

between entrepreneurship and intelligent organization is especially visible when emergence of this organization is becoming according to effectuation process. The link between project management and intelligent organization is clear when development of this organization is taking place according to causation process. Paradox management allows to join both processes of effectuation and causation and in consequence to explain the intelligent organization as an outcome of interplay between them (see figure 1.).

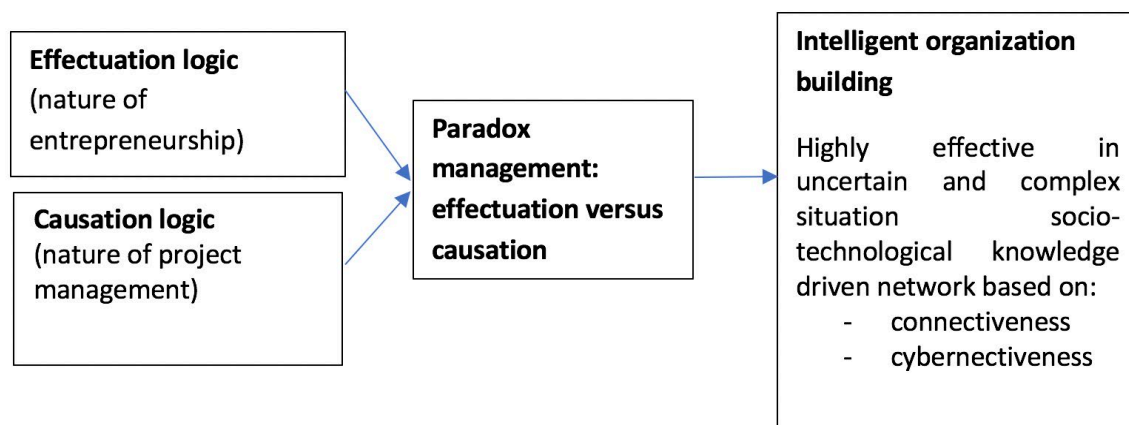

Figure 1. Conceptualization of the intelligent organization shaping as effectuation versus causation logic.

Based on our conceptualization of intelligent organization development as effectuation versus causation logic, we will adopt the process theory perspective proposed by Hernes (2007). Hernes argues that "process is constitutive of the world" (p. 44) and describes two perspectives on the process: technical, which focuses on processes, tools, and techniques, and social, which focuses on personal motivation and group dynamics. In our understanding of intelligent organization we are synthesizing this two perspectives. Following next work by Hernes (2007) we can classify the intelligent organization process as connectivity. According to this approach organization is seen as the unfolding of relations among heterogeneous units. In this context very promising in the field of intelligent organization explanation seems to be Latour's (1996) works in Actor-Network Theory.

As any research work this research also has limitations. This SLR gives a general overview rather than an extremely detailed account of findings due to the high number of articles reviewed. Thus, more specific research is required to carry out in-depth analyzes of each identified topic. Additionally, further empirical research is needed to better understand how intelligent organizations can maximise their benefits from the lenses of entrepreneurship and project management for its development.
