate that the score assigned to each variable was based on the interpretation of the researchers using our defined criteria, and not a measurement of SRL. Both researchers analysed the data and discussed uncertain classifications. Therefore, results might not accurately represent the actual engagement, motivation, and reflection, but what we could assess and categorize from the data in the responses.

Table 2: Criteria for categorization of engagement level

Engagement indicators:	Quantity of effort (comments about desire to complete or finish the simulator, how many things they have tried/done), quality of effort (comments about whether the simulator "fits" their motivation for engaging in the task, how thorough they have been in the task), exploration of the simulator, mastery of the simulator.
High:	High quantity and quality of effort put into exploring and mastering the simulator.
Medium:	High quantity or quality of effort put into exploring or mastering the simulator, but not both.
Low:	Low levels of both quantity and quality of effort put into exploring and mastering the simulator.

Table 3: Criteria for categorization of primary motivation type

Motivational indicators:	Joy, interest, external pressure, rewards or outcomes.
Intrinsic:	Presence of comments indicating joy from, or interest in, the simulator.
Extrinsic:	Presence of comments about instrumental use of the simulator, focus on external factors (rewards, outcomes), time/effort expenditure.

Table 4: Criteria for categorization of reflection on learning

Level of reflection on learning indicators:	How the students describe their experience with the simulator, their perceived learning from it, and insight regarding their learning process. We differentiate between how detailed and deep their thoughts about the simulator and their own learning are as described below.

High:	Reflects on what they have learned, but also how they learned, and what could facilitate more learning. Relating their learning to larger contexts.
Medium:	Reflects on what they have learned.
Low:	Reflects on what tasks they have done and if they have learned/not learned (e.g. answering "yes" or "no" without further specifications).

We categorised based on assessed levels of engagement and motivation. Categories were high, medium, and low engagement, where each category of engagement had sub-categories for motivation. This resulted in six tiers. No respondents were categorized as having high extrinsic engagement. This row is therefore left out. We counted the number of responses in each category, calculated mean levels of reflection and reported learning outcomes, and SD for each category. We also report mean SD of age, and gender distribution.

Figure 1 shows that 61% have been categorized as showing medium engagement, with the largest tier being medium intrinsic engagement, followed by high intrinsic engagement and medium extrinsic engagement.

The mean level of reflection appears to increase with higher levels of engagement and intrinsic motivation. The SD on reflection varies from 0.5 to 0.76, which is moderate to high. This indicates a moderate to high variance within each tier. The mean of reported learning also increases with higher engagement and intrinsic motivation. The SD for this is also moderate to high, indicating similar variance. Intrinsic motivation seems to influence engagement. We see that most responses we have coded as showing intrinsic motivation are categorized in medium to high tiers of engagement. Furthermore, we see that age does not vary in any significant way between tiers. The SD is not high considering the range of ages, and similar between tiers.

Regarding gender differences, we see some differences for each tier. Especially the percentage of men and women in each tier. These percentages are based on how many men or women are present in a tier in relation to the total population. 28% of men are categorized as having high intrinsic engagement vs. 20% of women. We see that a larger percent of men is categorized in the higher tiers, while a larger share of women is categorized in the lower tiers.

Engagement tiers	Distribution of students	Mean level of reflection	Standard deviation reflection	Mean of reported achievement of learning outcomes	Standard Deviation LO	Mean of age	Standard Deviation age	Percentage Men	Percentage of men	Percentage women	Percentage of women
High Intrinsic Engagement	23%	2,49	0,58	4,07	0,60	29,22	6,77	52%	28%	48%	20%
Medium Intrinsic Engagement	45%	1,75	0,69	4,01	0,66	29,31	7,35	47%	48%	53%	43%
Medium Extrinsic Engagement	16%	1,68	0,58	3,90	0,62	30,96	6,39	40%	15%	60%	17%
Low Intrinsic Engagement	2%	1,71	0,76	3,21	0,64	27,29	7,30	29%	1%	71%	3%
Low Extrinsic Engagement	13%	1,28	0,50	2,60	0,84	30,28	9,63	26%	8%	74%	17%

Figure 1: Results of data analysis

Categorizing by intrinsic motivation and level of engagement separately, we can see from Table 2 that in the overall population of respondents, a larger percentage of men tends to be intrinsically motivated and engaged by the simulator.

	% men	% women
Intrinsic motivation	78%	66%
High engagement	28%	20%
Medium engagement	63%	60%
Low engagement	9%	20%

Figure 2: Division of motivation and engagement by gender

4.3 Visualizing the Tiers of Engagement

In this section we visualize the data showed in the earlier chapter in figures.

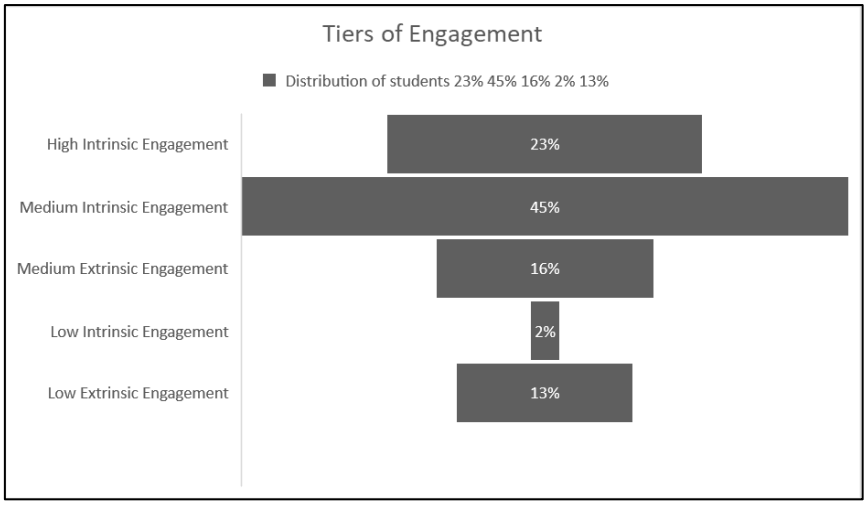

Figure 3: Tiers of Engagement

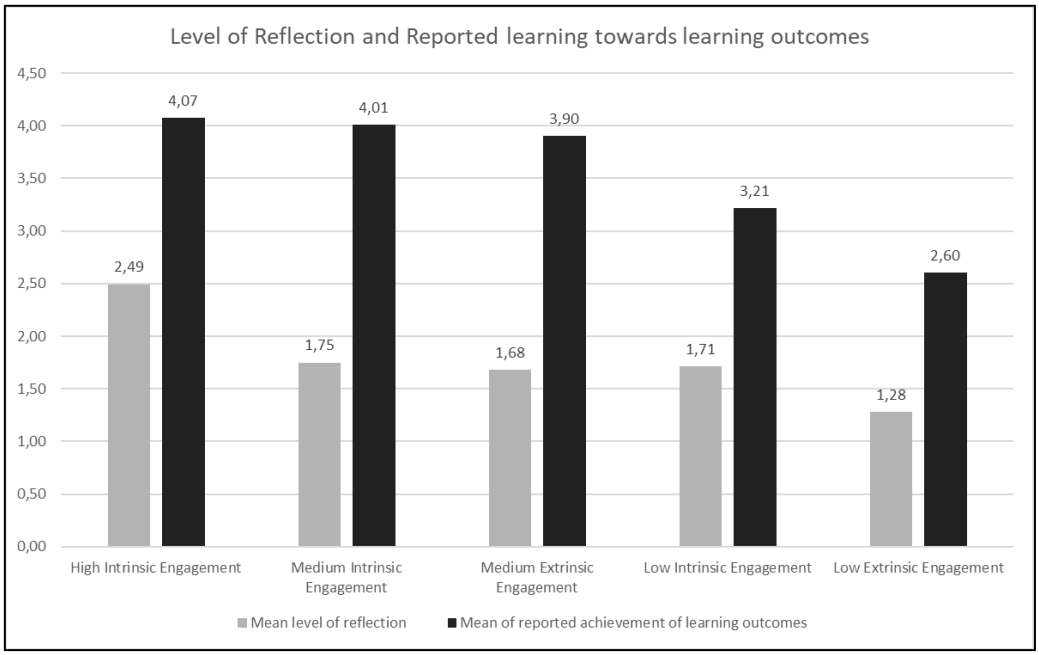

Figure 4: Level of reflection and reported learning

5. Limitations and Discussion

5.1 Limitations

This study is based on self-reported data. Although we believe we satisfy the criteria for validity proposed by Gonyea (2005), there are challenges with self-reported data and he therefore recommends that self-reported data should be combined with more objective data to increase validity. Our study would be stronger if we had measured motivation and engagement with instruments designed for this purpose. While our analytical framework has been designed to identify the presence of engagement and motivation, it is based on our interpretation of the data and application of the criteria, which weakens the validity. We consider the responses to be valid and representative of students' experiences, as discussed in the methods section, but we acknowledge that our analytical approach opens for errors of interpretation. In addition, there are potential confounding variables that can impact our findings and transferability to other contexts.

The study was made in the context of a fully online program, with a student population that has chosen the program due to the high level of flexibility, often combining it with full-time employment. As we see in their reflections on possibilities for collaboration, this impacts what they see as preferable or practically feasible. Similarly, the simulator was a mandatory assignment. As such, as a learning activity that differs from 'traditional'

assignments, the students' views could be impacted by not conforming to their expectations for an online program. This could also be seen in relation to the variance in age. Some respondents in the higher age groups are possibly not interested in digital games. These variables could impact students' motivation for the simulator.

Prior knowledge could also have an impact. Some students had prior experience with the simulator from a different course, which could have influenced their experience with the simulator (e.g. having mastered the simulator as a game, putting less effort into it as a learning activity for this course). Some students also reported experience from working in business, which could impact their views on the simulator's realism or relevance to working life.

5.2 Discussion

We aimed to examine if higher levels of reflection on learning could be found with students who were highly engaged by the simulator, compared to students showing low levels of engagement. As our survey was not intended to measure the level of engagement and motivational types, we had to develop an approach for analysing and coding our data. Our analysis indicates that there seems to be a connection between levels of reflection on learning and engagement, with high engagement corresponding with more complex reflections on learning. Intrinsic motivation seems to influence the level of reflection and engagement. This matches established theory. The tier of low intrinsic engagement breaks with this trend. This tier represents only 2% of the responses and could be an example of imprecision in our data analysis method. If we presume it to be valid, it could mean that intrinsic motivation is more intricately tied to reflection, than engagement itself. Nevertheless, intrinsic motivation appears to be key in attaining high engagement, as intrinsically motivated students populate most of the higher tiers of engagement.

The respondents have a varied demographic makeup. Within the tiers the average age and variance is similar. There is a relatively higher share of men in the intrinsic high and medium tiers of engagement. In the lower engagement tiers, there is a larger relative share of women. Our data has not revealed any specific insight on the gender gap, but this might link up with other studies, such as Riemer and Schrader's (2015) finding that women reported higher general negative affect towards GBL.

Students report they understand more of the context of working in a business, and the link between curriculum and "real" businesses. Some reflect on how this understanding affected their following work in the course. The simulator feeling realistic matches the results reported in Baksaas and Nygård (2021) and Hovland et al (2023).

The simulator itself is simplified in relation to reality. The most reflected students report that they see the connection between theory and practice, but also the shortcomings of the simulator. This points to how engaged students who want a more a complex and challenging simulator can see the shortcomings because they are on a higher reflection level. We expected that highly reflected respondents could report lower levels of achieved learning, as they might be more critical to the simulator's ability to provide insight due to the abstractions. While critical reflections on realism are present in the responses, the highly engaged and reflected students still reported the highest mean achieved learning outcomes. This could mean that awareness of the abstracted reality of the simulator is not a hindrance for learning, provided that students are sufficiently motivated to go beyond the simulator in their learning.

68% exhibit criteria signifying intrinsic motivation, and medium or high engagement. Returning to Miele and Scholer's (2018) concept of metamotivation (are the students motivated "enough" and/or "in the right way") brings some insight. Some comments that shed light on motivation revolve around interactivity and being able to make decisions and experiencing consequences. There's reflection on learning from effort put into exploring the simulator and making use of the information provided by in-game reports. The activity was individual, but when reflecting on the potential of collaboration, students express that group discussions would be useful for learning. Even so they prefer individual use. This is not surprising, as the program is online and flexible. The students are motivated to use the simulator, but not to use it in a less flexible context that would require more coordination.

Furthering reflection on metamotivation, a question is if some of the students who reach medium, but not high, engagement does so because they found the simulator to be lacking in challenge or realism. Could challenge and realism be a ceiling for engagement by limiting the feeling of meaningfulness? Although some comment on the simulator being too complex for an introductory course, others state that they found it helpful for grasping the course basics. Platz (2022) points out that GBL research on such design elements are hard to generalize and compare, with more studies needed. Our analysis has not resulted in strong findings on this point, but we can

see from some comments that highly engaged students seem to want more complexity and challenge. This suggests that challenge and complexity/realism could be a driver for engagement, but there could be individual differences (possibly related to type and amount of motivation) between students on what they deem complex or challenging enough to be engaged. Explaining why some are highly engaged by the simulator's current challenge and complexity (but want more), and some do not reach the higher tiers of engagement because of a lacking level of challenge and complexity. At the same time, the simulator must also not be too complex. This is an area where a deeper analysis of the qualitative responses might shed more light.

Comments relating to technical or practical issues with the simulator are recurring. Seen from a motivational perspective, it could point to such issues as external factors that inhibit the students from expressing their intrinsic motivation, i.e. reducing both the quality and amount of their motivation to engage with the learning activity and obscuring the connection between the simulator and the curriculum. Issues reported deal with how the simulator is introduced, the allotted time, feedback and guides for use. Among these we also find reflections that go beyond instrumental concerns about making it easier or taking less effort to complete. From these comments we can see potential for helping students reach higher tiers of engagement. By reducing frustration, we could potentially prime students to better experience the simulator as a meaningful learning activity by making the usefulness for learning more apparent. Additionally, opportunities for challenge could be included for the students who feel that the simulator is too simple to further their learning.

Some students reflected on how the additional narrative tasks they had to complete were useful for their learning. These assignments were added by the instructor to expand the simulator to also include theoretical tasks and terminology in a practical context. Many responses reflect on how this added realism or helped with visualizing or fostering understanding of concepts. Comments on the same relationship from lowly engaged students report that they didn't see connections between the theoretical curriculum and the practical tasks. These reflections are also coded as low. This could show that engagement is important to see the connections, and therefore reach a higher level of reflection.

6. Conclusion and Future Work

Our study shows that the students in the highest tier of engagement express higher levels of reflection on their learning than the respondents in the lower tiers. The middle tier, both intrinsically and extrinsically motivated, express lower mean levels of reflection (1.75 and 1.68 on a scale of 1-3 compared to 2.49 for the highest tier). This shows that engagement is important for students' perceived learning in our context: An online business simulator game as a learning activity. The qualitative data provides insight into several factors relating to the respondents' reflections. There is a large degree of variance within each tier. The high and medium level reflections contain a broad display of metacognitive thinking about the simulator as a learning activity. The comments highlight the importance of appropriate challenge and opportunities for the players to find the simulator meaningful. Intrinsic motivation seems to be a key component in reaching the highest tier of engagement.

The lowest tiers of engagement display a low level of reflection (1.71 and 1.28). The intrinsic motivated tier corresponds to only 2% of the respondents and could be reflective of methodological weakness in our analysis. When providing reflections beyond one-word responses, their concerns revolve primarily around issues connected to effort and technical/practical issues.

Our analysis indicates that the intrinsically motivated students have been more engaged and found the simulator meaningful. It is important to create opportunities for students to express their intrinsic motivation. With a heterogenous student population with a high need for flexibility, this could necessitate more focus on options to customize the simulator to fit their optimal level of complexity. Arenas for students to discuss the tasks could also be useful, provided it matches their needs for flexibility.

Based on our work so far, we see the use for a more precise measurement tool in future data collection. This will provide the opportunity to closer examine various motivational components connected to the students' self-regulation of learning, as well as possibly shedding more light on the relationship between intrinsic and extrinsic motivation on reflection. We also see the potential in reducing frustration and improving the integration of the simulator in the course to better enable students to see how it can be a meaningful part of their learning process and motivate them to reach a higher tier of engagement. The qualitative comments also point towards questions that could benefit from further inquiries. This includes the effect of the narrative assignments that expand on the simulator, realism, and complexity/challenge.

Acknowledgements

We are grateful to our colleague Kine Maridatter Maxwell-Dørum for comments on an early draft of the paper.

Abstract: "Serious Games" is a final-year 20 credit point module, undertaken as the default optional module for students on Undergraduate courses entitled BSc Computing and BSc Computer Science (Games Technology) at Nottingham Trent University, UK. The module focuses on developing students' critical evaluation skills, enhancing their ability to design and implement solutions for a real-world design brief, working with clients and making final products accessible to a broad target audience. Historically this was achieved through engagement with a single client, often via a wider research project or local educational establishment of some sort. More recently, the module has retained two client project briefs, which the students are then empowered to choose between. With each client brief the module team has sought to add extra value for the students. For the previous two academic years, the module team has partnered with Green Academy, a strategic team within the University whose priorities include stimulating pedagogical innovation and practice sharing within the area of sustainability and pioneering a shared understanding of sustainability education. The resulting partnership has introduced a brief for students which combines vital industry skills with sustainability literacy. Working with and alongside the students who are undertaking the module, the module has developed Serious Games on a diverse range of local and global sustainability issues and has exposed students to university research culture and our sustainability research specialisms. It has also necessitated that students engage with and contextualise the United Nations Sustainable Development Goals and the UNESCO ESD competencies which they are tasked with integrating into their design solutions. The long-term intent of this partnership is for these design decisions to be utilised in the Green Academy's ongoing strategy to further enhance the University's pedagogical framework and sustainability education offer, and to improve the provision of Serious Games for use by clients outside the University. This report is a synoptic overview of the module design and insights from the two-year partnership as well as how these observations have been leveraged to improve the design and delivery of the module for future clients and students.

Keywords: Serious Games, Interdisciplinary, Student-led Design

1. Introduction

As a module undertaken by students seeking to complete courses in and receive awards for BSc Computer Science (Games Technology) and BSc Computing, the current and ongoing primary objective of the module is to provide students with experience of working with real-world clients and creating prototypes to meet client briefs. Clients may take the outputs forward, either deploying them within their workplace, or developing the prototypes further, potentially alongside the students. The tangible benefits of this model are clear to students; they create a piece of project work that has focus, utility, and is easily understood by a potential employer. Their output can demonstrate that they not only have the technical ability to provide a working prototype, but that they are also able to understand and work effectively to a client brief with all the important transferable skills and competencies inherent in that scenario.

Clients are selected for the module on a year-by-year basis, with clients approaching the Serious Games module team or vice versa when a synergy of aims is identified. Contact between the team and Green Academy was first established early in 2022. Discussions quickly developed into the two teams working together to create a coherent brief which would meet the existing aims of the module and the aspirations of the Green Academy. The key initial aspiration for Green Academy was an experimental one; to explore whether students could develop a viable serious game prototype to teach other students about sustainability. The teams also both wanted to provide through the brief an opportunity for Computer Science students to enhance their sustainability literacy and be exposed to university research culture; a unique feature of Higher Education which is sometimes inaccessible to students. To our knowledge the module does constitute a pioneering model within the Higher Education sector in the way it has approached embedding sustainability within the context of computing courses and game design.

1.1 Core Module Learning Outcomes

As part of the Computer Science (Games Technology) and Computing courses, the Serious Games module requires that students, regardless of the brief they select, demonstrate that they are able to:

- Research and investigate previous Serious Games in the selected sector (Parallel Products), and analyse their positives and drawbacks, and utilise knowledge derived from this in their design.
- Communicate with their client regularly, refining the brief and matching their design to it as close as possible.
- Gather feedback from their clients, peers and potential end users, and use this to refine their design
- Investigate the brief beyond the information given, including researching traditional non-games based pedagogy.
- Tailor the game to the entire projected userbase, being aware of the variety of disabilities and disorders that they may have.

Accessibility is an important element of the module which focuses on a "one size fits all" universal design philosophy (Gillern and Nash, 2023). Students need to ensure that design is as accessible as possible, especially as clients often supervise learning for a small number or even majority of students who have a cognitive or physical disability. Given the rapid increase in students (Hubble and Bolton, 2021) and Staff (HESA, 2024) with declared disabilities, especially cognitive and learning difficulties such as Autism Spectrum Disorder, Blindness, Dyslexia, and Physical/Motor impairments, these themes also tend to resonate with students, with many having diagnoses of or experiencing one of these conditions, or having class mates or close friends who do.

1.2 Green Academy Brief

Green Academy provided a brief for students to *create a game based on an area of NTU sustainability research*. Students were advised that the game should:

- Be engaging, accessible, informative and inspire further exploration by those who experience it.
- Make reference to the UN Sustainable Development Goals (https://sdgs.un.org/goals).
- Help players facilitate one or more of the UNESCO ESD competencies (AdvanceHE, 2021).

Students were given the following user considerations:

- Your game should work for short-term development; open ended simulations will not work, unless there is a natural stopping point to enable students to return to the game later.
- Game play time should be a maximum 10-15 minutes so that it can be used within lectures and tutorials followed by critical discussion and exploration of learning.
- It must be easily accessible to both students and academics on multiple types of software and be able to be used within the university IT systems e.g. a browser based game.
- People should *want* to play it, so an elements of creativity, fun and excitement are important. We want the game to be memorable and offer critical perspectives.

Green Academy attended near the beginning of the module to deliver a workshop where they launched the brief and led students through a series of discussion activities which introduced fundamental concepts of sustainability such as the United Nations Sustainable Development Goals, also known as the 'SDGs' or 'Global Goals' (https://sdgs.un.org/goals) and planetary boundaries (Richardson et al 2023). Students were prompted to consider how a serious game could facilitate the development of sustainability competencies such as problem-solving, self-awareness or systems thinking (AdvancHE, 2021) within the player and what could 'go wrong' with such a game, so that they might avoid pitfalls associated with sustainability games and serious games in general (Ouariachi, Li and Elving, 2020; Watt and Smith, 2021).

Students were provided with a Google drive containing information folders for six different research projects led by NTU staff (and in one case co-led by a fellow NTU student from the School of Animal, Rural and Environmental Sciences). Each folder contained relevant research papers and one or more recordings of the researchers speaking about their research with the intention that this would enhance the sense of personal connection with the researcher. Students could browse each folder before deciding on one or more research projects upon which to base the game. The research projects were as follows:

- Climate change communications and politics (Poberezhskaya and Bychkova, 2021).
- Arctic lakes and carbon (Stevenson et al, 2021).

- Climate reporting by large companies (Pavlović and Miler, 2022).
- Climate change and biodiversity in 'winterbourne' chalk streams (Sarremejane et al, 2021).
- Citizens, environmental sustainability and local democracy - Nottingham's Carbon Neutral 2028 strategy (Henn and Arya, 2023).
- Local planning for climate change (Haupt et al, 2021).

Green Academy was invited back to attend several formative feedback sessions throughout the year to receive presentations from the students on their work so far, and to catch and advise on any potential flaws in the idea based on their specialist knowledge. Later in the year Green Academy also invited to observe the final demonstration of the prototypes, and finally to sit in on the final assessment session and provide feedback to inform student outcomes (though these were determined by the core module team in all cases).

2. First Year (2022-3 Academic Year)

In the first year of this collaboration, the cohort was split into two separate groups – 12 Games Technology Students and 15 Computing students. Alongside the brief provided by Green Academy, the Serious Games Team also partnered with a local Special Educational Needs specialist school, who requested a number of highly accessible games to assist their students with travel, cooking, and other elements of self-care.

Students were encouraged to use whatever development environment they were most comfortable with. Sessions teaching and supporting the students in using the Unity engine were held throughout the year, which was the development environment most students used. The students on the Computer Science with Games Technology course had previous Unity experience from their second year “Games Programming” module. While the remaining students taking this module also had programming experience, Unity can be time consuming to learn for those with no games development experience. Students were therefore encouraged to use freely available open-source assets where possible and were not assessed on the technical complexity of their games as much as they were on the “core idea”.

The final games were evaluated by a five-member panel consisting of module staff and other specialists in the field of Games Based Learning. The average grade awarded was used as a starting point, with the grade being elevated if the panel felt it was appropriate to combat the natural trend towards more moderate grades that tend to emerge because of taking the average of a grading panel.

3. Observations

Contrary to expectations, students responded better to more structured weekly sessions, than to the less teaching intensive teaching approach offered in the second term. The team’s aim was to enable them to embody their games design at their own pace, where coding support was offered when needed, in a less "hands on approach". The pressures of other competing coursework deadlines exerted a deleterious effect here in students' game production schedule. As a result, students voluntarily put themselves under crunch development conditions, which resulted in the final products being more variable in overall quality.

Further, many students were confused by the dual brief nature of the assessment, and a few attempted to meet both briefs. This resulted in a number of games that were not appropriately designed, though as they were required to submit their report for assessment at the end of the first term, most of these cases were caught, and students supported in reworking their design to clearly align with one brief or another.

Student feedback highlighted two primary issues with the scheduling of sessions.

- Students felt that the Unity Development sessions came too late in the year, preventing the students from managing their workload well and causing, in effect, crunch development.
- Students felt like that they did not have sufficient reason to come into sessions, as there was no obvious positive impact from doing so.

4. Second Year (2023-4 Academic Year)

In the second year, the cohort was one merged group of 21 students, of which 10 were on the Computing course, and 11 were on the Computer Science (Games Technology) course. Alongside the brief provided by Green Academy, the Serious Games Team also partnered with the Trent Institute for Learning and Teaching (TILT), who

requested a number of games to boost the internal provision of legally required training (specifically regarding the PREVENT duty, Safeguarding and British Values).

In response to student feedback and to try and maintain engagement, the entire module was more rigorously planned from the start. As highlighted by the previous cohort, Unity Tutorial Sessions were moved earlier in the year to accommodate students who had not used the tools before, and Research and Design focused labs were more evenly distributed throughout the year. The students were given a very clear format through which to log the feedback they obtained, and a number of formative feedback points were explicitly embedded into the teaching calendar. Sessions were also not only tied to the learning outcomes, but also very explicitly to the assessment. Further, students were always given an outlook of the next few weeks, informing the students of what they should be working on.

Entering the second term, we received a lot of student feedback through multiple channels from the Computing cohort that they felt like they needed more programming support earlier in the year. Thanks to flexible working and scheduling arrangements organised by the Team, we were able to rapidly adjust, integrating extra support Surgery sessions, and shifting Tutorials earlier in the year to compensate. The cohort responded very warmly to our proactivity in this manner, and engagement remained very high.

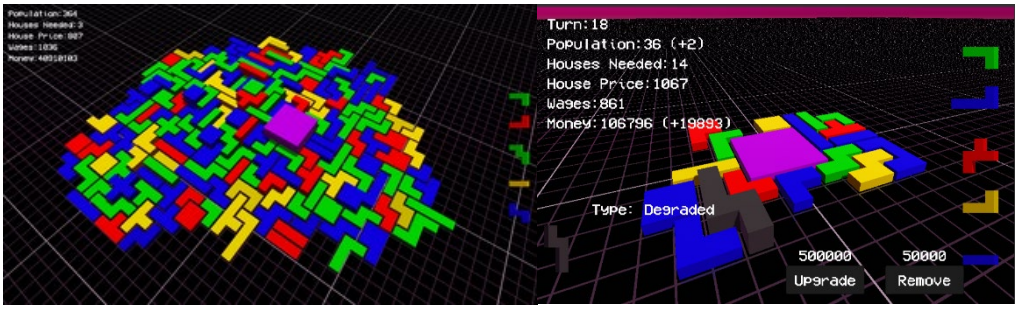
While moving the programming support sessions earlier in the year had a positive impact overall, some students found themselves scaling back their ideas based on what they thought they would be able to implement, rather than forming their ideas around the client's brief. In future years, students will be encouraged to "dream big" then implement as much functionality as they are able to, and explain any "out of scope" functionality during their demo.

We also arranged an explicit "Playtesting Day", where first year students were invited to trial some of the cohort's games and provide detailed feedback. The students were taught a rigorous playtesting process used in the games development industry, focused on making the test as unbiased and rigorous as possible.

- Designing the playtest to be playable with minimal instruction, utilizing Signifiers correctly.
- Preparing a cheat sheet and any emergency helpers in advance.
- Preparing questions in advance (Lemarchand, 2021).

This event ended up being far more popular than predicted, with nearly 70 first year students taking various courses throughout the department showing up for the playtesting session. This naturally caused some organisation issues, but most students benefitted greatly from this session, from finding bugs, gaining accessibility feedback or general enjoyability feedback.

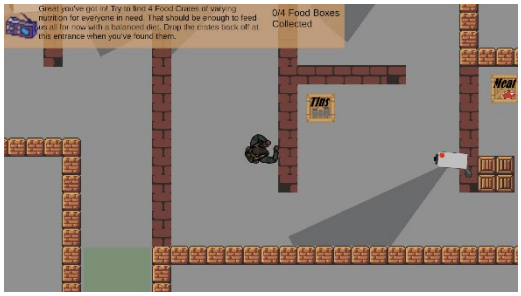
The assessment was undertaken in a similar manner this year – though one extra component that was added was a formal structure for recording and proving feedback had been collected and utilised.



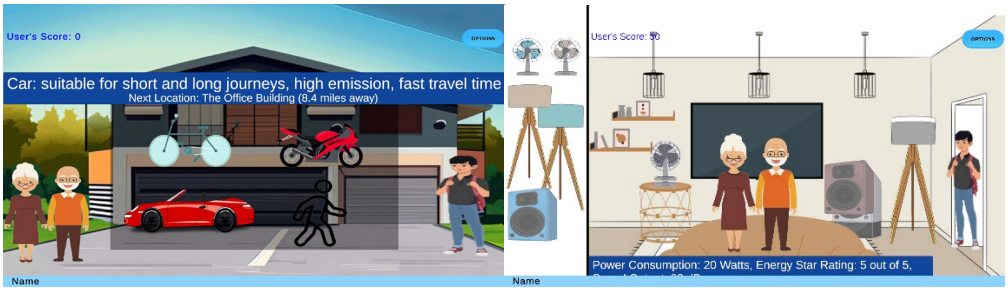
5. Outcomes

Despite some differences outlined previously in the delivery of the module over the two years of the Green Academy brief, both years resulted in several excellent student outputs. As the module allowed students to personalise their output in terms of an aspect of sustainability of their choice, the resulting prototypes were diverse in theme as well as format including for example a climate negotiation simulation, a game about a CEO seeking to contribute to sustainability before they retire and several games which involve players making decisions about alternative energy options. A number of the demonstration games have been adopted by Green Academy for use in training and events both to educate about sustainability issues and showcase how sustainability can be contextualised effectively across different academic subject areas. A selection of games are described below to illustrate the breadth and depth of student response to the brief.

- Winterbourne Babysitter: Based largely on Sarremejane et al's research (2021) on winterbourne chalk streams, Winterbourne Babysitter focuses on themes of Partnerships for the Goals (SDG 17) and the conservation of species, through a narrative resource-based game. The player uses time in a "non-Drought" phase to construct materials which must be used in a "Drought" phase to preserve eggs of various mythological species who have been placed in their care. Once enough time has passed, assuming the player has performed well enough, some researchers arrive to create a more sustainable future for the ecosystem. The endearing characters including various creatures and an NTU Professor from the real-life research project make for an engaging game play which educates players about a little-known aspect of UK conservation activity.



- System Sprawl: Based on themes of Sustainable Cities and Communities (SDG 11), System Shock is an abstract puzzle game where the player is tasked with placing colored pieces, representing different zones of a growing city, into a grid such that all area types have access to other area types which they need in order to run. As opposed to an active learning approach, this design attempts to inspire the player to think about how cities are built and grown, and adopt strategies to ensure resources, especially energy and other utilities can be used effectively and efficiently. An elegant composition, the game is at once compelling for the player due to the classic puzzle aspects and also visually articulates the complex predicament of trying to allocate finite resources for a growing population.



- Kobold Mining Corps: This clicker game incorporates fantastical lizards representing low-income nations and money-eating dragons symbolising high income nations. Focussing on SDG8 – decent work and economic growth – as well as broader themes of climate justice and geopolitics, the game facilitates both short term and long-term thinking and explores how the strength of individual workers can be multiplied. This game also focused on enabling the end client to enhance and customise the game via an easily edited modular design, requiring little programming experience.

- Environmental Vigilante: The game is set in a climate dystopia and explores social sustainability issues connected with SDGs 1-3 – No poverty, zero hunger and good health and wellbeing. The character is presented with several tasks to complete to ensure the safety and health of local citizens. One such task revolves around a food bank (a charity food donation point); a nod to the fact that the city where our university is located – Nottingham, UK – has one of the highest uses of food banks in the country.

- Energy Expedition: an interesting feature of this game is that it revolves around an intergenerational conversation about sustainability issues with a prospective university student and their grandparents as the main characters. The grandparents send the student around the local town on a sustainability discovery adventure, educating them along the way about ways to be more sustainable within your individual sphere of influence, for example the student is faced with decisions about selecting the most sustainable options of electrical appliances for their move to university. The game focusses chiefly on SDG 7 – affordable and clean energy – with the wider them of intergenerational learning which is a key tenet of our university sustainability strategy.

6. Ongoing Pedagogical Outcomes

Whilst students were very engaged throughout the year, there were a number of students who struggled with the module's apparent process on "reporting" over programming, in spite of the fact that there is no explicit requirement for programming to be taught or assessed under the module's agreed Learning Outcomes (with programming skills being assessed elsewhere on both sources). In particular, this caused a rift between the Games Technology Students, who had already had significant Unity experience in a second year module, and the Computing Students, who had not. The group who had already undergone teaching of the Unity Engine prior to the module, on average, scored 74% (SD 20%), with 8 of them (72%) attaining a 2:1 or better, whereas the group who had not, on average, scored 76% (SD 16%), with 7 of them (70%) attaining a 2:1 or better.

The appropriate test to determine if these two groups varied significantly is the Mann-Whitney U test, suited to comparing two relatively small sets of data. The U value for the Games Technology group was 53.5, and for the Computing group, 56.5. To disprove the null hypothesis that there is no impact of course on student outcomes, the lower of these would have to be less than 26 ($P<.05$). It seems relatively safe to say that the current provision enables Computing students to perform just as well as their peers in Games Technology – in fact, the statistics this year suggest that the Computing students performed better. Of course, the team is planning on monitoring this difference in years to come, especially considering how provision may be adjusted if the cohort size requires that the groups be split once more. For now, however, the balance of provision shall be left as is.

Therefore, it suggests that the purpose of the report is not strictly clear to the students, as while the report contents cover most of the learning outcomes, the report in and of itself is not, barring that for producing quality written work. Some students have explicitly expressed that the report is redundant. Furthermore, from the perspective of the final year as a whole for both modules, there are few explicit assessments of speaking skills outside of this module. Combined with very positive feedback with regards to the clients being present during their final demonstration, as well as concerns over AI use and workload, this assessment element is currently being changed to a full presentation component with a small written context document or brochure. This also has the effect of reinforcing the idea of communicating with a client in a clear manner, one of the key learning outcomes of the module.

The Playtesting Session, despite ending up being less effective than it could have been due to unexpected numbers and timetable complications, still showed great use and promise to the students. In future years, this session will be extended to a full day, with the testers being straddled throughout the day. Similarly, the structured feedback log will be maintained, as not only were students more clearly able to identify what feedback they had received and used, they were more likely to go out of their way to solicit feedback from their clients, their family and their peers.

The confusion found by the students in their first year was less pronounced this year, indicating that the extra clarifications embedded within the teaching content and the mark scheme helped students differentiate between the two briefs and create a more targeted and focused product. Whilst it's possible this could be further alleviated by mandating that students fill in a form declaring which brief they are following; it appears that this would likely inhibit the students by requiring them to commit to an idea that may not work early on.

Students fed back that they did not feel like there was enough opportunities for them to exchange ideas and help each other to work. This may be alleviated in future years by introducing sessions based on Beichner's SCALE-UP project – giving each student some time to head a roundtable discussion on their design ideas and concepts, either prior to or during the development of the student's first pitch session. (Beichner et al. 2008)

Sustainability based teaching is going to remain embedded into the module, particularly focusing on intersectionalities between equality and environmental sustainability, themes that are going to remain very relevant heading into the briefs to be used in the 2024/5 academic year. There are plans to remain in contact with Green Academy and other departments in the university to enhance teaching on the module and courses, including clear plans to resume a direct partnership in later academic years.

Going forward, the module team is attempting to work alongside their clients and their user groups in order to create highly specific briefs and goals for teaching to address gaps in their current curriculum. The module team has already been through an intensive co-design session with a local user group of SEN students and their teaching and support staff, to prepare the assessment specification and brief for the next academic year.

Abstract: Humans naturally engage in playful activities throughout their lives and play serves as a fundamental mechanism for cognitive development as well as the development of essential soft skills such as teamwork, decision-making, leadership, and communication. Recognizing this innate predisposition for play, educators are increasingly embracing gamification strategies into their classrooms. More attention has been driven to digital tools such as platforms Kahoot! and Duolingo which gained popularity and demonstrated the potential of game-based learning to increase engagement and knowledge retention. However, concerns about digital screen time fuelled a renewed interest in non-digital activities, including educational games. Non-digital games are often more accessible and affordable, making them suitable for schools with limited resources. Research suggests that non-digital games can effectively promote collaboration, communication, and critical thinking skills. In addition, they offer flexibility to teachers to adapt rules and scenarios to specific learning objectives and student needs. Recognizing the benefits of employing games as a pedagogical strategy, the first author of this study opted to incorporate game-based learning strategies into her classes, on a regular basis. Throughout the semester, various non-digital games were implemented, inspired on well-known classics such as memory card games, Monopoly and Pictionary. These games were carefully designed to address specific mathematics topics identified as either the most relevant or those where students revealed more difficulties. The participants in this study were pre-service pre- and primary school teachers enrolled in a maths undergraduate course. Since these students are future educators, the games served a dual purpose: improving current learning experiences and providing teaching resources for their future classrooms. At the end of the semester, a survey was conducted to evaluate students' perceptions towards the use of games in the mathematics teaching-learning process. In this paper we describe some of the games used in this study and analyse the results of the survey. Previous studies reveal that students generally welcome the incorporation of games, perceiving them as effective tools for enhancing motivation and promoting positive learning outcomes. Our findings corroborate these studies.

Keywords: Educational Games, Gamification, Non-digital Games, Mathematics Education, Pre-service Teachers.

1. Introduction

Mathematics is present in almost everything that surrounds us. Although not everyone is always aware of it, it is a fact that the world we live in has always depended and will continue to depend, increasingly, on mathematics (Pais and Hall, 2019; Yadav, 2019). Unfortunately, the scenario in most mathematics classrooms in Portugal is not stimulating. The mathematics experienced by students is boring and monotonous (Alien-Fuller, Robinson, and Robinson, 2010; Grootenboer and Marshman, 2016). In an era of so many transformations, changes are also needed in the teaching and learning processes, namely, of mathematics. It is necessary to develop "powerful and challenging" mathematical tasks, "to captivate students and boost their learning" (ME, 2021).

Changes are needed in the teaching/learning processes, and it is necessary that the role of both teachers and students adapt to the demands of today's society. Active, cooperative, and participatory learning methodologies should be privileged, which promote, through interaction, voluntary, active, and conscious learning (Pais, 2023).

In this context, one of the strategies that has been used with good results is gamification, where games are not considered as a merely playful activity, but can be seen as resources that stimulate visual and intellectual contact with different contents (e.g. mathematics, language or history) and facilitate the learning process (Sailer and Homner, 2020; Dinata, 2021; Pais and Hall, 2021; Morando and Turconi, 2022).

2. Gamification

Gamification is an active educational methodology that uses elements, designs, mechanics and rewards from games or video games, adapted to a non-game environment such as the educational context (Kapp, 2012). This methodology provides a better experience in the learning process, promoting the interest of the students and involving them in this process, which has a positive impact on their results (Dinata, 2021; Morando and Turconi, 2022).

The learning mechanisms based on gamification are related to the student's motivation (Ryan and Deci, 2017), which is often associated with the factors of novelty, challenge, competition, fun and pleasure (González-Cutre et al, 2016). In this context, learning becomes enjoyable and not a duty or obligation. Several studies (McGonigal, 2011; Kapp, 2012; Hamari, Koivisto and Sarsa, 2014) highlight the positive impact of adopting gamification strategies in the teaching/learning process, both on student motivation and on the development of soft skills such as teamwork, creativity, decision making, leadership, communication, and critical thinking (some of the main skills mentioned by the World Economic Forum (2020)). Additionally, using gamification in education has other widely recognized advantages, such as: making learning more fun and interactive, creating an addiction to learning, stimulating brain connections, and allowing the establishment of relationships with the real world (Kapp, 2012; Pais and Hall, 2021).

Non-digital games, in particular, have additional benefits (Ramo, Knaul and Rocha, 2020), including: improving social relationships, promoting team spirit, cooperation, face-to-face interaction and communication with others, and providing a "relief" from the digital world and screens.

3. Educational Games for Mathematics Classes

Didactical games can be powerful tools in the classroom, transforming the classroom into a dynamic and engaging learning environment. To be effective, they need to be designed strategically. The following aspects should be considered when creating a game for mathematics classes:

- Alignment with the curriculum: Games should directly address topics and address student misconceptions identified through their mistakes. This clarifies doubts and focuses learning on challenging areas.
- Building automaticity: Games should include a myriad of exercises, thereby developing the essential automatisms crucial for mastering maths concepts.
- Active and enjoyable learning: By incorporating game elements, students actively engage with the content in a supportive and fun environment. This fosters a dynamic learning experience.
- Inclusive learning environment: Random elements like dice rolls or bonus points ensure everyone has the chance to succeed and contribute, regardless of skill level. This builds a collaborative and supportive classroom atmosphere where all students feel valued. It also adds excitement and teaches valuable life skills like adaptability and resilience.
- Simultaneous engagement: Effective games keep all students involved, even when it's not their turn. Non-playing teams can verify moves and answers, fostering collaboration and a sense of shared responsibility.
- Simple rules: Clear instructions ensure students understand the game mechanics quickly, allowing them to focus on the learning objectives. The game should be challenging enough to be interesting but not so difficult that it discourages participation.
- Adequate pacing: Maintaining the right pace keeps students engaged and motivated throughout the learning experience.
- Rewards and Penalties: Rewards, even small ones, incentivize active participation and a desire to excel. Penalties for random answers encourage students to approach the game seriously and strategically. A balance between rewards and penalties promotes both engagement and valuable lessons about focus and responsible decision-making.

The last two authors of this paper have a long experience in designing didactical games, targeting a wide range of educational levels (from primary school to university), in a diversified range of educational contexts (formal such as schools and prisons, and informal such as museums and botanical gardens) and, in some cases, taking into account students with special needs (La Fortuna, Morando and Spreafico, 2022; Morando and Turconi, 2022; Morando and Spreafico, 2023).

4. Methodology

4.1 Methodological Options

The research question underlying this study is how the incorporation of non-digital educational games in maths classes can enhance student motivation and engagement in learning mathematics.

In this perspective, a mixed case study was developed (quantitative and qualitative, based on a logic of complementarity), grounded on a pragmatic paradigm and case study design (Yin, 1994; Ponte, 2006). The teacher responsible for the course in question is simultaneously one of the researchers of this study.

In order to develop this experience, the techniques of inquiry, direct observation and analysis of documents were applied, and the following instruments were used: field notes and final questionnaire.

The main objective of the questionnaire was to assess students' perceptions regarding the use of educational games in the classroom. The questionnaire was created using Google forms and answered online by 44 students. This was a convenience sample, as participants were easily accessible to researchers. Statistical analysis of the data, specifically descriptive statistics, was performed using Excel.

4.2 Description of the Study

This case study was conducted during the first semester of the academic year 2023-2024 and involved the 1st year students enrolled in the course "Mathematical Concepts I" (Conceitos de Matemática I) of the undergraduate program "Basic Education" (Licenciatura em Educação Básica) at the University of Aveiro, Portugal. This three-year program prepares pre-service teachers for pre-school to the 6th year.

The course consists of two weekly face-to-face classes (one 2-hour sessions and one 3-hour session) and had a total of 28 sessions. Out of the 65 enrolled students divided into two groups, only 51 attended the classes (6 dropped out, and 8 only took the exams).

The topics of the course are numbers and operations. In the first part of the course different numeral systems are addressed and the students learn how to represent (and convert) numbers in different numeral systems and bases. The four basic operations are explored (addition, subtraction, multiplication, and division) and their algorithms are detailed not only in the decimal system but also in other bases. The second part of the course is devoted to elementary number theory: multiples/divisors, divisibility rules, prime number decomposition and applied problems are addressed. The third and last part of the course is related to decimal numbers (focusing on rational numbers), exploring the four operations both with fractions and/or decimal representations. Problem solving is also addressed using different approaches with a strong emphasis in the use of diagrams, following Singapore's bar model methodology.

Recognizing the benefits of games as a pedagogical strategy, the first author of this study integrated game-based learning strategies throughout the semester. Specifically, sixteen class sessions incorporated educational games. The activities were strategically placed in the middle of classes to serve as a mid-point break while still enhancing learning.

In total, eight different games were played, two of which were created in five different versions, addressing different mathematics contents. The time allocate to the games in class varied between 10 and 30 minutes, though most of the games were played for 15-20 minutes. All games were played in teams and most of them involved three to four teams, requiring several replicas to be played simultaneously. The games were designed to be diversified in many ways as shall be described in the next section.

5. The Games Played

All games applied in this study have been designed by the authors of this paper, in accordance with the principles described in Section 3. The authors chose to use only non-digital games for two key reasons. Firstly, the course itself is designed with a paper-and-pencil focus, aligning with the educational environment these pre-service teachers will likely encounter. Secondly, the instructors identified a need to address basic maths skills in many students and felt this could be best achieved without resorting to digital tools.

This section describes a selection of the most popular games, chosen in accordance with the students' preferences shown in the bar chart of Figure 6.

5.1 Garden Animals

The most preferred game was "Garden Animals" which focuses on developing mathematical communication skills and deals with simple operations and comparing quantities. It is intended for two teams of 2 to 4 players each.

Materials needed:

- One deck of 40 cards featuring images of garden animals (see Figure 1 (left) for some examples).
- One deck of 24 cards containing numeric conditions (e.g., "There are more snails and bees together than there are caterpillars").

Game Instructions:

- Display four cards from the image deck face-up on a table.
- Teams take turns drawing a card from the conditions deck.
- Each team has a limited time (one minute) to identify the image cards that satisfy the drawn condition.
- Correctly identified image cards are collected by the team.
- If the opposing team spots a wrongly collected card, it is returned to the table, and the playing team receives a penalty point.
- Once the team declares there are no more matching cards or the timer runs out, the empty spaces are filled with new image cards from the deck.
- The game ends when there are no more image cards left to display or after a predetermined time limit.
- The team with the most collected image cards wins.

5.2 Maths Monopoly

The second most preferred game was "Maths Monopoly" which draws inspiration from Monopoly. It can be adapted to different contents and in this case, we explored the properties of the arithmetic operations such as commutativity, associativity, and the existence of a unit element. It's designed for 2 to 4 teams, with 2 to 3 players per team.

Materials needed:

- "Title Deed" Cards (deck of 40): These cards feature numerical sets coupled with arithmetic operations (e.g., "The set of even numbers with addition").
- Board Cards (deck of 24): one "Start" card, five cards saying "Chance"; four cards saying "Closure"; seven cards saying "Commutativity and Associativity"; seven cards saying "Other properties".
- Chance Cards (deck of 12): These contain random bonuses (e.g., "Draw two cards of your choice").
- "Money" Cards (three decks):
    - Closure Cards (deck of 24): These represent closure properties (e.g., "The set is closed for the operation").
    - Commutativity and Associativity Cards (deck of 48): These represent properties (e.g., "The operation is associative").
    - Other Properties Cards (deck of 48): These represent other mathematical properties (e.g., "The operation has a unit element, and it is in the set").
- Dice (two) and tokens (one per team).

Game Instructions:

- Place six "title deed" cards face-up in a rectangular grid (2 rows x 3 columns).
- Shuffle the board cards and randomly arrange them face-up around the rectangle, placing the "Start" card in a corner (Figure 1 (right)).
- Place all team tokens on the "Start" card.
- In turns, teams draw the dice and move their token the corresponding number of spaces around the board. Depending on the landed card, a card is drawn from the respective deck. Chance cards must be placed back in the deck. The other cards are kept.
- A "title deed" may be bought if a team is playing on its turn and has gathered three "money" cards that match the title. One of the cards must be a closure card. For instance, a team can buy (collect) "The set of integer even numbers with addition" handing in the cards "The set is closed for the operation" "The operation is commutative" and "The operation has a unit element, and it is in the set".

- The game ends after a predetermined time and the team with more title deeds wins.

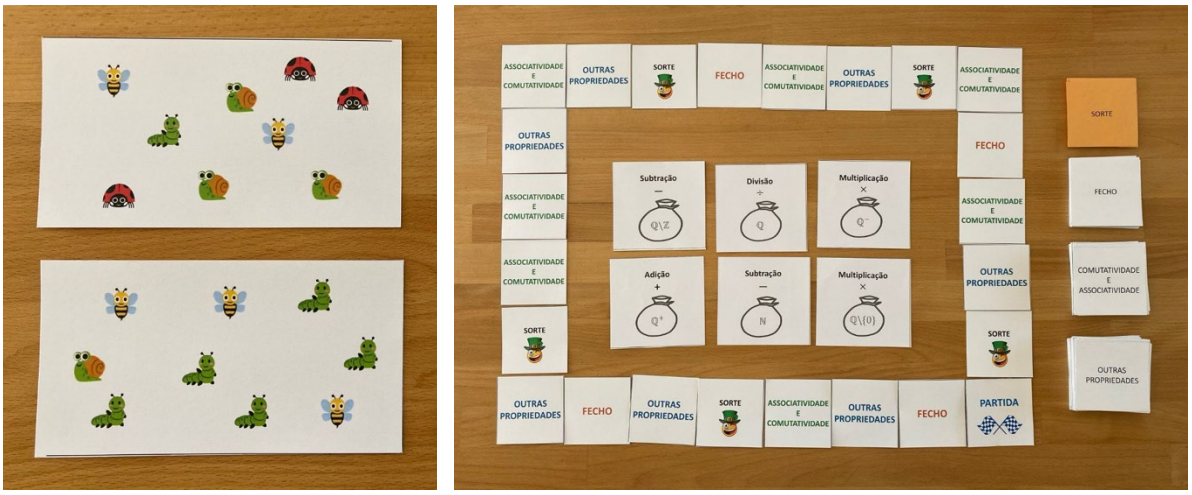

Figure 1**: Photos of "Garden Animals" (left) and "Maths Monopoly" (right).**

5.3 Mysterious Divisor

The third most liked game was "Mysterious Divisor" which explores prime factor decompositions and divisibility. It is designed for two teams of 2 to 4 players each.

Materials needed:

- Two identical decks of 20 cards featuring numbers and their prime factor decomposition (e.g., $1144=2^3$x11x13).
- One deck of 20 cards containing numeric conditions (e.g., "N is multiple of 26")

Game Instructions:

- Each team receives one of the identical decks and spreads it face-up on the table.
- Afterwards, each team draws one card from the conditions deck and reorganizes its deck by placing all number cards that satisfy the condition on the left-hand side of the table and all other number cards on the right-hand side. All cards must remain visible.
- Once ready, each team observes the other team's cards and tries to guess the drawn condition.
- Teams earn one point for correctly identifying the opposing team's condition.
- The game ends when there are no more condition cards left to draw and the winning team is the one with most points.

5.4 Boxes Game

This game is a fun activity that gets teams moving around the classroom! It's designed for the whole class, divided into four competing teams.

Materials needed:

- Five boxes placed around the room. Each box should be labelled with a different number range.
- Four decks of 20 cards. Each deck should be a different colour, but all decks should have the same contents. Each card must represent a number (it can be a numerical expression, a numeral in a certain numeral system, an equation with a single solution, etc.)

Game instructions:

- Divide the class into 4 teams.
- Each team chooses one member to be the messenger. He is responsible for placing the cards in the correct boxes.
- The remaining members must look at the cards and find the destination boxes.

- Teams have five minutes (or another pre-fixed time limit) to place the largest number of cards in the correct boxes. The time limit should be tight enough that players can't place all the cards. This encourages strategic thinking about which cards to analyse first.
- At the end of the game, each box is checked for correct and incorrect cards:
    - Each correct card earns the team 1 point.
    - Each incorrect card costs the team 1 point.
    - The team with the most points at the end of the game wins.

In this game the cards had numbers written in different bases and numeral systems (Roman, Egyptian, and Babylonian).

5.5 Decimal Numbers Pictionary

"Decimal Numbers Pictionary" takes inspiration from the classic game Pictionary and is designed for teams of 3 to 4 players.

Materials needed:

- Several identical decks of cards containing rational numbers in decimal form (terminating decimals).

Game Instructions:

- Distribute one deck of cards to each team.
- Each team chooses a member as the guesser (which can change every time a new card is drawn).
- The remaining team members draw a card from the deck and read the number on the card aloud, in its full form.
- The guesser writes the number down back in decimal form (e.g., the card has the number 23.5096; the readers say "twenty-three units, five thousand and ninety-six ten thousandths"; the guesser writes 23.5096).
- Each correct guess earns the team one point.
- The game ends after a predetermined time and the team with most points wins.

5.6 Open Middle

This game draws inspiration from the open middle maths problems available at https://www.openmiddle.com/. The proposed challenges all require selecting digits to place in blank spaces, without repeating any (e.g., Maximize $\square\square + \square\square$, using the digits 1 to 9 without repeating). It is designed for 2 to 4 teams of 2 players each.

Materials needed:

- A deck of chance cards with five types of cards: "all teams play" (most common card); "only your team plays"; "only the other teams play"; "earn one point"; "lose one point".
- A deck of challenge cards with solutions on the back.
- A timer.
- Paper and pencils for each team/player.
- Beans (points).

Game instructions:

- Each team takes turns drawing a card from the deck of chance cards.
- If the drawn card indicates a game for one or all teams, the team draws a card from the deck of challenge cards.
- Set a timer for one minute (or the time limit stated on the card).
- All teams try to solve the challenge using paper and pencil, if necessary.
- At the end of the timer, the teams flip over the challenge card to reveal the correct answer.
- Each team that correctly solved the challenge earns one point.
- After a pre-establish game time, the team with the most points wins.

The game was played in five class sessions and the topics covered were addition and subtraction of integers, hours and minutes, divisibility rules, mixed numbers, and fractions.

6. Survey Results

At the end of the semester, students completed a four-part questionnaire. The first section focused on participant characterization, the second section addressed the use of games in class, the third section (not analysed here) covered assessment methods, and the final section dealt with general course evaluation.

Regarding participant characterization, student ages ranged from 17 to 54 years old. The majority (81.8%) were between 17 and 19 years old, with only eight students (18.2%) aged 20 or older. Most students were full-time students (86.4%), while the remaining 13.6% were working students. The gender breakdown was heavily skewed towards females (95.5%), with only two male students (4.5%). This is usual in the "Basic Education" degree.

The second section of the questionnaire first asked students if they liked playing educational games in the classes, through a five-point Likert scale. As Figure 2 shows, there were no negative responses.

Figure 2: Pie chart of responses for the first question of the second section.

Further on, students answered four questions concerning educational games in maths classes. The responses are summarized in Figures 3 and 4.

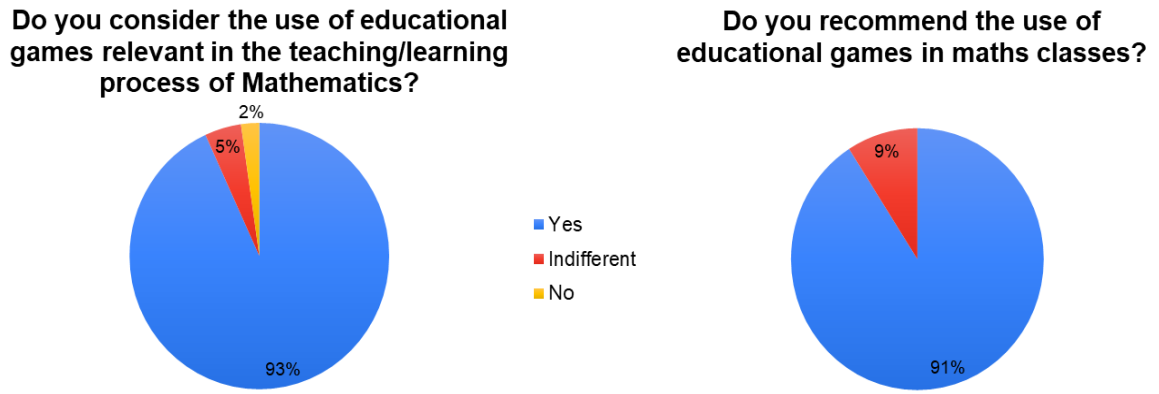

Figure 3: Pie chart of responses (Questions 2 and 3).

Figure 3 indicates strong student agreement that games are a valuable resource in the teaching/learning process. Additionally, students recommend using educational games in maths classes.

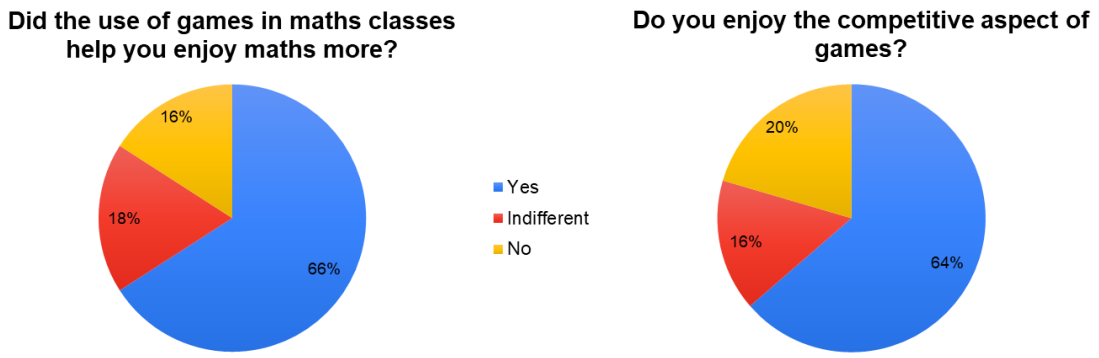

Figure 4: Pie chart of responses (Questions 4 and 5).

Figure 4 (left) shows that most students (66%) enjoyed maths more due to the use of educational games in class. However, the competitive aspect of gamification has varying appeal. While 20% of students reported disliking it, another 16% remained neutral.

Students rated their agreement with a set of statements concerning the use of educational games in class using a five-point Likert scale (1 = Strongly Disagree; 5 = Strongly Agree). The results are presented in the heatmap of Figure 5, which also includes the mean and standard deviation (SD) of the responses.

The use of educational games in maths classes contributed to:	**1**	**2**	**3**	**4**	**5**	**Mean**	**SD**
making learning more interesting.	0	1	4	14	24	4,4	0,8
making learning more interactive.	0	0	4	9	30	4,6	0,7
making classes more stimulating.	0	0	6	13	24	4,4	0,7
involving the students in the learning process.	0	1	2	15	25	4,5	0,7
increasing student motivation.	0	3	5	14	21	4,2	0,9
a more positive view of mathematics	0	0	8	17	18	4,2	0,8

Figure 5: Heatmap of responses related to the use of games in maths classes.

As Figure 5 shows, very few respondents disagreed with any of the statements. "Total agreement" was the most frequent response for all statements, reflected in a mean agreement level above 4 and a small SD. The heatmap allows us to conclude that the use of educational games generally contributed to motivating students, making the learning process more interactive, and engaging students in the teaching/learning process.

Students were asked to select which games they liked better (they could choose more than one). The answers are given through the bar chart of Figure 6.

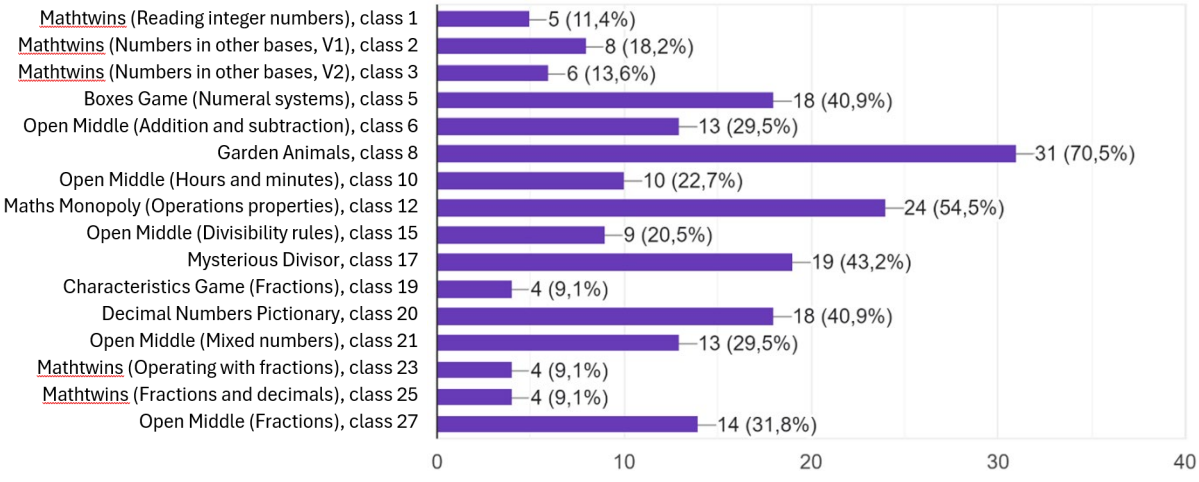

Figure 6: Bar chart of preferred games.

To gain a deeper understanding of student perceptions regarding the competitive aspect of games, they were asked to rate their agreement with a set of statements on a five-point Likert scale (1 = Strongly Disagree; 5 = Strongly Agree). The results are presented in the heatmap of Figure 7.

I consider that the pressure of competition contributes to increasing:	1	2	3	4	5	Mean	SD
my responsiveness.	3	4	8	18	11	3,7	1,2
my motivation to succeed.	3	5	7	15	14	3,7	1,2
the fun with the activity.	3	4	7	12	18	3,9	1,2

Figure 7: Heatmap of responses related to the competitive aspect of games.

Analysing the results of Figure 7, we see less consensus in opinions, reflected in an increase of the SD and a decrease of the mean responses. This aligns with the findings from Figure 4 (right-hand pie chart), where 36% of the students didn't have a positive opinion. Not everyone thrives in competitive environments, and although a minority in this group, they should not be neglected. One solution involves grouping these students together and facilitating non-competitive gameplay. The teacher successfully employed this strategy to accommodate students' diverse preferences.

In the final section of the questionnaire, students were asked to assume the role of the teacher and outline what they would maintain and modify for next year's course. Regarding what they would maintain, seven students said they would keep everything as-is. Educational games received the strongest attention, with another 26 students advocating for their continued use. Two students did not respond, while the remaining suggestions focused on other resources and methodologies employed in the course.

When asked about potential modifications, 17 students felt nothing needed to be changed. The remaining students suggested adjustments to the pace of content delivery or the need for breaks during class. No modifications related to gamification were proposed. It's important to note that the games were played mid-class, and complete breaks were not permitted. The teacher agrees with the students who highlighted the need for breaks, particularly during the 3-hour sessions.

7. Conclusions

This study investigated how educational non-digital games in maths classes can contribute to increase student motivation and engagement in maths learning. The results demonstrated that students not only enjoyed playing the games, but also reported feeling more involved in class and motivated to learn. These findings were supported by both questionnaire responses and the teacher's field notes taken during class observations.

Games offer both a leisure aspect and a competitive element. While most people enjoy the leisure side, not everyone embraces the competitive nature of games. In this study, none of the students reported disliking the educational games played throughout the course. However, 20% did indicate a preference for playing without competition. To accommodate these varying preferences, we recommend adapting the game rules for different student groups. For most students, a point and penalty system can provide a welcome challenge. However, others may benefit from a more collaborative setup that removes the competitive aspect. Ultimately, the teacher's role is to tailor the game format to best suit the players.

Students in this study not only found educational games to be a valuable tool for the teaching/learning process, but also recommended their use in classrooms. The participants, pre-service teachers enrolled in a mathematics undergraduate course, not only strengthened their own understanding of mathematical concepts through these games, but also gained valuable teaching resources for their future classrooms.

In summary, using non-digital educational games to promote maths engagement in pre-service teachers was found to be both fun and functional.

Abstract : There is a growing interest among researchers in using board games for supporting learning in school contexts. Co-op board games is a relatively new and promising type of games, which seems well-suited for improving students' collaboration skills. In this paper, we explore how two groups of Danish high school students interact when playing two different co-op games, *The Mind* and *Forbidden Island*, and how they reflect upon their shared game experiences. The data collection is based on video observations of group interaction and student interviews, which use stimulated video recall. In this way, we are able not only to describe the students' perceived outcomes of the gaming activities, but also their in-game practices. Our data analysis is informed by microsociological perspectives (Goffman and Collins), which are used to map the group interaction rituals and social norms of the students' gaming encounters. Based on the data analysis, we identify two analytical themes, which concern the students' use of verbal and non-verbal communication practices as well as their socialisation processes. The findings suggest that co-op games may be used as a valuable educational tool for qualifying high school students' collaboration skills as well as strengthening their group relations. The students especially valued playing *The Mind,* which they tried playing for multiple game rounds. Based on these findings, we discuss recommendations for the further use and study of co-op board games in educational settings.

Keywords: Co-op; Board Games; Microsociology; Collaboration; Communication; Socialisation.

1. Introduction

There is a growing interest among researchers in using board games for supporting learning in school contexts (Bayeck, 2020). This rising interest in the educational use of games can partly be explained by the fact that board games have developed from being a niche interest with few well-known titles such as *Chess* or *Tic-tac-toe* into a mainstream global market with thousands of new titles coming out each year (Naghikhani, 2024). Paradoxically, this wide variety of games may also make it difficult for educators to use board games to get an overview of what games to be used, how to use them, with what groups of students, and for what educational purposes.

In this paper, we wish to focus on the use of leisure co-op (cooperative) board games as a particular game format, which may have learning potential for improving student collaboration. We have chosen this focus for two reasons. First of all, we believe that the use of board games, and co-op board games in particular, offer a rich and focused approach to learning and reflecting on complex aspects of collaboration and communication, which are key skills in most educational systems (Bayeck, 2020). Moreover, we believe that leisure games may offer more engaging forms of learning than what can often be achieved through educational games.

Despite the growing interest in using board games in education, we lack more detailed knowledge on how such games are enacted and experienced by students. Consequently, this study pursues a microsociological approach to understanding how students interact during co-op board gameplay, and how they reflect upon their game experiences in relation to the norms and roles of everyday school collaboration. This brings us to our research question: How do upper secondary students interact, negotiate, and reflect upon co-op board games as a tool and activity for qualifying collaboration?

2. Cooperative Board Games and Student Collaboration

According to an international survey conducted among teachers, Danish school children are among the most frequent collaborators in terms of working in groups or in pairs (OECD, 2019). There may be many benefits from student collaboration in school contexts such as shared knowledge construction or possibilities for exploring multiple perspectives through group dialogue. At the same time, there also exist several challenges in student collaboration such as asymmetric participation or difference in communication and collaboration skills. Consequently, groups of students often end up working together more *in* groups than *as* groups (Howe & Abedin, 2013).

Parallel with the widespread practice of student collaboration, there is a high interest among Danish children and youth in playing analogue and digital games, both inside and outside school contexts. According to a large-scale survey of Danish students (N=3000) in grades 5 and 7, one of the primary reasons for playing together is linked with social relations and friendships (Hanghøj & Ejsing-Duun, 2023). This demonstrates how social aspects are crucial to most gaming experiences (Gonçalves et al., 2023).

Despite these overlapping tendencies, there exists relatively few studies on the use of co-op board games in school contexts. A recent study by Sousa et al. (2023) offers a quantitative analysis of 25 Portuguese high-school students' experiences of 5 different co-op board games. However, this study only provides limited insight into how the games were played, and how the students reflected on their game experiences in relation to everyday school practices. This calls for more qualitative approaches to the process of playing and reflecting on co-op games in educational settings.

3. Case Description

In this section we will briefly describe the two co-op games, *The Mind* and *Forbidden Island*, used in the study as well as the context for the study. The two games were studied as a part of a municipal development project entitled "Conquer the Cooperation" (in Danish: "Spil Samarbejdet Stærkt"). The aim of the project was to investigate the extent to which cooperative board games can strengthen students' understanding of academic cooperation at upper secondary school. The project is based on a collaboration between researchers from Aalborg University, the non-profit organisation The Board Game Bureau (BrætspilsBureauet), and two high schools in Copenhagen. The financial support comes from the Frederiksberg Foundation, a fund under Frederiksberg Municipality.

The project was carried out in spring 2024 in 6 classes with a total of 167 students (ages 17-19). The main activity in the project involved a visit to a class by a game facilitator, who conducted a 90-minute workshop, which divided the students into groups of four. Each group played the two co-op board games. After finishing each game, the groups discussed their game experiences and how they related to everyday cooperation in class.

The workshop's first co-op game was *The Mind* (Figure 1), which is a card game with 100 cards, each of which has a number from 1-100. In the first round, each player gets one card, so in groups of four students, there will be four cards in total. The players must lay down the cards without communicating, so that the lowest comes first and then they follow chronologically. In round 2, each player gets 2 cards, so the group now has 8 cards in total. In each round, the players get an extra card, and the players win if they manage to complete round 8 using 8 cards each. The game invites the students to develop non-verbal forms of communication to sense each other.

Figure 1: *The Mind* (Copyright: Pandasaurus Games).

The second game, *Forbidden Island* (Figure 2), is a turn-based tactical game in which players can communicate verbally. In the scenario, players must try to escape from an island that is constantly in danger of being flooded. All the players flee together or drown together. The players can escape only when they have collected four treasures. The treasures are claimed by redeeming five identical treasure cards. Along the way, the players can give each other treasure cards, ensuring that single players acquire cards faster to redeem a treasure. It does not matter who collects the treasures. During the game, players can choose to give cards to each other or counteract the flood. Each player is given a role from the start, which possesses some special abilities. The game calls for joint discussions of each player's actions and what might be the best tactical action to take.

Figure 2: *Forbidden Island* (Copyright: Gamewright).

In summary, the two games were chosen according to three criteria. First, the games had to be simple, as there was limited time for learning how to play them. Secondly, the games were chosen to explore *different game mechanics* – e.g. *The Mind* requires individual players to co-create a linear number sequence with direct consequences if they succeed or fail, whereas *Forbidden Island* relies on several different mechanics when drawing cards and moving player tokens, where it is harder to detect direct consequences of the individual player's actions. Thirdly, the two games enabled quite *different communication patterns* as *The Mind* relied on non-verbal group communication, whereas *Forbidden Island* required the players to verbally communicate and agree on shared decisions.

4. Theoretical Perspectives

In order to study the interaction and situated norms of cooperative board gaming, we will pursue microsociological perspectives on gaming (Kirschner, 2021). Microsociology focuses on small-scale, everyday interactions between individuals or small groups, interpreting how these interactions influence larger societal patterns. More specifically, we will draw on the work of Goffman (1961, 1974) on gaming encounters, and Collins' (2005) theory of interaction rituals.

According to Goffman (1961), gaming encounters can be seen as a particular form of *focused gatherings*, where gaming participants orient themselves toward each and follow the norms and rules of the specific gaming situation. Goffman (1961) also describes the *interaction tension* in gaming encounters as the game participants may be engaged in different ways during gameplay – e.g. some may be spontaneously engrossed, whereas others may be bored. Moreover, games often involve a risk of losing *face* (Goffman, 1955), e.g. when the individual player, either through his action or that of people closely related to him, fails to meet essential requirements placed upon him by virtue of the social position he occupies.

Furthermore, gaming encounters always involve specific *framings* (Goffman, 1974), which refer to the participants' mutually negotiated experiences and social norms of the game. As an example, a game session may be framed by the participants as being casual or serious. Similarly, game activities imply different framings (involving different norms and meanings), when enacted inside and outside school contexts (Hanghøj et al., 2018).

Building upon the insights of Goffman, Collins (2005) has developed a theory of *Interaction Ritual Chains*, which assumes that successful rituals create symbols of group membership and pump up individuals with emotional energy, while failed rituals drain emotional energy. Collins identifies four key ingredients for successful social interactions: *bodily co-presence* (physically assembling in the same space); *barrier to outsiders* (a sense of who is taking part and who is excluded); *mutual focus of attention* (awareness of each other's attention, focusing on a common object); and *synchronisation* (common mood or emotional experience) (Collins 2004). Correspondingly, Collins emphasises four outcomes of interaction rituals: *group solidarity* (a strengthened

feeling of group membership through shared experiences), *emotional energy* of a group (the positive or negative feeling that motivates a ritual participant toward action), *group symbols* (actions, artefacts or jargon that act as symbol carriers), and *moral standards* (shared norms and values that promote a sense of "rightness" in adhering to the group). Even though Collins does not write about board games, we agree with Stromberg (2009) that his theory of interaction rituals can also be used to describe how game participants may be able to create emotional energy through group interaction.

5. Methodological Approach

The study adopted focused ethnography as our methodological approach to documenting the students' interaction during gameplay and their following evaluation (Knoblauch, 2005). Focused ethnography is an applied and pragmatic form of ethnography that explores a specific social phenomenon as it occurs in everyday life. The focused ethnographic approach is characterised by limiting itself to a short time frame, relying on audiovisual collection techniques, gathering a large amount of data, and focusing on communicative elements. This approach seemed relevant as it was not the project's intention to follow the everyday life of a high school class over a longer period. Instead, we wanted to focus on very specific, limited elements, namely the students' game practices and their considerations about the potential of board games to enhance collaboration. We ensured focused data through our video observation of the game sessions as well as the subsequent interviews.

Our study was conducted in one of the 6 classes in the development project, where 8 students gave consent and volunteered to participate in video observations and interviews. A researcher had visited the class two weeks before the project and informed them about the upcoming workshop and the possibility of participating as informants. The 8 students were divided into two groups with an equal number of women and men. Figure 3 provides an overview of the informants' anonymized names. Students at the same line were interviewed together.

Table 1: Overview of informants.

Group A	Adam (M)	Beate (F)
	Chris (M)	Diana (F)
Group B	Elin (F)	Frederik (M)
	Gustav (M)	Hannah (F)

The eight students, as well as the rest of the class, conducted the workshop in the same room, which was also their usual classroom. The two groups that we observed were placed at the back of the room, where the cameras were set up (Figure 4). One camera filmed the tabletop where the game was placed, and the other two cameras filmed two students from each group.

Figure 4: Camera setup. Two cameras each focusing on a couple of the plates. One camera aiming at the table.

The video observation gave essential insights into how the students negotiated the collaboration during the game as well as their post-game discussion. The analysis was inspired by a multimodal approach, where both the spoken word as well as gestures and the role of the artefacts can give insight in the social relations (Davidsen & Ryberg, 2017). The multimodal understanding of communication was especially important in relation to the game *The Mind*, where the students were not allowed to communicate verbally. In our analysis, the verbal as well as non-verbal communication were included in our understanding of the collaboration.

After the workshop we processed the video data and began the analysis. We decided the topics for the student interviews and chose video sequences to play at the interviews. Two weeks after the workshop, we conducted the interview. The informants were asked the same questions, which were divided into three themes: 1) their experience of playing *The Mind*, 2) their experience of playing *Forbidden Island*, and 3) their thoughts about what they might learn about collaboration from the boardgames.

We choose to interview the students in mixed gender couples. We hoped that hearing each other's thoughts would inspire further reflections. To help facilitate the recall of events and reflections, the interviewer had placed the two board games on the table. At the interview, the students saw a two-minute scene of themselves playing the board game, prior to questions about the experiences related to the board game.

When addressing the third topic – what they might learn from the board games – we had written down quotes from the students during their post-game discussions, which reflected their game experiences. In the interviews, each student had to select a quote, which he or she thought came the closest to their own experience and then comment on it. Examples of the quotations: “The games can help us get used to each other's way of collaborating” and “In the game, no one knows the answer, but if you are confident in your answer, you can convince the others, even though no one actually knows what is correct.”

The combination of video observation and interviews allowed us to both follow the players’ negotiations as it happened and return to scenes that the students discussed post-game and in the interviews. This enabled us to compare observed behaviour with expressed reflections. Having transcribed and coded the data, we performed a thematic analysis that identified analytical themes through patterns of variation across the different data types (Braun & Clarke, 2006).

6. Analysis

Based on our thematic analysis, we identified two analytical themes: 1) *Learning to collaborate: Verbal and non-verbal communication*, and 2) *Learning to socialise: Make or break for all*. Each theme is based on data from the video observations as well as interview data.

6.1 Learning to Collaborate: Verbal and Non-Verbal Communication

The first analytical theme concerns the students’ verbal and non-verbal communication during gameplay as well as their post-game reflections on the same topic. More specifically, the theme concerns the communicative skills that the students needed to use during gameplay, and how this related to everyday forms of student collaboration.

Based on the different mechanics of the two games, the students’ communication patterns differed substantially across the two game sessions. When playing *The Mind*, the students had to be silent as the game only allowed them to communicate through eye contact and bodily gestures when gradually putting their handheld cards on the table in varying tempos. During the game, Elin laughingly encouraged the others to read the number in her eyes, and then she tried to draw the number with her eyes by moving her pupils. The others gave up laughing at their attempts to read the number she visualized. In this way, each student group’s interaction ritual relied heavily on bodily co-presence and mutual awareness (cf. Collins, 2005). Moreover, the students’ focused group interaction created high emotional intensity. Once a game round had been won or lost, this could be seen in loud emotional outbursts among group members – e.g. by spontaneously clapping their hands or making whooping sounds that reflected their wins and losses (cf. Figure 5).

Figure 5: Players clapping and cheering after completing a game round in *The Mind*.

When playing *Forbidden Island*, the interaction and communication patterns in the groups were quite different. In contrast to the rhythmic patterns in *The Mind*, where group members shifted between being silent and engaging in loud outbursts after each game round, the students would talk more or less constantly when playing *FI*, which lasted for about 30-40 minutes. Even though the game was turn-based, the group members discussed collaboratively before agreeing on the best move for each player (cf. Figure 6). In this way, there was less emotional intensity in the room, but constant verbal negotiation, which weighed different strategies, possible moves, and their consequences.

Figure 6: Players discussing and instructing the next player's move in *Forbidden Island*.

In the post-game interviews, the students commented on how their game experiences (especially from playing *The Mind*) required them to "read the other players' body language and eyes" (Elin) to avoid losses. Moreover, the students also described how the games made them reflect on their everyday communication and collaboration in school. One student, Elin, described how the game made her think about her own approach to collaboration, where she would often be (too) talkative:

> *So, normally I talk a lot, so the thing about not being allowed to say anything, I just had to get used to that, where there are others who might be used to being completely silent. In other games, you must communicate a lot verbally. And then it can be a challenge for them, so you can also develop those skills and get used to the fact that it is not dangerous to say something, nor is it dangerous to say a little less*.

This example shows how the students used their game experiences to reflect on different forms of "interaction tension" (cf. Goffman, 1961) and social norms that accompany different types of collaboration, both during gameplay and student work. Student collaboration as well as co-op gaming both require participants to align their social norms and find ways to reduce tensions in their interaction to make sure that the communication flows. As the quote shows, this implies that group members should neither be allowed to take too much space nor be too passive. Through such reflections, the students pointed out a learning potential in co-op board games in terms of becoming more aware of how and when group members should take the floor in student collaboration. Moreover, another student mentioned how co-op games could be used for "tuning in" to each other when doing group work or help to prepare for oral group exams (Chris). In this way, the co-op games could

be used to learn communicative and social skills, which was not only relevant to the game, but also everyday forms of student collaboration in upper secondary education.

6.2 Learning to Socialise: Make or Break for all

Playing co-op games provides the participants a way of socialising which is different compared to other game types. Many games include a clear distinction between winners and losers among players. Co-op-games are unique in the sense that there seldom is an internal division. Instead, the players participate as an entire group, who will make it to the victory or break and loose. In this analytical theme, we will investigate how the group participants socialise and contribute to a shared mood (cf. Collins, 2005) in the groups, and afterwards how the co-op-setup reflects the individual player's facework.

Even though co-op games do not encourage internal competition, locked situations can still arise, where the players' mutual assessments and decision-making may come into conflict. Such a situation arises at one point during the game session with *The Mind* (cf. Figure 7). The three players Elin, Frederik, and Hannah are in a situation where one of them must play the next card, but none of them want to. Elin and Frederik sit next to each other. Frederik puts his card on the table, presses his lips together in a smile, stares at Hannah, and folds his arms. Elin glances sideways at Frederik, presses her lips together, places her card on the table, puts her hands under the table, and smiles at Hannah. From Hannah's perspective, she sees two smiling teammates across from her, who have put down their cards on the table without showing any initiative to place their cards on the pile. Seconds pass. Hannah laughs. Elin and Frederik smile. Visibly pressured, Hannah throws her card onto the pile. It turns out to be the right move. Seconds later, the remaining players place their cards on the pile in the correct order, and the game round is won.

Figure 7: Elin with her arms crossed. Frederik with hands under the table. Hannah must take the next move.

The preceding tense situation triggered a shared mood, which in some games could have been a negative experience or cause tension. But with Elin and Frederik's comical imitation of each other's refusal to play their cards, they ease the situation's potential serious pressure on Hannah. In other situations, Hannah's action could be seen as a loss, as she is pressured to act against what she thinks is in their common interest. However, within the contexts of the co-op game, Hannah's yielding to the pressure turns out to be in the group's common interest in terms of making progress in the game. Her action triggers a positive shared energy that has a group-building effect (cf. Collins, 2005). So, what in other games could be seen as Hannahs individual defeat ends up being a collective victory; also for Hannah, who is celebrated for having yielded at the right moment.

During *The Mind* game sessions, the groups often found themselves locked in situations like the one mentioned between Hannahs and her teammates. In the succeeding interviews, the students commented on these situations. Chris explains that as a player you can only see your own card, which makes you believe you know how the cards should be played. However, the individual player does not have all the facts. Other players have their own cards and information exclusive to them. As a player, you need to count on the other players' insights. Diana and Chris elaborate further on this:

> *Diana: Everyone needs to participate for us to move forward. So, you have to look, okay, Chris is just sitting back completely, and Beate, she's ready, and if you also have low cards yourself, then you have to follow along. This is also generally true in group work, where you can see that some people might be more reserved with their answers, and then there are those, who just say something even if they have no idea whether it's right or wrong, just to say something. So, actually it is important to get everyone to speak up.*
>
> *Chris: I also think exactly what you said about being reserved. If you think about it in the context where Beate has low cards, but you also have low cards yourself. But you still have to make a decision about whether to wait or not, because you can sense that we are somewhat in the same number range, so you don't know, you have to either break through or hold back a bit.*
>
> *Diana: It's about actually daring to come forward with your point and without it being at the wrong time.*

As Diana and Chris explains, you cannot choose to not play your cards in *The Mind* as this will make the entire team lose. Everything depends on each player's active throwing of cards on the pile. Transferring the situation to group work, Diana and Chris also explain that when you work together, you need to dare to continue even though you get stuck.

As the locked situation with Hannah and the game-enhanced participation explained by Diana and Chris suggest, the students experience that playing co-op games may both have a group building effect and being able to support the development of group solidarity (cf. Collins, 2005). According to Diana and Chris, there are a lot of competitive persons in their class. In this way, they perceive co-op games as being particularly relevant in a high school setting to counterbalance the high focus on competition.

The discussion of competitiveness recurs in other interviews. Interestingly, several of the informants begin by stating that they are not competitive people, only to later change their statements to say that they are competitive people. This shows how there was a tendency for the informants in their facework (cf. Goffman, 1955) to distance themselves from the role of a competitive person. Being competitive is not perceived positively by the informants, as the role is associated with behaviour that can seem exclusionary and demoralising. Normally when playing board games, the competition might cause tension between the playing students. Hannah says:

> *Playing might be more fun, when there is a winner and a looser, but it can also quickly get out of hand. Some people get upset, or it ends badly, especially if you're in a class with many competitive people*".

Here Hannah emphasises that playing games involves a risk of reducing the sense of security within the group. From this perspective any board game might not necessarily support the development of group solidarity. However, the co-op games are *framed* (cf. Goffman, 1974) differently, as the players' competitiveness do not seem to be triggered when they are playing against the game itself. In Gustav's words: "You are not face to face against another person. The co-op board game is just pieces and cards." Thus, this game format does not trigger what he describes as his competitive mentality. According to Chris, he is a competitive person and is eager in securing that he or his teammates are making the best moves. However, he finds that his competitive nature is not triggered in the same way in the two games:

> *When it comes to competitive people, in* Forbidden Island *you wouldn't notice mistakes right away. If you spend the wrong card, it will bite you later, whereas in* The Mind *you can more directly and concretely see if you played a card too late or too early*.

Chris had to put more effort into facework and tolerate his own or others' unfortunate moves in *The Mind*, whereas in *Forbidden Island*, he finds himself being a bit more reserved.

On the one side, the students experience how competition may spark competitive energy and excitement. On the other side, competition also comes with a risk of damaging the relationship in the group. When Hannah is asked whether she would prefer to put the co-op games aside in favour of more risky and fun competitive games, she answers:

> *No, I don't think so. I think it (co-op-games) provides something different. I may not find it as exciting, but it contributes to cooperation and communication. I believe it offers many more positive qualities than if we were playing against each other*.

From Hannah's perspective the goal of playing co-op games is not simply having a fun time in class, but just as much as a way of learning to cooperate. In this way, she frames co-op games as having a clear educational value, even though they may be less fun than competitive games. In summary, the findings of this analytical theme indicates that co-op-games can serve as a tool for supporting group solidarity through shared moods and increased emotional energy. Using co-op-games may diminish the risk of conflict. Moreover, competitive players might have an easier time controlling possible losses.

7. Discussion

The analysis shows how the students actively engaged in the co-op games by interacting verbally and non-verbally with each other during the game sessions when negotiating their moves. Through mutual awareness, the students contributed with high emotional energy to the shared non-competitive mood of playing together as groups against the co-op games. The emotional intensity among group members was particularly high when the students played *The Mind*. Moreover, the analytical themes show how the students' reflected on their gaming activities in relation to the skills needed for everyday forms of student collaboration as well as different possibilities of supporting group socialisation in upper secondary education. Taken together, these findings indicate how the students frame co-op board games as valuable pedagogical tools, which can create mutual engagement among group members, which may potentially both support collaboration and socialisation processes.

Our study is based on a microsociological approach to mapping students' gaming interaction patterns as well as contextualising their post-game reflections. This approach allowed us to document detailed aspects of the student group's in-game communication patterns, and how the students related their gaming experiences to their everyday collaboration and socialisation practices in upper secondary education. There exist relatively few studies, which maps students' gaming practices through a microsociological lens – for exceptions, cf. Wisittanawat & Gresalfi (2021) and Hanghøj (2008). In this way, our study provides new microsociological findings and perspectives on how local gaming processes and interaction norms can be linked to everyday study practices.

However, there are also obvious limitations to our study. First, the students were only allowed to play the two co-op games for a relatively short time. This was particularly problematic with *Forbidden Island,* which the students were barely able to finish, before being asked to discuss the game. Based on the students' excitement with playing *The Mind* several times, which allowed them to discuss, reflect on and improve their strategies, it is highly likely that the students would also have benefitted from replaying *Forbidden Island*. Moreover, we were not able to explore how the games could have been adopted in everyday educational practice as this was beyond the scope of the development project, which formed the context of our study. In this way, we have not been able to validate the students' claims regarding the potentials of the co-op board games in terms of supporting collaboration and socialisation. This points to the need for more longitudinal studies of how co-op games may help to develop local practices.

8. Conclusion

The aim of this paper was to explore how upper secondary students interact, negotiate, and reflect upon co-op board games as a tool and activity for qualifying everyday forms of student collaboration. Analysis revealed that the students became actively engaged in playing the co-op games, employing different strategies and modes of verbal and non-verbal communication. Moreover, they reflected on how the gaming experiences related to their own roles during student collaboration, and how co-op games may be especially suited for socialising students into new classes, which is a vulnerable and mandatory process for all Danish upper secondary students. Based on these findings, our paper points to the need for more research on the process of playing co-op games, and how this may help qualify everyday forms of student collaboration and group formation.

Abstract: In pursuit of redefining the conventional campus introductory experience, this paper presents the development and implementation of the StaffsVerse project - a virtual campus immersion tool. Designed as a Metaverse representation, the StaffsVerse project intends to transform the physical campus of Staffordshire University into an interactive digital environment. Its purpose extends to serving as a versatile tool for remote education delivery, virtual campus tours, public science outreach, and facilitating a seamless transition for students into the university community. Through immersive digital engagement, the StaffsVerse project seeks to bridge the gap between remote learners and the campus environment while facilitating a smooth integration into academic and social aspects of university life. In contrast to previous implementations of virtual campuses, the StaffsVerse project is unique in leveraging the capabilities of Unreal Editor in Fortnite (UEFN). This approach enables the development of highly detailed, interactive, and engaging environments within the expansive Fortnite ecosystem. The project's primary objective is to harness the infrastructure and extensive user base of one of the world's most widely played multi-platform games, thereby ensuring a low barrier to access. Therefore, this paper will explore how the UEFN system's adaptability can effectively create an accurate virtual replica of the physical Staffordshire University campus. The key contribution of this paper includes an overview of the design and developmental journey of the StaffsVerse project. The evolution of the project will be outlined by discussing the two pivotal iterations of the game-based implementation and explaining the decision-making process that led to the resulting version. The examination extends to the unique features of the UEFN build, addressing the inherent challenges and opportunities specific to the platform. Furthermore, specific game-based decisions are discussed, such as replicating essential campus locations, integrating interactive features, and incorporating elements unique to the virtual environment. The paper will discuss the specific educational opportunities UEFN offers, including the potential for enhancing student engagement through gamified campus experiences, insights into creating a Metaverse university campus, and contributions to the growing discourse on the intersection of game-based virtual environments in learning.

Keywords: Metaverse, Student Engagement, Virtual Worlds, Onboarding, Virtual Campus

1. Motivation

Student demographics have driven transformational thinking in how educational services are delivered and experienced. This shift is particularly critical in higher education, where traditional methods often limit accessibility and fail to engage a technologically proficient student body. The advent of virtual environments and digital platforms presents an opportunity to redefine engagement paradigms.

Student transition is a known challenge in higher education. University is for many individuals, their first time living away from home. It requires adapting to new ways of learning, and increased autonomy, and this transition can create challenges. Typically, universities have used welcome (“fresher”) weeks to support this adjustment. But this often only begins once the student has arrived on campus. Other institutions have explored using their VLE to provide some pre-enrolment transition activities, but these often suffer from limited participation.

There is also the challenge of location acclimation. Most students will find themselves getting lost in their first few weeks of study while they try to learn to navigate a large campus. While many institutions offer “open” days and applicant sessions, these only provide a small opportunity to experience the campus. However, in recent years, due to the cost-of-living crisis, an increasing number of students are struggling to attend these sessions. For this reason, traditional campus tours and orientation processes can be intimidating and inaccessible for many potential students, especially those from international or remote backgrounds.

By creating a metaverse version of the Staffordshire University campus, the project aims to democratise access to campus experiences, allowing students to explore and interact with the campus environment from anywhere in the world. The Staffsverse project leverages the interactive capabilities of UEFN to create a dynamic learning

environment that goes beyond static online courses and video lectures, offering real-time interaction and exploration of educational content.

The choice to use Unreal Editor in Fortnite (UEFN) for developing StaffsVerse is driven by the popularity and extensive reach of the Fortnite platform. Fortnite's global popularity ensures that the virtual campus is accessible on a platform many students are already familiar with and enthusiastic about. This approach not only lowers the barrier to entry by using a familiar interface but also taps into the engaging and interactive elements of gaming to enhance the learning and orientation process.

Finally, the development of StaffsVerse is motivated by a forward-looking vision for the future of education. As digitally capable individuals become the primary demographic in educational institutions, there is a growing need to incorporate technology not just as a tool, but as an integral part of the campus infrastructure. A student's online engagement will need to offer an experience that compliments the physical resources of the institution.

2. Background

In the evolving landscape of Higher Education (HE), the shift towards virtual environments is driven by the need to adapt to the changing demographics and technological proficiency of students (Díaz et al., 2020). The StaffsVerse project, leveraging Unreal Editor in Fortnite, exemplifies this transformation by offering an immersive, interactive virtual campus that enhances the introductory and ongoing campus experience for remote learners. This exploration discusses the transformative impact of digital platforms in HE, and explores the development and utility of virtual campuses, the integration of gaming elements for learning, and the significant potential of metaverse technologies to enhance both academic learning and social connection in university settings.

2.1 Virtual Campuses and Online Tours

Virtual campuses have been a part of the educational technology landscape for over two decades (Anderson et al, 2020). One of the earliest and most notable implementations of virtual campuses occurred in environments like Second Life, where institutions such as Stanford University and the Open University established virtual campuses (Rymaszewski, 2007). This initiative was specifically designed to ease the transition for incoming students by creating a virtual replica of the campus environment. As part of their introduction to university life, students navigate through various interactive tasks and scenarios that simulate real-world campus activities. Studies from this period, such as those by Dalgarno (et al., 2010), have emphasised the importance of these interactions in creating engaging learning environments that extend beyond traditional classroom settings (Dalgarno et al, 2010; Jin et al., 2022).

As technology evolves, the focus of research shifted towards the immersive capabilities of technologies such as Virtual Reality (VR) (Heise et al., 2021). Recent advancements have seen the development of VR tours and interactive maps that enhance the induction process for new students. These tools serve not only to introduce students to campus layouts but also to significantly lessen the anxiety associated with navigating a new and often overwhelming physical environment (Concannon et al., 2020; Hawes & Arya, 2023). Research by Montana (et al., 2019) highlights that these virtual introductions can greatly ease the transition for incoming students by reducing initial stress and building familiarity, which in turn helps in smoothing their integration into their university life (Montana et al., 2019; Di Natale, 2024).

Moreover, these virtual experiences are increasingly recognised for their potential to make campus tours accessible to all, which can be particularly beneficial considering barriers that might prevent prospective students from visiting campuses (Baguma & Wolters, 2021; Dwyer et al., 2023). As institutions continue to explore these technologies, the emphasis is on creating more inclusive, engaging, and supportive virtual environments that cater to a globally dispersed student demographic. This shift not only reflects an adaptation to student needs but also aligns with broader educational goals of increasing accessibility and reducing barriers to higher education.

2.2 Transitional Games

Within the dynamic and evolving landscape of Serious Games (SG), where the integration of play and learning extend beyond mere entertainment to educational and therapeutic applications, a distinct category emerged - Transitional Games. Defined as "A subset of Serious Games, with the aim of supporting an individual through a period of transition, whether it be emotional or physical" (Threlfall et al., 2022). These types of games are

meticulously designed to assist individuals as they navigate significant changes in their lives, which can range from entering new educational environments, adjusting to different social settings, moving through different life stages, or recovering from physical or mental health conditions.

Transitional Games uniquely blend the engaging elements of gaming - such as storytelling, interactive gameplay, and immersive environments - with the structured support needed to facilitate a smooth transition. By focusing on both the emotional and practical aspects of change, these games provide a valuable resource for learning and adaptation. They do this by creating scenarios that mirror real-life challenges, thereby offering players the opportunity to practice responses and strategies in a controlled, risk-free setting.

This innovative approach allows players to develop necessary skills and coping mechanisms that can be critical during times of change. By fostering a deeper connection to the experiences faced during transitions, Transitional Games contribute significantly to the field of SG. They not only entertain but also empower individuals, helping them to face their real-world situations with confidence and a stronger sense of preparedness (Threlfall et al., 2022).

2.2.1 Examples of Transitional Games

Transitional games represent a dynamic subset within the field of SG, specifically designed to aid individuals during significant periods of change. These games effectively address various transitional needs, from easing students into university life to supporting young individuals in managing mental health challenges. The breadth and impact of serious gaming as a transformative educational and emotional support tool are clearly demonstrated through these applications.

2.2.1.1 Campus Quest

In response to the challenges new students face when transitioning to higher education, Curtin University teamed up with 2and2 to create Campus Quest, a gamified environment that allows players to get a glimpse of university life (Tutty & Leslie-McCarthy, 2012). This game targets young people from diverse backgrounds - including low-socioeconomic, regional, and indigenous communities. In the game, players strive to excel academically while managing four critical metrics: time, income, research, and social life. By engaging in various quests, each impacting these metrics differently, players gain insights into essential aspects of university life, such as securing housing, finding part-time jobs, and navigating support services.

Figure 1

The game's design simulates the delicate balance required in university life, where students must adeptly juggle academic responsibilities with social activities and financial management (Tutty & Leslie-McCarthy, 2012). Success in the game depends on maintaining a sustainable balance among these aspects, reflecting the real-life strategies that can help students thrive in higher education settings. Through this interactive experience, Campus Quest goes beyond mere entertainment; it serves as a practical tool that prepares students for the multifaceted challenges of university life. The transition from secondary to higher education is not just a change in academic setting but a significant life event. Campus Quest incorporates pedagogical principles that teach players about balance, resource allocation, and time management, key skills that support a successful adaptation to higher education.

2.2.1.2 SPARX

SPARX represents an innovative approach to mental health designed specifically for young people navigating the emotional transitions associated with adolescence to early adulthood. Developed through a partnership between the University of Auckland and the New Zealand Ministry of Health, SPARX is an interactive computer gam grounded in cognitive-behavioural therapy (CBT) principles to help teenagers manage symptoms of depression and anxiety (Merry et al., 2012; Lucassen et al., 2021). Within the game, players embark quests within a fantasy world where they are tasked with restoring balance to a virtual environment clouded by negative thoughts. As they advance through various levels, players face challenges that teach vital coping strategies, including breathing techniques, the identification and restructuring of negative thought patterns, and participation in activities that foster positive emotional growth.

Figure 2

The game structure allows players to learn at their own pace within a safe and engaging environment. Each level is designed to build upon the previous one, ensuring a gradual increase in skill and understanding. The game's narrative and challenges mimic real-life situations that might trigger stress or anxiety, providing players with practical skills they can apply in their daily lives (Merry et al., 2012; Lucassen et al., 2021). This helps to facilitate a smoother transition through potentially turbulent times by equipping players with the tools they need to manage their mental health effectively.

SPARX is exemplary of a transitional game as it aims to mitigate the emotional challenges of transitioning into adolescence and beyond. It serves not only as an educational tool but also as a therapeutic intervention that promotes mental well-being in a format that is accessible and relatable to young people. By blending therapeutic principles with engaging gameplay, SPARX effectively prepares its players for the emotional aspects of growing up, making it a critical tool in the landscape of educational and supportive serious games (Merry et al., 2012; Lucassen et al., 2021).

3. Universities and the Metaverse

The rise of the metaverse marks a significant evolution in the digital landscape, offering universities innovative ways to create, interact, and engage. As an advanced virtual environment, the metaverse provides persistent, immersive, and interactive experiences that goes beyond the capabilities of earlier virtual learning environments (Tan et al., 2022). Universities are increasingly drawn to these platforms for their potential to not only replicate physical spaces but also to foster new educational standards and enhance student engagement (Zhang et al., 2022).

Metaverse platforms allow universities to create dynamic virtual campuses that facilitate a range of interactions—from academic lectures to social gatherings—thus extending the traditional educational environment into a more flexible and accessible digital realm (Wang et al., 2022). These platforms support a variety of learning activities that can adapt to different learning styles and needs, thereby offering a more personalised educational experience. Research by Lee et al. (2021) emphasises how the metaverse can transform pedagogical approaches, allowing educators to implement experiential learning, simulations, and real-time collaboration on a global scale (Lee et al., 2021).

The StaffsVerse project, utilising the Unreal Editor in Fortnite, exemplifies this innovative approach by integrating the educational framework within a platform widely recognised and used by students around the globe. This not only reduces the technical and financial barriers to entry but also capitalises on the engaging and

interactive elements inherent to modern gaming environments. Furthermore, the StaffsVerse initiative is illustrative of how universities can leverage popular culture and technology to enhance educational accessibility and engagement. The use of a well-known gaming platform helps to bridge the gap between recreational and educational activities, attracting students who might not otherwise be reached through traditional methods. This approach also taps into the collaborative and competitive spirit of gaming to foster a deeper connection with educational content, encouraging more active participation and retention of information.

In conclusion, as universities continue to explore the metaverse, the potential for these platforms to revolutionise education becomes increasingly apparent. The metaverse not only supports the replication of physical campuses in a digital format but also encourages the development of innovative teaching methods and new forms of academic and social interaction. This shift towards immersive digital education platforms like the StaffsVerse project represents a forward-thinking approach to education, promising to enhance learning experiences, increase accessibility, and prepare students for a future where digital and physical realities are increasingly intertwined.

4. Pilot: The Mars Campus

Implementing the StaffsVerse campus was done in two phases. We initially constructed a pilot to explore several key questions, specifically regarding scalability and user experience. This Campus pilot was the “Staffordshire Mars Campus”, pictured in Fig.1.

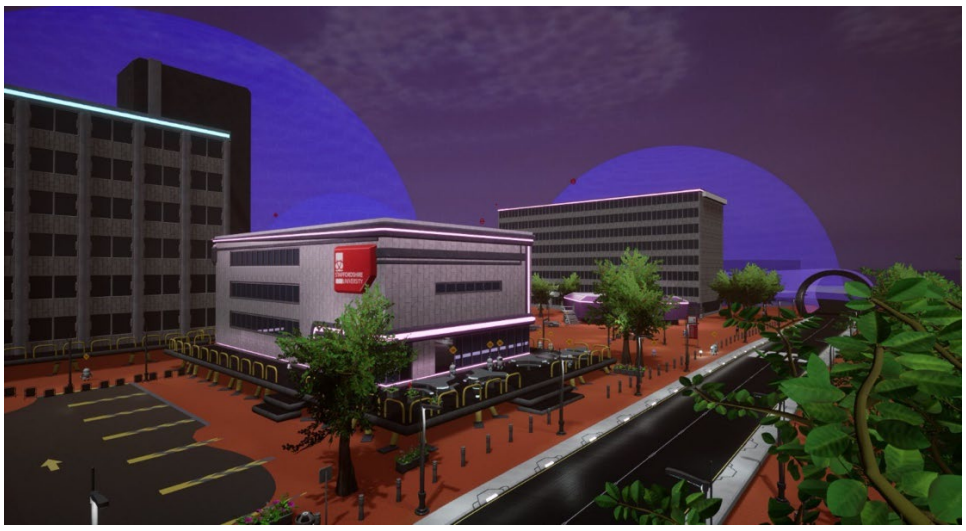

Figure 3: The Staffordshire Mars Campus. Pictured from left to right is the Melor, Beacon, and Flaxman buildings.

We made a number of design decisions in the implementation. Most notably, we chose to implement the campus as a creative “interpretation” rather than a true to life representation. We made the choice for two main reasons.

1. It enabled us to focus on the general navigational experience, avoiding unnecessary detail.
2. It facilitated a low-resolution rendering style that would be more efficient to deliver.

For this we chose the theme of a university on Mars and used that narrative direction to influence the visual elements of the implementation. However, although the visuals were a creative interpretation, the environment was implemented at a 1:1 scale implementation of the real-world campus. This meant that all the virtual features were in the same positions (and size) as their physical counterparts, this ensured that the navigation experience was analogous to navigating our Stoke-on-Trent campus.

We used this pilot to explore a number of technical challenges, but critically how to deliver a large-scale open world environment to multiple concurrent users. The aim of the pilot project was to create a live world that users would be able to login, interact with other players and engage in activities in real-time. Development of a bespoke implementation of a metaverse like application whereby potentially 100s of users can access the platform at any given time possess a huge technical and costly feat to ensure a smooth uninterrupted and secure play experience.

Historically, peer-to-peer (P2P) networks were a popular choice for hosting multiplayer games. However, over the years, the approach has fallen out of fashion. In a P2P setup, the responsibility of managing connections falls directly on the user. This requirement can prove technically daunting for average players who may lack the necessary expertise particularly when network configuration such as port-forwarding is required.

Moreover, P2P networks are inherently fraught with security management challenges. The decentralised nature of these networks, while offering certain benefits, significantly complicates the implementation of effective security measures. As a result, these networks are more vulnerable to attacks and breaches, which can compromise user data and game integrity (Glazer & Madhav, 2016).

Additionally, the structural attributes of P2P networks facilitate easier game outcome manipulation, making cheating a more prevalent issue. Players can exploit the network's vulnerabilities to alter game data or disrupt other users' connections, which undermines the fairness and competitive spirit of the gaming environment (Yahyavi & Kemme, 2013).

Given these issues, the gaming industry has gradually shifted towards more centralised (client server) network models (Lindner, 2023). These alternatives not only relieve the user from the burden of network management but also enhance security protocols and provide a more controlled and equitable gaming experience. This transition reflects an ongoing effort to address the intrinsic weaknesses of P2P networks while embracing the technological advances that promote a safer and more enjoyable multiplayer gaming landscape.

Games as a Service style games that can be updated in real-time require the use of dedicated servers, which allows developers to add new features to the application on the back end to add more playable content (Vaudour & Heinze, 2019). By focusing on this model for StaffsVerse events could be created around key points of the academic year such as open days, Welcome Week and large-scale events. This would enable the development of an ever-evolving environment where students could gain an understanding of these events at their own pace.

Commercial games and metaverse applications typically achieve this by hosting portions of the game in the cloud using solutions such as Amazon GameLift (Amazon) and Azure PlayFab (Microsoft). However, this comes with a significant cost, both in the rental of cloud computation and the cost of maintaining a self-managed system. This approach has the benefit of being able to rapidly spin-up additional servers should capacity be required.

However, these systems are primarily funded by the users themselves. Specifically, as players purchase or subscribe to a game, their contributions directly finance the necessary server capacity (Davidovici-Nora, 2013). This financial model aligns the scalability of the system closely with user growth. moreover, as our objective was to provide this service free of charge, we faced challenges in achieving the same financial sustainability. Following a detailed cost analysis, it became clear that hosting on a commercial cloud server was not a financially viable option for our project.

Another issue that was present was ensuring accessibility of the software. We developed this platform for Windows and targeted lower-end graphics cards. However, we could not guarantee the potential player base had access to the required hardware. Developing the application for more platforms such as consoles (PlayStation, Xbox and Switch) and mobile devices (iOS and Android) would only add to the increasing cost of development and maintenance.

In response, we explored alternative funding models and cost-effective hosting solutions that could support our vision without compromising service quality. This included considering partnerships and seeking sponsorships to offset operational costs, thereby ensuring the longevity and accessibility of our service. However, the release of the Fortnite Creator programme provided a suitable alternative.

5. Building Fortnite Maps in UEFN

5.1 What is UEFN?

Unreal Editor for Fortnite (UEFN), is the PC-only software used for creating custom experiences in the Fortnite ecosystem (Epic Games[1], 2024). UEFN provides a 3D viewport workstyle which will be familiar to developers who are used to working with Unreal Engine and the standard Unreal Editor.

UEFN allows developers to create Islands which Fortnite players can access through the Fortnite game client.

UEFN runs on Unreal Engine 5 (UE5), providing access to Unreal Engine's powerful rendering systems including Nanite and Lumen with preset islands delivering the Fortnite lighting aesthetic straight out the box. The toolset delivers a very familiar experience with most toolsets including Niagara (particle systems), the Material Editor, Sequencer (cinematic animations) and Control Rig (skeletal mesh animation), and the Landscape sculpting tools being available in UEFN.

The one key difference between UEFN and UE5 is the lack of script editing in Blueprints. Instead, opting to provide pre-set building blocks for games from "Fortnite Creative known as Devices" (Epic Games[1], 2024) which can be expanded with the Verse, a new programming language from Epic Games which has debuted in the UEFN ecosystem.

Fortnite is a Free-to-Play Game with no upfront cost to install the game or access User Generated Content (UGC) such as our virtual campus experience. Additionally, the wide array of possible hardware that Fortnite can be installed on reduces the need for purchasing of new systems to interact with the experience.

5.2 Rationale of using Fortnite to build a Virtual Campus

UEFN offers multiple key benefits compared to using UE5. Distribution of the project is important to its success, "UEFN is designed to create experiences for Fortnite. This means every experience you create is published to the Fortnite ecosystem, reaching a built-in audience of millions." (Epic Games[1], 2024), this means there is a high potential that applicants and students will at least have some level of familiarity with Fortnite's gameplay and menus, improving accessibility to the virtual campus experience.

5.2.1 Device Support

Fortnite itself is available for download on a wide array of devices, so instead of being restricted to a PC-only experience with UE5 (console release requires additional hardware and licensing), a UEFN developed experience can be released onto everything from PC to mobile devices (Epic Games[2], 2024), including both 8th generation consoles including Sony's PlayStation 4 , Microsoft's Xbox One, and the Nintendo Switch, and 9th generation games consoles including the PlayStation 5 and Xbox Series X/S devices.

Fortnite can be played on mobile devices natively using Android systems or via game streaming services (Epic Games[3], 2024) including Xbox Cloud Gaming, which offers access to Fortnite for iOS users on iPhone or iPad, and Nvidia Geforce Now which provides expanding the userbase for Fortnite to additional users include those with Chromebooks and a variety of TVs.

5.2.2 Decreasing Development Time

UEFN provides a significantly shorter pipeline of development due to having a large selection of features and functionality already in place, reducing the need to develop significant parts of the project.

This includes the core mechanics such as inputs, cameras, movement, interaction, and weapon-based combat to create third person games. The ease of access to a third person game template is ideal for the virtual campus experience although we made the decision to remove the default weapons from the experience.

These elements contribute to shorter development times for game developers, Bungie co-founder Alex Seropian setup Look North World to exclusively make games in Fortnite (Ferdinand, 2023), in discussion with YouTube channel GameDevAdvice *(2024)* stated "we've been going for six months, we've we just released our third game", highlighting a severely reduced development cycle time compared to normal games development which can take two to seven years to develop (Juegoadmin, 2023).

5.3 Overcoming the Technical Challenges by utilising UEFN

As well as mechanics already being setup and ready to use, certain technical challenges have been solved ahead of development, removing the need for lengthy, complex development processes to meet the requirements of the virtual campus experience including online gameplay, distribution, user management, and platform specific engine development.

5.3.1 Network Replication

UEFN removes the need for the development of network programming and dealing with replication of entities across networks due to built-in networking code which is running inside the Fortnite Framework. Fortnite

already supports up to 100 concurrent players on an Island (Epic Games[4] ,2024) with full replication of players, the world and actors within it.

5.3.2 Distribution

Islands created in UEFN are accessible from the main menu of the Fortnite game client by entering an island code in the search tool or by selecting featured islands from the graphical interface. Islands are downloaded via the game client and matchmaking is launched once complete.

5.3.3 User Management

Utilising the Islands system in Fortnite means all user management including login / join and logout / leave as well as having built in communication systems such as chat, parties, and friends etc.

5.3.4 Source Control

A bonus of UEFN is the inclusion of Unreal Revision Control allowing teams to work collaboratively on projects and reduces risk of lost work. Unreal Revision Control includes an Auto Checkout feature which, when enabled, locks assets the moment they are modified to prevent concurrent changes and merge conflicts. (Epic Games[5], 2024)

5.4 Insights from Implementation

During development of the UEFN version of the project, we identified the following approaches to assist with creating the virtual campus experience:

UEFN has a limitation on the size of the island, with a download size limit for users of just 400MB. With the need to focus on accurately representing the buildings and the location of the Stoke-on-Trent campus, we decided to weight our custom assets for the island to be meshes as opposed to textures or materials. To do this, we utilised existing textures and materials from Fortnite with tweaks and colour tints which also assisted the team in achieving the Fortnite art aesthetic. The memory usage of the project at time of writing is shown in Fig.2, currently using around a quarter of the available resources with most of the new assets in place.

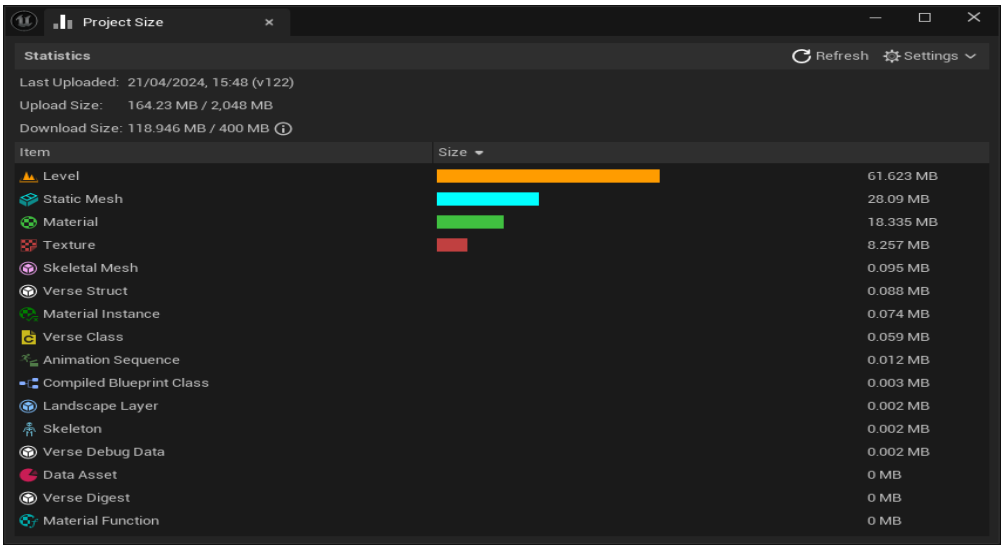

Figure 4: Screenshot of Project Size dialog of the StaffsVerse Island in UEFN

To maintain the technical consistency of Fortnite and allow us to use existing art assets and modular building pieces, all buildings were constructed using new assets, built to the same modular piece size as the existing Fortnite assets. All modular pieces were built around a base dimension of 512cm x 16cm x 384cm with some deviation allowed for unique assets or assets which required a particularly difficult form to achieve whilst maintaining those base dimensions. Trims were also created with sizes of 32, 64, 128, 256 etc. to facilitate further decoration of campus buildings.

Based on our experience, we highlight the following as key insights:

- Fortnite / UEFN provides an ecosystem which will speed up project development due to the built-in solutions for user management, networking and distribution.
- The third person gameplay mechanics of Fortnite are ideal for location exploration experiences.
- Utilise existing assets in UEFN to keep Island Size low using existing textures to maintain the Fortnite art style and matching dimensions to make better use of existing meshes.

6. StaffsVerse

Overview of the metaverse campus

Figure 5

Figure 6

Figure 7

Figure 8

7. Conclusion

In conclusion, the StaffsVerse project represents a significant step forward in the integration of virtual environments within higher education. By leveraging the capabilities of Unreal Editor for Fortnite (UEFN), this initiative not only offers a novel solution to the challenges of student onboarding and campus familiarization but also redefines the educational landscape by providing an immersive, accessible, and engaging digital experience. The successful implementation of the StaffsVerse campus underscores the potential of the metaverse to transform traditional educational models, bridging the gap between physical and virtual learning spaces. Furthermore, the project demonstrates how modern gaming platforms can be harnessed to create dynamic educational tools that are both cost-effective and widely accessible.

Abstract: Narrative-based serious games are accessible, engaging technologies that connect users' lived experiences to pedagogy. Despite having patient-centered goals, most narrative-based serious games are not designed alongside patients and communities, limiting their likelihood of acceptance, uptake, and impact. Literature reveals that many serious games intended for patients merely evaluate efficacy with end-users after game deployment and with a lack of consistent participatory design. This work aims to describe a patient-centered participatory approach to game development to teach self-advocacy skills to patients newly diagnosed with cancer. First, characters were developed based on panels that included patient advocates, cancer survivors, clinicians, and researchers. Second, storyline development created realistic story arcs, decision-points, and consequences based on qualitative interviews with patients, patient advocates, and cancer survivors. Third, game evaluation metrics (e.g., 1st vs. 3rd person perspective, game fail states that incentivize replaying the game, and provision of implicit or explicit feedback) were developed based on accessibility, usability, and patient preferences. Based on patients' insights, we implemented changes accordingly to maximize the game's efficacy and collected qualitative data on patients' assessment of the game's accessibility, relevance, and impact. During initial game development, patient and advocate feedback built relatable characters with a particular focus on providing sensitive information (e.g., palliative care) and inclusive storylines (e.g., diverse family situations). Following a prototype, patients and advocates suggested refinements to characters and additional storylines, including common and/or distressing experiences related to pain management, family dynamics, financial struggles, and disrespect from healthcare providers. Participants in a randomized trial of the game (N=34) found the scenarios relevant and realistic. Patients reported increased comfort speaking up, seeking support, and interacting with their families and healthcare team after playing the game. Our process demonstrates the essential role patients can inhabit in the development of narrative serious games, particularly in how patient input permeated every aspect of Strong Together's development, from initial design to evaluation. Such integration allows for adjustments to address patient concerns and refine patient-relevant metrics.

Keywords: Serious Games, Self-Advocacy, Healthcare, Cancer, Participatory Design

1. Introduction

Storytelling is a, if not the, primary universal method available to humans looking to explore the affective side of their lives. Especially in cases of hardship, we understand our experiences through stories (Bruner, 1991), may they be our own stories or the stories of others through which our own experiences resonate. Through these lenses, we come to understand ourselves and the world around us: self-image, motivation, ideology, the sciences, et cetera. Why do research papers include introduction sections? They frame the narrative of the paper for an audience to consume it more easily: the utility of storytelling.

Narrative-based serious games take advantage of that utility towards several educational and transformational goals. In a literature review of narrative in serious games, Naul and Liu (2019) highlight narrative as essential in offering highly motivating fantasy that is intertwined with pedagogical content, and they further explore the benefits of empathetic game characters in further immersing the player in the learning environment and altering their considerations when making in-game decisions, especially when players see aspects of their own experience in the characters. The narrative sets base context for the procedural rhetoric of a game, providing an affective layer to what the systems of player choice and game response are communicating (Bogost, 2007).

Narrative-based games are an attractive intervention for patient populations living with chronic conditions. These individuals often have high disease burden, including symptoms and side-effects related to their disease and treatment. This simultaneously makes educational interventions necessary to teach them ways to manage

their illness, but also difficult because they have limitations to their time and energy. Currently, there are over 32 million cancer survivors worldwide, making it one of the most common chronic conditions and one that contributes heavily to disability and healthcare costs (Chan & Nekhlyudov, 2023). For example, some of the most frequent unmet needs of individuals living with cancer include managing their fatigue, pain, and neuropathies. Yet, healthcare providers infrequently discuss these concerns, and engagement in traditional interventions is time-consuming (Schmidt et al., 2022; Lewandowska et al., 2020; Maqbali et al., 2021). Narrative games such as visual novels may address these concerns in an approachable, impactful medium and allow individuals from a variety of backgrounds in game and technological literacy to get the information they need in an engaging, efficacious manner.

While serious games are created with end-users in mind, they rarely include end-users during development, instead involving them during testing after game deployment (Khaled & Vasalou, 2014). We argue that the inclusion of consistent participatory design in the iteration cycle of the game design enhances the quality of the game and provides a pointed approach that directly impacts the users they are created for. Khaled and Vasalou (2014) argue that fluency in both domain content and game design is imperative for the attainability of serious games. This work aims to introduce and exemplify a patient-centered participatory approach to serious game development to teach self-advocacy skills to women newly diagnosed with gynecologic or metastatic breast cancer.

We propose the following major contributions:

- We introduce, exemplify, and advocate for a patient-centered participatory approach to serious game development.
- The design and evaluation of Strong Together, an efficacious serious game intervention aimed at promoting self-advocacy skills among patients newly diagnosed with cancer.

2. Related Works

Participatory design is a user-centered approach that involves end-users in the design and development process of software applications (Chen et al., 2020). In healthcare, participatory design has gained significant attention due to its potential to improve the usability, effectiveness, and acceptance of software tools among healthcare professionals and patients (Donetto et al., 2015). The complexity of healthcare environments, coupled with the diverse needs of stakeholders such as clinicians, patients, and administrators, underscores the importance of incorporating participatory design principles to promote collaboration, empathy, and co-creation, leading to solutions that better align with users' real-world needs and workflows.

For decades, system and software designers have employed participatory design methodologies within healthcare applications. Examples of participatory design include involving clinicians in the design of electronic medical record (EMR) applications (De Croon, Klerkx and Duval, 2014), telemedicine applications (Clemensen et al., 2017), clinical information system design (Pollack et al., 2016), medical artificial intelligence (AI) (Rodrigues et al., 2022), and surgical tools and procedures (Jamjoom and others, 2022). Recently, healthcare-related patient-centric systems, applications, and educational platforms began to employ participatory design frameworks such as the "Think-Aloud Protocol" (Fanfarelli, 2021) and co-design workshops (Alvarez et al., 2019) to allow users to verbalize their thought processes while interacting with prototypes, thus providing insights into potential usability issues and s fostering a sense of ownership and engagement.

A large body of research indicates numerous benefits of employing participatory design in healthcare software development. These include increased user satisfaction (Harper & Mustafee, 2023), reduced errors and inefficiencies (Tian et al., 2021), improved patient outcomes (Dykes et al., 2014), enhanced adoption rates (Rushton & Corrigan, 2021), and better alignment with clinical workflows. Additionally, participatory design fosters an equitable, collaborative culture that values end-user perspectives and promotes continuous improvement.

When it comes to game development, participatory design is usually limited to playtesting (Pietriková & Sobota, 2022), the part of game development lifecycle where representatives of the target audience (i.e., potential users) play various prototypes of the game to help identify technical issues, potential problems with game mechanics, or disconnects in storylines. It is exceedingly rare to find examples of games (either digital or analog) where future users participated directly in the creation process.

Serious games (SG), unlike their entertainment counterparts, often require a design approach that is more focused on co-design. SGs, defined as games designed for purposes other than mere entertainment, have gained traction in healthcare for their potential to engage users, promote behavior change, and enhance learning outcomes. SGs have diverse applications in healthcare, ranging from patient education (Damaševičius, Maskeliūnas & Blažauskas, 2023; Arif et al., 2024) and rehabilitation (Mitsopoulos et al., 2023) to medical training (Lin et al., 2023) and therapeutic interventions (Ahmed et al., 2023). For instance, virtual reality (VR) games are used in physical therapy for motor skill rehabilitation, while interactive simulations are employed for surgical training and procedural skill acquisition. Gamified mobile apps are also utilized for health promotion, disease management, and medication adherence among patients.

A growing body of research demonstrates the effectiveness of SGs in achieving various healthcare objectives. These games have been shown to improve patient engagement and motivation (You et al., 2023), enhance learning retention and skill acquisition (Chittaro, 2023), facilitate behavior change (e.g., smoking cessation (Aigner et al., 2023), weight management (Pervanidou et al., 2023)), and contribute to better clinical outcomes (e.g., reduced pain (Suleiman-Martos et al., 2022), improved adherence to treatment regimens (Maurin et al., 2020)).

The design and development of SGs in healthcare require careful consideration of user needs, objectives, and evidence-based strategies. Gamification elements such as rewards, challenges, feedback mechanisms, social interactions, and empathy play a crucial role in maintaining user engagement and fostering learning and behavior change but must be designed within the cultural assumptions and values held by those individuals. That is why participatory design approaches, such as co-design workshops, iterative prototyping, and usability testing, are integral to creating effective serious games.

3. Designing Strong Together

A panel of patient advocates (n = 2), clinicians (n =2), and nurse researchers (n = 2) worked alongside SimCoach Games' team of designers (n = 3), artists (n =1), and writers (n = 2) to create the characters within the Strong Together game in iterative steps. Each of the three characters was designed with sufficient backstory and depth to demonstrate familiar yet accentuated aspects of women with cancer. For example, one character is an over-committed retiree with strong social support, a second is a younger single mother with minimal family support, and the third is a middle-aged woman balancing a busy career and family obligations. We developed characters to highlight various common experiences that can make self-advocacy difficult in the context of cancer. We knew that users may not identify with each character, but their experiences were common enough that users could grasp the learning objectives.

After the characters were developed, the same panel of patient advocates, clinicians, nurse researchers, and gaming professionals met to map the learning objectives of Strong Together (e.g., specific self-advocacy skills) onto the characters' storylines. We gave each character central self-advocacy struggles that are the focus of their interactions and decision points. But we also interwove all learning outcomes into each storyline so that all learning objectives were present with varying degrees of depth. The panel's goals were to make realistic challenges, decision points, and consequences that reflected real-world patient experiences. We carefully reviewed the language, tone, and wording to reflect what women with cancer likely experience. A primary concern was that the negative consequences associated with selected poor decisions did not overwhelm or upset users while still providing upfront preparation for challenges they would likely experience in the future. We were careful not to include sensitive or overwhelming information (e.g., prognostic information) and touched on the availability of palliative and supportive care services lightly with extensive input and consensus-building from the panel.

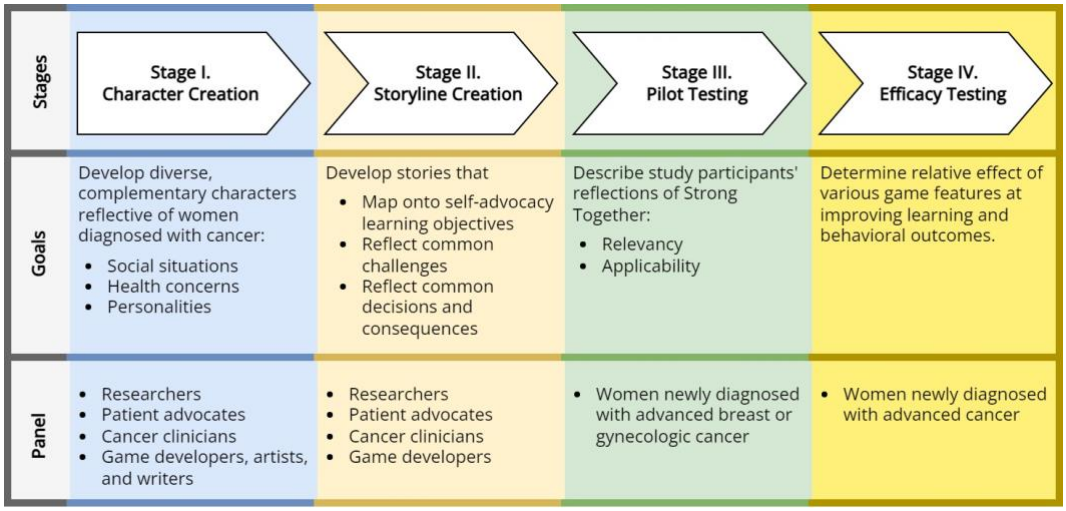

Figure 1: A summary of the participatory design process taken by our team during the development of Strong Together, in four stages.

3.1 Describing Strong Together

Strong Together is a single-player 2D visual novel developed in Unity for deployment on mobile devices. It is designed to encourage self-advocacy skills and explore realistic challenges and decisions taken on by its desired audience of players: patients newly diagnosed with cancer. In the game, players experience five stories starring three characters, and each meant to explore different archetypes of patients (shown in the top-left corner of Figure 2), featuring narrative-changing decisions in healthcare, domestic, and workplace settings, encountering hardships related and unrelated to care.

3.2 Identifying Key Features

Following the initial development of Strong Together, our team was invested in clearly articulating core design approaches and assumptions that went into its development by synthesizing insights from the patient advocates and the team of SimCoach Games designers, developers, and artists. Our team found it necessary to analyze the process of design components of the game as they are different from narratives and characters that were directly inspired by the patient advocates. In discussion with SimCoach Games' employees, we hoped to discover the assumptions that went into Strong Together's design but went unsaid. We asked questions about components of the game that, if removed, would "break" it. Three key features stood out as worthy of future evaluation: first-person perspective, implicit audio-visual feedback, and soft fail states. In these three features, we see a set of assumptions worth challenging and hypotheses worth testing, which may help us more precisely evaluate Strong Together in future work.

Though plot and decision points that reflect patient experiences were obvious inclusions from patient advocate perspectives, a more subtle detail of Strong Together's narrative is its perspective. Across the five stories, players make decisions while inhabiting one of three pre-written characters, each having their own specific backgrounds and personalities. The alternative, that players instead play from a first-person perspective, i.e., they are playing as a version of themselves that is experiencing the game's set of narrative experiences, was potentially desirable to patient advocates but not the preference of our designers, who preferred the narrative specificity of Strong Together's third-person perspective.

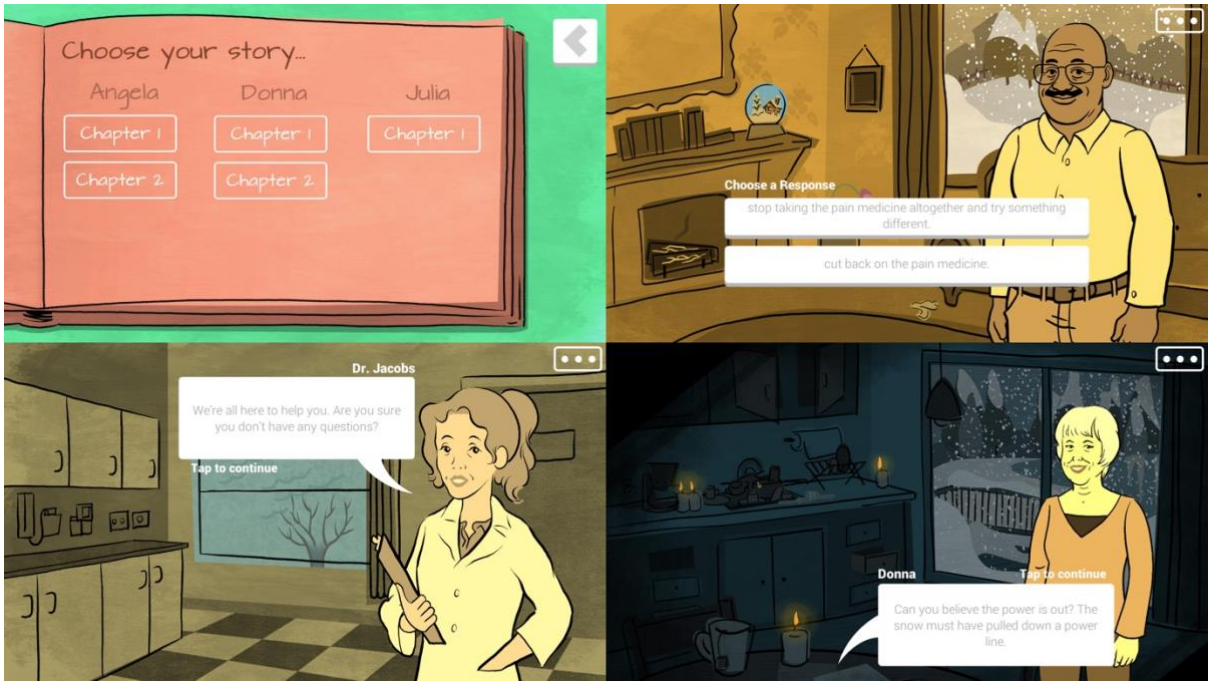

Figure 2: Four screenshots from Strong Together. Top-left shows the chapter-select screen where players choose which story to play. Top-right shows a decision point where the narrative will branch according to the player's choice. Bottom-left shows a game state where the player has made choices that have negatively impacted the player-character's well-being, which is implicitly conveyed to the player through a lack of foliage out the window and a reduction in color saturation. Bottom-right shows a scene of the player-character experiencing hardship that is not directly related to their illness, in this case, a power outage.

The implicit feedback system might be the most subtle among the three features. In addition to dialogue that conveys plot points relevant to the player-character's physical and mental well-being, behind-the-scenes the game quantitatively tracks this status as a numerical quality-of-life score, ranging from 0 to 100. Colors, foliage, and weather reflect the character's well-being, with low quality of life indicated by color desaturation, foliage loss, and worsening weather (e.g., increasing cloud coverage or rain). Improvements in the quality of life are subtly communicated through opposite aesthetic changes. However, there is much concern that users may not notice or appreciate this feedback in its subtlety. An alternative feedback scheme, such as displaying the player-character's quality of life through an on-screen health bar, may be perceived differently.

Similarly inspired by concerns about users being unable to notice or appreciate game mechanisms, we shifted our focus to the game's soft fail states, which may have disincentivized replaying sections of the game. To ensure comfort for cancer patients experiencing the player-character's stories, our team crafted narratives that contained only soft forms of failure, which have both emotional and mechanical implementation. In terms of the former, even the worst health outcomes were described as relatively mild, and choices are often recoverable, allowing any poor decision to be countered later by a better decision. A potential problem with both implementations is they likely discourage replaying the game, which may be less beneficial for learning self-advocacy skills. An alternative feature of Strong Together could utilize less recoverable fail states with more intense health outcomes, explicitly encouraging users to learn from mistakes and recover through replaying.

4. Methods

Women diagnosed with advanced gynecologic or metastatic breast cancer in the past three months were recruited from an academic cancer center in Pittsburgh, Pennsylvania. Participants were part of a larger randomized clinical trial (NCT03339765) evaluating the initial efficacy of the *Strong Together* serious game. Participants were randomized to receive the intervention and completed one-on-one semi-structured qualitative interviews with a research assistant at the end of the three-month intervention period. Three trained research assistants were not members of the game development team and were otherwise unbiased towards the evaluation of the intervention. These research assistants conducted interviews over the phone or in-person

depending on patient preference. We audio-recorded all interviews and transcribed verbatim by TranscribeMe.com with no identifiable information included.

We extracted participants' responses to selected interview questions that aligned with the purpose of this manuscript for the analysis including participants' reflections on how Strong Together reflected their experiences and taught them self-advocacy skills. The analysis consisted of simple descriptive content analysis by two coders utilizing Microsoft Excel. Two coders independently reviewed and coded the transcripts and subsequently met to discuss the discrepancies and achieve consensus. Initially, coders developed a preliminary codebook, which they utilized to code 20% of the transcripts to calculate the inter-coder reliability and refine the codebook. The coders repeated this process to achieve satisfactory inter-coder reliability (O'Connor and Joffe, 2020), which was .72 in this study. The resulting codebook was then applied to complete the analysis.

5. Results

A total of 34 participants who completed the interviews were included in the analysis. Participants' demographics are listed in Table 1. The average age of the participants was 59.4 years (SD = 13.0), with the majority self-identifying as White (85.3%). Two themes were identified: (1) Realistic and Engaging Storylines and (2) Learning Outcomes from Strong Together.

Table 1: Participant Demographics (N=34)

	Mean (SD)	N (%)
Age	59.4 (13.0)	
Years of formal education	14.0 (3.1)	
Current relationship status		
Married or living with a partner		23 (67.6)
Never married		5 (14.7)
Separated, divorced, or widowed		6 (17.7)
Racial identity		
White		29 (85.3)
Black		4 (11.8)
Asian		1 (2.9)
Latina ethnicity		1 (2.9)
Current employment status		
Employed		9 (26.4)
Unemployed		1 (2.9)
Other		3 (8.8)
Unknown		21 (61.9)
Difficulty paying for basic needs ("somewhat" or "extremely")		14 (41.1)
Current income does not meet basic needs		6 (17.6)

5.1 Realistic and Engaging Storylines

Most participants (n = 26) found various storylines and challenges in the serious game to be realistic and reflect their everyday experiences facing cancer. These challenges include finances, symptom management, nutrition, family matters, and others. Participants who didn't fully relate to the storylines indicated they already had a strong support system or had not experienced the portrayed challenges (n = 6). Additionally, 7 participants noted that they found the storylines reasonable and applicable to other individuals with cancer at different stages of life and cancer journey. Participants predominately (n = 21) reported enjoying the game. However, a few participants (n = 3) expressed that while they enjoyed the serious game, they did not always agree with the proposed best solutions.

> *They were realistic, when I went through them, the one with the single mother, I could relate to that because that's me, but they hit all the different scenarios of people in their life, whether they are younger or older or married or not, or have children.* – Patient 24

> *Angela's [game character] dealing with the fatigue and trying to take care of her daughters and her house and everything, you can relate to that real easy…. You could say, "Yeah. Okay. I really was tired." I understand why she would call off a day of work and finally ask Kat to help her.* – Patient 23

5.2 Learning Outcomes from Strong Together

Through their experiences with Strong Together's storylines, many participants (n=27) noted positive changes in their attitudes towards self-advocating. These behavioral and emotional changes made many participants feel more comfortable asking for help and speaking up about their discomfort or other issues they experienced. For these participants, they contextualized their improved attitudes and behaviors in relation to their healthcare team and social network.

> *I guess, don't be afraid to ask questions was the main thing. Because I always feel like we could be annoying to the doctors, nurses. You're always afraid you're imposing. And it did show you that that's what they're there for.* – Patient 10

Some participants (n=7) noted how the various storylines reassured them by reinforcing that they were already correctly advocating for themselves by speaking up and seeking more information about their condition.

> *I feel like I was already an informed decision maker; it just reinforced how I was already feeling.* – Patient 11

The 7 participants who experienced little to no significant changes in self-advocacy after engaging in the serious game cited that the lessons conveyed through the storylines were ones they already knew or followed. Some (n=4) also mentioned that they had a pre-existing support system in place already, whether it be a partner, family member, or friend. However, despite these 7 participants having minimal changes, they did not mention having any strong dislikes regarding Strong Together. Indeed, 4 participants with no significant changes either stated that the storylines were realistic and relevant to their own experiences or acknowledged that Strong Together could be applied to other cancer patients.

6. Discussion

Strong Together exemplifies a participatory design approach that is uncommon in the world of serious games, particularly those in healthcare (Khaled & Vasalou, 2014). This patient-centered approach began during initial game development stages and was then assessed systematically through qualitative interviews during a clinical trial. Over the course of the 34 interviews conducted, we distilled several lessons regarding patient-focused serious game design. Foremost among these was engaging with participants regarding their experiences inside and outside the game. Their statements showed that most participants found the storylines and scenarios realistic and relevant to their own lives, a detail of upmost importance given the prominent role of realistic life scenarios in the efficacy of narrative game-based interventions (Zhou et al., 2019).

Through sensitive discussions around these experiences, we found how these scenarios helped participants stay engaged with the characters and game. Due to the painstaking nature of serious game development and qualitative testing, however, this type of feedback loop early in development is rare and requires commitment from all stakeholders, as demonstrated in similar patient-centered design processes in non-game applications (Wolpin & Stewart, 2011; Ector et al., 2020). Conducting interviews and extracting key lessons from the feedback leads to the further development and enhancement of specific game and story features, which in turn leads to more testing. Participants must also commit to engaging with the story and playing through the various scenarios to understand the goals of Strong Together. Through this patient-focused approach to design, we can begin to create more effective serious games that align with the needs and preferences of their players, adding to a growing literature that suggests a strong utility of patient-centric design in supporting greater uptake and efficacy in healthcare-related interventions (Wolpin & Stewart, 2011; Ector et al., 2020; Verwij et al., 2023).

In this work, we described the process by which we analyzed the design procedures of Strong Together to reach three core features of the game that may contribute to its efficacy: a third-person perspective, implicit aesthetic feedback, and soft fail states. We are presently continuing this work with a proper evaluation of those three

features (Healy et al., 2022), for future publication. We have implemented three alternative versions of Strong Together that subvert those features: a first-person perspective, explicit feedback, and hard fail states. This work is essential in reaching greater specificity in which features of Strong Together contribute to its efficacy, potentially verifying our design and analysis procedures.

7. Conclusion

In Strong Together's design and evaluation, we present two core contributions: methodological and practical in the design of serious games. First, we described our application of participatory design throughout multiple game development stages, representing the consistent involvement of end-users and stakeholders during key decision points during the game's conceptualization and deployment. Second, we highlight features of the Strong Together game that contribute to end-users' uptake of the learning objectives. Based on the feedback from participants, we encourage other serious game developers to follow similar participatory design steps to ensure the relevancy and applicability of games to the perspectives of the end-user.

Game-based Learning for History: Student Perceptions and Preferences

Andreas Hellerstedt and Peter Mozelius
Mid Sweden University, Sundsvall, Sweden

andreas.hellerstedt@miun.se
peter.mozelius@miun.se

Abstract: With the rapid development of games in the 21st century, the panoply of games on history shows a wide variety. Backstories from most historical eras have been implemented in different game genres and modalities. Furthermore, a growing number of studies have pointed to the didactic potential of historical games as learning tools. This study aims at investigating university students' perceptions of gaming and their game preferences, with a particular focus on history. The research question to answer was: "What types of games do history students play, and how can games, in their view, contribute to learning in their subject?" Educational action research was used as the overall strategy in a study where data was collected from five different university course groups in general history at the basic level. Students answered questionnaires with open ended questions about gaming preferences and their perceptions of games. The answers were then analysed in an inductive thematic analysis. Findings show that the students play a mix of analogue board games, digital games and hybrid forms. In the transmedial array of games available, important genres include role playing games, strategy games, quizzes and first-person action games. The students frequently provide arguments for the use of games in history education, and they give reasons why they find a particular game useful for this purpose. They describe how these games have a potential to add value to history education. To some extent, they also discuss how this can be implemented. In conclusion, the authors argue that so-called technology tree games are particularly relevant to learning history from a structural perspective, while RPG:s can strengthen interpretive approaches through a subjective historical experience.

Keywords: Game-based Learning, History, Strategy Games, Technology Tree, Role-playing Games

1. Introduction

While different types of gaming have been around for thousands of years, digital games are a major part of modern culture to the point that games are now surpassing traditional entertainment media such as television and cinema. The majority of the population are in fact gamers, and games have become a frequently used learning tool in many subjects (Juul, 2009; Hellerstedt & Mozelius, 2020). Within the field of history education alone, a wide range of historical eras have been used as the setting for many different game genres and modalities. The idea of using games in history education has been discussed in academic research since at least the 1990ies and early 2000s (McCarty, 2001; Squire, 2003). Game-based learning for history education can be designed around tailored serious games, or with commercial-off-the-shelf (COTS) games. Examples of COTS games which have been used in history education are the series Age of Empires (Weir and Baranowski, 2011), Europa Universalis (Koabel, 2017) and Assassin's Creed (Looije, 2018).

In an earlier study, history teachers' gaming preferences were explored and also which games that could be integrated into curricula and lesson plans (Mozelius et al., 2017). This study aims at investigating university students' perceptions of gaming and their game preferences, with a particular focus on history. The research question to answer was: "What types of games do history students play, and how can games, in their view, contribute to learning in their subject?"

This article will present an action research study of the gaming preferences of history students at a Swedish university as expressed in questionnaire responses. After a short background and presentation of methodology, an analysis will follow, highlighting the game genres mentioned by the students and their reasoning around the educational benefits and uses of games, as well as potential challenges. In the final section, we will provide our conclusions from the study and some prospects for future work.

2. Games for History Education

The game most frequently discussed in research on games for history education is the Civilization series, originally developed by Sid Meier (with Bruce Shelley) in 1991 (Squire 2003; Fogu, 2009; Guys, 2012; Ford 2016). The basic concept and many central game mechanics from Civilization have been copied many times, while the Civilization series is still currently popular. The game can be said to have spawned a genre of its own, called "4X" (eXplore, eXpand, eXploit, eXterminate), describing the games' overall focus. One often discussed and copied element of the game design of this genre is the technology tree. A technology tree is a form of flow chart,

illustrating a civilization's progress in terms of technological, scientific, economic or cultural innovations. As we have shown in a previous literature study (Hellerstedt & Mozelius, 2023), researchers have pointed to the potential of strategy games in general and the 4X genre in particular in explaining causal mechanisms and structures in historical societies and their development. The interplay between factors such as economy, trade, science, diplomacy and conflict have been regarded as valuable features for history education, as has the technology tree concept. (Fogu, 2009; Guys, 2012; Wainwright, 2014; McCall, 2016; Hellerstedt & Mozelius, 2023). Learning and playing this type of game can, however, require many hours and has been recommended as an extra-curricular activity (Wainwright, 2014; McCall, 2016; Mozelius et al., 2017), while "the classroom instead serves as a venue for presentation, discussion, and analysis" of games (Wainwright, 2014, p. 581).

Previous research also describes the successful integration of game-based learning in history courses where game playing was combined with themed and detailed instruction (Squire, 2003; McCall, 2016). Wainwright (2014) describes how this can be done in a history class at university level. In this model, various aspects of history and how it is represented in the game mechanics were discussed critically and compared to the theories of prominent historians and social scientists.

From a critical perspective, many strategy games with historical themes have been considered to reinforce a Eurocentric narrative of world history while also suffering from gender bias. 4X games in particular often have an emphasis on war, competitive scientific development, international trade and aggressive expansionism. They sometimes also leave out highly controversial historical facts and developments (Fogu, 2009; Ford, 2016, Slocombe, 2019).

The aim of this study is to investigate university students' perceptions of gaming and their game preferences in general, with a special focus on games that involve history. As part of the HistoTree project, the study will also inform the implementation of games in future history courses at Miun in Sundsvall/Östersund, a largely distance based university in Northern Sweden. The research question that guided the study was: "What types of games do history students play, and how can games, in their view, contribute to learning in their subject?"

3. Method

This study was carried out with an action research approach. Action research has been presented as a practical but systematic approach "that enables teachers to investigate their own teaching and their student's learning" (Nolen & Putten, 2007, p. 401). Action research can be divided into various types, where this study was conducted in the British tradition of action research that has been described by Norton (2009, p. 71), as being something "that links research to improvement of practice and is education orientated". The research question to answer was: "What types of games do history students play, and how can games, in their view, contribute to learning in their subject?" The authors' overall objective is that the research results should have a positive impact on the future design of the involved courses.

One of the authors has also been a teacher in some of the course groups that data were collected from, while collaborating with other teachers at the department to include additional groups. Data were collected by questionnaires distributed in five different university course groups during the 2024 spring semester. Three courses can be classified as introductory, while the two other courses require prerequisites. With respect for personal integrity, respondents have been kept as anonymous as possible during the research process. We obtained 35 responses in total. The number of active students was 48, giving a response rate no less than 72,9%.

The questionnaires included six questions: 1. Do you play games of any kind regularly? 2. Which type of game do you play? 3. Do you believe that games can teach us anything about history? 4. If so, which games can, in your opinion, do so? 5. Do you play any games with a historical basis, in content, theme or aim? 6. Is there anything in the game/games that you believe can be particularly valuable for learning, and if so, what? The questionnaires were distributed through the course platforms and the students had several weeks (during the course of the spring term) to answer them.

3.1 Data Analysis

Data were analysed in an inductive thematic analysis according to the seven-stage approach recommended by Norton (2009). In a first stage of immersion, data were read and reread with the idea of getting familiar with topics and themes in the questionnaire answers. During this iterative reading, analytic ideas and suggestions for themes were written down as memos. In the following stage of a more detailed close reading the suggested themes and topics were revised to create preliminary categories. A third stage comprised deleting some of the

preliminary categories "to get rid of any categories that have only one or two examples in them, or any that overlap considerably with other categories" (Norton, 2009, p. 119).

This was followed-up by a fourth stage where remaining, relatively small and overlapping categories were merged to more substantial categories. This work continued in the fifth stage with a general rereading of the answers to check and revise themes and how they had been grouped into categories. Stage six looked at interrelations between the categories remaining from the previous, where authors also discussed potential super- and sub-categories for a taxonomy structure. Finally in the last stage, the remaining categories that contribute to answering the research question were presented, including quotes from respondents' answers, in an effort to achieve what (Norton, 2009, p. 120) calls an "analytical narrative".

4. Results and Discussion

The analysis shows that two broad game genres are particularly relevant to the teaching and learning of history in the eyes of the students: strategy games and role-playing games. The students specified several different learning affordances: games can motivate and facilitate the learning of basic facts, such as geography, dates, events and biographies of famous personalities. On a more advanced level, games are well suited for teaching structural explanation. However, they can also, according to the students, provide historical empathy and a subjective experience of the past. Table 1 summarizes the number of mentions of particular game titles, sorted by broad genres or types. Often, the same respondent has mentioned several titles.

Table 1: Games and game genres mentioned by respondents as *recommended* for history education

Genre/*Title*	Number
Strategy	**25**
Age of Empires	4
Civilization	5
Europa Universalis/Svea Rike	6
Crusader Kings	3
Victoria	1
Hearts of Iron	2
Total War	1
Civil War (Grand Tactician)	1
Last Train Home	1
Romance of the Three Kingdoms	1
RPG	**10**
Assassin's Creed	5
Pentiment	1
A Plague Tale	1
Kingdom Come	1
Disco Elysium	1
Ghost of Tsushima	1
Board games	**4**
Pen & paper RPG	**3**
Quiz	**3**
Trivial Pursuit	2

Genre/*Title*	Number
Smart 10	1
FPS	**2**
Battlefield	2
Chess	**2**
Educational games	**2**

4.1 Game Genres

The majority of respondents say they play on a regular basis, and they discuss a great number of games in their answers. Seven say they do not play regularly, although two of those still mention favourite games, indicating that they are at least occasional gamers or used to be in the past. Among games *played*, six mention first-person shooters (FPS), such as Counter-Strike (CS), and six mention strategy games among the games they actually play. However, no one mentions CS in the column for games that can *teach history*. Overall, a plethora of genres and a few specific games are mentioned in the games played category. 23 out of 35 mention computer/console games, either a specific title or, more often, generically.

The major genres mentioned as games that may teach history (*games recommended*) are computer strategy games (25), computer RPG:s (10) and board (4) and quiz games (3). Historical FPS:s (2) are also mentioned. In the *recommended* category answers are more specific than in the games played category. Strategy games mentioned include Civilization (5), Europa Universalis (5), Crusader Kings (4) and Age of Empires (4). 1990-ies Swedish language game Svea Rike, the pre-cursor of Europa Universalis and Crusader Kings, is mentioned once. Among computer RPG:s the Assassin's Creed series (5) is the most common, but a number of lesser-known titles are mentioned as well, such as medieval adventures A Plague Tale and Pentiment. Four mention board games (only one mentions specific titles, omitted here). Also mentioned are Chess (2), Trivial Pursuit (2) and quiz game Smart10 (1). Chess is mentioned by one respondent for training generic competencies like memory rather than any particular historical skills or knowledge. Three mention pen-and-paper role-playing games. Two respondents specifically mention computer games with a non-European setting as games recommended. It should be noted that the category "educational games" (2) refers to purpose designed games for education, as opposed to the other categories, which all refer to various types of commercial (off the shelves) games. The responses do not specify any particular educational games, hence the somewhat generic category.

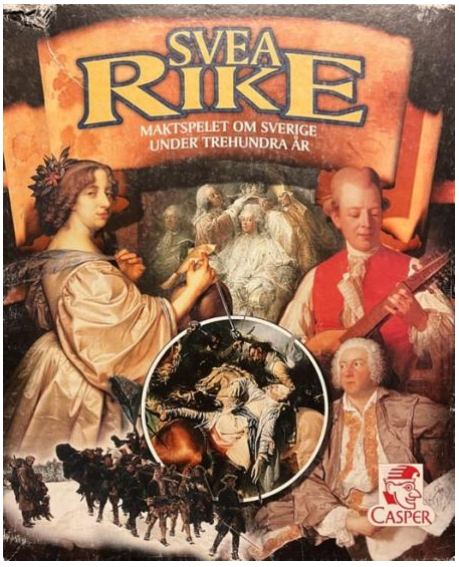

Figure 1: Original board game version of Svea Rike (1996). This game was subsequently developed into a digital game series. The computer game Svea Rike III was then retitled as Europa Universalis, itself the first in a successful series of games. Photo courtesy of Oskar Sjöström.

4.2 Learning Affordances

33 out of 35 respondents say that they believe games can teach history. The question therefore is rather what and how students may learn from games. Fortunately, many of the respondents were quite enthusiastic about this portion of the questionnaire and provided extensive discussions of this topic.

That games can draw students into history as an academic subject is perhaps the most obvious benefit of games for learning history. The fact that games with a historical setting can inspire and motivate was mentioned explicitly by six respondents, one even calling them a “gateway drug” to historical study. Another obvious positive outcome of gaming, although perhaps less often discussed, is the fact that games can teach basic facts (9). Historical geography is a particularly interesting aspect, which was stressed already in Kurt Squire’s seminal study on Civilization (Squire, 2003). Many of the games discussed above are set in the Middle Ages or the early modern period. The map of the world looked very different in those periods, and territories changed hands following conflicts and complex dynastic entanglements, some of which had massive consequences reaching down to the present day. Games such as Europa Universalis can provide students with an introduction to these aspects, and board and computer games alike have unique features which facilitate learning them. The medium is, at its best, well suited to visualizing geo-political relations and trade, but also timelines and various layers of dynamic historical development. It is important to point out that the respondents in this study often play both board games and computer games, not exclusively one or the other. Furthermore, the most common strategy games, the Civilization series and Europa Universalis and Crusader Kings, were either wholly or partly developed from board games. The basic mechanics are often similar, and while computer games can be said to benefit from impressive graphics, computing power, music and other advanced technical features, board games tend to be conducive to social interaction and a sense of community.

As already mentioned, nine respondents stress basic factual knowledge, which can be gathered from games in a variety of ways. This includes things such as famous or less famous events, biographies of historical figures, dynastic history and historical geography. Respondents often connect this type of learning to quiz games. Others point to games which include a “database” of factual historical information (in the AC series, like the “Civilopedia” included in the Civilization series since the early 1990-ies). This mechanism, which integrates factual knowledge into the game for a more directly didactical purpose, has been analysed and discussed as 'Tangential Learning' (Portnow & Floyd, 2008; Rath, 2015; Mozelius, Fagerström & Söderquist, 2017). While many respondents thus regard games as a valuable source for basic factual knowledge, many also mention the risks of game developers taking liberties with these facts. At least four discuss the problem that games often adapt historical facts to facilitate game play and commercial success. Others explicitly reject this however, stating that this is fine so long as the non-historicity is made clear. Interestingly, a similar point has been made by researchers. The important thing is not necessarily historical correctness, but the ability of the games’ mechanics to illustrate historical causality, social structure and explanation. This is especially true for higher level education and the teaching of historical theories (e. g. Fogu, 2009, Wainwright, 2014, Hellerstedt & Mozelius, 2023).

This leads on to the next important learning potential, which regards insights into “integrated relations of cause and effect”, as one respondent terms it, or “processes and connections” as another calls it. This is mentioned explicitly by four respondents. It seems logical to connect this type of deeper learning to strategy games of the 4X type, many of which implement the technology tree-mechanic in one way or another. Games such as Civilization are based on the interplay between variables such as production, trade, taxes, intellectual innovation etc, which in combination will produce different outcomes. Games of a more diplomatic/conflict orientation, such as Europa Universalis, provide an overview of complex causal interactions in a slightly different area.

Yet another and quite different aspect, which is mentioned by nine respondents, is the value of a subjective experience of history. This is described as games providing an understanding of “how life was lived in the Middle Ages”, for example. It ties in with an actor’s perspective and immersion into the historical game world, including “the communication with real or fictious people”. The game Pentiment (released in 2022) is lauded by one respondent for its game-world inspired by medieval manuscripts, early prints and woodcut illustrations. The game is set in early 16th century Germany and involves an apprentice illuminator investigating a murder mystery. Respondents describe this aspect with terms such as insight or empathy (Sw. *inlevelse*, similar to Ger. *Einfühlung*) or immersion in the “atmosphere” of a period. This aspect is clearly connected to the RPG genre. In this way, the respondents describe games as a gateway not only to factual knowledge, theory or causal explanation, but to *experiencing* history as well. In this aspect, respondents describe how the potential of digital games can be utilized in a different and complementary area compared to strategy games. Through immersion, interactivity,

communication and interpretation, it can provide the feel for everyday objects, practices and ways of living. Such aspects are often lost in grand strategy games with a God's eye view perspective.

5. Conclusion

It is evident that the responses point to two major potentials in using games in learning history at the college/university level: 1. training the use of structural concepts and explanatory analysis and 2. providing an immersive, subjective experience. Basic factual knowledge should not be underestimated, but these are the two areas in which games seem to facilitate the teaching of history on an emotionally deeper or theoretically more advanced level. The two are connected to the two major game genres: strategy games and RPG:s. The two areas are distinct, if not entirely incompatible – a good strategy game can presumably provide an immersive atmosphere and a compelling narrative too, although this feature is more strongly related to RPG:s. The strategy games Europa Universalis/Crusader Kings, for instance, include a dynastic perspective, incorporating marriage alliances and the education of children as part of the strategic game. From an analytical perspective, the skills involved are different, with one corresponding to a structural view of society, and the other focused on individual actors and subjective experience. They therefore seem to train two different sets of skills: historical empathy and structural explanation. They seem to be the 'sense and sensibility' of the historical gaming world. But the two also correspond well to the two main strands in modern historical research: the first directed towards history as social science (social and economic history), the second resembling history as an interpretive humanities discipline (cultural and intellectual history, the history of religion, etc.).

Of course, factual errors or biased misrepresentations of historical figures, events or social conditions are a problem for all the aspects mentioned. The respondents to the questionnaire did not specifically mention problematic biases regarding gender or race and themes such as colonial, Eurocentric perspectives, although these are some aspects commonly discussed in studies of GBL and history (Ford 2016). The reason for this may partly be that respondents were not asked to discuss the strengths and weaknesses of one particular game. As has already been mentioned, they do also discuss games with a non-European setting (such as Ghost of Tsushima) and games that have been developed outside North America and Europe (such as the Japanese game series based on the medieval Chinese novel Romance of the Three Kingdoms). With such games becoming more popular in the West, perhaps a Eurocentric bias may be somewhat less of a problem than it has previously been.

6. Future Work

We plan to build on the results from this study and the results from the previous literature study by Hellerstedt and Mozelius (2023). In combination, these will provide a knowledge base regarding best practices and the specific preferences of Swedish students. During the 2024 autumn semester students on various courses in history will be assigned game playing with content aligned to the actual course syllabi. The students will evaluate the games and summarize their analyses in short essays. This will be the next step in the HISTOTREE project that is described in the section below.

Acknowledgements

The study was conducted as a part of the two-year HISTOTREE project, enabled by funding from HEaD (Higher Education and Development) at Mid Sweden University, a five-year initiative for the purposes of didactic development that is further described in Mozelius et al. (2022). The authors would like to thank the teachers at the history section, Humanities dept. at Miun, and especially our history students of the spring term 2024, for participating in the study. Thanks to Oskar Sjöström of the Swedish Defense College for photography.

Abstract: Despite some efforts to design games to raise primary school students' awareness of the waste problems, there is a lack of research studying the directly involved stakeholder's behavioural intention to use the games. Prior studies have explored the users' games acceptance of the games that have already been developed. However, we believe that understanding the user's acceptance from the beginning of the game design process is also crucial. This research investigates the factors that influence the behavioural intention to use prospective game-based learning (GBL) for waste awareness among primary school parents, teachers, and students. An online survey based on the UTAUT 2 was distributed to each stakeholder, supplemented by a video demonstrating an Augmented Reality-based mobile game interaction scenario. The sample of participants included 135 parents, 47 teachers, and 129 primary school students from Malang, Indonesia. The internal consistency of game acceptance from the surveys was evaluated through Kruskall Wallis. Results show that Effort Expectancy is the factor with the highest acceptance value while Facilitating Condition has the lowest value. The three stakeholders argued that the prospective GBL seems easy to play and learn, but in contradiction, the adults are concerned that they cannot assist in teaching how to use the game and cannot provide the necessary technology. The cultural background seems to influence user game acceptance. Indonesians are known to be quite open to new technologies like GBL, although the facilitation condition might be low. Furthermore, there are some significant differences between the student-parent and student-teacher groups, but not in the parent-teacher group. Findings indicated that Indonesian teachers are more ready to adopt GBL than students and their parents. By understanding the perceptions and attitudes of these groups, educators and researchers can develop strategies to address any concerns or doubts they may have and promote the benefits of GBL.

Keywords: UTAUT 2, Games Acceptance, Behavioural Intention, Waste Awareness.

1. Introduction

Game-Based Learning (GBL) has emerged as an innovative pedagogical approach that forces the engaging nature of games to enhance learning outcomes. Recent studies show that using GBL potentially improve student's learning outcome compared to traditional teaching learning method (Acquah and Katz, 2020; Byusa, Kampire and Mwesigye, 2022). Despite numerous studies indicating that GBL can increase learner's performance, understanding its acceptance among parents, teachers, and students as direct stakeholders, particularly in specific cultural contexts like Indonesia, remains underexplored. In Indonesia, where cultural values and school curricula somewhat different from those in other parts of the world, it becomes imperative to study the acceptance and readiness of stakeholders towards GBL. This is especially important because, based on our careful observations, studies on technological readiness and acceptance in the Indonesian context often yield uniformly positive results without offering comparative insights among different stakeholder groups. In addition, the geographical diversity of the Indonesian archipelago presents challenges, as some students have limited access to the technology and facilities necessary for effective learning.

While previous research has often examined the acceptance of GBL by students, teachers, and parents separately (Bourgonjon *et al.*, 2010, 2011, 2013), our study seeks to integrate these perspectives. By exploring the connection of these stakeholders' different perspective, we aim to provide a more comprehensive understanding of the factors that drive the acceptance of GBL in Indonesia. This research aims to investigate the factors that influence the behavioural intention to use game-based learning for improving waste awareness among these three stakeholder groups in Indonesia. Notably, we have only come across two studies in our journey to find research that compares the level of games acceptance among them. In Yong's and colleague's research from Malaysia about parents, students, and teachers views in the use of digital games in learning

mathematics (Yong, Gates and Harrison, 2016), shows that students were supportive and positive towards it but not with their teachers and parents. In their study, the students' focus their affective aspect towards learning, while the teachers and parents are concerned with the practicality and effectiveness of using Math computer games for learning, but they do not perceive learning as an activity that should be fun. Other study from China (Xie, Wang and Hooshyar, 2021) revealed that teachers' and parents' perceptions toward digital GBL were shown to be significantly correlated with each other. There is a possibility that parental pressure may contribute to the teacher's lack of empowerment in classroom, even though the students show highly optimistic perception with GBL (Xie, Wang and Hooshyar, 2021). These two studies show that students are more ready to learn using digital games compared to adults, echoing with three studies by Bourgonjon and colleagues that exploring students, parents, and teachers (Bourgonjon *et al.*, 2010, 2011, 2013) acceptance in GBL, although they did not continue their studies to correlate those three results.

This study was part of a larger project researching how games can enhance primary student's waste management awareness. This paper represents the initial phase of our primary research, focusing on understanding user's technology acceptance before moving on to game design process. Unlike most previous studies that explored stakeholder game acceptance after the development of games, our research aims to assess the readiness of parents, teachers, and students to adopt GBL from the beginning. By exploring the perspectives of these three key stakeholder groups, this research aims to provide a comprehensive understanding of the factors that may facilitate or hinder the adoption of game-based learning, in the case of Indonesia.

2. Previous Studies on GBL's Acceptance

2.1 Factors Influencing User Acceptance in Game-Based Learning

Compared to teachers and students, parents' acceptance of GBL is less studied, possibly due to underestimating the importance of their perspective in education (Hillier, Milne and Aurini, 2019). Some parents seeing GBL as an opportunity to make learning more interesting and interactive for their children (Rosyati *et al.*, 2020; Amzalag, 2021), while others may be more skeptical, concerning whether children truly acquire knowledge when playing video or have concerns about the potential negative effects of excessive game play (DeCamp, 2019; Xie, Wang and Hooshyar, 2021; Hidayat, 2022). The top three factors influencing parents' games acceptance namely learning opportunity, game experience, subjective norms, social influence, and cultural background (Nikken and Jansz, 2006; Bourgonjon *et al.*, 2011; Yong, Gates and Harrison, 2016; Lin, Li and Yang, 2018; Xie, Wang and Hooshyar, 2021). In our prior research, encompassing a sample size of 42 parents, the findings revealed that issues related to screen time management, facilitation conditions, and limited opportunities for social interaction significantly influenced their perspectives on GBL (Hidayat, 2022). When parents hold negative views or disapprove of a particular technology, it is highly probable that their children's acceptance of games will be impacted as well (DeCamp, 2019).

On the other hand, the successful implementation of GBL heavily relies on teachers' perceptions and attitudes, as they play a crucial role in executing learning games (Hanghøj and Brund, 2010; Chee, Mehrotra and Ong, 2015). Teachers serve as instructional designers when incorporating GBL into their classrooms (Pedler, Hudson and Yeigh, 2020). Their perceptions and openness of new teaching methods and technology could lead and impact to their instructional strategies (De Grove, Bourgonjon and Van Looy, 2012; Stieler-hunt and Jones, 2015; Rasmitadila *et al.*, 2020). They also need to be comfortable with the idea of giving up some control over the learning experience (Acquah and Katz, 2020; Luo, Brown and O'Steen, 2021) as GBL often involves a more student-led approach to education. Key factors influencing teachers' adoption of GBL include facilitation conditions, gaming experience, and challenges during the preparation phase (De Grove, Bourgonjon and Van Looy, 2012; Ucus, 2015; Bandara, 2018; Ibrahim, 2018; Alizadeh *et al.*, 2021; Siburian and Mahmud, 2022). Several other factors are also very important to look at, such as perceived usefulness, personal gaming mindset, parent's involvement, learning opportunity, teacher's skills, and personal positive belief in GBL (De Grove, Bourgonjon and Van Looy, 2012; Ucus, 2015; Huizenga *et al.*, 2017; Bandara, 2018; Ibrahim, 2018; Alhebshi, 2020; Alizadeh *et al.*, 2021; Siburian and Mahmud, 2022)

Furthermore, understanding students' acceptance of GBL is essential for effective implementation and maximising its potential as an educational tool (Byusa, Kampire and Mwesigye, 2022). The perception of GBL by students can significantly impact their level of engagement (Armier, Shepherd and Skrabut, 2016), motivation (Liu, Liu and Yue, 2021; Byusa, Kampire and Mwesigye, 2022), and overall learning experience (Bourgonjon *et al.*, 2010; Janakiraman *et al.*, 2021). Factors influencing students' game acceptance include perceived usefulness,

perceived ease of use, perceived enjoyment, learning opportunity, gender, and usability (Bourgonjon *et al.*, 2010; Martí-Parreño, Galbis-Córdova and Miquel-Romero, 2018; Huang, 2019; Wang, Wang and Jian, 2020; Liu, Liu and Yue, 2021; Udeozor, Russo-Abegão and Glassey, 2023). Several other factors, including learning opportunity (Bourgonjon *et al.*, 2010; Beavis, Muspratt and Thompson, 2015; Martí-Parreño, Galbis-Córdova and Miquel-Romero, 2018) and usability (Saleh, Prakash and Manton, 2014; Beavis, Muspratt and Thompson, 2015) exert an influential effect on students' acceptance of GBL. Only two studies from (Beavis, Muspratt and Thompson, 2015) and (Ninaus *et al.*, 2017) had primary school students as their research subjects. However, some students may be hesitant to embrace GBL, particularly if their parents and teachers are still unaware with the beneficial of games (Piller, 2016).

2.2 Recent Studies of Utaut 2 in Games Study

The Unified Theory of Acceptance and Use of Technology 2 (UTAUT 2), an extension of the original UTAUT model, includes additional constructs like Hedonic Motivation (HM), price value, and habit, along with the original constructs of Performance Expectancy (PE), Effort Expectancy (EE), Social Influence (SI), and Facilitating Conditions (FC) (Venkatesh, Thong and Xu, 2012). It has served as a baseline model for new technologies and has been valuable in understanding technology adoption (Yein and Pal, 2021). In the case of the use in games research, Ramírez-Correa et al. (2019) argued that UTAUT 2 is better and suitable model to analyse online game use, although with certain changes, compared to Theory of Use and Gratifications or the original UTAUT. This model has been successfully used formerly in the online games sector, but we have not found in our review other works that have applied the UTAUT 2 model to GBL for primary school education. Ibrahim and colleagues' study with the utilisation of extended UTAUT for game-based learning seem to be the closest work (Ibrahim and Jaafar, 2011) even though their study occurred before the establishment of UTAUT 2. They add two new factors to the origin UTAUT with Enjoyment and Learning Opportunity but eliminate Facilitating Condition. Other recent work from Udeozor et al. (Udeozor, Russo-Abegão and Glassey, 2023) whom employed UTAUT 2 based survey and interview to investigate the factors affecting the adoption of digital games for engineering education also seem similar to our works. While the UTAUT 2 model has been widely used in various technology adoption studies, its application in the context of game-based learning, particularly among adolescents, remains relatively unexplored. To date, only one study we found that implemented UTAUT for primary school student's participant, however, this study focused on an online homework platform rather than on game-based learning. They (Chen *et al.*, 2024) extend UTAUT model by incorporating perceived playfulness, perceived interactivity, and flow experience into a theoretical framework for understanding the behavioural intention to use online homework platforms. Result shows that PE, EE, SI, and Flow Experience significantly impact elementary school students' behavioural intention toward online homework platforms. Perceived playfulness and perceived interactivity indirectly affect students' behavioural intention through the mediating effect of flow experience.

3. Methodology

This study was conducted in several phases (figure 1). The research began with the exploration of technology acceptance model that suitable most to our study. We decided to adopt UTAUT 2, but we exclude Price Value and Habit from our study since we did not evaluate user acceptance of published games; rather, we created a conceptual game from the interaction scenario video (Figure 2). After several iterative discussions about the questions with researcher's team, we got each 14 questions for students encompassing six factors, with two questions per factor except for facilitation condition and behavioural intention which include three questions, and each 12 questions for teachers and parents encompassing six factors, with two questions per factor (For a detailed breakdown of the survey results, see Appendix [https://shorturl.at/yYoGR]). This questionnaire is divided into two parts: the first section covers demographic questions, which include the participant's gaming experience and habit, while the second section focuses on game acceptance question. The survey was not formally tested for validity and reliability with the experts, due to constraints related to time and the challenging conditions imposed by the COVID-19 pandemic. However, to ensure that the child participants would understand the task, we conducted a pilot test like a trial with a sample of eight private primary school students, aged 7-12, to confirm clarity and eliminate any potential ambiguities. While we found that all students understood and easily completed the 7-point Likert scale surveys, it is acknowledged that the absence of formal validity and reliability testing represents a limitation of this study.

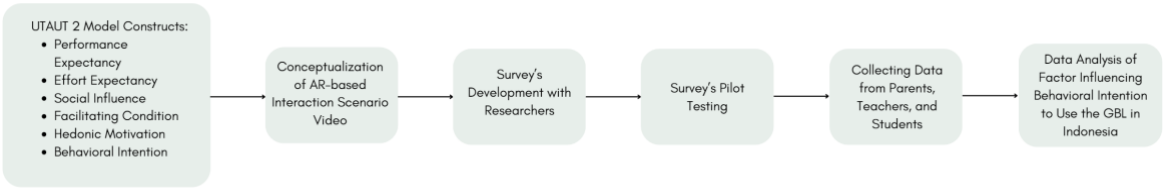

Figure 1: The data collection phases

Figure 2: The interaction scenarios video

Moreover, each group has different questions approach, in which, parents' acceptance of GBL refers to their willingness to support and engage with the use of games as a learning tool for their children, teachers' acceptance of GBL refers to their willingness to teach with the use of games as a teaching tool for them and learning tool for their students, while students GBL acceptance refers to their willingness and enthusiasm to participate in and engage with the use of games as a learning tool. Furthermore, the final phase involved analysing the collected data using Kruskall-Wallis.

4. Findings: Behavioural Intention to use the GBL

4.1 Performance Expectancy

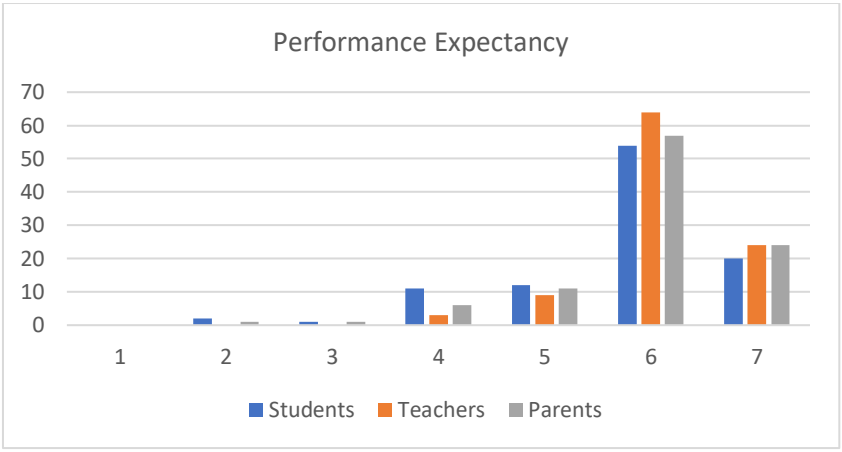

Figure 3: Frequency of responses for PE for students, teachers and parents

Figure 3 shows the frequency of response for the samples of students, teachers and parents for the variable PE. To check for differences between groups, we performed a Kruskal Wallis nonparametric test for independent samples. The test revealed statistically significant differences for PE between groups of students, teacher and parents ($H(2)=9.92$, $p=0.007$). Concerning the sample of students, they are the ones who have lower distribution values of PE, with an average of 5.4 and a standard deviation of 1.2. When we compare students with teachers

and parents, post-hoc Mann-Whitney tests using Bonferroni-adjusted alpha level of 0.17(0.05/3), showed a difference between students and teachers U(NStudents=129, NTeachers=47, z=-38.05, p=0.029) and between students and parents U(NStudents=129, NParents=135, z=-27.94, p=0.026). It is clear from Figure 3 that teachers and parents have a higher frequency of the higher scale values (6 and 7) than students. Teachers have the higher average value (6) and the lower standard deviation (0.7) followed by parents with an average of 5.7 and a standard deviation of 1.1. Between parents and teachers there was no statistically significant difference (U(Nparents=135, NTeachers=47, z=10.11, p=1)). In general, we can see that all of the groups have high values of PE, with averages above 5, however students have the more heterogeneous results, thus are the ones with more doubts about their PE.

4.2 Effort Expectancy

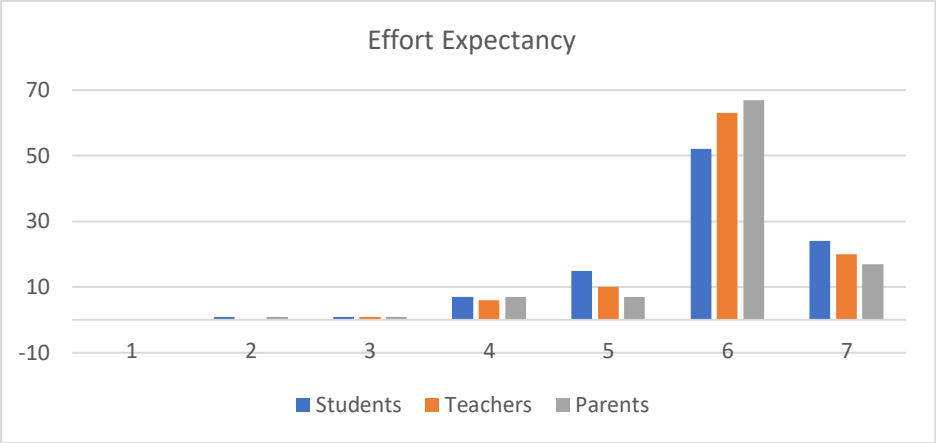

Figure 4: Frequency of responses for EE of students, teachers, and parents.

Figure 4 shows the frequency of response for the samples of students, teachers, and parents for the variable EE. The Kruskal-Wallis test showed no statistical differences in EE between student, teacher, and parent groups (H(2)=1.91, p=0.384). In this factor, students, teachers, and parents have Mean value distributions that are not too far apart, being 5.6; 5.8; and 5.7, respectively. Teachers have the lowest standard deviation (0.7) but with the highest value, followed by parents (0.9), and students (1.0). Overall, it becomes evident that all groups have high levels of EE, with average values exceeding 5. This proves that all three groups believe that the games interaction scenario video we provided, even with Augmented Reality technology, appears to be uncomplicated and easy to understand.

4.3 Social Influence

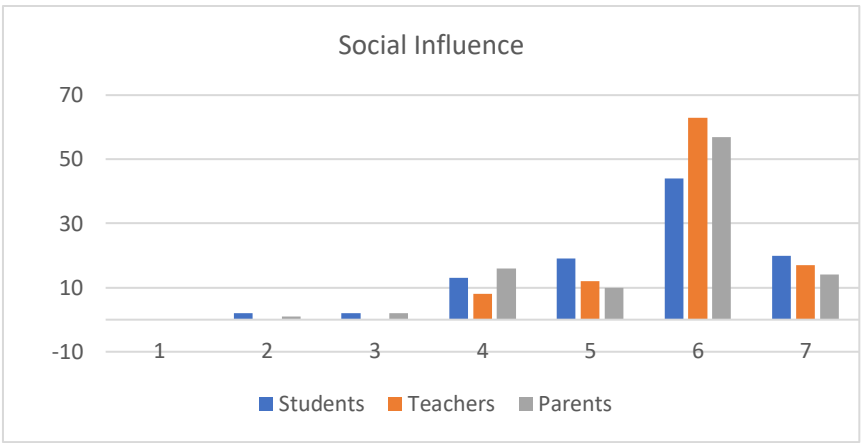

Figure 5: Frequency of responses for SI of students, teachers, and parents.

Figure 5 shows the frequency of responses for SI of students, teachers, and parents. The statistically significant differences between the groups are clear in this factor (H(2)=6.24, p=0.044). To discover the differences and comparisons among each sample, we employed the post-hoc Mann-Whitney test. There is a statistically

significant difference between students and teachers even after adjusting for multiple tests using the Bonferroni correction, the significance remains below 0.05 (U($N_{Students}$=129, $N_{Teachers}$=47, z=-36.23, p=0.044). However, in parents and teachers' comparison, the initial value is 0.032 and it indicates significance difference. But after adjusting for multiple tests using the Bonferroni correction, it increased (U($N_{Parents}$=135, $N_{Teachers}$=47, z=31.64, p=0.095). This means that, while there is some evidence of a difference in perceptions between parents and teachers, the difference might not be statistically significant when considering the multiple tests conducted. Furthermore, as shown from Figure 3, students and parents exhibit a more diverse range of values compared to teachers.

4.4 Facilitating Conditions

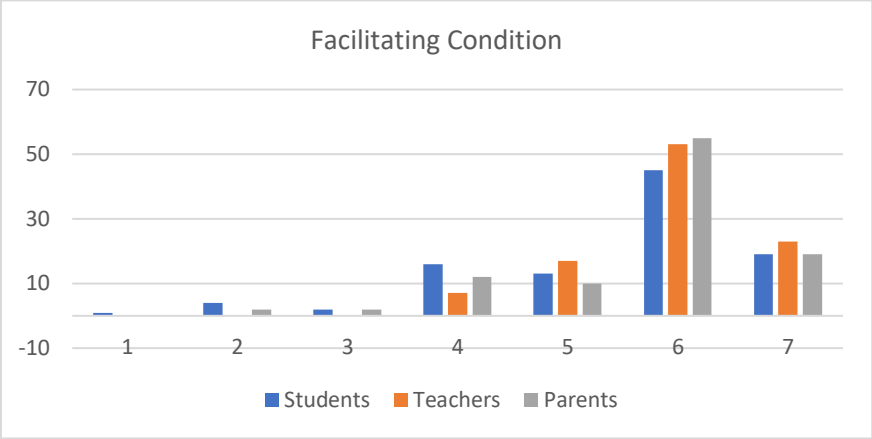

Figure 6: Frequency of responses for FC of students, teachers, and parents

In this factor, the Kruskal-Wallis non-parametric test shows that there is statistically significant difference between three groups (H(2)=15.08, p=0.001). The student's group has the broadest distribution of values compared to the other groups, with an average of 4.97 and standard deviation of 1.3. Consistent with the previous factors, we conducted a post-hoc Mann-Whitney test using a Bonferroni-adjusted alpha to examine the relationships. It was found that there is a statistically significant difference in the relationship between students and parents U($N_{Students}$=129, $N_{Parents}$=135, z=-31.91, p=0.01) and between students and teachers U(NStudents=129, $N_{Teachers}$=47, z=-52.27, p=0.02) Conversely, there is no statistically significant difference in the views of parents and teachers regarding FC U($N_{Parents}$=135, $N_{Teachers}$=47, z=-20.36, p=0.53). Relatively, all groups display a positive attitude towards the FC factor with average values above 5. However, in this factor, the Mean value for students is the lowest (4.97).

4.5 Hedonic Motivations

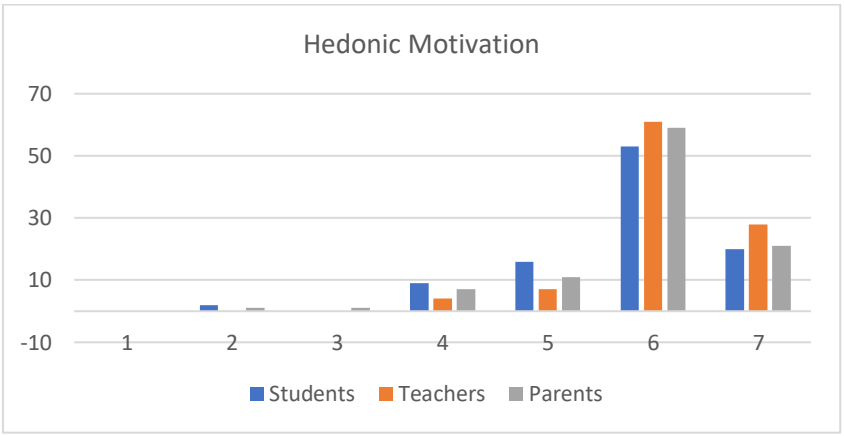

Figure 7: Frequency of responses for HMs of students, teachers, and parents

Based on the results of the Kruskal-Wallis test for the HMs factor, a statistically significant difference was identified among the three groups (H(2)=10.78, p=0.005). When comparing the three groups—students,

teachers, and parents—using post-hoc Mann-Whitney tests with a Bonferroni-adjusted alpha level, the p-value (Sig.) for the comparison between students and teachers was found to be 0.001. After adjustment for multiple tests, this value becomes 0.004. Both values fall below the significant level of 0.050, denoting a statistically significant difference in HM between students and teachers $U(N_{Students}=129, N_{Teachers}=47, z=-47.51, p=0.004)$. Conversely, the p-value for the comparison between parents and teachers stands at 0.040; after adjustment for multiple tests, it rises to 0.119. This adjusted value exceeds the significance level of 0.050, indicating that, when accounting for multiple tests, the difference in HM between parents and teachers is not statistically significant. Within this factor, teachers have the highest Mean value among the six factors we tested, displaying an average of 6.05 with a standard deviation of 0.69. Moreover, while teachers and parents generally expressed positive views toward HM, students appeared somewhat less enthused.

4.6 Behavioural Intention to Use GBL

Figure 8 illustrates the frequency of responses from the samples of students, teachers, and parents concerning the variable of BI. Upon examining the differences between the students, teachers, and parents groups, we found no significant differences in BI ($H(2)=4.16, p=0.128$). However, the mean values for BI in both the teachers' group (with an average of 5.58 and a standard deviation of 0.89) and the parents' group (with an average of 5.13 and a standard deviation of 1.2) are the lowest among the other six variables. This suggests that some parents might still be hesitant to permit their children to regularly use digital GBL (or on a daily basis), while certain teachers remain sceptical about the potential of GBL as a tool to augment learning activities and are uncertain about its implementation in schools. Nevertheless, on average, all groups displayed high values for BI, with Mean values exceeding 5. Thus, the average sample across the three groups demonstrates positive acceptance of this variable.

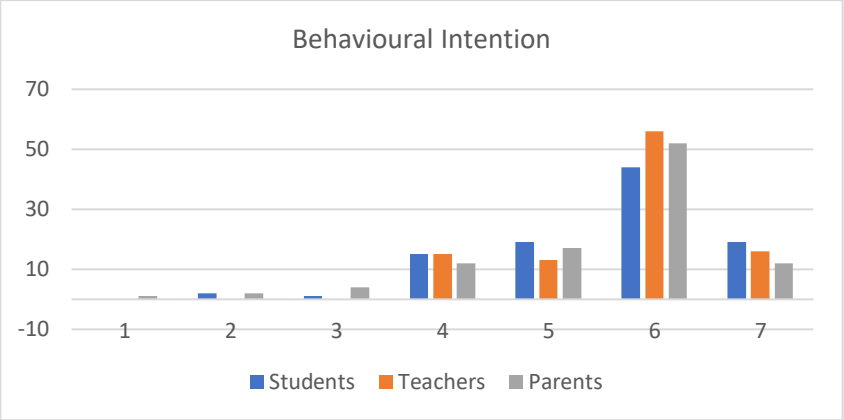

Figure 8: Frequency of responses for Behavioural Intention of students, teachers, and parents

5. Conclusions

Significant differences were found in the PE factor between student-teacher and student-parent relationships. Teachers and parents were confident in the potential of GBL to motivate and engage students, while some students were skeptical about its ability to deepen their understanding of environmental issues. This highlights the need to integrate LO into research on GBL's effectiveness. No significant differences were observed in the EE factor, as all groups found the GBL concept user-friendly. Positive perceptions from parents could ease teachers' concerns about GBL implementation. For SI, all groups generally felt supported in using GBL, although some doubts persisted due to the novelty of GBL in Indonesian schools. Some students may still feel the uncertainties about whether their parents or teachers would permit the use of GBL. Conversely, the teacher's group, which has the highest value, seems confident that both their colleagues and the students' parents would agree with the utilization of GBL in classroom. FC factor received the lowest scores, indicating doubts about having adequate tools for GBL, especially given restrictions on smartphone use in schools. Demographic data revealed that most students lacked personal mobile phones, relying on parents or siblings, which could limit parental support in resolving game-related issues. This indicates that some students may still have hesitation about whether they possess the necessary tools and if their parents or teachers can assist them when they encounter challenges with this technology. Conversely, the highest value for FC is still held by the teachers, who believe that they can support students in using GBL and that schools will provide adequate facilities for it. The

factor HM showed a significant relationship between students and teachers, with both groups finding GBL fun. However, some students found the concept less entertaining. It seems that teachers believe the game concept we introduced is highly entertaining, which would enhance their enjoyment when employing it for teaching. While for students, they might want to have more entertaining GBL. It is contrasting with findings from (Yong, Gates and Harrison, 2016; Xie, Wang and Hooshyar, 2021), where adults had lower confidence in GBL. Furthermore, factor BI showed no significant differences among groups, though parents had the lowest mean values, reflecting concerns about daily digital game use.

Remarkably, the interesting discovery in the case of Indonesian primary school was that adults showed a higher level of confidence in using games to improve students' learning experience than the students. This result could be attributed to cultural factors or their previous experiences with technology. Indonesian adults may have a greater appreciation for the potential educational benefits of GBL, viewing it as a valuable tool for enhancing learning outcomes, particularly in the context of environmental education. While the students may feel a lack of familiarity with GBL's effectiveness, or they just want a more fun games. It has come to be understood that parents and teachers never prohibit children from playing games, especially for educational purposes, but ensure that their responsibilities as students take priority overindulging in games. These insights could contribute for educational game designs area, to meet the needs and expectations of different stakeholder groups, particularly in primary school. Game designers should address the specific concerns of students perspectives, since they are the end-user of the GBL.

Furthermore, teacher's strong BI to use the game plays a crucial role in determining what kind of technology will be used in the classroom, as the teacher acts as a facilitator. Future research needs to gain a deeper about what technology that teacher's familiar with. While teachers might be confident in their abilities to use games to teach, as seen in the interaction scenario video, they might run into problems when using this strategy in the actual classroom. By understanding the perceptions and attitudes of these groups, educators and researchers can develop strategies to address any concerns or doubts they may have and promote the benefits of game-based learning.

Abstract: This paper examines social and collaborative elements of Cultural Game Jams developed and implemented in the large-scale Europe Horizon research and innovation project, EPIC-WE: *Empowered Participation through Ideating Cultural Worlds and Environments* (2023-2026). The project explores and develops transdisciplinary collaboration and co-creation across cultural heritage institutions, creative industries, higher education institutions, and youth citizens (ages 16-25) towards Cultural Game Jam interventions across three European sites: Óbidos (Portugal), Hilversum (Netherlands), and Aarhus (Denmark). The Cultural Game Jams are held at cultural heritage sites and are aimed towards value-sensitive game design and youth empowerment. This paper explores Cultural Game Jams as a potential format for enabling and developing youths' empowered participation, communality, and cultural socialisation by analysing the first Cultural Game Jam (2024). Framed by a Design-Based Research methodology and guided by experimental and short-term ethnography and design experiments, the analyses draw from qualitative empirical material, e.g., interviews, participatory observations, field notes, and the Cultural Game Jam participants' reflective process and design documentation. The analyses illustrate how co-creating games within cultural heritage contexts can develop youth perceptions of community, cultural socialisation processes, and individual/collective empowerment. Furthermore, the paper offers insights into the co-creation of games as new expressions of cultural heritage through epistemic collaboration and cultural participation in game jams while discussing possibilities for enabling new experiences of empowered participation, social learning, and community among youth citizens.

Keywords: Cultural Game Jam; Youth Citizens; Transdisciplinary; Epistemic Collaboration; Empowered Participation.

1. Introduction

Game jams are accelerated, social game-making events characterised by their relatively short time span, creative design constraints, and the public dissemination of created games, game concepts or game prototypes (Kultima, 2015; Fowler et al., 2016). Though participants in game jams emphasise different features as most exciting or relevant, e.g., enabling creativity and innovation or socialising, communities, and learning (Kultima, 2015), there is a lack of research detailing how game jams might foster empowered participation along with experiences of communality and socialisation beyond networking and elements of joyfulness and fun (Lai et al., 2021). While game jams generally revolve around a specific theme or constraint and might emphasise social topics and purposeful and serious approaches, technological challenges, or game typologies (e.g., Boulton et al., 2018; Lai et al., 2021; Abbott et al., 2023) less is known about game jams connected to culture and cultural heritage. However, isolated examples of 'purposeful game jams' can be located, with, e.g., the Sámi Game Jam addressing Indigenous culture and diversity (Kultima and Laiti, 2019) and cross-cultural online game jams across countries (Park et al., 2023). Generally, scholars find that cultural diversity and inclusivity "is still lagging behind its ever-diversifying reality" in the global game industry (Park et al., 2023, p. 2), calling for new approaches towards more culturally explorative, diverse, and sustainable game-making practices and experiences that also address the participants individual and social values that permeate and guide game-making. Hence, game jams that are set and enacted through culture and within cultural heritage spaces to produce games *through* and *for* culture are a novel format that this paper's underlying research and development project seeks to develop and examine.

This paper studies social and collaborative elements of Cultural Game Jams (CGJs), which is a game jam format developed and implemented in the large-scale European research and innovation project EPIC-WE that builds on transdisciplinary collaboration and co-creation across cultural heritage institutions (CHIs), creative industries (CIs), higher education institutions (HEIs), and youth citizens (YCs; age 16-25) towards CGJ interventions across three European sites: in Óbidos (Portugal), Hilversum (The Netherlands), and Aarhus (Denmark). CGJs, held in cultural heritage sites, focus on value-sensitive game design and youth-empowered cultural participation (Nørgård & Holflod, 2024). Drawing from the first project intervention, this paper examines the participating youths' experiences of value-sensitive game-making in diverse communities and cultural participation and socialisation (understood as individual and collective processes of acquiring knowledge of cultural histories, traditions, identities, and values), leading to the following research question guiding the present paper: *How can*

Cultural Game Jams enable youth experiences of empowered participation, communality, and cultural socialisation?

The paper first examines social, communal, and relational perspectives on game jams, addressing CGJs and their potential in youth cultural empowerment. It then outlines the design-based research methodology used in EPIC-WE and presents findings from the first CGJ, discussing the potential for social learning, novel communities, cultural playfulness, and youth empowerment.

2. Social, Communal, and Relational Perspectives on (Cultural) Game Jams

In recent years, game jams have emerged as a novel method and approach for introducing youth to diverse educational, cultural, and societal topics (Fowler et al., 2016; Lai et al., 2021) while serving as platforms for research and innovation (Kultima and Laiti, 2019). Despite this, they remain relatively unexplored (Kultima, 2021). Game jams are social, collaborative events where participants come together to ideate, develop, and prototype games within a limited time frame (Kultima, 2015). The goal is to foster creativity and rapid game (concept) development (Meriläinen et al., 2020). These events vary in duration, typically spanning from a few hours to a weekend, encouraging focused development without excessive planning. Participants come from different backgrounds and thus integrate experiences and competencies across disciplines, e.g., design, technology, programming, or visual arts, providing relevance in the enculturation of aspiring game developers who might look towards entering the industry (Kultima, 2015; Olesen and Halskov, 2018).

Game jam events furthermore promote fellowship and community, providing a platform for skill development, learning, and feedback (Kultima, 2018, pp. 146-147; Meriläinen et al., 2020). As a format and experience, game jams are thus collaborative, social, and communal places and spaces for rapid game ideation and development, enabling the potential of enculturation in, particularly, game industry domains. However, even after 'Two Decades of Game Jams' (Lai et al., 2021), there is still a lack of knowledge about how participating youth experience elements of sociality, relationality, and communality that extend beyond themes of social networking (Arya et al., 2015), social capacity building and social capital (Fowler et al., 2016), and social skills as a learning outcome (Aurava and Meriläinen, 2021).

A *CGJ*, a game-making format developed in EPIC-WE, integrates values-sensitive design (Friedman and Hendry, 2019) to innovate game ideas and prototypes within cultural heritage spaces. Unlike traditional game jams, these events emphasise creating games *as*, *through* and *for* culture and transforming cultural heritage using arts, archives, and local cultural collections. They aim to enable youth participation in cultural and societal domains, featuring collaborative work over a short period (36-48 hours) connecting four thematic categories of Games, Culture, Citizenship, and European values, which are 1) human dignity, 2) freedom, 3) democracy, 4) equality, 5) rule of law, and 6) human rights (Lisbon Treaty, 2007). These CGJs moreover address themes of diversity, inclusion, intergenerational perspectives, and cultural and societal challenges, which scaffold the participants to reflect on and enact new modes of social, communal, and empowered participation in game jams. Finally, CGJs follow four taxonomical phases: Experience, Play, Imagine, and Create (EPIC phases), leading youth through cultural game-making. The underlying WE Dimensions (Worlds and Empowerment) guide processes, focusing on empowering youth towards exploring new cultural and gaming worlds. In each phase, the participants reflect on their collaborative game development and thematic, cultural, and value-sensitive exploration and design through writing Game Logs.

3. Methods: Cultural Game Jams as Design-Based Research Interventions

Framed by a Design-Based Research (DBR) methodology (McKenney and Reeves, 2019) and drawing from experimental and short-term ethnography (Pink and Morgan, 2013; Estalella and Criado, 2018) and design experiments (Brown, 1992), this study examines diverse qualitative empirical material from a CGJ intervention. The data includes in-situ vox pop interviews, participatory observations, field notes, and the youth participants' reflective processes and design documentation during the CGJ.

EPIC-WE is situated in an ecosystem with different sectorial partners collaborating to design, develop, and implement DBR interventions within a quadruple helix innovation ecosystem, a strategic model for university-government-industry-public interactions and collaborations (Carayannis and Campbell, 2012), where CIs, CHIs, HEIs, and YCs collaborate on interventions with both scientific and innovation goals. DBR emphasises the interaction between developing theoretical insights and practical solutions in real-world contexts, closely involving stakeholders from and within the specific domains and contexts the interventions are designed

towards and address (Barab and Squire, 2004; McKenney and Reeves, 2019). This approach is applied explicitly to the co-creation of CGJs as design experiments (Brown, 1992) that involve cross-sector partnerships between CIs, CHIs, and HEIs, whereas YCs become epistemic and practical partners during the interventions by problematising and co-creating the field of CGJs together with the different partners, drawing inspiration from experimental collaboration (Estalella and Criado, 2018).

This paper primarily draws on the first intervention of the project by examining a two-day CGJ at the ARoS Art Museum in Denmark and the participating youths' (n=23), primarily students, experiences of collaboration, social engagement, and communality. CGJs engage youth citizens in creating games with material inspiration from cultural heritage through value-sensitive design processes and collaboration with peers from diverse backgrounds to co-create games that reflect and emphasise culture. The inspiration from tangible cultural heritage, such as artworks and artistic installations in the museum, along with more intangible cultural heritage, such as the European values also influencing the youths' ideation and design processes, led to different and novel approaches to collaborative game design processes of re-thinking, criticising, and transforming cultural expressions through game. In this process, the youth participants thus take on roles as both game-makers and culture-makers within cultural heritage domains. Through CGJs, the project aims to enable youth to experience and cultivate empowered participation and a stronger sense of belonging in culture and cultural heritage. By inviting them to be partners in culture-making and game-making, the overarching emphasis is on supporting them to explore and navigate cultural and societal challenges with curiosity, creativity, agency, and imagination - thus becoming empowered participants in culture and society.

A pilot game jam was also tested earlier in the project with 40 youth students (ages 17-18) (Eriksson, Holflod and Nørgård, 2024). During the *CGJ*, 23 youths (ages 15-25) co-created game prototypes drawing on cultural heritage and artworks as materials, imbuing and reflecting on their game-making processes, design and prototyping with European values. As a DBR intervention inspired by short-term ethnography, it is conceptualised as an intense and participatory inquiry through the intervention time and space (Pink and Morgan, 2013) by co-creating and accelerating the research process through intervention design and facilitation.

3.1 Data Production and Analysis

The empirical material produced during and after the CGJ employs a multi-method approach, incorporating in-situ vox pop interviews (Bayne and Gallagher, 2021), participatory observations and observation notes, and documentation of participants' reflective processes in game-making and design. At the outset of the CGJ intervention, we conducted vox pop interviews, seeking brief 5–10-minute insights from all youth participants about their motivations and expectations for the event. We asked questions like "What motivates you to be here today?" and "What do you expect from the game jam?" The researchers documented the participants' responses immediately after the vox pop interview. Researchers observed the game-making processes throughout both days of the CGJ, applying an observation grid to document the dynamics of youth participants' teamwork, collaboration, and participation. They also observed the facilitation and structure of the event, the participants' vocal reflections on the process, and the conditions and potentials for cultural reflectivity and empowered participation. An integral part of the CGJ involved documenting the youth participants' iterative reflections, game ideas, and game-making processes through the Game Logs. This documentation captured their thoughts on how their participation intersected with cultural heritage and European values in the context of game creation. The table below visualises the characteristics of the CGJ regarding organisation and details of the participating youths' backgrounds.

Table 1: Cultural Game Jam Details

	Cultural Game Jam 2024
Organisers Government - Cultural heritage Industry - Games University - Research	 ARoS – Aarhus Art Museum (CHI) Filmby Aarhus (CI) Aarhus University (HEI)
Venue	ARoS – Aarhus Art Museum
Duration of CGJ	2 days
Facilitators	2 art/museum guides (culture-making); 4 coding/game design guides (game-making)
Public - Number of youth participants	23

	Cultural Game Jam 2024
Age distribution	15-27 Avg: 21.4 SD = 3.33
Gender distribution	M: 10 F: 7 Other: 6
Number of games created	5
Distribution of participants by field of interest	Arts & Culture: 1 Game-making/Games: 8 Game-making/Sound design: 2 Art-making/Visuals: 7 Creative programming/Technology: 3 Idea Management/Design processes: 2

The analysis of the empirical material draws from thematic analysis and is guided by an emphasis on the researcher's reflexive positioning as both a condition and an asset in constructing themes and analyses across the empirical material (Braun and Clarke, 2022). In this paper, we accentuate two themes of participation created during the analyses: 1) Participation, communality, and empowerment in CGJs, and 2) Social learning and cultural socialisation in CGJs. These themes are interrelated, although different lenses through which we can understand the potentials and challenges of youth participation in CGJs.

3.2 Research Ethics and Data Management

Before the CGJ, all participants who signed up were provided with materials covering research ethics, GDPR, intellectual property rights (IPR), and general ethical considerations. These materials outline the formal procedural ethics of the project's research and interventions, including the participants signing declarations of informed consent prior to the game jam and IPR-related guidelines and agreements regarding game ideas and concepts that might be developed during the CGJ. Additionally, the project's framing within DBR emphasises the importance of participatory and relational ethics, thus highlighting how participation and representation are active democratic inquiries in the research and interpersonal relationships involving youth - and, therefore, inherently epistemic and interdependent connections. Finally, the project also had ethical consent from the ethical board at the university responsible for the present study.

4. Results: Exploring Youth Citizen Experiences of Cultural Game Jams as Social and Communal Spaces for Empowered Participation

The EPIC-WE CGJ was a two-day event in February 2024, where 23 youth participants collaborated on game-making *through* and *for* culture across diverse backgrounds and experiences at the ARoS Art Museum in Denmark. The HEI, CHI, and CI partners facilitated the event. In the following sections, we examine youth citizens' experiences of participating in the CGJ in Aarhus, their motivations to participate, their jam experiences, and their reflections on the CGJ and the cultural and value-sensitive game-making processes.

4.1 Lens 1: Participation, Communality, and Empowerment in Cultural Game Jams

During the first day of the CGJ, we performed 20+ in-situ vox pop interviews that generally display that the participants are motivated by an eagerness to explore both culture and games and test their different skills, particularly in the context of a CGJ. Moreover, they highlight the motivating factors of networking, potential career development, and exploring and innovating the intersection between games and culture. Through the interviews, participating youths express expectations of gaining new social and individual experiences while building relationships in a creative, collaborative environment. Regardless of background, they seek to expand their skills in game design, art, culture development, and programming. Common motivations include applying and extending existing skills in a different setting and exploring career opportunities. The communal and relational aspects of novel participation across disciplines and backgrounds are also highlighted as important. The community and socialising perspectives are, however, not only about meeting new people in a novel situation but also a vocal desire for a sense of community situated within a unique *game jam feeling*. This resonates with other research on game jam experiences that highlight the prevalence of perspectives on community and belonging as central motivating themes in participating across disciplines and cultures and towards building social capital (e.g., Fowler et al., 2016; Park et al., 2023). To exemplify this, one youth participant with a programming background emphasised "the communal elements of creating together, experiencing the game jam feeling and involvement, and being motivated by the process of creating something

new and different from others" in a vox pop interview. This message of communality and exploring new interplays between games and culture resonates across the vox pop interviews, with another youth from a game-making background articulating "the intensity of creating something together, and thus also the communal and collaborative elements of participating in the game jam." Of particular importance - and highlighted in the participatory observations - is the disciplinary diversity, with youth participants coming from different backgrounds and disciplines, though they generally emphasise the same motivations of exploring "... a different experience by jamming with other people and taking her friends with her and meeting new people. To socialise - and being and becoming part of a community that enables new connections and relational experiences", as articulated by a participant with a background in culture and project management.

Throughout the CGJ, and across interviews and observations, general themes voiced by the participants were the motivations and desires to become part of a different community that emphasises relationality across cultures and hence longings for novel ways of connecting within cultural game-making and design communities. It further relates to elements of empowered participation with and through culture, individually and collectively, and how it might be enabled by CGJs as a communal and safe environment to "... learn from each other and socialise in open settings while enjoying the experience of meeting other young people in a cosy, informal environment that 'feels' safe." Hence, the game-making activities in CGJs might be recognised as playful events or playful learning spaces, mimicking the characteristics of playfulness that are procedurally constructed by the participants towards trustful relationships (Whitton, 2018), as 'magic circles' for both vulnerable and empowered social participation in culture, further influenced by the value-sensitive processes of collaborative game-making as a playful and experimental co-creation of objects (games) that mediates and strengthens cross-cultural communication and relationships (Holflod, 2023).

4.2 Lens 2: Social Learning and Cultural Socialisation in Cultural Game Jams

The participants in the game jam came from diverse backgrounds, including audio design, visual design, programming, game-making, escape room design, animation, and dramaturgy. This variety fostered a rich and dynamic environment where different disciplines could converge to ideate and create something new and different. For example, a youth participant with an artist background reflected on this interdisciplinary collaboration during an interview, stating, "I had a feeling that it was lovely meeting across disciplines and perspectives. At some point, I drew a square on a Post-it note, and later, it blew from the table to the floor. Even later that day, some of the group members saw it, picked it up, and were excited with potential ideas stemming from the simple drawing - and it created a nice experience of learning from each other's perspectives." It exemplifies and highlights the perceived and experienced value of collaborating across diverse perspectives to spark creativity and innovation during the game jam. However, this case was enabled through an unexpected or unplanned situation, which was not explicitly designed for.

During the CGJ, the youth participants approached cultural material - artworks, tangible cultural heritage, and European values - as materials for their design processes, resulting in different game concepts and prototypes. The five cultural games created during the CGJ are publicly available (https://itch.io/jam/epic-we-game-jam-01-aarhus/entries), and they display how the participants drew inspiration from national paintings and artists, emulating a vibe, aesthetic, or atmosphere or by creating new ways of interacting with and in the specific artworks. An example of this is the game "Roomination", wherein the player navigates and ruminates on the eerie, melancholic hallways of a Vilhelm Hammershøi (1864-1916) painting – and experiences freedom (as an incorporated European value) in its interaction design as something that can be strived for but quite difficult to reach. From a processual perspective, the participant's collaborative engagement through a more and more refined game idea was a medium for social learning and cultural empowerment across backgrounds and disciplines. They actively learn from and build upon cultural artefacts by choosing, adopting, and remixing specific artworks. Moreover, by exploring different disciplinary perspectives on the artworks, such as aesthetics or narratives, and integrating them into their games, they assert their creative agency and reinterpret cultural heritage in ways that resonate with themselves as cultural citizens in contemporary society.

Cultural integration and socialisation became a central focus during the CGJ, with participants keen on exploring the intersection of games, culture, values, and citizenship - and their individual and collective relationships with culture and cultural heritage. While a few participants focused on CGJ themes and examined the processes and methods involved, the overall interest was integrating cultural elements into their game designs. Several participants emphasised the significance of cultural diversity and exploration within the game development process - and how it changed their perceptions of the cultural collection and artworks and their experiences of being and becoming cultural citizens less foreign to cultural heritage than before. As such, the format of CGJs

scaffolded potentials for cultural socialisation, which relates to processes of social and cultural influence wherein the youth participants acquire culture and are thus socialised into culture otherwise foreign to them, affecting and shaping cultural identity and relationality - towards both games as culture and as a medium for ideating and experiencing new expressions of culture.

During the final exposition of the created game prototypes, the research team observed and participated with the youth participants. It became evident that many of them had undergone significant shifts in perspectives towards cultural heritage. The participants from cultural backgrounds voiced similar processes of becoming more receptive and sensitive to the potential of game-making as both an interest and cultural expression. In contrast, game-oriented youth participants discussed embracing cultural perspectives and expanding their understanding of cultural heritage. They were immersing themselves in tangible cultural heritage, e.g., artworks and cultural worlds, in new ways previously perceived as difficult or impossible for them, with both 'groups' of participants articulating becoming more open to different European values, how they influence us, and how they can change perspectives on culture and games. These changes in perspectives are not only conceptual or theoretical but also very actionable and practical by expressing and demonstrating changes in ways of thinking, voicing, and acting, leading to more empowered and engaged participation with cultural heritage, both *tangible*, like artworks, and *intangible*, like values (Eriksson, Holflod and Nørgård, 2024).

5. Discussion: Empowering Communities and Cultural Playfulness

This study illustrates how co-creating games within cultural heritage contexts can develop youth perceptions and experiences of community, sociality, and individual and collective cultural empowerment. Moreover, the experimental ethnographic and design-based perspectives support examinations of democratic inquiry (DiSalvo, 2022) with participating youth citizens who become both epistemic and practical partners (Estalella and Criado, 2018) during the CGJs by co-creating and problematising the field with different participants and stakeholders.

From the Sámi Game Jam (Kultima and Laiti, 2019), it was discussed that the participants reflecting during the jam on their thinking and views led to experiences of empowerment; they learned something about their identity and could thus deal with personal and collective culture differently. On a similar note, the CGJs led to youth participants experiencing their own culture and cultural identity as a polyphony of voices from games, culture, values, and citizenship permeating and empowering their participation with cultural heritage and towards emergent communities. As mentioned, the first CGJ drew from experiences with designing and testing the format during a pilot test, revealing several vital insights. It underscored the importance of carefully designing and planning how participants interact with cultural heritage and values in game design and conceptualisation, and it highlighted a need for deeper engagement with specific cultural heritage pieces to facilitate the ideation processes of creating games through culture within empowering spaces of being, becoming, and belonging.

5.1 Playing with Culture, Participation, and Communities

Though game jams are mainly viewed as game-making events that are experimental, creative, and social, play and playfulness as theories and practices might offer new perspectives to conceptualise and discuss the CGJ participant's experiences of relating and socialising across backgrounds, disciplines, and culture in experimenting and creative processes. A recent review on adult playful learning and collaboration found that tangible construction play, i.e., creating, making, building, or materialising things together, are mediums to collaborate across disciplinary boundaries and hold the potential to permeate boundaries when the objects (e.g., games) are mediating materials for externalising one's perspectives along with enabling new participatory and communal spaces (Holflod, 2022). As also highlighted in the analysis, the youth participants were creating together throughout the CGJ - both in diverse design and game-making activities and the game prototypes themselves, and these processes enabled safe spaces for participation. In play, the players continuously negotiate and frame - communicate and meta-communicate - the boundaries of play (Bateson, 1972). They, in other words, examine questions of 'what if' and 'what might be' in a relationship between a playworld and a 'real' world, wherein playful engagement with objects (e.g., artworks and material cultural heritage) can become intrinsically connected to individual and collaborative world-building through objects in play (Holflod, 2023). Here, approaching cultural heritage playfully aids in supporting the players to create, frame, and reconfigure their processes and situations, with cultural heritage collections as play objects becoming references to the real world (Fink et al., 1968), supporting the creation and safe space (Whitton, 2018) for collaborative learning, game design, and relationships across backgrounds.

6. Conclusion

This paper reports on and discusses findings from the first CGJ from a cross-cultural European research and innovation project, with multiple similar game jams planned for and held during 2024 and 2025. As such, clear limitations of the present study are its local emphasis and lack of testing across sites and contexts, but in alignment with a DBR framework, it explores and produces tentative local theories by examining limited manifestations of a phenomenon, leading to context-sensitive knowledge about a specific domain (McKenney and Reeves, 2019). It, moreover, leads to possible implications to scrutinise and reflect on regarding game jams in cultural places and spaces and how youth participants experience social, communal, and collaborative practices and learning within such formats and environments.

Throughout this paper, we have explored the interplays between culture and games within the format of CGJs with youth participants, presenting and discussing their motivations and experiences regarding social and relational perspectives, communities, enculturation, and empowered participation. CGJs contribute towards youths engaging with cultural heritage in new ways, which materialise in games and become new expressions of cultural heritage. Moreover, more playful entanglements with cultural heritage and play methods to ideate and design game concepts can support collaborative and co-creative practices and relationships through safe spaces and mediating materials. Though this paper disseminates themes of interest to game-based learning environments and formats such as game jams and hackathons - in cultural, educational, and social domains - more robust knowledge through multiple interventions and studies is essential. We thus hope that the present study can inspire others to develop and test related formats and concepts for the cultural empowerment of youth citizens through game-making.

Acknowledgements

Abstract: In this paper, the authors present the findings of an empirical case study examining the efficacy of the Games Realising Effective & Affective Transformation (GREAT) Case Study design process. The process is underpinned by an established Mixed Methodological Research (MMR) framework for eliciting the preferences of gamers and determining their priorities in climate change policies. Funded by the Horizon Europe programme, the GREAT Project examines the impact and affordances of games for social engagement. The project explores the innovative potential of games as new forms of dialogue between citizens and policy stakeholders. The games are used as tools for players to express their preferences and actively shape policy issues. We present the first case study on this approach, which is one of ten to be undertaken with various partners over the next two years to test and validate the methodology, investigate its potential, and present findings. In partnership with the popular PC & Console game Smite, by the Hi Rez, game development studio. The study involved stakeholders' participation in the co-creation of research questions, designed to influence the prioritisation of future climate policies. The activity was embedded the Smite game playing community via the Playmob platform in January 2024 and engaged over four thousand active players with a completed response rate of 58 %. Quantitative analysis of the data collected during this period will be presented by the authors. In summary, the engagement in and completion rates of the activity were high, validating the initial GREAT project approach. The methodological approach and the substantive data sets produced are of interest to any organisation considering engaging diverse groups active in gaming communities in the political process, including NGOs and policymakers. The project and methodology applied is at the core of this paper.

Keywords: Digital Games, Applied Games, Policy, Climate Change, Data, Games Base Learning, Society

1. Introduction

This paper Reports on the findings of an exploratory case study of a European Commission (EC) and United Kingdom Research and Innovation funded three-year GREAT project. The project involves seven partners across Europe and aims to enhance citizens dialogue with governments and policy agendas relating to actions to mitigate climate emergency, using the medium of gaming to facilitate this. The scope of the paper does not address the sustainability of the digital Games industry per say but how the industry and specifically the associated playful development techniques for player engagement could be meaningfully deployed to address wider societal sustainability challenges. The growth of digital games over the last decade has been a remarkable phenomenon and this raises important questions about the cultural role and meaning of games and the potential for games to be applied for learning or social good over and above their core purpose of entertainment. Collaborative virtual gaming environments can support a variety of pedagogic approaches and can be applied, for example, 'as both constructivist learning environments and as didactic instructional tools' (Whitton & Hollins 2008).

The digital games industry is now a larger economic sector than either of the music or film industries and is estimated to have generated $180.3 billion in the year 2021 (Wijman, 2021). There is no consensus on the positive or negative nature of the impact of games on wider society though much has been written about

specifically children's over exposure to screen time and the negative impact of social media and forms on wellbeing. 'Serious' or 'Applied' games are considered a major emerging technology anticipated to enter mainstream use, in wider society Steiner et al (2015) In parallel, the proportion of (EU) citizens declaring dissatisfaction with functioning democracy in their countries has risen markedly. The deterioration has been especially evident within high-income, consolidated democracies, where the proportion has risen from a third to half of all citizens." (Foa et al., 2020). Similarly, the rise of 'fake' news and distrust of news sources and 'scientific 'information is at an all-time low (United Nations 2021). This dissatisfaction and mistrust correlate with increased scepticism and has occurred in an environment where the volume of data generated through citizens everyday interactions and transactions with media is increasing. Analysis of data has increased to the point that it has significant impact, that social media is contributing to a polarizing society (Vrontis et all 2022). It is in this context that the GREAT project was established aiming to explore these dilemmas through applying games technologies, designed to achieve positive transformation, restore community engagement and satisfaction with democracy and democratic processes. It does this by contributing to the establishment of policy priorities for addressing the challenges presented by climate change and by utilising the opportunities presented by the collection and storage of citizen generated data to bring together communities, in an open, ethical process.

The first case study undertaken by the project is an exploratory study for the United Nations Development Programme (UNDP). The paper provides detail on the methodology applied to the project and how this is elaborated through a research cycle and the steps undertaken in the cycle to examine the problem space this is framed within the context of the overarching research questions to be addressed in the project followed by discussion and interim findings and conclusions of this, the first of a series of, case studies to be undertaken in the project.

2. Methodology

In this section the authors provide detail on the methodological approach adopted and how this is reflected in the selected methodology applied to the study. The challenge facing the project is to apply games not simply to promote learning or social attitudes, but rather to gain insight into the cultural role of games through case studies which establish a new communication channel between citizens and policy makers centred around transparency and actionable insights. The project is oriented to the goal of harnessing the cultural and communicative value of games to provide an opportunity for input and feedback for citizens who may not normally engage in socioeconomic debates, and new sources of insight for policy stakeholders. The games and interventions co-designed and implemented are not one-off solutions acting as research tools that explore the effectiveness of the approach, establishing a method and data sources for future adoption.

Project activities support scalability and adoption from the outset, with case studies which test the concept and apply it in authentic conditions at a scale of genuine value to the policy stakeholders. This undertaking is built on three well-founded assumptions:

1. Games constitute a rich source of data that can reveal a great deal about players' engagement, preferences, and attitudes. However, this is closely guarded by publishers and developers as a competitive advantage in optimising their games. This data constitutes a huge opportunity to draw out insights into social preferences and attitudes at scale, but this requires new methods of gathering, storing and analysing data, and new forms of engagement with stakeholders, together creating an engagement ecosystem.
2. Data analytics developed methods to extrapolate from online interactions to gain insight into citizens real-world experiences. The online interactions of game players generate a similar stream of data, and analytics methods can be adapted to reveal the connections between game-world interactions and players' engagement with and attitudes towards real world experiences and issues.
3. Policy stakeholders require informed insight into citizens preferences and attitudes. Policy stakeholders are open to and will engage with this input. This is supported by the active engagement of policy makers in the project and the participatory Citizen Science approach that engages all stakeholders from the onset.

The methodological approach is situated with an established interdisciplinary framework an adaptation of the Multi Interdisciplinary Research (MIR) (Tobi & Kampen 2018) framework to refine methods and instruments of research based on synthesis of established community intervention/ co design evaluative methods).

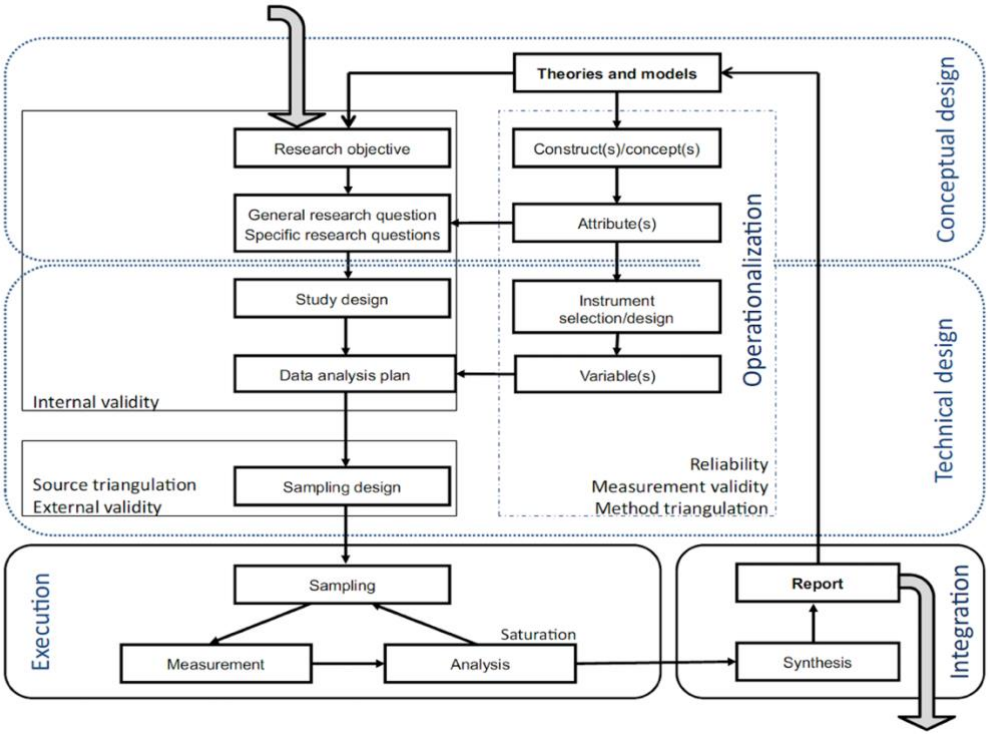

Figure 1: An adaptation of the MIR Framework (Tobi and Kampen 2018)

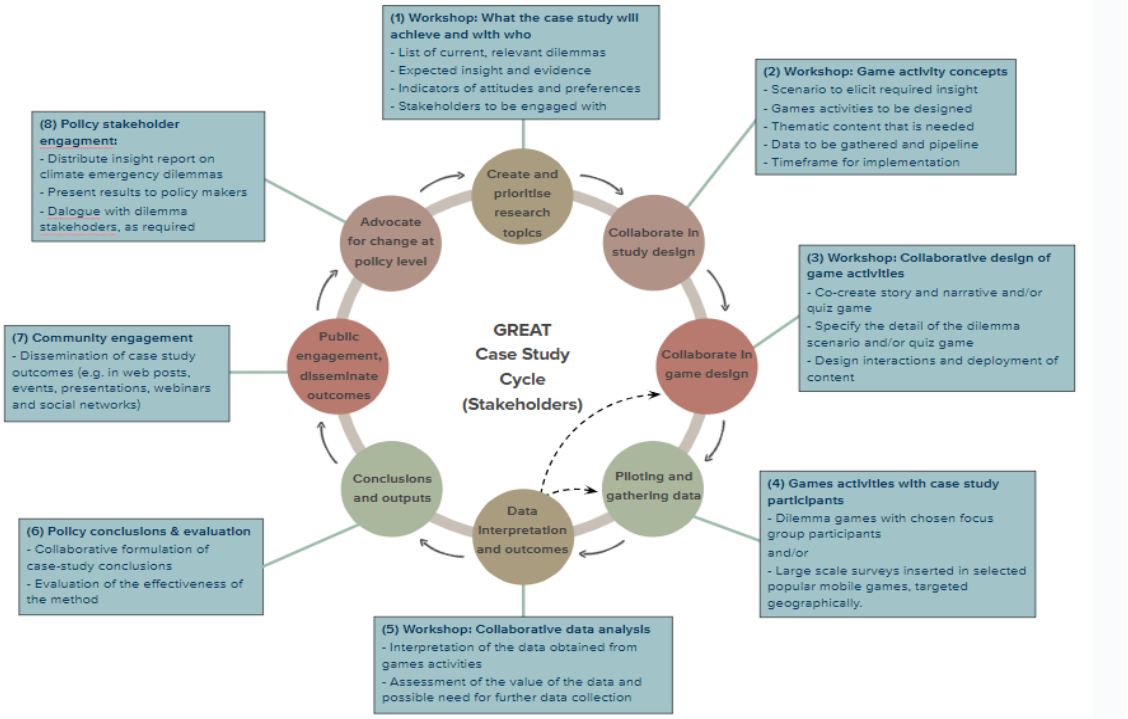

Figure 2: GREAT Case Study Cycle

The research question underpinning the initial steps of the case study displayed in this paper is: *How effective are games-based activities in eliciting, representing and communicating citizens' views on social dilemmas?*

This study utilizes the GREAT case study methodology [Figure 1 and Figure 2] which implements processes involving both policy stakeholders (UNDP) and citizens (Players). Thus, this methodology provides a link between policy and the public.

Table 1: UNDP exploratory Case Study Research Cycle Steps

Step 1: *What the case study will achieve and with who*	Participating stakeholders will participate in a workshop or equivalent activities to identify and prioritize the research topics.
Step 2: *Game activity concepts*	Participating stakeholders will join a workshop or equivalent activities to generate ideas for the game activity.
Step 3: *Collaborative design of game activities*	Participating stakeholders will engage in activities to co-create research questions based on strategic requirements
Step 4: *Games activities with case study participants*	Playmob quizzes embedded within the SMITE online game analysis of two methods 'paid for' (where links to the games are provided by paid advertising) and 'Non Paid' (where the quizzes are embedded directly in the gameplay).
Step 5: *Collaborative data analysis*	Data analysis undertaken using the collected data.
Step 6: *Policy conclusions & evaluation*	Formulate the conclusions that can be drawn from the results of Step 5.(outside the scope of this paper)
Step 7: *Community engagement*	Promote community engagement activities that are impacted by the policy dilemma and identify dissemination opportunities. (Outside the scope of this paper)
Step 8: *Policy stakeholder engagement*	Close the cycle by engaging with policy stakeholders, and in particular the policymakers who identified the dilemma addressed by the case study. (Outside the scope of this paper)

The GREAT case study methodology follows an eight-step process, each stage providing details for co-design and implementation. The work presented in this paper focuses on step 4, the remaining steps of the case study which are beyond the scope of this paper will inevitably close the loop on the cycle in future research, through detailed policy insights, policy stakeholder dissemination and the presentation of results directly to policy makers, the purpose of each step is listed in Table 1.

The project objectives and steps in the cycle determine the types of activities and participants to be involved in the co-design processes, i.e. citizens, domain experts, policy stakeholders and policymakers etc. The following section outlines the steps of the methodology in relation to the UNDP exploratory case study.

3. The Research Cycle Implementation

In this section we discuss the GREAT research cycle and how this was applied to the UNDP exploratory study.

3.1 Create and Prioritise Research Topics. (Step 1)

The research topics in the exploratory case study were developed by the United Nations Development Programme to address key themes identified in their organisation policy documents.

3.2 Collaborate in Study Design. (Step 2)

UNDP collaborated with the GREAT researchers to developing a set of questions to engage players in the climate change debate. The questions were a refined and improved version of questions previously developed in consultation by UNDP with key stakeholders for the Peoples Climate Change Vote and the University of Oxford using a polling method. The questions were refined by the GREAT team with input from partners ZSI and UoB.

The following research questions were developed to be embedded within the selected digital game (SMITE).

- What should the world do about climate change?
- To address the climate crisis, how should your country improve transport?
- To address the climate crisis, what should your country do about energy?
- To address the climate crisis, what do you think your country should do about nature?
- To address the climate crisis, what should governments do about farms and food?
- To address the climate crisis, what should governments do about the economy?
- How can your country better protect people from extreme storms, flooding, droughts, forest fires and other climate impacts?
- Do you think games can contribute to resolving climate change?
- In your view How do you think games could best help tackle climate change?
- What climate topics do you think games can best cover?

- Age.
- Gender.
- Level of Education.

3.3 Collaborate in Design of Games-based Activities. (Step 3)

In collaboration with UNDP stakeholders the game studio partner selected to be a collaborative partner for the UNDP GREAT case study was SMITE which provided free access to the game.

Smite was selected as the game had a high number of active users whilst not being of a scale that could present difficulties in terms of data management for this exploratory study. It was recognised the game had predominantly male players and future case studies aims to address gender balance in a more effective way.

SMITE is a game originally published in 2014 a free to play third person Multiplayer Online Battle Arena (MOBA) digital game developed and published by the Hi-Rez studios for multi platforms including the Microsoft X Box, Sony PlayStation 4, Nintendo Switch and Amazon Luna. In the game players control a 'god' 'goddess' or other mythological figures to participate in team-based combat activities using their tactics, approaches and ability to engage with other players and non-player characters (NPC) 'minions'. The game has multiple modes and supports an active e-sports community that participate in multiple global tournaments and currently has over ten million global players. The Case study explored two discreet approaches to embedding content in the online game SMITE. The first approach involved exploring the use of paid for advertising using 'google ads' embedded within the game. The second involved directly embedding the research questions into game playing experience.

Two alternative visual approaches were developed by Playmob to engage players. The visual approaches were designed in collaboration by the Playmob and Smite design team. The visual approaches were designed using themes from the game in which the activity would be embedded and to appeal to the SMITE community

3.4 Games Activities with Participants (Step 4)

The game participants were invited to respond to a series of questions relating to climate change.

3.5 Data Interpretation and Outcomes. (Step 5)

The responses to each of the research questions is provided herein:

Question 1 What should the world do about climate change?

2365 Responses 93.8% Engagements

Do everything necessary, urgently (1328) 56.2%

Act slowly whilst we learn more about what to do (835). 35.3%

Do nothing (210) 8.9%

Question 2 To address the climate crisis, how should your country improve transport?

2297 Responses 91.1 Engagements

Use more clean electric cars, busses or bicycles (1367) 59.5%

Transport goods on planes, ships, trains and trucks that run on clean energy (1101) 47.9%

Improve the design and planning of cities and rural communities (1463) 63.7%

None of the above (226) 9.8%

Question 3 To address the climate crisis, what should your country do about energy?

2255 Responses 89.4% Engagements

Use solar, wind and renewable power (1710) 75.8%

Waste less energy in homes, buildings and factories (1077) 47.8%

Stop burning fuels that pollute (1215) 53.9%

None of the above (231) 10.2%

Question 4 To address the climate crisis, what do you think your country should do about nature?

2221 responses 88.1% Engagements

Keep the Oceans and waterways healthy (1852) 83.4%

Conserve forests and land (1744) 78.5%

Support local communities, indigenous peoples and women that are environmental stewards (1104) 49.5%

None of the above (127) 5.7%

Question 5 To address the climate crisis, what should governments do about farms and food?

2205 responses 87.5% engagements

Use climate friendly farming techniques (1630) 73.9%

Reduce food waste (1639) 74.3%

Promote plant-based diets (691) 31.3%

None of the above (207) 9.4%

Question 6 To address the climate crisis, what should governments do about the economy?

2185 responses 86.7% engagements

Invest more money in green business and jobs (1439) 65.9%

Require more information on how products are made (1272) 58.2%

Make companies pay for their pollution (1520) 69.6%

None of the above (195) 8.9%

Question 7 How can your country better protect people from extreme storms, flooding, droughts, forest fires and other climate impacts?

2165 responses 85.8% engagements

Install more early warning systems for disaster (1436) 66.3%

Provide good affordable insurance (1233) 57%

Build infrastructure and conserve nature to protect lives and livelihoods (1607) 74.2%

None of the above (157) 7.3%

Question 8 Do you think games can contribute to resolving climate change?

2164 responses 85.8% engagements

Yes (1244) 57.5%

No (380) 17.6%

Don’t Know (542) 25%

Question 9 In your view How do you think games could best help tackle climate change?

2153 responses 85.4 engagements

Raise awareness of climate change (1509) 70.1%

Educate players on what we can do to take action (1305) 60.6%

Raise money for green projects (1435) 66.7%

Enable players to speak up on climate change (1009) 46.9%

None of the above (263) 12.2%

Question 10 What climate topics do you think games can best cover?

2151 response 85.3% engagements

Transport (379) 17.6%

Energy (670) 31.3%

Nature (615) 28.6%

Food and Farms ((408) 19%

The economy (421) 19.6%

Protecting people (335) 15.6%

All of the above (924) 43%

None of the above (227) 10.6%

Question 11 Age.

2147 response 85.2% engagements

Under 18 (102) 4.8%

18 – 35 (1822) 84.9%

36 -59 (224) 10.4%

60 plus (34) 1.6%

Question 12 Gender.

2147 responses 85.2% engagements

Male (1830) 85.2%

Female (191) 8.9%

X (161) 7.5%

Question 13 How old were you when you left education

2120 responses 84.1% engagements

Under 12 (20) 0.9%

12- 16 (83) 3.9%

17-19 (657) 31%

20 or over (803) 37.9%

Still in education (528) 24.9%

Never went to school (29) 1.4%

3.6 Conclusions and Outputs. (Step 6)

The analysis, conclusions and outputs from this study are currently being worked on and outside the scope of this paper which focusseds on the process and methodology applied.

3.7 Public Engagement and Disseminate Outcomes. (Step 7)

Outcomes of the UNDP exploratory case study will be disseminated through established academic publishing channels.

Advocate for Change at Policy Level. (Step 8)

Advocacy and policy interventions are subject to planning with UNDP and outside the scope of this paper.

4. Geographical Context for the Delivery of the Game

This exploratory Case Study was undertaken in a global, international geographical context specified for the delivery of the game. The data collected provides detail of the geographic location of the individual sessions undertaken by players in the game. Players of the SMITE game play on servers predominantly in the United States of America and this has served to highlight that in future studies, where distinct geographical focus may be required, targeted approaches will be taken by the project.

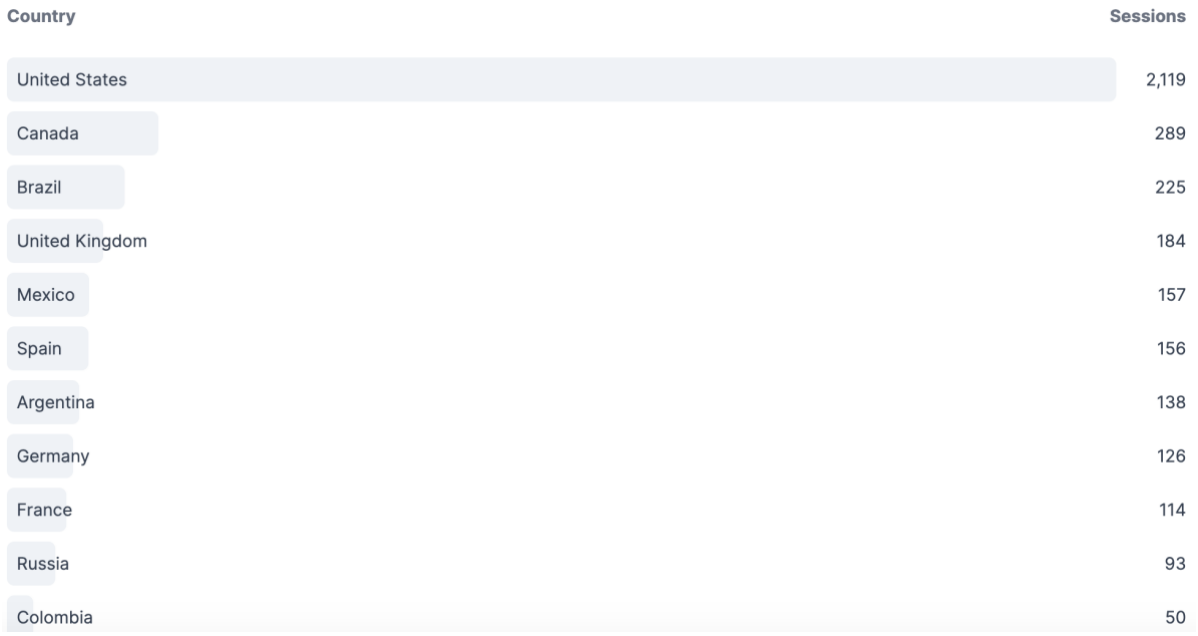

Figure 4: Geographical location

GREAT Project Research Questions.

The overarching research questions of the project were directly mapped to the UNDP exploratory case study activities to ensure alignment with the GREAT project objectives and are detailed in Table 2 below. This ensures that the project research questions are addressed within the case study.

Table 2: Mapping of Project Research Questions to the UNDP exploratory Case Study

GCS 1 United Nations Development Programme (UNDP) Mapping of the Case Study focus and contribution to the GREAT project research questions as proposed.	
Objective 1. Establish ways in which games can be designed to provide a link between citizens and policymakers.	
RQ 1.1: Which methods in digital games can be used to create an information exchange between attitudes and preferences of citizens on societal challenges (e.g., climate change) and policy makers working on these challenges?	Yes
RQ 1.2: How effective and efficient is the use of games in creating an information exchange between attitudes and preferences of citizens on societal challenges (e.g. climate change) and policy makers?	No
RQ 1.3: How can games be used to foster dialogue and collaboration on societal challenges (e.g. climate change)?	Yes
Objective 2. Understand the actual and potential impact that games can have on citizens' engagement in social issues and challenges, and on policy stakeholders' awareness of citizens' attitudes and preferences.	
RQ 2.1: What are the affordances of games in developing citizens' engagement with challenges and dilemmas arising from societal challenges like climate crisis?	No
RQ 2.2: What are the affordances of games in informing policy on the societal challenges like climate crisis?	?
RQ 2.3: What is the value to policy stakeholder groups of the information on citizens' attitudes and preferences generated through games-based activities?	No
RQ 2.4: What is the value to citizens of enabling them to engage in policy discourse through the design of and engagement in games-based activities?	No

GCS 1 United Nations Development Programme (UNDP) Mapping of the Case Study focus and contribution to the GREAT project research questions as proposed.	
RQ 2.5: How generalisable are the GREAT methods to other global challenges or other fields of research and innovation?	No
Objective 3. Provide practical guidance for games developers and policy stakeholders.	
RQ 3.1: Which are the key interventions in the GREAT method which lead to its effectiveness and efficiency?	No
RQ 3.2: Which variables need to be taken into consideration when adapting the method to new contexts?	Yes
RQ 3.3: What documentation and/or training is required for games developers, policy stakeholder groups?	Yes
Objective 4. Assess the benefits and risks to individuals and society of using games to promote engagement with societal challenges.	
RQ 4.1: What are the benefits and risks experienced by citizen participants, policy stakeholders, games designers and providers, as well as policy makers and organizations, when they participate in the GREAT method?	No

5. Discussion

Earlier project pilots carried out in the summer of 2023 and the design of the case study cycle steps made a start on addressing this question. If the method/methods as defined in RQ1.1 are characterised by the step cycle, then case study addresses this, though the early steps were not conducted exclusively by the GREAT project which developed the approaches and questions of earlier UNDP validated activities. The application of the Playmob approach using established digital games tested the method confirming an information an indication of preferences to policy makers was supported by the methods deployed in the case study.

The case study provides substantive quantitative data on those that were engaged and players that have completed surveys. The data provided in this paper suggests that the method is 'effective' though more detailed evaluative comparative study would be required to validate the method as being 'efficient'.

The UNDP exploratory case study does not provide any qualitative response to the research question.

In this case study the focus was on the use of games to foster dialogue and collaboration. There were two business models applied to foster dialogue and collaboration the first, Google Ads, being the purchase of advertising space (using google ads) the second, in-game rollout, engaging directly with games development studios to embed the approach within gameplay.

Table 3: Comparative engagement response rates Google Ads and In-game rollout

	Google Ads	In-Game Roll out
Reach/First page load	7,257	4,352
Engagement	398 (5%)	2,539 (58%)
Completion	179 (45%)	2,148 (84%)
Community Sign Up	18 (10%)	282 (13%)

The data relating to engagement and completion suggests that direct engagement in this case was more effective in fostering and supporting this dialogue. The data further suggests that games can be used as a medium for supporting dialogue. At least anecdotally the study does serve to identify affordances but does not provide substantiated evidence to support these, whilst the quantitative data generated is not compelling.

Data was generated that relates to citizens' engagement, however:

1. There is insufficient data to substantiate player engagement.

2. The case study question is not clear about the meaning of 'affordances', and if indeed this is a useful word to guide our inquiry.
3. There is a potential overlap with RQs 1.1, 1.2, & 1.3.

The Case Study involved discussion with stakeholders, though in this example most of the consultation occurred in earlier activities not managed by the GREAT project. The consultation with UNDP as sponsor of the activity provides limited evidence of sponsor engagement. In future Case studies, where practical and possible questions could be posed to UNDP on what 'value' in a qualitative sense they apply to the information provided to them via this activity and specifically examination of how this games-based activity data generated is used by them.The Case Study does not directly identify key interventions though game interventions within the GREAT method are, at least, implicitly identified in this Case Study access to large volumes of players for example could be construed as an effective characteristic of the intervention. Consultation and co-creation of engaging question sets could be considered likewise as could association with large scale successful commercial games. It will be possible to undertake a comparative study as part of the full UNDP Case study later in 2024 involving future refinements and improvements informed by this Case Study could be incorporated into the research cycle where applicable to ongoing activities with the GREAT Case study sponsors.

Each future case study undertaken by the project could produce a theory about the context (the characteristics of the participants, the circumstances) and identify the characteristics of project intervention that made it work or not work (i.e. an explanatory mechanism). These insights could be accumulated to suggest "use it, but when you do, be aware of these decisions you have to make". Further important insight could be attained through internal evaluation by the GREAT team and or supplemented by the documented reflections of stakeholders and sponsors Useful input could be obtained through the combination of citizen science approaches adopted in dilemma-based activities in the project with the Playmob method to produce rich quantitative data to supplement the large data sets produced through this method.

6. Conclusion

The UNDP exploratory case study detailed has provided valuable insight into the methodology and the research cycle to be applied in further case studies as they are undertaken in the GREAT project. The case study is focussed on a methodology to apply digital games to engage players in discussions focussed on climate change. Addressing the primary research objectives of the project the number of players responding directly to the intervention provides limited early indication of evidence of the efficacy of the approach. The response data is provided directly to the UN to help inform policy development.

The case study provided an opportunity to test two distinct approaches to working with games studios on a large scale. The case study provided evidence that working directly with the studios and embedding the activity within play is more effective in engaging players with the activity than using 'paid for' adverts within games.

Opportunity was provided to test the Playmob approach from a technical perspective, of server functionality and in the management of raw data. The case study did expose a deficiencies in the data in terms of its use for detailed analysis, this is being addressed by the GREAT data teams, reuse, interoperability of the data as it is currently formatted requires further work and standardisation, if the data sets are to be examined and used in other contexts or if the data sets are to be provided directly to the sponsoring stakeholder group for the activity.

The case study has been used in discussion with UNDP to inform the development of a future much larger scale implementation in partnership with several games and studios scheduled for late 2024. It is anticipated that recommended changes both to the methodology and technical improvements will be incorporated in this future activity.

Abstract: The UK's Higher Education landscape embraces global diversity, with the country ranking second as a destination for international students. However, limited research attention has been given to understanding the challenges faced by these students, particularly regarding language proficiency and cultural adaptation, which affect their sense of belonging. This study aims to address these challenges by investigating the impact of ScLINGO, a web-based gaming platform, on enhancing language skills and fostering social integration among international students, including those studying to become health professionals. Drawing on existing literature, the study seeks to fill this gap and promote sociocultural adaptation through a digital gamified language-learning tool. ScLINGO offers personalized bingo cards and interactive language exercises to familiarize players with everyday phrases and enhance language proficiency, encouraging both independent learning and collaborative interaction. The study navigates through three phases of game development, informed by insights and feedback from practitioners, students, and technology developers. By promoting cross-cultural competence and communication, the study aims to create a more inclusive higher education environment. ScLINGO's pilot phase addresses the rationale behind the game, building-up phases, and stakeholder feedback, anticipating its role in addressing cross-cultural maladjustment and facilitating effective support mechanisms for international students. Ultimately, the findings aim to contribute to the development of support systems facilitating international students' transition and adaptation to diverse cultural and learning contexts.

Keywords: Belonging, Communication, Gaming, International Students, Language

1. International Students and Language

International students are an integral part of higher education in the United Kingdom, comprising 20% of the total student population. According to Bolton *et al.* (2023), in 2021/22 there were 679,970 overseas students studying at UK universities. International students commonly encounter psychological challenges including acculturative stress, homesickness, loneliness, frustration, depression, isolation, and feelings of worthlessness (Tseng & Newton, 2002). Given their physical distance from family and friends, they often have less access to social support compared to local students (Bisadi *et al.*, 2013). However, fostering communication with peers and building a social network can help alleviate their need for social support (Poyrazli & Grahame, 2007).

Although studying in a cross-cultural setting may be valuable, international students may experience challenges and acculturative stress in adjusting to the new environment as it is a complex issue that depends on several factors. They may be vulnerable to stress, which refers to the physical, social, and psychological impact of adaptation to a new culture (Poyrazli and Grahame, 2007). They may experience homesickness and social isolation, a cultural difference and a lack of social support (Dee & Henkin, 199). They often feel overwhelmed by cultural differences (Özturgut, & Murphy, 2009). Examples of day-to-day needs and use of language are such as finding suitable accommodation, applying for social security ID, learning about the transportation system, adapting to local food and being familiar with the city and campus. Consequently, feelings of confusion, anxiety, sense of loss and isolation may arise. If not managed properly, international students' academic success, social wellbeing and psychological health could be in jeopardy (Hechanova-Alampay *et al.*, 2002). Additionally, they may face the fear of failure of academic achievement. Interestingly, many of these questions and challenges can be relived and resolved by the student asking his/her peers for help, however with the limitation of different language and/or accent these challenges persist. Heish (2007), noticed that international students kept silent in her American classes. The participant internalized a deficient self-perception as a useless person in her group discussions and perceived that a deficient identity was attributed to her. Studies that explore social connections within the campus commonly adopt the notion of belonging. Belonging involves feeling connected and the extent to which students feel personally accepted, included, and supported by others in the educational social environment (Goodenow, 1993). Research suggests the importance of establishing relationships with

international students so that other “good practices” may occur, where every location has a range of spoken languages or dialects. Therefore, students need an icebreaker when they start university life away from their mother tongue. The icebreaker supports them in acclimating to the new linguistic environment, fostering connections with peers, and building confidence in social interactions.

2. The use of Amification in Educational Settings Across Different Cultural Contexts

Gamification has emerged as a transformative approach in educational settings, leveraging game design elements to enhance student engagement and learning outcomes. Across different cultures, gamification has been shown to break down barriers and foster inclusive learning environments. For instance, a study by Bukina *et al*. (2022) found that gamification effectively reduces intercultural barriers, such as stereotypes and language differences, promoting better communication and collaboration among international students. For medical students, virtual patient simulations, like those offered by "Body Interact," allow medical students to practice diagnosing and treating patients in realistic scenarios, enhancing clinical skills and decision-making through interactive, gamified experiences (Kononowicz *et al*.,2019). Furthermore, the work of Naderi and Moafian (2023) highlighted the success of non-digital gamification methods in vocabulary learning, particularly in culturally diverse classrooms, suggesting that both digital and non-digital games can be tailored to meet the unique needs of students from various cultural backgrounds. These findings underscore the versatility and effectiveness of gamification as an educational tool, capable of bridging cultural gaps and enhancing learning experiences across the globe.

3. International Students as Health Professionals

As international students transition into roles as health professionals (HPs), a deeper understanding emerges regarding the significance of language in their professional practice. Feeling a sense of belonging in the workplace not only fosters positive outcomes like independent work, professional growth, and effective teamwork but also contributes to a fulfilling work experience. Conversely, the absence of belonging or feelings of social exclusion can hinder learning opportunities, compromise human dignity, and evoke negative emotions such as alienation, diminished self-esteem, resignation, and apprehension towards challenges. According to Jamaan (2020); Cena *et al*., (2021), in Medicine, users are exposed to scientific and commercial medicine names. Another dimension for HP students, is that communication is across more than one domain; HP-patient and HP-HP (peer) communications are both barriers to effective communication. According to Mattila (2010), there is a need to develop clinical practice arrangements when the language of the learning environment is other than that of the student nurse. This study focuses on international students who study and live in Liverpool and experience Scouse in their day-to-day lives. Scouse, officially known as Liverpool English or Merseyside English, is an accent and dialect of English associated with the city of Liverpool and the surrounding Liverpool City Region (Honeybone, 2007).

The study focuses on international students’ sense of belonging in the university community through language communication using a web-based application, entitled ‘Schlingo’, which aims to gamify the use of day-to-day language. Examples of the different meanings of words in English compared to the Scouse and be found in Table 1. ScLINGO has a benefit for HPs who are going to be working in the NHS and a health profession, interacting with patients, who will come from different age groups. And sorts of backgrounds. How to interact with them and minimize the potential for language misunderstanding.

Table 1:Scouse terms and meaning of words

Scouse Term	Meaning	Alternative (more common) Meaning
Part 1- Day-to-day language		
Boss	excellent or satisfactory	Superior or leader
Sound	Good or okay	Physical sensation of sound or volume level
Goin’ the ozzy	Visiting hospital	
You’re a wool	Someone from the surrounding areas of Liverpool.	Wool: is the textile fibre obtained from sheep a is the textile fibre obtained from sheep a
Part 2 - Clinical Terms		

Scouse Term	Meaning	Alternative (more common) Meaning
Patient is settled	Patient is not disturbing the member of staff	Patient has become calm or stable
Bulk	In pain	Big, huge

In summary, considering the challenges that international students face from academic, social, and cultural perspectives. Additionally, for health professionals who communicate with patients and colleagues in the health sector, the risk of misunderstanding or misinterpretation of a word, adds a professional perspective to these challenges for international students.

4. Gaming for International Students

Games have been received positively by international students in terms of high engagement, experiential learning, the learning process, personal versus professional, self-efficacy and knowledge (Hamari *et al.*, 2014) For Bukina *et al.* (2022), elements of gamification for international students break down intercultural barriers such as stereotypes and prejudices, non-verbal and language barriers. For health professionals, little attention has been focused on using digital games to address international students' adjustment issues (Bissadi *et al.*, 2013). The area of health professions, particularly concerning international students, and the utilization of gaming—both digital and non-digital—to support language acquisition in their work practice, remains under-researched. While there is a growing body of literature exploring the integration of gaming technologies in education and healthcare, there is a notable gap in understanding how these tools can specifically aid international students in navigating language barriers within healthcare contexts. Given the increasing globalization of healthcare systems and the diverse linguistic backgrounds of healthcare professionals, further research in this area is crucial to develop effective interventions and support mechanisms. By leveraging the immersive and interactive nature of gaming, healthcare educators can potentially enhance language learning experiences for international students, ultimately improving their communication skills and patient care outcomes (Kukkohovi *et al.*, 2023). This avenue of inquiry holds promise for addressing the unique challenges faced by international students in the health professions, fostering cultural competence, and promoting inclusive healthcare environments. Consequently, the area of health professionals who are international students, and using gaming (digital or non-digital) to support them in using language in their work practice, is under-researched. In summary, the focus of this study is on the use of the game 'ScLINGO' for international students and health professionals to develop their sense of belonging, and improve their social communication, professional language, and communication at work and in day-to-day life practice.

5. Theoretical Framework

Activity-based theory is a multidisciplinary paradigm for comprehending the relationship between action and cognition, built upon cultural-historical activity (Vygotsky, 1978). As described by Kuutti (1996), activity theory emerged from Vygotsky's psychological research into learning, specifically from his discussion of the mediating role of tools (e.g., a game) to facilitate cognitive processes. Activity theory is suitably situated in learning, with individual actions informed by a wider cultural and historical context (diverse linguistic, cultural, and ethnic backgrounds of international students). Stemming from Vygotsky's socio-constructivism theory and the notion that learning occurs in a socially mediated environment, (Kuutti, 1996 and Squire, 2002) expanded the model of activity theory and added another layer to the system to represent the community within which the activity takes place. This forms one of the bases for developing this game, as the development of negotiations and a dialogic approach with international students is one of the main objectives of this study. The community here includes the Community of Practice (CoP), a group of people who share a craft or a profession (Wenger, 2006), students, peers, colleagues, and patients in their work placement. Activity theory includes the used tool (ScLINGO), with the subjects being international students who are health professionals. The applied rule(s) is the language (English Scouse), and the community where the learning of language mediates includes peers and colleagues. The division of labour (elements to be developed) includes teamwork, collaboration, and social communication. The expected outcomes are developed senses of community belonging, social communication, and the use of professional language. Figure zzz below illustrates the Activity theory in using the ScLINGO game.

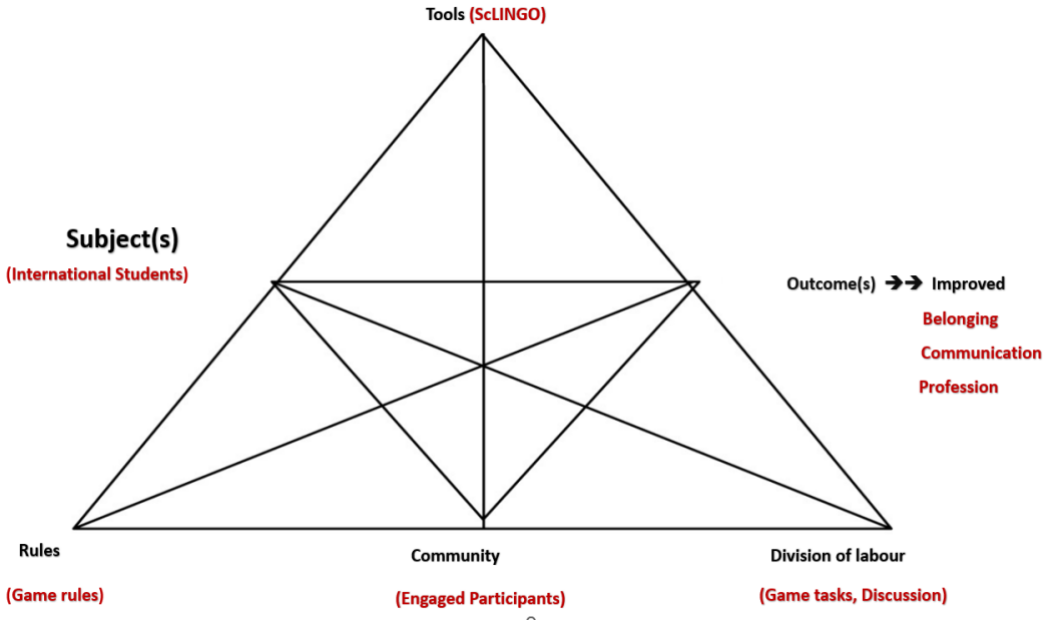

Figure 1: ScLINGO in Activity Theory

Activity-based theory posits that learning is most effective when individuals engage in hands-on experiences and active participation. By utilizing this theory, the game (ScLINGO) provides a dynamic platform for international students and health professionals to immerse themselves in practical scenarios, fostering a deeper understanding of cultural nuances and professional communication skills. Through active involvement in the game, participants can enhance their sense of belonging, refine social communication abilities, and develop proficiency in both professional and everyday language usage, thereby facilitating smoother integration into their respective environments. Besides, in building up the game, the team acknowledges that it should be rule-based which makes players understand the environment; 2) Games should be responsive which means giving players the controls; 3) Games should challenge the players; and 4) The players must build progress to achieve the game's goal (Prong *et a*l., 2018). Besides, in addition to these elements, ScLINGO has been designed to incorporate interactive group discussion and feedback by peers and the class facilitator to provide players with immediate guidance and encouragement as they navigate through the game's challenges.

6. Methodology

6.1 Conceptual Framework (Participatory Action Research (PAR))

Participatory Action Research (PAR) has been employed as a methodological approach for developing the ScLINGO game through a series of cycles, enabling active collaboration between researchers, international students, and health professionals throughout the game's design and implementation phases. It's worth mentioning that this research is still in the building-up stage of ScLINGO, aiming to simultaneously investigate, reflect, and solve issues that arise within the development and game usability, as APR suggests. Action research conducts research and takes action concurrently. According to (Baum *et al.*, 2006; Crane, 2010), this approach fosters a sense of ownership and engagement among participants (Ozaki, 2018), ensuring that the game addresses their specific needs and challenges in real-world contexts. However, a potential limitation of APR is the time and resources required for ongoing collaboration by different stakeholders and iteration, which may extend the development timeline. APR is iterative; plans are created, implemented, revised, and then implemented, lending itself to an ongoing process of reflection and revision. In action research, findings emerge as action develops and takes place; however, they are not conclusive or absolute, but ongoing (Koshy, 2010). The multiple iterations allowed us to understand domain-specific design constraints and provided insights into governing variables that drove the direction of our research. Therefore, we explain our approach as a double-loop learning process.

6.2 What is ScLINGO?

ScLINGO aims to enhance language skills and social integration among international students, addressing communication complexities in university environments. It promotes inclusivity and awareness of language diversity, fostering a sense of belonging through gameplay and discussions in classes. Future plans include tailored versions for various audiences, such as healthcare professionals in physiotherapy, expanding its utility beyond mental health nursing. ScLINGO considers two main aspects of the language (profession) and the language culture (day-to-day language). Therefore, it has two parts; C*LINGO* is based upon professional mental health terms, whereas *SLINGO* is based upon Scouse dialect. The breakdown of ScLINGO (S+C+L+INGO) is explained below.

6.2.1 S (Scouse)

Scouse, originating from Liverpool, encompasses both a dialect and the city's residents. Its name derives from a stew eaten by sailors (Hughes & Trudgill, 1979). The accent and language feature unique pronunciation, vocabulary, and intonation, influenced by Irish, Welsh, Lancashire, and maritime cultures. Notable features include terms like "boss" (meaning excellent) and "sound" (meaning okay). This distinctiveness is evident in various word meanings between English and Scouse.

6.2.2 C (Clinical)

The initial beneficiaries of this game are clinical practitioners in the Faculty of Health and Life Science at the University of Liverpool. More examples of the different words meaning between Clinical English and Scouse English can be found in Table 1 – part 2.

6.2.3 LINGO (Language + Bingo = Lingo)

Bingo is a well-known game dating back to the 16th century, where players mark off numbers on cards as they are randomly drawn by a caller. The objective is to complete a predetermined pattern on the card, such as a straight line or full card, to win a prize. Bingo is commonly played in various settings, including bingo halls, community centres, and online platforms, and it has a long history dating.

6.3 ScLINGO Team

One of the drivers of employing PAR is the engagement of different stakeholders in the development of the game (Koshy, 2010). Baum *et al.*, (2006) addressed PAR in health research and acknowledged that this approach that researchers and participants undertake, improves self-reflective inquiry, so they can understand and improve upon the practices in which they participate and the situations in which they find themselves. Hence, ScLINGO team across the iterative approach includes; pedagogical expertise (e.g. educators), professional expertise (e.g. nurses) and technological expertise (e.g. programmers).

6.4 ScLINGO Development Process

ScLINGO's phase 1 of development commenced with a cardboard prototype, facilitating hands-on testing and refinement. A ‘phase 2’ saw the transition to a digital version, incorporating online multiplayer functionality and expanded content options. Future iterations aim to integrate user feedback, explore additional features, and establish partnerships to enhance effectiveness and reach.

6.5 Phase 1: Carboard Game – CLINGO & ScLINGO

ScLINGO initially began as a non-digital game, utilizing pen and paper. Each student would require one or more printed cards before the session, resulting in extensive preparation and environmental concerns. However, due to its positive reception by both teachers and students, the decision was made to transition the game to a digital format. In the game, participants would draw cards containing language prompts or challenges and engage in interactive exercises to enhance their language skills and social integration. It is noted that at this stage, the game has two separate sub-sections (1) CLINGO (clinical words) (2) SLINGO (Scouse words). See Table 3 below.

List of Scouse words - for the facilitator

Scouse	Meaning	Example
Hiya Tya Alright What's 'appenin'	All greetings to say hello	"Hiya" "Tya" "Alright" "What's 'appenin'"
Ta-ra	Goodbye	"Ta-ra"
Ta Nice one Cheers	Thank you	"Ta" "Nice One" "Cheers"
La'	Lad	"What's 'appenin' La'"
Bird	Used when referring to someone's girlfriend	"I'll have to ask me bird first"
'Arl Fella Da'	Dad	"Am goin' the pub with me 'arl fella"
Ma	Mum	"Am goin' shoppin' wid me Ma"
Ar kid	Used affectionately when referring to a brother / cousin or friend	"Me and Ar Kid are on the way"
Bezzie	Best Friend	"This is me bezzie, Ellie"
Proper	Denoting something that is truly what is said or regarded to be	"I proper love being a scouser"

Printed card for the ScLINGO game – for the students

Clingo clichés

Challenging behaviour	Successful Leave	Therapeutic relationship
Nurses discretion	Unsettled	Optimum health
Risky Behaviour	Maintain a safe environment	Explicit Language
Increased arousal levels	Contributing Factors	Boundaries
Regular observation	Community access	Crisis

Table 2: ScLINGO on printed papers (phase 1)

It is worth mentioning that the primary resource for the Scouse words database originates from grey literature, such as "The Liverpudlian" (2023). Subsequently, the team continually updates and expands this database. Team co-creation fosters engagement and encourages ownership (Naik, 2014). Another aspect to consider is the distinction between the roles of the teacher (module content expert) and the facilitator (Scouse expert) when playing ScLINGO with students in the classroom. Finally, ScLINGO's non-digital version has been piloted with a small cohort of undergraduate students and received positive feedback from both students and teachers. However, using pen and paper does have its limitations, see a teacher quote confirms this difficulty by stating, “Pen and paper game is a hard work for you I think when you play it on a paper-based version obviously give the cards out and I have a master sheet and I would read that sheet with the master sheet laid out if I was to start at the top and work my way down where the digital package randomly generates So it was really nice to kinda have it in a new format it’s phenomenally easy to utilise in the current package click and that does the handwork for me.”

Upon agreement by the game stakeholders (lecturers, practitioners, etc.), it was decided to digitalize ScLINGO (phase 2). This shift is well-aligned and confirmed by literature (Naik, 2014; Naderi *et al.*, 2023), which demonstrates the advantages of technology in terms of accessibility and ownership (each student can access it on their mobile phone or computer screen), besides the ease of use and ability to upgrade game features. However, according to Naderi (2023), digital games should not lead to ignoring the benefits of non-digital activities and play in language education. For ScLINGO, according to this study, facilitators who experienced the non-digital version of the games have explained that the evolved discussion using printed paper was richer than students looking at their mobile screens, as Naderi *et al.* (2023), suggest that technology restrains face-to-face interaction. The preceding claim has been confirmed by the teacher’s view that states; “students may have more engagement in board games than their phones.”

6.6 Phase 2: Digital Game – CLINGO & ScLINGO

At this phase, ScLINGO (a Bingo-style game) has been digitized into a web format written with web standards JavaScript/HTML/CSS. There are two web pages: HTML controls the layout of the pages, CSS styles the look of the pages, and JavaScript adds functionality to the pages. The game is split into two web pages. The first page, called "The Caller," serves as the bingo caller itself and is used by the facilitator of the game. The second page, "The Card," is a webpage that generates bingo calls and must be opened by all players.

6.6.1 The Caller

The caller is a webpage that the facilitator of the event opens, placing it on a large screen or whiteboard where all participants can see it. When the page is loaded, a simple piece of JavaScript randomizes the order of the phrases. Subsequently, the JavaScript attaches these phrases to buttons and positions them in the centre of the screen. Because they are randomized, the order of the items on the page changes each time the page is loaded. Figure 1.1 shows the caller when first loaded.

Figure 2: The ScLINGO caller

The order of items is randomized each time the page loads, with a hidden list created simultaneously. This hidden list contains all Scouse phrases in a new randomized order, along with sound file locations. To initiate the game, the facilitator can press either "AUTO" or "NEXT." Pressing "NEXT" triggers JavaScript to read the first item on the list, causing it to flash red for 2 seconds, play a sound effect, and display in a bottom box. The top item is then removed, repeating the process with a new phrase upon subsequent "NEXT" presses. "AUTO" mode repeats these actions every 5 seconds. The game stops once all phrases are read, though usually manually before completion. This system enables facilitator-paced gameplay with randomized phrase presentation, enhancing engagement and control.

Figure 3: The Screen when the auto button has been pressed

6.6.2 The Card

During the setup phase, the facilitator loads "The Caller" on a large screen while players access the "Card" page by typing in a URL or scanning a QR code. Similar to "The Caller," the Card is an HTML webpage with CSS and JavaScript. It displays a 4x4 grid with 10 randomly selected Scouse words placed at random positions. The webpage's size adjusts based on where it's accessed. Users can access it directly or through platforms like Microsoft Teams. Each user receives a card with 10 different items. When a phrase is called out, users can cross it off their card by clicking the corresponding item on the webpage. Once all phrases are crossed out, users are prompted to call "Clingo."

Figure 4: Ticking correct word on A ScLINGO digital card

6.6.3 Piloting ScLINGO in Phase 2

The pilot involved 12 students, 1st year MSc mental health nursing students comprising a mix of local, non-local, and international students, all enrolled in mental health programs. The session was facilitated by one teacher and one facilitator. At this stage, CLINGO (https://ceds-demos.net/tools/clingo/) and SLINGO (https://ceds-demos.net/tools/sclingo/) are separate games, CLINGO started, followed by ScLINGO to prepare students before going to their placement and encourage discussion between them about used terms in their practice. Towards the end of the session, lasting 15-20 minutes, the conversation shifted towards professional language, especially as students had recently received their first timetable for clinical placements. This led to a discussion about the significance and relevance of professional language within their field.

Table 3: collected quotes from ScLINGO users (teacher, facilitator and students)

Theme	Quote
Teacher & Facilitators' quotes	
Social Discussion	"We revisited and we had a discussion, you know, both from the students' experience, you know, what did they think these phrases mean? what his professional opinion was, what they meant, and then that discussion on a word-by-word basis. While playing the game, the discussion was about the value of the word and benefits to the patient."
Learning and competitiveness	"So, I think the process of the interface of having the words and stuff like that was a real catalyst for a learning experience and getting the students thinking. Besides, The game is competitive in its essence you can see while students are playing. They are checking on each other to see who is ahead".
Accessibility and availability	"So it makes life a lot easier for the person facilitate the game. Accessible and available because it is it's an online platform, so you're not worried about haven't equipment with you. It's just it's available because it's available for anyone with a smart phone, for students, withe ScLINGO, students own the game on their phone (it is about ownership)."
Wider engagement	"just trying to raise awareness of all that it could be used as an icebreaker, but I think it's more than an icebreaker activity. I think it is saying something about not just particularly Liverpool, every geographical region of every country. So, you know, in the UK, whether you're in Liverpool, Newcastle, Birmingham, Glasgow."
Student's quote	
"As someone with a strong cultural identity, I recognize how fun and engaging it can be for friends and colleagues from outside the region to understand the many terms that local people use within daily communications, and how this can be an excellent tool to aid therapeutic engagement."	

6.6.4 Preliminary Findings

The team has collected qualitative findings based on collected feedback from interviews with students who experienced ScLINGO, these findings include Improvement and enhancement of Language Proficiency, Social Integration and Professional Communication.

Improved Language Proficiency: Interviews with participants indicated that students felt a notable improvement in their language skills after using ScLINGO. One student stated, "I feel more confident going to the shop now, especially with local phrases." This qualitative feedback suggests that gamified learning tools can significantly enhance language acquisition among international students.

Increased Social Integration: Feedback from students revealed a strong sense of social connectedness developed through the use of ScLINGO. A student shared, "Playing the game helped me make new friends and feel more at home." This highlights the potential of ScLINGO to foster a sense of belonging and community among international students.

Enhanced Professional Communication: Health professional students reported increased confidence in clinical settings. One nursing student mentioned, "Using ScLINGO made it easier to understand medical terminology and communicate with patients and colleagues." This highlights the practical benefits of ScLINGO in preparing students for real-world clinical interactions.

7. Enhancing ScLINGO: Implementing Strategies for Effective Integration and Broadened Engagement

The team at this current stage is refining ScLINGO and considering feedback from students and practitioners (lecturers and facilitators). This phase focuses on implementing four trending perspectives in the new version of ScLINGO, each designed to optimize user experience and educational outcomes. Ethical approval has been obtained to conduct a study on the impact of ScLINGO on students' sense of belonging and its social implications in both social and clinical practice (Ref, year). This study will commence after the induction day, where ScLINGO will be introduced to the wider university community.

7.1 Co-creation Process

From a methodological perspective, ScLINGO embraces a co-creation process, allowing users, including students and teachers, to actively contribute to expanding and refining its database. Research has shown that involving users in co-creating educational resources can significantly enhance their impact on learning outcomes (Ozak, 2018) and explore opportunities and limitations (Ismail & Adam, 2022). By empowering users to shape the content of ScLINGO, the game becomes more tailored to their specific needs and preferences, thereby maximizing its effectiveness as a language-learning tool. Stakeholders include Pedagogy Experts (teachers), Professionals (e.g. nurses), Technology Team (e.g. developers) and End Users (Students).

The co-creation of the game has a positive impact on students' sense of ownership over their learning. It allows them to construct their learning, leading to increased motivation and engagement (Ozak, 2018). In the study context, ScLINGO users (students and teachers) will have the opportunity to co-create the thesaurus for ScLINGO database, by adding new phases to a virtual ‘postbox’.

7.2 Facilitator Training

One of the outcomes from the pilot phase addresses the importance of the facilitator's role in using ScLINGO, as highlighted by a teacher quote: "The facilitator needs to have some knowledge of phrases to translate the terms, deconstruct them, and put them into the context of how they fit within a professionalized program. From a professional perspective, this means that you need to capture the voice of the person you serve, or you breach the regulations." Therefore, the next phase plans to provide ScLINGO facilitators with 'train-the-trainer' guidelines to support effective implementation in educational settings. These guidelines equip facilitators with the knowledge and skills necessary to utilize ScLINGO's various playing modes, including individual, group, and role-play formats. Each mode offers unique benefits, such as fostering independent learning, encouraging collaborative interaction, and promoting real-world language use. By offering diverse playing options, ScLINGO caters to different learning preferences and styles, ensuring that all users can engage with the game in a manner that suits their needs.

7.3 Wider Engagement

Although ScLINGO focuses on Scouse, the team envisions the importance of raising awareness about interprofessional learning (IPL) on a broader scale. Nationally, similar issues would arise if someone were working in Newcastle with Geordie accents or Glasgow with Glaswegian accents. Therefore, we are using a particular city and regional dialect to illustrate a broader set of verbal communication issues. I believe we should consider integrating it into the IPL components accessible to all students. Consequently, there are two planned scopes for ScLINGO's wider usability: educational integration across taught programs and inclusivity for use across all university students to promote social engagement and develop a sense of belonging.

7.3.1 Scope 1: Educational

The current ScLINGO game has primarily been utilized in modules associated with mental health topics, such as the MSc in mental health nursing program. However, considering that mental health is relevant across various disciplines, facilitators should also consider incorporating ScLINGO into other programs, such as adult nursing or physiotherapy. Therefore, ScLINGO meta-versions are planned to be developed for each module, providing specialized content tailored to the unique learning objectives and requirements of different courses.

7.3.2 Scope 2: Inclusiveness

ScLINGO prioritizes usability and wider dissemination, particularly in large-scale educational settings. For example, during an induction day welcoming 900 new students in September 2024, ScLINGO will be seamlessly integrated into the orientation program. Its user-friendly interface and intuitive design will facilitate easy access and navigation for all participants, enabling them to quickly familiarize themselves with the game and its features. The role of orientation events for international students has been addressed by Bisadi *et al.* (20213); the role of orientation programs in transferring university information should not be ignored.

7.4 Bridging Generation Language Gaps

The final outcome of piloting the ScLINGO game is the observation of a generation and language gap. It was noted that certain terms were suggested by tutors who may be three or more decades older than students, while others were proposed by students themselves. Interestingly, some terms were identified by younger individuals rather than their elders, and vice versa. This observation suggests the potential for bridging the language gap between generations. Additionally, there is a social awareness aspect regarding the use of certain words that might be offensive, stereotyping, or unacceptable within the community (e.g., "female" being equated to "Judy")

8. Conclusion and Recommendations

The development of ScLINGO is an ongoing collaborative process involving Communities of Practice (COP) (Wenger, 2006), comprising pedagogy experts, professionals, technology teams, and end users. Integrating Participatory Action Research (PAR) methodologies and activity-based theory, ScLINGO offers a dynamic platform for international students and health professionals to enhance their sense of belonging, improve social communication, and refine professional language skills in both workplace and day-to-day settings. Based on feedback from phases 1 and 2 of ScLINGO's development within its COP, it's concluded that ScLINGO incorporates diverse scenarios and cultural contexts, enriching the learning experience for international students and health professionals. Pedagogically, the next version of ScLINGO will integrate into existing language and clinical professional development curricula (e.g., physiotherapy). Socially, ScLINGO will be employed as an icebreaker on induction day for new university students in the upcoming academic year. Additionally, empirical data, collected through surveys and interviews, will evaluate ScLINGO's impact on students' sense of belonging, social communication, and professional practice. This longitudinal study will extend throughout the entire next academic year.

Additionally, empirical data collected through surveys and interviews will evaluate ScLINGO's impact on students' sense of belonging, social communication, and professional practice. This longitudinal study will extend throughout the entire next academic year.

8.1 Expected Results and Implications

The expected results from the implementation of ScLINGO include improved language proficiency, enhanced social integration, and a stronger sense of belonging among international students. These outcomes are anticipated to have significant implications for both academic and professional practices:

1. **Influence on Current Practices**: The findings could inform the development of more inclusive and effective support systems for international students in higher education institutions. By providing a gamified language-learning tool, universities can better support the linguistic and social adaptation of international students, ultimately contributing to their academic success and overall well-being.
2. **Theoretical Approaches**: The study's outcomes may influence theoretical approaches in digital gamification for language learning. By demonstrating the effectiveness of a gamified approach in enhancing language skills and social integration, the study can provide valuable insights for the development of future educational technologies and methodologies.
3. **Professional Implications**: For health professionals, the ability to effectively communicate in both everyday and clinical settings is crucial. The use of ScLINGO can help international health professional students overcome language barriers, leading to improved patient care and more effective teamwork in healthcare settings. This can contribute to the development of more culturally competent healthcare practitioners who are better equipped to serve diverse populations.
4. **Academic Relevance**: By addressing the specific needs of international students and providing a practical solution through ScLINGO, the study can highlight the importance of tailored educational interventions in fostering a supportive and inclusive learning environment.

In summary, the development and implementation of ScLINGO aim to address critical challenges faced by international students, particularly in the context of language learning, social integration and their professional practices. By enhancing their sense of belonging and communication skills, ScLINGO has the potential to make a meaningful impact on their academic journey and future professional practice.

Games Design Frameworks: A Novel Approach for Games Design Pedagogy

David James and Christopher J. Headleand
Staffordshire University, Games Institute, UK

c.headleand@staffs.ac.uk
D.James@staffs.ac.uk

Abstract: The discipline of Games Design has surged in popularity in higher education as a route to industry for aspiring game developers. Notably, at the time of writing 138 UK Universities are now offering game design degrees, and many further education institutions. This growth is not only in volume but also in the diversity of students who enrol in these courses. Young learners, coming from various backgrounds and with differing levels of professional and academic experience, are drawn to games as a field of study. Games disciplines (such as Games Art, Design, and Programming) are often seen as more accessible than their comparative parent disciplines (such as Computer Science). This diversity presents both an opportunity and a challenge for educators: to develop teaching methodologies that not only cater to a wide range of experiences but also effectively prepare students for the creative and technical demands of the games industry. This paper introduces a pioneering design concept utilized in the pedagogy of game design, namely the use of game frameworks. A framework is a structure built in a video games engine, containing a pre-made, playable game experience, which students are taught to build upon and modify. Frameworks abstract and modularise fundamental, complex elements of the game creation process, allowing new learners to quickly become engaged with the iterative process of designing gameplay. It also allows educators to focus on a specific area of interest. For example, a student can focus just on the UI elements of the game for a whole module of study, without needing to have built the entire game first. This allows students to focus on the elements being taught, without introducing a significant amount of non-assessed content just to enable to learning. This position paper discusses our application of this approach, including the process of framework design, supportive assessment, successes and challenges.

Keywords: Games Design, Pedagogy, Video Game, Games Education, Design Framework

1. Games Engines

Game engines are software tools that serve as a means of game creation (Sobota and Pietriková, 2023). A game engine contains many of the core pre-requisite systems involved in the creation of games, such as graphics rendering, lighting, collision detection, physics, sounds and artificial intelligence. Two of the most popular game engines are Unreal Engine and Unity, which provide the fundamental systems for a multitude of popular games, such as Fortnite and Pokémon.

Historically, the game industry would use in-house solutions to provide these core systems, which would incur a significant amount of time and cost to the developer. In modern game development, game engines are used extensively, and knowledge of game engine usage is a sought-after skill in people entering the industry.

Using game engines to develop games still requires a significant amount of technical, design, scripting and artistic ability, however. Game frameworks build upon these core systems provided by the game engine to create a coherent and structured environment in which students can develop their game creation skills (Mora, Riera and González, et al, 2017)

2. Pedagogic Challenges Teaching Games Engine Development

The study of games development at University is an incredibly popular field, with 138 UK Universities offering game development courses (Hot Courses Abroad, 2024), Staffordshire University's Game Institute has approximately 1800 students studying games development-related disciplines, including games design, games programming and games art.

As interest in these courses grows, Universities are met with the target and challenge of recruiting students from a diverse range of experiences (Universities UK, 2019). Some students will study games due to their passion for the technical creation of game systems, whilst others will study for their passion for games as an entertainment medium and pastime, but with potentially less technical experience learnt at College or School.

Whilst games are inherently technical products– requiring developers to have a core set of technical skills, such as scripting/programming – they are also incredibly creative. Games should immerse a player in an experience, providing challenge, reward and narrative. We have found that a good game developer could be someone with

a strong set of technical skills with an appreciation for designing these experiences, or someone with a strong set of design skills, who has enough technical skill to implement their designs. Therefore, a one-size-fits-all approach to teaching games development is not a workable approach when teaching such a large cohort with varying technical and design skills.

With a large cohort of game development students comes the necessity for a large, multi-disciplinary staff base. At Staffordshire, the Games Institute consists of over 60 games-specific academics. To ensure a supportive and successful student-to-staff ratio, many instances of the same class will run – often in parallel with different class tutors – which creates the challenge of ensuring all students receive a consistent learning experience.

3. Industry Expectations

Games industry development companies are often comprised of large, multi-disciplinary teams, with hundreds of employees (Berg Marklund, Engström and Hellkvist, et al, 2019). Upon completing their degrees, games graduates will be expected to join these teams and seamlessly integrate themselves into the companies' development pipeline.

Significantly, it is the case that game development is a long process, with some games taking many years to come to fruition (Aleem, Capretz and Ahmed, 2016). – from initial design to commercial release. As such, graduates will invariably find themselves joining a company where the game product is very much in-development – the initial design will have been completed, alongside the core systems. Graduates will be expected to quickly familiarise themselves with the product, and begin contributing to the project by developing upon the already pre-made systems and design brief.

Additionally, the games design role is equal parts creativity and technical ability (Gross, Sumner and Thürey, 2010) – a games designer is expected to conceptualise a game idea, and then prove this concept via the creation of playable prototypes. This requires designers to have a broad range of technical skills, including the ability to script/program these prototypes, but also design and implement the environments in which the gameplay takes place.

4. Alternative Approaches

Prior to the implementation of frameworks at Staffordshire University, the requirement for graduates to have technical game development skills whilst also being able to work with a range of in-development games was addressed to a limited extent by the use of commercial game level editors.

Games would sometimes be released with additional software, such as a level editor, that would allow the user to create their own worlds to play in. Epic's Unreal Tournament (2014) was a competitive multiplayer first-person action game, and users could download the Unreal Tournament Editor – in order to create new levels of their own design.

Staffordshire University adopted the use of this level editor in its "Introduction to 3D Games Engines" module, with first year students being tasked with creating a new level of their own design. Learning how to create engaging, aesthetically-pleasing levels for this pre-existing game taught students the importance of working with the limitations of the game. Marks were also awarded for the thematical consistency of their level – did it fit well with the levels already provided with the game?

Whilst this was a valuable experience, it was the case that whilst students learned how to use the Unreal Tournament editor, they did not learn the wider skills outside of this software that were often key requirements of a games designer role – namely, the ability to script and create their own prototypes.

Additionally, since Unreal Tournament contained thousands of industry-standard assets, such as highly-detailed 3D models and sounds, students' individual projects would often have very large file sizes, sometimes over 20 gigabytes per project. This meant that students would have to spend significant time in class saving their project and transferring it external media (or cloud backup) at the end of each class. Furthermore, the submission of the project at the end of the module via the University's digital upload system was a long, protracted process – as was the process for staff of downloading the student work for marking.

5. What is a Framework?

A framework is essentially a game product that provides more functionality than would be found in a base game engine template – but is less developed than a fully complete game (Cowan and Kapralos, 2017).

The initial complex set up of required game systems – such as creating inputs/controls, animations for characters etc – is already completed. However, there will be important areas of the framework that are deliberately missing, and lesson content will involve developing these areas and making the framework fully functional.

With this approach, staff and students can focus more upon the design and implementation of gameplay experiences – such as creating and balancing abilities and enemies.

To visualise: Without frameworks, a significant portion of the module content is spent building the underlying systems of the game, with very little time allocated to creating compelling gameplay experiences with these systems (Fig 1.):

Table 1: Representation of module time spent on development without frameworks.

Developing Core Systems						Designing Gameplay		
Week 1	Week 2	Week 3	Week 4	Week 5	Week 6	Week 7	Week 8	Week 9

With the implementation of a framework-approached, many of the core systems will already be implemented – requiring students to improve and expand upon these in order to create gameplay experiences within their projects (Fig. 2). This allows the module to focus on the core learning outcomes being delivered, rather than over assessing foundational skills.

Table 2: Representation of module time spent on development with frameworks.

Developing Core Systems			Designing Gameplay					
Week 1	Week 2	Week 3	Week 4	Week 5	Week 6	Week 7	Week 8	Week 9

Additionally, the framework should provide visual assets that can be used to create a playable environment. By providing these assets, lecturers can ensure that the games have a consistent theme -and also ensure that the assets are well-made and efficient. The Sentinel framework used in the University's "Introduction to Games Design" module included over 50 models that could be used in the creation and decoration of levels, but with the overall project size being only 16 megabytes – 1250 times smaller than the 20 gigabyte projects created in Unreal Tournament. This reduction also has a reducing university storage requirements. Given the UK's regulations, that require assignments to be stored for a number of years, this has a significant impact.

6. Designing Frameworks

Games are inherently multidisciplinary, containing design, programming, modelling and animation content. First year students are provided these frameworks as a structured foundation, with much of the core content already developed, and each week they will learn new techniques that expand upon this core framework content.

6.1 The Three Cs: Character, Control and Camera

Frameworks are constructed using the fundamental games design principle of the "Three Cs – Character, Camera and Control", which is used to develop games of all types (Pluralsight, 2014).

6.2 Character

A Game Development framework should include a core, central character which serves as the Player's avatar within the game. This includes the character model and associated animations that support the game mechanics that students will be expected to build within the framework.

By presenting students immediately with a pre-defined character, this helps to give the framework and the associated module a unique sense of personality. The character can be used throughout the lesson content – essentially as a module mascot – that drives the week-by-week content.

This approach was used in the Staffordshire University module "Introduction to Games Design". The character "Sentinel" is introduced both in the framework and the initial lecture slides. Sentinel is described as crash-landing in its spaceship on an alien planet, and must find a means of escaping. Over the course of the module, the lesson content describes a consistent narrative, with the Sentinel encountering new mechanics and gameplay systems (which the students themselves build). Firstly, students are taught how develop the Sentinel's damage and death systems, before creating combat mechanics in later weeks (see images below). This simple – yet coherent - narrative helps to add purpose and relevance to each week's content.

6.3 Control

Alongside the base animated character in the framework is the interactive control system. Creating core inputs – such as movement and aiming – is an involved process that could potentially be a significant hurdle to a new student.

By providing students with the initial controls, this initial blocker is mitigated and allows the student to immediately begin moving the character around the (largely empty) world space – a space which they will be tasked with designing over the course of the module.

It is also important to establish the control scheme as part of the framework, as it helps to set the style and scope of the game for students: The Sentinel framework, for example, contains simple movement controls on the keyboard, the ability to look around with the mouse, and the ability to attack.

6.4 Camera

The camera is the player's viewport into game world. Different games use the camera in various ways, and a game's genre is often described via it use of camera:

First Person – the player effectively sees through the eyes of the character they control. This an immersive view into the game world. The gameplay experience is designed around the player's limited field of view, with them being required to look around to solve environmental puzzles and/or engage in combat.

Third Person – the camera is positioned behind the Player character. This adds further personality to the player's character, as the player can see their character moving and reacting to the world around them (climbing, opening doors etc). Additionally, due to the positioning of the camera behind the player character, third person games allow for a greater view of the surrounding environment.

Top-down/isometric – the camera is positioned above the world, looking down at the player character. This view gives the player greater information about the surrounding environment, allowing them to make more informed decisions. Due to the distant positioning of the camera compared to first person games, the environment can also have less fine visual detail.

In the Sentinel framework, a top-down camera is used. This encourages students to focus on the encounters and puzzles within the level, without creating the requirement for fine visual detail that would be expected with a first-person view game.

6.5 Assessment Strategy

To encourage student exploration and development of the frameworks, the module should incorporate a supportive assessment strategy. In first year modules, this should include elements that support and reward less-technical learners, whilst also offering more experienced students the ability to grow and challenge themselves.

This concept of supportive assessment is based upon ensuring students are motivated by the creation of bitesize, attainable goals that reward innovation and exploration of the framework (Blaine Lawlor and Hornyak, 2012).

In "Introduction to Games Design", the initial weeks of the module are spent introducing core concepts which are used to develop missing parts of the framework – such as a health system for the player character, enemies and hazards to avoid etc. As each of these topics are introduced, so is a small set of bite-size tasks.

These tasks ask the student to evidence that they have completed the lesson content – for example, they will be required to evidence via a short video that they have a functioning health system working with the player character. Each of these bitesize, weekly tasks carry a small mark percentage, and students are introduced to the first of these tasks from the very first class.

The purpose of these tasks is to build confidence early in first year students. Students who are less technical are able to achieve initial marks by building the functionality along with the lecturers. By tasking students with building small, missing systems within the framework – as opposed to having to build the fundamental systems that drive the whole project – the scale of the work is made more immediate and achievable.

Once the main framework systems have been developed via bitesize tasks, a more open brief can be provided that encourages research and further development. In "Introduction to Games Design", students are introduced to assessment 2 – the "project". For this assessment, students are tasked with creating a full level for the framework, which should demonstrate all of the techniques shown in the initial weeks of the module, but with clear evidence of these developed beyond the content of the weekly tasks. This permits more capable students the opportunity to demonstrate their skills and achieve high marks, whilst also ensuring that less-technical students have the required knowledge to succeed at the assessment.

7. Results

7.1 Progression Improvement

Another challenge with Games Development subjects is their inherently ab initio subjects, with most students not having studied them in the past. This often leads to challenging first year modules, especially when the module is taught in the traditional method (no framework) requiring the students to effectively master several games development skills just to build a platform to explore the core learning outcomes.

We found that the framework approach has a significant impact on improving these progression rates. For example, we have the first-year module "Introduction to Games Design" (Fig. 3):

Table 3: Student progression rates from 2019 to 2023

Academic Year	2019/20 (Pre-Frameworks)	2020/21 (Pre-Frameworks)	2021/22 (Frameworks introduced)	22/23	23/24
Progression (Pass) Rate	62%	46%	76%	83%	85%

Notably 19-20 also coincided with the global pandemic, which significantly disrupted teaching. However, this is also as far back as we have data for this specific module. Even accounting for covid disruptions, we note a significant improvement in the overall pass rates of the module.

8. Student Satisfaction

In module feedback surveys, students have expressed an overwhelmingly positive reaction to the module following the implementation of frameworks. In feedback, students have expressed that use of frameworks has been an excellent introduction to the game engine software, with them going from little experience to creating fully playable levels and gameplay of their own design within a single teaching block.

9. Conclusion

The introduction of game design frameworks has demonstrably improved student engagement, pass rates, and general satisfaction in games development modules. This approach integrates supportive assessment strategies, and allows students to focus on the core learning requirement of a module, avoiding over-assessment.

By providing a structured and flexible games foundation, frameworks help to bridge the gap between varying levels of student experience. Less technical individuals can focus on learning and developing specific game components without the overwhelming complexity of building entire systems from scratch. This method further facilitates the development of both creative and technical skills, ensuring that students are well-prepared for the demands of the games industry.

The framework approach aligns with industry practices where game development often involves expanding upon pre-existing systems rather than creating everything from the ground up.

Additionally, the use of frameworks addresses several logistical challenges faced in traditional game design education. By incorporating bite-sized, attainable goals within the assessment strategy, students are encouraged to explore and innovate at their own pace. This approach supports less experienced learners by building their confidence and competence gradually while offering advanced students opportunities to push the boundaries of their skills.

The adoption of game design frameworks represents a significant advancement in the pedagogy of game development education. It not only aligns with industry expectations but also caters to the diverse needs of the student population. The positive impact on progression rates and student feedback underscores the effectiveness of this approach. As the field of game design continues to evolve, the integration of such frameworks will likely become an essential component of educational strategies aimed at preparing the next generation of game developers.

Comparison of two Different Game Mechanics Applied to Learning of Electromagnetism

Ladislav Janiga and Viera Haverlíková
Department of Didactics of Mathematics, Physics and Informatics, Faculty of Mathematics, Physics and Informatics, Comenius University Bratislava, Slovakia

ladislav.janiga@fmph.uniba.sk
viera.haverlikova@fmph.uniba.sk

Abstract: The paper presents two educational escape games, Tournament of J. C. Maxwell and Chest of Lord Maxwell, which were designed with the same topic and educational goal in mind: to consolidate and deepen knowledge about magnetism and electromagnetism, and to develop communication skills, teamwork skills, problem solving skills, experimental skills and analytical thinking. Both games were used in the teaching of electromagnetism in an upper secondary school. Data were collected through observation of the game process, administration of questionnaires to students and teachers, and interviews with students. The aim of this research is to compare two different game mechanics used to address the same subject matter and educational objective. The comparison will focus on the perception of the games by the students and the teachers who have incorporated the game into their teaching.

Keywords: Game-Based Learning, Non-Digital Educational Game, Upper-Secondary Education, Electromagnetism, Skills Development

1. Introduction

Escape games are “live-action team-based games in which players encounter challenges in order to complete a mission in a limited amount of time.” (Veldkamp et al, 2020) In recent years, escape games have become a phenomenon as a non-virtual entertainment activity popular with people of all ages. Parallel to their immense popularity in the entertainment industry, escape games are gaining popularity as learning environments in primary, secondary, higher education and professional development programmes (Sanchez, Plumettaz-Sieber, 2018). In escape game literature, all activities, tasks or challenges within an escape game are called puzzles. Puzzles usually follow the simple path: problem – solution - reward (Veldkamp et al, 2020). Successful puzzle solving in educational escape games relates to learning objectives. The unique combination of puzzles, environment and overall mission aims to reach the flow state of players – state of mind characterized by intense focus and pleasure, where players are immersed in an intrinsically motivating task (Csíkszentmihályi, 1990).

While recreational escape games are mostly suitable for groups of 3 to 7 people, teachers often must prepare an escape game for whole class or some larger group of students. This can be achieved in several ways:

- By preparing the same escape game in multiple rooms, so each team plays in its own room.
- By preparing tasks at stations in a larger space, teams use the same stations but arrive at different times, so they don't clash.
- Placing all the equipment and tasks for one team in a chest. Each team has its own chest, so all teams can play simultaneously in one room. (Veldkamp et al, 2020)

In the 2021 review, Lathwesen and Belova examined a total of 93 journal articles, book chapters, and conference papers in both English and German concerning escape games in STEM education. According to the review, there is a paucity of proposals pertaining to the fields of physics and biology education, as well as interdisciplinary studies. The utilisation of experiments within the context of chemistry, physics and biology escape games was identified as a beneficial practice, as it facilitates the development of specific experimental skills. However, escape games incorporating experiments are time-consuming and less readily adaptable. The majority of escape games appear to have been designed with the specific requirements of a particular course or institution in mind. It would therefore be beneficial for the STEM educational community to adopt a more systematic approach to the coverage of standard school or higher education topics, which are taught in many different countries around the world. (Lathwesen, Belova, 2021)

2. The Games

In light of the aforementioned considerations, we decided to design 2 games with same objective and focused on the same topic – magnetism and electromagnetism. The educational objective of the games is to consolidate and deepen knowledge on the topic of magnetism and electromagnetism, and to develop communication skills,

teamwork skills, problem-solving skills, experimental skills and analytical thinking. However, the games differ in terms of their game mechanics, motivational factors, and the way they provide feedback to players. In both games, the whole class is engaged into the game, participants are divided into groups of two to five individuals, and the games are designed for one lesson (45 minutes). In following paragraphs, game mechanics of the games will be described, followed by the overview of physics content and skills that are developed through the games.

2.1 Tournament of J. C. Maxwell

Tournament of J. C. Maxwell (tournament game) is an educational escape game. The game mechanics are inspired by the game Diver (Haverlíková, 2006). The game comprises 15 stands distributed throughout the school building. Each stand is associated with a different task. By successfully completing the task, students are provided with the location of the subsequent stand. If the response is accurate, the subsequent stand is situated on the main path leading to the finish of the game. If the response is incorrect, the subsequent stand provides a hint to the preceding task, requiring the students to return and identify the correct answer. Students are divided into groups of two to five individuals, with the objective of passing the stands in the shortest possible time and with the correct answers. Figure 1 illustrates the path of the stands. All stands are marked with letters. The purple stands mark the start and finish of the game. The orange stands represent the main path (task stands), while the blue stands are the clue stands. The green arrows indicate the correct responses, while the red arrows indicate incorrect responses. If a team responds correctly to all the tasks, they will only visit the orange stands, and the word MAXWELL can be formed from the letters on their path. To prevent the accumulation of teams at the stands, communication between teams, distractions from the game, and drop in attention span, it is essential that each team's order on the main path be mixed up.

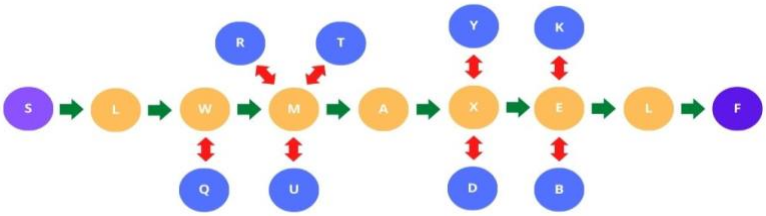

Figure 1: Path of the stands.

2.2 Chest of Lord Maxwell

Chest of Lord Maxwell (chest game) is an educational game in a real (non-digital) environment. It is an escape game, but the goal is not to escape the room; rather, it is to unlock and explore the chest. In exploring the chest, players must solve several physical puzzles. Figure 2 shows a schematic arrangement of the puzzles. The game is designed for groups of 2-5 people. Each group gets its own chest locked with a 3-digit numerical lock. All the necessary resources for the game are included in the chest. This allows multiple groups to play simultaneously in the same room without interfering with each other. The first puzzle, indicated by the blue square, is fixed to the chest and solving it will provide the players with a code to open the chest. Once opened, they will find several more puzzles, indicated by the green squares, and a smaller box locked with a 5-digit number lock. By solving the puzzles, players obtain the individual digits of the code required to open the box. The box contains a qualitative explanation of Maxwell's equations and a reward.

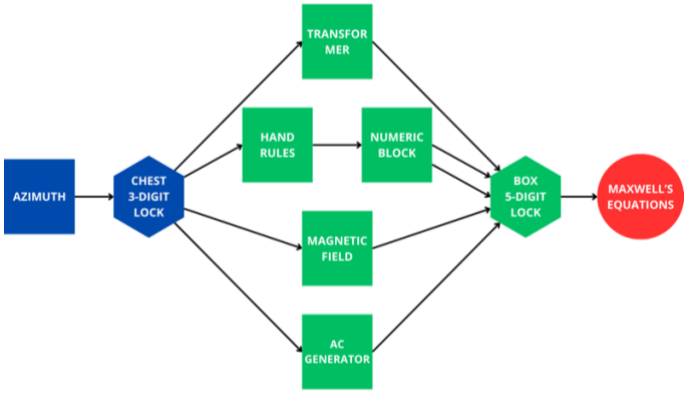

Figure 2: Schematic representation of the puzzles arrangement in the game.

2.3 Physics Content and Skills Developed Through the Games

Game tasks were based on the standards defined for teaching of physics in upper secondary schools in Slovakia for the topic of magnetism and electromagnetism. Simultaneously, the tasks aim to develop certain skills. Table 1 presents the overview of physics content and skills that are developed by the tasks of both games.

Table 1: Overview of physics content and skills developed through the games.

Physics Content	Tournament of J. C. Maxwell		Chest of Lord Maxwell	
	Skill Development	Task	Skill Development	Puzzle
magnetic field of a wire right-hand rule for a wire	picture analysis	W	problem-solving skills picture analysis	Hand rules
right-hand rule for a coil Lenz's law	problem-solving skills graph analysis analytic skills	X		
magnetic field of a coil right-hand rule for a coil	problem-solving skills equipment-manipulation skills analytic skills	E		
magnetic field of permanent magnets magnetic field lines	picture analysis	M	picture analysis	Magnetic field
Earth's magnetic field	compass usage	A	azimuth determination	Azimuth
usage of electromagnetism transformation ratio	experimental skills equipment-manipulation skills	L_1	experimental skills equipment-manipulation skills	Transformer
usage of electromagnetism	experimental skills equipment-manipulation skills – in a new situation	L_2		
Working principle of AC generator			Reading comprehension skills	AC generator
			Spatial orientation skills, analytical thinking	Numeric block

3. Research

The research was conducted in two phases. The initial phase of the study involved the testing of the tournament game. The second phase focused on the chest game. Subsequently, we analysed and compared findings from both phases with the goal to compare two different game mechanics applied in the teaching of the topic of electromagnetism in upper-secondary school. The comparison will focus on the perception of the games by students and teachers who have used the game in their teaching.

3.1 First Phase

Tournament of J. C. Maxwell game was subjected to a preliminary examination in February 2022 at the Bilingual Grammar School in Bratislava. A total of 55 students from four different classes participated in the implementation of the game as part of their regular physics lessons. The game was incorporated into the curriculum as a preparation for the summative assessment. Following the conclusion of the game, a discussion was held with the students to solicit feedback on the game. One week after implementation, an online questionnaire was sent to all participating students. The questionnaire focused on the difficulty and understandability of the game, teamwork, benefits of the game, and student attitudes towards the game. A total of 37 students completed the questionnaire voluntarily. The findings from this part of the research were presented at the GIREP Conference 2022 in Ljubljana, Slovenia (Janiga, Haverlíková, 2022). They will be published in the Springer book series Challenges in Physics Education. In addition, we posed some questions to the teachers

with the intention of evaluating the game from their perspective. The questions addressed the extent to which the objective was achieved, the level of engagement among students, the benefits and drawbacks of the game, and the teacher's attitude towards the implemented game.

3.2 Second Phase

The testing of the Chest of Lord Maxwell was conducted in December 2023 and April 2024 at three grammar schools in Bratislava. A total of 142 students participated in the implementation of the game. The course of the game was observed, and following its conclusion, an online questionnaire (the same as in the first phase) was sent to the participating students. Students completed it voluntarily, in their free time. This questionnaire focused on the difficulty and understandability of the game, teamwork, the benefits of the game, and the students' attitudes towards the game. The same questions as in the first phase were addresses to the participating teachers.

School A is the same institution where the initial phase of the research was conducted. A total of 90 students from six different classes participated in the research. The game was implemented within the context of the physics class as a form of preparation for the summative assessment. A total of 12 students from this school completed the questionnaire. The low return rate of the questionnaire may have been since the implementation of the game and the administration of the questionnaire took place just before the start of the Christmas holidays.

School B is a grammar school with Hungarian language as a primary language. Students understand Slovak, but Hungarian is their preferable language. A total of 30 students from two different classes participated in the research. The game was included in the curriculum six months after the topic was covered. A total of seven students from this school completed the questionnaire. The low return rate of the questionnaire may be attributed to the language barrier, given that the questionnaire was in Slovak, while the students attend a school where Hungarian is the language of instruction. Despite the possibility of completing the questionnaire in Hungarian, it is possible that the language barrier discouraged students from doing so.

A total of 22 super senior students at school C participated in the research. The game was introduced into the physics curriculum two years after the topic had been covered. A total of 22 students from this high school completed the questionnaire.

4. Findings

4.1 First Phase

Findings from this part of the research were presented at the GIREP Conference 2022 in Ljubljana, Slovenia (Janiga, Haverlíková, 2022). They will be published in the Springer book series Challenges in Physics Education. Therefore, we present here only a summary. The findings suggest the tournament game achieved its intended difficulty level, perceived as challenging but achievable by most students. Teamwork and physical exertion were not seen as significant difficulty factors. While most students understood the game's instructions and rules, some reported confusion due to the use of multiple communication channels (oral, written, visual). The understandability of tasks was generally high, with minimal issues reported. Although some students indicated difficulties with clues, further investigation revealed they simply hadn't visited the stands with the clues. The game was perceived as enriching by a large majority of students. The most frequently reported benefits included applying existing knowledge (71.8%), gaining new physics knowledge (61.5%), and discovering new perspectives (56.4%). Students identified teamwork, communication, and efficient work distribution as strengths of their teams, while acknowledging weaknesses like communication breakdowns and knowledge gaps. Roles primarily focused on task completion and explanation, with less emphasis on leadership, motivation, or writing. Interestingly, students in non-problem-solving roles perceived themselves as less valuable. In general, students shown positive attitudes towards the game, mainly focusing on teamwork, physical movement and the form of the game.

4.2 Second Phase

4.2.1 Observation

Observation revealed that all students were highly motivated from the outset of the game. In school C, there was a notable degree of competitiveness among the students. In schools A and B, smaller groups of three to four players were formed, while in school C, groups of four to six players were formed. In the case of smaller groups, there was a reduced need to divide puzzles and solve multiple puzzles simultaneously. If players encountered difficulties with a puzzle, they exhibited signs of frustration. In such instances, the players were queried regarding their solution procedures and provided with hints. From the observations made, it became evident that students faced the greatest difficulties with non-physics content puzzles (solving the numeric block and comprehending the method for extracting the code from the puzzles). In school A, 90% of the groups were able to solve all the puzzles and open the box within 45 minutes. The success rate at schools B and C was found to be significantly lower, with only 50% of the groups able to solve the puzzles and open the box within 45 minutes. If a group was unable to complete the game, a joint discussion was held with all groups to identify the solutions to the puzzles and to open the boxes collectively.

4.2.2 Students Questionnaire

The initial section of the questionnaire focused on how students perceived the difficulty of the game in its various aspects. The results are presented in Figure 3. The game was perceived as the most challenging in terms of the students' knowledge of physics. Conversely, they considered it the least challenging in the areas of teamwork and physical movement. This is consistent with the design intention of the game, which was to create a challenging experience in the areas of physics knowledge, skills, and logical thinking. The game requires minimal physical movement and can be mastered by an individual. A comparison of student responses from each school revealed that students at school C rated the difficulty of the game on physics knowledge as more challenging on average than students at school A and B (a bit hard) This distinction was reflected also in the ratings of overall difficulty. No significant differences were observed between the schools in other aspects of the game. It appears that the discrepancy in responses may be attributed to the fact that students at school C are superseniors, and that it has been approximately two years since they last encountered the topic in physics. In contrast, students at school A were presented with the game immediately after the topic was covered, while students at school B were presented with the game six months after the topic was covered.

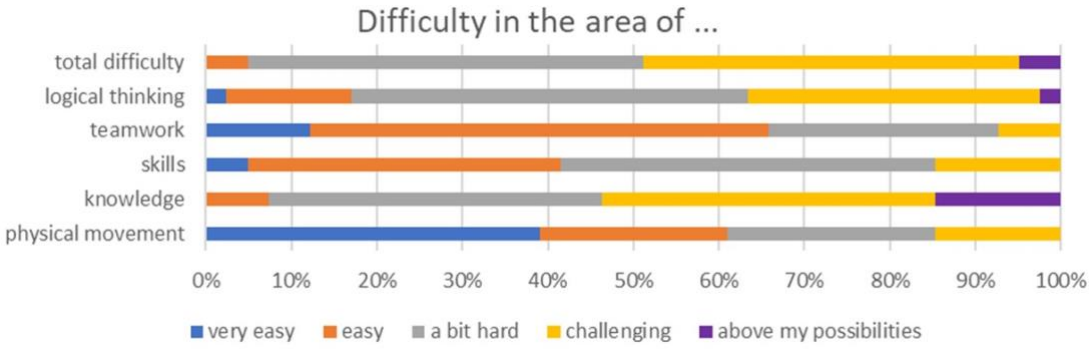

Figure 3: Relative numbers of students' evaluation of the game difficulty.

The second aspect under investigation was the understandability of the game. The students were requested to assess the degree of understandability of selected parts of the game. The results are presented in Figure 4. The students expressed high levels of satisfaction with the clarity of the rules, instructions, and clues provided during the game. A small number of students indicated that these aspects were not readily understandable. These were one student from school B and one student from school C. The problems could have been caused by a language barrier (school B) or by the fact that a few students missed the beginning of the lesson and only joined the game during the lesson (school C). In the case of the puzzles, students rated clarity as the aspect with the lowest level of understanding (acceptable or with only a few problems). Several students indicated in the questionnaire that they found the puzzles less understandable. However, they were aware that non-explicit assignments are an inherent aspect of the mechanics of escape games.

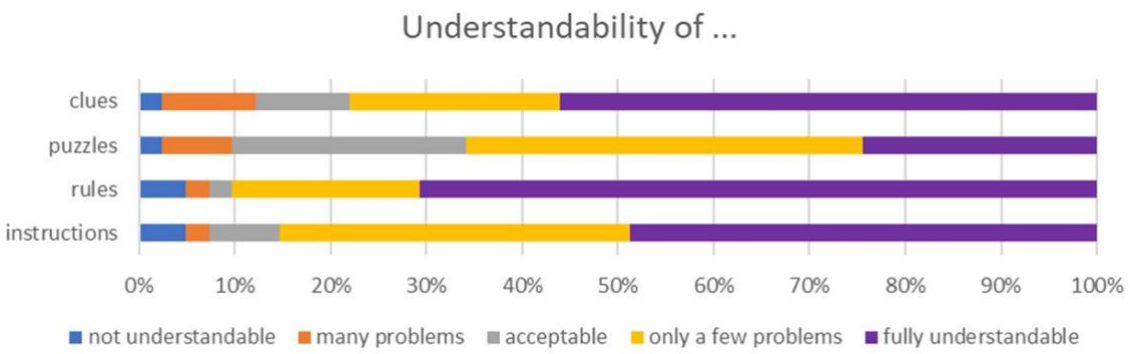

Figure 4: Relative numbers of students' evaluation of the game understandability.

In the third section of the questionnaire, students were requested to reflect on the game's potential for enrichment. Students indicated that the game facilitated the acquisition of new physics knowledge (75.6%), the acquisition of new experiences (53.7%), the development of novel perspectives on the topic (48.8%), the application of knowledge (39.0%) and the development of skills (24.4%). Only two students indicated that the game had no benefits for them. A comparison of the responses of the students from each school revealed that while in schools A and B the students' responses are evenly distributed among all aspects except skills, in school C 86.4% of the students identified acquiring physics knowledge as a benefit, while in the other aspects the frequency of responses is below 50%. We believe that this difference is caused by the significantly longer time that has passed in group C since the topic was discussed in class.

The fourth section of the questionnaire addressed the subject of teamwork, encompassing the strengths and weaknesses of the team, leadership, and the roles of each member within the team. The students identified teamwork, communication, peer-learning, work distribution, decision-making, speed, and peer motivation as the strengths of their teams. The students identified a few weaknesses in their teams, including a lack of knowledge and communication. The most frequently reported roles of team members were related to task solving, specifically solving and explaining. A small number of students reported roles as writer or motivator.

The fifth section of the questionnaire addressed the students' attitudes towards the game. Figure 5 displays the students' appreciations of selected aspects of the game. Furthermore, 54,8% of students indicated that they discussed the game with other players after the game, while 23.8% discussed it with students who did not play the game, 23.8% of respondents indicated that they did not revisit the game in their thoughts.

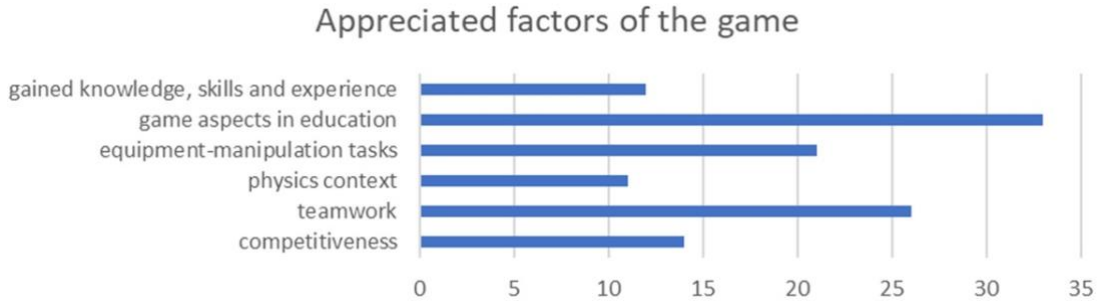

Figure 5: Absolute numbers of students appreciating selected factors fo the game.

4.2.3 Teachers Questionnaire

All three teachers involved in the research have concluded that the intended aim of the game has been fulfilled. The students demonstrated their ability to solve problems and consolidate their knowledge of the topic of electromagnetism. The format of the game necessitated collaborative effort and communication between the students. To solve the problems, students were required to engage in analytical thinking, including the identification of the task, the solution of the problem, and the acquisition of the code. Teachers from schools B and C posted that including the game in the sequence immediately following the teaching of the topic of electromagnetism would have been more beneficial.

Furthermore, the teachers were impressed by the level of student engagement. The teachers asserted that the small group work and game format facilitated the involvement of students who were previously quiet or inactive

in the teaching process. However, they emphasised the significance of the way students were allocated to groups to prevent the combination of students with inadequate physics knowledge. Failure in the game could result in frustration and a further decline in interest in physics.

The game's primary benefit, according to the teachers, is its capacity to engage students. The format of the game introduced a novel element to the usual structure of physics teaching. "Another significant advantage is that it encourages students to develop critical thinking, rather than merely memorise the content they have learned in class." Furthermore, one teacher emphasised the historical aspect of the game, stating, "I also appreciate the historical background of the game and the overall story provided for the chest, as this can also engage pupils who do not have a very positive relationship with physics."

All teachers expressed a desire to incorporate the game into their future teaching practices.

4.3 Comparison of the Perception and Evaluation of the Games

The data collected in phases one and two of the research, comprising observations, questionnaires completed by students and teachers, and interviews with students, was used to make an initial comparison of the perceptions of the two games. A comparison was made between the two games from the perspectives of the students and the teachers.

4.3.1 Students' Perspective

In terms of difficulty, students rated both games similarly in all aspects. Of particular interest is the aspect of physical movement, as the chest game requires almost no physical effort, whereas the tournament game involves rapid movement within the school building. An important strategy to win is not just to solve the problems correctly, but to solve them as quickly as possible. Two-thirds of the students who played the tournament game identified movement as an appreciated factor. Several of them reported that incorporating movement into this activity helped them to focus, think, and engage better in the game. They referred to it as a nice change in the routine of the lessons.

In the case of understandability, again, the students' ratings are very approving except for the clarity of the task assignment. In this aspect, the understandability of the tournament game assignments was rated at a higher level (only a few problems) than the understandability of the chest game puzzles (acceptable). As also noted by some students in the questionnaires, the puzzles of the chest game were not given explicitly, as it is an escape game, which may have caused that some students rate them as less understandable. A second factor that may have caused this difference is the specificity of the research sample. Most of the data collected from the second phase of the research came from school C, where the research was conducted with superseniors. Hence, with students who played the game approximately 2 years after having studied the topic. This point will need to be explored in the future with emphasis on selecting the same research sample for both games.

A significant aspect that was commended by both students and educators was the method of motivation. Tournament of J. C. Maxwell is designed as a team competition. Consequently, the motivating factor was competitiveness. In the case of the game Chest of Lord Maxwell, the motivating factor is the desire to explore the unknown and to open the locked chest. Both forms of motivation were identified by the students as being effective. In the case of the chest game, the motivating factor of competitiveness was also evident. Groups competed to explore the chest in the shortest possible time. However, the game was not designed with this in mind, and this factor is not encouraged in any way during the game. In the case of the tournament game, there have been instances where some teams have prematurely concluded the competition because they lacked the confidence to prevail against the other team. The anticipated motivational effect of competitiveness was, in fact, the opposite of what was intended. It is therefore of great importance that the composition of the teams is carefully considered in these games.

Each of the game provides feedback to students in different ways. In the case of the tournament game, students receive immediate feedback on their solution. If students choose the correct answer the game navigates them to the next task. If they answered incorrectly, the game navigates them to a stand where they get a hint and return to the previous stand to solve the task again. In the case of the chest game, students get 5 numbers from the five puzzles that make up the numerical code for the lock. If they solve the puzzles correctly, they open the chest. If the chest does not open, the students know that they do not have the correct code, but they do not know which of the numbers is incorrect and therefore which puzzle they did not solve correctly. Thus, the

feedback in this game is neither immediate nor sufficiently addressable. As a result, this requires students to be more resilient to frustration and more assisted by the teacher.

The importance of teamwork was identified as an appreciated factor in both games. The application of teamwork in the context of a game can result in a reduction in the perceived difficulty of the game, the maintenance of motivation, and the prevention of frustration. It facilitates peer-to-peer discussion and learning among students.

4.3.2 Teachers' Perspective

From the teacher's point of view, one of the most important aspects in deciding, whether to include a game in teaching, is the difficulty of the game in terms of preparation. In the case of the tournament game, the preparation process is more challenging due to the necessity of planning the location of the stands within the building, preparing the tasks within the envelopes, and then placing the envelopes and all the materials into the school. In contrast, the preparation for the chest game is relatively straightforward. The teacher is required to prepare the chests only once, after which they simply need to be checked before the lesson and brought into the classroom. Conversely, he must purchase the chests and numerical locks.

The format of Chest of Lord Maxwell allows for the entire class to participate in the game simultaneously and in the same location. This enables the teacher to monitor their students' activities, observe them at work, and address any issues that may arise. In the case of the tournament game, students are dispersed throughout the school building, and the teacher is unable to monitor their progress, identify any difficulties they may be experiencing, or help as needed.

5. Conclusion

The objective of this research was to examine how students and educators perceive the integration of two games with different game mechanics in physics education. The comparison enabled the identification of several key factors that should considered during the development and implementation of the game.

It is essential to establish an appropriate level of difficulty for the game, ensuring that it is neither too straightforward nor too challenging for players. The incorporation of non-explicit tasks serves to augment the complexity and duration of the game. It is recommended that in-game feedback be provided in a prompt and accessible manner. The incorporation of teamwork is a highly valued element, as it serves to mitigate the perception of difficulty, bolster motivation, and facilitate peer-to-peer learning. Nevertheless, the composition of the team is a crucial aspect that demands careful consideration. The efficacy of the teaching process is contingent upon the alignment of the learning and game goals, as well as the time required for preparation and implementation of the game. The format of the game has an impact on the role of the teacher during the game, which may be that of an observer, moderator or helper.

Given the limited sample size and the notable discrepancies between the samples, it is not feasible to generalise the conclusions drawn from this study. It is our intention to reinstate these two games in the classroom, with a particular focus on the selection of appropriate research samples.

Breaking Math Anxiety: A Success Story From an Indian Government School

Vidya Jayaraman, Nirmala Sundar and Uma Balaji Shankar
Inteligen Games & Robotic Private Limited, Bengaluru, India

vidya@inteligen.in
nirmala.sundar@inteligen.in
uma@inteligen.in

Abstract: Mathematics anxiety and fear among children pose significant educational challenges worldwide. This study examines the efficacy of a hybrid learning approach that combines digital game-based learning with hands-on activities to enhance mathematics engagement, reduce anxiety, and improve numeracy skills while fostering algebraic and mathematical thinking. The research was conducted at Government School, Ramagondanahalli, Bengaluru (RGHL), involving over 400 children aged 6-10 years from grades 1-5. Participants were primarily first-generation learners from economically disadvantaged backgrounds with limited access to educational resources. The intervention comprised weekly 70-minute sessions over six months, featuring the digital game "Magic Math Spell Caster" alongside modified traditional board games such as Snakes & Ladders, Bingo with Place Value Cards, and a custom Memory Card Game. The curriculum also incorporated activity worksheets with math manipulatives and practice sheets. The didactical approach underpinning the intervention was based on six key principles: Treating mathematics as a language to be spoken, promoting algebraic thinking; Structuring games into levels with well-defined learning objectives to scaffold mathematical thinking; Connecting concrete and abstract concepts to deepen understanding; Employing a hands-on approach to reinforce learning; Providing resources to every child to ensure equal access; Integrating assessments as digital interactive worksheets within gameplay. This approach allowed children to explore, make connections, and construct knowledge independently, fostering both algebraic and broader mathematical thinking skills. The program encouraged peer-to-peer learning by grouping children with different math proficiencies. Students progressed through game levels at their own pace, often exceeding curriculum expectations. This study contributes to the growing body of evidence supporting hybrid learning approaches in mathematics education for all children, emphasizing the development of robust mathematical and algebraic thinking skills.

Keywords: Hybrid Mathematics Pedagogy, Game-Based Algebraic Thinking, Mathematical Anxiety Reduction, Numeracy Skills Enhancement, Scalable Math Education Model

1. Introduction

In Bangalore, India, an innovative approach to mathematics education is unfolding at the Government School Ramagondanahalli, Bengaluru (RGHL). Operating under a Public-Private Partnership (PPP) model, The Government of Karnataka collaborates with Inventure Academy (an International School) and Whitefield Ready (an NGO) to offer English-medium instruction to some of the city's most underprivileged children (Kumar & Naik, 2020).

Many RGHL students are children of migrant laborers, enter the school without prior formal education, lacking foundational literacy and numeracy skills. This diversity in the student body presents a significant challenge: effectively teaching mathematics to a class with widely varying proficiency levels and interest (Banerjee & Duflo, 2011).

While RGHL's dedicated teachers work tirelessly to bridge learning gaps, they've identified a critical barrier: math anxiety. This phenomenon, characterized by feelings of tension and anxiety that interfere with the manipulation of numbers and solving mathematical problems, is not unique to RGHL but is a global issue impacting students' performance and long-term relationship with mathematics (Ashcraft & Moore, 2009).

The COVID-19 pandemic has exacerbated existing educational disparities, particularly affecting disadvantaged students (UNESCO, 2021). In India, even before the pandemic, only 28% of fifth-graders could perform simple division (ASER Centre, 2019). The prolonged school closures have likely worsened this situation (Azim Premji Foundation, 2021).

To address these challenges, Inteligen Games & Robotic Private Limited (Inteligen) designed an intervention for RGHL that combines digital games, physical activities and hands-on learning. This approach is grounded in research supporting the efficacy of game-based learning in mathematics education (Ke, 2008; Habgood & Ainsworth, 2011).

This study explores the impact of this hybrid learning approach on math anxiety and numeracy skills among RGHL's primary school children. The insights gained could inform strategies to improve mathematics education

and promote educational equity in India and beyond, particularly in the post-pandemic context (Bose et al., 2022).

2. Understanding the Challenge

2.1 Math Anxiety: A Complex Problem

To appreciate the impact of RGHL's new approach, we first need to understand math anxiety and why it has affected so many children (Ashcraft & Moore, 2009).

2.1.1 Why Math Anxiety Happens?

For many RGHL students, math feels like learning a foreign language. They're already struggling with reading and comprehension in English (their second or third language), and now they're expected to grasp mathematical vocabulary, syntax and complex concepts. It's no wonder stress levels rise (Beilock & Maloney, 2015)! Teachers at RGHL have found it challenging to build even basic numeracy skills, let alone guide students towards solving word problems, tackling application questions or developing higher-order thinking skills in math. The confidence of children in the math class was worrying and all the stakeholders were keen on implementing an alternate approach to make children open to learning math (Ramirez et al., 2018).

2.1.2 The Cascading Effect of Math Anxiety

When students feel anxious about math, it creates a vicious cycle. Their worry takes up mental energy, making it harder to concentrate and solve problems. This leads to poor performance, which in turn increases anxiety about future math tasks (Foley et al., 2017). Over time, students might start avoiding math altogether, limiting their academic and career options. For RGHL's students, many of whom are already facing significant life challenges, math anxiety could become yet another obstacle to overcome in their pursuit of a better future (Maloney & Beilock, 2012).

2.2 The Power of Play in Learning

While the challenges were clear, the solution came from the world of games. Research has shown that game-based learning can be a powerful tool in education, especially in subjects like math. Games can make learning fun and reduce anxiety (Ke, 2008). Games provide immediate feedback, helping students learn from mistakes (Habgood & Ainsworth, 2011) and adapt to different skill levels, ensuring each student is appropriately challenged (Plass et al., 2015). Game based learning encourages problem-solving and strategic thinking (Kim & Chang, 2010) which fosters collaboration and peer learning (Castellar et al., 2015). With these benefits in mind, Inteligen worked with RGHL to bring game-based learning into their math classrooms.

3. Methodology

3.1 Digital Game: Magic Math Spell Caster

At the heart of the intervention is an innovative digital game called "Magic Math Spell Caster". This game transforms math learning into an exciting magical adventure for kids from kindergarten to third grade. Here's what makes it special:

The Magical World:

- Students become young magicians in a fantastical world with 600 levels across four difficulty tiers
- Math skills are used to cast spells, defend magical towers, and defeat boss creatures
- The game aligns with standard elementary math curricula, complementing classroom instruction

Learning Objectives:

- Develop strong number sense and mental math fluency
- Master basic arithmetic operations
- Introduce algebraic thinking concepts
- Enhance understanding of place value
- Reduce math anxiety and increase engagement with mathematics

The Digital Abacus: A Revolutionary Learning Tool

- At the core of the game is a unique digital abacus that makes math visible and tangible:
- Color-coded, numbered beads that students move on screen
- Clear layout showing place values (ones, tens, hundreds, thousands)
- Students perform math operations by physically manipulating beads
- Provides immediate feedback and adapts in complexity as students' progress
- Bridges concrete and abstract mathematical thinking

How It Promotes Learning:

- Hands-on interaction engages multiple senses, enhancing understanding and retention
- Visual representation makes abstract concepts more accessible
- Supports various learning styles through its multi-modal approach
- Scaffolds the development of mental math skills
- Allows for easy identification and correction of errors

Adaptive Learning:

- Difficulty levels adjust based on each student's performance
- Ensures students are consistently challenged at an appropriate level
- Supports differentiated instruction in diverse classrooms

Progress Tracking:

- Comprehensive summary of the students' performance in the game.
- Allows monitoring of progress and identification of areas needing improvement

By combining engaging gameplay with innovative learning tools like the digital abacus, Magic Math Spell Caster doesn't just teach math—it transforms students' relationship with the subject. It builds confidence, fosters a love for learning, and makes math an exciting adventure rather than a dreaded chore.

Teachers at RGHL have observed remarkable changes. As one educator noted, "Students who once feared math now eagerly ask for more problems. They're not just learning math; they're enjoying it. The game has made the abstract world of numbers real and exciting for them."

3.2 Hands-On Fun: Physical Games and Activities

While the digital game is a key component, the approach also emphasizes hands-on, physical activities to reinforce learning and provide a multi-sensory experience. These activities include:

Math-Focused Snakes & Ladders:

- Traditional dice replaced with specially designed cards
- Cards pose math questions with answers always 6 or less
- Questions build number sense and mathematical vocabulary
- Players read questions aloud and give oral answers
- Creates an immersive environment for hearing, speaking, and learning math language
- Helps children associate math with fun and social interaction

Bingo with Place Value Cards:

- Combines the excitement of Bingo with place value learning
- Cards show numbers in different forms (e.g., "43" and "4 tens and 3 ones")
- Children match numeric representations with place value descriptions
- Reinforces understanding of tens and ones visually and kinesthetically
- Example: For "43", child sees both the number and a place value card showing 4 tens and 3 ones

Memory Card Games:

- Designed to build mental math skills
- Includes pairs of cards with equivalent mathematical expressions
- Enhances recall and promotes quick mental calculations

Manipulative-Based Worksheets:

- Special worksheets accompanied by math manipulatives
- Objects children can touch and move to understand math concepts
- Bridges concrete and abstract thinking
- Allows for hands-on exploration of mathematical ideas

These physical games and activities serve multiple purposes:

- Reinforce Concepts: They provide additional practice of skills learned in the digital game
- Multi-Sensory Learning: Engage multiple senses, catering to different learning styles
- Social Interaction: Encourage peer learning and communication about math
- Vocabulary Building: Create opportunities to use mathematical language in context
- Confidence Building: Offer a low-pressure environment to practice math skills

Teachers at RGHL have noted the complementary nature of these activities. One teacher shared, "The combination of digital and physical games keeps the students engaged. They're learning the same concepts in different ways, which really helps the ideas stick. Plus, it's wonderful to hear them using math vocabulary naturally as they play."

By integrating these hands-on activities with the digital game, the approach ensures a well-rounded, engaging math learning experience. Students not only learn math concepts but also develop communication skills, social skills, and a positive attitude towards mathematics.

3.3 Putting It All Together: The Hybrid Approach in Action

RGHL implemented this new approach over an 8-month period. Students played the digital game for about 70 minutes each week. The physical games and activities were woven into regular math lessons throughout the week.

This hybrid approach—combining digital and physical learning—offered several advantages:

- It catered to different learning styles. Some kids learn better on computers, others through physical activities.
- It kept things interesting. The variety prevented boredom and maintained engagement.
- It reinforced concepts in multiple ways, helping ideas "stick" better.
- It made math feel less like a dreaded subject and more like a fun challenge.

4. Results

The intervention at RGHL demonstrated significant positive outcomes. Let's break down the results:

4.1 Dramatic Change in School Exam Results

The school's internal exams revealed a striking transformation. Prior to the intervention, 20% (24 out of 120) of students across grades 1-5 scored above 60% in mathematics examinations. Following the implementation of the game-based approach, this percentage increased to 83.3% (100 out of 120 students), representing a 63.3% point improvement. This remarkable improvement shows the program's effectiveness on students of all ages.

4.2 Beyond Grade-Level Performance

One of the most exciting outcomes was seeing students, even those in lower grades, mastering concepts beyond their current grade level. Many grade 1 students were solving problems typically seen in Grade 2. Older students were exploring advanced topics out of sheer curiosity and enjoyment. This self-driven learning was unprecedented in the school's history.

4.3 Qualitative Changes in the Classroom and Long-term Impact

Teachers reported significant changes in student behavior and attitudes. Students who once dreaded math class were now eagerly participating. There was a noticeable decrease in math anxiety across all grade levels. Students appeared more confident, more willing to tackle challenging problems, and less stressed during math lessons.

The confidence gained in math began to positively influence performance in other subjects. Teachers believe this new approach to learning could lead to higher retention rates and better academic outcomes in the years to come.

The results at RGHL indicate the efficacy of innovative and engaging teaching methodologies in mathematics education. The implementation of enjoyable and accessible mathematics instruction has not only improved test scores but may have altered the educational trajectory of the students.

4.4 Beyond the Numbers: Transformative Impacts

The success of the intervention at RGHL goes far beyond improved test scores. The most striking outcomes were in how students approached learning itself.

4.4.1 Fostering Self-Directed Learning

The most remarkable outcome was the way the students took charge of their own learning. The engaging nature of the games encouraged children to practice math voluntarily, even outside of class time. This self-motivation is a crucial life skill that extends beyond mathematics. One teacher noted, "I'm amazed to see students asking for more math problems or wanting to play the game during free periods. They're driving their own learning now."

4.4.2 Building True Proficiency, Not Just Memorization

Unlike traditional rote learning methods, this approach helped students understand mathematical concepts deeply. They weren't just memorizing procedures, but grasping why those procedures work. "Before, students could recite multiplication tables but struggled with word problems. Now, they understand what multiplication really means and can apply it in various situations," explained a Grade 4 teacher. This growth in handling tough math concepts is setting students up for success in higher grades and beyond. They're not just learning math—they're learning how to learn, a skill that will help them throughout their lives.

5. Discussions

The success of the RGHL intervention offers valuable insights for other schools facing similar challenges.

5.1 What Made it Work

5.1.1 Personalized Learning

The adaptive nature of the digital game allowed each student to progress at their own pace. This personalized approach meant that both struggling students and high achievers were appropriately challenged.

5.1.2 Low-Stakes Practice

The game environment provided a safe space for students to make mistakes and learn from them without fear of embarrassment or negative consequences.

5.1.3 Immediate Feedback and Peer Learning

The approach fostered an environment rich in immediate feedback and peer-to-peer learning:

- Digital Instant Feedback: The game provided immediate responses to students' actions, allowing for quick identification and correction of mistakes.
- Physical Game Interactions: Board games and activities encouraged students to help and learn from each other.
- Collaborative Learning: Students naturally took on teaching roles, explaining concepts to their peers.
- Multifaceted Feedback: Students received instant feedback from both the digital game and their classmates.

Teachers at RGHL provided a powerful observation that encapsulates the impact of this approach: "Teachers observed students explaining concepts to each other during the board games. The students were not just

learning math; they're learning how to communicate and support one another. The immediate feedback, whether from the game or a classmate, keeps them motivated and helps concepts stick."

5.2 The Future of Math Education

The success of the RGHL intervention opens up exciting possibilities for the future of mathematics education, particularly in challenging and resource-constrained environments. This section explores potential avenues for expansion and further research.

5.2.1 Scaling Up

The positive outcomes at RGHL suggest that this hybrid learning approach could be beneficial if implemented on a larger scale. Considerations for scaling include:

- Investigating how the program can be tailored to different cultural and educational settings across India and globally (Banerjee & Duflo, 2011).
- Cost-effectiveness analysis: Evaluating the economic feasibility of widespread implementation, particularly in low-resource areas (Kumar & Naik, 2020).
- Partnership models: Exploring collaborations between educational institutions, NGOs, and technology providers to facilitate broader implementation (Bose et al., 2022).

5.2.2 Teacher Resources and Professional Development

The RGHL experience underscores the crucial role of teachers in the successful implementation of innovative educational approaches. Future initiatives should focus on:

- Comprehensive teacher training programs: Developing modules that equip teachers with the skills to effectively use game-based and hybrid learning approaches (Boaler, 2016).
- Ongoing support systems: Creating networks for continuous professional development and peer learning among teachers.
- Teacher-led innovation: Encouraging and supporting teachers to adapt and create their own educational games and activities (Blikstein, 2013).

5.2.3 Technology Integration

As access to technology improves, even in underprivileged areas, there's potential for more sophisticated and personalized learning experiences:

- Adaptive learning systems: Developing more advanced algorithms that can provide highly personalized learning paths for each student (Verkijika & De Wet, 2015).
- Data-driven insights: Leveraging learning analytics to provide teachers with real-time insights into student performance and areas needing attention (OECD, 2018).

6. Conclusion

The case study of RGHL demonstrates the transformative potential of innovative pedagogical approaches in addressing complex educational challenges, particularly in resource-constrained environments. By reimagining mathematics education through game-based learning, Inteligen and RGHL have not only improved academic outcomes but also fundamentally altered students' relationships with mathematics.

This approach aligns with research by Boaler (2016), who emphasizes the importance of fostering a positive mindset towards mathematics. The success of the game-based learning program in reducing math anxiety and increasing engagement correlates with findings from Verkijika and De Wet (2015), who observed similar positive outcomes using game-based interventions to address math anxiety.

The significance of mathematical literacy in the 21st century cannot be overstated (OECD, 2018). The RGHL intervention offers a promising model for enhancing mathematical competencies across diverse student populations, resonating with UNESCO's (2019) call for more inclusive and equitable quality education. The power of this approach lies not just in its engaging design, but in its ability to transform students' emotional responses to mathematics – from fear to confidence, confusion to understanding, and dread to excitement. This emotional

shift is crucial for long-term mathematical engagement and success, as highlighted by Ashcraft and Moore (2009) in their work on affective factors in mathematics education.

Looking ahead, the RGHL study provides valuable insights for educational interventions in underserved communities globally. It underscores the potential of creative, technology-enhanced, joy-centric learning approaches in mathematics education. As argued by Blikstein (2013), such innovative methods can democratize access to quality education and help every child discover their potential in mathematics.

In conclusion, this case study contributes to the growing body of evidence supporting the efficacy of game-based and hybrid learning approaches in mathematics education. It offers a promising roadmap for educators and researchers seeking to address educational inequities and improve mathematical literacy in challenging contexts.

thorkild@ikp.aau.dk
pgu@pha.dk

Abstract: A growing number of young Danes experience a drop in well-being as well as there is an increase in diagnoses such as ADHD and autism. These challenges are often linked with school refusal and an increasing need for special education programmes. Since 2007, selected vulnerable youth (age 16-25) have been offered an alternative to regular youth education called Specially Planned Youth Education (Særligt Tilrettelagt Ungdomsuddannelse or STU). More than 30% of students attending STUs are diagnosed with autism or ADHD. The purpose of this paper is to explore the learning potentials of esports educational programmes with this specific target group. The study presents data from an ongoing research project entitled "Esports as learning space and gateway for vulnerable youth at STU", which is supported by the Velux Foundation and currently in its second year while looking to finalise in 2026. More specifically, we analyse data from ten interviews conducted with vulnerable youth at three STUs, who participate in educational esports activities with commercial multiplayer games, primarily *League of Legends*, *Counter-Strike* or *Valorant*. The interviews concern the students' gaming interests, their experiences with attending the esports programmes, and their perceived learning outcomes. All interview data have been coded and analysed using thematic analysis. Patterns and recurring themes in the data have been sought after based on questions of how students perceive themselves, what activities they engage in during esports education, and what the potential learning outcomes of the education are. Drawing on Dialogical Self Theory, we analyse and discuss the students' different I-positions and identify possible transformations made possible through the STU activities, which aim to support students in obtaining an autonomous and meaningful adult life. Our preliminary findings show that students generally have more positive experiences at the STU's than at their previous education. This includes adopting different I-positions that are more committed to a community than what they experience in their leisure gaming.

Keywords: Special Education; Vulnerable Youth; Social Gaming; Esports; Communication; Dialogic Self Theory

1. Introduction

A growing number of young Danes experience a drop in well-being as well as there is an increase in diagnoses such as ADHD and autism (Dumstrei, 2023). These challenges are often linked with school refusal and an increasing call for special education programmes. At the same time, a recent survey shows that most Danish children and youth (ages 1-15) are active gamers with 46% of them playing daily or almost daily, with boys playing for longer periods than girls (Medierådet for Børn og Unge et al., 2023). The survey also shows that more than half of the children aged 9-15 play games in order to meet with their friends.

In this study, we will take a closer look at social gaming in the context of special education. We are interested in studying how vulnerable youth (aged 16-25) participate in esports programmes at Specially Planned Youth Education (Særligt Tilrettelagt Ungdomsuddannelse or STU), which is offered to vulnerable youth unable to attend regular forms of youth education. More than 30% of the STU students are diagnosed with disorders such as ADHD and autism (Ministry of Children and Education, 2019). Moreover, several of the STU students have experienced school refusal and suffer from low well-being and/or stress, isolation and anxiety. Our exploration is part of an on-going research project entitled "Esports as learning space and gateway for vulnerable youth" (2023-2026) funded by the Velux Foundation. In this study, we wish to focus more specifically on how the vulnerable youth experience their participation in the esports programmes, where they play competitive multiplayer games, primarily *Counter-Strike* and *League of Legends.* This brings us to our research question: How do vulnerable youth position themselves as participants in esports programmes at Specially Planned Youth Education?

2. Multiplayer Gaming as a Gateway to Well-being and 21st Century Skills

Extensive research has mapped how playing multiplayer online games may contribute to the development of 21st century skills, especially communication and collaboration, which are key to succeeding in online games (Zhong et al., 2022; Qian & Clark, 2016). Research has also shown how multiplayer gaming may be used in the classroom to include at-risk school children, who rarely participate in everyday teaching (Hanghøj et al., 2018).

Moreover, several studies analyse links between well-being and playing online games, showing that the value or harm of gaming on well-being cannot be determined solely from whether and how much people play, but rather depends on contingent factors related to the player, the game, and the gaming context (Hartanto et al., 2021). An important factor is young people's social capital, which both involve bonding (e.g. trust) as well as bridging interests. A quantitative study finds that young people with high social capital are able to increase their sense of well-being and self-esteem through frequent gaming; whereas young people with low social capital tend to experience a decrease in their sense of self-esteem as well as increase in depression symptoms in relation to frequent gameplay (Kim et al., 2022). All these studies demonstrate how gamers' development of social relations (online and offline, school, and non-school) are key to young people's well-being. At the same time, we need more knowledge on how social gaming in educational contexts is experienced from the perspective of vulnerable youth.

3. Esports Education Programmes at STU

Our study explores the participation of vulnerable youth in esports programmes at three different STUs in Denmark. There are several similarities across the three esports programmes. First, they are all coordinated and taught by teachers with solid gaming experience, who invite the students to play competitive online multiplayer games such as *Valorant*, *League of Legends, The Finals* and *Counter-Strike* over the course of a 3 year period in order to develop personal, subject-specific, and social skills, which is the overall aim of STU. Secondly, each esports programme works with individual learning goals for each youth. Examples of goals may involve being able to complete an internship, being able to show up for teaching on a regular basis, or being able to ask for help when feeling lonely. Thirdly, the STUs have a dedicated gaming room with gamer PCs and high-speed wifi, allowing smooth gaming experiences - cf. Figure 1. The rooms are organised so that students can play together in groups and correspond with the esport games, designed to be played in teams of 5. There are between 6-12 students assigned to each esports programme.

Figure 1: A gaming room at an STU.

There are also important differences between the three STUs. One concerns the number of lessons devoted to the esports programmes. Esport activities involve one day per week at STU 2 and 3, but three days per week at STU 1. Another difference concerns the integration of esports gaming activities with other subjects. STU 3 combines esports with physical exercise and media design, whereas STU 1 offers esport as a standalone activity. Moreover, there is substantial variation among the students in terms of their personal and social challenges.

4. Methodology

The following are our methodological considerations, focusing on data collection and coding strategies. Our data consists of ten semi-structured interviews (Kvale, 1996) conducted with students enrolled in the three esports programmes. The selection of the ten students was based on our aim to represent a wide range of experiences and positions, and, to a lesser extent, on accessibility. Not all students felt comfortable or prepared to be interviewed at the time of our data collection. Consequently, the findings presented in this paper are influenced by the specific voices available to us.

During the process of obtaining informed consent from the students, we addressed the five issues identified by Gallagher et al. (2009): ensuring that participants had sufficient information to make an informed decision, verifying their understanding of the information, managing parental or guardian authority, assessing their capacity to consent, and ensuring that consent was given voluntarily, without coercion or undue influence. These issues were addressed in the initial twelve months of the project, which were dedicated to acquiring domain knowledge through fieldwork.

All interviews were audio-recorded. Given the relatively small dataset, we chose a strategy that emphasised preserving authenticity (Hammersley, 2010) and staying connected to the interviewees' lived experiences (Forsey, 2012). This involved listening to the recorded interviews in various ways while taking notes. Although individual listening sessions occurred, we were also inspired by the Framework Method (Gale et al., 2013) and the methodology of story-sharing (Onwuegbuzie, Leech, & Collins, 2010). Therefore, we conducted shared listening and debriefing sessions with all research group members present.

The table below (Figure 2) provides an overview of the ten interviews, including data on age, STU experience, and game preferences - both at home and at the STU.

Table 1: Overview of interview data.

Name	Age	Experience at STU	Games played at home	Games played at STU
Mike (STU 1)	17	1st year	GTA5, Farming simulator, Ready or Not	Counter-Strike
Noah (STU 1)	22	3rd year	Counter-Strike, FIFA, Fortnite	Counter-Strike
Teis (STU 1)	17	1st year	GTA5, Fortnite, Roblox	Counter-Strike
Magnus (STU 2)	20	3rd year	League of Legends	League of Legends
Morten (STU 2)	19	1st year	League of Legends, Ghost of Tsushima, Lethal Company	League of Legends
Kim (STU 2)	22	2nd year	League of Legends	League of Legends
Mark (STU 2)	22	3rd year	Persona, learning games, League of Legends	League of Legends
Simon (STU 3)	19	2nd year	League of Legends, Elden Ring, Marvel Snap	League of Legends
Alfred (STU 3)	19	1st year	World of Warcraft, Fortnite, Hearthstone, Overwatch	League of Legends, Roblox, Fortnite
Oscar (STU 3)	18	2nd year	Counter-Strike, League of Legends, Dead By Daylight	League of Legends, Counter-Strike

We used thematic analysis (Braun & Clarke, 2006) to familiarise ourselves with the data, incorporating both inductive and deductive strategies for coding data and developing categories (Braun & Clarke, 2019).

5. Theoretical Perspectives

We use Dialogic Self Theory (DST) to conceptualise how the students position themselves as participants in the esports programmes, and to understand their construction of meaning when reflecting on their participation. The dialogic self is understood as a multiplicity of I-positions within a 'society of mind' meaning that it is both multi-voiced and dialogical (Hermans, 2013). The I-positions can both be internal and external. They combine and reflect how the self relates to the environment (Hermans, 2013). An internal I-position could be 'I as a mother', where external I-positions refer to an 'extended domain of the self', e.g. 'my children' (Hermans, 2013, p. 83). In DST the 'other' have two qualities, both the actual others independent from the self, but also as constructed and reconstructed through the imagination of the self. In this way 'my children' exist in tension between the voice of the actual others and how this voice is constructed within the self (Hermans, 2013). Beyond the I-positions there are also meta-positions of the self, which is a position distanced from one or several I-positions that observe these positions and consider them from a 'helicopter view' (Hermans, 2013). We draw on DST in order to understand how vulnerable youth media use is a form of expression that generates ongoing dialogue in the self, as Fecho (2013) illustrates. He argues that reading, writing, and artistic expression can be seen as a valuable media used by youth to "seek understanding of the chaos around them" (Fecho, 2013, p. 128) and that youth need different means to construct such meaning. In this sense we understand each student's participation in the esports programmes as an engagement in media where different I-positions are expressed in dialogue.

6. Analysis

The analysis presents how vulnerable youth positioned themselves as participants in the esports programmes as STU Students in contrast to prior school experience (section 6.1), as alignment between leisure and STU gaming (section 6.2), and as participants in communities (section 6.3).

6.1 Being a STU Student in Contrast to Prior School Experiences

The first theme concerns I-positions where students in one context primarily feel isolated and stressed while in another more at ease and sensing a high degree of autonomy. These experiences and narratives reflected how the students had shifted external I-positions from being school pupils to being STU students. Our coding showed how the internal I-positions among the students of being isolated, struggling mentally or not feeling cared for dominate their recollection of experiences of public school. One student recalls his school experience like this:

> *"It was awful. The school didn't care if we were there or not. The pupils were all mentally switched off, so you couldn't have a conversation with anyone. I felt very alone"* (Oscar).

Another student describes his pre-STU school experience in a similar vein:

> *"Public school is torture. School is the worst invention ever. During my last six years in school we constantly changed teachers. I really struggled"* (Morten).

In contrast to this, the students portray themselves as more at ease as students in the esports programmes:

> *"At the STU everything is more relaxed, you don't have to worry about grades, you are taught different stuff, social stuff, you learn to live on your own, whereas in school it is much more academic. At the STU it is much more about your mental state and how you feel. They make an effort so when the day is done you leave with a smile on your face"* (Mike).

For some the position they describe themselves with is more akin to friends than students and teachers.

> *"We have a great atmosphere here, where we get to have fun with each other, including the teachers. You could never do that at my former school. If you made a joke with a teacher, they would send you straight home! it is like hanging out with a bunch of friends and not teachers"* (Kim).

The internal I-position of feeling at ease or relaxed among teachers and peers at the STU is related to having a sense of freedom, to be able to choose.

> *"I love the freedom here. There is a lot of freedom. Freedom to say, I don't feel like doing this. For instance, if there is a game I don't want to play, I don't need to play it. They get that I don't want to. That makes me feel more comfortable… about the entire school actually"* (Kim).

Among the ten students, only one (Mike) expressed predominantly negative feelings about the esports programmes. Whereas his peers experienced fewer constraints and more agency, this student continued to struggle to find a position where he could pursue his interests. Here is what Mike said about the teaching and the teachers at the programme:

> *"They start to piss me off sometimes. I don't like playing Counter Strike. Everyone should have the right to choose what they want to play"* (Mike).

Mike explains that he did not himself choose to enter the esports programme, nor did his prior gaming interest align with the games they play at the programme. The latter being a subject we will discuss in the following theme.

Overall, the students describe how their prior school experiences are predominantly negative, whereas their participation in the esports activities at the STUs is generally positive. The students position themselves internally as more at ease at the esports programmes, they view the learning environment as less demanding, and they experience to various degrees being part of a group with positive social relations. Considering that these are young people, who throughout their educational life have struggled with school academically and/or socially, the overall impression from our analyses is that the students thrive as participants in the esports programmes.

6.2 Aligning Positions Between Leisure Gaming and Gaming at the STU

The second analytical theme concerns the students' adopted I-positions as *gamers* - both in relation to playing at home (leisure gaming) and playing at the STU (educational esports). All of the students played games frequently at home (cf. Figure 2), which often involved different types of games, ranging from multiplayer to more casual games. Some students described specialised game experiences, such as Oscar, who had played on a semi-professional *Counter-Strike* team, or Mike, who had a deep knowledge of enacting the role as fireman on a dedicated *FiveM* server, which is an online mod for *Grand Theft Auto*. This variation of game genres (First Person Shooter versus Online RPG) suggested that the students had different game preferences. Generally, the students all experienced positive outcomes of playing at home, e.g. in terms of relaxation or maintaining online friendships.

In comparison to playing at home, the students' alignment with the aims of the esports programmes varied. We identified four different I-positions, which reflect how the students aligned themselves differently toward the esports activities at their local STU. The first I-position concerns students, who did not align themselves with the gaming activities on their esports programmes. They mainly preferred to participate in the classroom as *individual gamers*, similar to playing alone at home. Mike is an example of a student taking this I-position as he clearly stated how he would prefer to "be left on his own" to play something relaxing and that he did not like playing *Counter-Strike* at the STU. Interestingly, Mike did play other First Person Shooters at home, which suggests that he was more misaligned with the STU context than with the game type. Another student adopting the individual gamer position was Alfred, who sometimes agreed to play *League of Legends* with the other students in the classroom, but often struggled with using toxic language and "tilting". Consequently, he was sometimes allowed to play his preferred games individually such as *Baldur's Gate III*. The students who adopted the individual gamer I-position were all new to the STUs and only partially identified with the overall aims and concept of the esports programmes.

The second I-position is the *social esports gamer*, which we saw among students, who mainly participated in the esports programmes for social reasons. These students explained how they primarily showed up to hang out and "have a good time" (Alfred) with their friends. In the words of Teis: "It doesn't matter what we play as long as we are having a good time [hygge]". The students identifying with this position would often play different games at home and at the STU, indicating a weak alignment between their personal gaming preferences and the games that their teachers had chosen for them to play at the STUs.

The third position, the *curious esports gamer*, was expressed by students, who were new to the games chosen by their teachers, but had developed an interest in the games. As an example, Oscar had several years of experience playing *Counter-Strike (CS)*, but had limited prior experience with playing *League of Legends (LoL)*, which was played at his STU. This meant that Oscar had to learn *LoL* from scratch, a massively complex game, in order to take part in the class. However, Oscar did not mind learning a new game, as he was interested in playing the game together with other team members at the STU, especially those with a competitive mindset like himself. In this way, some students aligned themselves with their teachers' choice of esports games at their STU,

even though they had not played these games before entering the STU. In some cases students had also begun playing the games at home after being introduced to them at the STU.

The fourth and final I-position we identified is the *serious esports gamer.* This I-position concerns students, who had strategic aims and considerable experience with playing the games in their esports programmes. These students were clearly aligned with the aims of their teachers as they continually tried to improve their game skills, strategies and team performances, often with a focus on team communication. An example is Simon, who had become so experienced with *League of Legends* that he had also tried to fill out the demanding role as team leader during game sessions.

As the breadth of I-positions show, there was substantial variation as to how the students experienced alignment between their identities as leisure gamers and as esports gamers at the STU. Some of the students were clearly aligned, other students willingly accepted the game preferences of their teachers, and others again expressed negative opinions of the games they had to play. This points to an important dilemma of choosing games for teaching esports to vulnerable youth with different gaming preferences.

6.3 Participation Across Committed and Non-committed Communities

The third analytical theme concerns the students' adopted I-positions as members of different communities. We identified three positions. The first was in relation to playing at home (leisure gaming), which we describe as a *non-committal* I-position. Secondly, we identified two forms of *committed positions*: one concerning being a part of the STU and the other being a team member.

The students' experiences with gaming communities from their leisure time involved friends from previous relations, people they had met online and regularly interacted with, or more or less random people they encountered online. One student (Noah) explained that he had gained several friends through discord communities in his leisure time, but that they only met online. Noah preferred to game online and explained that the good thing about gaming online is that you can always just leave and take a nap on the couch. In this way, Noah's I-position of being a leisure player was *non-committal* as it involved informality and low obligations towards the gaming community. Several of the students' I-positions related to leisure gaming are non-committed with low obligations with the option to "tap in and out of relations" when they prefer.

The I-positions that the students assumed as part of the esports programmes at the STU's were different. At the STU, they experience being part of a community, which involves presence in-game, in the class, and at other locations at the STU. This allows for different I-positions and possibilities for participation which all are variations of being *committed* to the community. Some students had experienced getting 'real friends' where they can talk about problems or dilemmas. Kim explains that he has gained "camaraderie" in the esports programme, which he has not experienced elsewhere, even though he had played *LoL* (the game played at STU 2) since he was 7 years old:

> "*Many expect that gamers have friends online when they sit and play online. But at the STU you also get physical friends, people you can physically hang out with. And … I don't know, go out in town, and have a pizza with, … Virtual or physical face-to-face is different. You get completely different camaraderie than you would get if you just sat and played and met them online.*" (Kim)

Kim's experiences of having friends physically and at the STU are different then online friends, among other things because there are different opportunities or potentials connected to physical friendships and activities. In this way, the students' participation in esports class permeates the boundaries of their leisure time, making it easier for them to socialise. Magnus explained that in the esports programme they get to know each other on the pitch (football analogy) but also personally. Mark experienced that he is better at communicating with people outside of the esports class where the game becomes a good topic to initiate talks with peers. Mark explained that he and Magnus do not have a lot in common besides *LoL*, but it is easier for them to communicate about *LoL* because it is a shared interest they are both passionate about. Further Mark experienced that talking about a specific game can lead to another conversation later on.

> "*It's really an icebreaker if you need to start a conversation with someone else. Like, have you seen the new patch notes and everything? And then move into a conversation from there*." (Mark)

It is not easy for Mark to initiate a conversation. But talking about the game as a topic, a new I-position emerges, where it is easier to initiate a conversation with his peers because of their common passion for the game. In this

way, the external position of *being a participant in the physical STU community* permeates the in-game and in class experiences and allows new I-positions for the students such as *I as an initiator of conversation*. For some students, the community they experienced at the STU led them to experience new friendships and positive relations, for others they became aware of other programmes at the STU and began to see opportunities in other subjects. We also identified an I-position as 'communicating team member', which highlights the difference between committed gameplay at the STU and non-committed gaming at home. When Mark played *LoL* at home, he did not trust or cooperate with players he met online and explained that it is *"almost like two different games when you play at home versus here,"*. In the esports programme he experienced being part of a team:

> *But when you're in Esports, where you actually have to do things with others, you are kind of forced into it…. is just where you sit in an enclosed/confined room and are forced to cooperate with others. You can't just go completely autistic and do your own thing. You have to communicate with others.* (Mark)

For Mark you have to do things with others in esports and you are actually forced into doing it. He also used his diagnosis of autism to explain that you cannot "just go completely autistic", in the sense that, here is a task that you cannot do alone but you must communicate with your teammates. Several students experienced that being a team member was closely tied to how they experienced collaboration and communication in the game. Moreover, Mark also described how he was not used to collaborating in the other classes at the STU, where they mainly work individually on their own assignments.

The esports programmes at the STU offer different I-positions as being part of a committed community than they encounter in their leisure gaming activities. To a degree that students say that the same game played at the STU compared to at home are almost two different games. The possible i-positions of being part of a committed community are both in relations to in-game and being team members, but also in relations to getting to know the other students before and after playing, and even broader at the STU.

7. Discussion

This study has aimed to provide more knowledge on how vulnerable youth perceive their participation in esports programmes. In this way, we have both tried to highlight the beneficial and inclusive aspects of esports activities, but also tried to shed light on how students' gaming interests imply many different I-positions. In other words: gaming is not just gaming, but always involves contextual and normative practices, which require negotiation among the social participants to make sense.

The analysis shows how the esports programmes offer unique social spaces for vulnerable youth, which allow them to adopt new I-positions - i.e. as students in the STU classroom, as esport gamers, as team members and as members of learning communities, which involve new forms of relations, commitment and communication. Overall, the students expressed positive experiences attending the esports programmes, which were in stark contrast to their negative experiences with prior forms of education. At the same time, the interviews also revealed that the students' participation involved tensions, which may create dilemmas for making the esports programmes succeed. A key finding here was the varying alignment between the students' game preferences at home and the esport games, which they had to play at the STU. Some students clearly experienced a strong or at least acceptable match between the two gaming contexts, whereas other students were less optimistic and even negative about the teachers' preferred games.

Another key finding is that the esports programmes at the STUs allows for the construction of I-positions that are committed to communities, which can help the students to communicate, form friendships, being part of a team/group, and talk with other people. The experience of participating in a committed community was rather unique for the STU-students as they seldom experience this in their leisure gaming activities or their prior schools. One aspect that requires further investigation is if the online participation in the esports programmes (offered at STU 1 to help students integrate slowly into the esports programme) offer the same or similar possibilities for adoption of it-positions as being physically present.

A limitation to our study is, as mentioned, a potential selection bias. Because of the vulnerable position of the youth attending the STU, the teachers suggested which students to be interviewed, which might have prioritised students with more positive experiences. Furthermore, some of the suggested students did not want to talk to us. In this way, there may be other I-positions present among the students, which we did not have access to. It is important to emphasise that several of the I-positions described in the analysis are somewhat overlapping.

The I-positions suggested here rely heavily on the researchers interpretation and could be conceptualised differently. Through our continued studies, we hope to refine and deepen the categories.

8. Conclusion

In this study we have used Dialogic self-theory to interpret how vulnerable youth position themselves as participants in esports programmes at three STU's in Denmark. We conclude that students have more positive experiences at the STU compared to prior school experiences and that participation in the esports programme allows for students to construct somewhat unique I-positions as members of committed communities being team members or students at the STU's. This potentially has a positive impact on students' construction of their self and identity. Further research is needed to identify and detail the different I-positions adopted by the students but also to understand how the esports programmes facilitate the construction of the students I-positions. For example, how alignment between students' I-positions as leisure gamers and the games played at the STU can impact the I-positions students develop.

"Open World" Texts: A Framework for Analyzing Recombinatory Writing Games (RWGs)

Allen C. Jones
University of Stavanger, Norway

allen.jones@uis.no

Abstract: This paper uses a literary studies and game-based design approach to propose a theoretical framework for understanding, assessing, and designing recombinatory writing games (RWGs) as well as for establishing the relationship between RWGs and the larger category of creative writing games for reading (CWGR). Central to understanding this framework is the way RWGs integrate and develop Surrealist and Oulipo writing techniques (play, collaboration, juxtaposition, and constraint) to democratize traditional notions of Literature in order to create the inclusive, non-judgmental arena necessary to establish open world exploration and creativity as motivators in writing games for reading. This paper develops a theoretical approach and then uses it to analyze example games and prototypes to clarify *divergence*, *juxtaposition*, *textuality*, *open world*, and *play* as the key aspects of the framework. No framework has yet been established for examining CWGR or RWGs, thus this paper represents a necessary foundation for future research and design as well as an essential part of the larger project aimed at developing creativity and inclusivity as motivators for game-based reading and writing.

Keywords: Creative Writing, Reading, Games, Literature, Open World, Surrealism

1. Introduction

The West assumes Shakespeare wrote the greatest works of all time. This notion has kept a very good writer's work alive, however, the hierarchy of genius reduces the inclusivity of Literature, and undermines creative, exploratory approaches to reading and writing, particularly for the majority of students, who do not identify as geniuses or even writers (Waitman, 2009; Runco, 2014). This along with the fact that writing in school is primarily associated with assessment (Boscolo and Hidi, 2007), creativity is increasingly perceived as childish as students progress academically (Jones, 2023; James and Nerantzi 2019), and the majority of educational reading games are not aimed at advanced reading, sets up a difficult task for those wishing to inspire upper-secondary students.

This paper proposes a framework for examining how game-based approaches to rearranging classic texts—recombinatory writing games (RWGs)—can motivate players by establishing a playful, building, exploratory experience comparable to open world games like *Minecraft*. This experience opens an inclusive creative space by democratizing the hierarchies associated with writing and Literature, and its recombinatory aspect facilitates creative and interpretive interactions with a primary text by combining Surrealist game-based techniques, the algorithmic recombination of the Oulipo, and the practice of "critical deformation": the idea that textual reorganization can serve as an effective method for critical analysis (McGann, 2001). To analyze this game-based process, *divergence, juxtaposition, texutality, open world,* and *play* are proposed as an analytical framework.

2. Surrealist, Game-based, Combinatory Writing

Surrealist writing games democratize traditional notions of Literature by turning the artistic process into a collaborative exploration focused on the concepts of "chance" and "the marvelous" (Durozoi, 2004, p. 65). "Chance" and "the marvelous" are technical terms referring to the way two objects combined at random (chance) can function to inspire new ideas (the marvelous). Surrealist methods modify French parlor games to develop a suite of collaborative, chance-based, combinatory games focusing on the production of surprising juxtapositions. The most famous textual example, *Exquisite Corpse*, asks players to write part of a single sentence while blind to what other players have written. The chance-based intersection of sentence parts is given overall coherence by syntax: article + adjective + noun + etc. The game transforms the notion of artistic production from the product of singular genius to a collaborative, playful, combinatory process.

This process revolves around the moment of unfolding, an action that reveals and connects the individually produced texts. Unfolding actively combines writer and reader, as each writer becomes a reader of a final text that they have co-authored but have never seen in full. This collaborative reading also pertains to future readers: the crease left by the fold acts as a material acknowledgment of the collaborative and chance-based process for any future reader (Laxton, 2009). This awareness of the text's collaborative creation transforms "reading" from the traditional notion of *convergent* sense making or comprehension (Bos et al., 2015), into a search for surprising and *divergent* juxtapositions, an experience comparable to that of the original writers/readers.

Collaborative, combinatory writing also challenges the notion of the text as fixed information in a one-way knowledge transfer from writer to reader. This is replaced with text as trace of playful process where connections can work at varying levels of cohesion. This may even go so far as to include "failure"; however, the measure of a "failed" juxtapositions is established by the reader rather than the writer, representing a further level of both textual openness and reader inclusion. This is in direct contrast to the way we typically read Shakespeare: as a set of ingenious connections established centuries ago and delivered to us under the threat of assessment.

The central mechanic of Surrealist writing games—juxtaposition—went on to influence the field of 20th century art (Lusty, 2021), to be used pedagogically in the field of Creative Writing, particularly songwriting (Pattison, 2010; Gooderson and Henley, 2017), and has recently been shown to improve solution-based processes (Mastria et al., 2022). In almost all fields, however, the emphasis on product has re-established a product- and assessment-focused process that undermines inclusion and creativity. Key to understanding the potential of Surrealist process is to understand this forgotten democratic aspect: how combinatory game design sets up a participatory community that transforms the writing and reading experience into in a creative and inclusive search for surprising textual juxtapositions.

3. Recombinatory Writing and "Critical Deformation"

While the Surrealists used these methods to produce original works of art, the experimental group Oulipo used combinatory methods as filters on source texts. Their methods quantify the "marvelous" juxtaposition in Surrealist game design, shifting from chance as a mechanic for sourcing texts (players write whatever they want) to data mining (a source text is mined by one of their algorithms) in what amounts to a mechanization of the combinatory process (Motte, 1986). For example, the ten sonnets of Raymond Queneau's *One Hundred Thousand Billion Poems* can be recombined to produce 10^{14} poems. Rather than a singular combination driven by individual players, this method runs basic algorithms to explore a nearly infinite number of combinations on a source text. While Surrealist method decenters the artistic product, the Oulipo jettisons it completely; the point is not the poems but the mathematical rules ("constraint") driving the composition (Motte, 1986). In essence, the process replaces traditional creative writing with algorithmic textual design.

While *One Hundred Thousand Billion Poems* still acknowledges individual genius, running its constraint on Queneau's poetry, S + 7 represents a combinatory equation, involving no original work except what is produced by running the constraint (it replaces every noun in a text with the dictionary entry seven places from the original). This procedural filtering treats the original text as *material* from which to systematically "fold" a "new" text (Queneau, 1986). Writer becomes coder, designing algorithms to create a productive recombination of the original text. The approach jettisons the notion of a single product to such a degree that even the process produced, S + 7, represents only one of numerous potential algorithmic processes of this type.

The Oulipo did some work on turning this combinatory approach into a method for literary interpretation, but this was not taken seriously until Jerome McGann coined the term "critical deformation" and made an in-depth argument that isolating parts of a literary text can reveal connections and thus serve as a critical reading tool (McGann, 2001; Ramsay, 2011). As McGann's deformations are too complex to present briefly, Yedda Morrison's conceptual artwork can clarify this approach. In her critical deformation "*Darkness, All that/the Remains:* a biocentric reading of Joseph Conrad's *Heart of Darkness,* 1902", Morrison (2012, p.177) erases "all things human" from the novel so that *Heart of Darkness* opens with enormous gaps:

flood

wind

river.

Rather than raising her original environmental questions, however, the process introduced ethical questions about race: "erase whites only? Thereby erasing colonialism? So blacks are "part of nature"? Erase blacks? As in erasing black history? Again?" (p. 177). This highlights the divergent and emergent nature of critical deformation. Rather than selecting quotes to support a predefined argument, ideas and critical questions emerge in the deformation process, which is essentially a Surrealist folding of the text driven by an Oulipian algorithm.

The presence of the fold as a mechanic in critical deformation reveals the surprisingly coherent and useful nature of this wildly divergent, collaborative, playful and sometimes nonsensical mechanic. In essence, critical deformation aims for the Surrealist product (surprising juxtaposition) with an Oulipean approach (systematic

exploration). The only characteristic absent is the rule-based framework: Oulipo has "constraints", Surrealism has parlor games, but critical deformation lacks a clearly defined set of rules to direct the process.

4. Creative Writing and Expressive Deformation

The lack of defined process in critical deformation makes it useful for experts but reduces the collaborative element and gears the method away from inclusion and towards experts. An example of this is the critical deformance "*Imagining Nonlinear Reading*", a word-cloud concordance of Dylan Thomas (see figure 1) built in digital, immersive 3D (Jones, 2012). Late one night at the lab, a student saw the word clouds and exclaimed, "Wow, that's beautiful!" This, however, was quickly followed by, "So…how do you play it?"

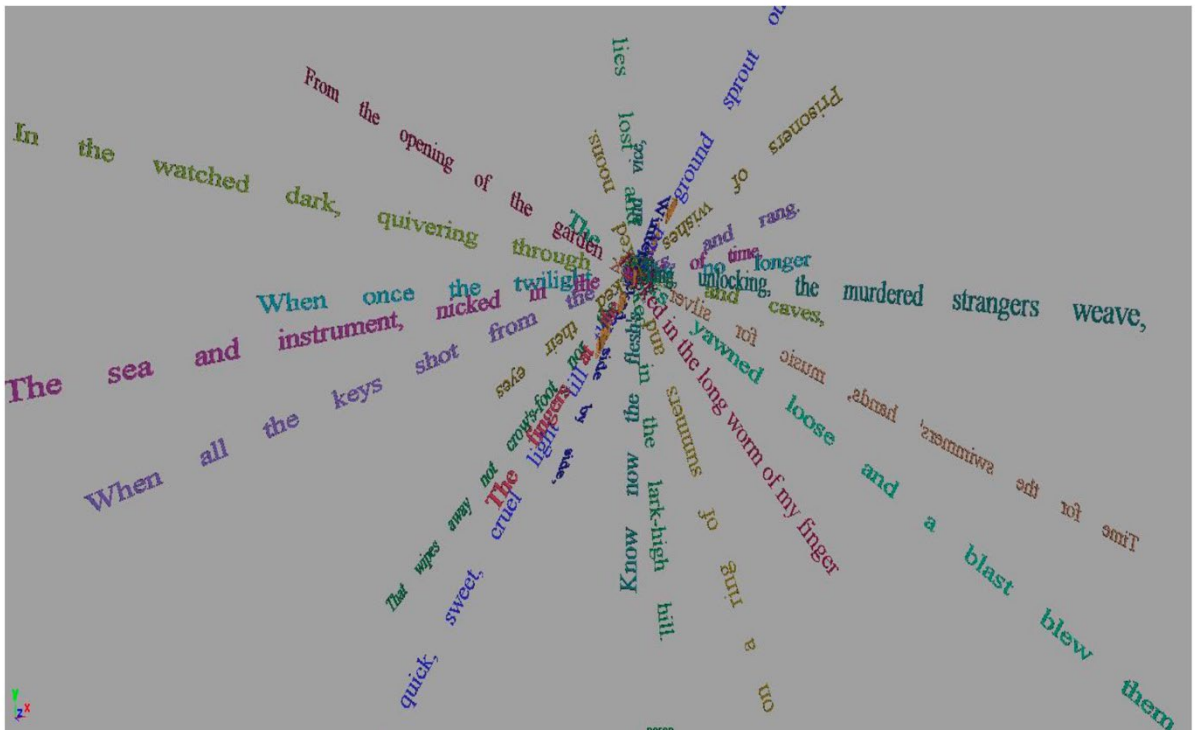

Figure 1: *Imagining Non-linear Reading*: word cluster surrounding "lock"

The lack of clearly defined methods in critical deformation has been overcome to some extent in the field of Creative Writing (CW) by emphasizing the artistic and expressive nature of the output. A common example of this kind of expressive deformation is the "replacement poem", an exercise where a poem missing key words is completed by students (Gropp and Jorgenson, 2020). As a critical deformance, this process reveals the incredible density and complex linguistic structures of good poetry; however, the motivator in CW is often the creation of a new expressive piece. In other words, the answer CW gives is that the product is beautiful, regardless of its usefulness. This removes the "critical" element from the process, but it reveals the incredible power of presenting reading from a design perspective, where the reader identifies themselves as a builder, modifying and building one text from another, developing their goals and processes as they go.

In CW, framing the writer as builder/designer moves reading from an information search to a process of mining the master texts for building blocks (ideas, structures, language, syntax) to use in a new artistic product. This designer/builder frame also creates an inclusive relationship to Literature. It doesn't matter if Shakespeare hands over the brick or if it is lying in the street. For students who see themselves as creative, this represents a goldmine in terms of producing engagement with literary texts. The problem with this, however, is twofold: first, creative self-expression does little to engage students who do not see themselves as creatives (Boscolo and Hidi, 2007); second, the central goal of critical deformation is not to produce art but to engage in interpretation. So, how do you adapt deformations as critical tools while motivating "non-creative" users?

This paper proposes five categories of analysis for writing games that attempt to do just that: *divergence*, *juxtaposition*, *textuality*, *open world*, and *play.* This framework can be used to analyze the extent to which the broader category of creative writing games for reading (CWGR) develop an open-world, exploratory, building

experience and establish divergent creativity as a motivator for rule-based recombination. In other words, the framework assesses CWGR as game-based critical deformations, i.e. as recombinatory writing games (RWGs).

5. Creative Writing Games for Reading (CWGR)

Replacement poems qualify as CWGR, however, they allow the writer to use any words they like in the replacement, which means the level of recombination is lower than if the writer were allowed only text from the original. Party games like *Apples to Apples* are also CWGR, however, they have no relationship whatsoever to a primary text. Thus, they are combinatory as opposed to recombinatory. And both these approaches use Surrealist and Oulipo methods like chance and the fold to varying degrees to drive their processes. In view of this radical variety in CWGR, the present paper proposes a framework to specifically examine the extent to which these processes use rules/constraints ("games"), collaborative or chance juxtaposition, and a "playful" (Stenros, 2015) or divergent approach to create inclusive, "open worlds" for design/builder-based textual exploration. This framework will be developed by looking at the way RWGs combine game-based design with the motivation of CW combinatory practice (traditional notions of writing a poem), allowing creativity and self-expression to function even for users with low self-efficacy in creative writing. The analysis will find that RWGs develop an open world, sandbox/building relationship between the reader (who functions as a co-writer) and the literary text: words become material, like the blocks of *Minecraft*, and writing becomes exploration (skimming), building/designing (text mining), and solving (reading). The games imply that one need not be an artistic genius; one need only stack blocks in interesting ways.

In many ways, *Minecraft* set up this game-based approach by redefining the notion of what makes a video game. One of the most played games in the world, it is not really a game at all: there is little sense of competition, scoring, or goals beyond exploration and building (Duncan, 2011). It is almost solely based upon the motivation provide by design/building. The first version plopped the player down by a beach with no goal beyond placing blocks and smashing them: "left click to place or mine blocks" (Person, 2009). *Minecraft* remains hugely popular (nearly one million online now according to activeplayer.io/minecraft) despite its rudimentary graphics, and while it has added some first-person shooter and survival elements, it remains fundamentally an exploration and building platform (Duncan, 2011).

In *Minecraft,* "playing" consists of wandering an infinite world and building freely. Like *Roblox*, the central "game" mechanic is design. Likewise, recombinatory writing games (RWGs) are only games in the sense that they present reading and writing as a design-based experience. Rather than a beach, a RWG plops the player down in a work of literature with the essential motivator being to smash things up and reassemble them in new ways. The master literary text becomes the blocks in *Minecraft,* each word equivalent to a different material. The rules built into language (grammar, sense, and narrative), make a very simple rule (line them up) quite complex. In *Minecraft*, players learn that different combinations create different effects; in RWGs, the player arrives with long training in their language's grammatical, syntactical, and narrative combinations. While *Minecraft* began with thirty blocks (grown to over 800), blocks in a RWG are equivalent to the user's vocabulary.

The measure of the open world aspect of an RWG can be understood in contrast to the closed, solution-based aspects these games also employ. For example, storytelling games are collaborative creative writing games whose goal is to reach a particular set ending (Perez & Bidarra, 2022), so the parts are creative, but the ending is solution-based. *Apples to Apples* is probably the most a popular purely recombinatory game: the texts are fixed, players select what text to play, and the combinatory result is judged by a single player. This makes it solution-based, though a solution based predominantly on the interpersonal dynamics of public judging. Both storytelling games and games like *Apples to Apples* are RWGs, however, they do not focus recombination on an original text. Thus, one might argue that they are creative writing games that use recombination, but their goal is essentially creative or communal as opposed to critical, as the deformation aspect is absent.

Even in CWGR that succeed in recombining an original text, there is the consideration of how and to what level. The highest level of "textuality" would be a game like *Dylan Thomas Dominoes* (Jones, 2021) that *only* uses the text of the original literary text under consideration in its deformation. Remove the game element from this approach, and you have something comparable to a text-analysis tool like Voyant, the product of the game comparable to an information visualization or "direct visualization" (Manovich, 2011). A direct visualization uses "distant reading" (Morretti, 2005)—a computational and quantitative approach that visualizes large quantities of text—to move "distant" enough from a text that it becomes a map of its own internal relationships. A simple example of this would be an author's complete works laid out in chronological order with all positive words highlighted in red. From a distance this becomes a density plot of the writer's positive word use over time.

CWGR with low textuality do not necessarily lose their function as deformations. While dismissing it as "subjective", McGann does include "adding" in his definition of critical deformation mechanics: "reordering", "isolating", "altering", and "adding" (2001). An example of a RWG that uses recombination of the original text but also allows subjective addition is "One into another". This Surrealist game, redesigned as an RWG ("analogy riddle") in a recent study (Jones, 2023), asks students to make riddles out of two terms in a literary text. While the goal is to compare terms, the riddle clues are user-based and thus represent an addition to the text under analysis. This moves the product away from the original text and into the student's contemporary experience. As such, it represents a lower "textuality" or use of the original text; however, it can allow for a higher level of divergent thinking, as the analogy can go anywhere, and grounding a comparison in student experience can also increase the open world aspect, as it opens the text outward to connect with the student's world.

One of the central design challenges of a fully open-world game is the high cognitive load of exploration-based, building/design mechanics: too much openness in a game can leave the player/writer lost. This is why zombie attacks were added to the early version of Minecraft (Duncan, 2011). This gave players a sense of something specific to do: build for protection. Misuguided notions of creativity as a completely open and free activity produce this problem of cognitive load: a lack of guidance can make creative play "grueling", as Margaret Robertson points out in her *Minecraft* game analysis (2010). On the other hand, a more solution-based system that leads to a pre-determined answer, while reducing cognitive load, limits the ability for an RWG to foster open exploration. Play is replaced with the race for a single solution.

This paper's exploration of Surrealist game design, Oulipo algorithmic composition, and critical deformation serves as the foundation for understanding RWGs as *interfaces that use open world game design to aim the creativity of combinatory writing at critical deformation*. The rest of this paper explores specific mechanics and games with the goal of clarifying the relationship between CWGR and RWGs. While this paper focuses on the framework, a future paper will present data from an ongoing research project designing and testing RWGs in Norwegian upper-secondary schools (Jones, 2023).

6. Freewriting as Experiential Frame and Mechanic

In CWGR, the open space of freewriting can function to develop both a divergent (Baer, 1993) and playful (Stenros, 2015) mindset as well as to train users in creativity as skill, motivator, and game objective. This, in turn, gives the player the skills and mindset necessary to experience recombinatory textual play as an open world.

The primary rule in freewriting is not to stop. This dismissal of judgment opens the low-stakes space essential for divergent performance (Amabile, 1982). In the 1980's, Peter Elbow famously developed narrative freewriting as a critical tool in American university writing courses (1973/1998); however, freewriting is fundamentally at odds with RWGs, as recombination reduces the words a writer can choose. In view of this, each of the following CWGR freewriting modifications train the user to navigate from the open space of divergent creativity toward the convergent (logical or solution-based) space of critical thinking and writing:

Open freewriting has no constraints, the only rule to keep writing. It functions to 1. Establish an experience of freewriting from which the other forms diverge, acting as a baseline for navigating between divergent and convergent thinking; 2. Develop the skill of divergent thinking/writing to reduce the cognitive load of recombination so it can be experienced as an open world activity. 3. Refocus writing from coherence and self-expression to a game-like, playful, combinatory mechanic facilitated by constraints.

Blind freewriting asks writer to close their eyes. This disrupts the hand-to-eye connection of traditional writing, a disruption that encourages divergence and begins the embodying process that is part and parcel of making textual interaction an immersive, material process of exploratory block stacking.

"Word bomb" drops random words into the freewrite that the player must immediately incorporate. This produces a radically divergent moment that must be turned convergent (incorporated into the freewrite). Note that while open freewriting cannot be easily gamified, word bomb introduces the possibility of altering game speed and thus can be used for scoring and competition. These kinds of game elements are key to establish "flow" (Csikszentmihalyi and Le Fevre, 1989) and demonstrate how the relationship between aspects in the framework—in this case divergence vs. convergence—can become game elements.

Catchphrase drops logical phrases into a freewrite. The player must then continue writing from that phrase. While convergent in the sense that the phrase must make sense, these result in divergent moments when the phrase succeeds in turning the writing in a new direction. In CW, the term "I remember", however, this typically

produces fluency over divergence. In the study associated with this paper, the catchphrase "Evil clowns should rule the world because" was used to combine convergent argument structures with divergent, playful content.

Non-sense asks players to put words together that *don't* make sense. This works to reveal other linguistic capabilities associated with stacking word-blocks like rhyming, random, sight-based, alphabet-based, or algorithmic ordering. Non-sense also serves to physicalize the process by moving players toward sound (rhyming) and sight (writing whatever they see), which disrupts logical, convergent, narrative-based writing.

The five variations of freewriting can function as game mechanics. For example, the first stage of the RWG prototype *Poetry Planet* (Jones, 2024) sets the player up as a space explorer whose goal is to conquer the most territory on a planet surfaced in the words of a classical literary text. The first screen—"Blast Off"—is split, a rocket ship on the left and a writing area on the right. To "fuel" the rocket, the player goes through a series of freewriting variations. The only prompt given is "Words are rocket fuel—start writing!" Typing fuels the rocket, the goal to reach the top of the screen. "Blast off" trains the player in basic divergent writing skills, develops their sense of writing as an unjudged, open world experience (write whatever you want), and introduces them to word stacking (juxtaposing) as a mechanic for progressing in the game.

7. Game Analysis: Poetry Planet

After completing the "Blast Off" level, the player flies to a *Poetry Planet,* a planet wrapped in the text of a classic piece of literature or a text of the player's/teacher's choice. The text is strung from south to north as a single line of words, the reversal effected by the organization pre-deforming the text to a certain degree. The goal of the game is simple: conquer the most territory. To do this, players move from word to word, the only rule to make sentences. When the path a player leaves circles a chunk of text, they have "captured" it (see figure 2).

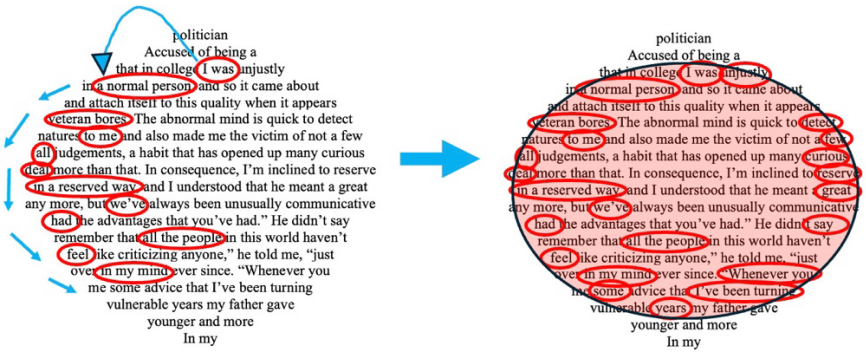

Figure 2: "Capture" in *Poetry Planet*

After capturing, a player can "mine" an area by playing "Mine the River" (see figure 3), a Tetris-like game where words drop from the top of the screen and must be dragged to the incline and ordered into sentences. The words dragged to the incline slowly slide down toward the pile. Once a sentence is completed on the incline, the trap door open and it is stored as "cargo". The goal is to keep the screen from filling during the allotted time. Mining gives players necessary elements to repair their ship and text for use in battles with other players.

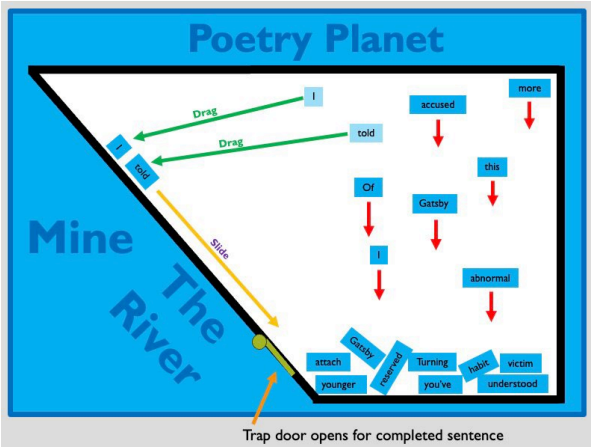

Figure 3: "Mining" with "Mine the River"

To win the game, players/teams can use any words in their "cargo" (all the sentences from "capture", "mine", and "battle") to make a "riddle sentence". Each team/player submits their riddle sentence for judging, and one is selected by majority player vote. Teams/players race to "solve" this riddle sentence by finding the location of each word on the textual planet (see figure 4). This mechanic is the one that most clearly moves from divergent word-block stacking toward convergent, solution-based thinking, as there are a limited number of correct answers. This mechanic also moves the player back to the original text (skimming to find pieces of the "riddle sentence") and makes a knowledge of that text strategically advantageous for more quickly completing the riddle sentence. This is promising in terms of arguing that this RWG functions as a CWGR in terms of using recombination not simply as a game mechanic but to motivate interaction with the original text.

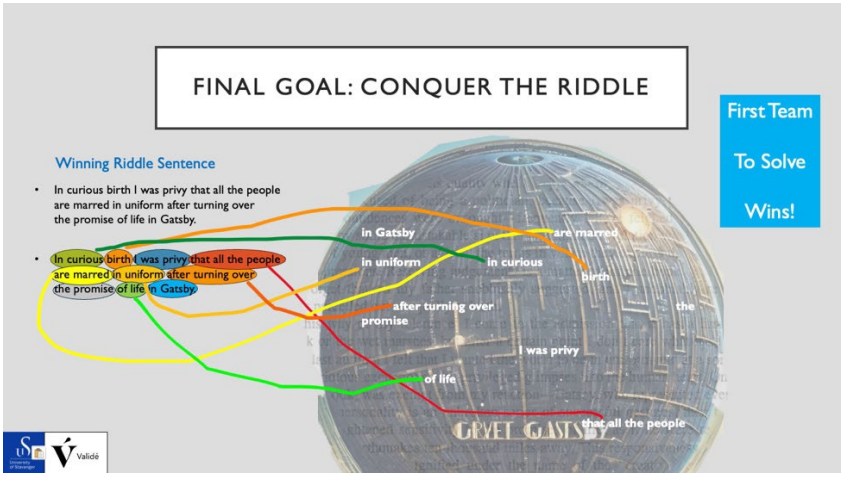

Figure 4: Screenshot of final stage of *Poetry Planet* prototype

The example of *Poetry Planet* shows us how game design can be used to direct highly divergent and subjective/additional writing (users freewrite with words not related to *Gatsby*) toward a second level that involves 100% textual recombinatory interactions (only Gatsby text is used in capture/conquer) through a third level of second-level recombination (designing a riddle sentence from recombinations built during gameplay) that sets up a potential foundation for critical analytical work (more complex riddle sentences build more complex conceptual juxtapositions/interpretations) toward a final riddle-solution stage, which is fundamentally convergent in terms of being solution-based (very few possible answers), and uses spatial immersion (fluency in the map of the planet/text) to set up an information visualization (knowledge about the spatial relationships between specific terms in relation to the overall planet).

Typically, RWGs only become clearly effective as reading tools when the games are followed by discussion and analysis that compares the game experience to a traditional reading of the text. While the game element in *Poetry Planet* has made deformation an accessible process, it has yet to do likewise with complex interpretation.

8. Using the Framework on *Poetry Planet*

This paper proposes the following framework for analyzing CWGR as RWGs:

- **Divergence**: the relationship of divergence to convergence in mechanics or game experience.
- **Juxtaposition:** the ways in which the game produces surprising juxtapositions from the original text.
- **Textuality**: the level to which a game uses the original literary text.
- **Open world**: mechanics and game experiences focused on free exploration and building.
- **Play**: the level to which the game uses a playful mindset as game experience or objective.

This framework reveals the following about *Poetry Planet*: 1. *Divergence: Poetry Planet's* "Blast Off" stage is extremely divergent, the critical or even sense-making aspect of reading sidelined to speed and competition. The "word bomb" variation begins some movement toward convergence in the sense of forcing players to integrate the *Gatsby* text. The game grows progressively more convergent in terms of strategy- (team building) and solution-based (riddle solving). Overall, the prototype moves from an open world, divergent structure to a solution-based one, as there are a limited number of answers to the riddle sentence. The final search is the least divergent action, however, as it involves repeatedly looking for meaning in context, it develops textual familiarity which can scaffold divergent thinking in post-game interpretation; 2. *Juxtaposition and Textuality*: the central

mechanic of *Poetry Planet* is textual juxtaposition, however, in the open freewriting phase of "Blast Off", there is no textuality (connection to the primary text), and as the player can write anything, surprising juxtapositions are less common than the later phases of constrained freewriting like "Word Bomb". The "planet" in *Poetry Planet* is completely *textual* (100% from Gatsby) and is, in fact, already a *juxtaposition*/deformation as the text is organized such that new juxtapositions have already been laid out across the planet's surface; 3.*Open world:* the immersive sense of approaching a planet makes the *open world* aspect both spatial and textual. It is spatial in the sense that a player can fly freely across a 3D text-planet and textual in terms of this paper's central argument: the free, exploratory, building experience of creative recombination makes an "open world" of the original text; 4. *Play:* much of the play in *Poetry Planet* is sacrificed to game mechanics. For example, the speed of "Blast Off" make it less playful; however, the high level of recombination in a strategic master riddle sentence (designed to be hard to find) and the presence of an interested audience (the other team) increases the playfulness of the product. Note that there is almost no collaborative recombination in *Poetry Planet*.

9. Conclusion

This paper has used Surrealist and Oulipo theoretical approaches to set up a framework for understanding and exploring recombinatory writing games (RWGs) as a subset of creative writing games for reading (CWGR). RWGs use recombinatory rules that function like Oulipean "constraints" as a method for critical deformations driven by Surrealist game-based juxtapositions. This framework is important as it represent a step forward in the analysis and design of RWGs as useful tools in directing the motivation of creativity toward reading and writing. It also can be useful in examining the extent to which creative writing helpers like AILit (Bakken, 2024) or other literary games (specifically role-playing games like *Losswords*) could potentially integrate recombination as a method for creative engagement and textual analysis.

For reasons of space, a forthcoming paper will have to connect this framework to the data collected in "Gamifying Reading", an ongoing study where RWG prototypes are being play-tested with 100 upper-secondary students in Norway accompanied by surveys examining how the games are experienced by different personality types (OCEAN model), by self-identified creatives versus non-creatives, and as a way to examine the difference between divergent versus solution-based aspects of the games on user experience and engagement. Specifically, this proposed framework will be useful to examine the data in the study. The final term that needs to be added in a future reworking of this framework is "criticality": the level to which a game encourages, scaffolds, or produces critical reading of the original text.

Embedding Psychology Themes in University Induction Using a Digital Escape Game

Jenny Josephs
Solent University, Southampton, UK

Jenny.Josephs@solent.ac.uk

Abstract: An "escape room" style game was developed as an induction activity for first year psychology students, encouraged by the need for icebreakers that meet specific, relevant and transparent learning outcomes. The game concept was designed using the escapeED framework for game-based-learning (Clarke et al., 2017), including consideration of narrative, participants, theme, objectives and evaluation. Groups of up to six students worked on an iPad "board" that had clickable objects on a representation of a lecturer's desk. Students had 20 minutes to solve four puzzles that identified objects to click on and reveal digits for a padlocked bag. However, clicking the wrong objects would cause loud music that would "disrupt the staff office". The four puzzles symbolised learning outcomes that students will develop throughout their course, such as seeking and evaluating evidence, using maths, and referencing. The puzzles also used staff profiles to promote discussion about psychology research, prompt the development of supportive networks and relationships with staff. A realistic calendar puzzle highlighted the social and academic opportunities that students should engage in as part of the psychology community, which they could also identify as by wearing the pin badge they unlocked on completion of the game. Psychology staff facilitated reflection on icebreaker activities, including themes of teamwork and leadership roles, asking for help, and learning and adapting from mistakes. A thematic analysis of three focus groups later highlighted that students resist looking at assignment feedback and are concerned about wasting staff time in office hours. This led to recruitment of senior students to facilitate the escape room, and changes in our reflective practice tutoring to address issues raised during the game. Overall, students reported a sense of fun and competition from the activities and felt better prepared for learning after the introduction to psychology skills during induction.

Keywords: Realistic, Psychology, Reflection, Icebreaker, Community

1. Introduction

Icebreaker activities typically encourage groups of individuals to introduce themselves and begin to develop a spirit of teamwork, community or belonging. This can be applied to university courses during induction, as students meet their peers and start to develop friendships and supportive academic networks. Icebreaker activities tend to be game-based or playful, and Chlup and Collins (2010) argue that this helps to foster a safe environment for adult learners, supporting students to share knowledge and learn from each other, and communicate concerns or solutions for shared problems. Indeed, introductory activities are arguably important in the context of social and emotional learning, as learners must be aware of their own behaviours and develop skills to understand and relate to others (Dressel, 2020), particularly since the transition to university might introduce greater diversity in the social sphere. Chlup and Collins give examples of icebreaker activities such as sharing unique personal interests or characteristics, engaging in reflection on how an individual relates to other members of a class, and swapping creative ideas to answer a prompt. These activities could foster qualities such as social engagement and interdependence, and celebrate diversity. The current research project began as an evaluation of the icebreaker activities for psychology induction at a UK university, where the original activities included a teambuilding challenge to construct a spaghetti tower, "find a person who…(matches various criteria)", and a problem solving discussion on moral dilemmas, though the learning outcomes for these was unclear.

Several studies have demonstrated effectiveness of icebreakers for increasing class engagement and sense of connection. For instance, Abbas et al. (2022) used chat bots in an online discussion forum to stimulate icebreakers between university students and found that over half of participants reported engagement with users on the platform had increased their sense of belonging at university. Similarly, Sasan et al. (2023) found that students who participated in icebreakers were more engaged in class discussion and reported greater sense of community. Students also reported that icebreakers helped generate a friendly atmosphere and positive mood for learning, and it helped to make facilitators more approachable. Chopik and Oh (2024) reported that students taking part in a self-disclosure icebreaker experienced a significant increase in perceived closeness with classmates and sense of belonging. Similarly, Jarusriboonchai et al. (2016) developed a mobile game where players answer personal questions about themselves and are challenged to learn information about the rest of the group. The playfulness of the game allowed participants to avoid perfectionism and enjoy being creative with their answers. The looseness of the game rules allowed different groups of participants to approach the

tasks in different ways, which parallels individual differences in learning. They also describe participants laughing at others making mistakes, indicating a non-threatening learning environment.

One element missing from some educational and icebreaker games is a formal reflection on the learning outcomes of the activity (Veldkamp et al., 2022; Cloude et al., 2021). Brooks et al. (2014) noted that students do value learning about their learning outcomes, and this could be embedded early in the curriculum to help students gain self-awareness, evaluate their learning needs, and acknowledge their values and transferable skills (Higher Education Academy, 2015; Pretorius & Ford, 2016). Delaney et al. (2021) used a group reflection following an engineering icebreaker, where students were challenged to build effective towers and discuss their performance; players indicated problems that could be addressed as they developed through the module. Similarly, Braad et al. (2023) asked learners about their metacognition (thinking about thinking) following game-based learning, which was perceived as useful for novices. An escape room was chosen for the current project as it can provide a breadth of collaborative learning tasks to reflect upon, and adapts well to target challenges to sense of belonging during university induction, including communicating expectations, building relationships with teaching staff and socialisation within course groups (Thomas, 2012).

Fotaris and Mastoras' (2019) systematic review highlights how escape rooms can have several benefits, including leadership, problem solving, critical thinking and communication. The use of narrative in Escape Room design makes them well suited to a constructivist approach to learning, as diverse learners collaborate to find the best method of addressing problems, perhaps based on their prior knowledge, experience and education. Morrell, Eukel and Santurri's (2020) nursing escape room highlighted perceived benefits, including confidence, engagement and active listening, and real-life implications. Escape games can be set in the context of induction, such as in Nybo et al. (2020), who introduced staff, academic calendars, polices and learning objectives. It also lends itself well to providing scaffolding, such as using pre-determined hints, evidenced in von Kotzebue et al.'s (2022) digital escape room on sex education. The escape room can also provide immediate feedback and action, which are effective in aiding game-based learning (Wouters & Oostendorp, 2013). A psychology-themed escape game was run with three first-year psychology cohorts and evaluated within the context of university induction and sense of belongingness.

2. Game Concept

The game was designed using the escapeED framework for game-based-learning (Clarke et al., 2017), including consideration of narrative, participants, theme, objectives, and evaluation. Importantly, the puzzles were varied and accessible to those who are new to psychology, and have varied skillsets. The first version of the game was piloted by game designers and enthusiasts, who completed it successfully with no psychology background. The game takes place in a seminar room on university campus, during the first week of induction. Four classes of 15-20 students organise themselves into groups of up to six and are given a name badge to write on. Students are verbally briefed that they have 20 minutes to solve four puzzles and unlock a padlocked bag on their desk. Groups are given an A4 booklet containing the instructions and puzzles and participants are encouraged to separate the puzzles so they can work on several at once, but encouraged to help each other and seek support from the three tutors (psychology lecturers) facilitating the session. Each group has an iPad that displays the "board" for the game (created in PowerPoint) and requires players to click on objects to find digits for the padlock. The board represents a lecturer's desk and depicts 19 objects including a computer, calendar, lunchbox, and pin board with "staff of the week" profiles. The instructions explain that the lecturer has a gift for players but has hidden the padlock combination; players are given permission to "move" objects but if they click on the wrong ones it will "unplug the earphones" and cause loud music to play and disrupt the office. The music included 10 second clips from popular rock, metal, ska, drum n' bass and 80's pop, and aimed to foster a sense of individuality and approachability of tutors. Selecting the correct objects reveals a padlock digit and plays applause audio.

The rationale for the four puzzles is explained in terms of psychology learning themes, community and belonging. The choice of puzzle focus was guided by feedback from first-year tutors, and identified skills that students start developing early in their degree, including statistics, referencing, critical thinking, and finding information from reliable academic sources. This aimed to set the context and expectations for ongoing studies. One of the most important elements of the game was to encourage students to learn to make mistakes and ask for help; earlier student feedback had indicated that some avoided booking office hours with tutors because they did not want to "*waste staff time*" or ask stupid questions, thus might miss opportunities for support. From the second version of the game, senior students were recruited to facilitate the game and take part in reflective discussion, where they emphasised the importance of engaging with tutors consistently.

2.1 Puzzle 1: Definition Search

Participants are given nine general psychology definitions and must fill in a grid with a one-word name for each definition (e.g. brain, stress, memory). These align vertically down the centre to spell out "bold four". A cognitive psychology journal abstract is included at the bottom of the page, aptly focused on visual search and memory when there are distractor objects. Five words in the abstract are in bold and name objects from the desk, which makes no sense within the context of the abstract. One letter of each of these objects is replaced by a number, e.g. "**Spe4kers**", and the bold 4 indicates the correct object. Players are not immediately told that they can search online for answers to the definitions, as the aim was to encourage them to ask questions about the rules. The puzzle aims to remind students that they have the skill to expand their knowledge by continually searching for answers.

2.2 Puzzle 2: Academic Timetable

Students are presented with a timetable grid that shows real modules, as well as activities including study groups, Campus Jobs, sports and societies, CV workshop and participating in research. This highlights how university is 9-5, and encourages students to consider the different opportunities available to them. Beginning at "start", players must follow a series of arrows to navigate through the grid and should end on one of the desk objects. Arrow directions are obtained by answering seven multiple choice questions on topics including biological, cognitive and clinical psychology. The task also encourages students to keep track of their working, so they can evaluate where they have made mistakes.

An underlying theme of this task was to encourage students to take part in a rich array of extra-curricular activities, particularly having observed low attendance for Psychology Society and career events. Such activities can help to develop soft skills, boost social engagement and self-confidence (Buckley & Lee, 2021), as well as increase wellbeing and belonging (Winstone et al., 2020), so are a valuable part of the university experience. Reflecting on experiences, skills, and employability is also embedded in the curriculum since students might not appreciate or communicate these on their CV (Dibben & Morley, 2019).

2.3 Puzzle 3: Maths

This puzzle highlights the active research of psychology stuff, showcasing a poster on perceptions on eating meat. Attention is drawn to a pie chart and bar graph about eating insects and other animals. Players must calculate a sum and select one of four answers, each of which is paired with one object from the desk. This task encourages mistakes if players are not attending to detail, since the pie chart gives raw data, so the sum will be incorrect if they do not calculate percentage first.

This puzzle encourages students to learn to accept and spot mistakes in a safe environment, which is an important part of learning (Brookfield, 2017). As much as 80% of learners can feel anxiety when working with numbers (Onwuegbuzie & Wilson, 2003), and this can lead to avoidance and fear of failure. Group reflection on this activity provides a platform to voice apprehension, where tutors can reassure new starters that they will be supported throughout their learning of statistics. Research also finds that students are reluctant to communicate statistically (Malik, 2015) so the puzzle provides an early opportunity to practice this. Tutors can model their approach to solving problems and position learners in the zone of proximal development, helping them to attain a higher level than what they can manage independently (Vygotsky & Cole, 1978). Engaging in this type of task could be used to help develop metacognitive skills (thinking about thinking) and self-efficacy (Franklin & Garfield, 2006), and is expanded in another research project that the students take part in during their modules.

2.4 Puzzle 4: Referencing

In this task, players complete a referencing puzzle to identify which of four colleagues was "staff of the week". Provided staff profiles include a photograph, current research keywords and other interests (e.g. boardgames and playing double bass). Solving the puzzle spells out "therapy" which matches one staff profile, which can then be clicked on the iPad board. The puzzle tasks include finding the first letter of a journal or article title, or the first initial of an author, and a visual guide is provided to identify different parts of a reference. This puzzle introduces an abstract from a child psychology journal (published by a colleague) to demonstrate the types of literature students should be reading. The reference list is formatted in APA style (American Psychological Association) and gives a head start to understanding the benefits of following guideline standards.

This task aimed to emphasise the approachability of staff, with unique and perhaps relatable interests. Psychology students have a personal academic tutor for their entire degree, but attendance at timetabled sessions can be low, so encouraging elements of less formal interaction might help foster open communication, staff-student community, and potentially support higher retention.

2.5 Reflection

On unlocking the bag students were rewarded with an "Achievement Unlocked" pin badge to identify themselves as part of the university psychology community. The bags also contained paper feedback forms to evaluate the game. Game facilitators helped to ensure 100% completion for students who engaged in the task. Tutors facilitated a group reflection on challenges, learning and evaluation of the task, with topics including growth mindset (Dweck, 2015), making mistakes, encouraging use of personal tutors, and discussing how reflective practice has a prominent place in psychology education (Van Beveren et al., 2018; Halpern et al., 2010). Group reflection typically lasted up to five minutes.

3. Evaluation

The game was evaluated by reflecting on the gameplay, debriefing with game facilitators, collecting feedback slips, and then more formally by conducting focus groups and collecting survey data.

3.1 Gameplay

In the first play-through of the game around 70% of groups completed, which meant some were not rewarded with a badge or sense of achievement. Facilitators were further instructed to give extra hints to groups struggling to finish in time, increasing completion to 90%; one or two groups failed to engage in the task, or with facilitators. Some tutors were observed supporting one group for the entire session, rather than working the room, which took some element of independence from learners, so future games incorporated a more formal briefing, and outline of expected aims and learning outcomes. Likert scales were used to collect feedback from 54 participants: 25.92% said it was too hard while 66.67% said it was about right; 88.89% said it was fun, with the remainder being undecided, 87.04% agreed it helped them interact with peers and 70.3% agreed it helped them interact with tutors (20.37% undecided). The game was then simplified and reordered to make it clearer which elements were puzzles and which purely for context.

3.2 Qualitative Data

Three focus groups were conducted by an undergraduate research assistant, each with four participants. Focus groups lasted around 45 minutes and the game materials were distributed to refresh memory. The focus group included questions about induction and expectations, walking through experience of doing the game, challenges and enjoyment, perceived learning and social life several weeks on. Data was analysed using thematic analysis (Braun & Clarke, 2006) and three themes will be discussed: appropriateness of induction activities, evaluating performance and social connection.

3.2.1 Appropriate of Induction Activities

When evaluating their first weeks at university, students reflected on their experiences. Mature students commented on some activities being childish, such as signing up for a doctor "*it was a bit tedious to me*", "*I was literally clawing at my eyes wanting to do something that was psychology or just work or something…I felt my motivation dropping a bit*". Thus, it is important that the game is mature as well as playful. Other students did not attend some induction activities, so it is important to emphasise the value of psychology-themed induction in advance. The escape game was evaluated as "*best activity so far*", "*it's a bit of a taster…this is what we're going to cover in a fun and interesting way*", and students valued the "*doable chunks*". Experiences on the game parallel the academic reality, including the need to read instructions carefully and ask for help if unclear "*before you start tackling the problem...first, you need to know what you're about to do*". It also mirrors the breadth and depth of study: "an *expectation of the amount of work that you have to do to get a four-digit number".* Students discussed feeling lost, both physically and psychologically "*I felt nervous…I had no idea where to go*", which parallels feelings when participating in an escape room. However, students valued our separate Treasure Hunt Walking Tour, which helped decipher the abbreviations for buildings and give a sense of space.

3.2.2 Evaluating Performance

Students reflected on their performance during the game, general academic skill, and being evaluated by peers and staff. The musical element of the game introduced a social comparison: "*I felt dumb at first, but since everyone was making mistakes I felt more comfortable and it was funny*"; it is useful to reflect on learning to improve, as students also commented that they resist looking at assignment feedback, and thus may miss opportunities to develop. One development from the game was that we changed the personal tutoring system, so all year groups meet together, and can share reflection on their challenges and achievements, to encourage others: "*Yeah, I think it might have helped me if my teammates were just as clueless as I was, in the sense that would have given me like, a comforting feeling that I'm not stranded on my own*". Although the game was evaluated as being quite hard, many commented on enjoying the sense of competition with others, feeling pride upon achievement "*oh my God I feel so great*", and not feeling "*inadequate*". However, some did comment on anxieties about learning, and seeking support from tutors "*I don't like asking for help either cuz I feel like they're gonna think I'm like stupid or something. So I just sat there like, 'uh-oh, what am I gonna do', and luckily, the lecturers are so nice and they sat with me*", for this reason we recruit senior students to join induction and talk about the value of engaging with tutors.

3.2.3 Social Connection

Groups discussed intentions to socialise at university, challenges and successes when making friends, and interacting with tutors. Several commented on focussing purely on learning: "*I don't want to make friends*" and "*I don't really have to fit in*", though also reflected that they now value the social connections they have developed. Students may not immediately appreciate the support that peers can provide, but social media platforms are a way of helping one another "*we have a little group chat where we just cry about things we don't understand*". Some students who did not connect well at the start also discussed feeling lonely and considering dropping out, describing some interactions as "*superficial*" because they only attend university for a few hours a week. This is why students are encouraged to form regular study groups (as highlighted in one of the puzzles). Another sub-theme was on personal interests, with some being disappointed with the university societies, and others feeling like induction was not aimed at them, due to their religion. A student suggested distributing flyers with halal food options around the city, and the university now hands out maps showing local LGBTQ venues. Our staff-organised socials are now more inclusive from this discussion, with one participant commenting "*I was SO happy when I saw the staff had added a trip to Sprinkles [ice cream venue]".* Conducting induction activities in person (rather than online) is beneficial as students will gravitate towards people who look similar or approachable, with one commenting to a mature student "*I knew if I sat next to you I'd feel safe*", and they reflected on how we connect with people who are going through the same experience. There was some contrast in how students connected with staff. Some were "*excited*" to talk to researchers "*in the sort of area I want to go into*" and valued informal research chats with staff in the corridor, others noted the importance of the personal tutor system when transitioning to university "*you kinda feel like, lost. So... you have like lots of doubts…if you have a specific person to ask questions, then that's gonna be easy*". One student who considered dropping out said they did not "*know if I was succeeding*", so would have valued reaching out to staff.

3.3 Discussion

The game successfully provided a fun, different and relevant introduction to psychology study, breaking the ice socially and academically. It models provision of a comprehensive taster of learning objectives and could be adapted to different courses. The escape game style allowed tutors to provide scaffolding for all groups and mirror the expected engagement in seminars. The process of planning the game encouraged collaboration with colleagues, to highlight and target development needs and better coordinate this across year groups. Similarly, focus group discussions allowed students to voice their experiences, leading to a change in personal tutor sessions, which now combine year groups and end with a social that splits across three venues, to cater for diversity needs (instead of just going to the pub). The element of music in the game was useful to provide instant feedback to players, and indicate need for support from tutors. This helped to provide a light-hearted atmosphere for learning and making mistakes, similar to Jarusriboonchai et al. (2016) and Sasan (2023). The inclusion of a reflective debrief allows tutors to draw attention to developing skills and achievements in the game and academic study, such as social engagement, leadership, compromise, and providing critical feedback. There was also indication that the informal interaction with staff across induction helped make them more approachable during seminars.

One limitation of the project was that the many elements made it difficult to evaluate their effectiveness, whether that be sense of belonging, or skill development and awareness. A university belonging scale was included to question sense of connection, respect and welcoming (Imperial College, 2020, adapted from Yorke, 2015) but responding was low (indicating another issue that first year students do not engage with research participation). Indeed, the focus groups provided useful insight, but might have recruited more outgoing and confident students and not those who were disengaged with the game, who might need more support. The game itself did not enforce prolonged social engagement, or interaction with all the tasks, as participants could choose to complete one puzzle independently. The group reflection could address this, but should be expanded to 30 minutes, explicitly discuss all learning outcomes and make it relatable to the domains assessed: cognitive, knowledge, practical and professional skill and transferrable skills. These activities could be revisited a month after induction, as Thomas (2012) stressed the need for induction to extend beyond the welcome week.

magdalena.svecova@ucm.sk

Abstract: The quality of a team in organizations has an impact on the success of the team in achieving their goals. Team building activities are one of the elements which can improve relationships in different kinds of teams. One of those can be playing competitive digital games, whether for teams working remotely or on site. This paper presents a case study that explores the design and development process of an innovative online game that combines elements of third-person action and multiplayer online battle arena (MOBA) games to provide an experience that strengthens team cohesion. The game design and mechanics support distribution of team roles based on Belbin's theory, highlighting the importance of diverse roles for balanced team functionality. By integrating unique character functions, the game encourages players to understand and appreciate the different roles individuals play in a team, enhancing empathy and mutual respect among team members. The game is uniquely designed to be simpler and more accessible than typical MOBAs, making it an ideal tool for educational and organizational settings to boost team cohesion and communication skills among people from various backgrounds. The leveling of the playing field allows individuals with minimal gaming experience to participate fully and effectively. The design principles ensure that the core mechanics of the game encourage teamwork and effective communication over individual skill, emphasizing collective success. The case study delves into the development process, the challenges faced, the solutions implemented, and the outcomes observed as part of a research project conducted between 2022-2023. The findings suggest that game-based learning can significantly transform traditional team-building methods, introducing a new paradigm for fostering high-performance teams in an increasingly digital world.

Keywords: Competitive Games, Game Development, Multiplayer Online Battle Arenas, Soft Skills, Team Cohesion, Team-Building

1. Introduction

In the rapidly evolving landscape of organizational management, the strength and cohesion of teams have become pivotal to achieving strategic objectives. Team cohesion, which embodies the unity of purpose and mutual commitment among team members, is not only vital for enhancing productivity but also critical for fostering an environment conducive to innovation and growth (Casey-Campbell, Martens, 2009; Chiocchio and Essiembre, 2009; Grossman et al, 2022). Recent developments in educational technology, particularly the integration of game-based learning, have introduced novel methods for cultivating essential teamwork skills (Ellis et al, 2008). Both commercial, open-source and serious digital games have been examined for their potential to foster teamwork and other important social skills (Di Pietrantonio and Mendonca, 2022; Kovalčík, Švecová and Kabát, 2023; Qian and Clark, 2016; Zheng et al, 2021; Zhong et al, 2022). Earlier studies have identified digital games as effective tools for collaborative learning (Hämäläinen, 2011; Karakas, Manisaligil and Sarigollu, 2015), imparting teamwork skills (García et al, 2016; Hewett, 2022; Wang and Chen, 2012) and enhancing team cohesion (Anderson and Hilton, 2015; Garcia et al, 2022; Greitemeyer and Cox, 2013; Keith et al, 2016; Keith et al, 2021). Riivari, Kivijärvi and Lämsä (2021) explored how collaborative learning and the use of games can improve the acquisition of teamwork skills within higher education settings. Wang and Huang (2021) examined serious collaborative games and identified game mechanics supporting collaborative play, with the most common being the player team and chatting channel.

Group processes in existing digital environments have primarily been studied through multiplayer online role-playing games such as *World of Warcraft*. However, teamwork in *WoW* is almost never enforced and it is possible to achieve high levels of the game without any social interactions. On the other hand, multiplayer online battle arenas (MOBAs) must be played together in a group, requiring coordinated team play and strategic decision-making. These games provide a dynamic and engaging platform for enhancing team dynamics (Tang, 2018) and their players get a sense of satisfaction from teamwork (Johnson, Nacke and Wyeth, 2015). They simulate challenges that require collaborative problem-solving, effective communication, and adaptive leadership—skills crucial for any high-functioning team. In MOBAs "individual players act collectively; teams coordinate to meet shared goals" (Tyack, Wyeth and Johnson, 2016). As Buchan and Taylor (2016) suggest, researching group processes in MOBAs can help develop understanding of group processes in work contexts.

Incorporating digital tools and gamification into employee training and development processes is increasingly seen as a vital strategy to enhance team cohesion and adaptability within modern organizations. Research by Stacho et al (2022) explores the utilization of digital tools and gamification in the adaptation process of Generation Z employees. Their findings highlight a significant gap in the adoption of these innovative practices, with only 30% of employers in Slovakia implementing comprehensive adaptation systems that include gamification elements, despite recognizing the potential benefits. This gap suggests a critical opportunity for organizations to enhance their adaptation strategies, particularly in engaging the incoming tech-savvy workforce effectively.

To enhance team performance within organizations, our project merges the dynamic mechanics of MOBAs with Meredith Belbin's theory of team roles. This integration is designed to cultivate an environment where team cohesion, communication, and role functionality are paramount. The union of these frameworks not only enriches the player experience but also stands as an effective developmental tool for assessing team dynamics in scenarios that mirror both competitive and collaborative professional settings. Meredith Belbin's research, which culminated in the identification of nine distinct team roles, provides a structured methodology for understanding and optimizing team dynamics. These roles are segmented into three categories: Action-Oriented (Shaper, Implementer, Completer Finisher), People-Oriented (Resource Investigator, Teamworker, Co-ordinator), and Thought-Oriented roles (Plant, Monitor Evaluator, Specialist), each offering unique contributions to team success. For instance, Shapers are dynamic and driven, often challenging the team to improve. Implementers, however, are more practical, turning ideas into actionable tasks, while Teamworkers support and maintain team cohesion through their cooperative nature. As Belbin explains, "[t]eams roles are functions of the different demands made on team members if the team is to become effective. Individuals respond to these demands in different ways" (Belbin, 2010). Belbin does not prescribe an exclusive role for each team member. One person can prefer two or more team roles. He also emphasizes that team members can consciously choose to play a distinctive team role (further aligning professional teamwork with playing).

Our research aims to build upon these findings by developing and implementing a MOBA game with complex gameplay mechanics and an emphasis on role specificity to improve team cohesion. Its working title is *Untitled Belbin MOBA Game* (*UBMG*), and it has not yet been released publicly. The structured environment of MOBAs forms temporary teams of complete strangers who must collaborate intensely and strategize in real-time to fulfill complex tasks within a short time (Mora-Cantallops and Sicilia, 2018), mirroring the dynamics of professional team settings. In Buchan and Taylor's (2016) findings, optimal functioning teams should consist of friends communicating through a voice chat, at similar play level and willing to perform different team roles. In professional settings individuals with different skill levels and work experience can be grouped to perform a task without prior acquaintance. We simulate this condition by testing the developed game on groups of strangers with varying levels of experience with digital games. Communication mechanics are implemented together with specialization of team roles that in Belbin's management theory should support effective teamwork (Belbin and Brown, 2022). The intention is to enhance the game's effectiveness in promoting a balanced team dynamic, where members appreciate and leverage their diverse roles for collective success. By aligning the game design with established theoretical frameworks, we aim to create an innovative tool that not only enhances team cohesion but also serves as a model for future developments in educational game design. The current paper presents a detailed case study of this game's development process, from conception through testing, with an emphasis on the challenges faced and the solutions implemented. We discuss the specific game mechanics and features designed to foster team cohesion and examine their effectiveness based on participant feedback collected during the study period between 2022 and 2023. Our empirical insights and practical frameworks can be applied across various environments to enhance team dynamics, making a significant contribution to the dialogue on innovative educational tools and lifelong learning. This paper aims to demonstrate how MOBA digital games can transform traditional team-building methods and set new standards for developing high-performance teams in a digital-first world.

2. Game Design and Gameplay Implementation

MOBA games such as *League of Legends* and *Dota 2* are characterized by their strategic depth, requiring players to select from a diverse roster of characters to form a balanced team capable of both offensive assaults and defensive stands. These games emphasize real-time collaboration, strategic role fulfillment, and adaptive tactics, all within a high-pressure environment where teams must destroy the opponent's base to win (Mora-Cantallops and Sicilia, 2018). Our original MOBA game *UBMG* is designed with simplicity and team collaboration at its core. The game mechanics are streamlined to ensure that players of all skill levels can participate effectively. The

primary game mechanics include character roles, communication, and interactive elements such as chests. To further enrich the character designs in *UBMG*, each character's unique abilities and their strategic importance in the game are closely aligned with their corresponding Belbin roles. These abilities enhance the gameplay experience by enabling players to engage in complex strategies and interactions that mirror real-world team dynamics. Each team consists of five fixed characters: Marksman, Flyer, Healer, Jungler, and Bruiser. Number of five team members has been proposed to be optimal for MOBAs (Thavamuni, Khalid and Iida, 2023). The roles are designed to promote interdependence, team cohesion, communication and strategic collaboration. Below is a detailed mapping of the game roles to the corresponding Belbin roles (Table 1). There may be more than one team role each member can perform, so it is possible to map nine Belbin roles onto five game characters.

Table 1: Game characters and their corresponding Belbin team roles

Healer	- maintains team health and stability during battles, using abilities such as healing, protection spells, and status enhancement, provides support during critical moments - can use directed spell to heal one character for 30% of hit points at a time or place a field that heals anyone standing in it for 5 seconds	The Healer is a character suitable for Teamworkers. Teamworkers are cooperative, perceptive, and diplomatic, supporting and encouraging teammates (Belbin and Brown, 2022). Complementary Belbin roles: Implementer, Specialist.
Flyer	- focuses on reconnaissance and coordination, providing strategic information from a high vantage point and coordinating team efforts - their abilities include flying to high points, vision enhancement, and strategic coordination	The Flyer combines best the roles of Resource Investigator and Coordinator. Resource Investigators are outgoing and enthusiastic, exploring opportunities and developing contacts, while Coordinators clarify goals and delegate effectively (Belbin and Brown, 2022).
Marksman	- offensive and strategic role, utilizing long-range attacks to disrupt enemies and provide strategic guidance to the team - abilities include long-range attacks making use of strategic positioning skills	The Marksman is suitable for the role of a Plant. Plants are creative, imaginative, and unorthodox, solving difficult problems by coming up with original ideas and strategies (Belbin and Brown, 2022). Complementary roles: Completer Finisher, Monitor Evaluator.
Bruiser	- leads the team in frontline engagements, ensuring strategic plans are executed effectively - they have high durability, strong melee attacks, and crowd control ability	The Bruiser integrates the roles of Shaper and Implementer. Shapers are dynamic and thrive on pressure, driving the team forward, while Implementers are practical and efficient, turning ideas into actions (Belbin and Brown, 2022).
Jungler	- manages resources and provides critical analysis, unlocking chests by answering questions and offering strategic advice - they can open chests to add boosts for the team by answering questions	The Jungler can perform the role of a Monitor Evaluator. Monitor Evaluators are serious-minded, prudent, and capable of providing logical, impartial, and critical views (Belbin and Brown, 2022). Complementary roles: Plant, Completer Finisher.

Voice communication is integral to the game's mechanics. Players must continuously share updates, make strategic decisions, and call for support, ensuring the team functions cohesively and can respond quickly to changing situations. For instance, the Flyer relays critical information from high vantage points, the Jungler reads out questions to unlock chests, and other roles communicate their needs and status. Interactive elements such as chests add a layer of strategy and teamwork. The Jungler can unlock these chests by answering questions, providing boosts and resources essential for the team's progress. This requires collaboration, as players must work together to solve the puzzles and gain the benefits, such as increased health, damage, or strategic advantages. The game progresses through a series of objectives that require strategic planning and execution. Teams must capture key points, defend their base, and engage in battles with the enemy team. The constant need for communication and collaboration ensures that every player is actively involved in the team's success. For example, in a scenario where the team plans an attack on an enemy tower, the Flyer would ascend to a high vantage point to observe enemy movements, relaying real-time updates and coordinating the attack to ensure

that team members are positioned effectively. This scenario showcases the Flyer as a Resource Investigator, identifying opportunities, and a Coordinator, organizing the team.

UBMG stands out from typical MOBA games in several significant ways:

- Fixed character roles: Unlike other MOBA games that offer a vast array of characters and emphasize team composition and meta-strategies, *UBMG* features only five fixed characters. Each team consists of the same roles, reducing the complexity of character selection and promoting balanced team dynamics and equal participation.
- Accessibility for all skill levels: The game is designed to be accessible to players with varying levels of gaming proficiency. The controls and abilities of the characters are straightforward, ensuring that people with different gaming experiences can play together. Experienced gamers do not gain a significant advantage from complex mechanics, as the game has a short learning curve and focuses more on strategy and teamwork rather than individual skill mastery.
- Emphasis on voice communication: The core mechanics of *UBMG* rely heavily on communication via voice chat, enhancing team coordination and strategic planning. Players must continuously share updates, make strategic decisions, and call for support, fostering a high level of interaction and cooperation. While this is also true for other MOBA games, it is vital for people to develop their communication level by sharing all kinds of information that players of different games would obtain from tutorial or introductory rounds playing against bots.
- Interactive elements: The game includes interactive elements such as chests that the Jungler can unlock by answering questions. These elements add a layer of strategy and teamwork, as players must collaborate to provide the correct answers and gain the benefits.
- Low poly graphics: The game features simple, low poly graphics designed to run on most types of non-gaming specific computers. This ensures that the game is easily readable and understandable, even by people with specific needs, and does not distract players from the objectives.

By integrating fixed character roles, ensuring accessibility for all skill levels, and emphasizing continuous voice communication, *UBMG* offers a unique approach to team-based gameplay. These design decisions, combined with the incorporation of Belbin team roles, create a cohesive and collaborative gaming experience that differs significantly from typical MOBAs. The emphasis on real-time communication and strategic planning over individual skill mastery ensures that team cohesion and effective collaboration are at the forefront of the gaming experience. These abilities not only define the gameplay mechanics but also deepen players' understanding of how each role contributes to the team's overall strategy and success. By engaging with these characters and their unique abilities, players experience firsthand the dynamics and challenges of working within a diverse team, enhancing both their strategic thinking and team collaboration skills.

The game takes place in a classic MOBA setting with three lanes connecting two opposing bases (Figure 1). Each lane is guarded by defensive towers, and the primary goal is to destroy the enemy's central structure. The journey towards this goal requires careful strategic planning and execution, beginning with the character selection phase. During this phase, five players on each side choose characters whose abilities complement each other, and they engage in real-time voice communication to strategize. This early interaction sets a collaborative tone, emphasizing the importance of choosing appropriate roles and planning a coherent strategy.

AI-controlled minions spawn at each base and move along the lanes toward the enemy. Players must work alongside these minions, using them as both shields and support to progress towards enemy towers. This aspect of the game necessitates players to communicate their movements and intentions, deciding collectively when to advance or retreat, thereby reinforcing team dynamics. Each character in the game is designed with unique abilities that necessitate reliance on other team members. For example, the Bruiser can absorb a great deal of damage and is effective at breaking through enemy lines, but this character relies on the Healer for sustainability and the Flyer for setting strategic traps that can disrupt enemy formations. This interdependence ensures that no single player can dominate the game alone, emphasizing the importance of each team member's role and fostering a sense of mutual reliance.

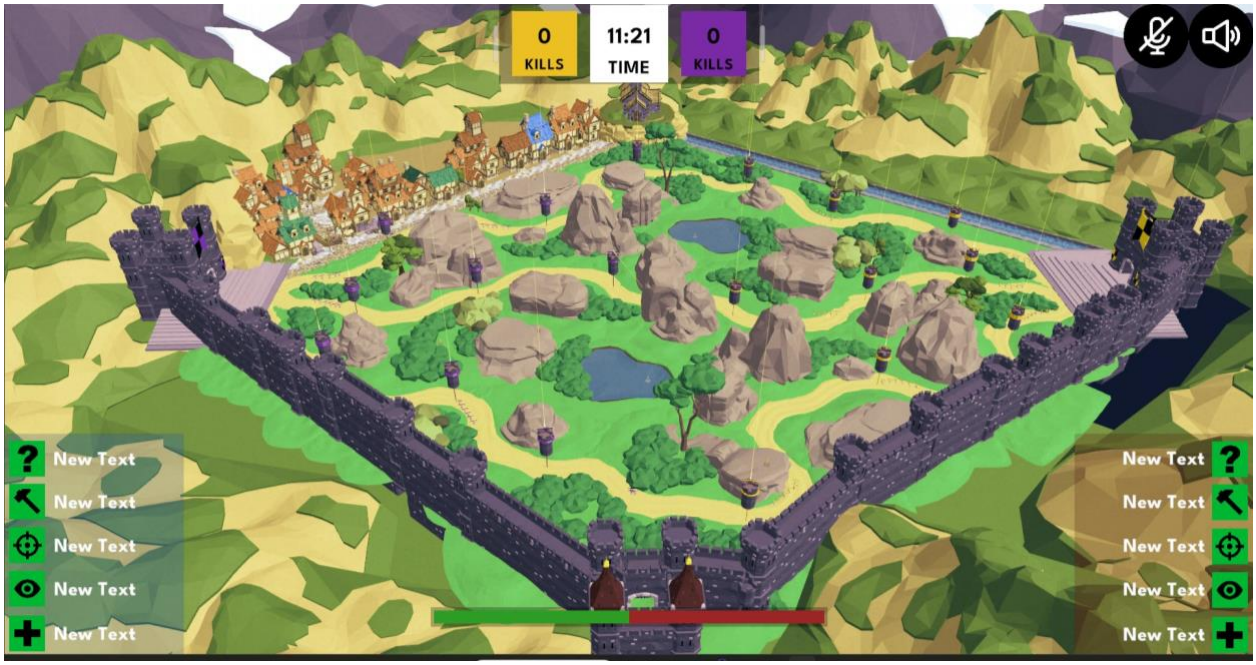

Figure 1: Overview of the map with the typical three lanes layout known from MOBA games

Players must continuously share updates about their status, enemy locations, and potential strategic moves. The third-person perspective of the game means that players do not have a complete view of the battlefield, further emphasizing the need for sharing information and coordinating actions. This setup encourages players to rely on each other for a comprehensive understanding of the game state, enhancing team collaboration.

Strategic decision-making is a constant necessity in the game. Teams must make collective decisions on when to push for objectives, defend against enemy advances, or regroup and strategize. These decisions require a high level of team consensus and adaptability, fostering a deeper engagement with the team's strategic processes. The immediate feedback from these decisions, whether in the form of successful engagements or objectives or learning from failures, helps teams adapt their strategies in real-time. This continuous loop of action, feedback, and adaptation is instrumental in developing team cohesion and dynamic problem-solving skills. By engaging with this MOBA game, players not only enjoy a strategically rich competitive experience but also develop essential soft skills applicable to any collaborative environment. The game's design, which integrates complex team roles and dynamic gameplay, acts as a powerful tool for team building. The deliberate alignment of game mechanics with real-world team dynamics ensures that players learn valuable lessons about teamwork, communication, and strategic planning, which are critical for success in both the virtual and real world.

In the development process, there were periodical tests of gameplay that revealed bugs and glitches that were fixed, but also some shortcomings in original design that proved to be gamebreaking. For example, the Marksman character was able to shoot on towers that were not yet reached by minions or even attack the enemy's core under the right angle. This was solved by nerfing his ability by shortening the arrow trajectory. Similarly, the Flyer (who was originally intended to observe) was used to not only surprisingly attack enemy players from behind, but also was able to drop directly on top of the enemýs castle and attack the core outside the reach of minions. First issue was fixed by adding a sound when the character touches ground and can shoot, the second issue was addressed by adding a roof to the castle.

3. Research Overview and Methodology

Following the detailed account of the game's design, this chapter outlines the methodological framework used to assess the efficacy of the custom-designed MOBA game in enhancing team cohesion. The target population in the conducted quantitative research was selected through purposive sampling, i.e. according to the determined characteristics and on the basis of inclusive criteria. We selected students from three different faculties of UCM in Trnava, Slovakia. To ensure that the subjects did not form teams prior to the study, the sample was selected only from first-year students. The total sample consisted of 144 respondents, with 124 valid responses (74 female and 50 male). In terms of age, the sample consisted of 91 respondents aged 18-21 years, 27 respondents aged 22-25 years, and 6 respondents aged 31 years and older. Respondents varied not only in

their current educational orientation, but also in their background (gymnasiums, business and hotel academies, vocational schools and others). Eighty-eight respondents regularly play computer games, while 36 respondents indicated that they do not play computer games. Out of 121 respondents, 69 meet new people in online spaces, while 52 do not. To measure team cohesion, we used the Youth Sport Environment Questionnaire (YSEQ; Eys et al, 2009). The YSEQ assesses the perception of cohesion in youth teams and was developed from the Group Environment Questionnaire (Carron, Widmeyer and Brawley, 1985). These questionnaires are commonly used in research focused on group cohesion in sports psychology. The complete questionnaire consists of 18 items, with responses available on a 9-point scale ranging from "strongly disagree" (1) to "strongly agree" (9). Higher scores reflect a stronger perception of cohesion. Cohesion is evaluated in two aspects (dimensions): task cohesion (TC), represented by 8 items (e.g., "We are united as a team"), and social cohesion (SC), represented by 8 items (e.g., "Some of my best friends are members of this team").

The second method comprises two separate questionnaires targeting the following aspects of inclusion:

- Need for Social Inclusion (NSI) – this questionnaire evaluates the extent and strength of the need for inclusion and its characteristics. It allows for diagnosing the motivational component of affiliation. The content focus and question formulation follow the experiences and attitudes influenced by this need.
- Social Inclusion (SI) – this questionnaire evaluates the degree and extent of social inclusion, allowing for diagnosing the behavioral component of affiliation (Kollárik, 2008).

The third method, the Achievement Motivation Inventory (AMI; Schuler and Prochaska, 2011)), is designed to diagnose achievement motivation in a professional context and consists of 170 items assigned to 17 scales (dimensions): compensatory effort (CE), competitiveness (CO), confidence in success (CS), dominance (DO), eagerness to learn (EL), engagement (EN), fearlessness (FE), flexibility (FX), flow (FL), goal setting (GS), independence (ID), internality (IN), persistence (PE), preference for difficult tasks (PD), pride in productivity (PP), self-control (SC), status orientation (SO).

The experiment proceeded in three stages:

1. Initial assessment (pretest) of cohesion level, social inclusion, and AMI in experimental and control groups.
2. Implementation of the designed game in the experimental groups. All participants underwent a comprehensive training session designed to familiarize them with the game mechanics and the specific roles they would be playing. This standardization was critical to ensure that all participants had a similar level of understanding and capability with the game. Following the orientation, teams participated in multiple gameplay sessions where they could apply and refine their teamwork and strategic skills in a dynamic and competitive environment. The game sessions were designed not only to stimulate participants' strategic thinking and role execution but also to foster intense collaboration and communication within the teams. All gameplay sessions were standardized. This involved controlling game variables such as session duration (60 minutes), game settings, and specific challenges presented during the game. The sessions were closely monitored to ensure adherence to the experimental protocol and to facilitate accurate data collection
3. Post-test assessment and two follow-up tests of cohesion level, social inclusion, and AMI in experimental and control groups after completing the game implementation in the experimental groups.

In addition to the post-test, interviews and feedback sessions were conducted after game sessions to collect qualitative insights from participants. This data helped to enrich the understanding of the quantitative findings and provided nuanced perspectives on the participants' experiences and the perceived impact of the game on their teamwork skills and cohesion.

4. Results and Discussion

The experimental results reported in Table 2, where the asymptotic significance values of the chi-square test are displayed (significant differences with $p < 0.05$ are bolded), reveal several notable findings.

Table 2: Experimental results

	Social inclusion								Team cohesion		Achievement motivation inventory															
	NSI	SI	a	b	c	d	e	f	SC	TC	PE	DO	EN	CS	FX	FL	FE	IN	CE	PP	EL	PD	ID	SC	sO	CO	GS

- Social Inclusion: The experimental groups demonstrated significant improvements in three out of eight dimensions of social inclusion between the pre-test and post-test groups. This indicates that the interventions applied had a meaningful impact on specific aspects of social inclusion, enhancing participants' feelings of being socially accepted and integrated.
- Team Cohesion: There was a significant increase in the task cohesion aspect of team cohesion within the experimental groups. Task cohesion refers to the degree to which group members work together to achieve common goals. The improvement in this area suggests that the experimental interventions fostered a stronger sense of teamwork and collaboration focused on task achievement.
- Achievement Motivation Inventory: The experimental groups reported significantly higher levels in four dimensions of the achievement motivation inventory:

- Confidence in Success: Participants in the experimental groups showed an increased belief in their ability to succeed. This boost in confidence can positively influence their motivation and performance.
- Flexibility: The increased flexibility suggests that participants became more adaptable and open to change, which is critical for effective problem-solving and performance in dynamic environments.
- Internality: Higher internality scores indicate that participants felt a greater sense of control over their outcomes, attributing success to their efforts and abilities rather than external factors.
- Competitiveness: The rise in competitiveness reflects a heightened drive to excel and outperform others, which can be a strong motivator in both individual and team contexts.
