No reproduction, copy or transmission may be made without written permission from the individual authors.

Review Process
Papers submitted to this conference have been double-blind peer reviewed before final acceptance to the conference. Initially, abstracts were reviewed for relevance and accessibility and successful authors were invited to submit full papers. Many thanks to the reviewers who helped ensure the quality of all the submissions.

Ethics and Publication Malpractice Policy
ACIL adheres to a strict ethics and publication malpractice policy for all publications – details of which can be found here:
http://www.academic-conferences.org/policies/ethics-policy-for-publishing-in-the-conference-proceedings-of-academic-conferences-and-publishing-international-limited/

Self-Archiving and Paper Repositories
We actively encourage authors of papers in ACIL conference proceedings and journals to upload their published papers to university repositories and research bodies such as ResearchGate and Academic.edu. Full reference to the original publication should be provided.

Conference Proceedings
The Conference Proceedings is a book published with an ISBN and ISSN. The proceedings have been submitted to a number of accreditation, citation and indexing bodies including the Web of Science and Scopus.

Author affiliation details in these proceedings have been reproduced as supplied by the authors themselves.

Since 2022 all ACIL conference proceedings are open access and freely available to read from https://papers.academic-conferences.org/index.php/ecie

The Conference Proceedings for this year and previous years can be purchased from http://academic-bookshop.com

E-Book ISBN: 978-1-917204-15-6

Full academic papers

Artificial Intelligence-Based Solution Model for Real Estate Business and Entrepreneurial Operations: Case Study
Nasser Abouzakhar *1-11*

Entrepreneurial Competences Development of University Students in the Czech Republic
Petr Adamec, Peter Marinič *12-19*

Management of Innovation in Digital Brands: An Integrative Review
Nárima Alemsan, Francisco Antonio Pereira Fialho *20-26*

An Empirical Study of Entrepreneurial Intentions of the University Students from Mountainous Region of Pakistan.
Muazam Ali, Mahwash Ghafoor Chaudhry, Nawzad Majeed Hamawandy, Hazzaa D Salman, Murtaza Ali *27-35*

Unpacking Saudi Family Firm Performance Benefits of Entrepreneurial Orientation, Digitalization, Ambidexterity, and Involvements
Wassim Aloulou *36-45*

Constraints to Green and Digital Transition in the Greek Agri-Food Sector
Nikolaos Apostolopoulos, Dimitrios Petropoulos, Panagiotis Liargovas, Eleni Anastasopoulou *46-53*

Private Enterprises and Innovative Interventions in Long-Term Care for Older People: Insights into Residual Stereotypes of Greek Rural Areas
Sotiris Apostolopoulos, Ilias Makris, Bobby Macaulay, Panos Dimitrakopoulos *54-61*

Perception of Gen Y and Z on Bank's Financial Performance: Exploring Managerial Capabilities and Digital Innovation
Comfort Adebi Asamoah, Alena Klapalová, Takyi Kwabena Nsiah, Izaskun Agirre-Aramburu *62-70*

The NEXUS story and its Stakeholder Analysis: Digitalising Multimodal Logistics and the Associated Value Chain Worldwide
Manuel Au-Yong-Oliveira, Camila Marinho, Valentina Chkoniya *71-80*

Dynamics of Organisational Change: Resistance, Readiness, and the Road Ahead
Konstantin Bagrationi, Olga Gordienko *81-88*

Entrepreneurship Education Around the World: A Study on Member Universities of the Association to Advance Collegiate Schools of Business
Zeynep Baysal *89-98*

COIL Method in Economic Higher Education: The Stakeholders' Perspective
Joanna Błach, Monika Klimontowicz *99-109*

Open Innovation Capabilities and Competences
Kristiina Brusila-Meltovaara, Pekka Makkonen,
Kerstin Siakas, Georgios Lampropoulos *110-117*

Effect of Economic Risk Sources on the Quality of the Business
Environment in the SME Segment: A Case Study from the Slovak Republic
Martin Cepel, Eva Cihelkova, Anna Kotaskova, Ivan Brezina, Roman Hruska *118-128*

Digital Transformation of Tax and Accounting Processes
Marie Černá, Jan Pokorný *129-136*

Entrepreneurship Education in International Context:
Skills, Attitudes and Competencies
Teresa Costa, Pedro Mares, Maria João Lima *137-147*

Enhancing Innovation in Higher Education Institutions:
Barriers, Actions and Strategic Instruments for Sustainable Innovation
Mara Gabriela Diaconu, Alenka Temeljotov Salaj *148-157*

Library Trends and Developments in a Technologically Driven Era
Anyanitha Distanont, Orapan Khongmalai, Sasipin Distanont, Chansin Treenuchagron *158-166*

Governmental Policies and Sustainable Outcomes in EU:
How Innovations Change the Game?
Denys Dmytrenko, Ondřej Kuba *167-175*

Faculty Participation in Technology Commercialization:
The Roles of Process, Policies and Career
Wenlu McIntosh, Kent Neupert *176-183*

Challenges of Preparing Students for International Entrepreneurship
in the era of Artificial Intelligence
Tiit Elenurm *184-190*

Maximising Hackathon Impact: A Comprehensive Framework
for Sustaining Post-Event Outcome
Marios Emmanouil, Yeoryios Stamboulis, Achilleas Barlas,
Lorenrzo Scatena, Eleonora Lombardi, Valerio Roscani *191-199*

The Debt Dilemma: Driver or Brake of Innovation in the EU?
Tomas Fisera, Bernard Vanicek *200-207*

The Evolution of Women Entrepreneurship in Turkey:
Challenges, Opportunities, and Future Perspectives
Abdurrahman Gumrah *208-217*

The Impact of Artificial Intelligence for Advancement in Entrepreneurial Education
Manisha Gupta, Mamta Singh *218-224*

Venture Clienting in Corporate Practice: What type of Established Companies
are Using the Venture Client Model?

Lennard Haarmann, Johannes J. Jobelius, Fabian Machon,
Martin Rabe, Arno Kühn, Roman Dumitrescu *225-235*

From Bonds to Bridges: Exploring Social Capital's Role on Migrant
Entrepreneurs' Identity Construction
Rim Hachana, Amal Ben Youssef *236-244*

Technology Audit: Results of the Assessment of the Technological
Maturity of Brazilian Innovation Institutes
Fabian Hecklau *245-251*

Action or reaction? Entrepreneurial and Market Orientation
for Implementing Circular Economy Practices in German SMEs
Antonia Hoffmann, Nils Marticke *252-262*

The Role of Cognitive Style in Influencing Entrepreneurial
Self-Efficacy and Subsequent Entrepreneurial Intention
Salma Nader Abbass Hussein, Hadia Hamdy Abdelaziz *263-270*

Social Entrepreneurship in the Japanese Context
Through the Lens of a Social Entrepreneur's Experience
Yuko Inada *271-279*

Key Factors for Student Startup Success: Insights from Higher Education Professors
Artūras Jurgelevičius, Agota Giedrė Raišienė *280-289*

Emphasizing Sustainability in Entrepreneurship Education:
Lessons Learned from a Case Study
Verena Kaiser, Małgorzata Krzywonos, Bettina Maisch *290-298*

Dealing with Failure: The Media's Portrayal of Entrepreneurs in Croatia
Korina Kastela, Vlatka Škokić *299-306*

Transforming Academic Libraries into Hubs of Innovation and Entrepreneurship:
A Case Study of a New Library Model
Orapan Khongmalai, Anyanitha Distanont *307-316*

Aspects Considered Relevant in Higher Education Curriculum to
PRODUCE Business innovative Graduates
Sithembiso Khumalo, Tanya Du Plessis *317-322*

Predicted and Prized Critical Skills for a Graduate to Produce Effective Innovation
Sithembiso Khumalo, Tanya Du Plessis *323-330*

A Literature Review: The Impact of Digital Transformation on Financial Performance
Florian Kidschun *331-338*

Power Outage Perils: Assessing the Impact of load-Shedding on SMEs
in Enoch Mgijima Local Municipality, South Africa.
Konwaba Klishi *339-346*

Towards Sustainable Strategies: Uncovering the Impact of Environmental
Policies on Innovation Activities of Czech Firms
Milos Kolar *347-354*

Drivers of Intrapreneurial Innovation: A Study of Individual Innovative Behaviour in Organisations
Burcu Kör, Lucque Schmeitz *355-362*

Artificial Intelligence and Managerial Decision-Making in International Business
Athanasios Kourkoumelis, Eleni E. Anastasopoulou, Georgios A. Deirmentzoglou, Andreas Masouras, Sofia Anastasiadou *363-369*

Instagram as Part of SMM Innovation in Educational Institutions
Michal Kubovics, Ľudmila Čábyová, Jana Galera Matúšová *370-376*

Innovative Content Production in Marketing Communication Through AI
Michal Kubovics *377-383*

The Possibilities of Artificial Intelligence Usage in Loyalty Programs
Andrii Kushnarevych, Daniela Kollárová *384-390*

The Influence of Artificial Intelligence on Modern Marketing
Lenka Labudová *391-397*

Entrepreneurial Spirit Paving the Way for Successful AI Deployment in Knowledge Work and Organizations
Anna Lahtinen, Pirjo Saaranen *398-405*

Innovating Sustainability: Digital Marketplaces as Catalysts for Circular Economy in Electronic Device Reuse
Anna Lahtinen, Pirjo Saaranen, Sami Nykter *406-415*

Innovating Civil Engineering: Strategies for Fostering Stakeholder Engagement in the Circular Economy
Monika Maciuliene, Auste Aleksandraviciute-Sviaziene, Kristina Kovaite, Gintare Guleviciute, Aelita Skarzauskiene *416-424*

The Process of Ecosystem Emergence for an Enabling Technology: The 5G Case

Mattia Magnaghi, Antonio Ghezzi, Massimiliano Luigi Vittorio Dell'Orto, Federico De Laurentiis, Andrea Rangone *425-432*

The Strategic Adoption of 5G Technology From a Business Model Perspective
Mattia Magnaghi, Antonio Ghezzi, Andrea Rangone *433-440*

Business Agility in Technology Companies
Pekka Makkonen, Kerstin Siakas, Georgios Lampropoulos *441-449*

Student's Entrepreneurial Intention in Higher Education: The Entrepreneurship Intention Questionnaire Applied at ESCE – Polytechnic Institute of Setubal
Pedro Mares, Teresa Costa, Maria Lima *450-459*

The Impact of Covid-19 Pandemic on Small Wineries in Cyprus and Reflections on Wine Tourism: Entrepreneurs' Perspectives
Stelios Marneros, Nikolaos Boukas, Andreas Efstathiades *460-468*

A Review on Elizabeth Holmes and her Sinking Ship's Backstory
Inês Martins, Ana Poças, Artur Freitas, Manuel Au-Yong-Oliveira *469-478*

Is formalisation Enough to Achieve Growth in SMEs?
Giancarlo Medroa *479-488*

The Perception of Corporate Social Responsibility and Employee Flourishing: Cultural Diversity as an Underlying Mechanism
Telma Mendes, Pamela Silva, Marisa Ferreira, Teresa Proença, Ana Borges *489-498*

The Interplay Between Digital Artifacts and Value Creation in the Ecosystem Design
Edoardo Meraviglia, Jacopo Manotti, Davide Moiana, Antonio Ghezzi *499-506*

Success Factors of Deep Tech Incubators: A Qualitative Study
Dario Meyer, Francesco Colonna, Rolf Meyer *507-514*

Navigating the Fourth Industrial Revolution: Generational Differences, COVID-19 Impact, and Knowledge Sharing in the Modern Workplace
Peter Mkhize *515-522*

Cultivating Collective Armor: Towards a Collaborative Cybersecurity Resilience Framework for SMEs
Nangamso Mmango, Tapiwa Gundu *523-531*

Venture Studios: Beyond Entrepreneurial Support Organisations? A Case Study Analysis and Framework
Davide Moiana, Antonio Ghezzi, Andrea Rangone *532-539*

Blockchain-Based Fraud Detection System for Healthcare Insurance Claims
Hopewell Bongani Ncube, Belinda Mutunhu, Sibusisiwe Dube, Kudakwashe Maguraushe *540-547*

Academic Entrepreneurship Overview: New Program Development Using Entrepreneurship Principles
Kent Neupert, Christy Suciu *548-554*

Promoting Consumers' Adoption of Buy-Now-Pay-Later Feature while Using E-wallet Application: The Case of Gen Z in Vietnam
Kim Thien Ba Nguyen, Tran Bao Tran, Chau Minh Thai, Viet Chi Duong, Thao Nguyen *555-564*

Evaluating the Entrepreneurship Pedagogy and Support Landscape in Secondary Schools in Nigeria
Sanya Ojo, Samuel Agbi *565-572*

Brand Communication Management of Startups in Portugal
Paula Oliveira, Paula Arriscado, Manuel Sousa Pereira *573-580*

The Social Economy and Contemporary Challenges: Innovation and Sustainability
Pedro Oliveira *581-587*

Towards a Socially Conscious Start-up Brand: EDI in Entrepreneurial Branding
Dennis Olsen, Daniel Brennan, Joy Osula *588-595*

Inspiring Entrepreneurship by Spreading New Technologies and Innovative Methods that Popularise Science and Art
Dan Ophir *596-605*

New Skills and Knowledge for Digital Entrepreneurs in the Age of Artificial Intelligence
Daniela Orozova, Nadezhda Angelova, Zlatin Zlatev *606-610*

Design Thinking for Frugal Innovation: Unleashing Sustainable Business Models in Emerging Markets
Jayshree Patnaik, Pradeep Kumar Tarei *611-618*

The Efficient Applicability Limits of Social Entrepreneurship
Ruslan Pavlov *619-626*

Robert K. Merton and Innovation-Related Topics: Three Theoretical Ideas
Tor Helge Pedersen *627-633*

Business Research and Development: Is there a Substitution Effect of Public Support?
Peter Pisár, Ján Huňady, Stanislava Honzova *634-642*

Covid-19 - The Impact on Cyprus' SMEs Tourism Enterprises – Lessons to be Learned
Dr. Amvrosios Prodromou, Dr. Ifigenia Efthimiou, Dr. Sotiris Apostolopoulos *643-654*

Innovative Learning Practices as A Driver of Students' Performance
Sara Proença, Vera Cristina Ribeiro, Luis Araújo Santos *655-663*

Managing Open Twin Transition in SMEs: a Case Study in Fashion Industry
Niccolò Ulderico Re, Antonio Ghezzi, Andrea Rangone, Giorgio Gottari *664-671*

Business Model Innovation Toward Sustainability: A Case Study in Outdoor Fitness Equipment
Francesca Rossignoli *672-678*

The Role of the Inclusive Leader in Driving Innovation: An Example of a Teal Organisation
Agnieszka Rzepka *679-685*

Ecological Innovations in Hotel Companies: A Case Study of Poland
Krzysztof Sala *686-693*

Use of e-Wallets and Their Impact on SME Business Transactions
Carola Salazar-Rebaza, Graciela Zurita-Guerrero, Wilder Ibañez-Luján *694-702*

From Potential to Action: Strategies for Supporting Female Founders in the Pre-Start-Up Phase
Thérèse Schmutz, Dario Meyer, Daniel Merz, Rolf Meyer *703-711*

Towards Health 4.0: Blockchain-Based Electronic Health Record for Care Coordination
Robert Sibanda, Belinda Ndlovu, Sibusisiwe Dube, Kudakwashe Maguraushe *712-720*

Empowering Future Entrepreneurs: Developing an Online Entrepreneurial Mentoring Program Across Diverse EU Regions
Katrin Singer-Coudoux, Henry Nicolai Buxmann, Markus Will *721-728*

Circular Economy Business Model in Cambodia: Drivers, Barriers and Impacts
Yamuna Sithambalam, Alyaa Afifah Abu Talib, Dinesh Elango, Zunirah Mohd Talib *729-737*

Innovation and Entrepreneurship in Southeast Asia: The Role of Geographical Indications
Robert Smith, Nucharee Smith, Mark Perry *738-747*

The Re-Emergence of Food Security in the Western World: Short Supply Chains in Portuguese Territorial Contexts
Cristina Sousa, Sofia Vale, Maria de Fátima Ferreiro *748-754*

The Efficiency of Intellectual Capital Formation at the Scientific Institutions of Engineering and Computer Sciences
Inese Spica, Rozite Katrina Ponne, Paula Jegere, Iveta Linina *755-765*

Intellectual Capital of Medical and Health Sciences and the Efficiency of its Formation at Scientific Institutions
Inese Spica, Sarmite Jegere, Ernests Spics, Lada Kalinina *766-774*

Am I Successful? An Answer of Women Entrepreneurs
Danijela Stošić Panić, Aleksandra Anđelković, Vesna Janković Milić, Marija Radosavljević *775-782*

The Effect of Social Media Marketing on Consumers' e-Waste Recycling Intention to Participate: The Case of the Vietnamese Market
Ngan Tran, Lai Nguyen, Vinh Ly, Thao Nguyen *783-791*

Factors Affecting Entrepreneurial Activity in an Emerging Economy in the case of Turkey: The role of the COVID-19 Pandemic
Naime Usul, Esra Karadeniz, Özlem Özdemir *792-800*

Innovation Success in the European Union: Aggregate Demand Analysis
Bernard Vaníček, Tomáš Fišera *801-808*

Business Transfers in Entrepreneurship Education: A Gap Covered by Buyer School and Successor School
Anmari Viljamaa, Elina Varamäki, Juha Tall *809-816*

Developing and Testing a Rural Business Incubator: A Best Practice Framework
Peetu Virkkala, Martti Saarela *817-825*

Exploring Product Development of Cyber-Physical Systems in Startups: A Status Quo Study
Thomas Alexander Völk, Monika Klippert, Tobias Düser, Albert Albers *826-834*

Commercialisation Tools in Network Research Organisations
Marzena Walasik, Beata Poteralska *835-844*

Inside the Entrepreneurial Mind: A Diary Research on the Evolution of Students' Entrepreneurial Intentions
Panagiota Xanthopoulou, Alexandros Sahinidis, Savvina Paganou *845-852*

Entrepreneurship and Happiness: Exploring the Nexus Between Lifestyle, Job Satisfaction and Subjective Well-being
Ivannia Gomezgil Yaspik, Ricardo Azevedo, Nina Szczygiel *853-861*

Uncollected Solid Waste Detection and Reporting Using Machine-learning and Geotagging
Belinda Mutunhu Ndlovu, Prestige Zhou, Kudakwashe Maguraushe, Sibusisiwe Dube *862-869*

PhD Papers

Business Redemption in Recent Times: The Role of Dynamic Leadership, Digital Innovation, and Sustainable Performance in the VUCA World
Charles Randy Afful *871-880*

Sustainable Development Goals and Blockchain: A Systematic Literature Review from a Business Studies Perspective
André Campos, João Proença *881-891*

"Whatever It Takes": Socioemotional Wealth and Endowment Preservation in Failing Family Firms
Mike Maximilian Degmayr *892-901*

Perceived Success and Entrepreneurial Identity in West Africa
Nouha Hajji *902-908*

From Farm to Fork: Addressing Food Waste in Households
Beatriz Sobral Hoffmann-Kuhnt *909-916*

Innovative Frontiers: Exploring Factors Influencing Travel Podcast Consumption in the Web 4.0 Era
Manisha *917-927*

Collective Action and Business Competitiveness
Manuel Névoa, *928-938*

The Power of Proximity: The Impact of Proximity Between Early-Stage Investors and Universities
Ole Peters, Louisa Heiduk *939-948*

Masters Papers

How do Startups use AI? A Q-methodology approach to understanding adoption patterns.
Franziska Sammet, Herbert Gillig, Maw Der Foo *950-959*

The Emergence and Transformation of the Lithium-ion Battery Industry in Shenzhen
Qing Shen, Baiyu Lu, Yuankun Luo *960-969*

Exploring the potential of AI to increase productivity in small marketing teams
Aniko Szenftner, Stefan Stumpp, Tobias Knopf *970-977*

Work in Progress Papers

Digital Work Instructions in Sheltered Workshops
Dries Couckuyt, Tesnime Imnadine, Sophie Dohogne, Tineke Verkest *979-983*

Understanding patient attitudes towards the use of AI in medical diagnosis using Necessary Conditions Analysis
Magdalena Czerwinska, Joanna Ejdys, Agnieszka Rzepka *984-986*

The Impact of Organisational Culture on Transportation Behaviours: An Exploratory Analysis
Lola Joly, Muriel Davies, Genane Youness, Stéphanie Buisine *987-989*

Between control and complexity: RRI in the Norwegian Biotechnology Advisory Board
Olga Mikhailova, Beniamino Callegari *990-993*

Initial insights from Innovation Strategy development in Wales
Abigail Phillips, Gareth Davies, Daniel Rees, Paul Jones *994-998*

A Druckerian Framework for Understanding and Leveraging Digital Ecosystems
Zhaoxia Yi, Yubo Fu *999-*
1004

Late Submissions

Establishing an Incubator: Accelerating Sustainable Fashion SMMEs
Sweta Patnaik, Shamil Isaacs *1006-*
1014

Unlocking Tourism Diversity in Winter: Clusters of Tourists in Lisbon
Based on Motivations, Profiles, and Behaviour
Ana Teresa Machado, Zélia Raposo Santos, Sandra Nunes, João Ferreira do Rosário,
Miguel Belo, Teresa Costa, Filipe Segurado Severino, Maria de Lurdes Calisto,
Ana Gláucia Roque, Margarida Cristina *1015-1022*

About the 19th European Conference on Innovation and Entrepreneurship, 2024

The European Conference on Innovation and Entrepreneurship (ECIE) is a prominent academic conference that has been held annually for 19 years. The conference serves as a vital forum for scholars, researchers, entrepreneurs, and practitioners to explore the latest trends, research findings, and practical applications in the fields of innovation and entrepreneurship. ECIE is committed to advancing the understanding of how innovation and entrepreneurship drive economic growth, competitiveness, and societal progress.

ECIE is recognized for its rigorous peer-reviewed conference proceedings, which ensure that the research presented is of high academic quality and practical relevance. The Proceedings of the 19th ECIE, 2024 includes academic research papers, PhD research papers and Master's research papers as well as work-in-progress papers, which have been presented and discussed at the conference. The proceedings are of an academic level appropriate to a research audience including graduates, post-graduates, doctoral and post-doctoral researchers. All papers have been double-blind peer reviewed by members of the Review Committee.

Aims and Scope

The primary aim of ECIE is to foster a comprehensive understanding of innovation and entrepreneurship by bringing together, from around the world, diverse perspectives from academia, industry, and policy-making. The conference seeks to bridge the gap between theory and practice, offering insights into the processes that fuel innovation and entrepreneurial ventures. ECIE encourages the exploration of new ideas, the development of innovative business models, and the identification of best practices that can be applied across different sectors and regions.

The scope of the conference is broad and interdisciplinary, encompassing a wide range of topics related to innovation management, entrepreneurial ecosystems, and the role of technology in driving business growth. ECIE also emphasises the importance of education and training in fostering entrepreneurial skills and mindsets, as well as the role of policy and government in supporting innovation and entrepreneurship.

Topics Covered

ECIE covers a diverse array of topics that reflect the dynamic and evolving nature of innovation and entrepreneurship. The call for papers asked for contributions that considered the following topics. In addition, the committee welcomed papers on a number of specialist mini-tracks which can be seen at the end of this list.

Innovation Management:

- Innovation Processes and Models
- Managing R&D and Product Development
- Innovation in SMEs and Large Enterprises.

Entrepreneurial Ecosystems:

- Startup Ecosystems and Incubators
- Social Entrepreneurship
- Corporate Entrepreneurship and Intrapreneurship

Technology and Digital Innovation:

- Digital Transformation
- Emerging Technologies
- Innovation in the Digital Economy

Entrepreneurship Education and Training:

- Entrepreneurial Mindset Development
- Curriculum Design and Pedagogy
- Experiential Learning

Innovation and Entrepreneurship Policy:

- Government Policies and Support Programs
- Regional and National Innovation Systems
- Public-Private Partnerships

Sustainable Innovation and Entrepreneurship:

- Sustainability and Green Innovation
- Circular Economy
- Impact of Innovation on Society

Global Perspectives on Innovation and Entrepreneurship:

- International Entrepreneurship
- Innovation in Emerging Markets
- Cross-Cultural Entrepreneurship

Research Methods in Innovation and Entrepreneurship:

- Quantitative and Qualitative Approaches
- Action Research and Participatory Methods
- Innovation Metrics and Impact Assessment.

Mini Tracks

Experts in the field proposed mini tracks on the following topics. Papers accepted on these topics after the double-blind peer review process were presented as mini tracks at the conference and are also published in these proceedings.

- Entrepreneurship Education and Learning
- Twin Green and Digital Innovation
- Management and Enterprise Development

The programme from the 2024 conference can be downloaded from here and full details about the conference can be seen from the conference website: https://www.academic-conferences.org/conferences/ecie/

ECIE Preface

These proceedings represent the work of contributors to the 19th European Conference on Innovation and Entrepreneurship (ECIE 2024), hosted by CESI, Paris-Nanterre, France on 26-27 September 2024. The Conference and Programme Chairs were Stephanie Buisine and Muriel Davies both from CESI Paris, France

ECIE is a well-established event on the academic research calendar and now in its 19th year the key aim remains the opportunity for participants from around the world to share ideas and meet the people who hold them. The subjects covered illustrate the wide range of topics that fall into this important and ever-growing area of research. ECIE is recognised for its rigorous peer-reviewed conference proceedings, which ensures that the research presented is of high academic quality and practical relevance. The conference serves as a key venue for the dissemination of cutting-edge research, the exchange of best practices, and the development of new ideas that can drive innovation and entrepreneurship in a rapidly changing global economy.

The opening keynote presentation was given by Stephanie Buisine, CESI, Paris-Nanterre, France who spoke on "*Meaningful Innovation*". The second day of the conference opened with an address from Olivier Hamant, INRAE, Ecole Normale Supérieure, Lyon, France on the topic of "*Suboptimality: The Inefficient Truth*".

With an initial submission of 245 abstracts, after the double blind, peer review process there are 122 Academic research papers, 8 PhD research papers, 3 Masters Research papers, and 6 work-in-progress papers published in these Conference Proceedings. These papers represent research from Australia, Belgium, Brazil, Bulgaria, Cambodia, Croatia, Cyprus, Czech Republic, Egypt, Estonia, Finland, France, Germany, greece, INDIA, Iran, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Malaysia, Netherlands, Nigeria, Norway, Oman, Pakistan, Perú, Philippines, Poland, Portugal, Saudi Arabia, Serbia, Slovakia, South Africa, Switzerland, Thailand, Tunisia, Türkiye, UK, USA, Vietnam, and Zimbabwe.

We would like to thank everyone who participated in this event.

Dr Stéphanie Buisine

Biographies of Chairs and Keynote Speakers

Conference and Programme Chairs

Stéphanie Buisine is Research Director at CESI, Paris, France and leads innovation research at LINEACT laboratory. Her career has taken her from technological innovation issues (ex: Human-Computer Interaction) to the methodological and strategic dimensions of innovation (ex: Creativity, Prospective on future needs), up to organizational innovation. Through innovation, her research aims to support self-determination of users, designers and collaborators.

Muriel Davies first studied engineering and management and then started a career working for 14 years in the textile industry on several plants as both a supply chain and quality manager. She then joined CESI, Paris, France in 2009 as a pedagogical manager, and then LINEACT CESI 8 years ago as a researcher. Today she conducts research on culture and organizational innovation with the current socio-environmental challenges as structural framework.

Keynote Speakers

Olivier Hamant is a biologist and a Director of Research at INRAE (the French institute for research on agriculture, food and environment) at Ecole Normale Supérieure in Lyon. He is also a Director of the Michel Serres Institute where he contributes to several projects in the fields of art, science and education around the existential issues of the Anthropocene. He has published approximately 100 scientific articles on biophysics and plant development. His research topic has also shed a new light on the question of the robustness of living organisms. In 2022, he published “La Troisième Voie du Vivant” (“The Third Way of Life”, Ed. Odile Jacob) soon to be translated into English.

Mini Track Chairs

Nasser Abouzakhar is an entrepreneur and the director of Anzar Property Investment Limited, which was founded in 2017. He is the author of the book Real Estate Investment: In the Pursuit of Building Income producing Assets to Grow Your Wealth. Nasser is a TEDx speaker, award-winning author, and a regular guest on the BBC TV channel for over 100 live TV interviews, including the Homes Under the Hammer TV show. Between 2004 and 2019, he worked at different universities in the UK as an academic, teaching and researching different technology-related subjects.

Dr Nikolaos Apostolopoulos, PhD, is an Assistant Professor in European Policies in Sustainability and Entrepreneurship at the University of Peloponnese, Greece. He also acts as scientific advisor at the Labour Institute of General Confederation of Labour (INE/GSEE) in Greece. He is co-editor of the edited volumes entitled: “Universities and Entrepreneurship: Meeting the Educational and Social Challenges”, “Entrepreneurship and the Sustainable Development Goals and Entrepreneurship”, “Institutional Framework and Support Mechanisms in the EU”.

Slava Baranovskiy is a serial tech entrepreneur, international speaker, startup mentor, guest lecturer and researcher. He is a founder of the Eligent Club (community of tech startup founders in the UK/EU), founder and programme director of Eligent Accelerator (online 6-month programme for socially-driven tech startups). Currently, he is a PhD candidate at the University of Liverpool (UK), and his research interests are socially driven startups, virtual accelerators, and entrepreneurial ecosystems.

Antonia Hoffmann is a doctoral student at the Chair of Management Accounting at the School of Management of the Technical University of Munich, Germany. Her research focuses on sustainability management in SMEs. In particular, she is dedicated to the circular economy in SMEs, focusing on craft enterprises. She focuses on the role of strategic orientation, cooperation and digitalization.

Dr Alexandros Kakouris, PhD, is an Assistant Professor in entrepreneurial learning and education at the Department of Management Science and Technology of the University of Peloponnese, Greece and at the Hellenic Open University, Greece. He holds a PhD in Physics, a PhD in Entrepreneurship and a MSc in Adult Education. His special interests concern fostering entrepreneurship and innovation to science graduates, context-aware entrepreneurship, support of youth entrepreneurship through teaching and counselling as well as nascent entrepreneurship, transformative and experiential learning. He is on the editorial board of International Journal of Management Education.

Marco Lamas holds a Post-Doc in Education (Entrepreneurship), PhD in Education (Entrepreneurship) and Bsc in International Relations. He is a Senior Professor at ISLA – Polytechnic Institute of Management and Technology, Portugal where he Leads the Business and Innovation LAB (BIL). Marco is also a Researcher, member of CEI and CEOS.PP, both from ISCAP -P. Porto, Portugal and also member of the Research Centre of ISLA-IPGT. He is a Founder member of SHINE - Scaling Higher Education Innovation for Europe.

Dr. Matti Muhos is the Professor of Growth Management, Renewing Business and Digitalization and the Director of the University of Oulu Kerttu Saalasti Institute, Finland. He holds the title of Docent in Technology Business, with a special focus on innovative start-ups and growing businesses in the IT industry, at the University of Jyväskylä, Finland. His research is focused on growth management, industrial engineering and management, technology business and international business. He participates in the editorial processes of several international journals as an editor, associate editor, guest editor and on both editorial and advisory boards.

Carlos Miguel Oliveira has a Ph.D. in Management and is a Coordinating Professor and Director of the School of Management at ISLA – Instituto Politécnico de Gestão e Tecnologia, Portugal. He is editor-in-chief of the Management in Review Journal and a collaborating member of CEOS.PP – Centre for Organisational and Social Studies. In recent years, he has published several articles in journals and conferences. He is a reviewer in some journals in the management area.

Dr. Martti Saarela serves as the Development Manager at the Micro-Entrepreneurship Centre of Excellence (MicroENTRE) at the Kerttu Saalasti Institute of the University of Oulu, Finland. He holds a doctorate in industrial engineering and management (Ph.D. in Tech) and also possesses a Master of Laws and a Master of Science in Economics. His primary research interests include the development of micro-enterprises, public

business services, start-ups, eHealth business, public procurement, and regional development. In recent years, he has been involved in numerous projects focusing on digital development in SMEs.

Prof. Dr. Augustinus van der Krogt is Professor in social business and digital transformation management at the Amsterdam University of Applied Sciences, Netherlands. In addition to lecturing he undertakes research on entrepreneurship, internationalisation, fintech, machine learning and digital business strategies. He currently focuses on research on the impact and challenges of Twin Green and Digital innovation by SMEs.

Dr Andreas Walmsley, PhD, is Associate Professor in Business at Plymouth Marjon University, UK. He conducts research in entrepreneurship, especially entrepreneurship education, graduate entrepreneurship and responsible entrepreneurship. He is on the editorial boards of the journals Entrepreneurship Education and Pedagogy and the International Journal of Entrepreneurial Behaviour and Research.

Dr Birgitte Wraae, PhD, is an Associate Professor in Entrepreneurship at the Department of Finance and Administration, Faculty at UCL University College, Odense, Denmark. Her research interests are in entrepreneurship, especially entrepreneurship education: identity formation, emancipation, and employability. She excels in doing research in connection with the entrepreneurial learning space. She has recently published a book on the entrepreneurial learning journey.

ECIE Review Committee

ECIE is fortunate to have a significant number of international experts in the field willing to review papers. Care is taken to ensure that a fully double-blind peer review process is followed, and reviewers are not selected if they have any research or organisational connection to the author/s.

Artificial Intelligence-Based Solution Model for Real Estate Business and Entrepreneurial Operations: Case Study

Nasser Abouzakhar
Anzar Property Group, Manchester, UK

nasser.abouzakhar@anzar.co.uk

Abstract: Artificial Intelligence (AI) is a collection of algorithms, tools and solution models that offer entrepreneurs a platform for managing and systemising their SMEs and business operations. Recently, AI opened new venues for smart activities and cost-effective solutions, saving time and money for start-ups and established enterprises. Advanced AI tools use high-efficiency algorithms such as machine learning to assess markets, evaluate product and service prices, and reduce maintenance costs. AI has radically disturbed many industries and sectors, offering opportunities to and allowing entrepreneurs to innovate and develop smart solutions in a competitive market. However, this disruption presents new challenges for entrepreneurs in dealing with AI technologies and establishing their 'smart' businesses. Investing in AI requires proper planning and understanding of the risks and challenges of applying new technologies and tools. Therefore, entrepreneurs must acquire the necessary skills and build competent teams of talents or experts to support them in maximising their returns and minimising risks. This paper presents a real-life scenario about some of the challenges faced by business enterprises in general and property businesses in particular. An AI-based innovation model for a real estate business comprising six primary services: Data analysis and strategy, Finance, Legal, Property Development, Property management, and Facility management has been introduced. This paper covers some of the entrepreneurial activities and AI-based solutions developed to improve the quality of their operations, manage their business processes, and maintain effective service delivery. Generative AI or Gen AI has significantly impacted many impressive real-life applications, delivering real value to many sectors, including finance, real estate, business management, research and development (R&D) projects, and entrepreneurial operations. Gen AI uses machine learning and neural network algorithms trained using big data text, images, audio and video. This paper introduces the main Gen AI types and covers real-life examples of applying Gen AI techniques to property business problems. It presents our GPT-based AI-powered property consultant application that uses GPT to help property developers, investors, and professionals, offering them solutions to business challenges such as property design and conversion options. If necessary, the user prompts the application, which responds with options for possible solutions like design solutions or converting office buildings or commercial properties to multiple residential flats and houses.

Keywords: AI-based models for businesses and entrepreneurial operations, Gen AI, Automated services, Optimisation of business systems and processes

1. Introduction

AI is becoming essential for innovation and analysing extensive data from across areas of sectors, offering compelling predictive insights and developing efficient, cost-effective solutions for many industries; it undoubtedly will transform our lives. AI tools have been instrumental in business operations, enabling new developments in finance, market predictions, property development and investment, and forecasting. With the support of machine learning techniques and predictive analytics, AI technologies can gather and analyse large amounts of data, like market conditions and sales data, to predict prices, allowing businesses and professionals to make informed decisions and minimise risks. AI has revolutionised how we perform many activities, manage business operations, predict and detect disease, develop marketing and sales strategies, etc.; the possibilities are endless (Mollick, 2024). Figure 1 shows what the author believes the main features offered by AI solutions, as follows:

- Data Analytics: ability to analyse big data and learn of that data to perform exciting tasks
- Effectiveness: improve the quality of business operations
- Cost Reduction: keep business costs and expenses as minimal as possible
- Efficiency: ability to reduce the time required to complete business tasks and operational activities

Figure 1: Artificial Intelligence Features

Advanced AI models like Gen AI, a subset of Artificial Neural Networks (ANNs), can process and analyse data to generate new content or data such as natural language or video. This newly generated content is based on patterns Gen AI recognised and similar to the data they were trained on; hence, the name Generative AI. Gen AI tools use high-efficiency algorithms like machine learning to evaluate product and service prices and reduce maintenance costs. For example, ChatGPT can initiate communication with potential clients, start the negotiation process to learn about their needs, get basic information about their situation based on their prompts, and then assess the available resources and offer them cost-effective solutions (Erne, 2023).

According to Forbes, AI is expected to grow 37.3% from 2023 to 2030, reflecting the rising impact of AI technologies in optimising business operations. About 25% of businesses adopt AI to address labour shortages and offer compensation for the lack of qualified employees. Furthermore, 77% of employees are concerned about losing their jobs because of the introduction of AI in 2024, showing a widespread concern among the majority of the workforce. However, AI is projected to introduce about 97 million new job opportunities, countering the job loss concerns. The impact of AI could reach 400 million workers worldwide, affecting around 15% of the global workforce.

2. Literature Review

Although Gen AI is considered by many as a game changer that is capable of showing interesting creativity and the ability to deliver real value in research and development (R&D), entrepreneurial operations and innovation, there is potential for more impressive content generation, design works, and scientific research. This offers good support to entrepreneurs and various enterprises across various industries to gain significant operational support; however, Gen AI needs to catch up in producing original ideas and content that human creative authors can make. Gen AI models are large algorithms trained on human intelligence using massive datasets, growing Internet content, and its expansion. These intelligent models can be tailored to specific sectors like education, finance, real estate, etc., offering disruptive applications across many industries.

Gen AI tools allow companies to provide high-quality services or develop enhanced products, opening new markets and clients. However, businesses must build pilot projects and plan for testing Gen AI tools and their

impact, which implies a lot of learning and education and making informed decisions. This should help them gain the necessary knowledge and build their understanding of how to deal with this extraordinary technology. It should also equip them with the right skills that will support them in achieving their business goals and objectives. Gen AI focuses on two major categories, Generative AI and Discriminative AI, as follows:

- Generative AI models analyse data to learn probability distributions of sub-categories within a dataset, which makes them capable of generating content similar to the training data. They offer content generation, create personalised content such as text, images, sound, and videos, and transform text into images or video, making Gen AI a significant model for producing creative content such as ChatGPT.
- Discriminative AI models are about summarisation and predictive analytics. They are based on ANN models that can classify data by identifying features. They offer exciting applications like speech recognition and analytics, AI-powered applications, document summarisation, chatbots, etc. Such smart tools can be trained on previous customer communications and interactions, creating exciting applications that support many businesses and organisations and offer quality customer service.

2.1 Gen AI Types

Gen AI has become an attractive tool for business intelligence, market assessment, and property legal matters, using online accessible data repository platforms to extract valuable information. For instance, property investors and developers became aware of the power of Gen AI and started using it to analyse the real estate market and for evaluation and assessment purposes. OpenAI tools such as ChatGPT use a large language model (LLM) designed to respond to user questions efficiently. LLM is an AI algorithm that uses deep neural network (DNN) learning techniques to process and summarise big data and predict new content. It is closely connected to Gen AI and designed to help generate content. This makes LLM capable of predicting the best output response textually or verbally to text-based queries or input questions. Different types of Gen AI (Abdullahi, 2024) (Almeida, 2024) can be distinguished based on the input and output content type, as shown in Figure 2 below.

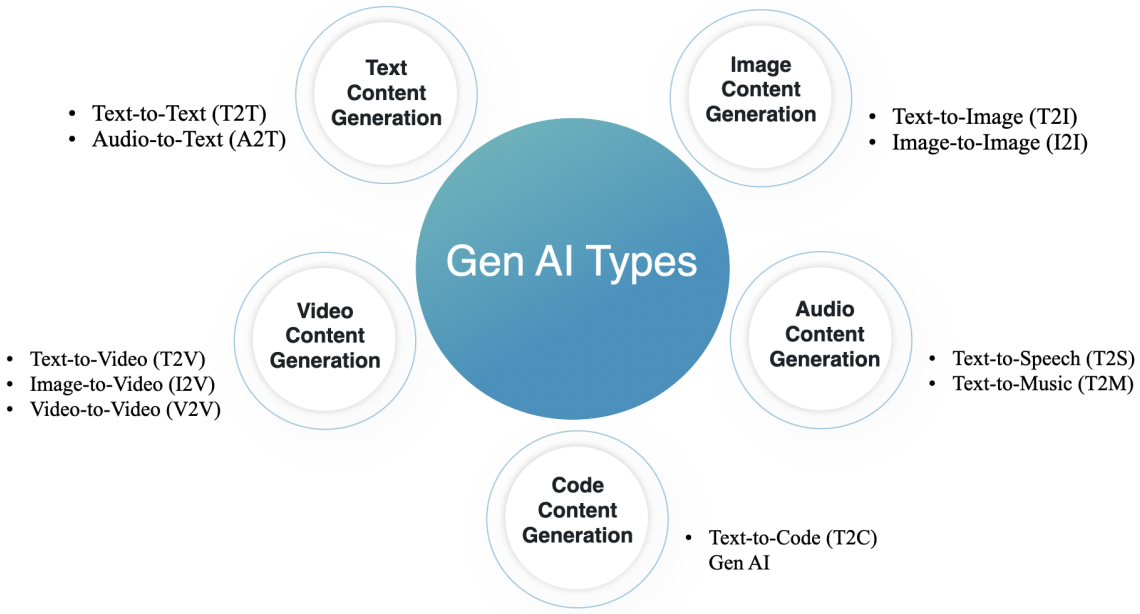

Figure 2: Gen AI Types

- Text Content Generation: Text AI generators are trained on large amounts of text from different sources, such as websites, e-books, and publications, to identify patterns and relationships between features in natural language. This makes them capable of generating new text such as reports, blogs, poetry, etc. There are two categories of text content generation, as follows:
- *Text-to-Text (T2T) Gen AI*
- *Audio-to-Text (A2T) Gen AI*
- Image Content Generation: This type of Gen AI analyses image datasets and their text descriptions and learns their features and concepts to create new images. There are two categories of image content generation, as follows:

- *Text-to-Image (T2I) Gen AI*
- *Image-to-Image (I2I) Gen AI*
- Audio Content Generation: Audio AI generators can analyse sounds and their metadata from different audio genres and associated text or song lyrics to learn features and patterns. There are two categories of audio content generation, as follows:
- *Text-to-Speech (T2S) Gen AI*
- *Text-to-Music (T2M) Gen AI*
- Video Content Generation: These generators can analyse visual, sound, and text content to learn how to generate new videos and apply effects if necessary. There are three categories of video content generation, as follows:
- *Text-to-Video (T2V) Gen AI*
- *Image-to-Video (I2V) Gen AI*
- *Video-to-Video (V2V) Gen AI*
- Code Content Generation: These AI generators are trained from large, accessible code datasets for different programming languages. This helps identify patterns and language structure and then write or develop program code to perform various tasks, whether for producing new programs or debugging purposes. There is only one category of code content generation, as follows:
- *Text-to-Code (T2C) Gen AI*

2.2 Gen AI Tools

Many Gen AI tools are currently available for businesses to help them with their operations and business challenges. These tools use LLM models trained on extensive data to learn how to generate human-like content, such as predicting the highly likely word to follow a previous one in T2T Gen AI. Figure 3 shows six tools: OpenAI's ChatGPT, Google's Gemini, Inflection's Pi, Anthropic's Claude, Microsoft's Copilot, and Adobe's Firefly (Kothari, 2024); Table 6.1 shows a brief comparison between all these tools (Kothari, 2024), (Abdullahi, 2024) (Almeida, 2024).

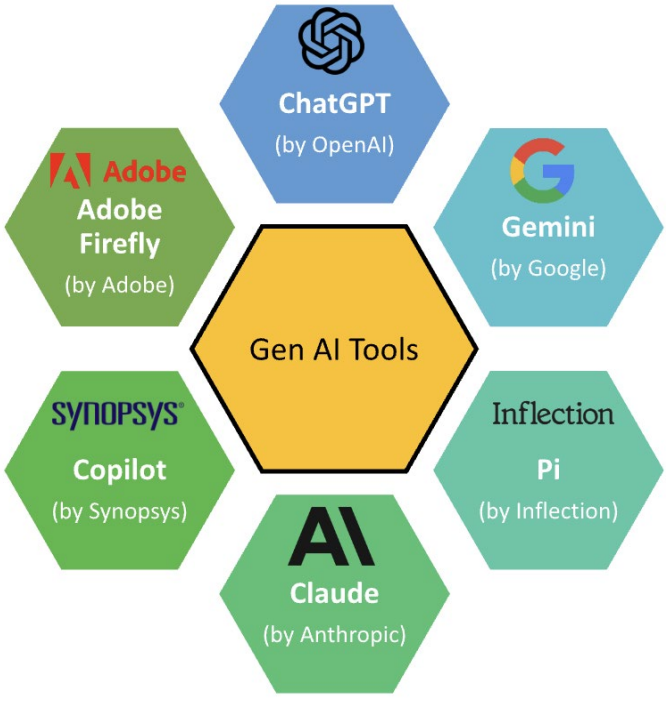

Figure 3: Gen AI Tools

Table 1: A Brief Comparison Between Gen AI Tools

Tool	Model	Code generation	Context window	Message limit
ChatGPT	GPT 4+ & Turbo	Yes	32k & 128k	40-80 per 3h
Gemini	Gemini Ultra	Yes	1 m	~ Limitless
Pi	Inflection-2.5	No	?	?
Claude	Claude 3 Opus	Yes	200k	100 per 8h
Copilot	GPT 4+	Yes	?	100 per day
Adobe Firto efly	Diffusion	Yes	1k	?

These tools use a large language model (LLM) to respond efficiently to user questions and use many resources to gather information, such as published research papers and articles, technical reports, social media, programming code, and online communications. These resources and LLM allow these tools to respond to users and offer helpful content using human-like smart AI functionalities. Therefore, communicating with Gen AI tools is essential to getting a helpful output or response to your query, such as an exciting image, useful video, or article. However, you must provide the Gen AI tool with the correct input or prompt, use the right words, structure requests correctly, and communicate clearly to receive the perfect response and desired information (Patel, 2024). For example, prompts instruct or ask ChatGPT or Google Gemini a question to generate a response in text, images, or both. ChatGPT can respond to customers' questions or queries, providing helpful information and efficient support, offering customers a superior experience and satisfaction. ChatGPT is a large AI-based natural language processing model, and its name ChatGPT combines 'Chat', which uses the AI chat feature used by chatbots, and 'GPT', which stands for Generative Pre-trained Transformer, an LLM.

Getting the best of Gen AI tools requires a proper understanding of how to instruct "prompt" those innovative tools to generate the results you are aiming for. It is not always guaranteed to receive the desired output; it is just about increasing the opportunity to get the desired results. Regardless of the content of your prompt, the way you structure and frame it would significantly improve the generated response and results. In other words, the quality of your prompt determines the quality of the tool's response. The better you write and frame your prompt, the better the output. Examples of valuable prompts will be introduced in the following sections, illustrating some techniques you must be aware of to produce well-framed prompts for Gen AIs.

With its intelligent features, the Internet has improved the real estate business regarding property market assessment, valuation, conveyancing, etc., but it has brought benefits and limitations. Bringing real estate businesses online helped interested customers check property prices, locations, and neighbourhoods. However, the Internet has limitations and cyber security challenges, threats, risks, and vulnerabilities. Many Internet and AI tools have become available to property businesses to speed up and simplify previously paid services that are often costly. Those tools cooperate to create an ecosystem that offers efficient and effective services to their customers. AI tools can help property investors and professionals like estate agents, letting agents assess the property market and improve their customers' experience (Fielden, 2024).

Many of these features and services were not possible ten years ago and were time-consuming and intensive. Today, we can look for a property and view it virtually; if we like it, we can offer our price, apply for a mortgage on the same website, and start purchasing the property on the same day. With such innovative online services, advertising and selling a property has become much easier and faster. They simplify and expedite the communication between buyers and sellers or tenants and landlords, thus saving time for all parties involved

(Mather, 2019). AI technology and online services resolve many complex problems and challenges impacting businesses, as follows:

- Keep them operating effectively and productively, delivering their services to their customers.
- Monitor operations and more measurability of results and completed tasks.
- Ensure agility and accountability to minimise errors
- Speed up activities and workflow and improve service support
- Minimise wastage in effort and time and avoid the use of ad hoc measures
- Develop a dynamic and efficient business that is capable of resolving its problems and challenges and able to change
- Better satisfaction of business members and employees
- Minimise the risks of human errors and make informed decisions

3. Methodology

AI has radically disturbed many industries and sectors, and the real estate sector is not an exception, offering opportunities to and allowing property business entrepreneurs and start-ups to innovate and develop intelligent solutions in a competitive market. However, this disruption presents new challenges for entrepreneurs in dealing with AI technologies and establishing their 'smart' businesses. AI tools such as machine learning can assess the property market, evaluate prices, and improve the customer experience. With the introduction of such tools, the role of real estate businesses such as asset management, buy-to-let companies, and letting agents or estate agents will develop and change. Figure 4 shows our AI-based innovation model for a real estate business comprising six primary services, as follows:

- Data Analysis and Strategy: Analysing the current property markets at different geographical locations and the demand and supply levels is essential in the real estate business. Applying AI mechanisms and its learning models can help predict future changes to market behaviour.
- Finance: Offer digital mortgage brokering, providing online access to capital and proposing different types of loans. Moreover, auto search tools for the best suitable mortgage products offer a comparison platform and options for borrowing beyond banks, providing an efficient, transparent mortgage/loan application process that speeds up lending. Furthermore, it helps find and close the best deals faster, eliminating intermediaries and reducing costs.
- Legal: Blockchain technology is a platform capable of processing smart contracts and managing and electronically signing property-related legal documents. It is a decentralised system capable of verifying identities using the personal digital key to authenticate and authorise a smart contract or transaction (Wu, B. and Wu, B., 2023). Using the blockchain and smart contracts can improve the contract management process, speed up a transaction process, ensure transparency and avoid extra costs. The blockchain can transfer and record transactions and real estate titles and makes background checks on all entities involved.
- Property Development: Digitally manage the development planning stage and develop the project life-cycle using smart tools such as Building Information Modelling (BIM). BIM can simulate the planning and development process, visualise all the milestones of construction projects, design buildings, estimate costs, and analyse them before construction.
- Asset Management: It is about ensuring the growth and success of the investment through the property's income generation and capital appreciation. AI tools can be used to monitor the property's performance, stay current with market trends, make critical decisions, and mitigate risk on behalf of the investors. This includes two main activities.
- *Property Management: Online marketplaces are used to find potential tenants; chatbots filter unqualified applicants, assess those qualified ones, select successful applicants, and use auto-filling tools to prepare tenancy agreements. This helps property managers properly manage their property's occupancy using cost-effective solutions and supports potential tenants in overcoming geographical barriers.*
- *Facility Management: The facility manager can use smart tools and applications to monitor and optimise efficiency, control costs, regulate property usage, and report to the property owner in real-time. This helps to optimise regular checks and routine maintenance, anticipate repairs, and respond to problems and breakdowns in the property.*

Figure 4: AI-based Real Estate Innovation Model

A Gen AI application using a feed-forward ANN model has been developed to help property investors and professionals develop appropriate real estate projects such as market analysis, commercial conversions, etc. The application has multiple built-in features using ChatGPT to interact with the backend model to analyse the user's input(s) and provide the necessary output(s). The following section details the application prototype and its main features.

We developed a Gen AI application prototype using a GPT, an ANN model that uses the Transformer Gen AI model, which can learn the context of the input data using feed-forward NNs, deciding the weights of the input data to determine the relationships between different parts of the input content. It is commonly used in natural language processing and AI applications like ChatGPT. The developed application is a GPT-based AI-powered property Consultant using ChatGPT to support property investors and professionals. Figure 5 shows four prompt options and an input field, allowing property developers, investors and professionals to use the application for various services. The application is designed to help them analyse properties, property locations and markets and obtain information about converting large properties into multiple flats and houses, as follows:

- Analyse any property market using SWOT (Strengths, Weaknesses, Opportunities, and Threats) and PESTEL (Political, Economic, Social, Technological, Environmental, and Legal) analysis.
- Identify supply and demand for residential properties in any city or country.
- Get information about a property use class and building conversion options.
- Design options for property conversion, such as commercial-to-residential conversion projects.

- Evaluate and optimise the property conversion design process to efficiently use a space, offering cost-effective solutions.

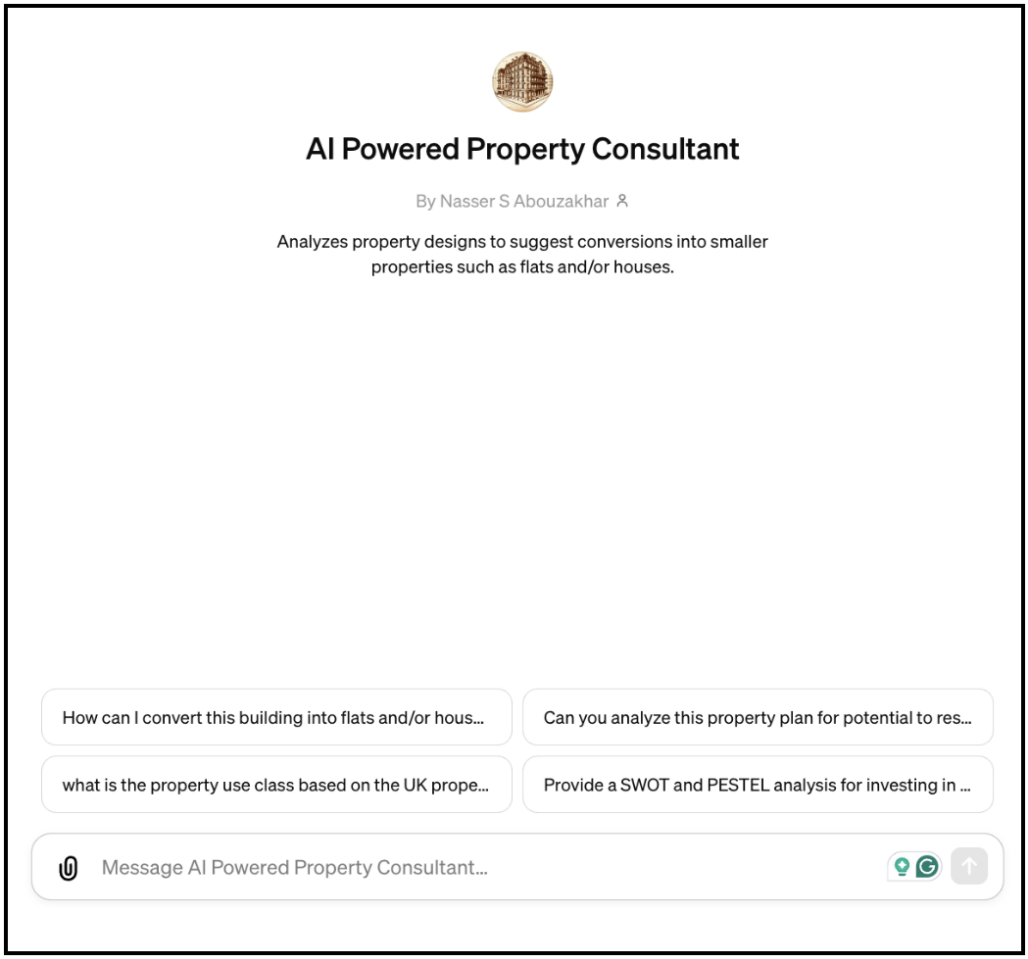

Figure 5: AI-Powered Property Consultant

Gen AI transforms how planners and developers approach business activities, offering practical tools to explore, experiment, and create innovative solutions. The application uses input parameters to offer its users innovative solutions and optimises the property conversion and design process regarding development time and renovation works. This makes the application capable of analysing each scenario option against the user's predefined criteria. The AI-powered property Consultant uses an iterative process supported by powerful Gen AI algorithms operating in the background, capable of proposing helpful solutions. Each suggested solution is analysed against predefined criteria such as building design, number of floors, area of the building or floor, etc., considering the building requirements and regulations.

The application offers the user an incredible way to explore various design and property conversion possibilities, ensuring efficient use of the available resources and space and allowing the user to compare and contrast multiple designs and select the best option based on the desired output. This app can accept a property design plan, such as Figure 6, which shows a four-story residential building with a basement used as input to the application to provide a conversion option for this property into multiple flats. The application's proposed solution output is shown in Figure 7 (a), offering detailed design options for all the apartments at each property level. Figure 7 (b) shows the remaining part of the output, which includes extra suggestions from the application.

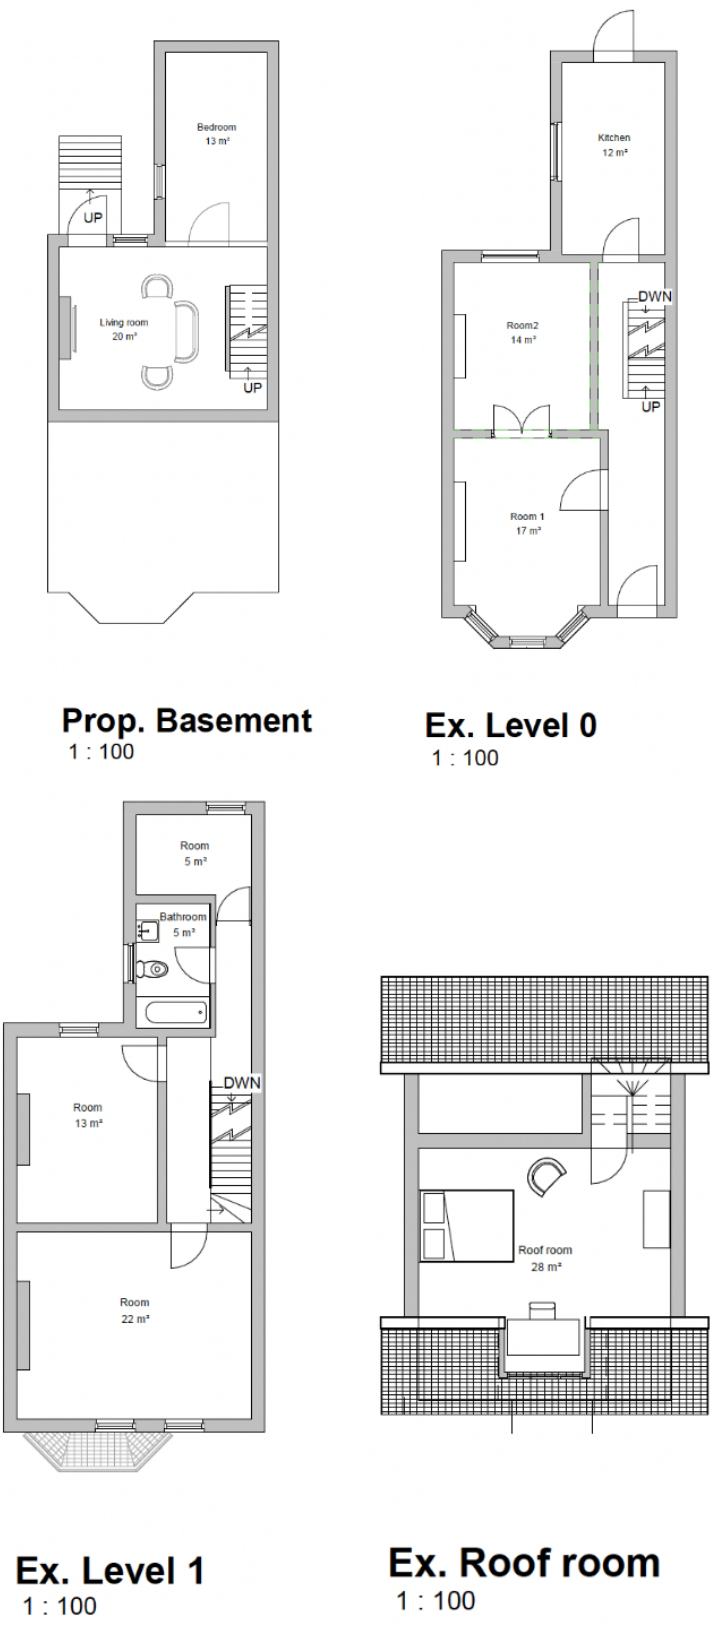

Figure 6: Property plan

AI Powered Property Consultant

Thank you for providing the floor plans. Based on the layout provided, here are some suggestions for converting this building into flats:

Proposed Basement:

- The existing living room can be converted into an open-plan living/kitchen/dining area.
- The current bedroom could be maintained as is, or if there's enough natural light, potentially split into two smaller bedrooms.

Existing Level 0:

- Room 1 can be an open-plan living/kitchen/dining area.
- Room 2 can remain as a bedroom.
- The kitchen area could be converted into a bathroom if the existing one isn't sufficient.

Existing Level 1:

- The largest room (22 sqm) can be converted into an open-plan living/kitchen/dining area.
- The 13 sqm room can be kept as a bedroom, or if there's another space for a kitchen, it could be split into two smaller rooms.
- The smallest room can be an office or a small bedroom.

Existing Roof Room:

- This could make a spacious studio flat with an open-plan living/kitchen/dining area and a separated sleeping area.

Figure 7 (a): The generated output

General Suggestions:

- Ensure each flat has at least one source of natural light and ventilation.
- All flats should have a bathroom with a toilet, sink, and bath or shower.
- Kitchens should be designed with efficiency in mind, possibly with integrated appliances to save space.
- Consider soundproofing between floors to improve the quality of living for residents.
- Compliance with fire safety regulations is critical; ensure there are sufficient escape routes and fire-resistant materials.
- Check if a change of use permission is required from residential to multiple dwellings.
- Make sure to comply with the minimum space standards and natural light requirements for new dwellings.
- Consider the accessibility requirements for all residents, including those with mobility issues.

These are preliminary suggestions and would need to be reviewed by an architect and in accordance with local building regulations and planning permissions. Always consult with a professional to ensure all conversions are legal and safe.

4. Discussion

AI has disturbed the real estate industry, providing opportunities for investors and entrepreneurs to develop smart systems that help them deal with various business challenges, such as market analysis, cost management, customer experience, etc. The role of the developed AI-Powered Property Consultant application prototype is to support its users in terms of analysing property markets at different geographical areas including the demand and supply levels and offering business opportunities for development strategies such as commercial conversions. Such support is essential for various property businesses to find the best deals and minimising costs. The application prototype can play a major role in business growth and investment success, staying with market trends, mitigating risks and making informed decisions about property development and significant conversion projects.

The developed application prototype can support property developers, investors and professionals in developing successful property projects using ChatGPT features. The application analyses the users' prompts and provides the results as requested according to relevant property markets, locations and local situations, providing SWOT and PESTEL analysis. The necessary details for property conversions, such as use classes, design and conversion options, can also be offered. The application can provide cost-effective development projects and evaluate the process effectively.

5. Conclusion

AI has radically disturbed many industries and sectors, offering opportunities to and allowing entrepreneurs to innovate and develop intelligent solutions in a competitive market. AI opened new venues for smart activities and cost-effective solutions, saving time and money for start-ups and established enterprises. Advanced AI tools use high-efficiency algorithms such as machine learning to assess markets, filter unqualified clients/applicants, evaluate product and service prices, and reduce maintenance costs. An AI-based innovation model for a real estate business comprising six primary services: Data analysis and strategy, Finance, Legal, Property Development, Property management, and Facility management has been introduced. This paper introduced a real-life scenario about some challenges and the ongoing change in the property business landscape and operations. It also covers some of the entrepreneurial activities and AI-based solutions implemented to improve the quality of its operations, manage property business processes, and maintain effective service delivery.

Gen AI has significantly impacted many real-life applications, such as content generation, design works, scientific research, and experimentation. It uses machine learning and ANN algorithms trained using big data text, images, audio and video. This paper covered the main Gen AI types, including the main tools of Gen AI, and presented some real-life scenarios of applying Gen AI techniques to property business problems. A GPT-based AI-powered property Consultant application has been introduced. This application can support property developers, investors, and professionals by offering solutions to various design and property conversion problems. It can analyse user prompts and property plans and provide options for converting office buildings or commercial properties to multiple flats and houses.

Entrepreneurial Competences Development of University Students in the Czech Republic

Petr Adamec and Peter Marinič
Mendel University, Institute for Lifelong Education, Brno, Czech Republic

petr.adamec@mendelu.cz
peter.marinic@mendelu.cz

Abstract: Entrepreneurship and entrepreneurial activities represent driving force of developed economies from national economic point of view. From individual point of view of each entrepreneur, it mainly represents possibilities of applying and developing potential innovative business ideas and ensuring independent and freer future existence of individuals. Small and medium-sized enterprises form a significant part of the economy in developed economies and are characterized by many positives in the current turbulent world. Also, for these reasons, European Union support the development of entrepreneurial activities and the development of entrepreneurship appears as an important topic in the educational environment as well. Today, there are already identified approaches to the development of entrepreneurship at the European level, which enable the effective development of relevant entrepreneurship competence, especially in primary and secondary education level. Entrepreneurship Competence Framework - EntreComp, is interconnected with other frameworks for the development of wide range of competences among pupils. From theoretical point of view, pull and push factors can be identified to support entrepreneurship among future entrepreneurs, which motivate future entrepreneurs to enter business. In our paper, we focus on identification of the situation in implementation of entrepreneurship support in the Czech Republic in the broader concept of education policy, with subsequent focus on possibilities of developing entrepreneurship among university students in Brno. We analyse the motivation of students for entering a university course focused on the development of practical competences leading to the possibility of active action in the role of entrepreneur. We connect the results of the analysis with the theoretical approach to the development of entrepreneurship and with the approaches of the official education policy in the Czech Republic. We hope that this will confirm the correctness of our approach to the development of entrepreneurship competence and support the development of other activities in this area.

Keywords: Entrepreneurship, Entrepreneurship competence, Motivation for entrepreneurship

1. Introduction

Small and medium-sized enterprises play a significant role in the creation of employment and gross domestic product in developed economies. They are perceived as a stabilizing element of the economy because they are characterized by higher flexibility, ability to adapt to sudden changes in the economy, ability to respond to changes in the purchasing behaviour of consumers, and ability to fill gaps in the market. At the same time, they represent the potential of applying entrepreneurial ambitions among the younger generation together with another form of applying entrepreneurial ambitions through self-employment or trade.

If we deal with the issue of young entrepreneurs and possibilities of their entry into business, this issue is linked to area of motivation. Motivation can be defined as impulse to perform a certain activity. Usually, motivation is associated with achieving certain goal and is therefore purpose-oriented towards meaningful activity. Motivation therefore influences human behaviour and its regulation, organization, and stimulation to activity (Marinič et al., 2014). Motivation as stimulation to activity can take two forms, which depends on origin of source of the motivation. First form is effort to use external opportunities as source of motivation according to the pull theory. Second form is effort to avoid internal usually negatively perceived phenomena as source of motivation according to the push theory. We can also distinguish two types of entrepreneurs, opportunity entrepreneurs connected with the pull theory and necessity entrepreneurs connected with the push theory (Humbert & Drew, 2010).

Pull theory assumes that individuals are motivated by attractive incentives that as opportunity entrepreneurs can identify in business environment. Usually, this type of motivation affects opportunity entrepreneurs with more significant results and for longer time. Such attractive incentives include possibility of use one's own talent, innovative approach, and identification of interesting business opportunity or gap in the market (Giacomin et al., 2023). Push theory assumes that individuals as necessity entrepreneurs feel tension between current situation and situation in which they would like to be. Usually, this type of motivation affects necessity entrepreneurs more intense but for shorter time. Negatively perceived working conditions, low evaluation of provided work performance, underappreciation of working abilities, and threat of dismissal or unemployment can be identified as the tensions necessity entrepreneurs feels (Amid & Muller, 1995). At the same time, previous research shows that opportunity entrepreneurs are more successful, achieve higher profits and

contribute more to economic growth, innovation, and job creation (Reynolds et al., 2002). On the other hand, necessity entrepreneurs are older, less educated, have less experience, and are worse at predicting the future (Robichaud et al., 2010).

We can therefore state that for development of entrepreneurship competence among young generation we should focus on attractive incentives as motivation according to the pull theory to form young individuals as opportunity entrepreneurs. Thus, the *main goal of the paper is to analyse motivation of university students to attend the course aimed at development of entrepreneurship competence according to pull and push theory of entrepreneurship motivation*. At the beginning we analyse the curricular documents focused on development of entrepreneurship competence to recognize approach to the topic at primary and secondary education level in the European Union and the Czech Republic. We would like to point out continuity of the approach to the topic at all levels of education system in the Czech Republic, its link to European documents, and emphasis on attractive incentives according to the pull theory of motivation as basic approach to entrepreneurship competence development.

2. Methodological Approach

We searched for relevant curricular documents at the European level and in the Czech Republic that focus on entrepreneurship competence development and analysed approach contained in these documents according to push and pull theory of entrepreneurship motivation. We analysed 112 questionnaires used for entry to the course implemented at the Mendel University in Brno between 2019 and 2022 to identify university students' motivation to enrol in the course aimed to develop entrepreneurship competence. The questions "*What motivates you to enrol in the course?*" and "*What do you expect from the course?*" were part of the questionnaire. Qualitative approach was used for the analysis of the obtained data due to open nature of these questions and freely formulated answers.

3. Entrepreneurship and Entrepreneurship Competence in the Curricular Documents

Entrepreneurship and its development are considered important by the European Union. It is necessary to develop entrepreneurship and appropriate entrepreneurship competence already at young age of individuals so they can widely use entrepreneurship competence not only in the field of business but also in their future life in general. The European Union therefore developed frameworks as certain form of unification of education in the individual member states to ensure greater comparability of initial conditions in education for the young population.

Key competences for lifelong learning (European Commission, 2019) were formulated because education is currently understood as never-ending process. This document is also used as suitable framework for developing key competences at all levels of the education system. The individuals will then use obtained competences not only during their further educational journey, but also in working and personal life throughout whole their lifetime. The competence focused on entrepreneurship is also included among the key competences. As key competence, entrepreneurship competence is defined as ability to act on opportunities and ideas and transform them into values for others. This competence is based on development of creativity, critical thinking and problem-solving skills, development of ability to take initiative and cooperate in implementation of plans and projects that have cultural, social, and financial value.

In the area of knowledge, it is mainly about understanding that there are different circumstances and opportunities for fulfilment of ideas and activities leading to realization of projects; understanding that there are different resources and processes for each project to achieve them. Knowledge within the entrepreneurship competence also relates to ethical issues and sustainability, to ability to identify strengths and weaknesses. In the area of skills, it involves development of creativity, imagination, critical thinking and problem-solving skills. It also involves innovative approach and strategic thinking, ability of individual and cooperative activity, and sustainable use of available resources. Integral part of the skills are economic skills to assess financial impact of individuals' decisions and understanding connection between financial side of and risk associated with the decisions. In the area of attitudes, entrepreneurship competence refers to the development of proactive approach to life, ability to take initiative and courage to achieve goals, motivating others while maintaining empathy, and responsibility in ethical matters (European Commission, 2019).

The Entrepreneurship Competence Framework – EntreComp (Bacigalupo et al., 2016) provides concretization of the approach to entrepreneurship competence development. The framework is built on the approach of bridging education and practical working environment. Its implementation is not intended to be strict and

precise but rather inspirational; to encourage active incorporation into national education frameworks and usage by individual schools or teachers. The framework defines entrepreneurship as activity based on opportunities and ideas with aim of transforming them into value for others in financial, cultural, or social form. Entrepreneurship can take many forms, including intrapreneurship, social entrepreneurship, green entrepreneurship, or digital entrepreneurship. Entrepreneurship competence applies to wide range of areas in individuals' lives and enables them to develop their personalities, contribute to society development, jobs creation or self-employment, establishment of start-ups or scale-up ventures (Bacigalupo et al., 2016).

Entrepreneurship competence is also directly mentioned among key competences in current framework education programmes in the Czech Republic for primary and lower-secondary education (ISCED 1 & ISCED 2). Specifically, the competence includes orientation in basic activities needed to carry out business plan and its implementation, understanding the essence of goals and risks of business, and developing one's entrepreneurial thinking. The key competences also include problem-solving skills and critical thinking or abilities for cooperation and valuation involvement of others like the European framework. Among other competences they contain also civic competence including topics of ecological and environmental problems and sustainable development or digital competence including safe use of digital technologies. Newly prepared framework education programme in the Czech Republic refers directly to entrepreneurship competence as ability of individual to develop ideas, opportunities and challenges, and create new values in social, cultural, environmental, and economic context, as well as values associated with personal development. These skills also lead to successful coping with changes, uncertainty, eventual failure in various areas of life, and support adaptability. Pupils' practical experience in planning and implementing activities or projects are priority. Similarly, the entrepreneurship competence is directly listed among the key competences also for upper-secondary general education (ISCED 3). For the upper-secondary vocational education and training (ISCED 3) also vocational competences are included in the framework education programmes. Chosen areas of entrepreneurship competence are included among the vocational competences specified as ability to optimally use one's personal and professional prerequisites for successful usability in the world of work, building and developing one's own professional career, and related need for lifelong learning.

Comparison of characteristics of the European and the Czech competence frameworks indicates significant similarity in arrangement of competences, their definitions, as well as delineation of their components. Increase in the similarity over time can be seen due to ongoing revisions of framework education programmes in the Czech Republic. Even though the Entrepreneurship Competence Framework should be inspirational, its parts are transcript into Czech curricular documents verbatim. Skills and abilities with positive connotation, i.e. those that relate to pull theory of entrepreneurship motivation, are significantly dominant among components of entrepreneurship competence. This can thus be considered appropriate, because motivation forming opportunity entrepreneurs have a longer-term effect and more positive impact on individuals and society.

4. Entrepreneurship and Entrepreneurship Competence Among University Students in Brno

The next part of the paper presents the results of the analysis of entrepreneurship motivation among 112 university students at Mendel University in Brno who decided to enrol in course of entrepreneurship and entrepreneurship competence development from 2019 till 2022. Presented results follow and enrich findings of previous research conducted on the same research sample (Adamec & Hrmo, 2023). In current paper we used other students' statements to be able to connect information from enrolment questionnaire with the pull and push theory of entrepreneurship motivation. We briefly present the South Moravian Region and the city of Brno as centre of support and development of entrepreneurship and entrepreneurship competence.

4.1 Entrepreneurship Development in South Moravian Region and Brno

Brno is the second largest city in the Czech Republic and the centre of the South Moravian Region. The city is important centre of higher education with almost 65,000 university students in a wide range of fields of technical, natural, and social sciences. In the field of business support, the South Moravian Innovation Centre (abbreviated as JIC in Czech language) is an important institution which focuses on the support of commercial use of research and development of universities located in Brno, mediates the connection of universities and scientific research institutions with the business sphere, helps innovative companies, students with original ideas, researchers, and inventors. Brno as region supporting the development of entrepreneurial activities and entrepreneurship competence received the European Entrepreneurship Region Award, based on developing

tailored activities supporting entrepreneurs across the entire funnel, from students and pre-entrepreneurs to start-ups, scale-ups, and global champions (“Famalicão…”, 2023).

There are several options for supporting the development of entrepreneurship and entrepreneurship competence among university students within the three largest universities in Brno (Masaryk University, Brno University of Technology, Mendel University in Brno). Courses are available for students at these universities to develop entrepreneurship, either in the form of entrepreneurship competences development, or through the support of practically oriented knowledge, skills, and abilities for active business. These universities also have contests between students to identify and support interesting student business ideas.

4.2 Evaluation of Feedback From University Students of Entrepreneurship Course

At the Mendel University in Brno, the “START-UP Mendel” course is one of the activities aimed at development of entrepreneurship and entrepreneurship competence among enrolled students. The course is voluntary and is not part of any study program or required for finishing any study of the students at the university. Data for analysis were obtained through the enrolment questionnaire which students were supposed to fulfil to be enrol in the course. As part of enrolling process students answer the question: "*What motivates you to enrol in the course?*" and "*What do you expect from the course?*". These seemingly simple questions indicate not only their motivation for the course but also for entrepreneurship itself. The answers then show students' internal readiness and motivation for entrepreneurship and its multi-layered nature due to wide range of motives.

We obtained data from 52 students in the academic year 2019/2020, form 30 students in the next year, and from 20 students in the year 2021/2022. According to our data 38 students (73% of enrolled students) in the academic year 2019/2020 had prior business idea, the year later 15 students (50% of enrolled students), and in 2021/2020 only 8 students (40% of enrolled students) had prior business idea. The data indicate decrease in number of enrolled students and students with a priori business idea before enrolling in course. We also identify changes in number of students already in team before enrolment in course. Twelve students created teams before enrolment in 2019/2020, in 2020/2021 it was only 2 students, and in 2021/2022 students created team in 6 cases. In first two years students in teams also had business idea already before enrolment in course, but only one pair in 2021/2022 had such idea. Other 4 students in 2021/2022 wanted to work in teams but had no business idea. Changes in interest and motives of students during the time indicated by the data can be seen as decrease of interest in entrepreneurship and entrepreneurship competence development through the course, but it could be caused also by the pandemic situation after 2020.

As supposed, motives of students are mostly based on interest in entrepreneurship and practical side of doing business. However, there are also students whose interest in courses can be characterized as purely pragmatic at any university. In the university environment it is understandable because their motivation lies in the fulfilment of study obligations. This pragmatic motive we can see in the student’s statement:

> *"...motivation for me is two beautiful ECTS credits that I can get by finishing this course, because as I already know every credit is useful and counts."*

We also supposed that the motivation of students would be in attractive incentives according to the pull theory of entrepreneurship motivation. But we were able to identify also statements associated with previous negative experiences in the role of employee or effort to avoid negatively perceived role as employee in the future. These external influences connected with the push theory of entrepreneurship motivation as necessity entrepreneurs are illustrated by students’ statements:

> *"...going to temporary jobs, where I work according to instructions and where I invest my time and energy to satisfy predominantly financial expectations of owners, is meaningless to me. In addition, contractual employment relationships are often poorly financially valued."*

> *"...in my several years as a part-time worker for all kinds of companies and individuals, I found out that being employed all my life is really not what I want in the future. If I were in job, I would be afraid that I would be stuck in time, and I wouldn't be able to develop.''*

> *"...I don't enjoy the classic model of an employee, as I am very creative and thoughtful, so it is problem for me that even if I do more on part-time job, I still get paid the same. I like to create and build new things. I have the business plan that could help those around me and generate profit for me at the same time. Now I am involved in the global business in which I work with the team of approximately 6 people.”*

> *"...I definitely don't want to spend the rest of my productive life in so-called 'rat race'. I want to learn how to turn ideas into sustainable business."*

These statements indicate that the students already have lot of experience in developing their own business ideas, and even in international cooperation. The development of wide range of competences and personal development is clearly important for those students. The idea to be employee after graduation does not seem attractive to the students. The issue of the negative concept of the classic role of employee is stressed. Other student also pointed to the failure to meet one's own goals and the low financial evaluation of employees' work related to the push theory of entrepreneurship motivation as necessity entrepreneurs. The last statement simultaneously points to already developed concept of entrepreneurship, as it refers to "rat-race" used by Robert Kiyosaki.

On the other hand, positive influence of previous entrepreneurial experience can be identified in the form of already implemented business and in long-term thinking about business. This positive previous entrepreneurial experience can be seen as positive internal factors according to the pull theory of entrepreneurship motivation as opportunity entrepreneurs. It can be demonstrated by students' statements:

> *"…I have been interested in entrepreneurship for several years and have (already) launched the first project. However, I would like to expand my knowledge, motivate and possibly share some of my ideas with team of active people."*

> *"...I have been running my own business for about two years now and at the same time I am working on other projects. I also have lot of other ideas for possible business, and I expect possible help with implementation of one of them. At the same time, I expect opportunity to contribute to someone else's ideas."*

This indicate that students not only expect additional information for further entrepreneurship competence development, but also expect opportunity to share their previous entrepreneurial experience with others.

Enrolment to the course is associated with the expectation of obtaining decisive motive for realization of the long-intended goals and plans in the field of business. It seems that students may have business plans in their minds for long time, but for various reasons they have not been able to implement them until now. These motives can also be recognized as internal positive factors according to pull theory of entrepreneurship motivation and hopefully can be used for starting active entrepreneurial life of students after the course. This type of motivation can be seen in students' statements:

> *"...I have been carrying the business ideas in my head for 3 years. I expect this unique opportunity will help me group all my ideas into one concrete and feasible plan and start the business in it. And most importantly, successfully."*

> *"…since I studied at secondary grammar school, I have been thinking of various things that would be good for business. Since then, countless ideas have crossed my mind. Looking back, some of them were unrealizable, but some were great, and often someone came up with the same thing. However, I never had enough courage to take risk and start my own startup. I often did market research, project plan, but as obstacles started to appear, I lost courage even though I believed in my idea. I expect the course to give me courage to start something of my own and I will pursue my goals more confidently and meet new people who are as passionate about entrepreneurship as I am, who will enrich me with their thoughts and approach to business."*

This demonstrates active approach to entrepreneurship, but it is limited by various fears, lack of determination and courage.

The development of entrepreneurship through the course can represent the fulfilment of long-term dream for students. Especially with the very positive approach to the entrepreneurship which can be identified as factor of pull theory of entrepreneurship motivation. We can see it in the students' statements:

> *"…I love entrepreneurship, motivating myself and others, multitasking, innovation, and constant improvement in what I enjoy. I've dreamed of entrepreneurship since I was a child"*

> *"...school period is ideal for acquiring new skills. I have always admired people who have built something, I would also like to build something of my own to realize myself and develop. They say that environment shapes a person, that's why I would like to be in environment where others will think the same way."*

> *"...I didn't even think that it would be possible to learn something about business from the real side while studying. I think it's absolutely great idea."*

The enthusiasm shown in statements is combined with certain degree of surprise that entrepreneurship competence can also be developed through practical course during university studies. Students appreciated developing their entrepreneurial skills and abilities connected to entrepreneurial activities, but also the entrepreneurship competence development linked to general personality development. They also point out that this approach will give them advantage compared to other students who do not use such opportunity. They draw attention to the fact that it is environment that has significant influence on complex formation of person and the university should be such environment forming person appropriately and comprehensively.

We also identified the influence of the wider environment on motivation to develop entrepreneurship and entrepreneurship competence among students. South Moravian Region and the city of Brno really seems to be suitable environment that contributes to the positive motivation of students to become entrepreneurs. Students perceive very positively cooperation of the South Moravian Innovation Centre (JIC) in this course and the involvement of experts from the centre to teaching activities. This can be seen in students' statements:

> *"...this course interested me due to connection with JIC. I have been following this organization for long time and I am determined to establish cooperation. I was often messing around with the idea of my own project/business. However, more thoughts and ideas run through my head, and I don't know how to decide. However, I would very much like to expand my horizons with managerial skills and try to refine my philosophy for my future business."*

> *"...I heard about JIC for the first time during my work at the marketing agency with which they cooperated at the time. I like the idea of the centre that guides students in important direction and toward meaningful activities. I like comprehensive and modern approach, and this is also what I expect from the course."*

> *"...in 2020/2021 I participated in online lectures and workshops from JIC, and it was absolutely great. That's why I would like to move forward in some real project with other students."*

The analysis of students' motivation to develop entrepreneurship and entrepreneurship competence through the university course shows specific examples of motives that are directly related to the pull and push theory of entrepreneurship motivation. As expected, the data points to dominant influence of positive internal factors according to pull theory of entrepreneurship motivation that increase students' interest in entrepreneurship and entrepreneurship competence development. Among these factors there were positive previous experiences as well as long-term thoughts about entrepreneurship. These also demonstrate positive influence of appropriately designed curriculum at lower levels of education in the Czech Republic, aimed to develop entrepreneurship and entrepreneurship competence.

5. Discussion

The analysis of university students' motivation to enrol in the course "Start-up Mendel" at Mendel University in Brno points to their previous entrepreneurial experience, or at least interest in entrepreneurship, which can be seen as attractive incentives according to the pull theory of entrepreneurship motivation. In this sense, our current analysis points to the same motivation that has been identified among university students at Masaryk University in previous research (Marinič, et al., 2014; Marinič, 2016; Marinič & Záthurecký, 2016). Although previous research was carried out in the period 2013-2015, when relatively high unemployment rate even among young population in the Czech Republic was recognized, the motives according to pull theory of entrepreneurship motivation were more dominant than motives according to push theory of entrepreneurship motivation. Students with entrepreneurship motivation according to push theory were also identified, although to lesser extent. In other words, students seem to be permanently more motivated by positive image of entrepreneurship, rather than negative concerns about employment or threat of unemployment.

The analysis of the competence frameworks shaping European education policy shows that the entrepreneurship competence is perceived as important part of the education process (European Commission, 2019). The importance of the entrepreneurship competence is also enhanced by its processing in separate framework, even though this framework does not necessarily have to be implemented verbatim, but rather used as summary of recommendations for the effective development of entrepreneurship competence (Bacigalupo et al., 2016). We can also see the interconnection of European competence frameworks and Czech curricular documents. In the national concept, the development of entrepreneurship competence is treated

similarly, and over time the emphasis on the development of entrepreneurship competence is increasing. We can see positive approach to the development of entrepreneurship competence according to the pull theory of entrepreneurship motivation in those documents. Emphasis is placed on comprehensive development of personalities, on proactive approach to entrepreneurship, development of creativity and innovation, with current development of critical thinking and responsibility. Those areas are developed among pupils at primary and secondary level of education and create suitable basis for entrepreneurship competence development among university students as can be seen in motives of analysed university students.

Students who show interest in the entrepreneurship and entrepreneurship competence development can use wide range of support within university environment. As we pointed out, in the South Moravian Region and in the city of Brno, not only students have significant support for the development of entrepreneurship and entrepreneurship competence. The region in cooperation with universities creates appropriate conditions for the development of entrepreneurship, but also the possibilities for the realization of specific business ideas of students. The time that students spend at the university correspond to the period of their greatest personality development and it is also the time when students can already develop business activities legally.

6. Conclusion

Entrepreneurship represents important area in persons development and has benefits for society in economic, social, cultural, ecological, and other areas. Therefore, great emphasis is placed on entrepreneurship and entrepreneurship competence development in the European Union. This is reflected in inclusion of entrepreneurship competence between key competences to be developed among pupils and students across education system. Entrepreneurship competence development must be motivated as any other learning process. We can distinguish two approaches to entrepreneurship motivation, according to the pull and push theory. Pull theory of entrepreneurship motivation consists of positive attractive incentives for entrepreneurship. Pull theory of entrepreneurship motivation consist of effort to avoid negatively assessed states and to see entrepreneurship as solution. Entrepreneurship competence in the European frameworks, but also in the Czech curriculum documents, are based on positive approach connected with the pull theory. Students are predominantly positively motivated especially through motives related to pull theory of entrepreneurship motivation according to our current analysis of the university students' motivation for enrolment in the course about entrepreneurship and entrepreneurship competence development. They acquire knowledge and skills in business and gain advantage towards other students in their future life. At the same time, they are motivated by possibility of sharing their own experience and sharing experience with experts, which can help them to start of their own real business.

Management of Innovation in Digital Brands: An Integrative Review

Nárima Alemsan and Francisco Antonio Pereira Fialho
UFSC, Florianópolis, Brazil

narimalemsan@gmail.com
fapfialho@gmail.com

Abstract: The present paper explores how innovation management is manifested in digital brands. The objective of this study is to analyze the approaches to innovation management within digital brands. The methodology adopted is an integrative review with a qualitative approach. Innovation management in digital brands has become increasingly crucial in today's dynamic business landscape. Digitalization has revolutionized the way brands interact with consumers, requiring constant innovation to remain competitive. This study aims to shed light on the strategies and practices adopted by digital brands to manage innovation effectively. The methodology has a qualitative approach through integrative review, which allows for the synthesis of existing literature on innovation management in digital brands. Through research and analysis of academic articles, this article identifies key themes and trends in innovation management in the digital context. Themes such as open innovation, co-creation with consumers, agile development methodologies, and digital transformation strategies emerge as central components of innovation management in digital brands. A conceptual framework is developed to provide a structured understanding of the various dimensions of innovation management in digital brands. This framework serves as a guide for professionals and researchers seeking to navigate the complex landscape of innovation in the digital age. The results of this study reveal a multifaceted approach to innovation management in digital brands. Also it includes the development of a descriptive figure conceptual of innovation management in digital brands. In conclusion, this integrative review highlights the importance of effective innovation management in digital brands. By adopting innovative strategies and embracing digital technologies, brands can drive growth, improve customer experiences, and maintain competitiveness in today's digital economy. Furthermore, this study contributes to the academic discourse by offering insights into the evolving nature of innovation management in the digital sphere. By understanding these dynamics, organizations can adapt their strategies to thrive in an increasingly digital-centric marketplace.

Keywords: Management, Innovation, Digital brands, Integrative review

1. Introduction

In today's ever-evolving business environment, the management of innovation has become a cornerstone for the success and sustainability of digital brands. The advent of digitalization has not only reshaped consumer behaviors but has also significantly altered the dynamics of brand-consumer interactions. As a result, digital brands are faced with the imperative need to continually innovate to stay relevant and competitive in an increasingly crowded marketplace.

As digital technologies continue to advance and consumer preferences evolve, traditional paradigms of brand management are being challenged. Consequently, digital brands are compelled to adopt innovative strategies to not only meet but exceed consumer expectations. By prioritizing the needs, preferences, and behaviors of consumers, brands can create more relevant and impactful innovations. User feedback and participation can drive the development of new products and services that are closely aligned with consumer expectations. Additionally, fostering a culture of continuous improvement and agility within the organization enables brands to quickly adapt to changing market conditions and consumer trends. By embedding user-centric principles into their innovation strategies, digital brands can enhance customer satisfaction, loyalty, and ultimately, their market position.

Exploring the nuances of innovation management in digital brands, this study seeks to unearth the underlying principles and practices that drive successful innovation initiatives. The methodology employed in this research entails an integrative review, which allows for the synthesis of existing literature on innovation management within digital brands. By systematically analyzing and synthesizing a diverse range of scholarly articles, this study endeavors to offer valuable concepts into the multifaceted nature of innovation management in the digital realm.

Furthermore, the rapid pace of technological advancement and the proliferation of digital channels have democratized access to information and empowered consumers like never before. This shift in power dynamics necessitates that digital brands not only innovate in terms of product and service offerings but also in how they engage with and empower their audience. From personalized marketing campaigns to interactive brand experiences, the landscape of brand-consumer interactions is undergoing a profound transformation. Understanding and effectively managing this transformation is essential for digital brands seeking to maintain relevance and forge meaningful connections with their target audience.

In this context, the main objective of this study is to delve into the intricacies of innovation management within digital brands, examining the various approaches and strategies employed to foster innovation in this dynamic landscape. Overall, this research aims to contribute to the existing body of knowledge on innovation management by shedding light on the strategies and practices employed by digital brands to drive innovation and maintain competitiveness in today's digital era. Through a qualitative analysis of the literature, this study seeks to provide actionable ideas for practitioners and scholars alike, fostering a deeper understanding of the complexities of innovation management in the digital landscape.

2. Theoretical Development

According to the literature, an innovation management (Keupp, Palmié and Gassmann, 2012) is a set of interconnected and interactive elements aimed at creating value (Den Ouden, 2012). It provides a common framework for developing and deploying innovation resources, evaluating performance, and achieving intended outcomes. The following principles form the foundation of the innovation management system:

- Value creation (Sjödin et al, 2020);
- Future-focused leadership (Zipp et al, 2024);
- Strategic direction (Hunsaker and Knowles, 2021);
- Culture; (Lounsbury et al, 2021);
- Exploration of insights; (Storey and Salaman, 2009);
- Uncertainty management; (Grote, 2004);
- Adaptability; (Tuominen, Rajala and Möller, 2004);
- Systemic approach. (Fischer, 2002).

So, it emphasizes the importance of integrating innovation into the overall strategy of an organization, fostering a culture that encourages creativity and risk-taking, and effectively managing the uncertainties inherent in the innovation process.

Moreover, innovation refers to the process of translating an idea into a product or service that creates value for customers, it is essential to entrepreneurship (Bessant and Tidd, 2007).

Thus, by adhering to these principles, organizations can establish a robust innovation management system that drives continuous improvement and sustainable growth.

3. Methodology

Through an integrative review (Souza, Silva and Carvalho, 2010) with a qualitative approach, this research aims to provide a comprehensive understanding of how digital brands navigate the complexities of innovation management. A qualitative approach with integrative review was adopted, encompassing a broad range of studies, from empirical research to theoretical analyses and literature reviews, to capture the richness and complexity of this intersection between archetypes, brand communication, knowledge dissemination, and innovation. Two databases were selected for the search: Scopus (4.601 results) and Web of Science (445 results). Search string: "Management" AND "Innovation" AND "Digital". Timeframe: 2021 to 2023. Only open-access articles in English were considered. Moreover, the exclusion criteria was: articles that addressed the topics only in a general manner or focused solely on physical brands. So, after these selected criteria, out of a total of 237 articles, a final selection of 7 articles was chosen for the analysis and discussion in the paper. After the final selection of articles and a thorough analysis of the literature, the results found are presented.

4. Results

As results, presented below is a synthesis matrix table:

Table 1: Thematic Synthesis - Management, Innovation and Digital

Authors	Title	Objective	Methods	Results
Mancuso, I., Petruzzelli, A. M. and Panniello, U. (2023).	Digital business model innovation in metaverse: How to approach virtual economy opportunities	This paper aims to understand the mechanisms of value creation and capture in the metaverse resulting from	The paper analyzes the cases of four cross-industry incumbents—Gucci, Samsung, Hyundai, and Nike—pivoting their business	The paper provides a framework for innovating business models, supporting companies in leveraging the metaverse for value

		continuous evolutions in digital technologies, and how organizations can develop them.	models in the metaverse to identify value mechanisms. It provides a framework for BM innovation in the metaverse, considering both "phygital" transformations and virtual immersions.	creation while contributing to academic knowledge on metaverse impact on BM innovation.
Mariani, M. and Dwivedi, Y. K. (2024).	Generative artificial intelligence in innovation management: A preview of future research developments. Journal of Business Research, 175, 114542.	This study aims to outline future research opportunities in Generative Artificial Intelligence (GenAI) within innovation management by combining a review of academic literature with the findings of a Delphi study involving leading scholars in the field.	The study utilizes a combination of a literature review and the results from a Delphi study involving prominent scholars in innovation management to identify major research themes at the intersection of GenAI and innovation management. Ten significant research themes emerged from this analysis.	including the relationship between GenAI and different types of innovation, its impact on intellectual property and new product development, as well as considerations regarding creativity, ethics, regulation, and organizational design.
Liao, J., Pang, J. and Dong, X. (2023)	More gain, more give? The impact of brand community value on users' value co-creation.	This article aims to investigate whether users who derive more value from brand communities are more inclined to engage in value co-creation activities,	Drawing from reciprocity theory, this study employs structural equation modeling to analyze survey data and archival data, combining quantitative methods to explore the relationship between brand community value, value co-creation, and users' self-presentation within the community.	Furthermore, the influence of information value on value co-creation is contingent upon the level of self-presentation, with higher levels of self-presentation enhancing the effect.
Lu, H. T., Li, X., and Yuen, K. F. (2023).	Digital transformation as an enabler of sustainability innovation and performance– Information processing and innovation ambidexterity perspectives.	This study aims to assess the impact of digital transformation factors on sustainability innovation ambidexterity and sustainability performance in firms operating in the maritime industry.	A survey questionnaire was distributed to 187 maritime professionals holding relevant roles in innovation, performance management, sustainability, or digitalization. Structural equation modeling was employed to analyze the collected data.	The analysis revealed that digital capabilities, alignment between digital technology and business strategy, sustainability exploration innovation, sustainability exploitation innovation, and digital flexibility were the primary factors influencing sustainability performance, ranked in decreasing order of importance.
Di Vaio, A., Palladino, R., Pezzi, A. and Kalisz, D. E. (2021)	The role of digital innovation in knowledge management systems: A systematic literature review.	This article aims to explore the role of digital innovation in knowledge management systems (KMS) and its impact on business governance.	A comprehensive survey of the scientific literature on digital innovation in KMS was conducted to understand its implications for new business models and knowledge optimization. A bibliometric analysis was performed on a database comprising 46 English-language articles published between 1990 and 2020.	Digital transformation tools are shown to contribute to the long-term value creation process. This research adds to the existing literature on KMS by examining it through the lens of digital innovation processes, emphasizing the importance of fostering new knowledge creation and sharing initiatives to support

Authors	Title	Objective	Methods	Results
				global and inclusive growth.
Pynnönen, S., Haltia, E. and Hujala, T. (2021)	Digital forest information platform as service innovation: Finnish Metsaan. fi service use, users and utilisation.	This study aims to explore the engagement of forest owners with the Finnish state-funded Metsaan.fi e-service portal as a service innovation, considering factors influencing their activity and perceptions of the service.	Both quantitative and qualitative analyses are conducted to understand forest owners' views on the Metsaan.fi e-service. The quantitative analysis identifies factors explaining forest owners' activity in using the service, while the qualitative analysis employs theories of innovation diffusion and e-service quality to analyze open-ended survey questions.	The findings emphasize the importance of considering attitudinal patterns of intended users when designing governmental e-services and suggest integrating innovation adoption theory and service-research theory for deeper insights into the value creation and service needs of different user groups.
Bril et al (2021)	Improving personnel management by organizational projects: Implications for open innovation.	The aim of this study is to analyze and develop clear criteria for assessing the effectiveness of projects aimed at improving personnel management systems at Russian enterprises across various industries and types of activities.	The study presents the methodology and basic elements of a one-stage economic assessment process for organizational projects related to personnel management.	The "maximum costs of the HRM" model offer a systematic approach for decision-making in HR management and facilitate future digitalization efforts within organizations

Source: (Own authorship, 2024)

Therefore, this table provided a comprehensive overview of the themes found in literature. In this sense, below is a discussion of these results.

5. Discussion

Despite focusing on different topics, several patterns emerge from these findings:

- User-Centric Design and Service Innovation: designing e-services with a deep understanding of user attitudes and needs is crucial for enhancing user engagement and satisfaction. Integrating theories of innovation adoption and service research can provide deeper insights into user behavior and preferences, thereby facilitating the creation of more effective and user-friendly digital services.
- Knowledge Management and HR Management: digital innovation processes, such as knowledge management systems and human resource management, are essential for facilitating organizational growth and fostering innovation. The studies advocate for the integration of innovative technologies and methodologies to optimize knowledge creation, sharing, and decision-making processes.
- Sustainability and Digital Transformation: digital transformation tools play a significant role in enhancing sustainability performance by enabling organizations to innovate and adapt to changing environmental and market conditions. The studies emphasize the need for alignment between digital technology, business strategy, and sustainability objectives to drive long-term value creation.
- Co-Creation and Community Engagement: understanding user behavior and engagement within brand communities is crucial for fostering value co-creation. Factors such as information value, social value, and self-presentation influence users' willingness to engage in value co-creation activities, highlighting the importance of nurturing positive community dynamics.
- Value Creation and Innovation: the studies highlight the importance of leveraging emerging technologies and digital platforms, such as the metaverse and Generative Artificial Intelligence (GenAI), to innovate business models and drive value creation. They underscore the role of

information value, social value, and digital capabilities in fostering innovation and supporting organizational performance.

Consequently, the integration of user-centric design, advanced knowledge management, digital transformation, community engagement, and technological innovation collectively drive the success of digital brands. These patterns demonstrate that a holistic approach to innovation, balancing technology with human-centric strategies, is essential for thriving in the digital age. By leveraging these key components, organizations can navigate market complexities, create significant value, and maintain a competitive edge.

With this, there are some relationships between the studies:

All studies highlight the central role of digital technology in facilitating innovation. Whether through the creation of new experiences in the metaverse, the implementation of GenAI in innovation management, or the digitization of knowledge management systems, technology is seen as a fundamental catalyst.

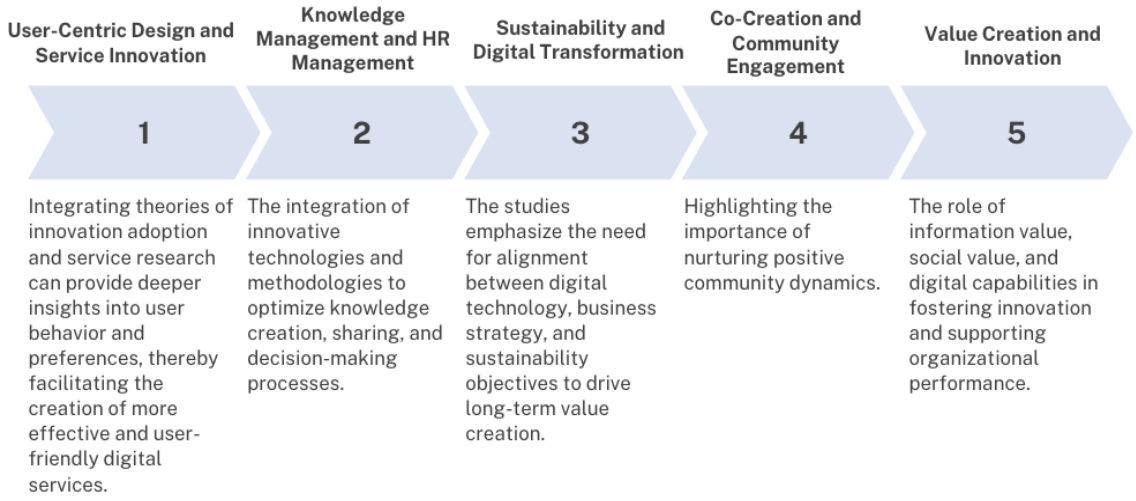
Also Highlights the Importance of Co-creation and Engagement: active user involvement and value co-creation are recurring themes. Brand communities and digital platforms are examples of how companies can foster user participation, increasing perceived value and encouraging collaborative innovation.

Ambidexterity in Innovation: the need to balance the exploration of new opportunities with the exploitation of existing capabilities is a common theme. Companies must continuously innovate while optimizing current processes to maintain sustainability and competitiveness.

Strategic Adaptation and Flexibility: the ability to quickly adapt to technological and market changes is emphasized. Companies that can align their strategies with digital innovations and adjust rapidly to new realities tend to be more successful.

Continuous Evaluation and Improvement: systematic evaluation and continuous improvement of organizational processes are essential for success.

Therefore, the results of studies also highlight that effective digital innovation and management depend on deep technology integration, a balance between exploring new innovations and exploiting existing ones, active user engagement, strategic adaptability, and a systematic approach to continuous evaluation and improvement. These patterns provide valuable guidance for companies and researchers seeking to understand and implement innovative practices in a rapidly evolving digital environment.



In summary, these findings underscore the transformative potential of digital technologies and innovative management practices in driving value creation, fostering community engagement, promoting sustainability, and optimizing organizational performance. Thus, organizations can develop more effective strategies for navigating the complexities of the digital age and achieving sustainable growth.

Additionally, the adoption of digital technologies and forward-thinking management strategies can bolster organizational flexibility and adaptability to swiftly changing market dynamics. This flexibility is paramount for maintaining a competitive edge in industries characterized by rapid shifts in consumer preferences. Through nurturing a culture of experimentation and continual enhancement, enterprises can effectively harness digital innovation to promptly refine their product and service offerings, catering precisely to evolving customer demands and seizing emerging market opportunities.

Furthermore, the integration of digital tools empowers organizations to collect and analyze extensive datasets, facilitating well-informed decision-making and predictive analytics. By capitalizing on insights derived from data-driven analysis, businesses can uncover invaluable patterns, forecast market trends, and tailor personalized experiences for their clientele.

In addition to enhancing organizational flexibility, the integration of digital technologies fosters a culture of innovation and adaptability within organizations. By embracing digital tools and fostering an environment that encourages experimentation and continuous improvement, companies can stay agile and responsive to evolving market trends.

This proactive approach enables enterprises to swiftly iterate on their offerings, adapt to changing consumer preferences, and capitalize on emerging opportunities, thus maintaining a competitive advantage in dynamic market environments. This data-centric approach not only amplifies operational efficiency but also empowers organizations to craft finely tuned marketing initiatives, optimize resource allocation, and foster innovation across diverse operational domains. As result, an Infographic was created as shown in figure 1:

Source: Author's own work (2024)

Figure 1: Effectively manage innovation in digital brands

So, the Figure 1 illustrates the key components necessary to effectively manage innovation in digital brands. The transition from points 1 to 5 follows a logical and interconnected progression that covers the essential aspects of innovation and success for digital brands. Here's an explanation of how these points are connected and why the sequence makes sense:

User-Centric Design and Service Innovation is the starting point because it emphasizes understanding user attitudes and needs, which is crucial for enhancing engagement and satisfaction. Without a deep understanding of users, any innovation or service is likely to fall short. This focus on the user naturally leads to the need for robust systems to manage this knowledge, connecting seamlessly to Knowledge Management and HR Management. Effective digital innovation processes, such as knowledge management systems, are essential for capturing, sharing about users, thus facilitating organizational growth and fostering innovation.

Building on effective knowledge management, Sustainability and Digital Transformation become the next logical step. Digital transformation tools play a significant role in enhancing sustainability performance by enabling organizations to innovate and adapt to changing environmental and market conditions. This alignment between digital technology, business strategy, and sustainability objectives is crucial for driving long-term value creation. As digital transformation improves internal processes and technology infrastructure, it also enhances the ability to engage and co-create with the community, which is addressed in Co-Creation and Community Engagement. Understanding user behavior and engagement within brand communities fosters value co-creation, which is essential for maintaining dynamic community interactions and innovation.

Finally, Value Creation and Innovation highlight the importance of leveraging emerging technologies and digital platforms to drive business model innovation and value creation. By utilizing advanced technologies like the metaverse and Generative Artificial Intelligence (GenAI), companies can create significant value and support organizational performance. This final point underscores the cumulative impact of the previous steps: user-centric design informs knowledge management, which drives digital transformation, fostering community engagement, and ultimately leading to innovative value creation. This sequence shows how each element builds a foundation for the next, creating a cohesive and continuous cycle of innovation and growth for digital brands.

By integrating these components into a cohesive framework, organizations can navigate the complexities of the digital landscape and drive sustainable growth and competitiveness in today's dynamic market environment. So, these concepts demonstrate how various concepts intersect and complement each other to drive innovation, value creation, and organizational success in the digital age.

6. Final Considerations

This study provided an in-depth analysis of innovation management in digital brands, revealing the growing importance of this practice in a dynamic and highly competitive business landscape. By examining the approaches adopted by digital brands to manage innovation, we identified key themes such as open innovation, co-creation with consumers, agile development methodologies, and digital transformation strategies. So, value

creation and innovation; co-creation and community involvement; sustainability and digital transformation; HR knowledge and management; and User-Centered design and service innovation have relationships between these concepts and are promising for future research.

Thus, they can be worked on and built with the bases for the development of a conceptual model that encompasses such constructs. The development of a conceptual framework provides a structure to understand the different dimensions of innovation management in digital brands, guiding professionals and researchers in navigating this complex environment.

To conclude, our findings underscore the multifaceted approach required to effectively manage innovation in digital brands, highlighting the importance of adopting innovative strategies and embracing digital technologies to drive growth and maintain competitiveness in today's digital economy. Thus, by fostering a culture of innovation and leveraging digital tools to their fullest potential, organizations can position themselves as leaders in their respective industries, driving sustainable growth and delivering value to both customers and stakeholders alike.

Abstract: Pakistan is an emerging country, that needs to understand the importance of entrepreneurship, which can support its developing economy. Particularly in mountainous region, educated entrepreneurs can develop new business ventures with their innovative ideas and plans. The Hofstede National Culture and the Theory of Planned Behavior are the primary subjects of this research study. The quantitative research approached is used and the data was collected by the questionnaire from the 362 sample of university students from Gilgit-Baltistan with the probability sampling method. The data was tested empirically and analyzed with the help of PLS-SEM. The research findings show positive responses, indicating that students of Gilgit-Baltistan have positive entrepreneurial intentions. The results further revealed that the variable of attitude towards behaviour, subjective norms and perceived behavioral control have significant role in developing entrepreneurial intentions. However, the moderating variable of individualism plays an insignificant role in developing entrepreneurial intention. The main contribution of this research was the identification of the various factors which influence the entrepreneurial intention of the university students of Gilgit-Baltistan.

Keywords: Entrepreneurial intentions, Individualism, Theory of planned behavior, National culture

1. Introduction

Rural entrepreneurship plays a major part in the development and improvement of national economies. It functions as the engine of the economy, generating income and a variety of new job prospects (Gherghina et al., 2020). In addition, entrepreneurship fosters and advances social equality and political continuity, commercial possibilities, creative ideas and goods, and healthy rivalry among companies (Ali et al., 2023). According to Audretsch and Thurik (2001), it lessens the issue of youth unemployment and increases entrepreneurial opportunities and financial independence. Many nations successfully managed the problem of unemployment while encouraging an entrepreneurial culture within their borders (Kumar & Raj, 2019). According to Urbano and Guerrero (2013), educationists, scholars, and strategists all agreed that entrepreneurship has a number of beneficial effects on the socioeconomic growth of developing and emerging countries.

Recently entrepreneurship gained more importance in Pakistan, however very few numbers of studies conducted on the entrepreneurial intention of the youth particularly in the remote and mountainous areas of Pakistan (Ali & Yousuf, (2019). The progress of small-medium size enterprises (SMEs) may be considered a reflection of entrepreneurial business although this sector is mainly confined to the urban areas of Pakistan. Sustainable development requires the equal participation and progress of every part of the country in economic activities. Despite its remote area, Gilgit-Baltistan maintains a strong position in the development of Pakistan. It has an abundance of natural resources, tourism places and trade routes. One of the most famous and important trade routes, Karakorum Highway, passes through Gilgit-Baltistan, connecting China and Pakistan. The recent China-Pakistan Economic Corridor (CPEC) program has further enhanced the role of Gilgit-Baltistan. The main route of the CPEC door starts and passes from Gilgit-Baltistan. Entrepreneurship development initiatives in Gilgit-Baltistan will definitely uplift the life of local people and communities. Government rational consideration increases entrepreneurship opportunities while exploring the natural beauty, valuable minerals, indigenous products and tourism spots (Ahmad, 2021).

2. Literature Review

2.1 Entrepreneurship

The idea of entrepreneurship arose in the early 1700s. Entrepreneurship has been defined and characterized according to the setting and environment by numerous authors such as (Schumpeter, 1954). The "Global Entrepreneurship Monitor" (2022) defined "Any attempt at new business or new venture creation, such as self-employment, a new business organization, or the expansion of an existing business, by an individual, a team of individuals, or an established business." Earlier researcher on entrepreneurship concur that entrepreneurship can promote economic advancement (Jena, 2020).

2.2 Entrepreneurial Intentions

Entrepreneurial intention, according to Remeikiene and Startiene (2013), is an active mindset that pushes people to look for new business prospects or breakthroughs in the industry. According to Bird (1988), entrepreneurial intention is essentially the first step in the decision-making process for launching a new company. It primarily serves as a predictor of the anticipated level of entrepreneurship-related behavioral commitment. Bird (1988) went on to say that intention is a specific emotion that is sparked by the surroundings and real-world experiences. Entrepreneur and intention have a strong relationship, mainly, the intention of starting new business ventures are developed in advance (Henley, 2007). The intention is basically the accumulation of relevant information, which can be helpful in the formation of new entrepreneurial businesses (Choo & Wong, 2009). The planning and formation of a new business venture is not like an event, it's a long way process which requires years to complete and success (Ali *et al*., 2023). Van Gelderen et al. (2008) argued that entrepreneurial intention is the main element of the entrepreneurial process and support for creating new businesses.

2.3 Theory of Planned Behaviour (TPB)

The theory of planned behaviour (TBP) is basically derived from the theory of reasoned action and it was initially proposed (Fishbein & Ajzen, 1977). The main objective for developing the theory of planned behaviour was to describe the relationship among attitude, subjective norms, perceived behavioral control and entrepreneurial intentions. Rogers et at. (2008), described that people's decision is based on the expected outcomes which they derived from the performance of particular behavioral activities. Doswell *et al*., (2011) further argued that the theory of planned behaviour supports understanding people's volunteer behaviour and act as a predictive variable. Entrepreneurial intentions mostly depend on the variable of ATB, SN and PBC. These three elements would constitute the explanatory variables of intention.

2.3.1 Attitude towards behaviour

The perception of the entrepreneur plays very important role in gaining the expected future opportunities and benefits. People's ideas shape their attitudes when they engage in particular behaviour. According to Ajzen & Fishbein (2005), behavioral beliefs, expected results, or benefits and costs are believed to influence behaviour. The majority of recent research has also looked at how the intention of starting a new firm is influenced by implicit beliefs or perceived outcomes of entrepreneurship. Entrepreneurial intentions are sparked by the personal benefits that come with starting a firm (Volery et al., 2013). An attitude toward entrepreneurship has shown a consistent and strong impact on entrepreneurial intention in most of the research in various cultural settings (Almobaireek and Manolova 2013).

2.3.2 Subjective norms

Azjen, 2005 Subjective norms are social forces that people absorb from society and have a significant impact on whether or not they engage in particular behaviors. Individual family members, relatives, coworkers, colleagues, fellows, and possibly experts in the conduct of interest make up the group of other key individuals. Individuals experience social pressure to engage in actions that others of their social group deem acceptable, and this compels them to carry out these acts. Following up on Ajzen's research study, Lapista et al. (2012) found that people are more interested in launching companies that their entrepreneurial acquaintances have already taken up. Study of Otuya et al. (2013) also corroborate the importance of subjective norms on the purposeful behavior for initiating new business operations.

2.3.3 Perceived behavioral control

The term "perceived behavioral control" refers to the subjective evaluations that individuals use to gauge their aptitude for engaging in specific behaviour. “Ajzen and Cote (2008) it can be established from the control belief concerning the accessibility of factors that may support or obstruct performance of the behaviour”. Ajzen (2012) defined the internal and external factors as those that either maximize or minimize the perceived difficulty in carrying out the behaviour in question. These factors include “facilities, opportunities, knowledge, skills, obligations, dependence, personal behavioral experience, information, past experiences of other people” and other factors. According to Linan *et al*., (2013) people feel more at ease and motivated to engage in entrepreneurial activities when other members of the community acknowledge, appreciate, and value their decisions. “The social and internal environment also play a significant role in developing the positive perception about entrepreneurial activities, which in turn affect the perceived control behaviour”.

2.4 Culture and Entrepreneurial Intentions

Every country and society have naturally different landscape, physical environment, weather conditions, economic opportunities, technological facilities and multiple culture. People of the particular country have to adopt culture friendly, environmentally suitable and technologically supported types of businesses for the success and personal satisfaction, Sharpero and Sokol (1982), the culture has a unique characteristic as different form socio-political, economic and technological environment, has a strong significant in shaping the economic entrepreneurial behaviour of individuals. The significant role of culture in predicting people intention in starting new business is documented by (Zeffane, 2014). Most research studies on entrepreneurship, including Farrukh et al. (2017), incorporate the cultural variable as suggested by Hofstede national culture. Hofstede's research identifies how culture manifests in various forms and how “individual and community-level cultural norms” are influenced by national culture.

2.4.1 Individualism verses collectivism

The concept of individualism represents preferences of doing for the personal and close household interest, although the dimension of collectivism gives important for the benefit holistic things in order to gain their loyalty and support. The people of individualistic communities prefer of personal independence, self-rule and personal benefit and interest (Habermas, 1990). On the other hand, the people of collective communities feel more dependent on each other, working for common goal, strongly committed for team performance and cohesive in teams.

In individualistic societies people mainly focus on materialistic grown and progress and financial benefit in common which motivate and support for entrepreneurship business activities in the long-run (Gupta *et al*., 2010). Moreover, various research scholar also highlighted the important role national culture and entrepreneurial intention (Dheer 2017; Farrukh et al. 2017). Although, there are limited studies on the moderating role of national culture on the entrepreneurial intention particularly in the context of rural areas (Mfazi & Elliott, 2022). Hence this study analyzed the moderating role individualism on the relationship between ATB and entrepreneurial intentions.

3. Methodology

The survey data were collected from the public sector universities located in Gilgit-Baltistan of Pakistan. The questionnaire from the earlier studies was utilized, and the components were measured using a 5-point Likert scale that ranged from 1 (strongly disagree) to 5 (strongly agree). The TPB and EI questionnaires utilized in this study were adopted from the previous research of (Ali *et al*., 2023). Similarly, the variable of individualism was adopted from the research conducted by (Farrukh *et al.,* 2017).

The survey questionnaire was closed-ended and made up of “5-point Likert scale”, starting from strongly disagree, agree, neutral, disagree and strongly agree. Furthermore, given the exploratory nature of this study, Smart PLS-SEM was utilized for data analysis, consistent with the methodological guidelines of (Zeb *et al*., 2020). As a widely adopted tool in the social sciences for theory testing and empirical study, it is well-suited for analysing complex relationships among latent variables.

4. Result and analysis

4.1 Descriptive Statistics

The demographic descriptions of the respondents are elaborated in the table-1 below follow by gender, age, program, semester, university and father occupations. As mentioned previously the respondents of this study is the university students from Gilgit-Baltistan. The respondent's characteristics observed included gender, age, program, semester, university and father occupations. The respondents profile was analysis by using SPSS version 22.

Table 1: Demographic profile

Sr. No	Attributes	Frequency	Percentage (%)
Gender			
1	Male	251	69.3%
2	Female	111	30.7%
Age			
1	21-25	177	48.8%
2	26-30 years	95	26.2%
3	31-35 years	63	17.4%
4	36 & above	27	7.40%
Program			
1	BS	208	57.4%
2	Master	119	32.8%
3	MS/M.Phil.	35	9.60%
University			
1	KIU Gilgit campus	105	29.0%
2	KIU Ghizer campus	66	18.2%
3	KIU Hunza campus	63	17.4%
4	KIU Diammer campus	59	16.2%
5	UOB Skardu	69	19.0%
Father occupation			
1	Government job	167	46.1%
2	Private job	44	12.1%
3	Own business	97	26.7%
4	Agricultural work	54	14.9%
Total		362	100%

The above descriptive results show that almost 70% responds are male and 30% are female students. The results further disclosed the gender inequality among the rural areas of Pakistan which need to be revisited for the equal participation (Arshad et al., 2016). Similarly, the age of the respondents falls 48.8% between the age limit of 21-25 and vice versa. Moreover, the degree program distribution shows that 57.4% students are from the BS degree program and rest are from the Mater and M.Phil. degree programs.

Accordingly, the number of students from KIU Gilgit campus is very high compared to the other campuses. KIU Gilgit is the main campus and the pioneer university of Gilgit-Baltistan. Similarly, the father occupation shows highest number belong to the government sector employees. The father occupation tells us that entrepreneurial

business is rare in Gilgit-Baltistan. Moreover, the inclusion of father's occupation as a variable is justified by the reality that, in rural areas, men typically occupy dominant roles across various spheres of life, influencing economic and social dynamics.

4.2 Data Analysis

The research model was analysed while applying the Smart PLS-SEM version 4.0 one of the widely use software for structural equation modeling (Ringle *et al*., 2015). According to Sarstedt *et al*., (2014) most of the business studies used the "structural equation modeling" for the data analysis. Moreover, it is more suitable for the theory testing and examination of latent variable relation (Fornell and Larcker, 1981). Additionally, it supported to find the effect of TBP and Individualism on the entrepreneurial intention of the university students of Gilgit-Baltistan. Two-way data analysis approached is followed first one is the measurement model, and the second one is the structural model.

4.3 Results Measurement Model

The measurement model has assessed the entrepreneurial intention, theory of planned behaviour national culture dimension of individualism along with the latent construct and items. The reliability was measured by applying the Cronbach alpha, "composite reliability and average variance extracted" was used for the test of convergent validity. The detail of the factor loading, Alpha value, Average Variance Exerted and Composite Reliability are presented in the table 1.4 below.

Table 2: Result of the measurement model

Constructs	Items	Factor Loadings	Alpha value	AVE	C.R
Attitude towards behavior			0.833	0.640	0.876
	ATB1	0.847			
	ATB2	0.830			
	ATB3	0.724			
	ATB4	0.793			
Subjective norms			0.732	0.626	0.833
	SN1	0.731			
	SN2	0.734			
	SN3	0.898			
	SN4	Deleted			
Perceived behavioral control			0.791	0.601	0.857
	PBC1	0.687			
	PBC2	0.789			
	PBC3	0.875			
	PBC4	0.737			
Individualism			0.803	0.631	0.871
	IC1	0.699			
	IC2	0.892			
	IC3	0.875			
	IC4	0.690			

The results show that factor loading of all the items are above 0.7 as recommended by Hair at al., (2010), however one item from the construct of subjective norm is deleted (SN4) due to low factor loading. Similarly, the Cronbach's alpha values of all the constructs are above 0.7 as recommended by Yusoff *et al*., (2011).

Moreover, the convergent validity was evaluated by AVE and CR whose values are above 0.5 which are significant according to (Zeb *et al.*, 2019).

4.3.1 Discernment validity

Fornell and Larcker (1981) set a criterion to assessed the discernment validity called the "Fornell-Larcker Criterion". Moreover, Fornell and Larcker criterion is one of the popular tool used for the measurement of the discriminant validity. Similarly, the second criteria for the assessment of discernment validity is Heterotrait-Monotrait (HTMT) introduced by (Henseler *et al*., 2015).

Table 3: Fornell-Larcker Criterion

Constructs	1	2	3	4
ATB				
IC	0.491			
PBC	0.214	0.255	0.217	
SN	0.096	0.230	0.219	0.129

Table 4: HTMT Criterion

Constructs	ATB	SN	PBC	IC
1 ATB	0.797			
2 IC	0.375	0.795		
4 PBC	0.169	0.203	0.200	
5 SN	0.064	0.194	0.181	0.101

The standard set by Fornell and Larcker described that the square root of all respective construct's average variance exerted should be greater than the following values of other constructs that confirmed the sufficient discernment validity. Similarly, as the criterion set by HTMT method, all values were less than the 0.85 criterion thus further confirming the desired discriminant validity among the constructs.

4.4 Structural Model

The path of the structural model measurement validates and confirms the strengthen of the direct and indirect relationship between the exogenous variable and the endogenous variable. Moreover, the path coefficient shows the effect of an independent variable on a dependent variable. The structural model path coefficient was performed via bootstrapping. The results of the structural path coefficients are presented in table 4.10 below.

Table 5: Summary of the hypotheses results

Hypothesis	Relationships	β values	t values	p values	Decision
H1	ATB -> IE	0.280	9.032	0.001	Accepted
H2	SN -> IE	0.356	6.614	0.000	Accepted
H3	PBC -> IE	0.119	2.667	0.004	Accepted
H4	IC x ATB -> IE	-0.110	1.748	0.081	Not Supported
H5	IC x SN -> IE	-0.040	0.678	0.498	Not Supported
H6	IC x PBC -> IE	-0.029	0.443	0.658	Not Supported

The path coefficient of attitude towards subjective norms on entrepreneurial intention of the university students show significant effect (β = 0.280, t = 9.032, p = 0.001), hence hypothesis H1 is accepted. Similarly, the path coefficient of subjective norms on entrepreneurial intention of the university students are significant (β = 0.356, t = 6.614, p = 0.000), hence the hypothesis H2 is also accepted. Similarly, the path coefficient of perceived behavioural control on the entrepreneurial intention of the university students is also significant (β = 0.119, t = 2.667, p = 0.004), according the hypothesis H3 is also accepted.

However, the moderation effect is not significant as the path coefficient shows that individualism does not strengthen the relationship between ATB and entrepreneurial intention (β = -0.110, t = 1.748, p = 0.081), hence

the hypothesis H4 is not accepted. Similarly, the path coefficient of Individualism on the relationship between SN and entrepreneurial intention is not significant (β = 0.040, t = 0.678, p = 0.498), hence the hypothesis H5 is also not accepted. Finally, the last hypothesis H6 IC x PBC -> IE also show insignificant result (β = -0.029, t = 0.443, p = 0.658), there hypothesis H6 is not accepted accordingly.

5. Discussion and Findings

Previous research scholars have identified various factors that influence the entrepreneurial intention of the university students. However, limited knowledge exists regarding the specific context of Gilgit-Baltistan. The geographical location, environment, context and economic conditions are different from other places of the country. The comprehensive literature reviews and empirical studies found some new insights about the entrepreneurial intention of the university students of Gilgit-Baltistan. The empirical findings disclosed the effect of behavioral and culture factors on the entrepreneurial intention of the G-B university students. The results further revealed the positive affect of the independent on the dependent variable. All the behavioral factors positively influence the entrepreneurial intentions of the university students of G-B. Moreover, the variable of subjective norms and attitude towards behaviour and have strong effect as compared to perceived behavioral control variable.

Gilgit-Baltistan has a strong community culture, where family and friends play a significant role in shaping individual decisions. Students might be more likely to consider entrepreneurship if they perceive their family and friends supporting and encouraging it. Similarly, a positive attitude towards entrepreneurship, shaped by personal beliefs and perceptions of its desirability and feasibility, can significantly drive intention. The research finding of Hassan, (2021) also validated that the students in Gilgit-Baltistan might have a more positive attitude towards entrepreneurship due to the region's unique strengths, such as its natural beauty and potential for tourism and eco-friendly businesses. They might see entrepreneurship as a way to capitalize on these resources and create their own success stories. The challenging environment of Gilgit-Baltistan could foster a spirit of innovation and problem-solving among students, making them more open to the entrepreneurial venture as a means to address local challenges and create change. Moreover, the harsh and unpredictable environment of Gilgit-Baltistan might cultivate a sense of resilience and perseverance among students.

The moderation affect shows some contrasting and interesting results. The association between the independent and dependent variables is not strengthened by individualism's moderating influence. The results further validated the appropriateness of the research findings, as the people of Gilgit-Baltistan mostly lived in a combine family system and their culture values are contradictory to the individualistic norms and values. Gilgit-Baltistan, despite its diverse population, might have a relatively low degree of variation in individualistic values compared to other populations studied in research on entrepreneurship and culture. Ali *et al*., (2023). This lack of variation could weaken the ability of individualism to moderate the relationship between the independent and dependent variables. Moreover, the stronger collectivist influence: the culture of Gilgit-Baltistan might be predominantly collectivistic, where family, community, and social norms play a stronger role in shaping individual decisions than individualistic values. This could overshadow the potential moderating effect of individualism. The nature of entrepreneurial opportunities and challenges in Gilgit-Baltistan might not be directly influenced by individualistic values. For example, access to resources, infrastructure, and social networks might be more critical factors than individual preferences for independence and self-reliance.

The research findings also make a practical contribution to the policymakers, the interested individuals and the institutions. The results show the important factors that play an important role for entrepreneurial intention development, particularly in the context of the university students of Gilgit-Baltistan. The research shows a positive relationship between the theory of planned behaviour except for the individualism factor. The results provide new insights for the policymaker to formulate policies based on the research findings.

The following major recommendations are suggested on the base of the research findings and literature study for the government institutions, universities and stakeholders. The university students of Gilgit-Baltistan showed a positive response towards entrepreneurial activities. Based on the research findings, it is suggested that practical entrepreneurial programs should be arranged inside and outside the universities. Moreover, business exhibitions and industrial tours will further enhance the entrepreneurial skills of university students. It is also suggested to develop, implement and teach case studies during their study course. This method will motivate students towards business activities and coping with the challenges. Similarly, business incubators or entrepreneurship development centers should be established.

Unpacking Saudi Family Firm Performance Benefits of Entrepreneurial Orientation, Digitalization, Ambidexterity, and Involvements

Wassim Aloulou
Imam Mohammad Ibn Saud Islamic University, Saudi Arabia

wjaloulou@imamu.edu.sa

Abstract: This study aims to enhance family firm research by introducing contemporary concepts such as entrepreneurial orientation, digitalization, and ambidexterity. It develops hypotheses to examine their impacts on family firm performance, while also exploring the influence of family and generational involvements on the relationship between entrepreneurial orientation and family firm performance. Furthermore, the study investigates the mediating role of innovation ambidexterity in the relationship between entrepreneurial orientation and performance. Using a quantitative approach, this study analyzed data from 256 Saudi family firms through structural equation modeling (SEM). The findings indicate that both firm digitalization and entrepreneurial orientation significantly affect innovation ambidexterity. Additionally, entrepreneurial orientation and innovation ambidexterity have significant impacts on family firm performance. However, firm digitalization does not demonstrate a significant effect on family firm performance. Moreover, innovation ambidexterity mediates the relationship between digitalization (fully) and entrepreneurial orientation (partially) with family firm performance. This research highlights the importance for family firms seeking to combine entrepreneurial orientation with a high degree of digitalization to explore and leverage innovative practices, especially when family involvement holds greater significance than generational involvement. These findings reinforce the notion of revitalizing entrepreneurial orientations by involving new, well-educated generations. The study also calls for further empirical research on the potential of Saudi family firms and their generations to engage in entrepreneurial behaviors, ensuring their sustainability and modernization in the digital era.

Keywords: Entrepreneurial orientation, Innovation ambidexterity, Firm digitalization, Family involvement, Generational involvement, Family firm performance

1. Introduction

Saudi family firms are considered as the backbone of the Middle East's and GCC's economies accounting for an estimated 63% of all businesses in the Kingdom (Adileh, 2022; Ramadani et al., 2023). They are growing during the last decades and the dynamics of their business model are changing (Aloulou, 2018; Aloulou & Alshaeel, 2023; Aloulou, 2023b). They contributed of $216 billion to the GDP of the country, and had employed about 7.2 million people, representing a 52 percent of the total workforce (Alsharif, 2019). These statistics prove how important are family businesses in the Saudi economy. In GEM report of 2018, Saiz-Alvarez et al. (2022) highlighted the prevalence of family businesses in Saudi Arabia over the entire population of the study. There are significant percentages of individuals involved in the ownership and management of family businesses.

92 percent of the family businesses are in major areas of the country with 45% in Riyadh, 28% in Makkah and 18% in the Eastern Province. The largest percentage of Saudi family companies fall under the legal form of limited liability company, as they are more in line with the reality and composition of Saudi families (according to a study by the Business Sector Observatory (Marsad) of the Riyadh Chamber) (Asharq Al Awsat, 2021).

Family businesses contribute more than 800 billion riyals ($213.3 billion) or 32 percent annually to the Kingdom's domestic income and provide many job opportunities for citizens. For instance, the family business sector is vital and plays a prominent role in the development of the national economy in addition to its distinction in the process of localizing national talents of both genders (Saudi Gazette, 2018). More than 80% of the total workers in the private sector work in family businesses, which stresses the need to strengthen and build the capabilities of family businesses, increase their adaptation to the new economic environment imposed by "Vision 2030", and benefit from the promising investment opportunities generated by it.

The mechanisms through which entrepreneurial orientation impacts firm performance remain incompletely understood (Rauch et al., 2009; Kollmann & Stöckmann, 2014; Wales et al., 2021). Potential mechanisms may influence this relationship in a family firm context. To address the potential gap in a such relationship, numerous scholars have investigated the link using several intermediary variables (mostly mediators), such as exploratory and exploitative innovations (Kollmann & Stöckmann, 2014; Wales et al., 2013); innovation and resilience capabilities (Freixanet et al., 2021; Mendoza-Silva, 2021; Aloulou, 2023a); and using several moderators such as family involvement (Aloulou, 2018) or generational involvement (Cherchem, 2017).

This study aims to enhance family firm research by introducing contemporary concepts such as entrepreneurial orientation (EO), firm digitalization (FD), and innovation ambidexterity (INNOVAMBI). It develops hypotheses to examine their impacts on family firm performance (FFP), while also exploring the influence of family (FI) and generational (GI) involvements on the relationship between EO and FFP. Furthermore, the study investigates the mediating role of INNOVAMBI in the EO-FFP relationship.

This study draws on the resource-based view (RBV) and the strategy-conduct-performance framework to examine the mechanisms through which EO influences FFP. It develops a model of EO-capabilities-performance linkages based on a quantitative study design and data from 256 Saudi family firms to simultaneously test the different hypotheses.

The study also calls for further empirical research on the potential of Saudi family firms and their generations to engage in entrepreneurial behaviors, ensuring their sustainability and modernization in the digital era.

The paper is organized into four primary parts. The first part, Section 2, offers an extensive examination of the existing literature on EO, FD, INNOVAMBI, FFP and FI, and GI. This section focuses on the theoretical framework and the development of hypotheses. Moving on to Section 3, the study's methodology is outlined, covering the sampling approach, data collection procedures, measurement instruments for the key variables, and the analysis strategy. In Section 4, the paper presents a comprehensive overview of the study's findings. Finally, the last section delves into a discussion of these findings, emphasizing their implications for theory and practice, addressing research limitations, suggesting potential directions for future studies and concluding with key remarks.

2. Theoretical Background and Hypotheses Development

2.1 Resource-Based View, Information Processing Theory and Organizational Capability Perspective

From the Resource-Based View (RBV) perspective, firms seek unique resources and capabilities to achieve higher performance (Barney, 2001). To foster innovation, firms must continuously develop and integrate their skills and abilities (Teece et al., 2016). Firm resources and capabilities are critical for sustaining competitive advantage. EO is recognized as a strategic resource for family firms to enhance performance (Zhou et al., 2005). From a perspective of organizational capability, innovation ambidexterity enables firms to translate EO into performance outcomes (Kollmann & Stöckmann, 2014; Aloulou, 2023a). Adopting the strategy-conduct-performance paradigm (Aloulou, 2023a; 2024), we investigate the role of innovation ambidexterity as organizational capability in converting strategic orientations into higher performance.

Drawing from the information processing theory, this study explores the influence mechanisms between firm digitalization and performance, building on prior research (Ribeiro-Navarrete et al., 2021; Issah & Calabro, 2024). Firm digitalization involves using digital technology to organize, process, and store data. To achieve long-term success, firms must integrate digital technologies into innovation activities, fostering stronger capabilities and creating growth opportunities (Aloulou, 2029b; Felipe et al., 2020; Cai et al., 2019). Developing higher-order capabilities, such as innovation ambidexterity, is crucial for leveraging strategic resources like EO and lower-order capabilities (technological resources) like firm digitalization (Aloulou, 2023a; 2024; Enrique et al., 2022; Felipe et al., 2020; Zhang et al., 2016; Zhou & Wang, 2021).

2.2 Key Concepts Defined and Linked

2.2.1 Entrepreneurial orientation

EO is a vital concept in entrepreneurship, supported by scholars (Rauch et al., 2009; Runyan et al., 2012). It comprises three dimensions: Innovativeness, Proactiveness, and Risk-taking. Innovativeness involves embracing novelty and creativity to develop new products or processes. Proactiveness enables firms to anticipate and respond to changes, staying competitive. Risk-taking reflects a firm's willingness to pursue activities with potential outcomes, even if failure is possible (Covin and Slevin, 1989; Lumpkin and Dess, 1996).

2.2.2 Firm digitalization

Firm digitalization refers to the integration and utilization of digital technologies and processes within an organization's operations, strategies, and business models. It involves leveraging digital tools such as cloud computing, data analytics, artificial intelligence, and automation to enhance efficiency, productivity, and customer experiences (Hao & Song, 2016; Yu et al., 2017).

2.2.3 Innovation ambidexterity

Innovation ambidexterity is the ability of an organization to balance and integrate both exploratory and exploitative innovation, combining the pursuit of new possibilities with optimizing existing capabilities for long-term growth and adaptation (Raisch et al., 2009; O'Reilly & Tushman, 2013).

2.2.4 Family and generational involvements

Active participation of family members in a family business, known as family involvement, impacts operations and outcomes (Sciascia & Mazzola, 2008). The level of family involvement shapes the direction and success of family enterprises. Generational involvement refers to the number of family generations simultaneously involved as the primary steward in the management of the firm (Cherchem, 2017; Zahra et al., 2007; Alrubaishi et al., 2021).

2.2.5 Family firm performance

Within the field of family business studies, family firm performance refers to the overall effectiveness and achievement of a business that is owned and operated by a family, encompassing financial success, sustainability, and the ability to pass the business to future generations (Williams Jr, 2018). When objective data is scarce, subjective measurements of family firm performance (FFP) have been deemed suitable (Singh et al., 2016). This study emphasizes FFP, which is assessed based on Top Management's satisfaction with firm results and influenced by strategic and technological resources (e.g., EO and FD) as well as firm capabilities (INNOVAMBI).

2.3 Hypotheses Developed

2.3.1 EO and family firm performance

Entrepreneurial orientation (EO) is positively linked to family firm performance, as it enables firms to innovate, take risks, and proactively respond to market changes for an enhanced competitiveness, growth, and sustainability. EO fosters a culture of entrepreneurship in terms of innovativeness, proactiveness and risk-taking, driving family firms towards superior performance outcomes (e.g., Wales et al., 2013; Aloulou, 2018*;* Kallmuenzer et al., 2018). We can state the following:

H1: There is a positive relationship between EO and FFP.

2.3.2 FD and family firm performance

Firm digitalization positively impacts family firm performance by enhancing operational efficiency, improving decision-making, and increasing innovation capabilities and leading to improved financial performance, competitiveness, and sustainability. Digitalization enables family firms to respond effectively to market changes, driving superior performance outcomes (Suder et al., 2022; Ribeiro-Navarrete et al., 2021; Issah & Calabro, 2024). The following hypothesis can be stated:

H2: There is a positive relationship between FD and FFP.

2.3.3 INNOVAMBI- family firm performance

The role of innovation ambidexterity in enhancing firm performance is significant as it allows firms to simultaneously pursue exploratory and exploitative activities. These activities can lead to enhanced competitive advantage, adaptability, and long-term success.

Innovation ambidexterity also positively influences family firm performance and enables them to simultaneously innovate and optimize existing capabilities, leading to improved financial performance, growth, and survival (Van Doorn et al., 2020; Stubner et al., 2012). The following hypothesis can be stated:

H3: There is a positive relationship between INNOVAMBI and FFP.

2.3.4 EO, innovation ambidexterity and family firm performance

EO is positively linked to family firm performance, as it fosters a culture of entrepreneurship, driving family firms towards superior performance outcomes. However, the relationship between EO and performance is not direct; rather, it is mediated by innovation ambidexterity.

The importance of innovation ambidexterity in driving family firm performance is also supported by theoretical perspectives on organizational ambidexterity (O'Reilly & Tushman, 2013).

Innovation ambidexterity plays a crucial mediating role in the EO-performance relationship (Raisch et al., 2009). Innovation ambidexterity allows firms to simultaneously pursue new opportunities and optimize existing capabilities, leading to enhanced performance outcomes.

EO enables family firms to develop innovation ambidexterity by encouraging experimentation, risk-taking, and learning from failures. In turn, innovation ambidexterity enables family firms to translate EO into tangible performance outcomes.

The mediating role of innovation ambidexterity suggests that family firms with high EO are more likely to develop innovation ambidexterity, which ultimately leads to superior performance outcomes. Several studies have emphasized the mediating role of innovation ambidexterity in the EO – (firm, new product…) performance relationship (Kollmann and Stöckmann, 2014; Mirbaha et al., 2019; Huang et al., 2020; Lisboa et al., 2011). We ca advance the following hypotheses:

H4: There is a positive relationship between EO and INNOVAMBI.

H5: INNOVAMBI mediates the relationship between EO and FFP.

2.3.5 Firm digitalization, innovation ambidexterity and family firm performance

Firm digitalization refers to the adoption and integration of digital technologies and capabilities (digital platforms, data analytics…) into the operations and processes of a firm (Gupta et al., 2020). It involves leveraging digital tools, platforms, and data to enhance efficiency, innovation, customer experience, and overall firm performance.

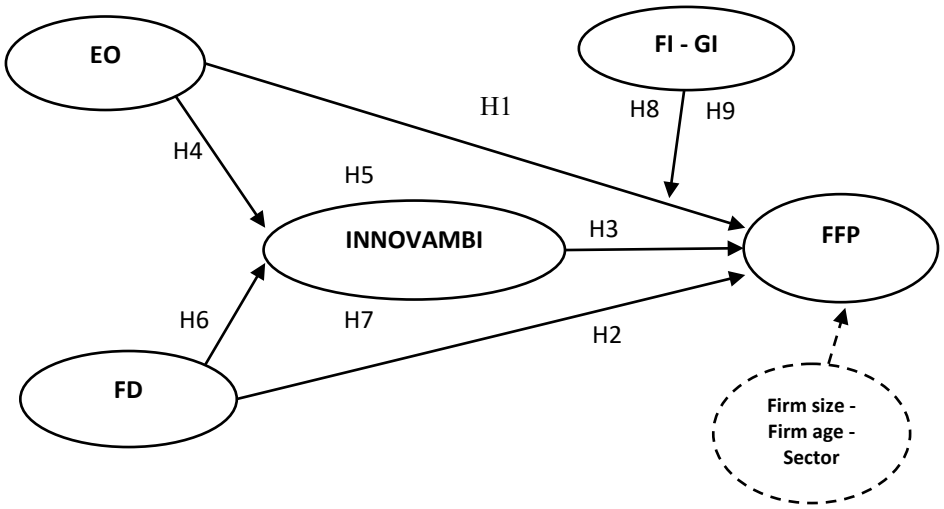
Innovation ambidexterity is critical in the context of firm digitalization because it enables firms to simultaneously explore and exploit digital technologies and opportunities. It also plays a mediating role between firm digitalization and firm performance. In fact, firms that can develop and maintain innovation ambidexterity are more likely to translate the benefits of digitalization into improved financial and non-financial performance outcomes. Innovation ambidexterity allows firms to fully realize the performance benefits of their digitalization efforts (Oduro & De Nisco, 2023; Fengel et al., 2022). From above, we can advance the following hypotheses:

H6: There is a positive relationship between FD and INNOVAMBI.

H7: INNOVAMBI mediates the relationship between FD and FFP.

2.3.6 Moderating roles of FI and GI in the EO-FFP relationship

Several studies suggested that high levels of family involvement strengthened the positive relationship between EO and firm performance in family firms. This may be due to the alignment of family values, long-term orientation, and commitment to the firm's success, which amplifies the impact of EO on performance outcomes (Kammerlander et al., 2020; Arzubiaga et al., 2018). In addition, family involvement can influence the implementation and effectiveness of EO in family firms. Family members' involvement in decision-making processes and in implementing entrepreneurial strategies can shape the extent to which EO is embraced and translated into action. We can state the following hypothesis:



H8: FI moderates the relationship between EO and FFP.

Generational involvement refers to the active participation and influence of different generations within the family firm, including both senior and next-generation family members. The interplay between different generations can have a moderating effect on the EO-performance relationship in family firms. generational involvement can influence the adoption and adaptation of EO strategies. Different generations may have varying perspectives, values, and preferences regarding entrepreneurial activities. Research suggests that next-generation involvement can bring fresh ideas, innovation, and a greater willingness to take risks, which can contribute to the effectiveness of EO in family firms. However, senior generation involvement can provide stability, experience, and resources to support the implementation of EO strategies (Cherchem 2017; Sciascia & Mazzola, 2008). Therefore, other studies stated that family firms with a high degree of generational involvement had a stronger alignment between EO and family goals, leading to improved firm performance (Alrubaishi et al., 2021; Liew & Loo, 2023). From above, we can hypothesize the following:

H9: GI moderates the relationship between EO and FFP.

2.4 Research Model

Figure 1 showed the research model and hypotheses suggesting the influence of EO and FD on FFP through INNOVAMBI.

H1-H4, H6: Direct relationships

H5; H7: Indirect effects (mediation)

H8-H9: Indirect effects (moderation)

Figure 1: Research Model

3. Methodology

3.1 Sampling and Data Collection

This empirical study was conducted among Saudi family firms. To identify them, we selected them from different sources: official sources (national chambers of commerce, and National Center of Family Businesses) and personal sources (social network and personal contacts). Five regions are taken into consideration and main industries: manufacturing, trading and service are covered by this study. Senior and middle managers were selected to be respondents because of their knowledge about the context and topics of the study.

After ensuring the accuracy and appropriateness of the language in the questionnaire, an online version of the questionnaire was set up and a link was generated. Data were gathered during the period from October 2022 to June 2023 with the help of three paid assistant researchers. They helped the researcher disseminate the questionnaire link through emails and social media platforms (e.g., WhatsApp contacts and groups).

Data were collected from 256 family firms. 63% of these firms are from Riyadh and 37% from the other Saudi regions. 42.6% of these firms have one generation, the rest have two or more generations. 40.6% of firms have a percentage of family involvement 5% and high. Most of the respondents are male (87.9%). 36.3% are owner/CEO, 31.6% are departmental executive officers or middle-level managers. 32.4% are members of the board of directors or senior consultant of the firms.

3.2 Measures

We collected the measures of the following constructs using a multi-item five-point scale ranging from 1 (strongly disagree) to 5 (strongly agree):

Entrepreneurial orientation (EO): it is measured with 9 items from Covin & Slevin (1989). EO is conceptualized as a strategic posture that reflects a firm's propensity of innovativeness, proactiveness and risk-taking. The construct was validated in different contexts (Kreiser et al., 2002; Runyan et al., 2012; Dess et al., 2011).

Firm IT/Digital capability (F-IT/DT): it is measured with 6 items adapted from Hao & Song (2016) and Yu et al. (2017). It is referred to as the use of IT/digital technology for facilitating technical and market knowledge creation, for internal and external communication, for marketing and promotion purposes, for moving toward automation or digitalization of processes and for developing new products and/or services.

Innovation ambidexterity (IA): it is measured using 11 items from Zhang et al., (2016). It denotes the capacity of a company to effectively engage in both exploration (learning and acquiring knowledge, technology and skills, product development, management, and markets entirely new to the firm) and exploitation (enhancing product quality, processes, and knowledge; upgrade competences; and expedite product and process advancements to improve overall attributes) activities, maintaining a delicate balance while acknowledging the trade-offs involved. The two dimensions (exploration and exploitation) were measured independently, then added to form a single index for innovation ambidexterity.

Family Firm Performance (FFP): it is measured using 7 items from scales developed and adapted from previous studies (Aloulou, 2019a; 2023a). This measure exhibits subjective attributes to assess performance, incorporates a competitive assessment and addresses the notion of performance over time (Chen et al., 2014; Singh et al., 2016). A sample item is: “The extent to which your firm’s performance during the last 2 or 3 years, relative to all other competitors, our profitability has been substantially better” from “Much below the average” to “Much above the average”.

Family Involvement (FI): is measured as the share of family executives in top management (i.e., dividing the number of family top managers by the total number of top managers), aligning with prior research approaches (e.g., Minichilli et al., 2010; Sciascia et al., 2013; Sciascia & Mazzola, 2008; Zahra et al., 2007; Kammerlander et al., 2020)

Generational Involvement (GI): it is measured by involving a clear and straightforward question to respondents: "How many generations are presently involved in business management and strategic decision-making?" Respondents can indicate a single generation, two generations, or multiple generations (three or more) in consistency with previous studies (e.g., Cherchem, 2017).

Control variables: firm size, firm age and sector of activity are the control variables used in this study. (Aloulou, 2018).

3.3 Analysis Strategy

In our study, we employed SPSS software for an exploratory factor analysis (EFA) to uncover underlying latent factors. Subsequently, with AMOS software (version 21.0) a confirmatory factor analysis (CFA) was conducted to refine and empirically validate the measures and a structural equation modeling (SEM) analysis with maximum likelihood estimation (MLE) was used to test simultaneously the hypothesized relationships in the conceptual model.

3.4 Common Method Bias

Given that this study relied on self-reporting for all variables, the potential issue of common method bias was considered. Following MacKenzie and Podsakoff's (2012) approach, Harman's one-factor test was performed to assess common method bias. The results revealed that 5 factors were drawn out and the largest factor explained 26.716% (<50%) of the total variance. No single factor accounted for a majority of the total variance, indicating the absence of common method bias. To further examine the measurement model, a confirmatory factor analysis (CFA) was conducted, comparing a multifactor model to a single overall latent factor model. The fit indices for the multifactor model [x2/DF = 1.318; RMR = 0.047; CFI = 0.965; TLI = 0.961; GFI = 0.877; RMSEA = 0.035; NNFI = 0.870] demonstrated significantly better fit compared to the one-factor model [x2/DF = 6.216; CFI = 0.400; TLI = 0.360; GFI = 0.407; RMSEA = 0.143; NNFI = 0.363]. These results indicate that common method bias is not a significant concern in this study.

3.5 Reliability and Validity of the Measurement Model

The reliability and validity of the constructs are examined. The findings of the exploratory factor analysis reveal that the factor loadings are significant and higher than 0.5, the KMO index is higher than 0.6 and the constructs are reliable with Cronbach’s Alphas exceeding 0.7 and composite reliability indexes exceeding 0.84. Convergent validity is also demonstrated with an average variance extracted (AVE) higher than 0.5 for each construct. The discriminant validity also was demonstrated. The square root of the AVE estimated for each construct is verified to be greater than the correlation between that construct and all other constructs in the model (Hair et al., 2019).

The descriptive statistics show significant and positive correlations among main variables (independent, mediator and dependent). Significant and positive correlations were found between control variables (Firm size and firm age) and EO, FFP and generational involvement. Discriminant validity was demonstrated and

showed that the values of square root of the AVE are superior to values of correlations between constructs (Fornell & Larcker, 1981).

4. Results

After checking for the model fit [x2/DF = 1.245; RMR = 0.065; CFI = 0.963; TLI = 0.959; GFI = 0.864; RMSEA = 0.031; NNFI = 0.841], the findings indicate that both FD (estimate = 0.250***, p<0.001) and EO (estimate = 0.123**, p< 0.01) significantly affect INNOVAMBI. Thus, hypotheses H4 and H6 were supported. Additionally, EO (estimate = 0.337***, p < 0.001) and INNOVAMBI (estimate=0.211**, p < 0.01) have significant impacts on FFP. Hence, hypotheses H1 and H3 were supported. However, FD does not demonstrate a significant effect on FFP (estimate= 0.055, p=.290) and hypothesis H2 was not supported. Moreover, we followed the recommendations of Zhao et al., (2010) to test the mediation hypotheses and used the bootstrapping technique to observe the indirect effects of EO of FD on FFP. The results showed that INNOVAMBI mediates the relationship between FD (fully) and EO (partially) with FFP. Consequently, hypothesis H5 was partially supported and H7 was fully supported.

Therefore, FI moderates the relationship between EO and FFP (estimate of the interaction = 0.108*, $p < 0.01$) while GI did not moderate this relationship (estimate of the interaction = 0.116, $p = 0.079$). Hypothesis H8 was supported and hypothesis H9 rejected. Merely, GI can moderate this relationship for p <0.1. This result may be considered with precaution. The significant interactions should be probed to explore how the relationships change at different levels of the moderators.

5. Discussion, Implications, Limitations, and Future Perspectives

This paper examines the relationship between EO and FFP, as well as the relationship between FD and FFP, with a focus on the mediating role of INNOVAMBI. The study highlights the complementary roles of EO and FD in enhancing the ability of family firms to balance exploration and exploitation activities, leading to improved performance. The strategic orientation associated with EO and the technological resources associated with FD enable Saudi family firms to explore and experiment with new digital technologies and business models, while also exploiting digital capabilities to drive innovation and performance. The findings indicate that Saudi family firms consider the unique characteristics of the family (family members, relying on new well-educated generations) in guiding their strategic choices, utilizing digital technologies, and pursuing simultaneous exploration and exploitation to achieve superior performance.

The theoretical implications of the study are twofold. Firstly, the research goes beyond previous studies that focused on individual antecedents to ambidexterity by considering EO and FD in the research model. Secondly, the study contributes to the literature on EO, FD, and INNOVAMBI by providing insights into the mediating role of INNOVAMBI in the relationships between EO and performance, as well as FD and performance. The study demonstrates that INNOVAMBI serves not only as a balance between exploration and exploitation but also as a mechanism through which strategic and technological resources can translate into enhanced performance.

From a practical standpoint, the findings have important implications for family firm managers. Family firms pursuing exploration and exploitation activities from an INNOVAMBI perspective should be mindful of their strategic (EO) and technological (FD) resources. The study suggests that INNOVAMBI serves as a suitable mechanism for family firms to simultaneously leverage the benefits of EO and FD to enhance firm performance.

However, the study has several limitations that suggest potential avenues for future research. Firstly, it highlights the importance of investigating the interaction between EO and FD and their impact on INNOVAMBI as an organizational capability. Future research could delve deeper into this interaction. Secondly, the use of cross-sectional data limits the ability to establish causal relationships between EO, FD, INNOVAMBI, and performance. Future research could adopt longitudinal designs to examine the effects of EO and FD on INNOVAMBI and performance over time.

6. Concluding Remarks

In summary, this study examines the factors influencing innovation ambidexterity (INNOVAMBI) and its impact on firm performance. It emphasizes the simultaneous effects of entrepreneurial orientation (EO) and firm digitalization (FD) in developing INNOVAMBI. Additionally, it demonstrates how innovation ambidexterity serves as a valuable mechanism for firms to leverage their unique resources and achieve superior performance. By shedding light on the intricacies of innovation ambidexterity and its performance outcomes,

this research contributes new insights to the field. It also advances our understanding of the mechanisms underlying the relationships between EO-performance and FD-performance. It also builds the basis for undertaking further research comparisons between Saudi family and non-family firms to test these two key relationships.

Abstract: The European Union's Green Deal and the United Nations' 2030 Agenda are key strategic frameworks that aim to transform all nations towards a climate-neutral continent. At the heart of achieving this ambitious goal is the need for greater policy coherence, particularly concerning the digital Green Deal. The adoption of digital technologies in green sustainability initiatives requires a comprehensive update of existing policies to properly exploit all the opportunities offered by digitalisation. This study focuses on identifying constraints to environmental and digital advancement in the agri-food sector. In particular, it examines existing policies and those that need to be implemented to facilitate the green and digital transition of agri-food enterprises. The research methodology comprises in-depth, semi-structured interviews with fifteen (15) policymakers at the national, regional, and local levels in Greece, all of whom are responsible for decision-making in the agri-food sector. The findings underline the need for a substantial reform of the current institutional framework to make it more favourable to agri-food enterprises, especially for very small enteprises and SMEs, for whom the barriers are even greater. Improving access to financial support is also highlighted as a critical need. To ensure a smooth twin transition towards environmental sustainability and digitalisation, the study advocates improving the educational background and promoting digital literacy among stakeholders. These measures are considered necessary to increase the competitiveness of agri-food enterprises in today's global landscape. The study essentially highlights the central role of a strong policy framework for the environmental and digital transition of the agri-food sector. By addressing the barriers identified in the study through the implementation of appropriate policies, agri-food entrepreneurs can adopt sustainable practices and harness the transformative potential of digital technologies.

Keywords: Agri-food sector, Policies, Sustainability, Green transition, Digitalisation

1. Introduction

Alongside the exceptional crises, it is imperative to acknowledge the pivotal role of climate change and its tangible, particularly evident impacts across the globe in recent times. Furthermore, the rapid advances in technology and the subsequent digital transformation brought about by the 4th Industrial Revolution need to be taken into account (Apostolopoulos et al, 2021; Pistikou et al, 2023). The European Green Deal is an ambitious initiative by the European Union (EU) to achieve climate neutrality by 2050 in full compliance with the 17 United Nations Sustainable Development Goals and the Paris Climate Agreement (European Commission, 2017; Castillo-Díaz et al, 2023). This agreement has promoted the transition to a sustainable and circular economic model, supporting the use of clean energy sources and the adoption of green practices in all sectors of the economy (Agoraki et al, 2023; Apostolopoulos et al, 2023; Paris et al, 2023), including the agri-food sector. The integration of digital technologies in agriculture, such as precision agriculture and production monitoring systems, have been central elements of this strategy (European Commission, 2019).

The green and digital transformation of the agri-food sector has been a key issue in efforts to ensure sustainable and resilient agri-food systems (Saviolidis et al, 2020). However, this transition is not without challenges and obstacles that affect the effectiveness and efficiency of the initiatives involved. Despite the recognition of the importance of digitalisation, access to advanced technologies has remained limited in many areas, particularly in rural areas (Ferrari et al, 2022). This weakness is due to a number of factors. First, the financial difficulties especially of very small and small-medium agri-food enterprises make it difficult to invest in new technologies (Klerkx et al, 2019). Funding is therefore a critical factor. Despite increased investment in Research and Development (R&D), the financial resources available to support agri-food enterprises toward green and digital transformation has been insufficient (Cao et al, 2021). The lack of investment incentives and

the high cost of the initial investment required for digitalisation and the implementation of sustainable practices act as a deterrent.

The institutional framework has been an equally important barrier (Apostolopoulos et al, 2020; Liargovas et al, 2017). In many cases, regulations are not in line with the needs of modern agriculture and technological progress. The lack of coherent policies and control mechanisms and the complexity of bureaucratic procedures make it difficult to implement innovative solutions (Long et al, 2016; Apostolopoulos et al, 2021; Makris et al, 2024). The role of the new Common Agricultural Policy (CAP) is to support the agri-food sector towards environmental sustainability, climate change mitigation, and increased digitalisation. By incorporating practices that reduce greenhouse gas emissions and increase resource efficiency, the CAP aims to create a more sustainable and resilient agri-food sector (European Commission, 2021; European Commission, 2023). However, a shift from traditional to contemporary techniques necessitates not just financial resources for procuring new equipment but also the provision of adequate education and training in its application. The traditional culture and established habits of many farmers have acted as a barrier to the adoption of new practices, as they are unfamiliar to them (Apostolopoulos et al, 2023; Gemtou et al, 2024).

By examining the perspectives and experiences of 15 policymakers in the agri-food sector, we add knowledge and strengthen the academic literature on the challenges faced by agri-food enterprises in adopting green and digital practices in Greece. Although the global interest in this topic is huge, there is a lack of research in the literature considering the policymakers' side. The question that this research aims to answer is the following:

- What are the challenges faced by agri-food enterprises in their green and digital transition efforts?

The framework of our survey is the following. The introduction of the environmental and digital framework in the agri-food sector follows the literature review based on the scientific papers on green and digital practices of agri-food enterprises. Then, we outline our methodological approach. Next, we analyse and discuss our findings, and finally, we present the conclusion, the limitations, and future research.

2. Literature Review

The existing literature has identified research conducted on policy measures designed to support agri-food enterprises in a green and digital transition in line with the Sustainable Development Goals and the European Green Deal (Apostolopoulos et al, 2018; Stein & Santini, 2022). However, further research is required to enhance support to the agri-food sector in this twin challenging transition. The present research examines the perspectives of various stakeholders, including state, regional, and local actors, on the challenges faced by agri-food enterprises in Greece in adopting digital technologies for environmental sustainability.

Enabling the introduction of digital technologies is one of the promising ways to ensure sustainable development (Bohnsack et al, 2022; Deirmentzoglou & Deirmentzoglou, 2022). The utilisation of digital technologies in the agri-food sector has the potential to significantly reduce environmental impacts. This can be achieved by decreasing the consumption of natural resources, lowering pollutant levels, and cutting CO2 emissions. This shift in approach fosters long-term sustainability of the agri-food enterprises in line with environmental and social advantages. Research emphasizes the positive contribution of digital technologies in achieving more sustainable production and consumption processes (Mäkitie et al, 2023). The successful adoption of these technologies depends on the socioeconomic context and the presence of policy support measures (Barrett et al, 2020; Carayannis et al, 2020; FAO, 2022).

The EU has incorporated digital measures into its agricultural policies in response to concerns about environmental impact (Venghaus & Hake, 2018). The recent CAP reform has allocated 40% of the budget for the promotion of climate- and environmentally-friendly agricultural practices for the period 2023-2027 (European Commission, 2023). Despite these efforts, EU agriculture continues to have negative impacts on the environment. Doukas et al. (2023) found that "green" payments incentivize agri-food enterprises to adopt new technologies like renewable energy sources (RES) and smart agriculture. However, Slätmo (2019) noted that more stringent environmental sustainability policies may hinder the economic development of rural agri-food enterprises. Meeting EU criteria for environmental, social, and governance (ESG) requirements can be stressful for agri-food small-medium enterprises, as highlighted by Jónsdóttir and Gísladóttir (2023). Despite the prevalence of initiatives aimed at promoting positive impacts, there is currently no compelling evidence that ESG-focused portfolios outperform traditional ones. The development of a unified sustainable economic classification framework remains a challenge (Zairis et al, 2024).

The Greek agri-food sector is currently unable to undergo the long-awaited transformation. This impediment can be described as the 'triangle of stagnation'. The three sides of the triangle correspond to three key factors: the low level of education that characterises the workforce, the low level of investment in the agri-food sector, and the slow transition to digitalisation compared to most European countries (Paris et al, 2023). In particular, the majority of Greek farmers and producers (approximately 97%) have gained their experience in the field, while a minority (approximately 3%) have received basic training from accredited organisations (Doukas et al, 2022). Only a small number have received full agricultural vocational training after successfully completing integrated training programmes of at least two years' duration. Furthermore, the transition towards digitalisation and innovative production processes is slow and cautious. For example, the European Knowledge and Innovation System (AKIS) has identified the Greek system as being characterised by a lack of coherence and fragmentation (O'Flynn et al, 2018). Another research by Tsilika et al (2020) has shown how Greek SMEs are using improvisation and creativity to innovate in a challenging environment.

3. Methodology

The main purpose of this study was to explore the perspectives and experiences of executives responsible for developing and implementing policies that support the viability and sustainability of the agri-food sector. The interaction between the researcher and the research participant plays a pivotal role in interpreting the participant's experience (Ponterotto, 2005). In light of the research objective, the phenomenological approach, which entails the detection of the perspectives of policymakers in the agri-food sector and the selection of an interpretative contour, namely an in-depth comprehension and interpretation of their personal perceptions, beliefs and experiences, serves to inform the choice of qualitative research (Fossey et al, 2002). Qualitative research enables an understanding of the entrepreneurial phenomenon within its specific context (Van Burg et al, 2020) while also elucidating and explaining the complexity of entrepreneurial actions (Drakopoulou-Dodd et al, 2014).

The purposive sampling technique was used to approach specific stakeholders relevant to the subject (Kenny & Duckett, 2003). The sample size was carefully chosen to ensure it accurately represented individual characteristics, based on the principles of relevance and adequacy (Polit & Hungler, 1999). We conducted semi-structured interviews to gather qualitative data from fifteen executives representing state, regional, and local authorities in 2023. The interviews, conducted in Greek, the native language of the participants. Both telephone and online interviews were used, as research indicates that data collected via these methods are as reliable as face-to-face interviews (Apostolopoulos et al, 2021). Before the interviews, the interviewees were fully informed about the research objectives and assured of their anonymity.

We used content analysis to examine the research data (Bengtsson, 2016). After reading the transcripts, we identified sub-themes and we produced a report for sub-theme interpretations. Saturation was reached when no new concepts were extracted (Guest et al, 2006). We identified three sub-themes related to a specific theme:

- Institutional framework
- EU & national support
- Educational background

4. Data Analysis

In accordance with the interpretative framework, our research question was formulated for the policymakers of the agri-food sector. The data analysis was conducted in the native language of the survey participants to avoid ambiguity (Temple & Young, 2004). The emerging sub-themes regarding the research question were recorded and captured in Table 1. Then, the creation of categories was specified in detail. Combining the interview results with previous literature added value, and validity to the research findings (Flick et al, 2004).

Table 1: Emerged sub-themes regarding the main theme

Theme	Sub-themes	Summary
Green and digital transition of agri-food sector	Institutional framework	Bureaucracy Environmental regulation
	EU & national support	Financial instruments
	Educational background	Re-skilling, up-skilling Lifelong learning

5. Findings

The findings were structured based on the three emerging sub-themes: i) institutional framework, ii) EU & national support and iii) educational background.

- Institutional framework

The institutional framework is often challenging, characterised by complex procedures and significant bureaucracy that discourage investment. Nevertheless, recent efforts to digitise public sector services are promising steps towards simplification. Although perfect environmental practices are still a work in progress, it is essential to implement and monitor the institutional framework through robust control mechanisms.

> *'… The necessity for a novel institutional framework, the streamlining and digitisation of procedures, the implementation of additional measures accompanied by financial instruments and incentives, and the prioritisation of environmental protection are all evident…' (R7)*

> *'I believe that the European Union has established a regulatory framework for the environmental framework, and that the directives adopted by national legislation are sufficient. Of course, it is not enough to have the institutional framework, but it must be implemented and there must be control mechanisms to confirm it…' (R9)*

- EU & national support

In light of the ongoing climate crisis and the European Green Deal's objective of achieving climate neutrality by 2050, it is of paramount importance that agri-food enterprises align themselves with this goal. The parallel increase in the world population calls for the agri-food sector to increase its production in the coming years in order to ensure food security. It is of the utmost importance that the increase in production is achieved through environmentally friendly practices, such as the prudent and sustainable management of resources and the reduction of energy and water consumption. This will ensure the sufficiency and quality of the product and protect the environment. The adoption of new technologies is key to achieving these objectives. The green and digital transition of the agri-food sector requires cooperation between the EU and the state to provide appropriate financial support.

> *'... The Common Agricultural Policy (CAP) represents the primary European policy initiative for the agri-food sector. In order to advance sustainability and environmental protection, the CAP should provide subsidies and funding for practices that promote these objectives…. The CAP and Rural Development Programmes place great emphasis on the role of investment in new technologies and agricultural innovations in facilitating the transition to a more digitised agricultural sector..' (R1)*

It is evident that each state must adapt European policies to its own needs and develop national action plans.

> *'… Careful planning and strategy are needed at national level, in line with the new CAP and green growth. So we will slowly move forward with careful steps towards innovative products, new technologies, innovation, and intelligent agriculture.' (R8)*

> *'… Two major regions of Greece (Macedonia and Peloponnese) are going to face significant challenges due to the closure of all lignite plants by 2030. In this direction, the Just Transition Programme has been created to support these regions through very high aid rates for green, digital, and just transition-oriented investments.' (R5)*

All global crises to date have had a significant impact on societies. The pandemic crisis, in particular, has compelled countries across the globe to accelerate the green and digital transformation of enterprises, with the aim of ensuring their long-term sustainability and competitiveness.

> *'... In the midst of a pandemic, the Recovery and Resilience Fund (RRF) was established a a pivotal financial instrument.... for the implementation of investments in the agri-food sector with a focus on green and digital transformation...' (R4)*

However, many times the financing environment for a prospective investor or entrepreneur of an agri-food enterprise is not friendly.

> *'It is recommended that the Greek state facilitate entrepreneurship by providing subsidies and loans for the implementation of sustainable practices and the development of digital infrastructure. It is unfortunate that many entrepreneurs encounter difficulties in accessing bank loans due to the high interest rates or the requirement of excessive collateral. This highlights the challenging financing environment that entrepreneurs face... There are a lot of delays in payments...' (R13)*

- Educational background

The fact that we are at the beginning of a very large and rapid transition means that it is important to implement a continuous programme of education and retraining for farmers-entrepreneurs so that they are able to meet the challenges of this transition and remain competitive at the international level.

> *'...it is essential to link research with application in the production process. University curricula need to be updated and vocational training programmes for farmers and retraining increased'. (R1)*

> *'...strengthen the Young Farmers Programme so that more young people can join it, be trained in new farming practices and technologies and be able to participate in networks sharing knowledge and experience that promote the sustainable and digital development of the agri-food sector'. (R6)*

It is essential to ensure that this knowledge is kept up to date, which is a key aspect of lifelong learning.

'It is my opinion that farmers should engage in lifelong education and training in order to remain informed about new farming practices and modern production processes. This is essential for the sustainability of both production and the enterprise...' (R9). The integration of precision farming, for example, into the daily operations of agri-food entrepreneurs represents a significant challenge, given the constant emergence of new technological developments.

> *'... Modern production demands specialized knowledge and a highly skilled workforce. The transition to a new technological era necessitates up-skilling, re-skilling, and continuous education of human resources, with a focus on enhancing digital and green skills. Implementing effective human resource policies is crucial to ensure the creation of quality jobs in agri-food enterprises...' (R8)*

> *'....producers should seek education and specialisation, which presents a challenge for us as well as for ourselves, who prepare the background they need to know. There are fast-track specialised seminars, public schools, in cooperation with institutions such as the Regions, which cover a significant number of the current issues and challenges of the future...' (R2)*

6. Discussion

This research examines the challenges faced by agri-food enterprises in Greece in adopting green and digital practices in a constrained framework characterized by ongoing crises and climate change. Despite significant obstacles, the green and digital transition of the agri-food sector is necessary and, with the coherent European and national policies, will be possible. To facilitate this transition, governments, regional and local authorities must work together to develop a favourable institutional framework that support this twin transition. The current system suffers from dysfunctionality and excessive bureaucracy, hindering agri-food enterprises from pursuing innovative and further environmentally friendly development paths. This is in line with other previous research, like Liargovas et al (2017), Slätmo (2019), Apostolopoulos et al (2021), and Makris et al (2024). We emphasize the need to revise the institutional framework to better align environmental policies with the needs of the agricultural community. This is crucial with the upcoming European performance certification procedures for agri-food enterprises, requiring adherence to ESG criteria (Jónsdóttir & Gísladóttir, 2023). Additionally, our research indicates that it is essential to implement and monitor the institutional framework

through robust control mechanisms, to ensure compliance with the extra environmental standards (Saviolidis et al, 2020).

Concurrently, the implementation of financial incentives and the provision of financial instruments can facilitate the alleviation of economic constraints (Patsoulis et al, 2022). Our study highlights financial instruments in support of digital practices in agri-food enterprises. Despite available funding for environmental initiatives, they have not led to significant changes. De Schutter et al. (2020) suggested that the EU can provide financial support through the CAP, but support strategies are not comprehensive. Large producers receive priority, leading to issues in sustainable land management. Very small to medium-sized agri-food enterprises face difficulties in accessing subsidies due to the strict eligibility criteria in place. Overcoming technological barriers requires investment in education and training for farmers, as well as infrastructure development to support the adoption of new technologies. Research conducted by Ellis and Moarif (2015) indicated that enhancing education and up-skilling of entrepreneurs is of paramount importance for the cultivation of sustainable knowledge for green entrepreneurship in agriculture. Furthermore, it is vital to cultivate a green culture among citizens through information events, with the aim of increasing awareness of the polluting emissions associated with food production.

7. Conclusion

Our research contribution adds important insights to the literature on the emerging topic of the green and digital transition of the agri-food sector which is not only a technological or economic challenge but also a social challenge that requires the cooperation of all stakeholders. Incentives for this twin transition include policy measures to simplify procedures and reduce bureaucracy; financial support like subsidies, loans, tax exemptions; educational opportunities such us training, up-skilling and lifelong learning; and technological support for R&D and access to new technologies. The recent energy crisis has exploded the energy costs of agri-food enterprises prompting the search for alternative energy sources. The introduction of digital tools, automated systems and RES can increase the efficiency of crop and food production and reduce operating costs. In addition, social incentives to promote the circular economy and protect natural resources, are crucial. The coherent implementation of support policies can facilitate the twin transition, resulting in significant benefits for agri-food enterprises and contributing to their sustainability and environmental protection.

8. Limitations and Future Research

This research focused on the views of the policymakers regarding agri-food enterprises in Greece. Future research should involve cross-verifying data from agri-food entrepreneurs to ensure validity and take a holistic approach. It is important to understand how the sustainable practices will lead to a long-term viability and a resilient plan for the agri-food enterprises. Also, further research should include cross-country analysis taking into account the diverse cultural, socio-economic, and regulatory contexts.

Acknowledgments

The authors would like to thank the Laboratory of European Sustainable Development Policies and the Greek Public Electricity Enterprise (DEI) for their support.

Abstract: In many areas of rural Greece there exist remnants of traditional stereotypes that were socially constructed in closed societies where the institution of the patriarchal family previously reigned and are regenerated by the dominant culture. These stereotypes have shaped over time the perception that long-term care for older adults should be provided within the family structure and exclusively by family members. Notably, it was previously considered a disgrace in Greek rural society if children moved their parents to a residential or nursing home. Public or other care facilities for older people emerged just two decades ago, except a few led by the church. However, these attitudes have been softened in recent years. European and National funded programmes have shaped different notions towards long-term care in these areas. This was facilitated by the structural changes that occurred in the Greek countryside in combination with the existing low birth rate in these areas and the presence of concrete migratory flows. The present study explores the business environment that is being formed and its potential to unleash the productive forces that have pinned down the relevant residual stereotypes. It also examines the socio-economic impact of the above enterprises on rural areas. Qualitative interviews were conducted with eight entrepreneurs who have invested in rural long-term care settings for older persons and eight elected chairpersons of local councils. Our findings indicate that regardless of financial support towards private care entities for older people, in order for the services offered to take a more prominent social role, the development of local consensus and innovative interventions is required in tandem. If achieved, such care providers can contribute to the socio-economic development of rural areas. This study provides international literature with further evidence on the crucial role of such enterprises on supportiveness towards inhabitants' quality of life improvement while results can be useful for Greek and European decision-making centers as well as potential rural entrepreneurs.

Keywords: Entrepreneurship, Long-term care, Older people, Rural areas, Stereotypes

1. Introduction

One of the most crucial issues globally at the moment from various point of views is the ageing of the population. It is also the main reason for the problematic demography of many developed societies (Rudnicka et al, 2020). European populations are ageing rapidly compared to other regions worldwide (Grundy et al, 2017), a situation most pronounced in Greece (Camarero et al, 2019). The percentage of the Greek population aged 65 or over is expected to increase during the next decades (Kollia et al, 2018). The result of this, in the context of rural depopulationis leading to failures in the provision of certain services (Anastasiou et al, 2021). Considering that the biggest share of older adults is settled in countryside villages, most living alone (Kouvatsou et al, 2020), the need for care services is only going to increase (Jakovljevic et al, 2021). In this regard, the large percentage of population ageing in the non-metropolitan areas is related with significant social inequalities and exclusion, high number of single-person households and increasing health and care needs, with consequences for the rural residents' welfare and quality of life (Babatsikou et al, 2017). This situation exacerbates health inequalities between older residents of rural areas and their urban counterparts (Apostolopoulos et al, 2020). Meanwhile, changes in the average Greek family structure attributed to increasingly complex family attributes and new living standards (Anastasiou and Duquenne, 2020), are significantly increasing the demand for care services, moreso than other EU countries (Jakovljevic et al, 2021; Karagiannaki, 2005). The major trends in the above context significantly impact the rural long-term care sector, largely due to the fact that most care providers for older people operate near to urban centres (Prouskas et al, 2021). Despite the existing challenges of rural environment, all demographic statistical rates reveal that long-term care facilities will inevitably need to be developed more in the future. Across Europe, long-term care services are mostly offered to older populations through a combination of public and private entities and certain non-profit organizations (European Commission, 2021). The major differences between Northern and Southern EU countries as far as formal and informal care for older persons in terms of family and friends catalytic role and its contribution to the coverage

of the needs for care related to older adults (Lyberaki and Tinios, 2018). Concurrently, rural regions of Greece are characterized by fewer entrepreneurial opportunities (Thomakis et al, 2022), inadequate healthcare access (Anastasiou, 2020), low quality of public healthcare provision (Apostolopoulos et al, 2022), limited access to high-skilled workforce (Vlachou et al, 2021), problematic rural economy (Papadopoulos et al, 2019) and barriers to many others dimensions of rural development. The latter are mostly related to the high level of sovereign debt, consequences of the financial crisis 2009 and austerity policies imposed by the government (Apostolopoulos et al, 2019). In this respect, healthcare and entrepreneurship have been found to enhance rural development (Khalid et al, 2021) and strengthening rural community resilience (Farmer and Kilpatrick, 2009). Finally, as a result of the Covid-19 pandemic, more challenges have emerged for Greek non-metropolitan areas in this crucial sector, with one of the lowest resident-to-bed ratios with regard to long-term care in the EU (European Commission 2021).

This study examines the extent to which the existing long-term healthcare provision in rural Greece are ready to meet the ever-increasing demand for care services towards older adults. In doing so, it will consider the role of stereotypes, the impact of European funds and the potential value of relevant private care providers in supporting rural socio-economic development. In addition to the above goals, it seeks to explore the innovative practices implemented by enterprises in this sector.

2. The Greek Rural Long-Term Care Field

In Greece, the demand for long-term care services for older people exceeds the supply (European Commission, 2018). The institutionalized system of long-term care for the older adults is fragmented and responsibilities are distributed among many institutions including the Ministry of Health, social welfare, insurance organizations and local self-administrative authorities. Most of the existing rural long-term healthcare facilities for older people are the result of European financial programs. Over previous decades there has been a transformation of rural Greece through modernizing the past reliance on anagricultural economy (Kizos, 2018). However, they continue to be characterized by a small and ageing population due to youth outmigration to urban areasexacerbated by the low quality of living conditions in rural settlements (Kotsamanis, 1990). However, based on recent resettlement of economic migrants, the characteristics of Greek rural territories are changing, thus solving the problem of human resources faced by many established rural businesses (Anastasiou et al, 2021). These changes have created a new environment with business opportunities that are not only oriented to the primary or secondary sector but also to the tertiary sector (Lambrinidis, 2004). In addition, the above-mentioned process has been greatly helped by the transport networks, telecommunications and internet networks as well as by the digital transition systems that have expanded in rural areas and created business opportunities (Townsend et al, 2013). Certain greek rural health providers such as rehabilitation & recovery centers as well as medical diagnostic centers utilised the technological dynamics in the field towards open innovation practices (Apostolopoulos, Makris, and Stavroyiannis, 2023)

The case of older adults is indicative of the extended changes taking place in rural areas. Families in rural Greece retain patriarchal characteristics, including the obligation of children to take care of their older parents themselves, in their own homes. It was considered a disgrace in Greek rural society as well as in other societies of Southern Europe (Jakovljevic et al, 2021) if children removed their parents to a nursing home. Moreover, only the church provided such care in rural areas.

3. Methodological Approach

3.1 Methods and Materials

Semi-structured qualitative interviews were conducted (Paunović et al, 2024) with eight business owners/COOs of relevant enterprises active in the field and eight elected chairpersons of local councils. Interview topic guides focused ontheir views and experiences as regards the current status of long-term care in rural Greece, its evolution in relation to the addressing of stereotypes, the respective impact of those enterprises in socio-economic development, and the influence of EU funding. The research team adopted a combination of convenience and purposive sampling in order to recruit relevant participants (Gregory and Austin, 2020). Respondents were based throughout Greece, with a focus on rural locations.

Table 1 : Description of the study sample

R	Status	Characteristics
R1	Entrepreneur	Private nursing home
R2	Entrepreneur	Private residential care home
R3	Entrepreneur	Care services for older persons
R4	Entrepreneur	Private nursing home

R10	Elected chairperson of local councils.	Mountain community of the Region of Western Greece
R11	Elected chairperson of local councils.	Mountain community of the Region of Epirus
R12	Elected chairperson of local councils.	Mountain community of the Region of Thessaly
R13	Elected chairperson of local councils.	Mountain community of the Region of Western Macedonia
R14	Elected chairperson of local councils.	Mountain community of the Region of Macedonia
R15	Elected chairperson of local councils.	Mountain community of the Region of Sterea Ellada
R16	Elected chairperson of local councils.	Mountain community of the Region of Eastern Macedonia and Thraki

3.2 Data Analysis

At first, the semi-structured interviews were analysed separately, followed byan inductive approach using a comparison strategy (Yin,1994). Subsequently, emerging themes and sub-themes were identified, respectively (Gioia et al, 2013). The coding and category creation (Table 2) were captured in detail (Krippendorff, 2018). In order to facilitate comparisons between sections (Strauss and Corbin, 1990) there was a percentage weighting by the coding group of agreement or disagreement (Hayes & Krippendorff, 2007).

Table 2 : Emergent themes and sub-themes.

Theme	Sub-theme	Highlights
Predominant rural perceptions of long-term care entrepreneurship	Residual stereotypes Migrant informal caregivers Care for older people provided by church institutions Care for older people provided by public facilities Care for older people provided by private companies	Past stereotypes have been mitigated without being eliminated Informal migrant caregivers of older people largely meet existing needs in rural areas There exist several church-based care settings for older people Public and municipal bodies provide care at home for older people Private rural care enterprises for older people have found a fertile ground for growth
Private entrepreneurship in long-term care & rural civil society	Information and communication channels Social consensus The role of local elected officials	Lack of information Social consensus is crucial for the development of long-term care entrepreneurship The role of local elected chairpersons is vital.
The impact of long-term care enterprises in rural areas	Socio-economic challenges Unleashing productive forces Quality of life of older adults	Socio-economic development Reducing the impact of stigma Improving older people's living conditions Participation of family members involved in eldercare within the operational process

Theme	Sub-theme	Highlights
Innovative interventions by long-term care providers	Innovative services in home care for older people Innovative interventions in the facilities of long-term care enterprises	Serving the older adults Quality of life Improving user experiences

4. Findings

The findings were grouped on the four themes identified in Table 2: Predominant rural perceptions of long-term care entrepreneurship, Private entrepreneurship in long-term care and rural civil society, The impact of long-term care enterprises in rural areas and Innovative interventions by long-term care providers.

- Predominant rural perceptions of long-term care entrepreneurship

Respondents perceived that the stereotypes that the older adults should be cared for exclusively in the home by a family member have been significantly eroded. As a phenomenon it continues to exist to a limited extent.

> *"A lot have changed in the villages. The rationale logic that a family member, usually the woman, would devote part of her life to caring for older individuals in the family has to some extent been overcome. The search for alternatives is a real issue".R4*

For some years, women migrants largely solved the problem of caring for older people in the countryside, for a fee, while also contributing to the mitigation of stereotypes. However, the number of migrant women caring for older persons was seen to bedecreasing and as a result, searching for alternatives leads people to the private care providers.

> *"Migrant women have largely solved the problem of care for older adults. But in recent years the number of women migrants in villages has been decreasing and this is where the difficulties begin." R10*

The church operates care facilities, but usually for poor people without family. Such facilities, however, cover a limited part of the overall needs.

> *“There are church facilities where older people without family usually go. Some of those structures however, require high fees for the hospitality.” R15*

Local government has developed specialized services to support older people in the countryside. However, they are rather limited and cannot address the whole problem.

> *“There are programs such as Care at Home which are important for older people and offer services free of charge. However, they cover limited needs and as a result, they do not solve the problem.” R13*

More and more care enterprises are operated in the countryside to meet existing needs. However, these are usually located close to urban centres.

> *"In recent years many such private facilities are being established in rural areas close to urban centers. Some the children of some older people from our village have taken their parents there." R9*

- Private long-term care entrepreneurship and rural civil society

Local rural society lacks information about the services offered by long-term care enterprises.

> *"As local council chairs we do not have any information from long-term care businesses, nor do we know much about the services they offer." R16*

Long-term care businesses for older people, do not have the appropriate channels of communication and information with local communities, creating barriers towards a wider social consensus.

> *"We don't interfere with families on how to care for their older adults. We only support the public facilities offered. I would not recommend that someone take their older person to a private long-term care facility because I know little about them." R12*

Informing local communities through elected local councils present a major gap that long-term care businesses need to fill.

"The role of local chairs is crucial but to date we have not developed a channel of communication and information with them." R1

- The impact of long-term care businesses in rural areas

Long-term care businesses for older people were perceived to contribute to the socio-economic development of rural areas. They create jobs and income.

"Long-term care enterprises, apart from the better quality of life they provide to older people, they also contribute to the economic development of the region, adding value to the local community and creating jobs." R7

Their operation was perceived to alleviate the stereotype that care of the older persons should be carried out exclusively within the home by a family member and frees up family productive resources.

"More and more families are turning to us to meet their needs for the care of their older family members." R3

Long-term care businesses create quality of life for older rural residents.

"Older people need quality care services. We provide them with that, through our structures and the scientific support we provide." R1

- Innovative interventions by long-term care enterprises

For long-term care businesses to provide reliable services to older people either in their homes or in their own facilities, they have developed and provide specialized, innovative services.

"As we are talking about seniors that their families trust them to us, this requires innovative interventions in both quality service and communication. It certainly enhances user experiences" R5

The quality of life of older people by private long-term care organisations is reported to be achieved by the development of innovative services (based mostly on the establishment of cutting-edge technology)

''We established smart devices per room that help older adults towards managing lights, adjusting curtains etc." R6

"We have invested in innovation. Innovative services lead to a better quality of life for older people. People have demands. They don't easily compromise if we don't offer them innovative services. We have invested in modern equipment such as smart beds and ward layouts as well as in digital intercom systems and sophisticated means of transport." R8

5. Discussion

Our findings indicate that the stereotypes in rural areas of Greece, whereby the care of older people was supposed to be carried out exclusively by family members at home, have been significantly mitigated, but not eliminated. This is mainly due to the migration of young people from the countryside to urban centres, leaving the rural areas predominantly inhabited by older people. This evolution has led to carefor older people being undertaken largely by migrant women for a fee. However, when there was a shortage of migrants, alternatives were sought, involving private care providers. On top of that, public facilities and church institutions in rural areas are very limited, while the latter often appeared to be a substitute for public sector services (Pöyhönen and Seppänen, 2016). Despite taking advantage of European resources, the long-term care services owned by local government, are unable to tackle the problem in its entirety. Searching for relevant findings in the international literature, the existence of stereotypes towards rural care of the older adults was identified in many other countries as well (Jakovljevic et al, 2021; Okoye and Obikeze, 2005). Stereotypes characterise the perceptions among specific social groups within different types of settlements (Frydrychová et al, 2017; Palacios et al, 2009). The inability of public organisations to cover the care of the rural older population is also observed in other countries (Knapik, 2020). Hence, the provision of rural care for older people by immigrants is not a Greek phenomenon (Zechner, 2008). What the present research has demonstrated as regards the distinguishing feature of greek rural long-term care (for older people) from other countries is the increasing tendency to create private care homes in rural areas, close to urban centres, when in many countries the deinstitutionalisation of care for older people is constantly being strengthened (Herron et al, 2021; Anttonen and Karsio, 2016).

Additionally, the present study indicates the increased need for long-term care of older people in the Greek countryside and the lack of information on the range of services offered by private care providers. This

information deficit creates an obstacle to the formation of a broader social consensus. Specifically, it was highlighted that the availability of private care establishments for the older adults in rural areas is not sufficient, and can be constrained by local culture. Similar findings in the international literature reveal that care providers for older people need to comprehend the various aspects of stereotypes (Nemmers, 2005). They also need to understand local contexts and address stereotypes of rurality through social consensus (Manthorpe et al, 2005).

Finally, the research indicates that private long-term care enterprises for older people in rural Greece contribute to the socio-economic development of areas, create jobs, reduce stereotypes and promote older people's quality of life. Similar findings were detected in the international literature. Research by Hjaltadóttir and Gústafsdóttir (2007) showed that older individuals who receive long-term care feel safe and experience quality in their lives and this crucial factor adds value to a threadbare world that retains its humanity. It is evident that private long term care enterprises create jobs (Torpey, 2011) and enhance socio-economic development (Brown Wilson, 2009). Subsequently, our study highlights that private rural long-term care providers for older people offer reliable and innovative services either at home or within care home services. The improved quality of life of older people is due to the innovative services delivered by private rural long-term care enterprises, and specifically their innovative living settings. They have also placed emphasis on improving their organisational environment by leveraging advanced technologies. We identified similar findings in the international literature. Research by André et al (2014) showed that improving the organizational environment creates quality characteristics in the field. Innovative interventions in improving the social context and providing human-centred care (Loria et al, 2024) for older adults play a significant role in quality of life (Fleming et al, 2014), with the same applying to innovative living arrangements (Adams et al, 2017). Lastly, it was observed that some care providers have developed collaborations with medical doctors in the field of home telehealth services (Frishammar et al, 2023).

6. Conclusions

This study has shown that the rural Greek culture of a family member caring for older people in the home has been mitigated, but not eliminated. The outmigration of young people from the Greek countryside, as well as the arrival of foreign migrants and funded programmes have suppored the long-term care of older people. In parallel, it was revealed that the increased needs for long-term care of the older adults in rural Greece have created a trend towards the establishment of many relevant facilities offering care home services, while in many other countries the deinstitutionalization of this care is constantly being strengthened. This study also indicates that national or European financial support for private enterprises operating in the field is not sufficient, and further social consensus and innovative interventions are needed in order to be appreciated by local communities who seek to overcome the stereotypes in rural Greece.

Abstract: The inception of digitalization has transformed many organizations. Presently, personal and professional lives are difficult to fathom without the utilisation of digital technologies. For organisations, digital innovation has brought up several opportunities. While most of the previous research considers how digital innovation affected worker productivity, and business performance and emphasised the massive deployment of digital technologies, little research assesses the factors influencing digital innovation. To fill this gap, this study aims to explore the impact of managerial social capital and managerial human capital on digital innovation, and the intervening impact of digital innovation on the connection between firm performance and managerial social capital as well as managerial human capital. To achieve this, 728 bankers in Ghana were conveniently sampled and the structural equation modelling in the PLS approach was utilized to analyse the data. The results showed that managerial social capital and managerial human capital have a substantial impact on digital innovation. Most significantly, digital innovation emerged as a favourable mediator on the managerial social capital and perceived performance affiliation, and the managerial social capital and expected performance connection. The findings urge managers and policymakers to combine the efforts of managerial social capital and digital innovation to increase the performance of banks as digital innovation has become a necessity in today's dynamic and digital era.

Keywords: Digital innovation, Bank performance, Managerial social capital, Managerial human capital, Gen Y and Z

1. Introduction

Due to the intense competition of today, shifts in consumer preferences and satisfaction, and profound advancements in digital technologies, businesses are engaging in initiatives that will strengthen their competitive advantage, support their expansion, and ensure their survival. This means that in this dynamic, organisations must be inventive, efficient, and productive. Organisations' efforts to achieve this led to the development of digital innovation (DI). According to many, DI is the strategy shift that elevates an organisation and improves performance (Wang, Guo and Zhang, 2023; Le and Ikram, 2022; Migdadi, 2022). From the perspective of Nambisan et al (2017), it refers to the degree of integration of digital technology in various advancements. Nambisan et al (2017) and Nylén and Holmström (2015) suggest DI can improve the design, control, and improvement of products, services, and processes. Performance is ultimately the result of process, service, and product design, control, and improvement. Hence, organisations trying to innovate digitally need to develop new managerial competencies. According to earlier research, one important predictor of a strategic shift is dynamic managerial capabilities (Matarazzo et al, 2021; Adner and Helfat, 2003). There is, however, a dearth of literature on how dynamic managerial capabilities affect DI, particularly in the banking sector where digital technology has been widely used over the years. Digital banking, as a strategic shift, is too important to ignore given its significant influence on the non-financial and financial performance of banks (Diener and Špaček, 2021; Lim et al, 2019).

The dynamic capability approach (Teece, Pisano and Shuen, 1997; Teece, 2007) emerged from the resource-based view and focuses on how companies sustain and expand their competitive advantage. That is the ability of businesses to develop, bring together, and rearrange both external and internal competencies in reaction to a rapidly changing environment (Teece et al, 1997). Being able to manage dynamically is vital since it keeps organisations running smoothly. Managers have a critical role in business performance and strategic change; creating and identifying new opportunities (Huy and Zott, 2018; Helfat and Martin, 2015). Dynamic managerial capabilities originate from the fundamental managerial resources of managerial cognition (MC), managerial social capital (MSC), and managerial human capital (MHC) (Adner and Helfat, 2003). These resources serve as the foundation for the patterned components of managerial intentionality, contemplation, decision-making, and action (Martin, 2011). As a result, the study concentrates on MSC and MHC, highlighting the elements of the

extensive literature on these managerial resources as well as the dynamic qualities that enable managers to implement strategic change.

Organisational performance, according to Otley (1999), is the analysis of an organization's performance concerning its goals and objectives. In other words, an organization's performance serves as a barometer for its growth and development as it shows how well a business is accomplishing its goals. Based on previous research, some of the well-established measures of organisational performance in the literature are financial, learning and growth, safety, quality, information technology, communities of practice innovation and work-life quality and employee and customer satisfaction (see Paliszkiewicz, Gołuchowski and Koohang, 2015). The expected and perceived financial performance is the main emphasis of this investigation. The rationale is that earlier research has focused on how social capital, entrepreneurship, and leadership in general affect business performance (Schmid and Sender, 2019; Tata and Prasad, 2015; Zehir et al, 2011). Nevertheless, we are not aware of any research that examines the impact of dynamic managerial capacity variables on company performance. Furthermore, there exists numerous of research on business performance. However, breaking down performance into more focused metrics helps managers and organisations understand which factors to consider when utilising dynamic managerial capabilities. Thus, the purpose of this study is to investigate how MSC and MHC affect both expected (PPE) and perceived financial performance (PPP). Consequently, the mediation role of digital innovation on the affiliations are examined.

2. Literature Review

2.1 Managerial Human Capital, Managerial Social Capital, and Digital Innovation

Digital technology's wide-ranging effects have led to a fundamental restructuring of entire industries, as it becomes more and more required to satisfy commercial objectives. Furthermore, recent studies have demonstrated the enormous and unpredictable potential that digital technologies present for the creation of unique products and services (Nylén, and Holmström, 2015). This has increased the bar for technological advancements in all economic areas. Due to customers' changing views on satisfaction, traditional company practices have experienced an unprecedented transformation to meet the new requirements of customer experience. Managers' interest in mastering digital innovation is growing, as the COVID-19 pandemic also revealed the shortcomings of traditional methods for creating novel goods and services. To sustain and enhance the company's competitive edge and overall performance, managers have a fundamental responsibility to revitalise and enhance the company's resource base. Managers must begin their businesses, develop their leadership skills, and widen their social networks to do this.

The educational backgrounds, work experiences, and interpersonal interactions of managers comprise managerial human capital in terms of skills and knowledge (Kor and Mesko, 2013). According to Helfat and Martin (2015), managers can benefit from this kind of capital by using it to reorganise the resource base and recognise and take advantage of opportunities and hazards. The diversity and level of growth of managers' skill sets vary (Adner and Helfat, 2003). Nonetheless, managers have access to resources and information because of the goodwill that arises from their formal and informal interactions with others (Ambrosini and Altintas, 2019; Helfat and Martin, 2015). We call this managerial social capital. Adner and Helfat (2003) assert that managers can gain insights from both formal and informal work connections that may enable them to identify new opportunities. Because the banking industry is so interwoven with all other economic sectors, it stands to gain from having a wider social network, helping them gain access to information and resources (Adler and Kwon, 2002). This can help with environmental scanning and subsequent opportunity discovery.

One kind of strategic change that gains from managerial human and social capital is digital innovation. For example, research indicates that when senior managers have more external relationships, organisations purchase more strategy transformation items (Helfat and Martin, 2015). In a similar line, Maritan (2001) found that to carry out the strategic transformation, strong leadership was required to supervise the beginning of investments in new competencies and resources and to be in touch with business unit managers. According to earlier studies, social capital fosters the growth of creative and competitive capacities by making up for the lack of resources required to establish organisational routines (Hughes et al., 2014; Agarwal and Selen, 2013). Based on the inference above, the following hypotheses were formulated:

$H1_a$: MHC positively impacts DI.

$H1_b$: MSC positively impacts DI.

2.2 Managerial Human Capital, Managerial Social Capital, and Financial Performance

Prior literature hypothesized that there is no direct influence of MHC and MSC on firm performance and the results validate those entrepreneurial skills, the second dimension of MHC directly do not influence firm performance (Heubeck, 2023). Nonetheless, the foundation of managerial capabilities lies in managers' capacities to grow, diversify, and modify their companies' revenue streams. This ability sheds light on the relationship between organisational performance, strategic change, and the calibre of managerial decisions (Adner and Helfat, 2003). In summary, the concept distinctly links fluctuations in company performance during periods of transition to fluctuations in management aptitude (Helfat and Martin, 2015). Bertrand and Schoar (2003) found that manager fixed effects were major predictors of business performance as well as corporate investment programmes, diversification, and acquisitions—factors that were conducive to strategic change. Martin (2011a) found evidence of dynamic managerial capabilities: financial performance, new product launches, business unit creation, and resource reconfiguration were all impacted by multi-business teams, which were composed of senior executive leaders of business units.

From a wider angle, research on entrepreneurship has shown a direct correlation between MHC and MSC and the survival and performance of businesses. Additionally, it is discovered that two MHC characteristics that affect business success are leadership and entrepreneurial talents. For example, a study by Zehir et al (2011) shows a strong and positive correlation between company operational success and leadership. The study's conclusions showed how entrepreneurial leadership abilities affect business performance. Moreover, research to date supports a strong and positive correlation between social capital and business performance (Schmid and Sender, 2019; Tata and Prasad, 2015). Based on the above inference, the following hypotheses were formulated:

$H2_a$: MHC impacts expected performance (PPE) positively.

$H2_b$: MHC impacts perceived performance (PPP) positively.

$H2_c$: MHS impacts PPE positively.

$H2_d$: MHS impacts PPP positively.

2.3 The Intervening Role of Digital Innovation

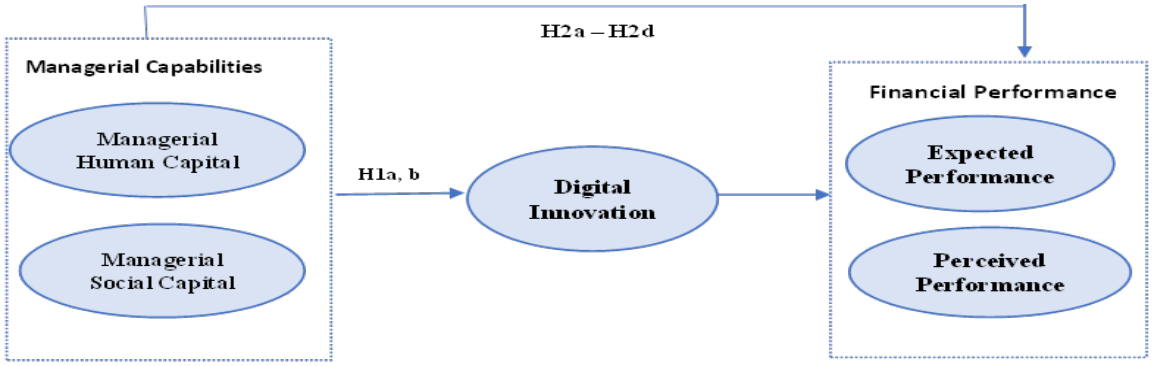
According to preliminary studies, DI boosts some performance indicators for a business, including net profit margin, customer happiness, sales growth, profitability, and overall performance (Wang et al, 2023; Le and Ikram, 2022; Hanelt et al, 2021). Numerous literary has also recognised the impact of DI on society at large. One of its main effects, especially in the financial sector, is its ability to encourage a cashless economy (Mohd Thas Thaker et al, 2023). However, it has improved client services, engagement, accessibility, and experience. Most academics concur that DI is crucial. Furthermore, the study of Guo et al (2022) demonstrated the mediating role that value creation and value capture innovation play in the beneficial relationship between value proposition innovation and digital start-up performance. Also, Migdadi (2022) sampled manufacturing companies to present a unified framework that integrates knowledge management processes (KMP), innovation capability (IC), and organisational performance (OP). Additionally, the study tested the effects of KMP on IC, IC's effect on OP, and KMP's impact on OP via IC as the mediator. The findings show that KMP affects an organization's ability to innovate in the areas of marketing, processes, products, and operations. IC also affect the financial, operational, and product quality aspects of an OP. Lastly, IC acts as a mediator in KMP and has an impact on OP. This research corroborates the notion that digital innovation affects organisational effectiveness.

Currently, DI is a strategic instrument that helps businesses survive and become more competitive. The managers who are driving forces through their MSC and MHC will decide whether to accept and adopt it. Previous research, considering the issue under investigation indicates that the association between entrepreneurial skills and company performance is mediated by digital business model transition. Nevertheless, no research has examined the mediating role that digital innovation plays, particularly in the banking environment, between the two variables of dynamic managerial capabilities and company performance. Accordingly, the research indicates that DI has a higher probability of mediating the link between MSC and company performance as well as the relationship between MHC and firm performance. Therefore, the following hypotheses emerged:

$H3_a$: DI favourably impacts PPE.

$H3_b$: DI favourably impacts PPP.

$H3_c$: The impact of MHC on PPE is mediated by DI.



$H3_d$: The impact of MHC on PPP is mediated by DI.

$H3_e$: The impact of MSC on PPE is mediated by DI.

$H3_f$: The impact of MSC on PPP is mediated by DI.

2.4 Conceptual Framework Development

While the direct relationship between DI and firm performance is well-established in prior studies, the direct effects of MHC and MSC on firm performance have only received partial attention. Consequently, this study implies that digital innovation has a mediating effect on the subsequent affiliation, as illustrated in Figure 1 below. Stated differently, DI serves as a conduit for the beneficial outcomes of MSC and MHC, which in turn improves business performance.

Figure 1: Conceptual framework

3. Research Methodology

3.1 Measurement, Sampling, and Data Collection

Applying the quantitative technique, emphasizing data gathered from bankers in Ghana, allowed the research to achieve its goal. The researchers used the inverse square root approach and statistical power analysis to estimate an adequate sample size because the overall number of the targeted population was unknown. The research employed purposive sampling and convenience sample approaches to facilitate the identification of qualified participants for the investigation. To gather the data for the study, A questionnaire with a range of 1-5 was created. Every question on the questionnaire was adapted from earlier studies. While MHC and MSC were measured using 10 and 12 items adapted from Heubeck and Meckl (2022), DI measured with nine items developed by Sanders Jones and Linderman (2014). Further, firm performance was evaluated utilizing ten items adapted from Cazacu et al (2023). 728 respondents between the ages of 18 and 44 made up the analysis. The first step was analysing the respondents' demographic data using percentages and frequencies. Men made up 441 of the total participants, with women making up the remaining. More than half of the participants were between the age of 20–29. Over half of the participants had a bachelor's degree. While 309 respondents had master's degrees, 61 respondents, representing 8.38 per cent had PhD. Also, while about 88 per cent of the respondents have 5-10 years of working experience, 68 respondents have worked between 11-19 years and the rest had 16^+ years of working experience.

3.2 Data Analysis

According to Hair et al (2017), partial least squares structural equation modelling (PLS-SEM) valuation is a highly adaptable technique based on the iteration of PLS regressions. As a result, we examined the assumptions using partial least square structural equation modelling (PLS-SEM). A multitude of papers attest to the PLS-SEM's acceptance in management research and its appropriateness for sophisticated and simple models. Furthermore, PLS-SEM offers several ways to assess the reliability and validity of a scale (Hair et al, 2017). The measurement and the structural model were investigated using the SmartPLS software. To determine whether each item was acceptable, tests for discriminant and convergent validity as well as reliability were performed. Finally, we used the PLS bootstrapping approach to verify the validity of our suggested assumptions. The study used a 95 per cent confidence interval to determine the significance level for the significant paths. This meant that a relationship was considered negligible if the T-statistic was less than 1.98 or the P-value was greater than 0.05.

4. Results and Discussion

4.1 Reliability, Convergent and Discriminant Validity Analysis

Before proceeding with the structural model analysis, it is imperative to assess the measurement model, encompassing validity and reliability. Table 1 shows that all average variance extracted (AVE) and composite reliability (CR) values above the predetermined thresholds of 0.50 and 0.709, respectively, indicate the achievement of convergent validity and reliability (Hair et al, 2017; Fornell & Larcker, 1981). The Fornell-Larcker criterion was utilised to assess discriminant validity, it is commonly recognised by empirical research. Table 3 shows the square root of the AVE for each variable. These values imply adequate discriminant validity because they are higher than the variables' highest correlation with other variables.

Table 1: Measurement of convergent validity and reliability

Variables	Proxy	CR	AVE
Digital Innovation	DI	0.923	0.668
MHEntreprenuer	MHE	0.917	0.737
MHLeadership	MHL	0.970	0.866

MSRelational	MSR	0.777	0.636
MSStructural	MSS	0.789	0.556
Pexpected	PPE	0.989	0.946
Pperceived	PPP	0.976	0.891

Source: Authors' analysis.

4.2 Evaluation of Quality Criteria

The study evaluated the predicted accuracy of its model using the R square and Q square. Table 3 displays the coefficient of determination (R2) for DI, PPE, and PPP, which are 0.530, 0.283, and 0.261 respectively. Because all R square statistics are above Cohen's (1988) recommended values for a significant level of 0.26, they demonstrate that the constructs have appropriate explanations. In addition, based on Hair et al (2017) thumb rule, the Q2 values of 0340, 0.262, and 0.227 for DI, PPE, and PPP, respectively, show that the predictive relevance of the model is good.

Table 2: Fornell-Larcker

	DI	*MHE*	*MHL*	*MSCa*	*MSR*	*MSS*	*MHC*	*MSC*	*PPE*	*PPP*
DI	0.817									
MHE	0.390	0.858

4.3 Discussion

According to Generation Y and Z, the current study offers preliminary evidence that MSC and MHC greatly boost managers' capacity to engage in DI. Previous research has focused on the larger perspectives of social capital, entrepreneurial abilities, and leadership skills (Helfat and Martin, 2015; Hughes et al, 2014; Agarwal and Selen, 2013).

Table 3: Assessment of quality criteria

	R square	*Q square*
Digital innovation	0.530	0.340
Expected performance	0.283	0.262
Perceived performance	0.261	0.227

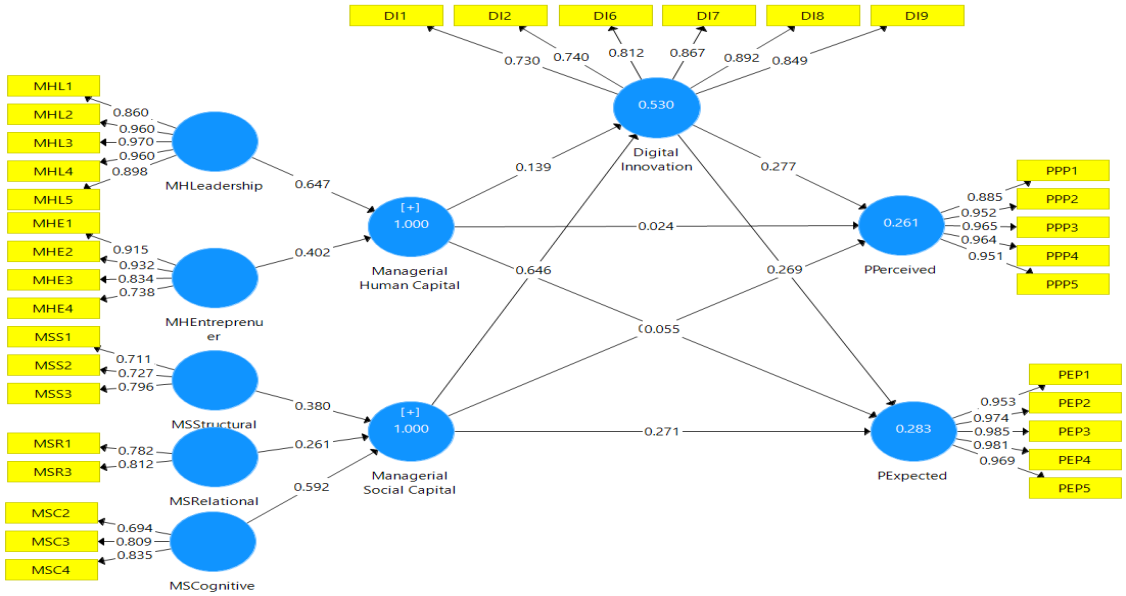
Source: Authors' analysis.

We suggested that MSC and MHC have a major impact on PPP and PPE concerning H2a–H2d. The outcome showed that MHC does not directly improve PPP (β=0.024; p<0.580) and PPE (β=0.055; p<0.198). This result aligns with the findings of Heubeck's (2023) study, which showed that MHC—leadership and entrepreneurial skills—does not directly correlate with organizational performance. Conversely, there is a positive correlation between MSC and PPE (β = 0.271; p<0.000), as well as a well-directed relationship with PPP (β = 0.259; p<0.000). From a broader viewpoint, social capital derived from social ties plays a significant role in the success of firms (Schmid and Sender, 2019; Tata and Prasad, 2015). This study assessed social capital from the perspective of dynamic capacities, and the findings are in line with Martin's (2011) study, which found that manager social relationships affected financial performance.

The relationship between DI and PPP (H3a) also turned out to be positive, with a coefficient value of 0.269 and a t-value of 4.906. The p-value of 0.000 indicates that there is a strong association between DI and PPE. Additionally, with an estimate of 0.277, the path from PPP to DI (H3b) shows a favourable and significant direct influence. A p-value of 0.000 validates the statistical significance, while the t-statistic of 5.190 indicates good dependability. Thus, there is substantial evidence to support the conclusion that DI positively and significantly influences Generation Y and Z's expectations and perceptions of banks' financial performance. Previous research, such as Wang et al (2023), Le and Ikram (2022), and Hanelt et al (2021) which found that DI significantly affects organisations' overall performance, supports these findings.

Table 4: Direct Effect

Hyp.	Path	Beta	Std. Dev.	T - Statistic	P-value	Decision
$H1_a$	MHC->DI	0.139	0.033	4.186	0.000	Accepted
$H1_b$	MSC->DI	0.646	0.029	22.473	0.000	Accepted
$H2_a$	MHC->PPE	0.055	0.043	1.289	0.198	Rejected
$H2_b$	MHC->PPP	0.024	0.043	0.554	0.580	Rejected
$H2_c$	MSC->PPE	0.271	0.057	4.746	0.000	Accepted
$H2_d$	MSC->PPP	0.259	0.057	4.585	0.000	Accepted
$H3_a$	DI->PPE	0.269	0.055	4.906	0.000	Accepted
$H3_b$	DI->PPP	0.277	0.053	5.190	0.000	Accepted



Source: Authors' analysis.

Finally, as indicated by Table 5 and Figure 2, an examination was carried out concerning the mediating role of DI with MHC, PPE (H3c), PPP (H3d), and the correlation between MSC and PPE (H3e) and MSC and PPP (H3f). The findings showed that there is a mediating effect of DI on the variables. As a mediating effect of DI, the results support the hypothesis that MHC has an indirect and substantial link with PPP (β=0.039; p<0.000) and PPE (β=0.037; p<0.002). This finding is noteworthy both conceptually and practically since it shows that MHC is only necessary to boost a bank's financial performance in the presence of digital innovation. These results support Heubeck's (2023) findings, which indicate an indirect relationship between MHC and business performance. According to Adner and Helfat (2003) and Helfat and Martin (2015), MHC improves performance through organisational strategy variables. This finding augment that claims. Likewise, with a t-value of 4.724 and a p-value of 0.000, the analysis validated a DI mediating association between MSC and PPE. Additionally supported (β=0.179; p<0.000) was the mediation relationship between MSC and PPP. As a result, DI becomes a significant mediating factor between managers' interpersonal relationships and business performance. The findings of this study indicate that the banking sector should continuously prioritise the adoption of digital technologies to enhance and innovate its processes, services, and goods to promote customer experience as well as organisational competitiveness, growth, and survival.

Table 5: Specific indirect effect

Path	Beta	Std. Dev.	T - Statistic	P-value	Decision
MHC->DI->PPE	0.037	0.012	3.047	0.002	Accepted
MHC->DI->PPP	0.039	0.012	3.140	0.002	Accepted
MSC->DI->PPE	0.173	0.037	4.724	0.000	Accepted
MSC->DI->PPP	0.179	0.036	4.959	0.000	Accepted

Figure 2: Structural model: direct and indirect paths

5. Conclusion

This study aimed to investigate the relationship between MSC, MHC, PPE, and PPP through the mediating role of DI. The survey comprised banking personnel from Ghana, a developing country. 728 people in total responded to the distributed survey. Choosing the respondents involved considering their generation cohort, they are the active members of the working population. Using the SmartPLS 3, it was feasible to develop the hypothesis. The results showed that MHC positively impacted DI. MSC demonstrated a good relationship with PPP and PPE as well as DI. The DI had a strong direct correlation with PPE and PPP. It was successful in assigning DI as a mediating variable on the link between MSC and MHC and financial performance indicators. From the standpoint of Generation Y and Z, the study's findings have provided relevant insight into MHC, MSC, DI, and financial performance in Ghana's and other developing countries' banking sectors.

5.1 Managerial Policy

The few previous research on the relationships between MSC, MHC, DI, and financial performance left gaps that this study fills. The empirical results of the study validated that MHC and MSC present financial institutions with multiple opportunities to improve their DI processes, ultimately leading to better financial performance. According to the findings, businesses that want to improve their financial performance should use digital technology to help with process, service, and product creation, control, and improvement. Additionally, the study demonstrates that MHC and MSC share almost 50 per cent of the variances in variables that affect DI. When hiring, selecting, and developing training programmes for future managers, firms and managers should consider the foundational variables of these constructs (relational dimension, cognitive dimension, structural dimension, entrepreneurship skills, and leadership skills). The study's findings also provide managers and businesses with the motivation to use digital technology more frequently to improve productivity. The reason is that, before the advent of DI, the relationship between MHC and financial performance was weak.

5.2 Limitations and Further Research

This study has some gaps that allow for additional research. In this case, longitudinal data is better than cross-sectional data because the latter may hinder a thorough analysis of the data to identify the factors antecedents required for both financial performance and DI. Secondly, collecting data from a specific country (Ghana) and analysing the data based on the opinions of workers (Gen Z and Y) reduces generalizability and increases bias risk. Research with a broad range of respondents from other departments within the organisation and in other countries can be conducted in the future. Moreover, studies should consider which attributes of MHC and MSC impact banks' performance to aid personnel selection and training, with a focus on managers' perspectives.

valentina.chkoniya@ua.pt

Abstract: The NEXUS project involves innovation and entrepreneurship. The first task of the project team, which is eclectic and includes several different profiles (research assistants, researchers, managers, engineers, designers and marketing specialists) was to do a stakeholder analysis, which involved doing some field work – six unstructured interviews – as well as some secondary data analysis (scientific articles on the Scopus database; Google searches; among others). The main concerns were to: unlock value through stakeholder engagement; move from concept to collaboration – for sustainable port development; and to connect ports worldwide which will involve international stakeholder collaboration and synergies for sustainable innovation. A Stakeholder analysis is a process consisting of identifying the individuals or groups that have a specific interest in a project, which can affect them, or be affected by them, including large groups such as customers and suppliers; employees; shareholders and investors. It is necessary to sort them according to their impact and consequences regarding the project. It is essential to manage stakeholder expectations when making decisions, especially in a project with thirty-five partners and with a global reach. The initial funding is around 92 million euros (approved by the Recovery and Resilience Plan (RRP)), to ensure the ambitious implementation of the new NEXUS platform and other related products. To minimize backlash, early as well as ongoing stakeholder involvement is a prerequisite. Strategy formulation should not occur in an "ivory tower" and involvement is key. For effective and efficient decision-making, to minimize risks, which need to be identified as well as all the connections and relationships to be created and nurtured. The research question at the outset was: How may we successfully implement a multi-partner project which involves considerable investment, and which aims to digitalize maritime ports worldwide? The theme is, currently, without precedent as the impact intended is for there to be a positive impact on all stakeholders involved – a win-win situation all around. The project will finish in 31-12-2025 and will produce 28 innovative solutions for commercialization. NEXUS is a green and digital project which is up to date as regards the latest sustainability norms and regarding overall operational efficiency in multimodal logistics. Work Package 10 is a specific exploitation, internationalization, promotion, and dissemination package.

Keywords: Maritime ports, Global strategy, Financed Project, Interviews, Decision making, Innovation

1. Introduction

The Recovery and Resilience Plan (RRP or PRR in Portuguese notation) is part of the European Council's economic and social impact mitigation instrument, Next Generation EU. This instrument aims to support the dual climate and digital transition. The RRP, as a national action programme, covers an extended period until 2026, with the aim of supporting and implementing reforms and investments for sustainable economic growth after the pandemic. The RRP benefits from a total funding of 16.643 billion euros, a total of 13.944 billion euros in grants and 2.699 billion euros in loans, targeting investment in three fundamental areas: resilience, climate transition and digital transition.

The present article focuses on NEXUS Agenda, one of the selected Mobilising Agendas for Business Innovation of the Recovery and Resilience Plan (PRR). NEXUS Agenda is a consortium headed by the Port of Sines and comprises 35 partners sharing the main objective to digitalise and decarbonise the logistics chain associated with the Port of Sines corridor. The consortium represents the whole value chain, covering port authorities, maritime, terminal and railway operators, carriers, dry ports, logistic operators, technology suppliers, importers, and exporters, and is supported by universities and research institutes. The initial funding is around 92 million euros (approved by PRR), to ensure the ambitious implementation of the innovative project. NEXUS Agenda aims to create an ecosystem comprising 28 products and services for the Sustainable and Digital Transition of Sines Corridor. This includes three main categories: open data collaboration platform, federated applications and services, and hardware assets, distributed across ten work packages.

The research question at the outset was: How may we successfully implement a multi-partner project which involves considerable investment, and which aims to digitalize maritime ports worldwide?

Agenda NEXUS is the first project of this kind in Portugal. Like other international projects such as MAGPIE and PIONEERS, this entrepreneurial project has ambitious innovative goals, in line with current sustainability and

digitalisation needs (the need to minimize the carbon footprint while minimizing costs at the same time - simplifying and streamlining processes).

2. Bibliometric Analysis

A bibliometric analysis was performed, to show trends in the research (large dataset, broad scope) pertaining to our "stakeholder analysis" AND strategy topic. A search in the Scopus database on 09-03-2024 with the terms "stakeholder analysis" AND strategy revealed 633 documents. Exporting the CSV files to VOS viewer (co-occurrence of author keywords; minimum number of occurrence of keywords = 2) revealed figure 1.

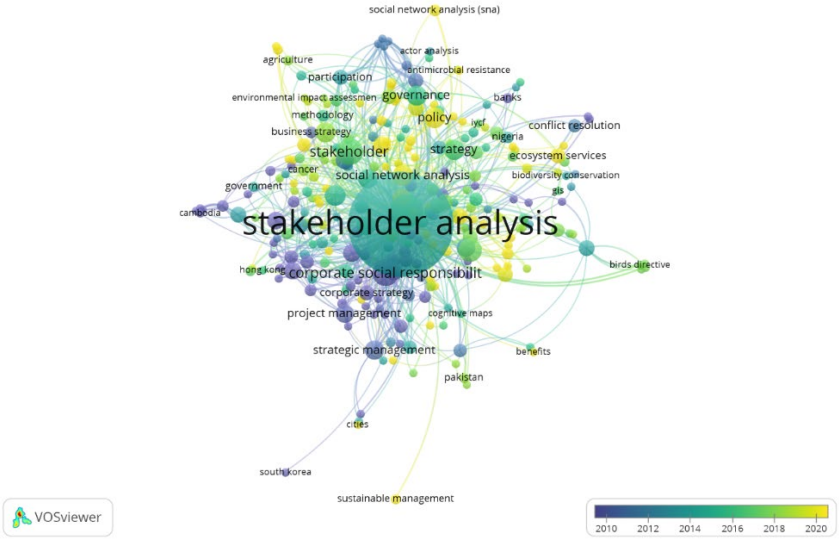

Figure 1: VOS viewer (co-occurrence of author keywords)

Table 1 shows the 22 main keywords in the VOSviewer analysis. Note that China appears above the United States of America in the analysis (with 12 versus 5 occurrences on Scopus for this topic) as China is apparently being more discussed in the literature for this topic. Stakeholder Analysis appears most linked to the term Corporate Social Responsibility (CSR); as well as to the term governance (table 1). Indeed, within the NEXUS project the Stakeholder Analysis was decided to be done by the governance stakeholder and the rationale behind the Stakeholder Analysis is that all stakeholder impacts and consequences (and needs and expectations) of the NEXUS project must be predicted and planned for in advance. NEXUS is about CSR, innovation, community development, corporate strategy, participation, sustainable development, decision making, project management, among others, so the VOSviewer depictions (figure 1 and table 1) show we are on the right track and aligned with the literature.

Other author keywords visible in figure 1 though not in the top 22, in table 1, are: benefits, conflict resolution, stakeholder engagement, public participation, participatory approach, and participatory planning, which are all essential concepts, at this earlier as well as at later stages, of the NEXUS project.

Table 1: The 22 main keywords in the VOSviewer analysis

Selected	Keyword	Occurrences	Total link strength

3. Methodology

The approach adopted in this article is a case study (the analysis of a contemporary phenomenon using various methodological approaches) outlining, in particular, the stakeholder analysis which was performed. The case study herein involves a qualitative analysis of the NEXUS Agenda innovation project (literature reviews plus six unstructured interviews). The case study research method was selected as it allows for a specific analysis of the project's scope in a real context. Of note is that in the literature review, which was performed, a comparison was made with similar projects (Eisenhardt, 1989; Ghauri, 2004). The case study allows for a more profound analysis (Piekkari et al., 2009), provides a detailed analysis, combining information from various sources, ensuring the validity of data (Ghauri, 2004). The research question is linked to the management of an innovation project - enabling the study of the processes conducted in the stakeholder analysis conducted as part of the NEXUS Agenda.

The literature review was conducted through a search in the Scopus database (a main database in the social sciences area). Search terms were established according to the research topic and organised into a search sequence, allowing for greater interaction and reorganisation in the process (Pittaway et al., 2004). The search terms, applied to the title, abstract and keywords, resulted in the following search string: search 1 - "stakeholder analysis"; search 2 - "ports" AND "stakeholder*" AND "innovation"; search 3 - "sustainability strategies"; search 4 - "port management"; search 5 - "port" AND "entrepreneur". The searches were conducted on March 28th, 2024.

A qualitative methodology was used to collect data through interviews (Duncan & Holtslander, 2012; Easwaramoorthy & Zarinpoush, 2006). Six unstructured and exploratory interviews (Saunders et al., 2019), regarding the stakeholder analysis, were conducted during the months of January, February, and April 2024 (as the need arose): with a freight forwarder, a cargo owner, a specialist in Ports, two technology firms / suppliers and a Portuguese taxpayer. The interviewees were chosen because they had the necessary knowledge to help answer the research question (a purposive sample). The interviews lasted approximately 10 minutes each and were conducted by telephone. Handwritten notes were taken of the interviews. Previous knowledge of the company was used (following a desk research effort to that end) to tailor the interview script used to the specific context of the company.

With the data from the interviews and other sources, it was possible to develop a study of the stakeholder analysis process that was close to reality.

4. Literature Review

4.1 The Port's Role in Supply Chain Management and its Sustainable and Digital Transition

Ports serve as pivotal elements within the supply chain, enabling local production and consumption sectors to engage on a global scale. In recent years, the advent of globalization has significantly modified the paradigm of supply chain management, leading to increasingly demand-driven markets. Factors external to ports, including technological advancements, governmental policies, competitive forces, and a growing emphasis on sustainability in its comprehensive context, have earned increased focus (Notteboom, 2022).

Ports are facing a tremendous challenge, due to the sustainable and digital transition under the label 'Industry 4.0' and 'Logistics 4.0'. The challenge is to ensure that port clusters remain economically profitable by developing and introducing sustainable innovations in the process, providing value to society (Mendes Constante et al., 2023a).

An increasing need to introduce sustainable practices has been emphasised in the industry, fostering a holistic implementation of sustainability in port management (Notteboom, 2022). The benefits include, among others, increased security and resilience of the infrastructure, reduced emissions, creation of job opportunities and convergence with the local community (Mendes Constante et al., 2023a).

Business management over different time horizons is highly strategic. Considering that the environment in which the business operates is constantly changing means understanding that the management strategy must focus on the present and the future (Aalders, 2023).

A sustainable approach to supply chain management comprises three pillars of sustainable business models, mentioned in the literature: environmental, economic, and social (Daly & Cobb, 1999). Accordingly, ports address different reliance on stakeholders for economic, environmental, and social issues thus engaging stakeholders, whose progress is regularly disclosed through reports (Herremans et al., 2016). Ports operate as

an economic engine, contributing significantly to a country's economic growth (Vinod & Prakash, 2023). As powerful economic business networks, ports can support multi-layered sustainability (Lavissière et al., 2020).

4.2 Innovation and Entrepreneurship

In the port and intermodal context, considering the current paradigm shift, the implementation of innovative technologies is imminent (Musso et al., 2022). Consequently, ports face exceptional challenges arising from emerging trends: the energy transition, the digital transition, the focus on the circular economy, urbanisation, etc. (Mendes Constante et al., 2023). Developing a business model is a complex activity that implies close collaboration between those involved, by concentrating diversity as much as possible (Osterwalder & Pigneur, 2011).

Musso (2022) argues that 5G networks are the backbone of data collection and sharing infrastructures to be combined with technologies such as cloud computing and storage, Blockchain and Artificial Intelligence, among others (Musso et al., 2022).

Innovation in ports is remarkably complex because of two main factors, both arising from the interconnected nature of port activities, which require coordination and collaboration between several companies. Innovation does not occur in environments with isolated efforts, but through a joint effort of interconnected actors, as the concept itself implies this interconnection (Gilbert & Rasche, 2008). The result of innovation, however, is constrained by institutional nuances, such as a risk-taking culture, regulation, and an attitude in favour of cooperation (Mendes Constante et al., 2023). Port clusters involve a variety of activities along the supply chain, involving challenges for building an effective innovation ecosystem. International activities in ports are controlled by subsidiaries of multinational corporations, representing most companies present in port clusters (de Langen & Haezendonck, 2012).

The innovation system approach aims to describe, understand, and clarify the structure, processes, and dynamics of innovation. Systems of innovation may be supranational, national and/or regional (Mendes Constante et al., 2023). The literature suggests that there are advantages to the spatial concentration of initiatives and the promotion of innovation, even if they are restricted to a particular region. It is in this environment that innovation ecosystems are born - although the concept is subject to various interpretations in academia - based on the complex relationships established between the parties involved in technological and innovative development (Mendes Constante et al., 2023).

Mendes Constante (2023) proposes a framework with port-specific characteristics, identifying the components of a port innovation ecosystem, mentioning that the great distinctive characteristic of this ecosystem is its absorptive capacity (Mendes Constante et al., 2023). Nicotra (2014) says that this capacity "determines its ability to recognize and assess the potential value of external knowledge and then to assimilate and integrate it into innovation activities" (Nicotra et al., 2014, pp. 90). The framework comprises 'Human capital (formation), Demand for innovative products and services, support structures for cooperative innovation projects, research cooperation, incubation services (including venture capital)', with the base of an 'innovation-oriented culture, and pro-innovation government (regulation)' (Mendes Constante et al., 2023).

4.3 Stakeholder Analysis

In the literature there is no unanimity regarding stakeholder theory, and it is possible to analyse a set of different narratives that outline the various perspectives, considering the subject matter, such as strategic management (Miles, 2017; Gilbert & Rasche, 2008).

The term "stakeholder" does not find a consensual definition in the literature, considering the various interpretations of the authors, which are invariably different based on the scope of use of the term. This inevitably leads to challenges and constraints in the development of theory and empirical tests (Harrison et al., 2015; Miles, 2017).

Thus, Miles (2017) suggests a system for classifying this construct, which makes it possible to list, filter and order the definitions presented, drawn from both stakeholder and managerial perspectives. This multi-dimensional model comprises four sections, aiming to provide clarity in identifying and analysing stakeholders (Miles, 2017). Each section focuses on distinct aspects of stakeholder identification, featuring: Managerial Perceived Determinants; Managerial Perceived Relationship Attributes; Stakeholder Perceived Determinants; and Stakeholder Perceived Relationship Attributes. This framework leads to the configuration of 4 quadrants, relating to 4 classes of stakeholder, class 1 influencer, class 2 claimant, class 3 recipient, and class 4 collaborator (Miles, 2017).

Kennon et al. (2009) proposed a stakeholder analysis tool. It is presented as a 16-square matrix with two axes centred on the stakeholders, which are *influential* - stakeholders who have power and influence on the organisation or project management (x-axis), and *important* - stakeholders who have power over the execution of the project or the outcomes (y-axis) (Kennon et al., 2009). This helps to have a holistic view of the stakeholders.

4.4 Stakeholder Governance

Governance is intricately linked to stakeholder theory and has acquired particular importance due to the emerging challenges and complexities that new businesses present. The literature emphasises that globalization, technological innovation, and a broader impact of corporate actions require a reassessment of traditional governance models, highlighting the importance of considering a wide range of stakeholders in governance processes. The fundamental role of executive governance in orchestrating interactions between stakeholders to optimise the creation and dissemination of value is also highlighted, advocating a governance framework that comprehensively integrates the perspectives of a diverse set of stakeholders. Businesses should identify and prioritise stakeholders based on their ability to affect or be affected by the actions of the business. This involves effective governance, which implies strategic engagement with various stakeholders (Parmar, et al., 2010; Yuan & Wang, 2024).

4.5 Stakeholder Management and Engagement in Port Operations

To achieve a competitive advantage and remain important players in the market, interaction with the port's stakeholders is a strategic move (Ascencio et al., 2014).

Proper contact with stakeholders must be ensured via proper interactions that allow valuable feedback regarding future improvements. A first step is to identify and analyse these groups, conducting a Stakeholder Analysis, enabling mutual needs and expectations to be identified in the short, medium, and long term (Aalders, 2023).

Port stakeholders can be identified as all those involved directly or indirectly in the international trade processes, such as the importers and exporters, the Port Authority, the terminal operators, customs, customs agents, transport companies (ground and maritime), freight forwarders, empty container parks, surrounding society, etc. (Ascencio et al., 2014). Stakeholders have been categorized into three groups: business-related stakeholders; societal groups and local communities and institutional stakeholders (Notteboom, 2022).

The literature has distinguished three stakeholder engagement strategies, also based on different relationships, the transactional, which aims to inform, the transitional, that responds, and the transformational, whose purpose is to involve (Herremans et al., 2016).

5. Case Study Presentation

5.1 NEXUS Agenda

The Recovery and Resilience Plan (RRP) is a key component of the European Council's Next Generation EU initiative, aimed at mitigating economic and social impacts. This instrument is designed to support the dual transitions of climate and digitalization.

This article specifically highlights NEXUS Agenda, one of the selected Mobilising Agendas for Business Innovation under the RRP. Led by the Port of Sines, the Nexus Agenda consortium includes 35 partners who share the common goal of digitizing and decarbonizing the logistics chain associated with the Port of Sines corridor. Many of these members are companies currently exploring products in innovative areas, such as Physical Internet Supply Chain Orchestration and Collaboration, Last Generation Port and Logistics Community Systems, Innovative Gate Operational Systems and Access Control Solutions, Highly Specialised Terminal Operating Systems and Gate Control Solutions, Cloud and Data Solutions for Transport Operations, Transport Management Systems and eCMR solutions, Carrier Operations optimisation), among many others.

The primary objective of NEXUS Agenda is to establish an ecosystem comprising 28 products and services for the Sustainable and Digital Transition of the Sines Corridor.

The work within the NEXUS Agenda is divided into a distinguished structure, through 11 work packages. The agenda is divided into four primary areas of work packages:

1. Work packages 1 to 8 are core to the project, relating to R&D&I activities that will lead to the NEXUS ecosystem of products and services for the digital and ecological transition.

2. Work package 9 addresses advanced training and HR qualification needs for the port, multimodal and logistics sector.
3. Work package 10 has to do with all matters relating to the exploitation, dissemination, and internationalisation of the agenda (including the Stakeholder Analysis).
4. Work package 11 is responsible for project management.

5.1.1 Similar projects

At the European level, there are other similar projects.

The Horizon 2020 project, "Pioneers," represents a strategic initiative aimed at transforming European ports into models of sustainability, aligning with the European Green Deal's vision for a climate-neutral continent by 2050. This project, involving a consortium of 46 partners from 11 countries, seeks to create a replicable green port master plan by 2026.

The Magpie project, led by Project Manager Reyer Will, embodies a transformative approach towards creating smart, green ports across Europe. This ambitious initiative involves a consortium of 45 diverse partners, including four major European ports, knowledge institutions, industry associations, and private enterprises, all focused on enhancing logistical efficiencies from the port to the hinterland through innovative, sustainable technologies.

These projects, as well as NEXUS Agenda, are united by the Green Deal initiative and European ideas of creating green and digital corridors, aligning with the Global Gateway Strategy to create sustainable and trustworthy connections for the benefit of people and the planet.

The main difference concerns the leadership of the project, as NEXUS Agenda is led by the Port of Sines Authority, while in the other projects the ports participate as partners. The funding itself also differs, both PIONEERS and MAGPIE being funded by the European Union's Horizon 2020.

5.2 Mission, Vision, and Values

NEXUS Agenda's mission is "to create an innovation ecosystem that promotes the green and digital transition of the transport and logistics sector, with a special focus on the multimodal corridors of Sines". This aligns with the NEXUS Agenda's vision of positioning the Port of Sines as a catalyst for an international reference ecosystem in the field of the green and digital transition.

5.3 Products and Services Ecosystem

NEXUS Agenda aims to develop an ecosystem of 28 products and services for the Digital and Sustainable Transition in the transport and multi-modality sector.

The 28 innovative products and services across three key categories:

- Nexus Open Data Collaboration Platform.
- Nexus Federated Applications and Services.
- Nexus Hardware Assets.

The NEXUS Open Data Collaboration Platform aims to gather, organize, standardize, and analyse a vast quantity of quality multimodal network data, which will then be accessible through an open data collaboration marketplace. Establishing a comprehensive environment for sharing data and collaborating which will encourage innovation and the application of artificial intelligence.

NEXUS Federated Applications and Services covers 25 applications and services to be included in the Open Data Collaboration Platform's Apps and API portfolio. These will significantly leverage the wealth of accessible high-quality logistic data and synergies with other products in the ecosystem. Each of these digital products and services will have its own Unique Selling Proposition (USP) and *Go to Market Strategy*. They will be prepared for commercialisation both through NEXUS and as stand-alone solutions.

NEXUS Hardware Assets include innovative hardware-based products that offer significant synergies with the open data collaboration platform and all its applications and services.

6. Stakeholder Analysis Process

The NEXUS Agenda has emerged on the national scene as an entrepreneurial and innovative project. The unprecedented scope of the agenda gives the project the potential to strategically position the activities associated with the Sines corridor at an international level.

As clarified in the literature, the Stakeholder Analysis process consists of identifying individuals or groups that show some specific interest in the organization, either impacting it or being impacted by it, for example in the decision-making processes. The success of a project, especially an innovation project, can be determined by those who are involved (Kennon et al., 2009). In this sense, a stakeholder analysis was conducted as a way of trying to deeply understand the impact of stakeholder clusters.

In NEXUS Agenda's case, the target segments were identified. The process involved allocating stakeholders from the NEXUS ecosystem to quadrants in the matrix. The interviews with a freight forwarder, a cargo owner, a specialist in Ports, two technology firms / suppliers and a Portuguese taxpayer were a valuable contribution to identifying the stakeholders' needs regarding the NEXUS Agenda. This first process resulted in the definition of six main clusters: project partners, potential customers, professional experts, academic public, governmental institutions, and Portuguese and international population.

An adaptation of the 16-square matrix proposed by Kennon et al. (2009) was used, distributing the clusters into four quadrants. The matrix crosses the levels of influence, on the X axis, and the level of importance, on the Y axis (Kennon et al., 2009).

Figure 2 shows the Stakeholder matrix for the NEXUS project.

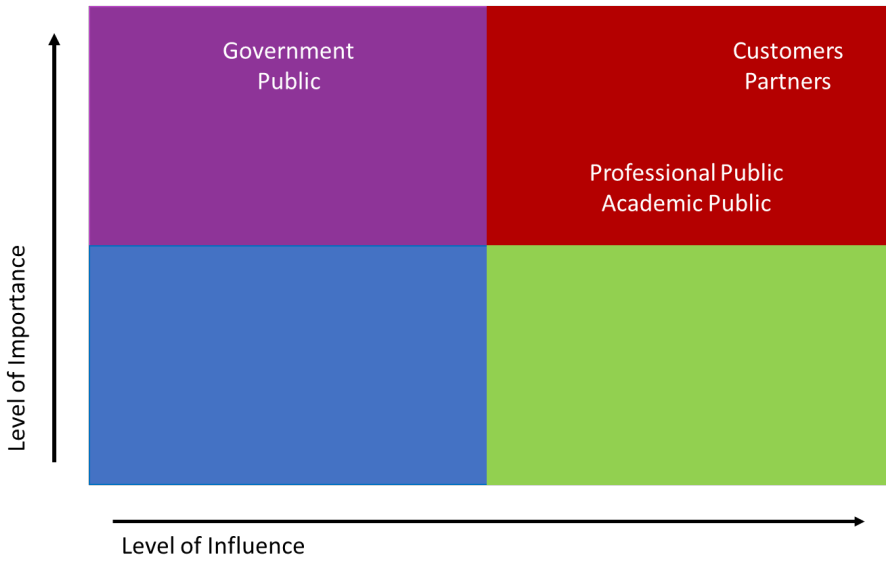

Figure 2: Stakeholder matrix – NEXUS Project

In figure 2 we can see that both the government and the [general] public are important but have a low level of influence in the outcome of the NEXUS project. The professional (specialists) and academic publics (higher education institutions) have a greater influence on the outcomes but are less important. Finally, customers (including potential customers) and [project] partners are both important and influential.

7. Discussion and Conclusion

> *Love change and hence implement the right strategy for all - and not just a strategy to maintain the status quo*
>
> *(The Authors)*

Transformation efforts "have gone under many banners: total quality management, reengineering, right sizing, restructuring, cultural change, and turnaround. But, in almost every case, the basic goal has been the same: to

make fundamental changes in how business is conducted to help cope with a new, more challenging market environment." (Kotter, 1995).

The NEXUS project falls under Portuguese cultural norms, which mean high uncertainty avoidance (99/100) and low motivation towards achievement and success (31/100) (rather favouring quality of life) (Hofstede Insights, 2024). This may mean a subconscious attempt at maintaining essential processes and systems in place - rather than changing the fundamentals which need to be changed – as "innovation may be resisted" (Hofstede Insights, 2024). Change requires hard work. Change requires an embracing of the unknown. Will the senior leadership of NEXUS be up to the task – beyond incremental innovation and more in the direction of radical [technological] innovation?

Future NEXUS project difficulties may involve the following, as enumerated by Kotter (1995):

Error #1: Not Establishing a Great Enough Sense of Urgency

Error #2: Not Creating a Powerful Enough Guiding Coalition

Error #3: Lacking a Vision

Error #4: Undercommunicating the Vision by a Factor of Ten

Error #5: Not Removing Obstacles to the New Vision

Error #6: Not Systematically Planning For and Creating Short-Term Wins

Error #7: Declaring Victory Too Soon

Error #8: Not Anchoring Changes in the Corporation's Culture

The above-mentioned errors correspond to phases which need to be traversed over a long period of time. These phases cannot be disregarded or jumped over as this will lead to failure. Haste is the enemy of a solid implementation - that sticks in the long term. All of the above eight errors may have tragic consequences for a project. Having said this, it is normal that even the best managers and leaders commit at least one big error during transformation efforts (Kotter, 1995).

The Kotter (1995) change model has gained a good reputation for addressing the main issues involved – including communication (or a lack of it). As regards error 4 - communication between partners is a constant, and frequent visits to the Sines Port have occurred during the NEXUS project.

As the project has not yet finished certain business implementation errors may still appear – to date, the project is on track. Project team members have been chosen on a voluntary rather than mandatory basis – all the better for the necessary intrinsic motivation (Amabile, 1998) to be present. Job satisfaction, passion, curiosity, and a personal challenge are all present at key points of the project – making for creativity to be nurtured and not killed (Amabile, 1998) – a prerequisite for success.

To sum up we would like to include a quote from an interview with a member of the Portuguese population – a Portuguese taxpayer. The interview was done on 17-04-2024 - by telephone and for around 10 minutes:

> *"From my point of view the NEXUS project makes sense, to the taxpayer, as if the general objective is to make ports more efficient, in Portugal, including Sines, then the money is well spent. To lower costs is essential, as is to contribute to a better functioning of ports, and to make them more profitable. Being a project aiming at mainly public entities it should be noted that private entities that use the ports will also benefit, from the better and improved services. Obviously, an online platform should not just be glossy and nice but provide real time information which is of use. Do not just provide the weather forecast, which we can get anywhere nowadays, from many other sources and sites... A better interaction with ports, which leads to added business, for a public good, is a good objective to have. As a taxpayer I am interested in that. More efficient public services. If the project does contribute to more traffic to our ports, stating when cargo will arrive and leave... without having to make telephone calls... that is advantageous. Anything that optimizes work is good and if that brings business to a Portuguese port instead of to Vigo, in Spain, or others, then all the better. Invest to gain something... to stimulate real time information, to make things more fluid, help logistics, that is good. Ports are a point of entry for wealth in the country and so as a taxpayer I am happy that money is being well spent. It is important to be efficient, have less people involved in the process, to make management processes quicker, this is all desirable." (a Portuguese taxpayer).*

This research has some limitations. Considering that the project is still ongoing, there might be a lack of comprehensive data available for analysis, which could limit the depth of the findings. Stakeholder dynamics can change over time, and an ongoing project may encounter new stakeholders or shifts in existing stakeholders' interests, which may not be fully captured in the analysis.

Future research should include interviews with stakeholders after the project has finished. Have the objectives been achieved and the expectations fulfilled? Only then will we really be able to answer the research question: How may we successfully implement a multi-partner project which involves considerable investment, and which aims to digitalize maritime ports worldwide?

Dynamics of Organisational Change: Resistance, Readiness, and the Road Ahead

Konstantin Bagrationi and Olga Gordienko
Graduate School of Business, HSE University, Frankfurt am Main, Germany

kbagrationi@hse.ru
oagordienko@hse.ru

Abstract: In today's rapidly changing and competitive business landscape, organizations are constantly forced to innovate to maintain success within their industries (Bagrationi, 2022). Resistance to change is often seen as a conscious and active choice of employees against proposed changes based on various prerequisites and motives (Oreg & Vakola and Armenakis, 2011). The purpose of this research is to explore approaches to resistance to change and readiness for change in terms of their differences. The following research questions were raised during the study: 1) What areas of research exist in the scientific discourse regarding attitudes towards change? and 2) What distinguishes understanding resistance from understanding non-readiness for change in these studies? To answer these questions, a bibliometric analysis was conducted of all English-language articles published in the journals of the first quartile (Q1) in the period from 1948 to 2022 in the category «Management, Business and Accounting», with an emphasis on attitudes to organizational change. The co-citation analysis was incorporated to narrow the sample from 21,162 articles to the most significant 258 articles. With the help of thematic analysis four main areas of research related to resistance to change and readiness for change were identified: 1) the «individual psychological» stream, 2) the «group» stream, 3) the «institutional and strategic» stream and 4) the «agency» stream. Our findings indicate that the bases for resistance to change and readiness for change are fundamentally distinct. This research underscores the variance in strategies for addressing resistance to change versus a lack of readiness for change. Tackling resistance to change is a reactive process that necessitates dynamic engagement by leadership, involving transformational actions, support for staff, and conflict resolution. This stands in contrast to the proactive fostering of change readiness, which primarily involves educating and informing employees.

Keywords: Attitude towards changes, Readiness for changes, Resistance to changes, Organizational psychology, Leadership

1. Introduction

Innovations emerge from various sources such as technological advances or changes in market demand (Vermeulen & Barkema, 2002; McGrath & Rotchford, 1983): new ideas, products and processes, or organizational structures, the implementation of which can significantly improve organizational performance (Ven van de & Poole, 2005). Regardless of their origin, innovations inevitably require organizations to implement accompanying changes (Tsoukas & Haridimos and Chia, 2002).

The existing literature identifies several constructs reflecting different aspects of attitudes toward change. Thus, «employee cynicism» towards change is considered to be a specific type of social attitude when employees doubt the sincerity or truthfulness of management's intentions (Andersson, 1996). «Commitment to change» reflects the degree to which an employee is willing to support and participate in the change process (Herscovitch & Meyer, 2002). «Openness to change» indicates an individual's willingness to accept and support innovation (Miller & Johnson and Grau, 1994). «Acceptance of change» is related to actively recognizing the need for change (Jones & Jimmieson and Griffiths, 2005), while coping with change focuses on an individual's ability to adapt to new conditions (Folkman & Lazarus, 1985).

«Resistance to change» considered a conscious and active choice of employees against proposed changes based on various backgrounds and motivations (Oreg & Vakola and Armenakis, 2011). This may be due to threats to status, personal power, disagreement with the goals of the change or problems in the relationship with management (Eisenbach et al., 1999). On the other hand, «readiness for change» is usually related to positive perceptions and openness to upcoming changes, recognizing their necessity and usefulness (Armenakis & Bedeian, 1999). This paper focuses on these two constructs: although attitudes towards change are a complex and versatile phenomenon, resistance and readiness are the most fundamental and most popular among in the existing academic discourse.

The article by Stroh, 2021 identifies a pivotal shift in change management practices, stating a moving focus from primarily addressing employee resistance to actively cultivating their psychological readiness for change (Stroh, 2021). In this regard, the question arises: how relevant is it to study exactly resistance to change? Can the entire spectrum of employees' attitudes towards change be described in terms of one or another degree of readiness?

Through the systematic review analysis, the authors of the article discuss the possibility that employees may simultaneously exhibit both readiness for change and resistance to change and conclude that it is important to

distinguish between the concepts of «readiness for change» and «resistance to change» as each of these concepts has its own characteristics and mechanisms of influence on the success of change (Repovš et al., 2019).

2. Methodology

The first stage of the methodology for this systematic review was conducted in alignment with the Preferred Reporting Items for Systematic Reviews and Meta-analyses (PRISMA) guidelines to ensure the robustness of the findings (Moher et al., 2009). The review process comprised several key phases: (1) formulating research questions, (2) identifying relevant databases and keywords, (3) selecting sources and analysing them, and (4) discussing the results.

Phase 1. The following research questions were formulated:

- RQ1. What directions of research on attitudes toward change exist in academic discourse?
- RQ2. What is the difference between understanding resistance and understanding readiness for change in these works?

Phase 2. To answer the formulated research questions, a bibliometric analysis of all English-language articles published in Q1 journals between 1948 and 2022 in the Management, Business & Accounting category (Small, 1973) was conducted. This resulted in a sample of 21162 articles.

Phase 3. Authors used co-citation method of analysis (CCA-R) via VOS viewer software identify most relevant articles from the initial sample (Van Eck & Waltman, 2017). This resulted in 326 articles that formed 6 clusters. Then, articles were excluded if their title or abstract did not align with the theme of employee attitudes toward change. This reduced the sample to 285 research papers. Their full-text versions were then processed using Natural language processing (NLP) algorithms in Python. As a result, a tag cloud was obtained, visualizing the significant preconditions for the emergence of a particular attitude towards wards change. Thematic analysis was conducted using Latent Dirichlet placement (LDA) algorithm to build a machine learning model based on a hierarchical Bayesian network.

Phase 4. The of LDA results were then interpreted to identify key factors, primary clusters, and research themes within the domain of employee attitudes towards change.

3. Findings

As a result of the CCA-R, six clusters were identified, each covering a specific area of study of attitudes to change. (Figure 1)

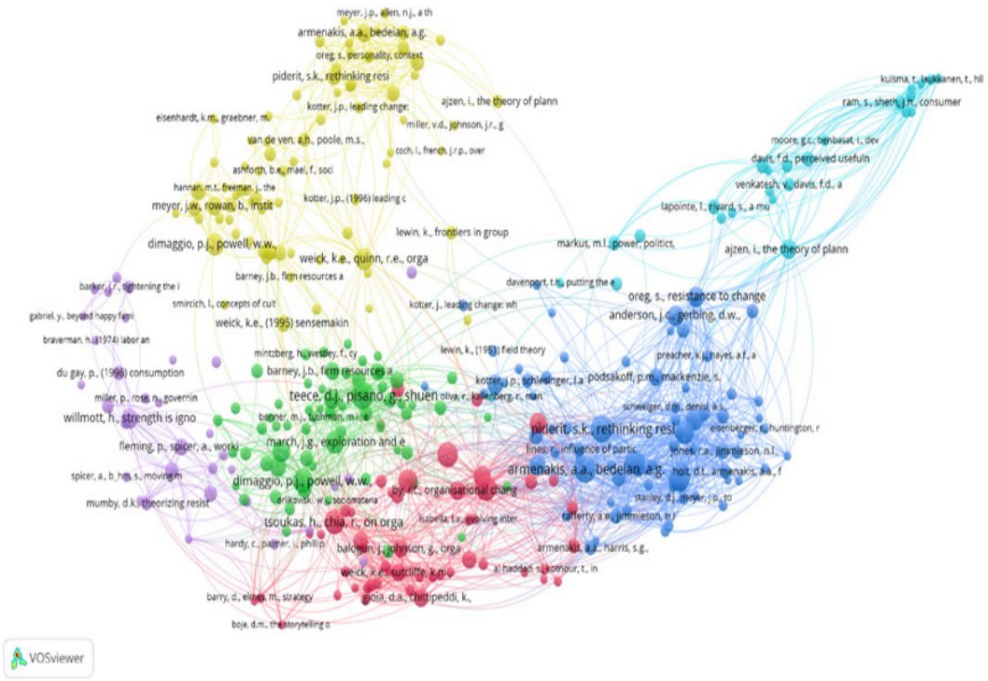

Figure 1: CCA-R

The red cluster summarizes strategic aspects of change, focusing researchers' attention on the role of top management (e.g. Kotter, 1995; Tsoukas & Haridimos, 2002). This cluster includes C. Lewin's seminal work, "Frontiers in Group Dynamics: concept, method and reality in the social sciences; social equilibrium and social change", where the "planned change" approach was first introduced, laying the foundation for subsequent studies of organizational change as a strategic process (Lewin, 1947). The green cluster emphasizes the dynamism of the change process and the adaptability of the organization during the period of change implementation (e.g. Eisenhardt & Martin, 2000). Studies of this cluster can be classified as institutional: they examine the role of culture, power relations, and change policies (e.g. Orlikowski, 1996; Oliver, 1991), as well as the dynamic capabilities of the organization (Eisenhardt & Martin, 2000). The purpose of several works categorized in this cluster was to develop tools to assess the readiness for change and the level of resistance of an individual employee (Oreg, 2003) and to explain how resistance can be managed (e.g. Armenakis & Harris, 2002). Th light-blue cluster centered around behavioral aspects, primarily the theory of planned behavior (Ajzen, 1991), which establishes a direct link between attitudes, norms, perceived behavioral control, behavioral intention, and behavior itself. The purple cluster highlights control and power dynamics. Articles provide meaningful contributions to the understanding of control and power in the context of organizational change: a dialectical approach focuses on the relationship between control and employee resistance (Mumby, 2005), other works consider identity regulation as a form of organizational control and explore its implications for employee behavior in organizational change (Alvesson & Willmott, 2002), and analyze cultural management in organizations and its relationship to control and power (Willmott, 1993). The yellow cluster, functioning as a «mirror», duplicates key works from the other clusters, identifying basic principles and approaches to the study of attitudes toward organizational change.

Thus, through co-citation analysis, we have uncovered key research areas in the field of attitudes to change. However, more detailed study is needed to uncover the interactions among theories and concepts. Thematic analysis, exposing important themes and relationships that might have been missed or under-reported in co-citation analysis, can pinpoint where theories intersect and guide more detailed research into readiness for change or resistance (Table 1). This allowed us to proceed to the description of the main results of the thematic analysis.

Table 1: The results of the thematic analysis

Group 1	Group 2	Group 3	Group 4
personality	discussion	structure	contract
psychological	act	divisional	main
contribute	readiness	requirement	agreement
failure	team	direction	life
employee	interpersonal	culture	relevant aspect
internal world	affect	emergent	department
desire	force	reason	goal
age	allow	gradual	necessity
career	common vector	openness	adaptivity
support	take action	unofficial	community
skill	organize	failure	balance
benefit	provoke	incremental	basis

4. Discussion

Group 1. (48%) «Individual-psychological» direction

The works included in this group focus on causes related to individual psychological characteristics such as personality traits and attitudes (e.g. Herold et al., 2007; Oreg, 2006). The publications included in the first group indicate that, overwhelmingly, employees seek comfort - an understandable and familiar situation, and the thought of impending change inspires anxiety and causes fear and alienation, subsequently becoming a complete barrier to attempts to overcome resistance to change by management (Rosenberg, Mosca, 2011). Researchers identify personality assumptions (self-esteem, self-efficacy, and others) and attitudes that directly influence resistance to change (Oreg, 2006). Other individual factors that influence attitudes toward change include demographic characteristics such as age, gender, skills and education, threat of personal power,

attitudes (trust) toward management, attitudes toward the difficulty of learning new technologies, and divergence of individual and organizational interests (Mumby, 2005; Venkatesh et al., 2003)

Thus, the first group is particularly significant and occupies almost half of the total volume of the thematic model. In a large number of works of this group the central role in the framework of employees' reaction to changes is given to individual-psychological characteristics, attention is focused on internal barriers and motives that can both contribute to resistance to changes and create conditions for readiness for them. According to this approach, resistance is predominantly caused by personal characteristics that directly influence the perception of change and reaction to it, such as self-esteem and self-efficacy, and the causes of resistance are associated with anxiety due to the need to leave the comfort zone, with the avoidance of uncertainty (Oreg, 2006). Thus, in the works of the first group resistance to change is associated with personal preconditions and predisposition to a certain reaction to change, readiness for change is more associated with the perception of change by each individual employee and the degree of his/her awareness of these changes (Kotter & Schlesinger, 1979).

Group 2. (22.5%) «Group» orientation

The second group rightly emphasizes the importance of group dynamics, team and interpersonal relationships in shaping and changing attitudes toward change (Armenakis & Harris, 2002). Interactions within the group directly affect participants' awareness of the upcoming change, which can contribute to the formation of readiness, and group dynamics is one of the main factors affecting the success of organizational change (Armenakis & Harris, 2002). One reason for resistance may be the establishment of close ties within groups, which may lead to acting in the group's interests for fear of losing interaction with colleagues (Rafferty & Jimmieson and Armenakis 2013). In top-down directive change implementation, there is an increasing role for the authority of individuals and resistance to change may be based on the opinion of an authoritative participant (Eisenbach et al., 1999).

The second group focuses on the relationship between group dynamics and interpersonal relationships in the context of organizational change. Resistance to change in this group is primarily manifested through group dynamics: close ties within groups can lead to actions against organizational change for fear of losing those ties (Rafferty & Jimmieson and Armenakis 2013). Resistance can also arise from authoritative actors in a group when these actors resist change (Eisenbach et al., 1999). Norms and values play a key role in shaping readiness for change at the group level (Armenakis, Harris, 2002; Bordia et al., 2004). The degree of compliance of changes with the values and norms of the organization can serve either as an incentive or a barrier to their implementation, affecting the attitude towards wards change at the individual level (Rafferty & Jimmieson and Armenakis 2013). According to the works of the second group, to increase the level of readiness for change, it is necessary not only to provide clear information to employees about the upcoming changes, but also to take measures that promote the strengthening of interpersonal trust of employees in general and their trust in management in particular (Kotter, 1995).

Group 3. (16.8%) «Institutional and strategic» direction

The third group focuses on the attitude towards changes at the organizational level: the importance of aligning organizational changes with the company's development strategy is emphasized (Burns, 2004). When employees only learn about planned organizational changes retrospectively, the negative side of informal communication (rumors that create anxiety and fear of change) is manifested (Rosenberg & Mosca, 2011). Moreover, negative past experiences of change implementation can have a negative impact on the implementation of current changes: failed or incomplete changes cause employees to become cynical about management actions in the present and future changes in general (Tsoukas et al., 2002). In contrast, a policy of «small steps», continuous incremental change that allows the organization to continually adapt, can increase readiness for change through pairing long-term system plan-strategies with «quick wins» (Burnes & Jackson, 2011). On the other hand, the third group shifts the focus of attention to the external environment as well: it is in the third group that much work on institutional theory and resistance as a form of response to institutional pressures is concentrated (Greenwood & Hinings, 1996). The context and reason for change can also influence the adoption or non-adoption of a particular innovation (Rosenberg & Mosca, 2011).

The third group's focus on the organizational level is also expressed in the way it illustrates the importance of organizational structure as a factor in a company's ability to change: structural characteristics (centralization or decentralization, hierarchy, size) directly affect the performance of the change implementation process and the level of resistance (Orlikowski, 1996). Other important ideas of the third group are the importance of the presence of a responsible person (Gioia & Chittipeddi, 1991) controlling the process of change implementation

(whose presence contributes to increasing the level of readiness for change and promptly identifying problems with the current policy of change implementation), as well as the significant role of organizational culture, namely the conformity of change to the values and norms of the organization (Huber et al., 1993). In the works of the third group, resistance to change is generally viewed as an intentional action on the part of employees - it is to some extent an active expression of disagreement with proposed changes, often based on past experiences or rumors (e.g. Orlikowski, 1996; Rosenberg & Mosca, 2011; Tsoukas et al., 2002).

Group 4. (12.7%) «Agent-based» orientation

The last group examines the role of individual agents - active stakeholders - in shaping employees' attitudes towards change and relates the roles of individual actors to their capabilities in reducing resistance or in shaping readiness for change. Key here are the concepts of 'narrative' and 'meaning making' in the company: how exactly agents narrate change, how exactly meanings are translated (Isabella, 1990). It has been noted that the success of change is mediated by the achievement of consensus (agreement) rather than a directive approach (Gioia & Chittipeddi, 1991). Individual conditions of success of change agents are considered, such as high social status of the actor (as a necessary condition for its effectiveness in the role of a change agent, providing employees with necessary resources and the opportunity to acquire the necessary skills, providing support from immediate and top management, which will contribute to the perception of changes as fair (Eisenbach et al., 1999; Rosenberg & Mosca, 2011).

Thus, the works included in the fourth group emphasize how the role of individual agents in the process of change implementation is critical for generating positive employee attitudes towards the change: the narratives through which agents communicate information about change can both generate willingness and provoke employee resistance (Weick & Sutcliffe & Obstfeld, 2005; Isabella, 1990). When change agents with high social status competently communicate with employees and support them on their mastery journey, their readiness for change increases (Higgs & Rowland 2005). In the absence of such work, especially if change is perceived as imposed or unfair, readiness levels may decline. At the same time, resistance is often a conscious choice; lack of readiness is more often related to a lack of understanding of how to adapt to a new situation. Effective change agents know how to distinguish between these two phenomena and adapt their strategies accordingly. Resistance to change in this context may be due to the actions of specific actors, e.g., employees with high social status who deliberately obstruct change for fear of losing their status or authority/privilege. The success of change may depend on the ability of agents, through transformational behavior, to form a suitable narrative by which change is perceived in a less negative way by company employees (Huy, 2002). Readiness for change, within the agency approach, can be enhanced by the actions of individual actors providing employees with the necessary support to acquire new skills. Research focusing on change readiness involves the development of approaches to foster positive attitudes towards change among employees and the organization (Teece et al., 1997; Ajzen, 1991).

5. Conclusion

Organizational change has traditionally been the focus of attention of researchers and practitioners in management and organizational psychology, with a special place in the discourse given to issues related to how to prepare employees for the upcoming changes and overcome their resistance (Burnes & Jackson, 2011; Kotter, 1995; Lewin, 1947; Coch, French, 1948). Since the late 20th century, «resistance» and «readiness for change» have become key concepts in academic and practical management discourse, epitomizing different attitudes towards the change process. The purpose of this study was to attempt to delineate the boundaries of these constructs.

Thus, resistance is most often associated with several social-psychological factors such as fear of the unknown, bias based on experience or the influence of the social environment and is expressed as active opposition to proposed changes (DiFonzo & Bordia and Rosnow, 1994). Readiness, on the other hand, acts as an indicator of understanding of the meaning of change, support and participation by management and their agents in the change process that organizations seek to implement (Teece et al., 1997). From these perspectives, unpreparedness is rather related to the lack or absence of knowledge and conditions for successful adaptation to new circumstances (Kotter, 1995; Burnes & Jackson, 2011). Therefore, resistance to change and readiness for change have different backgrounds and motivations, which require different approaches to studying and overcoming them (Oreg, 2006; Eisenbach et al., 1999; Armenakis & Harris, 2002; Kotter, 1995).

Since the mid-twentieth century, staff resistance, which is often seen as a conscious choice of employees, has been assigned the role of a major obstacle to the successful implementation of organizational change (Lewin,

1947), and methods aimed at overcoming it are often based on a reactive approach, suggesting a predominantly reactive response to pre-existing circumstances. The goal of such interventions is to address concerns that may serve as sources of resistance - including those related to previous experiences, existing stereotypes, social pressures, and so on (Markus, 1983). To overcome resistance to change, management should, on the one hand, take into account both perceived threats to employees' status and social capital (including employee «blat», see: Bagrationi & Volkov, 2022), which cause disagreement with the goals of change, actively manage the change process by implementing a change-oriented style, such as transformational behavior (Eisenbach et al., 1999).

In contrast to methods within a reactive approach to overcoming resistance, building readiness for change requires methods implemented in a proactive approach. Such methods may also include persuasive tactics, for example: providing additional information about the benefits of change or showing successful adaptation examples of other organizations (Ajzen, 1991; Armenakis & Bedeian, 1999). However, change readiness techniques are not aimed at transforming the already established attitudes of individual resisters, but at creating conditions for the involvement of a wide range of employees in the change process by providing them with the necessary support, by teaching them new skills and competencies (Weick & Sutcliffe and Obstfeld, 2005; Isabella, 1990). They may also include creating a positive narrative about the upcoming changes, utilizing feedback mechanisms to capture employee opinions, and actively engaging leaders at various levels to promote change (Huy, 2002). Thus, the key difference between the two approaches is that while methods for overcoming resistance involve responding to problems that already exist, methods for creating readiness involve creating favorable conditions for the successful implementation of change.

Management often perceives their subordinates as a single social group with common goals, whereas the presence of different subgroups requires a much more nuanced approach to change management (Collins, 1998). Programs need to be shaped to both overcome resistance and build readiness. It is necessary to form programs aimed at both overcoming resistance and building readiness. The specificity of strategies designed to mitigate or neutralize resistance implies, for example, the inclusion in such programs of active leadership of change agents who are able to form an attractive vision of the company's future for employees after the implementation of changes (Bagrationi & Thurner, 2020): they need to actively communicate with employees, clarify their concerns and fears, and provide them with information about the reasons, goals and benefits of the proposed changes. To achieve this goal, change agents not only need to demonstrate their commitment to change and try to become a role model (Higgs & Rowland, 2005), but also use an individualized approach to employees who show a high level of resistance to consider their concerns, motives and needs in the communication work (Eisenbach et al., 1999).

Strategies to build readiness for change include emphasizing transparent and clear communication, employee training and development, and management support at all stages of the change process (Teece et al., 1997). Such strategies may involve a variety of training courses, master classes and workshops aimed at increasing employee awareness of change and its benefits to the organization (Armenakis & Bedeian, 1999; Bamford & Forrester, 2003). The combination of these strategies is aimed at forming a synergetic effect that facilitates the process of change implementation and minimizes potential risks associated with resistance and unpreparedness of employees.

Based on this analysis, the directions for future research can be suggested. Since the vast majority of research has focused on a static understanding of the constructs under study, future research may shift the focus of researchers and practitioners to how resistance and readiness for change evolve over time in different contexts. Moreover, both best and unsuccessful change management practices should continue to be analyzed to identify key success factors.

Entrepreneurship Education Around the World: A Study on Member Universities of the Association to Advance Collegiate Schools of Business

Zeynep Baysal
Department of Business Administration, OSTIM Technical University, Ankara, Türkiye

zeynep.baysal@ostimteknik.edu.tr

Abstract: It has long been debated whether people are born entrepreneurs or if it is a combination of skills and knowledge that can be acquired through education and training. While there are passionate scholars on both sides of the debate, the increasing number of studies and programs focusing on training people on how to become entrepreneurs perhaps shows that the balance is shifting in favour of the latter side. The purpose of this study is to examine how universities are performing the task of teaching entrepreneurship by focusing on member institutions of the Association to Advance Collegiate Schools of Business (AACSB). A total of 461 out of 1794 institutions that are members of the AACSB member directory were examined for the study. First, descriptive statistics were used to determine the number of bachelor's and master's degree programs that focus directly on entrepreneurship education along with lower-level programs such as minors and certificates. This was supplemented by examining additional entrepreneurship-related best practices employed by these institutions, such as entrepreneurship centres or certificate programs. All analyses were bifurcated by examining results based on criteria such as educational level, geographical location, and AACSB accreditation. The results show that although almost all business schools have included some form of entrepreneurship courses in their curricula, the number of programs or degrees directly dedicated to entrepreneurship remains a minority. In addition to classroom teachings, some of these institutions offer innovative practices related to entrepreneurship, such as entrepreneurship scorecards, entrepreneurship competitions, and certificate programs. All data collected and analysed were used to develop an overview of undergraduate and graduate level entrepreneurship education to encourage institutions and individuals to develop entrepreneurship programs that cover all theoretical and applied aspects of entrepreneurship education to support aspiring entrepreneurs along their journey.

Keywords: Entrepreneurship education, Association to Advance Collegiate Schools of Business, Case study

1. Introduction

Entrepreneurship education, which can be defined as any activities undertaken by institutions to teach individuals how to become entrepreneurs, is one of the key items of the Entrepreneurial Framework Conditions stipulated by Global Entrepreneurship Monitor (GEM) which lays down the conditions that support or hinder new business creation (GEM, 2024). However, it is reported in the GEM 2023/2024 report that entrepreneurial education is the weakest assessed of all items, which indicates there are some issues to be fixed in this area. The debate of whether entrepreneurship can be taught or is an inherent quality that people are born with lays the foundation of the quality and the quantity of entrepreneurship-oriented education. This debate also shapes the methods of teaching entrepreneurship and the mindset of entrepreneurship scholars. As many fields of higher education, entrepreneurship education is also changing to keep up with the trends which raises the question of how the universities and colleges of today undertake the task of teaching entrepreneurship.

1.1 Purpose

The purpose of this study is to examine how entrepreneurship is being taught by higher education institutions and provide an overview that encompasses the best practices. For this purpose, the institutions included in the member directory of the Association to Advance Collegiate Schools of Business (AACSB) were studied regarding the entrepreneurship-oriented education they provide as well as the extra-curricular activities they undertake such as holding entrepreneurship competitions, offering certificate programs, and establishing entrepreneurship centres. The findings were used to provide an overview of entrepreneurship education to provide insights to higher education institutions aspiring to provide extensive entrepreneurship training.

1.2 Limitations

As any research, this study also has certain limitations. First and foremost, the study is limited to the sample of AACSB member institutions. Although AASCB is one of the highly regarded accreditation institutions for business schools, as evident by 88% of the highest ranked management schools according to QS Top Universities Ranking being AACBS members (AACSB, 2024; QS World University Rankings, 2024), the geographical distribution of the members may raise concerns. The majority of the members in the sample are

from the United States of America (57%) and even though this may simply be a reflection of the global distribution of higher education institutions, it may also lead to the results of this study to be interpreted as representing the "American view" on entrepreneurial education.

Another limitation is the fact that not all institutions listed by AACSB has shared all necessary information. Considering the fact that there is a significant number of institutions with no data about their programs and courses whatsoever may lead to questions about the completeness of the study. Therefore, it is possible that the institutions that have not disclosed data about their entrepreneurship-oriented courses and activities might indeed have valuable contributions that may have been overlooked due to this shortfall.

2. Literature on Entrepreneurship Education

The term entrepreneurship, as coined by Richard Cantillon in 1755 and later expanded by François Quesnay in 1888 and Jean-Baptiste Say in 1845, is often attributed to Joseph Schumpeter who defined it as the act of "reforming or revolutionizing the pattern of production by exploiting an invention or, more generally, an untried technological possibility for producing a new commodity or producing and old one in a new way by opening up a new source of supply of materials or a new outlet for products by reorganizing and industry and so on" (Schumpeter, 1942; Śledzik, 2013). Following the definition of Schumpeter, entrepreneurial activities often include various methods of introducing ideas and transforming those ideas into marketable products and services for the purpose of earning profit.

Early theories on entrepreneurship are exceedingly diverse which include economic theories such as the theories of Schumpeter (1989), Kirzner (1997) and Marshall (1948) with a focus on the role of entrepreneurs in the market and their relationship to profits; psychological theories including but not limited to the studies of McClelland (1961), Hagen (1962) and Kunkel (1997) that emphasize the personality of individuals and their psychological motives; and sociological theories such as Weber (1904), Young (1971), Hoselitz (1963) and Cochran (1971) that underline the impact of the society on the emergence of entrepreneurship.

In addition to diverse disciplines studying entrepreneurship, another compelling question asked by scholars is whether entrepreneurship is an inherent quality people are born with or something that can be taught. Notwithstanding the view on whether people are born entrepreneurs or they have to be taught how to become one, the role of entrepreneurs in economies as engines for growth has long been accepted (Adekiya and Ibrahim, 2016). However, the view on this debate is epochal since it affects how educational institutions approach entrepreneurship education. Literature is divided on theories that argue certain personality traits are required to become entrepreneurs and thereby entrepreneurship education is useless and those that claim knowledge and skills to be acquired through education is what turns individuals into entrepreneurs.

2.1 Arguments for Entrepreneurship Education

Entrepreneurship education comprises all kinds of educational activities that aim to support the entrepreneurial journey of individuals. This education may be offered as a course, a concentration area (which is a subsection of a degree where the student focuses on entrepreneurship by choosing elective courses in that field), an undergraduate degree, or a graduate degree by a higher education institution or may be in the form of trainings delivered by other public and private institutions. The common goal of these activities is to provide individuals with theoretical and practical knowledge on how to establish their own businesses.

Early research on the relationship between entrepreneurship education and entrepreneurial intent demonstrates that exposure to entrepreneurship education during early ages encourages and supports the entrepreneurial intent (Gibb and Ritchie, 1982; Lee-Gosselin and Grise, 1990; Dyer, W, 1994). In other empirical research, Zhao et al (2005) uncovered a strong positive relationship between entrepreneurial education and entrepreneurial intent, which was later supported by Adekiya and Ibrahim (2016) in their research investigating the relationship between entrepreneurship training programs and the tendency of students to engage in entrepreneurial activities as well as Hutasuhut, Aditia and Thamrin (2024) who found a significant relationship between entrepreneurship training and entrepreneurial orientation and intent. Davidsson and Honig (2003) had a different approach which included not only the entrepreneurial intent but also the success of entrepreneurial activities which led to the conclusion that formal entrepreneurship education had a significant role in predicting entrepreneurial intent but no significant relationship was discovered between education and entrepreneurial success.

From a theoretical perspective, the foundation of entrepreneurship education is laid down by theoretical frameworks such as Theory of Planned Behaviour and Self-Efficacy Theory. Theory of planned behaviour

developed by Ajzen (1991) is relevant in the sense that entrepreneurship is a planned behaviour for which the intention would depend on personal attractiveness, social norms and feasibility. It is claimed that intentions models predict entrepreneurial behaviours better than individual (personality traits) and situational factors (external variables) (Krueger, Reilly and Carsrud, 2000). On the other hand, the Self-Efficacy Theory developed by Bandura (1978) emphasizes perceived behavioural control and observational learning in shaping intentions and behaviours which in this case is reflected in entrepreneurial intent and behaviour.

2.2 Arguments Against Entrepreneurship Education

Looking from the other end of the spectrum, not all scholars are in agreement that entrepreneurship education is the right path to follow when the goal is to increase the number of nascent entrepreneurs. Shane and Venkataraman (2000) and Kuratko (2005) are among the first scholars who challenged the idea of legitimizing entrepreneurship education as a solution that will lead to an increase in new business creation. The question of whether entrepreneurship can be taught, as coined by "teachability dilemma" by Haase and Lautenschlager (2011), is often answered by the scholars on this side of the debate by accentuating the importance of experience over classroom education.

One of the dominant arguments of those against entrepreneurship education is that it is a skillset that can only be obtained through real life experience and this experience supersedes classroom teachings. As claimed by Kent (1990), one of the early scholars studying the topic of entrepreneurship education: "Entrepreneurship education must be entrepreneurial". This approach emphasizes the notion that entrepreneurship should be taught in a more "learning-by-doing" standpoint where students engage in more hands-on activities to acquire real life experience (Cope and Watt, 2000; Rasmussen and Sørheim, 2006).

Neck and Greene (2011) posit that there are three approaches to entrepreneurship education which are named as 1) Entrepreneur World; where the entrepreneur is the focal point of the education, 2) Process World; where the entrepreneurship process is taught from idea creation to business establishment, and 3) Cognition World; where the knowledge structures and thinking patterns of entrepreneurs is the main attraction. However the scholars believe that these traditional approaches no longer function in the new world and propose a new approach where entrepreneurship should be taught as a method (Neck and Greene, 2011). This approach requires the entrepreneurship education to be taught as an experience and action-based set of courses which involve simulations, real enterprise creation and design-based learning.

3. Methodological Framework

The approach to entrepreneurship education is varied among institutions based on their view on whether it should be a separate field or just a track of the business administration curriculum. To further understand this disparity, this study aims to provide an overview of how entrepreneurship education is delivered by leading higher education institutions around the world by conducting an analysis of secondary data. This section provides information on the research methodology including sampling methods, analyses and findings.

3.1 Research Methodology

The methodology employed in this study includes statistical analysis of secondary data complemented by case examples. First step of the analysis was to calculate the descriptive statistics of schools and programs by countries, institution type, size, educational level and the accreditation status of institutions. Second step of the analysis was to examine each school and the entrepreneurship-oriented programs they offered. And final step was to investigate the best practices of the schools in the sample. Case examples were selected based on subjective criteria such as their uniqueness and contribution to the entrepreneurship education. All the findings and analysis results were then compiled to provide an overlook of how entrepreneurship education is undertaken in different institutions around the world.

3.2 Sampling and Data Collection

The sample used in this study is selected from the higher education institutions which are members of the Association to Advance Collegiate Schools of Business (AACSB). AACSB is a highly regarded global nonprofit association established in 1916 which aims to help business schools worldwide achieve educational excellence (AACSB, 2024). The institution undertakes accreditation activities for colleges and universities focused on business education as well as creating a network among its members to elevate the standards of business education. The justification for selecting this sample is the vast amount of higher education institutions (1794 institutions as of July 2024) included in the database provided by AACSB and its coverage of highest-ranked

colleges and universities. This is believed to help this research achieve a view on best practices in the business education ecosystem.

Data used in this study is obtained from AACSB Analytics Hub which provides varied data on all the institutions included in the member directory. The term "institution" used here refers to all colleges, universities and other educational entities added to this list. The search engine provided by the Hub delivers 1794 institutions in total that are included in the member directory. When schools and programs related to entrepreneurship are searched, the results show that 461 out of 1794 institutions have some type of an entrepreneurship program which is calculated as 1908 programs in total.

3.3 Analysis and Findings

First step of the analysis was to lay down the descriptive statistics of the data obtained from AACSB Analytics Hub. This database is a paid service offered by AACSB to its member institutions which offers information about the universities and colleges and gives the opportunity to compare these institutions on various dimensions. Table 1 exhibits the distribution of institutions that offer entrepreneurship programs based on geographical location, institution type and size.

Table 1: AACSB Member Institutions with Entrepreneurship Programs

		N	**%**
Status	Institutions with Entrepreneurship Programs	461	26
	Institutions without Entrepreneurship Programs	1333	74
	Total	1794	100
		N	**%**
Countries	United States of America	261	57
	United Kingdom	39	8
	France	19	4
	Australia	17	4
	Canada	16	3
	Germany	10	2
	Taiwan	7	2
	Ireland	5	1
	Others (<1%)	87	19
	Total	461	100
		N	**%**
Institution Type	Public (owned by state)	319	69
	Private (owned by private entities)	142	31
	Total	461	100
		N	**%**
Size	Small (Up to 35 Full-time Faculty Members)	78	17
	Medium (36-75 Full-time Faculty Members)	139	30
	Large (More than 75 Full-time Faculty Members)	201	44
	Not Declared	43	9
	Total	461	100

Table 1 demonstrates that the distribution of entrepreneurship-oriented programs in AACSB member institutions leans towards not having programs purely dedicated to the field. An investigation into the curricula of AACSB member institutions shows that business schools tend to integrate entrepreneurship as a course or a track to their studies rather than dedicating a separate program or degree to this discipline.

Regarding the geographical distribution, a significant percentage of all institutions appear to be located in the United States of America which can be explained by the fact that a high percentage of all higher education

institutions worldwide are located in that region. This may also be caused by AACSB being perceived more important in American institutions since being originally founded as "American Assembly of Collegiate Schools of Business" despite its current positioning as a global nonprofit association (AACSB, 2024).

Although not directly related to the study, the distribution of the members by institution type and size is also provided in Table 2 which provides insight into the characteristics of the research sample. Data indicates that majority of the member institutions are public institutions, and the number of large institutions is higher than the others which means they have more than 75 full-time faculty members. These two factors might be correlated since public universities are often larger than private universities and such institutions have more government support and funding which may have led to having more entrepreneurship-oriented programs.

After a general overview of the data, the institutions that offer entrepreneurship were analysed based on the educational level of the programs, accreditation status of the institutions and the names of the programs offered.

3.3.1 Level of education

Another important dimension of how entrepreneurship programs are distributed is the level of education. Results demonstrate that entrepreneurship programs are widespread among both undergraduate and graduate level studies. Table 2 summarizes the results of the analysis.

Table 2: Distribution of Entrepreneurship Programs by Level of Education

Level of Education	**N**	**%**
Undergraduate	810	42.5
Masters-Specialist	451	23.6
Masters-Generalist (MBA)	282	14.8
Graduate Level Certificate	98	5.1
Doctoral	74	3.9
Masters-Generalist (non-MBA)	71	3.7
Undergraduate Certificate	65	3.4
Masters-Generalist (EMBA)	38	2.0
Masters-Generalist (MBA/Dual Degree)	11	0.6
Integrated Undergrad-Masters	7	0.4
Executive Education	1	0.1
Total	**1908**	**100**

As exhibited in Table 2, the percentages of undergraduate and graduate level entrepreneurship programs are very close despite the latter being slightly higher. In fact, the sum of all master's and doctorate level programs (48.6%) exceeds the number of bachelor's level programs (42.5%) which may be interpreted as entrepreneurship education being considered more appropriate for more mature and educated individuals. This supports the notion that older and more experienced entrepreneurs are often more successful in their endeavours compared to newly graduates (Azoulay *et al.*, 2018). This may also be because entrepreneurship education requires the individual to have a basic understanding and knowledge in business functions which may be provided by a bachelor's degree.

Additional investigation into the other levels of entrepreneurship education reveals that some of the institutions prefer to have entrepreneurship as a concentration, minor program or track to their business administration programs. Certificate programs are also quite common but none of these lower-level programs are as widespread as entrepreneurship majors provided at undergraduate and graduate level. This illustrates that entrepreneurship education has been accepted as a legitimate university degree.

3.3.2 Accreditation status

AACSB accreditation is a profoundly prestigious achievement for any institution related to business education which means that they have gone through a long and intricate process of being scrutinized by AACSB. Table 3 shows the distribution of the institutions analysed, by their accreditation status.

Table 3: Distribution of Institutions by Accreditation Status

Accreditation Type	N	%
Business Accreditation	311	67
Business & Accounting Accreditation	112	24
Not Accredited	38	8
Total	**461**	**100**

As the table demonstrates, majority of the institutions that offer entrepreneurship programs are accredited by AACSB. This indicates that the decision to dedicate a program to entrepreneurship is a decision that is more commonly adopted by highly prestigious colleges and universities worldwide.

3.3.3 Terminology use in naming of programs

Findings of the research also demonstrate that a significant number of undergraduate and graduate level entrepreneurship-oriented programs offered by the institutions have one thing in common: The term "innovation". Innovation, which can be broadly defined as the act of introducing something new, is a concept that goes hand-in-hand with entrepreneurship. Following the ideas of Schumpeter (1942), being innovative is often considered as a pre-requisite of being an entrepreneur.

This is evident in the names of the programs offered by the institutions in this study. After the choice of simply naming the programs as "Entrepreneurship" (which makes up 30% of all programs), the most common choice is to combine the term with innovation. A pattern can easily be drawn by looking at the programs named "Innovation and Entrepreneurship" or "Entrepreneurship and Innovation" on both undergraduate and graduate level, which is approximately 16% of all programs.

Looking at the names of the programs, there also exist some unique examples that attempt to combine entrepreneurship with innovation and creativity. BINUS Business School from Indonesia (BINUS, 2024) having a program called "Creativepreneurship" under its business school and the Chulalongkorn University from Thailand (Chulalongkorn University, 2024) offering a program called "Technology Management and Innopreneurship" is just two examples of these attempts to merge these concepts which are already being used interchangeably.

3.4 Case Examples from Selected Institutions

Following an overall analysis of all entrepreneurship programs offered by AACSB member institutions, this section provides case examples from selected institutions to provide an overview of the entrepreneurship programs.

3.4.1 Entrepreneurship centres

Entrepreneurship centres are entities established within universities which aim to encourage and support entrepreneurial activities at these institutions. These entities are sometimes referred to as "entrepreneurial institute" or "entrepreneurship academy" as in the case of California State University/DH (California State University, 2024) in the USA and ESMT in Germany (ESMT, 2024). Entrepreneurship centres often work as bridges between the entrepreneurship education and real-life practice. As previously mentioned to be one of the shortcomings of theoretical entrepreneurship education, entrepreneurship centres help the whole process become more integrated with the real business world.

For instance, Bettany Centre for Entrepreneurship established under Cranfield School of Management in England (Cranfield School of Management, 2024) describes its role as facilitation of entrepreneurial growth to unlock the entrepreneurial potential of students, faculty and staff by closely linking research, education and practice. They provide consulting, events for networking, entrepreneurship competitions and scholarships to aspiring entrepreneurs. A similar case can be observed in Ozyegin University in Turkiye (Ozyegin University, 2024) which offers incubation and acceleration centres for students named as "Startup Factory" and "OpenFab". Babson College in the USA (Babson College, 2024) is another unique example which provides three distinct entrepreneurship centres for entrepreneurship (Arthur M. Blank Centre), women's entrepreneurial leadership (Frank & Eileen Centre) and family entrepreneurship (Bertarelli Institute).

3.4.2 Entrepreneurship competitions and scholarships

Since competition and rivalry is at the heart of entrepreneurship, it is also one of the most common type of activities undertaken by institutions that focus on entrepreneurship. Frequently referred to as "pitching day", "elevator pitch competition" or similar names, these competitions provide a platform for students to experience the real-life scenario where they go on stage in front of real investors and pitch their idea to receive investment. Such competitions usually offer rewards to the highest-ranking projects but more importantly they provide the aspiring entrepreneurs with the opportunity to meet the investors and create networks.

Examples include DePaul University's "University Pitch Madness" in the USA, University of Bath's "Dragons' Den Pitching Competition" in England, Jönköping University's "Entrepreneurship Challenge" in Sweden, LaTrobe University's "PitchFest" in France, Chongqing University's "Internet+ Innovation and Entrepreneurship Competition" in China and many more. Since pitching, which is delivering a very short speech to convince investors to make an investment in the project, is considered one of the key competencies of any entrepreneur, these competitions provide the opportunity to their students to experience this "rite of passage" in a controlled environment. One unique example in this field is the pitching tools provided by the University of Edinburgh which includes resources for students that teach how to create a successful pitch as well as a website (pitch.com) to help them achieve success in this crucial step. In addition to the competitions, certain institutions such as Indiana University in the USA prefer to provide entrepreneurship scholarships to students to support them in their entrepreneurial journeys (Indiana University, 2024).

3.4.3 Entrepreneurship certificates

Universities and colleges with a distinct focus on entrepreneurship also offer programs that provide their students with certificates to document the entrepreneurial activities they have undertaken. These documents are used by their graduates in their professional lives as a proof of their commitment to becoming entrepreneurs.

One of the examples of these certificate programs is the "Entrepreneurship Scorecard" offered by OSTIM Technical University in Turkiye (OSTIM Technical University, 2024). As a university that positions itself as an "entrepreneurial university", this certificate contains all the entrepreneurial activities undertaken by their students throughout their studies. Each activity is scored by pre-determined criteria whether it is an entrepreneurship training or participating in entrepreneurship projects and each student is given the scorecard along with their diploma and transcript to demonstrate what they have done as potential entrepreneurs.

3.5 Overview of Entrepreneurial Education Around the World

In the scope of this research, 461 higher education institutions were investigated to determine how they deliver entrepreneurship education. Quantitative and qualitative analysis results were combined to create an overview of entrepreneurship education around the world. Figure 1 demonstrates the overview.

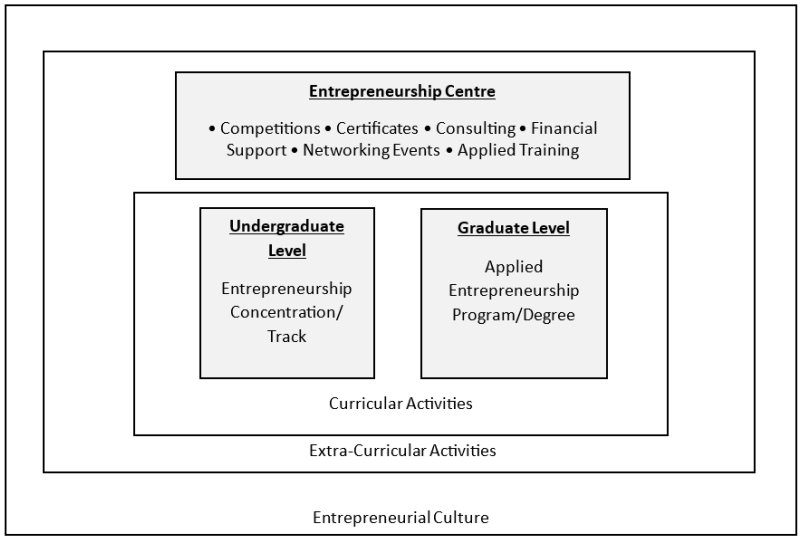

Figure 1: Overview of Entrepreneurship Education Around the World

The overview of entrepreneurship education around the world provides three dimensions: Curricular Activities, Extra-Curricular Activities and the Entrepreneurial Culture. Curricular activities encompass all undergraduate and graduate level education whereas extra-curricular activities are organized under an entrepreneurship centre that will focus on supporting entrepreneurial activities of student and staff and all these activities are encircled by an entrepreneurial culture that lays the foundation of the overview.

As depicted in the overview, descriptive statistics and best practices of the business schools in the AACSB member directory suggest that entrepreneurship should not be a separate program or a degree at undergraduate level. Therefore, having entrepreneurship as a concentration area or a track to be added to the business degree would provide the undergraduate students with the necessary entrepreneurial mindset without focusing the whole degree on this topic. A separate program or a degree dedicated to entrepreneurship may be considered at graduate level provided that it is an applied program that requires students to participate in real-life entrepreneurial activities such as establishing a company, seeking investment or developing and implementing a business plan.

Considering the importance of real-life experience, perhaps the most crucial component of the overview is the entrepreneurship centre. A separate entity to be established under the university or college should be responsible for supporting and encouraging entrepreneurial activities by organizing competitions and networking events, providing certificates and trainings and offering consultancy services and financial support. These extra-curricular activities will help incubate and accelerate business ideas for which the foundation is laid down by undergraduate and graduate level programs.

Finally, the whole structure should be supported by an entrepreneurial culture to be created and sustained at the institution. Without such a culture that underlines the importance of having an entrepreneurial mindset, none of the other activities would bring any success.

4. Conclusion and Discussion

Entrepreneurship education has long been debated by scholars who passionately believe in its effectiveness as well as those who think that it is nonsense. However, the increase in programs focusing on entrepreneurship education in recent years demonstrate that higher education institutions recognize the importance of entrepreneurship and are willing to take necessary measures to integrate it into their programs.

The aim of this research was to investigate how universities and colleges around the world undertake the task of teaching entrepreneurship by conducting research on members of Association to Advance Collegiate Schools of Business (AACSB), which is one of the most prestigious associations that conducts accreditation processes for business schools. Data obtained from AACSB Analytics Hub was used to achieve an overview of entrepreneurship education programs offered by these institutions as well as investigating some of their best practices in the field of entrepreneurship. Results of the quantitative and qualitative analyses were used to provide an overview of entrepreneurship education around the world. This overview is proposed as a suggestion for higher education institutions to advance their entrepreneurial endeavours and adopt a holistic view on entrepreneurship education.

4.1 Suggestions for Further Research

This research was conducted to develop a provide an overview of entrepreneurship education around the world based on the preferences and best practices of some of the most prestigious business schools around the world. However, considering the fact that majority of AACSB member institutions are from the United States of America may raise certain concerns that could be relieved by conducting a similar research based on other directories or rankings that have a more balanced geographical distribution. Another suggestion for further research may be to have a deeper investigation into the dimensions identified in the overview such as the activities of entrepreneurship centres or how to create and maintain an entrepreneurial culture at higher education institutions.

Abstract: COIL (Collaborative Online International Learning) is an innovative teaching method that allows students to experience international cooperation and develop intercultural skills using digital technologies. This online teaching method became popular recently based on the experience gained by higher education institutions during the COVID-19 pandemic. COIL is an effective and convenient teaching method that provides students with the experience of „internationalisation at home." The COIL engages students, teachers, and business partners. As those groups have different educational needs and expectations, the question arises as to what extent this teaching method can address those needs. Therefore, the main objective of this paper is to identify the main benefits and limitations of the COIL method in economic higher education based on the empirical survey results. The survey was conducted after the successful COIL implementation in 2023/2024 in several courses at the University of Economics in Katowice, Poland. The COIL method was applied in the form of three different models and was organised in cooperation with partners from several European universities. In particular, the COIL method was applied within a course devoted to Digitalisation and Sustainability, aiming at developing projects on business plans for start-ups using innovative technologies to enhance sustainable development. The paper presents the COIL concept, course objectives, and learning outcomes, as well as an assessment of the COIL method from the perspectives of students, teachers, and business experts. The main findings suggest that all students appreciate the advantages of COIL: the possibility to gain international experience, improve communication and intercultural skills, and learn the basics of project management. They also signalled some challenges related to international teamwork. However, teachers, in general, are satisfied with the quality of outcomes of students' cooperation, although applying the COIL method requires lots of administrative work and developing new skills. Similarly, business partners highly assessed the benefits of the COIL method for students in terms of their future professional careers.

Keywords: COIL methodology, Innovative teaching methods, Project-oriented education, Economic studies

1. Introduction

The technological advancements observed during the last decades have changed all aspects of human life, including teaching methods. The new generations' needs in graduate programs have required universities to seek new ways of acquiring knowledge and skills to face the new digital age. As a result, during the last two decades, innovative teaching methods aimed at engaging students have been broadly discussed, and this interest has been boosted after the COVID-19 pandemic. Those methods include flipped learning, case studies, problem-based learning, storytelling, gamification, collaborative learning, experiential learning, just-in-time learning, social media, and self-learning.

COIL (Collaborative Online International Learning) is an innovative teaching method offering students the possibility to experience international cooperation and develop intercultural skills by using digital technologies. This online teaching method became popular recently, based on the experience gained by higher education institutions during the COVID-19 pandemic. COIL is an effective and convenient teaching method used to provide students with the experience of „internationalisation at home".

The COIL engages students, teachers, and business partners with different educational needs and expectations. Thus, the question arises as to what extent this teaching method can address those needs. Therefore, the main objective of this paper is to identify the main benefits and limitations of the COIL method in economic higher education based on the empirical survey results.

The survey was conducted after the successful COIL implementation in 2023/2024 in several courses at the University of Economics in Katowice, Poland. The COIL method was applied in the form of three different models and was organised in cooperation with partners from several European universities. In particular, the COIL method was applied within a course devoted to Digitalisation and Sustainability, aiming at developing projects on business plans for start-ups using innovative technologies to enhance sustainable development.

The paper is structured as follows: the second section presents the COIL concept and assumptions for its implementation; the third section focuses on research methodology; and the next section presents the stakeholders' assessment of the COIL method. The paper ends with concluding remarks.

2. COIL Method in Economic Higher Education- the Concept and Implementation

2.1 The Characteristic of the COIL Method in Economic Higher Education– Theoretical Framework

The evolution of the COIL method commenced at the beginning of the 21st century. The growing interest in implementing this method results from constraints on physical mobility and the development of virtual exchanges and networks (Rubin, 2017; Rubin and Guth, 2022; Hacket et al., 2023). COIL represents a relatively new method with ongoing literature and research development. Most of the existing literature addresses rather the broad concept of "virtual exchange" or "international virtual exchange", often through case studies offering descriptive analyses of implementing and leading exchange. The literature review reveals that international virtual exchange has primarily served language learning, peacebuilding, and developing international cultural competencies. Most exchanges involve a one-to-one relationship between two institutions rather than leveraging a network of partners (Woodman and Kastler, 2020). The studies directly focusing on the COIL method present its model, emphasise that the method creates the space for shared course design and implementation, enhances learning outcomes and promotes cultural awareness through interactions with international counterparts (Vahed and Rodriquez, 2020). They also stress the role of administrative support in enhancing the sustainability of the COIL programs (Guth and Rubin, 2015; Rubin, 2016).

Several characteristics make COIL unique compared to other initiatives. Firstly, it fosters peer-to-peer experimental learning focusing on teamwork skills and facilitates developing digital skills by learning how to work remotely and manage digital tools professionally. The term "COIL" itself is transparent and explicit in describing the practice and benefits of collaborative learning for both educators and students (Rubin, 2017). In practical terms, it involves two or more educators from different geographic locations collaborating online to design a shared syllabus for their students. This syllabus includes joint online group assignments with co-created learning outcomes. The method focuses on subject-specific knowledge and intercultural competence development, making it adaptable to various disciplines.

Typically, a COIL course involves the creation of multicultural student teams comprising individuals from each participating institution. During this process, educators intentionally design assignments with intercultural learning in mind and facilitate and promote this collaborative learning throughout the COIL course. The primary goal of this collaboration is to broaden students' understanding of course content and to help them develop intercultural competencies. In doing so, COIL offers students an authentic international learning experience at their home institution rather than at an institution abroad (Woodmann and Kastler, 2020).

It is important to emphasise that the COIL implementation is not a goal. COIL should be treated as a tool for achieving learning outcomes and providing students with the necessary knowledge, skills, and mindset. As a complex academic endeavour, it requires careful consideration and planning before implementation. Using a COIL format changes teaching methods and requires technological integration (Alvarez and Steiner, 2019).

Only a few studies have examined implementing the COIL method in economic higher education. For instance, Marilú Marcillo-Gómez and Desilus (2016) examined students in International Business Courses at two universities: in the United States and Mexico City. The topics referred to intercultural communication, culture structure, cultural values, guidelines for behaviour, and cultural influences on communication contexts. Mestre-Segarra and Ruiz-Garrido (2022) explored students' reflections and the experience of 23 learners from different nationalities enrolled in a business-related master's degree. Similarly to previous research, they analysed the application of language and content, along with cross-disciplinary skills and cultural awareness. Kjølseth and Siddiq (2023) investigated how students perceive and describe group work in an online course in international business. O'Dowd (2019) explored different virtual team models, referring to business-focused competencies needed in professional settings, albeit with a focus on foreign language skills. Additionally, other studies analysed how the COIL method may be used for teaching entrepreneurship (Katre, 2020; Romero-Rodriques et al., 2022; Elenurm, 2022). To the best of the authors' knowledge, no research has referred to digitalisation and sustainability so far.

2.2 The COIL Implementation in the "Digital Transformation and Sustainability" Project

The main objective of the COIL project was to present and discuss the convergence of digitalisation and sustainability, focusing on the main opportunities and challenges. The course introduced the problematics of digitalisation and its impact on business and individuals' daily lives. The main course objectives refer to the following questions:

- How do emerging technologies transform industries and business models?

- How can digitalisation support the socio-ecological transformation of the economy?
- How might new business models built on digital technologies positively impact sustainability?
- How do these questions relate to regional and international business environments?

As presented in Table 1, the international teams were diversified, including first-year undergraduate students in bachelor programs in International Management, Economics, and Ethics (UCO Angers) and bachelor and master students in Finance and Accounting programmes (UE Katowice). The total number of fixed meetings was 8, but the students were also collaborating in subgroups between meetings.

Table 1: The COIL project metrics

The metric	**Description**
Title	Digital Transformation and Sustainability
Institutions	Universite Catholique De L'Quest, Angers, France (UCO Angers) University of Economics in Katowice, Poland (UEKAT)
Number of students	40, including: • 29 UCO Angers students • 11 UEKAT students
Model of realisation	additional elective course created for COIL purposes
Language	English
Type of module	fully online
Duration	6 weeks (from March 10 to April 21, 2023)
Number of general meetings/ duration	4 meetings/ 15 hours
Number of students' interim meetings/ duration	at least 4 meetings/ according to the students' needs

Source: Own elaboration

The COIL implementations included three stages: a preparatory phase, a course launch, and course facilitation, each involving specific activities as outlined in Figure 1.

During the preparatory phase, the COIL expert conducted COIL Design Workshops for university teachers. Based on the knowledge shared during those workshops, the teachers collaborated on course design and curriculum.

The project was launched in the summer semester of the academic year 2022/2023. The COIL method was applied in the form of three different models and was organised in cooperation with partners from several European universities. Specifically, the COIL method was applied within a course focused on Digitalisation and Sustainability. From March 10 to April 21, 2023, the course included four general meetings for participants. The first meeting (4 hours) introduced the project and was focused on team building. The second meeting (3 hours) facilitated monitoring of students' progress and included a mid-evaluation. Students presented their projects and shared their experiences during the last two meetings (2 meetings, 4 hours each). Additionally, four interim meetings for individual groups were scheduled to facilitate project work and consultations with teachers. Each group could choose the most suitable time and software solution to organise their project work. They also had the opportunity to ask for advice and discuss their outcomes with Polish and French teachers. The students were required to submit brief reports on their interim meetings as part of their assessment. The last stage, comprising COIL facilitation, is described in the next section.

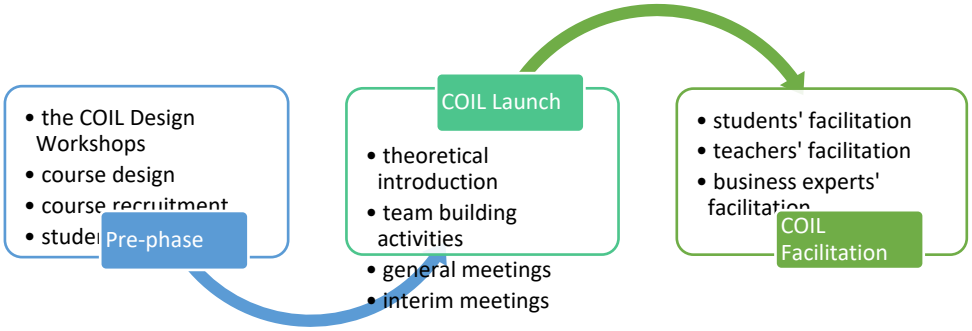

Figure 1: The stages of the COIL project. Source: Own elaboration

3. COIL Assessment - Research Methodology

As part of the teaching quality assessment and improvement process, the COIL project's stakeholders - students, teachers, and business experts - were asked about their opinions on the various aspects of the COIL project (Figure 2).

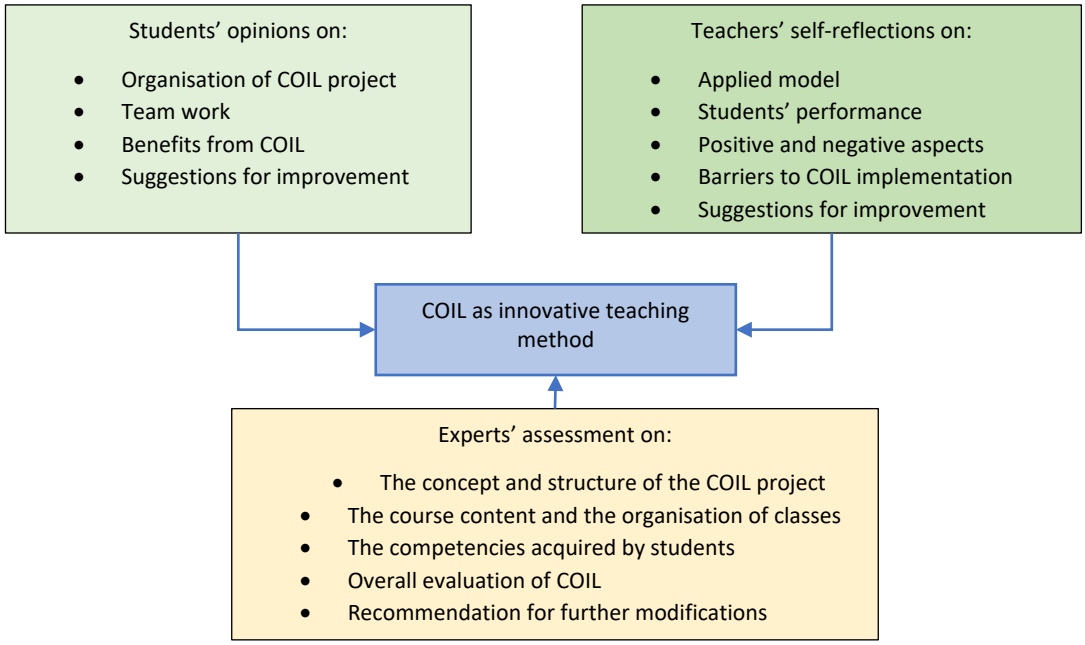

Figure 2: The scope of COIL project's evaluation. Source: Own elaboration

The students' opinions on the COIL project were collected through a closed and open-ended survey questionnaire. For closed questions, students were asked to select their answers using a 5-point Likert scale, where 1 means "definitely not" and 5 means "definitely yes". Additionally, the open-ended questions allowed students to provide their comments and suggestions. The survey was distributed to all 40 students participating in the COIL project, and 24 students (both from UEKAT and UCO Angers) responded, resulting in a response rate of 60%. Similarly, teachers shared their opinions through the questionnaire, while the business expert prepared reports using an assessment form. Three opinions from teachers and three expert assessments were collected in this manner.

4. The stakeholders' assessment of COIL implementation – the research results

4.1 Students' Evaluation

The first part of a survey questionnaire addressed to students consisted of 11 closed questions related to the organisation of the COIL project. Table 2 presents the mean results for these answers.

Table 2: The students' opinions on the organisation of the COIL project

No	The organisation of the COIL project	Mean
A1	Were the goals of COIL clearly explained?	3,88
A2	Do you find the team-building activities successful?	3,29
A3	Do you find icebreaking activities successful?	3,42
A4	Are you satisfied with the digital platform used during the virtual meetings?	4,21
A5	Do you find the theoretical introduction sufficient to run the project tasks?	3,25
A6	Do you find the information about the project task sufficient?	3,92
A7	Do you find the information on evaluation criteria sufficient?	3,83
A8	Was the number of virtual meetings sufficient?	4,00
A9	Do you feel the workload on the project was adequate for the reward?	3,52

No	The organisation of the COIL project	Mean
A10	Do you find the project task complicated?	3,33
A11	Do you find the project task time-consuming?	3,58
	Overall assessment	**3,65**

Source: Own elaboration

Students assessed positively all aspects of the organisation of the COIL project with a final score of 3,65. Particularly, the digital platform used during virtual meetings received the highest score of 4,21 (A4). While students generally found the number of virtual meetings sufficient, some suggested having more frequent but shorter joint meetings to better monitor progress on the final presentation. However, the theoretical introduction and team-building activities received lower scores, ranging from 3,25 to 3,29 (see Figure 3 for details).

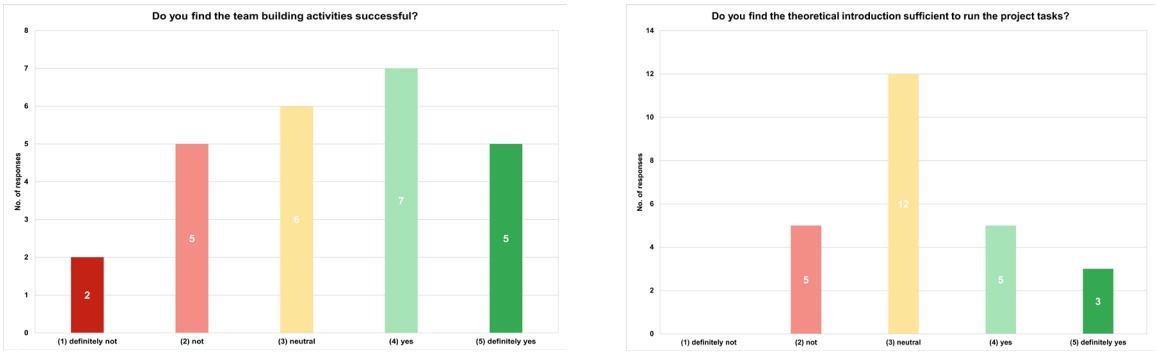

Figure 3: Answers to questions A2 (panel B) and A5 (panel B). Source: Own elaboration

The second aspect of the students' assessment was related to teamwork, which was evaluated through four closed questions. The mean results for the answers to these questions are presented in Table 3.

Table 3: The students' opinions on the teamwork

No	The teamwork in the COIL project	Mean
B1	Did you have any problems in organising meetings with team members?	3,29
B2	Did you find the workload of the project team members balanced?	3,08
B3	Did you have any communication problems with your team?	2,83
B4	Did you enjoy the collaboration with your team?	3,75
	Overall assessment	**3,23**

Source: Own elaboration

Students also positively assessed the teamwork-related aspects of the COIL project. Overall, students enjoyed the collaboration (3,75) and felt that the workload was balanced within their teams (3,08). However, some students mentioned difficulties in organising meetings with team members. Altogether, 13 out of 24 students selected answers 4- "yes" and 5 – "definitely yes" for this question (B1). However, they indicated lower importance of communication problems with their teams: only 9 students selected answers 4 "yes" and 5 "definitely yes" for this question (B3, see figure 4 for details).

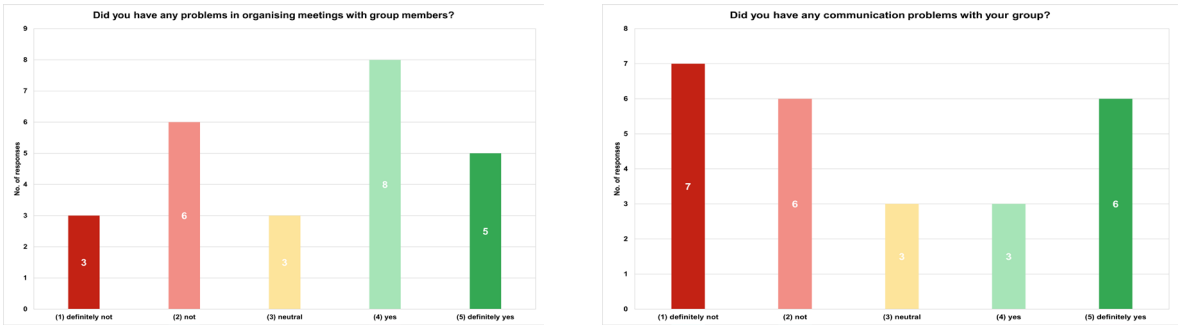

Figure 4: Answers to questions B1 (panel B) and B3 (panel B). Source: Own elaboration

The third part of the survey questionnaire focused on the educational and internationalization benefits of the COIL project. The answers to the 9 closed questions included in this part are presented in Table 4.

Table 4: The students' opinions on the benefits of the COIL project

No	The benefits of the COIL project	Mean
C1	Do you find COIL as valuable teaching method?	3,79
C2	Did COIL help you develop your competencies in international teamwork?	3,62
C3	Did COIL help you to improve language skills?	3,75
C4	After the COIL experience, do you feel better prepared for online project work?	3,75
C5	Would you be interested in taking part in the COIL project once again?	3,08
C6	Overall, do you find project important for developing international skills?	3,92
C7	Overall, do you enjoy taking part in the COIL project?	3,46
C8	Have you been interested in being an exchange student and studying a semester abroad (before COIL experience)?	4,00
C9	Are you interested in being an exchange student and studying a semester abroad (after COIL experience)?	3,96
	Overall assessment	**3,70**

Source: Own elaboration

The assessment of the benefits of the COIL project received the highest score of 3,70, indicating that students generally valued their participation in the project. However, question (C5) concerning future participation in the COIL project received the lowest score of 3,08, with only 9 students selecting answers indicating a willingness to participate again (see Figure 5 for details). Nevertheless, students appreciated the COIL method as a way to develop international skills (3,92), improve language skills (3,75), be prepared for online project work (3,75) and gain competencies in international teamwork (3,63). Additionally, the majority of students (17) agreed that COIL is a valuable teaching method. However, only 11 students stated that they enjoyed taking part in the COIL project (C7, see Figure 5 for details). Interestingly, the COIL experience slightly reduced interest in being an exchange student and studying abroad (compare results for questions C8 and C9).

In the open questions, students provided positive comments on the benefits of the COIL project, such as gaining knowledge on sustainability, developing skills related to teamwork, widening experience with international communication and group project management, discovering new ways of working and communicating, knowing better other cultures, establishing international relationships, and practising social skills. Overall, students' opinions show their satisfaction with the COIL project experience.

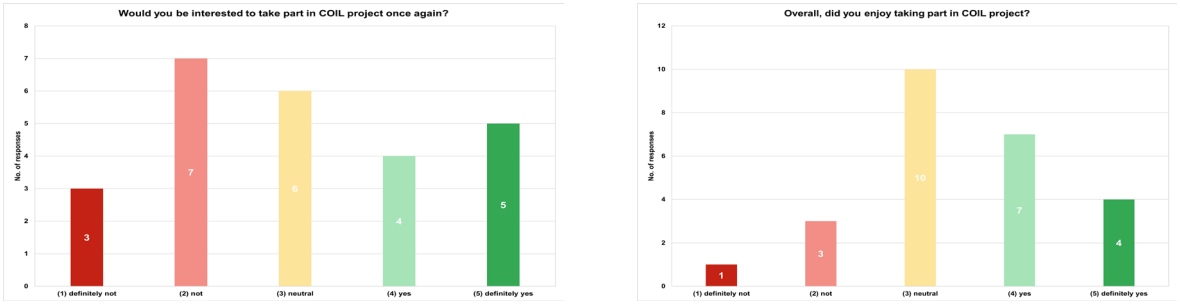

Figure 5: Answers to questions C5 (panel A) and C7 (panel B). Source: Own elaboration

4.2 Teachers' Evaluation

When asked to reflect on this innovative teaching method's positive and negative aspects, teachers evaluated the applied model, students' performance, organisation, and barriers to implementation.

The applied model was based on the additional elective course created for COIL purposes. Such a model offers flexibility in scheduling joint meetings. It can also be used for students from various study programs who may be enrolled in elective courses. However, this model requires many additional formalities for teachers, students and university authorities:

- the necessity of obtaining the rector's and dean's approval to launch an additional elective course,
- the requirement to create particular additional exam protocols for students enrolled in this course,
- the organisation of student registrations for the additional elective course (risk of low student interest in the extra elective course and underrepresentation of students from one partner university),
- upon completion of the subject, students must submit their application to the Dean for the accreditation of ECTS points received from the COIL project.

Teachers positively assessed students' performance - the high quality of their final presentations due to international cooperation and the exchange of diverse experiences and perspectives, despite encountering difficulties in organising teamwork. In teachers' opinion, the COIL project offers an invaluable opportunity for practising teamwork skills within the international environment. On the other hand, teachers recognised the importance of difficulties in teamwork organisation, notably in finding a suitable time frame for all team members. This problem was enhanced by the disproportionate representation of French students within teams, which led to the marginalisation of Polish students' scheduling preferences.

Finally, the teachers admitted that organising the COIL project requires considerable time, involving multiple coordination meetings with teachers from the partner universities, which creates an additional workload. However, this is balanced by the satisfaction derived from witnessing the positive results of students' work. Additionally, teachers confirmed that online activities serve as both disruptors and facilitators of the process. Despite occasional difficulties with managing the timetable, all teams successfully prepared for the final presentation.

According to teachers, the significant barriers to the successful implementation of the COIL projects can be classified into organisational, content-related and technical barriers (Table 5).

Table 5: Barriers to the COIL project

The barrier type	Characteristics
organisational	the limited administrative support to the organisation of international teamwork difficulties in managing communication in international teams limited possibility to find partners willing to engage in joint projects for part-time students (Sunday-Saturday teaching days) limited number of teachers willing to participate in the COIL projects due to the additional organisation workload various regulations and organisational requirements at the partner universities
content-related	lack of balance in the level of knowledge and skills among students from different universities differences in study programs and subjects at the partner universities

The barrier type	Characteristics
technical	difficulties in accessing online platforms, including indicated information sources and study materials

Source: Own elaboration

Teachers also formulated several suggestions for future COIL project organisation at the UEKAT by addressing the existing regulations and the implemented solutions. Ahead of the project launch, all students should undergo training if electronic platforms beyond those typically used within the university are employed. The quality of COIL project implementation could be improved by engaging the universities' planning department in the preparatory phase. This would entail aligning the schedule with students' existing lectures and classes, ensuring their optimal participation in the COIL project. The number of students enrolled in the COIL project could be enlarged by assigning more European Credit Transfer and Accumulation System (ECTS) points compared to other elective courses conducted in Polish. The procedure of granting ECTS points for the COIL project in the form of an elective course should be automatised.

4.3 Business Experts' Evaluation

The external business experts, who also have experience in lectures and workshops for students, were invited to assess the courses based on the COIL documentation (course description cards, study materials for students, and exemplary students' presentations). They were asked to assess the COIL projects with regard to the concept and structure of the project, its implementation, the competencies acquired by students, and the overall evaluation of COIL as an innovative teaching method. The experts were asked to answer the questions using a 5-point Likert scale where 1 means "definitely not" and 5 means "definitely yes".

Table 6 presents the mean results for the answers related to the COIL project's concept and structure.

Table 6: Experts' opinions on the concept and structure of the COIL project

No	The concept and structure of the COIL project	Mean
A1	The goals and content of COIL were properly defined	5,00
A2	The communication process was planned correctly	4,67
A3	The principles of cooperation among students were properly planned	4,67
A4	The tasks designated for students to develop were harmonised with the course objectives	5,00
A5	The assessment criteria for student projects were appropriately planned	5,00
Overall assessment		**4,87**

Source: Own elaboration

Regarding the concept and structure of the COIL project, the experts highly assessed the design of the project (A1) and the clear communication from teachers regarding tasks (A4), principles of cooperation (A3), and assessment criteria for students (A5). The overall assessment of this COIL project aspect was the highest, with a score of 4,87.

The mean results of the answers related to the COIL project implementation are presented in Table 7.

Table 7: Experts' opinions on the implementation of the COIL project

No	The implementation of the COIL project	Mean
B1	The software and other IT tools were properly selected for implementing COIL	5,00
B2	The materials for students were available online before the planned activities and tasks	4,33
B3	Online activities related to integration and building international teams were planned	5,00
B4	Students had the opportunity to choose the project topics	4,33
B5	Students had the opportunity to choose communication tools	5,00
Overall assessment		**4,73**

Source: Own elaboration

Regarding project implementation, the experts appreciated the students' ability to choose project topics (B4) and the communication tools for teamwork (B5). They acknowledged the possibility of using various teaching methods and teamwork tools. They also valued the effectiveness of the icebreaking and team-building activities during the first joint meeting (B3). They emphasised the importance of selecting proper software and other IT tools for online meetings, communication between meetings and resource platforms (B1).

Six dimensions further assessed the students' competencies gained by participating in the COIL project. The mean results are presented in Table 8.

Table 8: Experts' opinions on the students' competencies

No	The students' competencies	Mean
C1	COIL enables understanding of cultural differences and increases tolerance	5,0
C2	COIL enables the development of participants' language skills	5,0
C3	COIL facilitates the development of teamwork skills	4,75
C4	COIL enables understanding of the international context of discussed issues	4,75
C5	COIL enables the practical application of acquired knowledge and skills	4,00
C6	COIL increases students' chances of finding employment	4,33
Overall assessment		**4,64**

Source: Own elaboration

In the context of the student's competencies, the experts appreciated that COIL helps students to:

- understand cultural differences,
- increase tolerance, integrate and build relationships,
- develop their English skills and teamwork skills,
- apply critical thinking, searching for and selecting sources of information,
- develop their independence and responsibility for organising teamwork activities,
- understand the international context of discussed issues,
- gain digital skills by using IT tools for online teamwork and communication,
- apply the acquired knowledge and skills in practice,
- increase their chances of finding an attractive job.

Additionally, the experts confirmed the importance of topics covered by the COIL project as the nexus between sustainability and digital transformation is very up-to-date and focused on real-life business models and technological solutions.

They also provided recommendations for improving COIL in the future. Experts proposed planning more time during classes for students' free expression. They suggested adding a brief evaluation session during the final meeting, which may provide an opportunity for students to analyse their actions, recognise their impact on the team's work organisation, and take responsibility for the course of this work. Discussing challenges and actions taken by students to overcome them from a broader perspective could be a catalyst for interesting conclusions and the development of competencies useful in students' future professional careers. The experts also recommended additional topics that could be included in the COIL projects, such as technology transfer or sources of funds for sustainable projects.

5. Discussion and Conclusions

The main findings of our case study suggest that all students appreciate the advantages of COIL, such as the possibility to gain international experience, improve communication and intercultural skills, and learn the basics of project management. Similar to Katre's (2020) research the results show that collaborating in cross-cultural teams, supported by appropriate technologies for effective synchronous and asynchronous communications, can equip students to develop a deep understanding of their own and other people's cultures. This aligns with the results of Vahed and Rodriguez (2020), who discovered that COIL positively influenced intercultural awareness and stimulated students to be globally engaged.

However, students also signalled some challenges related to work organisation within international teams. Teachers, in general, are satisfied with the quality of students' cooperation outcomes, although the application

of the COIL method requires lots of administrative work and the development of new skills related to this innovative method. Similarly, business partners highly assessed the benefits of the COIL method for students in terms of their future professional careers and the skills required by future employers. The relatively lower scores given by students compared to the assessment by experts may stem from the different perspectives and time horizons. Experts, as external stakeholders, focused more on the COIL method as a tool for developing important skills related to international cooperation, communication and teamwork organisation (long-term perspective). In contrast, students, as internal stakeholders activiely participating in the COIL project, were more focused on the immediate process of using the COIL method for this particular course and working within this specific team (short-term perspective).

When designing future COILs, teachers should allocate more time to team-building activities and theoretical presentations on the project's topic. They should also pay closer attention to how team member meetings are planned, organized, and supervised. Alvarez and Steiner (2019) stressed the importance of structuring and preparing the course. Stronger administrative support could facilitate the teachers' increased engagement. Previous research also pointed out this postulate (Marcillo-Gomez and Defilus, 2016; Rubin, 2017).

Making attendance in the COIL courses more attractive for students requires planning them as electives for more credits than standard ones. Marcillo-Gomez and Defilus (2016) shared the same recommendation based on their research.

Our results contribute to previous studies examining the COIL method as a new pedagogical technique. Most of them give little attention to the practical components of designing and implementing COIL projects. Although the existing practitioner-based resources share tips and insights for designing projects, they do not provide empirical evidence to support program design decisions in economic higher education. Future research should focus on specific elements within the COIL framework to determine what could lead to greater student learning outcomes.

Abstract: Productivity can be enhanced and competitive advantages can be gained by using an open innovation approach instead of a closed innovation approach. The successful implementation of an open innovation approach requires careful examination of the existing innovation capabilities and competences of a company. This study aims to explore and give a picture of the current level of open innovation capabilities and competences of companies with particular emphasis on companies in Finland. A quantitative approach was followed and a 13-item survey was administered. The reliability of the survey used was .957 and its items included statements regarding the five-level maturity model for open innovation. Level five of the model represents the highest maturity level and level one of the model corresponds to the lowest. Claims regarding maturity level one were excluded as innovation activities do not occur at this level. The survey was administered in both 2022 and 2024 and consisted of three questions for each maturity level from level two to level four and four questions for level three. Maturity levels four and five indicate that companies understand the significance of strategic thinking and that they also include innovation strategies within their general strategy or perceive it as an integral addition to their strategy. We conclude that the effective open innovation culture forms an essential part of the overall success of a company. Therefore, an increase in innovation culture characteristics simultaneously results in an increase in the innovation maturity level.

Keywords: Innovation maturity, Open innovation, Innovation competences

1. Introduction

Open innovation has emerged as a contemporary concept for businesses that want to capture external ideas for generating value and minimizing risks. Chesbrough (2019) coined the open innovation expression and defined it as "*a paradigm that assumes that firms can and should use external ideas as well as internal ideas, and internal and external paths to market, as the firms look to advance their technology*". After a decade, Chesbrough and Bogers (2014) defined open innovation as *"a distributed innovation process based on purposefully managed knowledge flows across organizational boundaries, using pecuniary and non-pecuniary mechanisms in line with the organization's business model".* The central theme in these two definitions is that innovation is co-created in collaboration between external stakeholders.

By opening up the innovation process to employees, customers and external innovation partners, valuable insights and knowledge that will improve outcomes and benefit future activities will be gained. The internal innovation team members will work together with external networks aiming for a win-win situation for all involved stakeholders. Hence, open innovation facilitates improved employee engagement, access to talents, and creation of lucrative partnerships. The incorporation of open innovation practices in an organization signifies more than a strategic choice; it represents a paradigm shift towards collaborative, externally oriented approaches to problem-solving and value creation (Malodia et al, 2023). For example, Luan et al (2024) showed that open innovation impacts digital transformation, i.e. integration of digital technologies into all aspects of an organization. Their results offered empirical insights into the complex relationship between open innovation and technological development. They divided technological capabilities into technological maturity and technological diversity and highlighted their significance as channels through which open innovation influences digital transformation.

Siakas et al (2014) emphasized that key factors for success embrace organization specific knowledge and capacity to exploit this knowledge. Other success factors are related to collecting and building up firm specific knowledge, low levels of uncertainty regarding present and future technology developments, and understanding

of market demands and competitive threats. Hence, internal structures and processes must continuously be balanced to meet conflicting requirements regarding how to identify, capture and exploit specialized knowledge across technological fields, business functions and product divisions. Open innovation supports ideas flowing out of the organization for evaluation, sharing and exploitation and flowing back into the organization as new offerings and new business models. Moreover, ideas from other organizations may be evaluated, shared, and exploited. A core issue in open innovation is finding the right balance and mechanism between intellectual protection and openness in adopting open innovation.

The main aim of innovation is to create and sustain value (Siakas et al, 2016). The quest to innovate drives the organization to capture information and knowledge externally and transfer the obtained knowledge to the internal knowledge base for contributing to the creation and delivery of value (Lampropoulos & Siakas, 2018). This contributes to the dynamic capability of the organization which facilitates performance increase, profits, and organizational growth, reaching out to new markets. Openness promotes visible operations among dynamic capabilities through commitment of various stakeholders. Openness also facilitates understanding of opportunities and threats. Increased customer value enables companies to optimize revenue. A by-product of an open innovation approach is the identification of partners for the whole open innovation value chain.

Digital technologies of today enable collaboration across geographical distances with limited resources (Enkel et al, 2020; Kanakaris et al, 2019). They facilitate identification of suitable knowledge owners and partners for collaboration (Makkonen et al, 2019). Access and integration of large numbers of diverse and dispersed external unknown individuals can be achieved with the use of social media (Makkonen et al, 2020; Siakas et al, 2016) and crowdsourcing (SIakas and Siakas, 2020). When using crowdsourcing, organizations open up to the public, usually starting with their customer base to obtain ideas. Hence, it is an outside-in open innovation approach.

Open innovation provides new prospects for obtaining more and better resources, data and diverse means for carrying out a project. It also provides opportunities for networking and connecting with potential partners, collaborators and investors. Knowledge management systems are tailored to each organization separately. In order to identify potential organizations for collaboration in open innovation it is important to assess and understand the KM maturity of that organization (Peirera et al, 2021).

This paper examined the maturity of open innovations through the Open Innovation Maturity Model designed by Enkel et al (2011). The study aimed to investigate the open innovation maturity by using an online questionnaire that was responded to by 145 part-time students working in diverse Finnish companies. The aims were to increase awareness of the importance of maturity related to knowledge management and innovation practices for keeping up with globalization (see eg. Siakas et al, 2020) and for using smart technologies to a higher degree (see e.g. Lampropoulos et al, 2024).

2. The Open Innovation Maturity Model

Rocha et al (2019) emphasized that maturity is an indication of the measurement of organizational capability and maturity models offer simple but effective ways for measuring quality of processes. Companies can obtain an overview of their innovation capabilities by using maturity models. Maturity models can help meet challenges faced by a rapidly changing environment and also allow companies to enhance their competitive advantages. One maturity model of open innovation as applied in a previous study (Makkonen et al, 2023), which examines the maturity level of open innovation in any company (Enkel et al, 2011). The open innovation maturity model includes five maturity levels as follows:

> *"Level 1 —Creative individual attempts are dismissed. The organization focuses on day-to-day operations. Innovation output is inconsistent and unpredictable".*
>
> *"Level 2 —The need to innovate is identified; innovation is clearly defined. There is a basic understanding of the influential factors. Innovation output is inconsistent but traceable".*
>
> *"Level 3 —Appropriate practices, procedures and tools are in place, innovation is encouraged among employees. Outputs are consistent and ensure sustained market share and positioning".*
>
> *"Level 4 —Practices, procedures and tools for integrating innovation activities are used. A deep understanding of the internal innovation model and how it relates to business requirements has been established. Innovative outputs are consistent, diverse and a source of differentiation"*

> *"Level 5 —Practices, procedures and tools are institutional. Individuals are encouraged to innovate. Synergy is achieved through the alignment of business and innovation strategy and synchronization of activities. Outputs provide sustained competitive advantages in existing and new markets."*

This study aims to establish the maturity levels of companies, in particular their readiness to adopt and integrate open innovation by using the maturity model. Paulk et al (1993) highlight the importance of maturity models in achieving Improved performance through innovation efforts and Enkel et al (2020) note that companies can utilize open innovation strategically to enhance their innovation capabilities

3. Our Study

Using the maturity model as a basis for examining the innovation levels, a survey was conducted both during spring 2022 and during the spring of 2024. The aim of the questionnaire was to reveal the status of the open innovation maturity in the companies especially in Finland. The participants were given a set of claims in the open innovation context. It should be noted that claims regarding maturity level 1 were excluded as innovation activities do not occur at this level. Therefore, the questionnaire contained claims related to the maturity levels 2 to 5. Three innovation related claims were included for each of the maturity levels. The three claims were as follows:

Level 2:

1."The necessity of innovation is identified in your organization" (level 2)

2."The meaning of the word Innovation is clearly defined in your organization" (level 2)

3."There is a basic understanding of the influential innovation factors in your organization" (level 2)

Level 3:

4."Appropriate practices, procedures and tools are applied" (level 3)

5."Innovation is encouraged among employees" (level 3)

6."Innovation outputs are consistent and ensure sustained market share and positioning" (level 3)

Level 4:

7."Practices, procedures and tools for integrating innovation activities are used" (level 4)

8."Internal innovation model has been established in your organization which is deeply understood and it relates to the needs of your business" (level 4)

9."Innovative outputs are consistent, diverse and a source of differentiation" (level 4)

Level 5:

10."Innovative practices, procedures and tools are institutional" (level 5)

11."Individuals are encouraged to innovate" (level 5)

12."Collaboration is achieved through business and innovation strategy alignment as well as synchronization of activities" (level 5)

13."Innovation outputs provide sustained competitive advantage in both existing and new markets" (level 5)

The participants were given these aforementioned claims and were then able to provide their comments on open innovation activities. The focus was on elements and activities promoting open innovation as well as hindering it. The participants work in various fields including technology companies such as sawmills, ICT, steel and zinc industries, chemistry, public health care and public rescue services.

The data collection was undertaken by administering an online questionnaire uploaded on to the Webropol platform as well as the use of a paper-based one. The participants rated each item (variable) of attributes on a Likert scale of 1 to 5 where 1 meant "Not at all important" and 5 meant "Extremely important". Statistical analysis was carried out using Excel.

4. Data Analysis

The data collected was analyzed using IBM Statistical Package for the Social Sciences (SPSS) and descriptive statistics were used. Specifically, the data used derived from a total of 145 higher education students who were involved in this study. The students were enrolled in engineering, business and healthcare programs, representing both the public and private sector as well as a great variety of industries. However, the responses of 4 students were missing several answers to the questions of the questionnaire and they have been removed from the analysis. The Cronchbach's Alpha of the 13-item survey was .957 which renders its constructs and items highly reliable. As a result, the data of 141 higher education students, 70 female (56.03%) and 62 male (43.97%) students, are presented in this study. Students came from 17 different countries. However, as the study was mainly run in Finnish universities, the vast majority of the participants (78.01%) are students whose country of origin is Finland. Most students were pursuing Master degree programs (freq.: 81, perc: 57.45%) followed by students pursuing Bachelor degree program (freq.: 54, perc: 38.30%). Six students (4.26%) were pursuing different professional programs. Apart from one participant who did not specify whether they attended their program as a part time or full-time student, most students (freq.: 97, perc: 68.79%) were attending as part time students followed by full-time students (freq.: 43, perc: 30.50%). Given the background of the students examined, this outcome is justifiable as the vast majority of them were also working. Specifically, a total of 119 students (84.40%) answered that they were employed while 21 students (14.89%) were unemployed. One student did not disclose their working status. There was a similar distribution among the different types of companies regarding their entity being international (freq.: 49, perc: 34.75%), nationwide (freq.: 44, perc: 31.21%), or local (freq.: 40, perc: 28.37%). Eight students (5.67%) did not specify the entity of their current or previous company. The distribution of the companies' size is presented in Figure 1. Based on the results, employees from small, medium, and large companies participated in this study. When asked what their position level was, most students had a mid-level position (e.g., expert with responsibility) (freq.: 62, perc: 43.97%) followed by an operational level position (e.g., worker) (freq.: 36, perc: 25.53%) and an executive level position (e.g., management) (freq.: 35, perc: 24.82%). Eight students (5.67%) had a different position based on the options given. Students' working experience varied and the results are depicted in Figure 2.

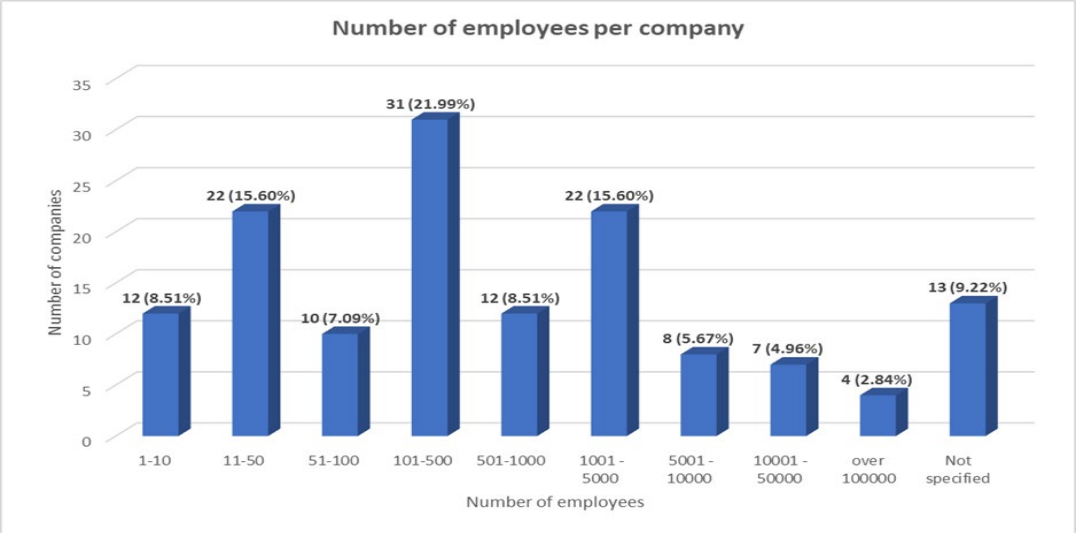

Figure 1: Distribution of company size

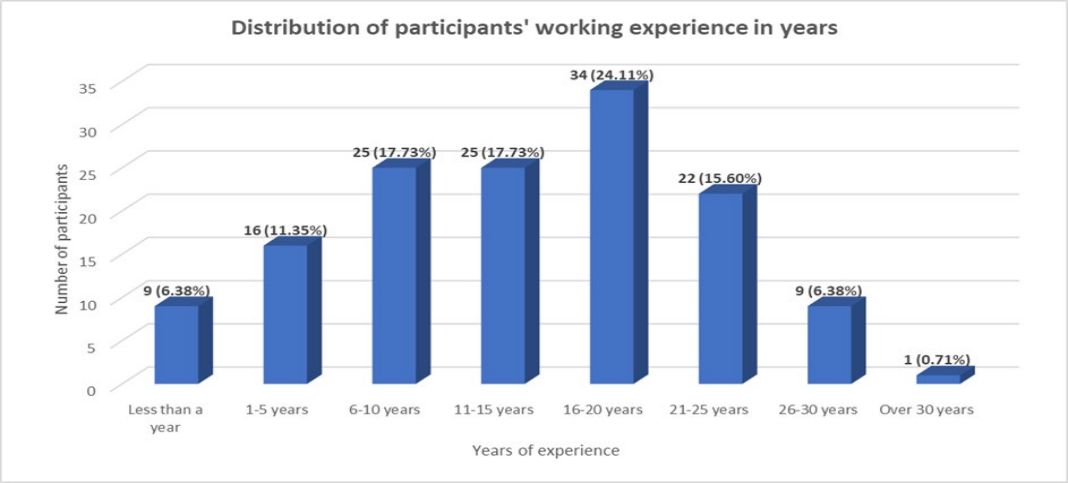

Figure 2: Distribution of participants' working experience

Furthermore, the responses to the 13-items of the questionnaire related to companies' maturity level are presented in Figure 3. Questions 1-3 refer to maturity level 2, questions 4-6 are related to maturity level 3, questions 7-9 refer to maturity level 4, and questions 10-13 are related to maturity level 5. All questions used a Likert scale from 1 to 5. Based on the results, it is obvious that mostly positive responses in terms of the importance of the practices and statements are observed. However, the neutral responses are also high. On the contrary, there are fewer responses which regard these matters to be of lesser or no importance at all.

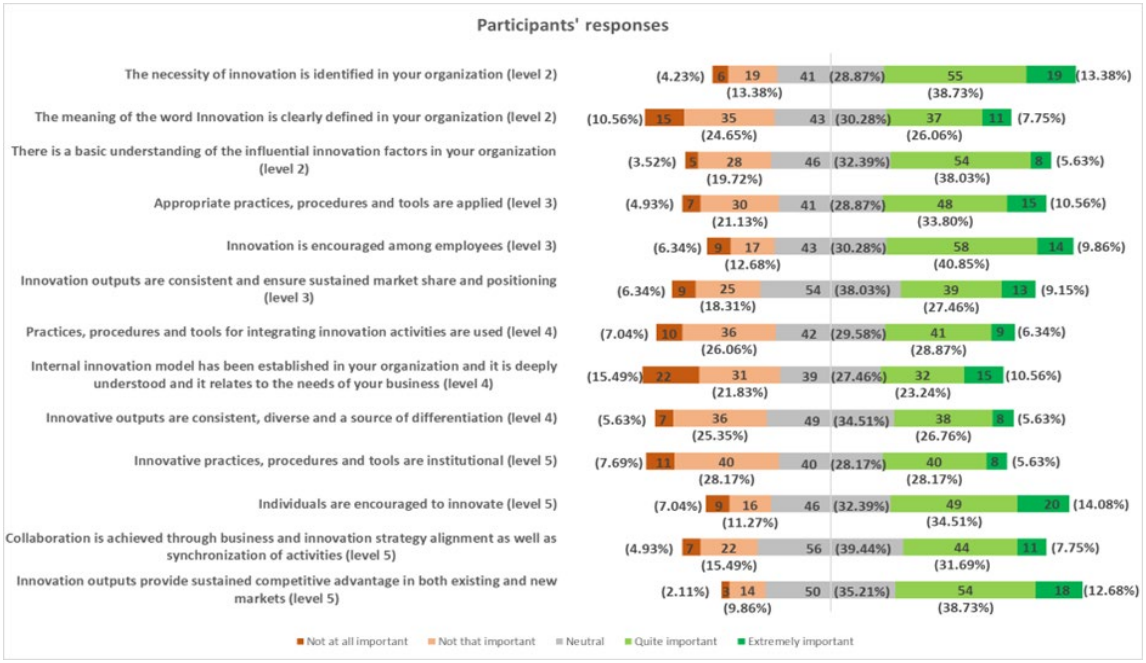

Figure 3: Distribution of participants response to each question related to company's maturity level

Moreover, Tables 1-4 present the mean value of the participants' responses to each question. Based on the outcomes, when taking the mean value of the participants' responses into account, it can be inferred that the open innovation thinking capabilities of the companies examined are mostly focused on maturity Levels 5, 3, and 2 while Level 4 has the lowest mean value. Therefore, companies should focus more on actions that would also help them improve in that regard to achieve better innovation competences and organization cultures. From Table 3 it can be observed that lowest mean value has been received to the response " our organization internal innovation model has been establish and it is deeply understood and it has relation to the needs of our business ", thus greater emphasis should be given to establishing innovation models and to understanding the correlation between business needs and innovation models.

Table 1: Maturity Level 2 statements

Statement	Average
The necessity of innovation is identified in your organization (in Finnish Tarve innovaatiotoiminnalle on identifioitu organisaatiossasi)	3.44
In your organization the meaning of the word Innovation is clearly defined (in Finnish Innovaation käsite on organisaatiossasi selkeästi määritelty)	2.96
In your organization there is a basic understanding of the influential innovation factors (in Finnish Organisaatiossasi on perusymmärtämys innovaatioihin vaikuttavista tekijöistä)	3.23
Mean of responses at Maturity Level 2	3.21

Table 2: Maturity Level 3 statements

Statement	Average
Appropriate practices, procedures and tools are applied (in Finnish: Asianmukaiset käytänteet ja toimintatavat ovat käytössä)	3.24
Innovation is encouraged among employees (in Finnish: Työntekijöiden keskuudessa innovaatioihin rohkaistaan)	3.36
Innovation outputs are consistent and ensure sustained market share and positioning (in Finnish: Innovaatiotoiminnan tulokset ovat yhdenmukaisia ne varmistaa vakaan aseman markkinoilla)	3.16
Mean of responses at Maturity Level 3	3.25

Table 3: Maturity Level 4 statements

Statement	Average
Practices, procedures and tools for integrating innovation activities are used (in Finnish: Käytänteet, toimintatavat ja työkalut on integroitu käytössä oleviin innovaatioaktiviteetteihin)	3.02
In our organization internal innovation model has been establish and it is deeply understood and it has relation to the needs of our business (in Finnish: On olemassa sisäinen innovaatiomalli meidän organisaatiossa ja se on syvällisesti ymmärretty ja sillä on yhteys liiketoiminnan tarpeisiin)	2.91
Innovative outputs are consistent, diverse and a source of differentiation (in Finnish: Innovatiiviset tuotokset ovat johdonmukaisia, monipuolisia ja erilaistamisen lähteitä)	3.03
Mean of responses at Maturity Level 4	2.99

Table 4: Maturity Level 5 statements

Statement	Average
Innovative practices, procedures and tools are institutional (in Finnish: Innovatiiviset käytänteet, toimintatavat ja työkalut ovat vakiintuneita)	2.96
Individuals are empowered to innovate (in Finnish: Yksilöt ovat oikeutettuja innovoimaan)	3.39
Collaboration is achieved through business and innovation strategy alignment as well as synchronization of activities (in Finnish: Onnistunut yhteistyö saavutetaan niveltämällä liiketoiminta- ja innovaatiostrategia sekä synkronisoimalla aktiviteetit)	3.21
Innovation outputs provide sustained competitive advantage in both existing and new markets (in Finnish: Innovaatiotuotokset antavat pysyvän kilpailuedun nykyisillä ja uusilla markkinoilla)	3.50
Mean of responses at Maturity Level 5	3.27

5. Discussion

The general findings suggest that open innovations have been accepted in the companies examined at a moderate level. This means that strategy-driven innovation work should be introduced and enhanced. Creating networks and ecosystems utilizing both internal and external capabilities should be set up to enhance the open innovation maturity levels (Chesbrough, 2019). Organizations that have more advanced innovation maturity levels also have better performance across key financial as well as innovation metrics. Their innovation speed, scale, and effectiveness is better than their competitors. They can also convert their innovations into financial outcomes more rapidly and efficiently than their peers. Mature companies are more likely to outperform their less mature peers on profitability and also achieve higher operating margins (Densik et al, 2023).

An increased effort should be made to change the organizational culture towards a more innovation driven one, allowing idea generation and other innovation activities such as brainstorming amongst their employees. Organization support in addition to open innovation activities enhance innovation (Zang et al, 2022) and should thus also be taken into consideration. The significance of corporate change management should also be taken into consideration in addition to organizational support in the innovation enhancement process of a company. Adopting an open innovation culture also requires changes in the organizational management. For a smooth innovation enhancement process, companies should consider and apply appropriate approaches and methods ensuring motivated employees and also short-term and long-term benefits, such as the one presented by Kotter (1996).

6. Conclusion

Overall, it can be concluded that companies with a high level of open innovation maturity are better positioned to take advantage of the full potential of external knowledge and resources in order to drive innovation, obtain and maintain a competitive advantage. As the main aim of innovation is creating and sustaining value, organizations should utilize their innovation capabilities to their full potential in order to enhance their performance, increase profits, and enable organizational growth as well as maintaining or gaining competitive advantages within their market position. Open innovation allows for innovation utilizing both internal and external capabilities and also allows for a better understanding of opportunities and threats. Our findings conclude that the importance of the innovation practices and statements observed, a small number of responses could be noted, which regarded these matters to be of lesser or no importance. Therefore, companies should focus more on actions that would also help them improve in that regard to achieve better innovation competences and organization cultures.

To fully utilize open innovation, agile business models and processes for managing partnerships as well as a culture of collaboration should be established (Lampropoulos & Siakas, 2018). Our study finds lowest mean values for the establishment of the organization's internal innovation model, its deep understanding and its relation to the needs of the business. Thus, greater emphasis should be put on the innovation models. The innovation levels should be continuously assessed and adapted by using performance metrics as well as market feedback to further enhance and encourage innovation activities. Activities such as idea-sharing platforms and both internal and external partner networks with an organizational culture allowing for mistakes and experimentation and thus learning are key elements of an innovative organization. Furthermore, open innovation maturity could be enhanced by expanding the awareness of diverse innovation opportunities, fostering collaboration with external partners across different dimensions of innovation, aligning innovation efforts with strategic objectives, and optimizing resource utilization. By establishing a holistic approach to innovation and also enhancing a culture of openness and continuous improvement, organizations can leverage external resources more effectively, cultivate innovation ecosystems, and remain competitive in dynamic markets. (Keely et al, 2013). It should be noted that the survey was completed by university students, thus the results of the study are limited thereto, and further studies should be completed by giving the survey directly to companies. The aim of this study was to establish the maturity levels prevailing in different companies and also to highlight the need for innovation activities, in particular open innovation. Our study provides guidelines for the implementation and the overall level of open innovation activities. Open innovation maturity should be enhanced to harness external knowledge, resources and capabilities to further foster and drive growth, innovation and competitive advantages in today's rapidly changing business environment.

Abstract: The aim of the article is to define and quantify the impact of specific economic risk sources on the quality of the business environment (QBE). The subject of the analysis was the evaluation of the impact of selected economic risk sources, including the macroeconomic environment, monetary policy and interest rates, and corporate financing on the QBE. Data was collected between 2018 and 2022 using an online survey method. A total of 480 SMEs from the Slovak Republic's business environment completed the questionnaire. Advanced statistical techniques, including descriptive statistics, correlation analysis, and linear regression analysis, were employed to evaluate the statistical hypotheses. The empirical results yielded several significant findings. All examined sources of the macroeconomic environment, such as the level of basic macroeconomic indicators, the state of the macroeconomic environment in the context of starting a business, and innovation activities of SMEs, determine the QBE. Other key factors that positively influence the quality of the business environment include: stabilization of the business environment by the central bank's monetary policy; the level of bank interest rates on the innovation activities of companies and availability of bank loans. The findings are significant not only for the SME segment itself and their owners and top managers but also for national-level institutions along with non-profit organizations assisting in improving the entire SME segment in the business environment.

Keywords: Quality of business environment, SME segment, Economic risks, Entrepreneurship, Case study

1. Introduction

The business environment is a dynamic and interconnected system influenced by a wide array of institutions and actors at both national and international levels. The complexity of this environment is shaped by interactions among economic, political, technological, and social factors, which are continuously evolving and interdependent (Gaganis et al., 2019; Blasiu). Understanding and monitoring these changes pose significant challenges, and many national and international organizations define specific indicators to ensure international comparability and facilitate the analysis of these dynamic processes (Yarmoliuk & Savchuk, 2022).

Some of the most extensively studied areas of the business environment include risk management, corporate financing and capital, employment, quality of human resources, social policy in connection with the labor market and legislation, legal frameworks for business operations, public finance, including tax and levy policy, antitrust policy, subsidy policy, licensing policy, certification systems, and other related fields. (Barata & Fontainha, 2017; Buno et al., 2015; Hanggraeni et al., 2019, Kotorri & Krasniqi, 2018; Rózsa et al., 2023).

The originality of the article lies in the comparison of research findings from empirical quantitative research on the impact of economic risk sources on the quality of the business environment over the years 2018 and 2022. The quantitative research was conducted based on the individual attitudes of owners and managers within the business environment of the Slovak Republic, with a sample size of 631 respondents.

The structure of the article is as follows. A critical literature review was conducted to identify significant economic risk sources determining the quality of the business environment. Subsequently, the article's objective, data collection methodology, questionnaire and variables, statistical hypotheses and methods, and the demographic structure of the research sample were formulated. The following section presents empirical research results, supported by the application of correlation and regression analysis. The discussion includes an international comparison of empirical results with similar studies in research articles. The conclusion outlines the limitations and future research directions.

2. Literature Review

The effect of economic risk sources on the quality of the business environment in the SME segment has been a significant area of research, particularly given the crucial role SMEs play in the global economy (Manggu et al., 2024; Zsigmond & Mura, 2023; Petrů et al., 2018; Kozubíková et al., 2017; Virglerova et al., 2017). Economic risks, including macroeconomic instability, fluctuations in monetary policy and interest rates, and insufficient corporate financing have been shown to have profound impacts on SMEs' operational performance and growth potential (Çera et al., 2019; Yarmoliuk & Savchuk, 2022). Understanding and mitigating these risks is essential for ensuring the sustainability and competitiveness of SMEs (Belás et al., 2020; Rózsa et al., 2024). Various studies have explored these dimensions, highlighting the multifaceted nature of economic risks and their implications for the SME sector (Ajufoh et al., 2023; Belás et al., 2019).

Risks related to the labor force are widely discussed in terms of working and socioeconomic conditions (Devkota et al., 2023; Navickas et al., 2022), generation gap and performance (Cizrelioğulları & Babayiğit, 2022; Šakytė-Statnickė et al., 2023), migration (Přívarová et al., 2022), technological development (Andrade et al., 2023), incentives (Abou-Shouk et al., 2023), networking activities (Rozsa et al., 2022), workshops (Ključnikov et al., 2022a), and satisfaction (Matijová et al., 2023). Other aspects include firms' brand value (Plaikner et al., 2023), digital transformation (Krajcik et al., 2023), innovative organizational strategies (Civelek et al., 2023a), sustainable development (Civelek et al., 2023b), innovation performance (Civelek & Krajčík, 2022), and internationalization (Ključnikov et al., 2022b).

One of the primary economic risk sources affecting SMEs is the macroeconomic environment. Macroeconomic instability, such as fluctuations in GDP growth rates, inflation, and exchange rates, can create uncertainty and volatility, which in turn affect business planning and investment decisions (Lacko et al., 2023; Ceylan, 2021; Halim et al., 2017). Studies have shown that SMEs are particularly vulnerable to macroeconomic shocks due to their limited financial resources and lower resilience compared to larger firms (Altnaa & Neszmélyi, 2022; Pedauga et al., 2021). This vulnerability necessitates a robust understanding of macroeconomic trends and the implementation of strategies to mitigate their adverse effects.

Monetary policy and interest rates also play a crucial role in shaping the business environment for SMEs (Khariza et al., 2020). Changes in interest rates can affect borrowing costs, which are critical for SMEs that often rely on external financing for their operations and expansion. High interest rates can increase the cost of capital, making it more difficult for SMEs to finance new projects or manage cash flow (Ghosh, 2019).

Conversely, low interest rates can stimulate investment and expansion by reducing the cost of borrowing. However, sudden changes in monetary policy can create uncertainty, leading to cautious spending and investment behaviors among SMEs (Mtunya et al., 2017). Research by Ferrando et al. (2023) highlights the importance of stable monetary policy in fostering a supportive business environment for SMEs. Additionally, Caglio et al. (2021) emphasize that understanding the impact of interest rates through regression analysis can help SMEs make informed financial decisions.

Corporate financing is another critical factor influencing the quality of the business environment for SMEs. Access to finance is often cited as one of the main challenges faced by SMEs, and the availability of financial resources is closely linked to economic conditions. During periods of economic downturn, credit availability may decrease, and lenders may become more risk-averse, further limiting the financing options available to SMEs (Nguyen et al., 2021; Zubair et al., 2017).

The quality of the business environment for SMEs is intricately linked to various economic risk sources. Understanding and addressing these risks through informed policy-making and strategic business practices is crucial for fostering a resilient and dynamic SME sector. By leveraging insights from academic research and applying robust risk management frameworks, SMEs can better navigate the complexities of the economic landscape and contribute to sustainable economic growth.

3. Aim, Methodology and Variables

The aim of the article is to define and quantify the impact of specific economic risk sources on the quality of the business environment (QBE). The subject of the analysis was the evaluation of the impact of selected economic risk sources - the macroeconomic environment; monetary policy and interest rates; and corporate financing on QBE.

3.1 Data Collection

The respondent is defined as an owner or a top manager of a SME operating within the business environment of the Slovak Republic (SR). Data was collected between 2018 and 2022 using an online survey. The "Albertina" database was used in 2018 to identify and subsequently contact the respondents. Attitudes from the respondents were gathered using a survey method through the completion of an online questionnaire. The response rate was 5.3% (n = 329 respondents). In 2022, data collection was carried out through the panel agency MNFORCE, with a sample size of 151 respondents.

3.2 Statistical Hypotheses

The following statistical hypotheses (SHs) were formulated to achieve the aim of the scientific article:

SH1: The macroeconomic environment (EF1) is a statistically significant economic factor that has a positive effect on the quality of the business environment (QBE).

SH2: Monetary policy and interest rates (EF2) are statistically significant economic factors that have a positive effect on the quality of the business environment (QBE).

SH3: Corporate financing (EF3) is a statistically significant economic factor that has a positive effect on the quality of the business environment (QBE).

3.3 Questionnaire and Variables

Respondents could answer the statement with one of the five responses: strongly agree, agree, neutral, disagree, and strongly disagree (Likert scale responses). The questionnaire contained the following dependent variable (DV) and independent variables (IVs):

DV: The business environment in our country is of high quality and suitable for business (QBE).

IVs: Macroeconomic Environment (EF1) – EF11: I consider the macroeconomic environment in our country to be favorable for business activities. EF12: The state of the macroeconomic environment in our country supports the initiation of new businesses. EF13: The current macroeconomic environment supports innovative activities of companies. EF14: The current level of basic macroeconomic indicators (GDP, employment, inflation) supports business and creates interesting business opportunities.

Monetary Policy and Interest Rates (EF2) – EF21: The central bank's monetary policy positively influences the business environment. EF22: Interest rates in banks positively affect the business environment. EF23: Interest rates in banks positively influence the innovative activities of companies. EF24: The central bank's monetary policy stabilizes the business environment.

Corporate Financing (EF3) – EF31: Companies have a good access to bank loans. EF32: Bank loan conditions are acceptable for companies. EF33: The cost of loans is acceptable for companies. EF34: Banks positively influence the quality of the business environment.

3.4 Statistical Methods

Regression analysis is used not only for predicting the future values of the dependent variable in time series but also for identifying causal relationships between variables. By applying linear regression models, the significance of indicators (determining the direction and strength of influence using RC1, ..., RC3) on QBE is verified. LRM is appropriate to apply because all variables are identically scaled (same metrics - response scaling: 1 – strongly agree, ..., 5 – strongly disagree) and are formulated in such a way that the respondents' attitudes towards selected economic factors (EF1, ..., EF3) converge linearly with their attitudes towards statements regarding QBE.

In the first phase, descriptive statistics (mean, standard deviation, skewness, kurtosis) were calculated for the initial evaluation of statements related to the DV and IVs. In the second phase, paired correlation coefficients were used to determine the dependencies between the dependent variable (DV) and independent variables (IVs), which were presented through correlation matrices (Schmidt & Finan, 2018). The significance of the paired correlation coefficients was verified at the significance level ($\alpha = 0.05$). The estimation of regression coefficients of the independent variables was conducted using the least squares method (Hair et al., 2010). A regression coefficient is statistically significant if the p-value of the t-test is less than α ($\alpha = 0.05$; Salmerón et al., 2018). The general form of the linear regression function is as follows:

$$QBE = RC_0 + RC_1 \times EF_1 + RC_2 \times EF_2 + \beta_3 \times EF_3 + \varepsilon_n , \quad (1)$$

where: – dependent variable (quality of business environment); RC_0 – constant, RC_1; …; RC_3– estimate of regression coefficients; EF1, …, EF3 – independent variables (items of economic factors: EF1, ..., EF3); ε_n – random error.

LRM is verified using regression characteristics: multiple correlation coefficient (R), coefficient of determination (R^2), and adjusted coefficient of determination (Adj. R^2); ANOVA – F test. Negative dependence among the indicators of selected factors was verified using the Variance Inflation Factor (VIF). If the VIF value is less than 5 (Liao & Valliant, 2012), multicollinearity in the LRM is rejected. The Shapiro-Wilk test (S-W test) was applied to verify the normal distribution of errors. The assumption is accepted if the p-value of the S-W test is greater than the significance level (Salmerón et al., 2018). Bartlett's test was used to verify the assumption of homoscedasticity. This assumption is accepted if the p-value of the Bartlett test statistic is higher than the significance level (Yang et al., 2019). The presence of autocorrelation in the regression models was not investigated, given that the data is not from time series. All tests were conducted using SPSS Statistics vs. 27 software.

3.5 Structure of SMEs

The demographic structure of the SME research sample according to the characteristics of enterprises and respondents was as follows (2018: n = 329 / 2022: n = 151): i. Location of enterprise operation: Prešov Region 76/21 enterprises, Košice Region 75/14 enterprises, Bratislava Region 56/28 enterprises, Banská Bystrica Region 30/16 enterprises, Žilina Region 28/25 enterprises, Trnava Region 27/8 enterprises, Trenčín Region 20/24 enterprises, Nitra Region 17/15 enterprises; ii. Sector of business: Services 122/67 enterprises, trade 69/32 enterprises, manufacturing 51/13 enterprises, construction 39/19 enterprises, agriculture 20/3 enterprises, transportation 11/5 enterprises, other business sectors 17/12 enterprises; iii. Duration of enterprise operation: 104/46 enterprises operating for 1 – 5 years, 78/44 enterprises operating for 5 – 10 years, 147/61 enterprises operating for more than 10 years; iv. Size of enterprise: 234/111 micro-enterprises (up to 10 employees), 71/24 small enterprises (up to 50 employees), 24/16 medium-sized enterprises (up to 250 employees); v. Highest education level of the entrepreneur: 10/12 with secondary education without graduation, 95/61 with secondary education with graduation, 224/78 with higher education; vi. Gender of the entrepreneur: 251/81 male, 78/70 female.

4. Research Results

Table 1 presents the results of the descriptive characteristics (e.g. mean, standard deviation, skewness, and kurtosis) of the respondents' evaluation of the statements about the selected economic factors (EF1, …, EF34).

Table 1: Descriptive statistics of economic statements (2018/2022)

V	EF11	EF12	EF13	EF14	EF21	EF22	EF23	EF24
Mean	3.438/ 3.437	3.380/ 3.583	3.082/ 3.364	2.988/ 3.576	2.942/ 3.325	2.948/ 3.457	2.924/ 3.430	2.891/ 3.483

Note: EF11, ..., EF34 – Indicators of economic factors. Source: own data collection.

4.1 Effect of Macroeconomic Environment on the QBE

The results of verification of dependences between the indicators of EF1 and QBE are presented in the correlation matrix (see table 2).

Table 2: Dependences between macroeconomic environment and QBE (2018/2022)

	QBE	EF11	EF12	EF13	EF14
QBE	1				
EF11	0.423*/0.671*	1			
EF12	0.407*/0.810*	0.325*/0.709*	1		
EF13	0.382*/0.695*	0.227*/0.674*	0.412*/0.708*	1	
EF14	0.328*/0.607*	0.253*/0.661*	0.389*/0.615*	0.315*/0.606*	1

Note: * Statistically significant on the $\alpha = 0.05$; EF11, ..., EF14 – Indicators of macroeconomic environment. Source: own data collection.

The results of correlation analysis (see table 2) confirmed that there are the significant pairwise dependences between independent variables (indicators of macroeconomic environment) and quality of business environment on the $\alpha = 0.05$.

The results of verification of relationships between the indicators of EF1 (independent variables) and QBE (dependent variable) are presents in the LRM1 (see table 3).

Table 3: LRM1 – relationships between indicators of EF1 and QBE (2018/2022)

ANOVA – Analysis of variance					
Variability	Degree of freedom	Sum of square	Mean square	F- ratio	
Model	4/4	101.66/141.17	25.4/35.3	36.931/83.966	
Error	324/146	222.97/61.37	0.69/0.42	p-value	
Sum	328/150	324.63/202.54		<0.000/ <0.000	
Verification of regression coefficient in the LRM1					
Variable	Regression coefficient	Mean Square	t-Stat	t-Stat (p-value)	VIF value
Constant	0.994/0.284	0.221/0.199	4.497/1.428	0.000/0.155	-/-
EF11	0.269/0.083	0.046/0.068	5.821/1.222	0.000/0.224	1.150/2.575
EF12	0.183/0.561	0.055/0.073	3.365/7.678	0.001/0.000	1.388/2.574
EF13	0.228/0.199	0.058/0.077	3.949/2.591	0.000/0.011	1.255/2.364
EF14	0.122/0.096	0.052/0.067	2.346/1.442	0.020/0.151	1.240/1.999

Note: EF11, ..., EF14 – Indicators of macroeconomic environment. Source: own data collection.

The results of regression characteristics are follows (2018/2022): R = 0.560/0.835; R^2 = 0.313/0.697; Adj. R^2 = 0.305/0.689; SE = 0.830/0.648; n = 329/151. Also, the results confirmed (see table 3) that the LRM1 is a statistic significant for each time period (2018/2022) on the $\alpha = 0.001$. Linear regression function are follows:

2018: QBE = 0.994 + 0.269×EF11+0.183×EF12 + 0.228×EF13+0.122×EF14 (2)

2022: QBE = 0.284 + 0.083×EF11+0.561×EF12 + 0.199×EF13+0.096×EF14 (3)

where: – dependent variable (quality of business environment); EF11, …, EF14 – independent EF1.

The VIF values (see table 3) did not show the presence of multicollinearity in the LRM1 (2018 or 2022). The results of Bartlett´s test (BTS) and S-W test are follows (2018/2022): BTS(2018) = 0.428/BTS(2022) = 0.274; S-W(2018) = 0.249/S-W(2022) = 0.314. The hypotheses SH1_2018 and SH1_2022 were accepted. LRM1 confirmed the positive effect of macroeconomic environment on the quality of business environment.

4.2 Effect of Monetary Policy and Interest Rates on the QBE

The results of verification of dependences between the indicators of EF2 and QBE are presented in the correlation matrix (see table 4).

Table 4: Dependences between monetary policy with interest rates and QBE (2018/2022)

	QBE	EF21	EF22	EF23	EF24
QBE	1				
EF21	0.122*/0.577*	1			
EF22	0.129*/0.615*	0.188*/0.540*	1		
EF23	0.210*/0.547*	0.222*/0.515*	0.535*/0.708*	1	
EF24	0.270*/0.575*	0.330*/0.635*	0.294*/0.583*	0.315*/0.529*	1

Note: * Statistically significant on the α = 0.05; EF21, ..., EF24 – Indicators of monetary policy and interest rates. Source: own data collection.

The results of correlation analysis (see table 4) confirmed that there are the significant pairwise dependences between independent variables (indicators of monetary policy and interest rates) and quality of business environment on the α = 0.05.

The results of verification of relationships between the indicators of EF2 (independent variables) and QBE (dependent variable) are presents in the LRM2 (see table 5).

Table 5: LRM2 – relationships between indicators of EF2 and QBE (2018/2022)

ANOVA – Analysis of variance					
Variability	**Degree of freedom**	**Sum of square**	**Mean square**	**F- ratio**	
Model	4/4	29.46/99.44	7.37/35.21	8.085/35.206	
Error	324/146	295.17/103.10	0.91/0.71	p-value	
Sum	328/150	324.63/202.54		<0.000/ <0.000	
Verification of regression coefficient in the LRM2					
Variable	**Regression coefficient**	**Mean Square**	**t-Stat**	**t-Stat (p-value)**	**VIF value**
Constant	2.362/0.442	0.254/0.281	9.314/1.573	0.000/0.118	-
EF21	0.022/0.249	0.065/0.084	0.334/2.949	0.739/0.004	1.144/1.105
EF22	-0.017/0.323	0.062/0.099	-0.276/3.266	0.783/0.001	1.438/1.057
EF23	0.161/0.135	0.072/0.102	2.253/.328	0.025/0.186	1.469/0.983
EF24	0.262/0.212	0.069/0.091	3.803/2.325	0.000/0.021	1.230/1.057

Note: EF21, ..., EF24 – Indicators of Monetary policy and interest rates. Source: own data collection.

The results of regression characteristics are follows (2018/2022): R = 0.301/0.701; R^2 = 0.091/0.491; Adj. R^2 = 0.080/0.477; SE = 0.954/0.840; n = 329/151. Also, the results confirmed (see table 5) that the LRM2 is a statistic significant for each time period (2018/2022) on the α = 0.001. Linear regression function are follows:

2018: QBE = 2.362 + 0.022×EF21-0.017×EF22 + 0.161×EF23+0.262×EF24 (4)

2022: QBE = 0.442 + 0.249×EF21+0.323×EF22 + 0.135×EF23+0.212×EF24 (5)

where: – dependent variable (quality of business environment); EF21, …, EF24 – independent EF2.

The VIF values (see table 5) did not show the presence of multicollinearity in the LRM2 (2018 or 2022). The results of Bartlett´s test (BTS) and S-W test are follows (2018/2022): BTS(2018) = 0.150/BTS(2022) = 0.207; S-

W(2018) = 0.201/S-W(2022) = 0.639. The hypotheses SH2_2018 and SH2_2022 were accepted. LRM2 confirmed the positive effect of monetary policy with interest rates on the quality of business environment.

4.3 Effect of Corporate financing on the QBE

The results of verification of dependences between the indicators of EF3 and QBE are presented in the correlation matrix (see table 6).

Table 6: Dependences between corporate financing and QBE (2018/2022)

	QBE	EF31	EF32	EF33	EF34
QBE	1				
EF31	0.298*/0.548*	1			
EF32	0.257*/0.578*	0.533*/0.633*	1		
EF33	0.136*/0.577*	0.342*/0.642*	0.629*/0.781*	1	
EF34	0.244*/0.586*	0.408*/0.497*	0.493*/0.564*	0.533*/0.618*	1

Note: * Statistically significant on the α = 0.05; EF31, ..., EF34 – Indicators of corporate financing. Source: own data collection.

The results of correlation analysis (see table 6) confirmed that there are the significant pairwise dependences between independent variables (indicators of corporate financing) and quality of business environment on the α = 0.05.

The results of verification of relationships between the indicators of EF3 (independent variables) and QBE (dependent variable) are presents in the LRM3 (see table 7).

Table 7: LRM3 – relationships between indicators of EF3 and QBE (2018/2022)

ANOVA – Analysis of variance					
Variability	**Degree of freedom**	**Sum of square**	**Mean square**	**F- ratio**	
Model	4/4	38.08/94.34	9.52/23.58	10.764/31.822	
Error	324/146	286.55/102.21	0.88/0,74	p-value	
Sum	328/150	324.63/202.54		<0.000/ <0.000	
Verification of regression coefficient in the LRM3					
Variable	**Regression coefficient**	**Mean Square**	**t-Stat**	**t-Stat (p-value)**	**VIF value**
Constant	2.449/0.629	0.208/0.276	11.762/2.280	0.000/0.024	-
EF31	0.193/0.216	0.062/0.087	3.120/2.489	0.002/0.014	1.457/1.871
EF32	0.143/0.206	0.076/0.109	1.875/1.878	0.062/0.062	2.078/2.820
EF33	-0.101/0.117	0.074/0.121	-1.371/0.962	0.171/0.338	1.862/3.103
EF34	0.161/0.353	0.071/0.089	2.258/3.979	0.025/0.000	1.547/1.691

Note: EF31, ..., EF34 – Indicators of Corporate financing. Source: own data collection.

The results of regression characteristics are follows (2018/2022): R = 0.342/0.682; R^2 = 0.117/0.466; Adj. R^2 = 0.106/0.451; SE = 0.940/0.861; n = 329/151. Also, the results confirmed (see table 7) that the LRM3 is a statistic significant for each time period (2018/2022) on the α = 0.001. Linear regression function are follows:

2018: QBE = 2.449 + 0.193×EF31+0.143×EF32 -0.101×EF33+0.161×EF34 (6)

2022: QBE = 0.629 + 0.216×EF31+0.206×EF32 + 0.117×EF33+0.353×EF34 (7)

where: – dependent variable (quality of business environment); EF31, …, EF34 – independent EF3.

The VIF values (see table 7) did not show the presence of multicollinearity in the LRM3 (2018 or 2022). The results of Bartlett´s test (BTS) and S-W test are follows (2018/2022): BTS(2018) = 0.124/BTS(2022) = 0.253; S-W(2018) = 0.327/S-W(2022) = 0.142. The hypotheses SH3_2018 and SH3_2022 were accepted. LRM3 confirmed the positive effect of corporate financing on the quality of business environment.

5. Discussion

All indicators of the macroeconomic environment positively influence the quality of the business environment in Slovakia. Among the macroeconomic environment indicators, the favorable assessment of the macroeconomic environment by SMEs has the most significant impact on the quality of the business environment (EF11: RC = 0.269). Other macroeconomic environment indicators also have a significant (though weaker) positive impact on the quality of the business environment (EF13: RC = 0.228; EF12: RC = 0.183; EF14: RC = 0.122).

The most significant indicator of the economic factor “monetary policy and interest rates”, which positively influences the quality of the business environment in Slovakia, is the stabilization of the central bank's monetary policy (EF24: RC = 0.262). Also, significant (though weaker than EF24) is the positive impact of bank interest rates on the innovative activities of companies on the quality of the business environment (EF23: RC = 0.161).

The most significant indicator of corporate financing that positively influences the quality of the business environment in Slovakia is access to bank loans (EF31: RC = 0.193). Also, significant (though weaker) is the positive impact of banks on the quality of the business environment (EF34: RC = 0.161). The influence of bank loan conditions (EF32: t-test: p-value = 0.062) and the cost of loans (EF33: t-test: p-value = 0.172) is not significant.

6. Conclusion

The aim of the article was to define and quantify the impact of specific economic risk sources on the quality of the business environment (QBE).

All indicators of the macroeconomic environment positively influenced the quality of the business environment in Slovakia in 2018. The favorable assessment of the macroeconomic environment by SMEs had the most significant impact on the quality of the business environment among the macroeconomic indicators in 2018. Other macroeconomic environment indicators also had a significant positive impact on the quality of the business environment in 2018. On the other hand, the state of the macroeconomic environment and its support for starting a business had the most significant impact on the quality of the business environment among the macroeconomic indicators in 2022. Similar conclusions were reached in the studies by Liu, Q. (2021) and Lizhong (2020), where their research provides empirical evidence on the impacts of macroeconomic factors on the quality of the business environment.

The most significant indicator of the economic factor "monetary policy and interest rates" that positively influenced the quality of the business environment in Slovakia in 2018 was the stabilization of the central bank's monetary policy. On the other hand, according to respondents, the significant impact of interest rates on the business environment and the effect of interest rates on the innovative activities of companies were notable indicators with a positive influence on QBE in 2022. Additionally, the positive impact of bank interest rates on the innovative activities of companies was also significant for the quality of the business environment in 2018. The empirical evidence of the impact of monetary policy stabilization and interest rates on the business environment is confirmed, for example, by studies by Ma & Zimmermann (2023) or Klimova (2021).

The significance of the empirical findings from the conducted quantitative research lies in a deeper understanding of the economic determinants that influence the quality of the business environment. The findings can serve national policymakers in the area of business support for the small and medium-sized enterprise (SME) segment. Additionally, the findings can help owners and managers of SMEs, as well as educational organizations, to better understand and deepen their scientific knowledge, thereby contributing to the sustainable growth of the SME segment in Central European countries.

The conducted quantitative research has its limitations. The subject of the study was the individual attitudes of owners and managers of small and medium-sized enterprises from only one Central European country. The questionnaire was evaluated using linear regression models, which quantify causal relationships between variables in only one direction. Data collection was carried out over a longer time horizon of 4 years.

Digital Transformation of Tax and Accounting Processes

Marie Černá and Jan Pokorný
University of West Bohemia, Plzeň, Czech Republic

macerna@fek.zcu.cz
pokorny@fek.zcu.cz

Abstract: The world today is changing rapidly in many ways. Fundamental changes that differ country by country are visible also in the area of taxes and accounting. New activities whose adoption is enabled due to the great development of technologies in fact exert pressure on individual economic subjects' actions in many areas. This is visible also in supporting activities like tax and accounting processing. Setting of business processes has to be therefore changed quite often as a reaction to the frequent changes in legislation regulating these areas. Legislation in these two areas, taken from the Czech accounting units' point of view, changes so often. Even if these changes of the legislative framework can be described as more frequent in the area of taxation (great change at least twice a year, often in the area of income taxes), this year the great change happened also in the area of accounting. In association with the adoption of the New accounting act started to be influenced set accounting processes of accounting units concerned. New accounting act should come into force since January 1, 2025. The aim of this contribution is to identify and, through the analysis of the development of digitalization tools, assess the possibilities of selected accounting units in the area of digital transformation of tax and accounting processes. This contribution uses, with the intention to describe and assess the situation in above specified areas, information focused on related significant legislative changes and relevant research methods to which belong literature research of professional publications, analysis of information and methodical support in specified area (provided mainly by the state authorities). The intention of the authors is to assess the degree of use of digitalization by selected, in the contribution further specified, accounting units. Therefore, in the final part of the contribution, obtained results are summarized using the method of synthesis.

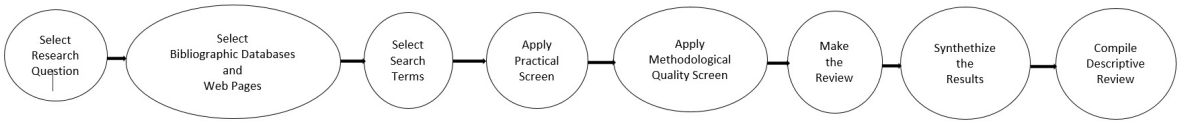
Keywords: Accounting, Digitalization, Supporting processes, Taxation

1. Introduction

The origin of digitalization dates back to the early 1970s (3rd industrial revolution). That was the moment when electronization, information technologies (IT) and automation of production were used for the first time. Then, during the 4th industrial revolution, fast internet, integrated and flexible information and communication technologies (ICT) and data storage (Cloud), are introduced (Veber et. al, 2018).

Schallmo and Williams (2018) define digitalization as "the use of digital technologies and of data (digitized and natively digital) in order to create revenue, improve business, replace/transform business processes (not simply digitizing them) and create an environment for digital business, whereby digital information is at the core." Digitization is then seen as a tool used when trying to develop digitalization of the businesses, funded organizations, public administration, etc. It is usually introduced as "the process of using digital information technologies to convert analog data into its digital counterpart." (Samoilenko, 2023).

Digitalization and its development is present on many levels of human-made networks, society, industry or organization (Samoilenko, 2023). Schallmo and Williams (2018) state that digital transformation affects different areas of society and the economy by opening up new opportunities for networking and enabling collaboration between different actors. As stated by Leitner-Hanetseder et. al (2021), digitalization is taken by the current society as one of the biggest and most permanent changes influencing many areas of people's lives. Digitalization is widely used also in business entities. These subjects are focused on digitalization of all relevant areas of business activities. To them belong also areas of accounting, taxes, document work, online communication with the customer, etc. (Veber et. al, 2018). The reason is obvious, among other things, from the statement by Anton (2023), who confirms that digitalization is a process that accounting firms are also subject to if they want to remain competitive and meet the needs of communication with customers. Losbichler and Lehner (2021) say that digitalization in accounting manifests itself both on the side of automating routine activities and on the side of supporting or automating demanding analytical activities (machine forecasts and involvement of artificial intelligence).



Tendencies leading to support of digitalization are present everywhere. Compiled contribution deals with an interesting and up to date issue, digitalization of tax and accounting processes and tries to emphasize importance of process management and its tools in this area. The aim of this contribution is to identify and, through the analysis of the development of digitalization tools, assess the possibilities of selected accounting units in the area of digital transformation of tax and accounting processes. Literature review and analysis mentioned in the following part of this article will focus on these areas. The authors will assess the situation

from the perspective of Czech companies that focus on accounting and tax processing. Authors try to consider positive impact of digitalization, even if there can be also negative impacts identified. This type of digitalization impact was assessed in other works of the authors and is not the subject of this article. This article will focus on tools used by business entities for the development of digitalization in taxation and accounting. The authors will also add information relating to measurement of the rate of digitalization.

2. Methods

To be able to make this assessment, authors of the article conducted the qualitative research. Undertaken method was document and text analysis. With the intention to identify the relevant literary sources were also used systematic literature review (see Figure 1) and traditional literature review (Moahmmed, 2021).

Authors expectations were that there are online sources in the form of information provided by web pages of public and private subjects dealing with this issue and also databases administered by the state authorities and other organizations (Czech Statistical Office, European Commission or OECD).

Source: Own processing according to Fink (2014), 2024

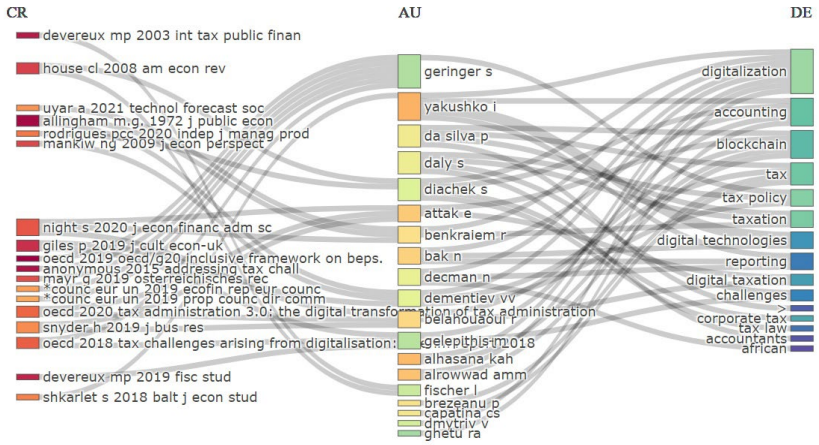
Figure 1: Steps of systematic literary review

To sum up, to be able to compile this article, its authors used most often these methods:

- Literary research of the current state in analysed area (systematic literature review, traditional literature review, document and text analysis).
- Analysis of the current state of digitalization of taxes and accounting processes set by the Czech legislative (Act No. 365/2000 Coll., Act on Public Administration Information Systems and on Amendments to Certain Other Acts, Act No. 12/2020 Coll., Act on the Right to Digital Services and on Amendments to Certain Acts, etc.).
- Analysis of the data provided by European Commission (EC).
- Synthesis of information that enables the authors to identify and describe the possibilities of selected accounting units in the area of digital transformation of tax and accounting processes.

3. Results and Discussion

3.1 Systematic Literary Review



The first step leading to compilation of related parts of this article was a systematic literary review. This review was focused on searching the literary sources dealing with influence of digitalization on tax and accounting processes issue.

Research question was set as: “Are there any articles dealing with our issue published in Web of Science database?” The intention was to find and assess the findings of various authors in the analysed area. Authors tried to search for articles dealing with all three terms, digitalization, taxation and accounting. 32 articles were found. The results included 24 articles in journals, 7 articles in proceeding papers, 1 early access article and 1 review. Therefore, there was no necessity to narrow the selection by searching just in the titles. There was also no necessity to limit the search by years of publication. Articles in analysed area have been published since 2018 till 2024. Results of this review are visible in the following figures 2 and 3. Figure 2 shows the main data (number of sources, number of documents, etc.). Figure 3 is a three-field plot showing the connection between selected sources (CR), authors (AU) and key words (DE).

Source: Own processing, 2024

Figure 2: Results of systematic literary review

Source: Own processing, 2024

Figure 3: Results of systematic literary review (three-field plot)

Selected articles were further analysed. 4 articles of the highest relevancy were then selected as the starting point helping the authors compile the introductory parts of this article. These were articles written by Rakovský (2021), Belahouaoui and Attak (2024), Vishnevsky (2022) and Ponomareva (2022).

The authors decided to use also other sources (web pages, databases) focused on this issue. Therefore, the traditional literature review was also done.

3.2 Current State of Taxes and Accounting Processes Digitalization in the Czech Republic

In this part of the article, information about the current situation of the Czech accounting units in the area of taxation and accounting are given.

In the field of taxation and accounting, digitalization is primarily focused on digitization associated with the transcription of data in paper form into electronic form. The storage of data and any other processes associated with working with data are also addressed here. In connection with digitization, the Czech Republic has adopted a document called "Digital Czech Republic, the path to a digital economy". This document should serve to build a digital marketplace. The process of digitalization of public administration and improvement of citizens' access to public digital services is solved by the Act No. 12/2020 Coll., Act on the Right to Digital Services and on Amendments to Certain Acts.

Digitalization in taxes (the Czech Republic)

Entrepreneurs and companies keep tax records in selected accounting software. The accounting software is able to create various tax declarations. All the data is created and stored in the storage, the software overwrites the data and creates the tax declaration that the user needs.

Tax administration is provided by the Financial Administration. Financial Administration maintains a website where it is easy to find various forms or information related to taxes. Digitalization of tax administration is ensured by the Digital Information Agency, who sets the new standards, introduce comprehensive methodology and supervision of the process of digitalization. Governance of public affairs is currently ensured using the tools shown in table 1.

Table 1: Tools used for public affairs governance

Tool	Area of use
eGovernment	*Communication with state and public administration institutions in electronic form.*
Czech POINT	*Contact points solving requests for extracts from public and non-public registers and submissions to the state administration.*
"Data box"	*Communication with state authorities (Czech Social Security Administration, health insurance companies).*
"My Taxes"	*An application that allows filling out electronic forms, save them and send them through the EPO application or through the Online Tax Office (DIS+).*
Electronic submissions for financial administration (EPO)	*Electronic filing office. (Electronic submission of tax declarations.)*
Online Tax Office (DIS+)	*Online Tax Office. (Electronic submission of tax declarations.)*

Source: own processing, 2024

Digitalization in accounting (the Czech Republic)

Nowadays, accounting is mainly carried out using information and communication technologies (ICT). This may be called computerised accounting. Manually processed recording of information about the economic transactions of the company was moved to a digital form. The same way as many other activities, accounting has become much faster and simpler, because of the use of ICT. Electronic accounting also provides easier archiving of all data.

Among the digital tools currently used by the Czech accounting units belong:

- Data mining. (Tool used to ensure extraction of data from documents and its transformation to usable information.)
- Electronic signature. ("Data in electronic form that is attached to or logically connected to a data message, and which serves as a method to unambiguously verify the identity of the signed person in relation to the data message". (Act No. 227/2000 Coll., Electronic Signature Act and Amendment of Certain Other Acts))
- Time stamp. (Service that enables to clearly demonstrate time of document creation – related to legal consequences).
- Artificial intelligence. (So far, the transcription of received receipts and invoices with the help of artificial intelligence.)

The same way as in other countries, accounting in the Czech Republic is regulated by legislation. As the main legislative document is taken Act No. 563/1991 Coll., Accounting Act. This document was revised and its new version came into force on January, 1, 2024. Its validity was postponed to 2025. In this document are currently included issues related to artificial intelligence, digitalization, international accounting standards or functional currency.

Economic entities providing their goods or services in the Czech Republic (with the obligation to keep accounts or those keeping accounting records on a voluntary basis) can keep accounting records using:

- Internal accounting (ensured by own employee of the company).
- Outsourcing (ensured by an external firm/experts specialized in provision of accounting services).
- Cloud (software on which the accounting is operated).

Digitalization in the area of taxes and accounting is closely related to the purchases and use of facilities enabling to secure network connections and the ability to share and work with data. Information focused on

this issue are provided by variant organizations (Czech Statistical Office (CZSO), European Commission (EC) or Organisation for Economic Co-operation and Development (OECD)).

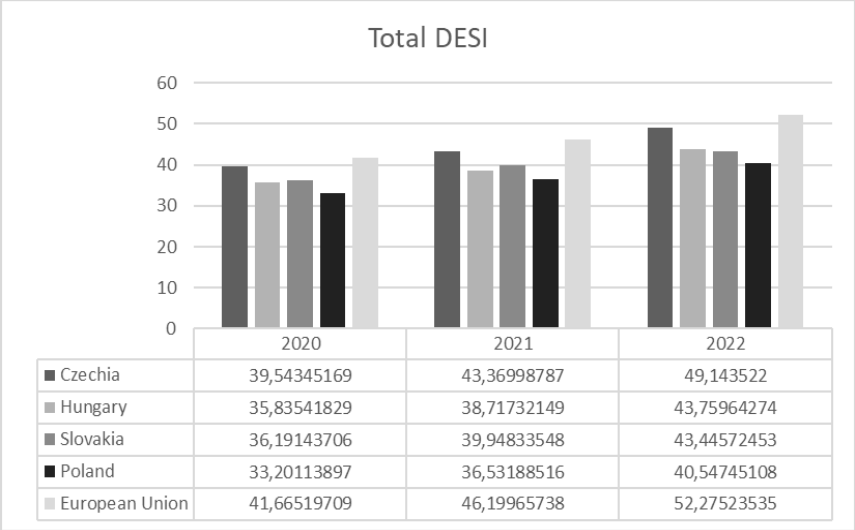
The intention of the authors was to assess, on the basis of statistical data, the level of use of digitalization by selected accounting units operating in the Czech Republic. Next part of the article will therefore describe and explain the indicators used most often for evaluation of the rate of digitalization in individual countries of the European Union (EU). The authors will try to focus on the rate of digitalization reached by business units in the Czech Republic.

3.3 Data Provided by EC and OECD

European Commission and OECD gather and store the data on EU countries level of digitalization. There are several indicators used for evaluating rate of digitalization in individual countries. Some of them are described in the following table 2.

Table 2: Selected indicators of the rate of digitalization

Abbreviation	Indicator	Principle
DAI	Digital Adoption Index	*It focuses on measuring the extent of digital technology diffusion within and between countries.*
DDI	Digital Density Index	*It serves government leaders and businesses to understand, measure and manage digital technologies more easily, as well as to create strategies to support competitiveness and growth.*
DESI	Digital Economy and Society Index	*It monitors the development of digital competitiveness of the EU member states.*
DFI	Digital Futures Index	*It explores who is leading the global race to adopt new innovations and technologies and create the world's digital future.*
DGI	Digital Government Index	*Assesses digital government in different countries according to how the environment is set to enable the use of technology and data leading to the digital transformation of the public sector.*
DMI	Digital Maturity Index	*It is used to identify and document proven practices in the use of information processes and technologies for tax collection.*



Source: Own processing in accordance to Kepková (2024), 2024

Even if these indicators monitor activities in many areas, it is possible to use them as the starting point for measuring the level of digitalization in the area of taxation and accounting at least in the Czech Republic. Considering the fact that the interaction in the field of taxation and accounting takes place between business and public administration entities, it is possible to assume that all parties involved have appropriate tools for this. These tools are thus implemented and used by both businesses and the public sector.

Situation and development of the EU countries in the area of digitalization is evaluated mainly using the Digital economy and society index (DESI). That is the reason why authors also started with analysis based on data provided by DESI. The DESI index is a composite index that consists of four basic measured areas: Human capital, Connectivity, Integration of digital technology and Digital public services.

Use of DESI was different till 2022, when this indicator was taken as the tool for comparison of individual EU countries. Since 2023 is its setting a little bit different. EC compile this index with different purpose which is defined as emphasizing “the need to accelerate and deepen the collective efforts, including through policy measures and investment in digital technologies, skills and infrastructures.” (EC, 2023) Next figure (4) presents the position of the Czech Republic since 2020 (year when Covid-19 started) till 2022 (change of DESI setting).

For the comparison with the Czech Republic were used other V4 countries, EU average was also added. Authors focused on the adoption of digitalization at the side of businesses. Figure 5 shows V4 countries position from the point of view of Integration of digital technology which is one of the DESI dimensions. Integration of digital technology dimension can be further divided to sub-dimensions, digital intensity, digital technologies and e-Commerce. Figure 5 shows the total amount of these three sub-dimensions. Used evaluation scale is 0 – 100 for figures 4, 5 and 6.

	2020	2021	2022

Source: Own processing according to EC, 2024

Figure 4: DESI values for V4 countries (2020 – 2022)

As shown in Figure 4, position of the Czech Republic is quite good in all three analysed years. The values are below the EU average, but above the values reached by other three analysed countries in analysed three years. This enables to see the situation in the Czech Republic in this area as satisfying, but it is necessary to go deeper to individual dimensions and sub-dimensions the DESI index consists of.

	2020	2021	2022
Czechia	33,83840436	32,51795034	30,48363559
Hungary	21,58464916	18,37866973	16,64837748
Slovakia	27,83280336	26,20911306	24,33826994
Poland	22,88051196	20,56152415	18,96392475
European Union	36,07473152	32,71284579	29,28687601

Source: Own processing according to EC, 2024

Figure 5: DESI - Integration of digital technology - values for V4 countries (2020 – 2022)

For example, when focusing on the Integration of digital technology dimension of DESI, position of the Czech Republic is in all three years better than position of the next three analysed countries, but the Czech Republic is still below the EU average in 2020 and 2021. The situation goes better in 2022. If the authors went to greater detail of information provided by EC, there were the possibility to extract individual components of DESI. Next figure (6) presents the position of V4 countries from the point of view of component called Digital technologies for businesses. Used score is again 0 – 100.

	2020	2021	2022
Czechia	29,46756002	26,53176983	24,38911826
Hungary	20,16473072	17,77265903	15,90869511
Slovakia	27,97894209	25,65061006	24,73270502
Poland	21,99062249	19,68915841	18,61011781
European Union	34,5476867	31,18693821	27,9856808

Source: Own processing according to EC, 2024

Figure 6: DESI - Digital technologies for businesses - values for V4 countries (2020 – 2022)

Digital technologies for businesses consists of values observed for Artificial intelligence, Big data, Cloud, e-Invoices, Electronic Information Sharing, ICT for environmental sustainability and Social media.

As visible in Figure 6, position of the Czech Republic is again quite good. The values are below the EU average and almost always above the values reached by the rest of V4 counties. There is just one exception relating to the values in 2022, when was the Czech Republic overtaken by Slovakia that achieved a better value.

When assessing the information provided to the authors by DESI, it is possible to say that the conditions for digitalization are in the Czech Republic good. This is visible from its position in Total DESI. It is also necessary to say that there is visible increasing tendency in Total DESI, but decreasing tendency in the Integration of digital technology indicator and also in Digital technologies for businesses indicator. From this, it is possible to conclude that development of activities associated with digitalization has decreasing tendency. It indicates that it will be necessary to improve this situation for example through the introduction of new user friendly ICT tools in this area. This also means that increase in Total DESI has to be caused by increases in other observed areas (dimensions).

To be able to make more detailed conclusions leading to recommendation for both sides, businesses and state administration, situation should be also assessed from the point of view of public sector, but this is going to be the subject of authors' further research.

4. In Conclusion

Compiled article focuses on digital transformation in tax administration and accounting management. The approach of article authors corresponds to the researches presented by other authors focusing on this area. The authors agree with the thoughts of Vishnevsky (2022) that it was also established that requirements for taxes and tax policy depend on the technologies' life cycle.

Authors introduced tools and methods used in the Czech Republic as a support for digitalization of tax and accounting processes. It is obvious that thanks to the process of digitalization of taxes and accounting adopted by accounting entities, time is saved in the processes taking place in the economic department of these entities. There is also a considerable saving of paper material and a reduction in the incidence of errors in data entry to the system. In addition, digital taxes and accounting make it easier for an entity to control outstanding receivables and payables. Today, it is commonplace to use software to generate value added tax (VAT) returns, VAT control reports and others in the prescribed format for submission to the relevant tax authority.

Last part of the article was focused on measuring the level of digitalization. It is done with respect to the original intention of the authors, which was to assess, on the basis of statistical data, the level of use of digitalization by accounting units operating in the Czech Republic. Therefore, they also presented the possibilities of measuring the level of digitalization. Most often used indicators of digitalization level were described and finally DESI was used as an example showing the current position of the Czech Republic among V4 countries and also in relation to EU average in the area of digitalization. Authors focused specifically on assessment of dimension called Integration of digital technology and also on DESI component called Digital

technologies for businesses. It was found that position of the Czech Republic among the countries selected as the sample for comparison is good. Development of the digitalization in the Czech Republic needs to be assessed in relation to individual measured DESI dimensions and components. Total DESI seems to have increasing tendency.

To sum up, it is possible to say that digitalization has positive impacts (these were described above), but also negative impacts (these were described by the authors in other research papers and will be surely studied by them also in the future) that appear very often in the social areas and relates to the availability of tools used in digitalization for the general public. This area is seen by the authors as possible field of their future research similarly as the assessment of the state of digitalization from the point of view of entities belonging to the public sector.

Abstract: Entrepreneurship plays an important role in the economic development of the nations by driving innnovation, economic efficiency, and job creation. On the other hand, entrepreneurship education and international education seem to be an important antecedent for entrepreneurship intentions. In this context, universities and campuses have an important role in fostering entrepreneurial activities, namely extra curricular and curricular programs that empower young and nascent entrepreneurs to develop skills, attitudes and competencies that can later be applied to business creation. The main objective of this study is to present the extra curricular program, EXIT program, and confirm its impact on entrepreneurial skills, attitudes and competencies acquired or developed by students. This study employs a mixed research approach that includes both qualitative and quantitative methods. The results reveals that EXIT program effectively contributes to the development of various attributes associated with student resilience. It notably boosts critical thinking, creativity, initiative, problem-solving, proactivity, responsibility, cooperation, social responsibility, and a balanced mix of ambition, optimism, and realism. EXIT's impact on student skills development underscores its substantial positive influence, especially in domains like teamwork and communication. Feedback from the focus group discussions attested to the overall positive reception of EXIT by participants. The program demonstrated its effectiveness in improving their entrepreneurial skills, facilitating multicultural experiences, and encouraging collaborative efforts.

Keywords: Higher education, Entrepreneurship, Entrepreneurship intention, International education, Blended intensive program

1. Introduction

In a knowledge-based society, organizations value the role of innovation and entrepreneurship. Entrepreneurial activity can improve organizational competitiveness, encourage social transformation and promote the development of more sustainable products and services.

Entrepreneurship education is a key factor for socio-economic and sustainable development (Gangi, 2017). Thus, education for entrepreneurship is becoming increasingly important, particularly in today's dynamic world where changes can be expected or unexpected, reversible or irreversible and can vary in intensity (Miceli et al, 2021). In this context, the acquisition of entrepreneurial attitudes and skills by students becomes a differentiating factor highly valued by organizations. On the other hand, international education is also crucial today, because it allows students to overcome cultural and linguistic barriers and fosters knowledge and understanding of other cultures, languages, behaviors, and realities, enhancing student´s career opportunities (Sabet & Chapman, 2022).

The main objective of this study is to present the EXIT program and confirm the impact of this program regarding the entrepreneurial skills, attitudes and competencies acquired or developed by students. EXIT is a Blended Intensive Program (BIP) on Entrepreneurship. BIPs are a new format of Erasmus+ mobility. Every BIP combines online teaching with a short period of physical mobility, where students can spend one week at another university alongside peers from other European universities and experience different cultures, behaviors, values, in real organizational context.

Organized in two main parts, the first part of the study introduces a brief reflection about entrepreneurship education and international education in developing entrepreneurial intentions and activity. The second part presents the BIP, which aims to equip students, as future entrepreneurs and agents of change in organizations, with entrepreneurial skills, attitudes and competencies necessary to increase their opportunities.

2. Literature Review

Entrepreneurship plays an increasingly important role in economic development and contributes to the development of innovations, increases economic efficiency, and creates new jobs (Sutter et al., 2019). So how can individuals become more entrepreneurial to participate in this activity?

Entrepreneurship intention (EI) is determined by attitudes that are affected by "exogenous influences" such as traits and situational variables (Ajzen, 1991; Krueger et al., 2000; Costa & Mares, 2016; Mares, Costa & Galina, 2017). Among the determinants of EI, entrepreneurship education seems to be an important antecedent, and several studies establish a correlation between entrepreneurship education and entrepreneurial activities (Henderson & Robertson, 2000; Galloway & Brown, 2002; Peterman & Kennedy, 2003; Souitaris et al., 2007; Izquierdo & Buelens, 2008; Solesvik et al., 2013; Pfeifer et al., 2016; Nabi et al., 2018; Cui et al., 2021; Sun, Shi & Zhang, 2023).

According with Ratten and Jones (2020) entrepreneurship education is defined as the process of providing individuals with the concepts and skills to recognize opportunities that others have overlooked and to have the insight and self-esteem to act where others have hesitated. For Ratten and Usmanij (2021) besides the positive aspects related to entrepreneurship education there is a challenge involved, as not everyone is able to think or act entrepreneurially.

In fact, the subject has also garnered increasing interest among researchers, and several studies on entrepreneurship education with various approaches centered on different aspects have emerged. Some attempt to understand how the pedagogical use of a simulation can contribute to social entrepreneurship education (Costin, et al, 2018), or to illustrate the importance of case methodology in entrepreneurship and training education, particularly in Creative industries (Ó Cinnéide, 2010), or to evaluate the impact of having entrepreneurs as invited teachers in schools and their possible contribution by sharing their experiences (Blenker & Christensen, 2010), or to assess the entrepreneurial competence in entrepreneurship education and training (Lans & Gulikers, 2010) or even to learn from experience (Cope & Watts, 2000; Politis, 2008) and learn from failure (Testa & Frascheri 2015).

Several educational programs of entrepreneurship have emerged, focused on the development of entrepreneurial attitudes and recognizing the importance of this theme in the overall education of young people (Costa & Carvalho, 2012). Entrepreneurship education among youth can foster the acquisition of skills and the development of essential attitudes to create a new business. Tipically, entrepreneurship education courses include a range of topics such as financial management, human resources, new product development, creativity, market research, business plan, etc. These courses and programs enable students to enhance their entrepreneurial knowledge, skills, attitudes, and even personal qualities (Wu et al., 2022).

According to the model of Heinonen and Poikkijoki (2006) the results of youth entrepreneurship education can be measured considering three dimensions:

- Attitudes (self-confidence, initiative, risk-taking, creativity, problem solving);
- Knowledge (technical, economic and financial literacy, management knowledge);
- Competencies (communication, presentation and transmission of ideas, teamwork, ability to explore opportunities in the various phases of the entrepreneurial process, including opportunity evaluation, execution and business plan).

As defined by Heinonen and Poikkijoki (2006, p. 84) "The aim of entrepreneurship education is to integrate the skills and attributes of an entrepreneurial individual with the entrepreneurial process and related behavior."

During the Blended Intensive Program (BIP) on entrepreneurship, students had the opportunity to develop this kind of skills, as well as the international / multicultural competencies mentioned above, integrating them in the entrepreneurial process (EP), since, during this program, the students have the opportunity to work in the five phases of EP: idea generation, opportunity evaluation, planning, company formation/launch and growth.

3. International Education

International education is a critical tool of soft power (Lomer, 2017). In a polarized world, where international understanding is sometimes difficult, the ability to influence the behavior or interest of other stakeholders in international entrepreneurship context can be a competitive advantage. Cultural immersion and the exposure to the values and customs of a host country through international education is an important training for future entrepreneurs. For this reason, international education has increased in recent years.

In fact, international education in higher education institutions (HEIs) has grown significantly both in terms of volume and in scope and complexity over the last decades, evidencing a strong concern and effort to respond to the global economy and cultural forces (Welch & Denman, 1997; Goby, 2007).

The commoditization of higher education provided a new understanding of international education. Today international education is seen as a service good that provides career opportunities (Sabet & Chapman, 2022). It is consensual that this education provides additional skills and competencies that are likely to increase job prospects. It is widely established that students with international education develop several entrepreneurial key skills through international mobility, such as:

- Self-awareness, self-confidence, sense of identity, and personal independence;
- Being informed, greater interest in global affairs and cross-cultural perspectives;
- Organizational skills, project management, decision-making, creativity and taking on responsibility;
- Vision, independence, experience, broader outlook and attitude;
- Problem-solving, coping strategies and risk taking;
- Patience, flexibility, adaptability, open-mindedness and humanity;
- Team work and team leadership skills;
- Fluency, accuracy and appropriateness of language competence;
- Mediation skills, conflict resolution, sensitivity, humility and respect;
- Forging of relationships and networks;
- Challenge to personal stereotypes, cultural relativism;
- Enhanced intercultural communication, conducting business inter culturally;
- Cultural empathy;
- Non-judgmental observation, respect for local values without abandoning one's own;
- Cultural understandings, ways of thinking and adaptation to complex cultural environments Key skills required by employers;
- Self-awareness;
- Initiative and enterprise;
- Willingness to learn;
- Planning and organizing;
- Integrity;
- Commitment/motivation;
- Problem-solving;
- Flexibility;
- Self-management;
- Team work;
- Communication skills;
- Foreign languages;
- Networking;
- Leadership;
- Customer service;
- Interpersonal skills.

Intercultural skills and international education offer more employability in the global job market (EAIE, 2012; Karacsony et al., 2022; Sabet & Chapman, 2022). The benefits are not limited to better understanding of foreign work culture, in fact students with international education are more confident and self-reliant. Furthermore, these students have wider intellectual horizons and a greater ability to appreciate other perspectives (Yeravdekar & Tiwari, 2014; Sabet & Chapman, 2022).

4. Methodology

4.1 Research Design

This study used a case study design and adopted a mixed research approach that includes qualitative and quantitative methods. Mixed methods research explicitly offers a framework for combining methods (Timans et al., 2019). The main advantage of use these mixed methods approaches is that they allow for the use of several data collection methods, which can contribute to a more robust research and minimize the weaknesses of a single-method research. Additionally, some experts believe that the mixed method approach improve the

validity of the data collected, and provides stronger evidence of the results obtained (Khoo-Lattimore et al., 2019).

4.2 Data Collection

For the quantitative study sample and data collection, a structured survey was applied. The survey consisted of Likert-scale and open-ended questions. The survey was developed to assess the impact of the EXIT program on students. Students were asked questions such as: "How satisfied are you with your participation in the project?" and "How relevant is the topic addressed in this project?". It was also intended to analyze the degree of satisfaction with the activities carried out and the project's contribution to the development of entrepreneurial attitudes and skills in participants.

For the qualitative study, a semi-structured group interview (focus group) was carried out. Through the focus group, it was intended to obtain more detailed information about the students' satisfaction regarding their participation in the project, as well as to identify positive and negative aspects of the project. Focus group included questions such: "What did you like most about EXIT program?" and "What skills and attitudes have you improved by participating in this project".

The analysis of student participation in EXIT program by country of origin underscores the program's international appeal and diversity (Table 1). Portugal, Belgium, and the Czech Republic had the largest contingents, indicating strong local and international interest. Smaller but still notable representations from countries like Austria, the Netherlands, Poland, and Latvia highlight the program's broad reach across Europe. This diverse participation enriches the experience for all students and contributes to the global perspective fostered by EXIT program.

Table 1: Student population

Country	Institution	Students
Austria	St. Pölten University of Applied Sciences	5
Belgium	EPHEC asbl	5
	UC Leuven Limburg	5
Czech Republic	Institute of Technology and Business in České Budejovice	5
	College of Polytechnics Jihlava	4
Latvia	BA School of Business and Finance	1
Netherlands	Rotterdam University of Applied Sciences	5
Poland	Wyzsza Szkola Bankowa WE Wroclawiu	4
Portugal	School of Business and Administration	16
TOTAL		50

4.3 Online Questionnaire

For the quantitative study, an online questionnaire was administered to all students who participated in the EXIT. It was managed through Google Forms and made accessible by a link to capture anonymously the students' evaluation about the project. The questionnaire was divided into 2 sections. In the first section was requested information on respondents' demographic data (namely, age, gender, nationality and home institution). Section two was dedicated to collect data regarding the project evaluation.

The number of questionnaires filled in was 32 of the total of 50 students with a return rate of 64%.

To ensure the clarity of the questionnaire, 5 participants were invited to check their understanding of the survey questions. After their feedback, some of the questions were rephrased to provide more accurate ideas of the questions in the questionnaire.

4.4 Focus Group

After the completion of the project, a focus group was held with Portuguese students. A semi-structured interview guide was developed based on the insights obtained from the questionnaire that was used to collect data. The focus group approach was chosen, because it offers the advantage of enabling students to present diverse perspectives, while also facilitating the exchange and comparison of their experiences (Kvale, 1996). The students were encouraged to openly describe and discuss their experiences and highlighting aspects that they

considered important in the project participation. Eight students agreed to take part in an online focus group, which lasted approximately 40 minutes. It was audio recorded and then transcribed.

4.5 Data Analysis

Quantitative and qualitative data were analyzed separately. For the quantitative data, it was collected, compiled, and checked for consistency and accuracy before being entered using Microsoft Excel. Then, frequency tables and other descriptive statistics were generated.

Content analysis was used to evaluate the outcome of the focus group for the qualitative data.

5. Results

The analysis of the results from a survey applied to the students as well as from the focus group allowed to understand several aspects and dimension that are presented below.

5.1 Quantitative Results – Student Survey

The collected sample of student survey was composed of 32 valid answers, representing a response rate of 64% (Table 2).

Table 2: Number of students that participated in the survey

Country	Number of participating students	Number of replies	Response rate (%)
Austria	5	4	80
Belgium	10	8	80
Czech Republic	9	7	77.8
Latvia	1	1	100
Netherlands	5	2	40
Poland	4	2	50
Portugal	16	8	50
Total	50	32	64

Regarding the sociodemographic data, the majority (84.4%) were aged up to 24 years. More specifically, those aged between 19 and 21 years represented more than half of the respondents (56.3%), followed by those aged between 22 and 24 years old (28,1%). The age mean is 22 years, the youngest aged 19 years old and the oldest respondent was 31 years old. Regarding gender, most participants were female (78.1%).

Project Evaluation

Concerning the satisfaction level with the project (Figure 1), it was possible to verify that data was concentrated among the highest levels of satisfaction with the majority (75%) in the level of 5 to 7 of Likert scale used. However, it is essential to pay attention to the percentage of respondents who indicated that they were "Slightly Dissatisfied" or "Dissatisfied" (3.1% and 18.8%, respectively) to identify areas for improvement. This feedback is crucial for ongoing program development, ensuring that EXIT continues to meet the expectations and needs of its participants.

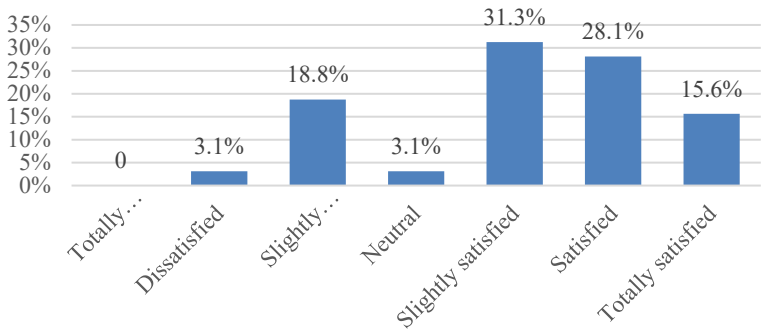

Figure 1: Students' overall level of satisfaction with the project

The assessment of the topic's relevance in EXIT, focusing on "Entrepreneurship, Innovation, and Technology in Tourism and Hospitality," provided insights into participants' perceptions of the program's topic.

Figure 2 shows that the majority of participants recognized the value of the addressed topic in this project. The combination of "Relevant" and "Totally Relevant" responses, totaling 40.6%, indicated a substantial level of approval for the chosen topic. While there were a few participants who found it "Slightly Irrelevant" or "Totally Irrelevant," their numbers were relatively low. Overall, EXIT's topic appeared to resonate with a significant majority of participants.

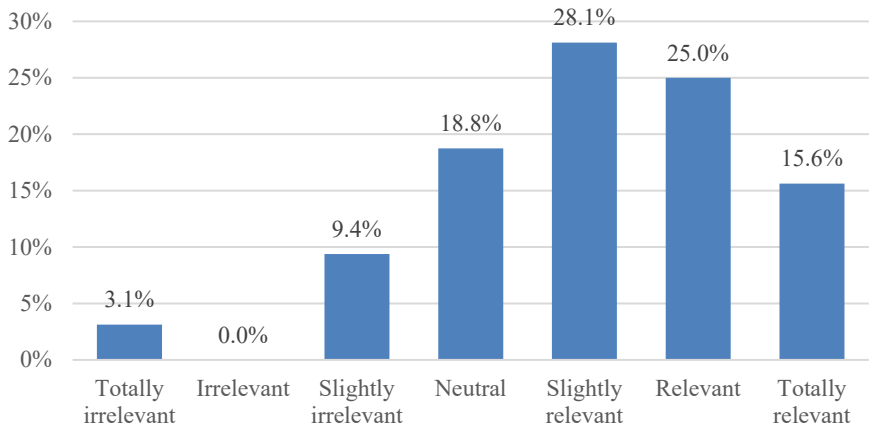

Figure 2: Topic relevance

The feedback from students who participated in EXIT provided valuable insights into their satisfaction with the various facilities and leisure activities offered during the program.

The analysis of student evaluations on the facilities and leisure activities within EXIT indicated a generally positive experience (Table 3). Students were particularly pleased with "Watching the Dolphins" and the "Special Dinner," both of which received the highest mean scores. In contrast, accommodation, lunches, and coffee breaks received moderately positive ratings, indicating satisfaction but with potential areas for improvement. The feedback highlights the importance of delivering engaging and memorable leisure activities, as they significantly enhance the overall participant experience and contribute to the success of the program.

Table 3: Facilities and leisure activities evaluation

Item	Mean	Std. Deviation
Accomodation	5.47	1.414
Lunches	5.19	1.635
Coffee Breaks	5.22	1.539
Watch the dolphins	6.25	1.047
Special dinner	6.38	1.264

Note: 1-Totally dissatisfied; 2-Dissatisfied; 3-Slightly dissatisfied; 4-Neutral; 5-Slightly satisfied; 6-Satisfied; 7-Totally satisfied

Participants in EXIT engaged in various activities throughout the program, and their feedback provides valuable insights. The mean scores assigned by students to different activities offer a quantitative perspective on their perceived effectiveness and satisfaction (Table 4).

As can be seen in the following table, brainstorming received the highest mean score, showing that students found this activity particularly engaging and productive. It suggests that participants valued the creative process and the generation of innovative ideas, which aligns with the entrepreneurial spirit of EXIT.

The international forum, as well as the preparation and presentation of the websites also presented averages above 5, demonstrating that in general the participants enjoyed carrying out these activities. The mean score of these activities indicates that participants generally considered them beneficial but perhaps with some room for improvement.

On the other hand, the preparation of the financial plan received a lower mean score compared to the other activities. This suggests that students encountered challenges or had concerns about this particular task. It could be perceived as complex, demanding, or in need of improvement in terms of instruction or support.

Table 4: Activities evaluation

Item	Mean	Std. Deviation
International Forum	5.06	1.294
Brainstorming	5.31	1.635
Business Model Canvas	4.81	1.615
Business Website	5.06	1.759
Presentation of the websites	5.25	1.344
Financial Plan	3.63	1.718

Note: 1-Totally dissatisfied; 2-Dissatisfied; 3-Slightly dissatisfied; 4-Neutral; 5-Slightly satisfied; 6-Satisfied; 7-Totally satisfied

Project impact on students

The impact of EXIT on student, as measured by various attitudes, is an important indicator of the program's effectiveness in fostering valuable entrepreneurial skills.

It was possible to verify that EXIT has a predominantly positive impact on various attributes related to student. It significantly enhances critical thinking, creativity, initiative, problem-solving, proactivity, responsibility, cooperation, social responsibility, and a balanced mix of ambition, optimism, and realism. These findings indicate that the program effectively cultivates these valuable attitudes in participants.

While the program encourages risk-taking, there may be potential for further development in this area. The impact on ethics is an area where the program might consider additional emphasis to foster ethical considerations among participants. Overall, EXIT positively influences students.

Table 5: Contribution of the project in the development of attitudes

Item	Mean	Std. Deviation
Critical Thinking	5.22	1.475
Creativity	5.75	1.270
Initiative	5.56	1.480
Risk-taking	4.63	1.699
Problem solving	5.25	1.778
Proactivity	5.28	1.442
Ethic	4.78	1.581
Responsability	5.63	1.185
Cooperation	5.94	1.216
Social responsability	5.53	1.270
Ambition, optimism and realism	5.22	1.453

Note: 1-Totally disagree; 2-Disagree; 3-Slightly disagree; 4-Neutral; 5-Slightly agree; 6-Agree; 7-Totally agree

After rating the impact of their participation in the project on the development of a set of attitudes, students were asked to identify the main skills developed by participating in the project. The analysis of EXIT contribution to student skills development showed a strong positive impact, particularly in areas such as teamwork and communication. These findings underscore the project's ability to enhance critical skills for future professionals. The slightly lower percentages in conflict management, exploring opportunities, and contingency capabilities suggested potential areas for program refinement to ensure a more comprehensive skills development experience.

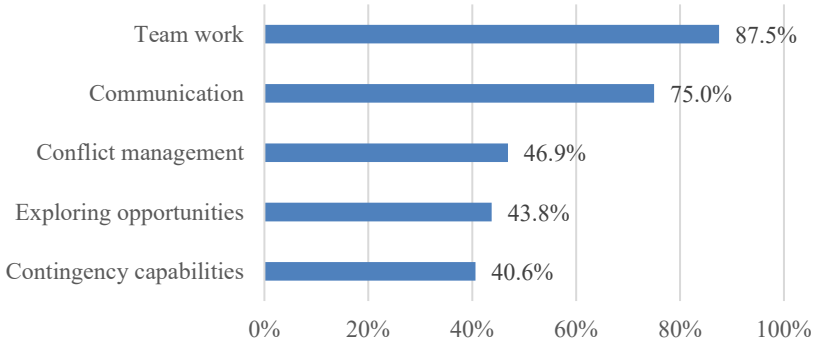

Figure 3: Contribution of the project in the development of students' skills

The study also sought to establish whether the students had developed any business-related knowledge from their participation in EXIT. According to Figure 4, majority of respondents indicated that they deepened their knowledge in the areas of management and finance (71.9% and 65.6%, respectively) through the EXIT program. These high results suggests that the program is highly effective in teaching management and finance principles.

With only 50% of respondents indicating a deepening of knowledge in marketing, this is an area with potential for improvement. This moderate percentage suggests that while essential marketing concepts are being covered, there may be gaps in the depth or breadth of the subject matter.

On the other hand, website development had the lowest percentage, with only 43.8% of respondents reporting a deepening of knowledge. This indicates a significant area for development in future editions.

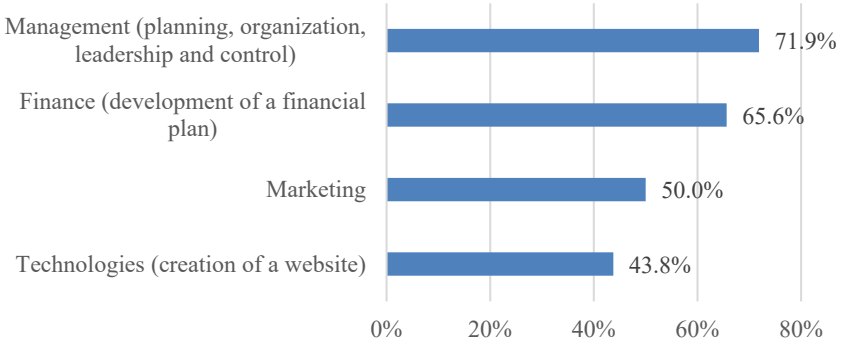

Figure 4: Contribution of the project in the development of knowledge

The recommendations made by students who participated in EXIT provided insight into the perceived value of the project and their willingness to endorse it to their peers. The analysis of recommendations by students who participated in EXIT overwhelmingly supports the project (Figure 5). The fact that 87.5% of participants would recommend it to their colleagues is a strong evidence to the program's positive impact and perceived value.

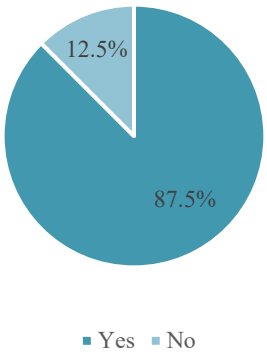

Figure 5: Program recommendation to other colleagues

5.2 Qualitative Results - Focus Group

Eight students participated in the group interview (focus group). The focus group aimed to gather in-depth insights from students who participated in EXIT, specifically to understand their opinions and experiences related to the project. Students were encouraged to provide sincere feedback, and the discussion provided valuable feedback on various aspects, including the program's effectiveness, learning outcomes, and areas for improvement.

Positive Aspects:

- Skills Development: Participants overwhelmingly expressed that the program significantly enhanced their entrepreneurial and teamwork skills. They emphasized that the hands-on approach of "learning by doing" allowed them to apply theoretical knowledge to real-world situations. This experience positively influenced their confidence in their entrepreneurial capabilities.
- Cultural Exposure: Students appreciated the multicultural environment of EXIT, highlighting the diversity of backgrounds and perspectives within their teams. They noted that working with international peers broadened their horizons and increased their cultural awareness, which they considered a valuable aspect of the program.
- Cohesion and Collaboration: The participants emphasized the strong teamwork and collaboration that developed during the project, especially during the face-to-face sessions. They noted that working together with their peers, who came from diverse cultural and educational backgrounds, fostered a sense of unity and cohesion among the group members.

Negative aspects:

- Difficulty Working in Online Groups:
- One of the recurring themes in the discussion was the challenges students faced when working during the online sessions. Some reported difficulties in areas such as communication, collaboration, and team dynamics. This issue can be attributed to the virtual nature of the project and the inherent challenges of online teamwork. Respondents indicated that, during the online sessions, they experienced some difficulties in establishing personal connections and building relationships with their teammates through digital interactions. The online environment also posed challenges in terms of team dynamics. Participants reported difficulties in coordinating efforts, setting clear roles, and maintaining engagement within virtual groups. These challenges were seen as potential barriers to effective collaboration, which is essential for the success of the project.
- The implications of this issue are twofold: first, it impacted the quality of teamwork, making it less effective and cohesive than in-person collaboration. Second, it may have hindered the participants' ability to leverage diverse skill sets and perspectives within their groups. These challenges raise concerns about the program's adaptability to the online format and the need for better strategies to facilitate effective virtual teamwork.
- Tasks Complexity:
- Students mentioned that the in-person tasks were more demanding. The complexity of these tasks required a significant investment of time and effort. Some felt that certain in-person tasks were significantly more demanding than others, causing an imbalance in the effort required. Addressing this issue is essential to ensure a fair and equitable experience for all participants. Striving for a more even distribution of effort across tasks and groups can enhance the overall quality of the program and alleviate undue stress on students.

6. Conclusions

This paper presents an International Intensive Program on Entrepreneurship and underscores its significance in fostering the development of students' skills, behaviors, and attitudes. The program effectively met the motivations and expectations of students participating in EXIT. It provided them with the opportunity to enhance their skills, interact with diverse individuals, and collaborate in a multicultural environment.

This study highlights the importance of an entrepreneurship education program, not only in providing theoretical knowledge but also in cultivating an entrepreneurial mindset by nurturing entrepreneurial skills, behaviors, and attitudes among its students.

Furthermore, the analysis of the results demonstrates the efficacy of the "learning by doing" approach, promoting both the acquisition of valuable knowledge and healthy competition among students. This was evident in the strong teamwork and cohesion displayed by the groups.

The analysis of student evaluations provides a valuable perspective on the effectiveness of various EXIT activities. While some activities received high mean scores, indicating strong satisfaction, others, like the Financial Plan, appear to need attention or potential improvement. This feedback underscores the importance of continuous program refinement to ensure that all activities align with the participants' expectations and learning objectives. Addressing these insights can help enhance the overall experience and educational outcomes for future EXIT participants.

The feedback from the focus group discussions indicated that participants generally responded positively to EXIT. It was effective in enhancing their entrepreneurial skills, fostering multicultural experiences, and promoting collaboration. The challenges raised were seen as opportunities for program refinement. Overall, the insights from this focus group will be valuable for future program enhancements and improvements.

The negative aspects raised during the focus group discussions provide valuable insights into areas that require attention and improvement in the EXIT program. The challenges associated with online group work and the demanding nature of in-person tasks are significant concerns that should be addressed. By acknowledging these issues and developing strategies to mitigate them, the program can continue to provide a valuable and enriching experience for future participants. Additionally, a review of task complexity and time management in the in-person activities can help ensure a fair and manageable workload for all students. This evaluation also yielded valuable suggestions for improvement, which are essential for ensuring the continuous enhancement of the EXIT program.

The main limitation of this study is the sample size. The size of our sample limits the robustness and reliability of more detailed statistical analyses. Advanced techniques and the exploration of correlations often require larger datasets to produce meaningful and generalizable results. With a smaller sample, there is a higher risk of statistical anomalies and reduced confidence in the findings. In this way, we chose to present a range of statistics and figures to provide a clear and accurate representation of our data without overextending the analysis.

Enhancing Innovation in Higher Education Institutions: Barriers, Actions and Strategic Instruments for Sustainable Innovation

Mara Gabriela Diaconu and Alenka Temeljotov Salaj
Norwegian University of Science and Technology, Trondheim, Norway

mara.diaconu@ntnu.no
alenka.temeljotov-salaj@ntnu.no

Abstract: Innovation and sustainability have become increasingly important in recent years in education and research, helping to address global challenges and strengthening the collaboration between universities and industry. Integrating sustainable innovation practices in higher education institutions (HEI) plays a key role in creating a support system for academic and industrial collaboration and delivering value to society. Sustainable innovation involves making intentional changes to an HEI organization's philosophy and values, as well as to its products, processes, or practices. It serves the specific purpose of creating social and environmental value in addition to economic returns. Even so, there is still a need to improve the transfer of knowledge and technology as an integrated system between university and industry. The paper explores how universities develop an environment favourable for innovation while fostering a supportive culture for it. The article presents the findings from round table interviews involving forty participants with the following profiles: research managers, research advisors, innovation advisors, project managers, project support staff, researchers in education processes, support staff for researchers in project implementation, solution development, technology transfer offices, and other similar profiles. For the discussion three exploratory questions were given regarding the problems/barrier's universities face in sustainable innovation, actions that should be taken to increase innovation potential, and means/instruments of innovation in an academic environment. An extra question was presented looking for suggestions for possible actions and means as strategic steps for a brief period intervention of 6-12 months. This work sheds light on several critical aspects related to sustainable innovation in HEIs by investigating barriers hindering innovative thinking, exploring organizational and individual-level actions, and examining the means and instruments of innovation in an academic environment. The research data has offered valuable insights into effective strategies for overcoming barriers and creating an environment that fosters innovation. Furthermore, the study provides practical recommendations and short-term strategies for empowering universities to create a vibrant culture of innovation and maximize their impact on research, education, and knowledge transfer.

Keywords: Innovation, Universities, Impact, Strategies, Sustainability, Education

1. Introduction

Innovation, Sustainability, Digitalization and Entrepreneurship are emerging areas in universities (Kreiterling, 2023). The role of universities is crucial in fostering innovation as they are centres of knowledge creation and dissemination, and can, therefore, manage effective transfer and utilisation of knowledge and bring economic and societal impact (European Union, 2019). Consequently, universities explore more innovation and sustainability through their research, rethink the education system, and try different models of how to deliver and transfer innovation outcomes to real-world applications and make a positive impact (Kreiterling, 2023). Higher education institutions (HEIs) could integrate innovative thinking concepts and practices into various aspects of their operations. These encompass education and curricula, research endeavours, facility and campus operations, community engagement and awareness, organizational management and frameworks, as well as evaluation and reporting mechanisms. (Lozano, et al., 2015).

The Organisation for Economic Co-operation and Development (OECD, 2005) defines innovation as the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations. The concept of the entrepreneurial university was developed by Etzkowitz and Leydesdorff (2000) and became one of the key concepts for the triple helix model where universities need to evaluate the traditional role of education and research and add a third mission that contributes to the economic growth and the transfer of research results from the lab to the society and economy. Innovation, from a university research point of view, and the way it is used in this study is defined as the process of translating knowledge and findings generated through academic research into new or improved products, services, processes, or systems that bring about positive societal, economic, or environmental impact. Innovation involves the application of creative thinking, experimentation, and collaboration to develop solutions that address pressing challenges, meet market needs, or create opportunities for societal advancement (Etzkowitz and Leydesdorff, 2000).

The fusion of education, research, innovation, sustainability, technology, business, and an entrepreneurial mindset is creating the playground for achieving competitive and sustainable developments in society.

Universities have to take on this new role of facilitators of innovative thinking by creating, developing, and applying new innovative environments (Morawska-Jancelewicz, 2022).

1.1 Research Questions

Overcoming some of the barriers requires HEIs to change their education and research mindset and establish a robust innovation strategy aligning with their overall objectives, set clear goals, and define a roadmap for execution.

The main goal of this article is to inspect how sustainable innovation is set in the holistic picture of universities. The following research questions (RQs) have been established for this paper.

RQ1 What problems/barriers do universities face in sustainable innovation?

RQ2 What are the actions that should be taken to increase the innovation potential in universities?

RQ3 What are the means/instruments of innovation in an academic environment?

The three Research Questions have been followed by an action question: Propose 3 actions and means as steps for the next 6-12 months.

1.2 Contextual Framework

Higher education institutions are facing many challenges in education, research, and innovation. The HEI is affected by the changes and innovations that take place in societies and economies globally. It is widely held that HEI should adhere to these changes and models, and innovate accordingly (Barber, et al., 2013). Under the new circumstances, HEIs should rethink their model of functioning; create knowledge that can be commercialised into new products and services; educate researchers and students in innovation and new ways to implement the science at the same time as acquiring funding for their research.

Research has already found certain barriers that HEIs are facing in enhancing their capacity for delivering innovation. In recent years, the universities expanded rapidly, and as seen by Hall and Lulich (2021), even though universities adopted innovation, entrepreneurship and transformation in their strategic plans, there are still some missing parts: plans do not express visions of bold initiatives, restructuring or 'bold innovation'; do not express the type of competitive drive; do not necessarily provide mechanisms to fulfil the goals; no facts about measured changes. It is common for HEIs to encounter difficulties when attempting to translate innovative ideas into practical, scalable solutions. Several barriers often impede the HEIs from thinking about innovation from research and development and implementation of innovation in future commercial solutions (Gkrimpizi, Peristeras and Magnisalis, 2023) and among these barriers are the lack of planning and focus, issues related to applicability and continuity of actions, and resistance to change.

Another dimension of introducing sustainable innovation in HEIs and education relates to the need to establish a collaborative work environment within HEIs. According to Margalef García and Pareja Roblin (2008), fostering such an environment presents a significant challenge. The authors emphasize the importance of facilitating collaboration among colleagues, staying open to new ideas, sharing power and supporting others by allocating time for teamwork and colleagues (Margalef García and Pareja Roblin, 2008). Furthermore, in a study on the successful adoption of a new blended learning approach, Garrison and Kanuka (2004) found that the creation of clear institutional policies for innovation, the establishment of supportive organisational structures at HEIs, such as contact points or specialised units, and a managerial strategic approach to innovation are essential.

Some authors suggest that in addition to the managerial support for innovation initiatives as a "top-down" approach, there must also be a buy-in from the academic staff for the strategic orientation towards innovation at HEIs. MacKeogh and Fox (2009) highlight those negative attitudes among academic staff towards innovations, low acceptance of new actions and education models, and lack of awareness about the potential and quality of these innovations emerged as barriers to the integration of innovation in universities.

Therefore, understanding and addressing these barriers is crucial for HEI to navigate the path towards innovation and unlock its true potential. The lack of planning and focus is a common barrier that HEIs face when attempting to drive innovation (OECD, 2016). Without a clear strategic roadmap and goals, it becomes challenging to align efforts and allocate resources effectively.

Efforts to enhance innovation potential within academic settings involve several drivers and actions. The facilitation of closer engagement with industry and businesses as part of everyday research activities fosters knowledge exchange, technology transfer, and collaborative research initiatives that align academic efforts with

real-world challenges and opportunities. Well-functioning links between universities and companies can stimulate economic growth (Mansfield, 1991; Salter and Martin, 2001) and help solve societal problems.

Brennan, et al. (2014) mention that integration of innovation in the university research context encompasses a wide range of activities including, but not limited to, technology transfer, commercialization of research outcomes, interdisciplinary collaborations, and the development of entrepreneurial mindsets among researchers and students. As such, innovation and the innovation capacity of a nation depend not only on the strength of individual players (firms, universities, government research laboratories, etc) but more importantly on the links between those actors (Morlacchi and Martin, 2009). These benefits may be delivered through the commercialisation of technologies resulting from academic research.

Schumpeter's definition of innovation is linked with the economic and growth aspect of innovation by defining it as the commercial or industrial application of something new, such as a new product, process, or method of production, but it may also manifest itself as new markets or sources of supply, as well as new forms of a commercial business or financial organisation (Schumpeter and Swedberg, 2021). Additionally, cultivating a new organizational culture, strategy, and priorities within universities is essential. Equally important is the development of knowledge in innovation and the building of competencies among researchers. Innovation is a new product, but it may also be: a new process of production; the substitution of a cheaper material, newly developed for a given task, in an essentially unaltered product (Kline and Rosenberg, 2010); the reorganization of production; internal functions, or distribution arrangements leading to increased efficiency; better support for a given product; lower costs or an improvement in instruments or methods of fulfilling innovation.

Furthermore, establishing a robust support system within universities is crucial. Such systems provide guidance, mentorship, and resources to facilitate the translation of research outcomes into practical applications. Innovation and sustainability have become increasingly important in recent years in education and research in addressing global challenges and strengthening the collaboration and transfer of knowledge between public education and private sectors (Kozirog, Lucaci and Berghmans, 2022).

Finally, ensuring access to resources, such as experts in intellectual property rights (IPR), innovation, and related fields, is vital for navigating legal and commercial aspects of innovation, protecting intellectual assets, and maximizing the impact of academic research. Technology Transfer Offices (TTOs) are pivotal in facilitating the transfer of research outcomes to commercial applications (Morawska-Jancelewicz, 2022), leveraging expertise in IPR and commercialization strategies (Weckowska, 2015). Additionally, adding new competencies and practices in innovation and sustainability could make a university stand out in its domains, attracting approaches to new research and actions (UNESCO ESD Monitoring and Evaluation, 2012) thus, by adopting a comprehensive and holistic approach, HEIs can make significant strides towards achieving the Sustainable Development Goals.

Considering the above-mentioned issues, HEI innovations have to be nurtured via changes in collaboration and managerial processes, sustainable ecosystem and industry collaboration, funding strategies and efficient allocation of resources, and new skills and competencies for students and the academic staff, to name a few. To unveil the barriers, actions, and drivers that will create more innovative universities, this study presents the research questions and the methodological background of our analysis, which is then followed by an in-depth description of the respective research results.

2. Method

We looked at the research styles that could be used to answer best our need to explore the barriers to innovation and the research questions, and we conducted a round table discussion to answer our research aims for this study. The choice of research style depends on the aim of the research, the research question, the degree of desired research autonomy, the level of investigator/interviewer intervention, the level of participants freedom to speak on a given question, the available resources, the time frame, and aesthetics (Crabtree and Miller, 1999; Brewer and Hunter, 1989). As shown in Figure 1 below (Brewer and Hunter, 1989 cited in Crabtree and Miller, 1999) the study is at the description stage and the qualitative research questions were used to describe better the status of the innovation in universities.

The purpose of the round table discussion is to provide a place for the exchange of ideas and discussion of their relevance in the way of generating innovation) in the field of research where this is applied (Crabtree and Miller, 1999) Round table discussions are part of the qualitative research and are small group discussions where everybody has an equal right to participate. A round table is not a public meeting - it is a focus event to closely explore specific issues identified elsewhere or to identify contemporary issues not addressed before, it can be used to explore solutions, define actions, and develop strategies. A round table confronts issues and ideas rather

than people and aims to create a win-win situation rather than a win-lose scenario (Day, 1998; Ashton, de Angelis and Graf, 2014). The premise on which the idea of round tables is based is simple – participants, be they researchers, administrators, experts, local authority employees, members of community-based organisations or members of the public, are seen as being of equal stature (Day, 1998).

Aim	*Analysis Objective*	*Research Question*	*Research Style*
Identification	Identify/name	What is this? Who is that? What is important here?	Field, doc-hist, philos
Description	Qualitative description	What is going on here? What is the nature of the phenomenon? What are the dimensions of the concept? What variations exist? What meanings/practices occur in lived experiences?	Field, doc-hist, philos
	Quantitative description	How many? How much? How often? What size? How is the phenomenon distributed over space?	Survey
	Normative description	What is the value of a phenomenon?	Field, doc-hist, survey, philos
Explanation			
Generation/ association	Interpretive, explanation, generation	What is happening here? What patterns exist? How do phenomena differ and relate to each other? How does it work? How did something occur/happen?	Field, doc-hist
	Statistical, explanation, generation	What are the measurable associations between phenomena? Does variable x relate to other variables? Why does it work? Why did something occur?	Doc-hist, survey
	Deductive, explanation	Given these premises, then _____?	Philos
Explanation			
Testing/ prediction	Causal confirmation	What will happen if __? If __ then __? Does one variable cause the other?	Exper
	Theory testing	Is the original theory correct? Does the original theory fit other circumstances? Are there additional categories or relationships?	Field, doc-hist, survey, exper
Intervention/ control	Prescription testing Evaluation	Is __ more effective than __? Does __ have greater efficacy than __? How can I make "x" happen? What difference does this program/intervention make?	Exper (RCT) Field, survey

NOTE: Doc-hist = documentary-historical; exper = experiment; philos = philosophical;
RCT = randomized control trial.

Brewer and Hunter, 1989 cited in Crabtree and Miller, 1999

Figure 1: Research Aims, Analysis Objectives, Research Questions and Appropriate Research Styles

Round table discussions are a qualitative research method characterized by their interactive and collaborative nature, facilitating in-depth exploration of complex topics through participant-driven dialogue. They offer a platform where diverse perspectives can converge, allowing participants to share insights, experiences, and opinions in a conversational format. This method promotes rich data collection by encouraging open discourse and enabling participants to build upon each other's contributions, thereby generating nuanced understandings of the research topic. Moreover, round table discussions can foster consensus building among participants, leading to the identification of common themes, priorities, and potential solutions to research questions or issues under investigation.

However, despite their benefits, round table discussions present challenges: there is a risk of certain participants dominating the conversation, potentially marginalizing quieter voices and limiting the diversity of perspectives represented in the data. Organizing and conducting round table discussions can be time-intensive and logistically demanding, involving coordination of schedules, management of participant dynamics, and facilitation of meaningful dialogue. The qualitative part of the description phase chosen for this study and for the research questions seeks to explore the meanings and perceptual experiences of the practices to capture the holistic vision and interdependent nature of the system. There was no 'leader' as such, but there would be a facilitator to ease the work process and to maintain focus and scribes to record the process, decisions, and actions.

To uncover the problems and challenges faced by HEIs in fostering innovation, we organised a series of round table discussions - as part of the problem description step of the research. The primary objective was to identify and understand the barriers that hinder innovation within the university setting and determine the necessary actions to overcome them.

Based on the Day (1998) and Crabtree and Miller (1999) studies, we designed the fifteen-minute discussion tables: within an hour time slot, a maximum of four round table presentations took place. In the general setup of the arrangement, the host was the presenter and introduced the theme for two minutes then switched to the moderation of the open discussion. The goal of the round table discussions was to find out from the participants

about the innovation barriers and actions they have noticed in their institution. To be a part of the study, the participants were informed that their answers would be anonymised, and professional notes would be taken.

The round table discussion ran in a small scenario: the participants had to imagine they were the appointed managers of the newly created "Innovation Driver Unit" in their organisation, for which they needed to develop and implement the unit strategy. To help in creating the strategy the RQ questions have been unveiled to the participants on a flip chart sheet as shown below.

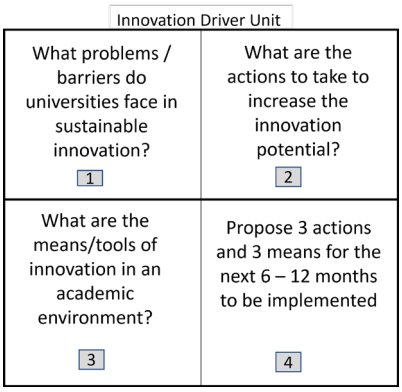

Figure 2: Material used for the round table discussions

The questions were asked one by one and approximately three minutes for discussion was given. Notes were taken on the flipchart while the discussion was taking place and confirmed with the participants that the notes were what they were expressing. The research conducted in this study involved only four groups of forty participants at the same conference, which may present a limitation in terms of the diversity of ideas collected. The restricted number of participants and their professional profiles may not fully capture the wide range of perspectives and experiences necessary to comprehensively understand the barriers and drivers of sustainable innovation in higher education institutions. To address this, the intention is to replicate the setup with an additional 2-3 events, incorporating participants from varied profiles and levels in HEIs management.

3. Result

The results of this paper have been collected while implementing four rounds of 15-minute round table discussions at the EARMA (European Association of Research Managers and Administrators) Conference 2023: Widening and Deepening of the RMA Profession, 24-26 April, Prague. The conference aims were to share best practices in research, innovation and education in HEI and network and it was attended by 1,400 participants from the Research Management and Administration community; 40 representatives from universities, applied sciences institutions, and research centres worldwide participated in the round table discussions. The profiles of the participants were: research managers, research advisors, research advisors or professional experts in pre-award and post-award phases of projects, innovation advisors, project managers, project support staff, researchers in education processes, support staff for researchers in project implementation, solution development and technology transfer office contacts, and other similar profiles. Discussions were organized in groups of ten, each comprising diverse professional backgrounds.

The answers from the flipchart have been inserted in a database coding the rounds, questions, and answers, and creating 5-6 labels for each question to classify the answers. The labels have been correlated with the Contextual Framework and the literature review.

3.1 Observations from the Round Table Discussions (Data Collection)

During the collection of data, four round table discussions were run, and the lead researcher of the table and presenter made sure not to allow one person/sector of the table to dominate the discussion and ensured that everyone got a chance to speak.

The observations gathered from conducting the round table interviews at the conference provided valuable insights into the dynamics and effectiveness of the discussions. Firstly, the attendance numbers did not vary significantly across (10 to 11 participants per table). Secondly, the participants at the tables had different professional backgrounds and were from different organisations, creating a balance and adequate representation in the group. Thirdly, the clarity of the process varied: some participants found the guidelines straightforward, while others required additional explanations regarding the research questions (RQs) being

addressed. During the discussion, no person was appointed to answer, but if there were no answers, then the lead researcher asked about the type of organisations they were from and if there was something that they could tell about their organisations. It made people comfortable to talk about the areas that they knew and quickly they were happy to talk about the other areas and aspects of innovation that were on the flipchart sheet. The allocated time of 15 minutes per discussion group was thought sufficient for the exchange of ideas, yet some persons or groups desired more time to dive deeper into their specific barriers or actions.

There was a noticeable trend towards thematic discussions aimed at harmonizing perspectives and responses among participants. Interestingly, differences emerged between attendees from higher education institutions (HEIs) and applied sciences university's regarding their opinions and experiences. While some topics prompted consensus, particularly among HEI representatives, discussions with applied sciences participants often brought forward distinct viewpoints, reflecting their unique operational contexts and objectives such as close collaboration with industry or product-based research.

When the four questions were answered, a short oral summary was given and then there was an exchange of business cards or email addresses for further contact if interested. The tables ran one after the other for one hour, changing groups every fifteen minutes.

Overall, these observations emphasize the importance of facilitating robust thematic discussions to enhance the effectiveness and inclusivity of future round table interviews.

3.2 Results from the Round Table Discussion

The general results obtained after the execution of the round table are shown below, answering each of the established research questions (RQ). The focus here is on the objective reporting of the participants' answers, leaving the interpretation and implications for the discussion section.

3.2.1 Problems/barriers that universities face in sustainable innovation

The motivation behind the RQ1 'What problems/barriers do universities face in sustainable innovation' lies in the desire to understand and address the barriers and challenges that research and education organizations encounter in their transition towards a culture of innovation. By identifying these barriers, the study aims to shed light on the specific needs of universities as they strive to embrace innovative thinking. The results (represented in Figure 3) present the recorded responses and corresponding numbers that highlight specific barriers faced by universities in sustainable innovation according to the participants.

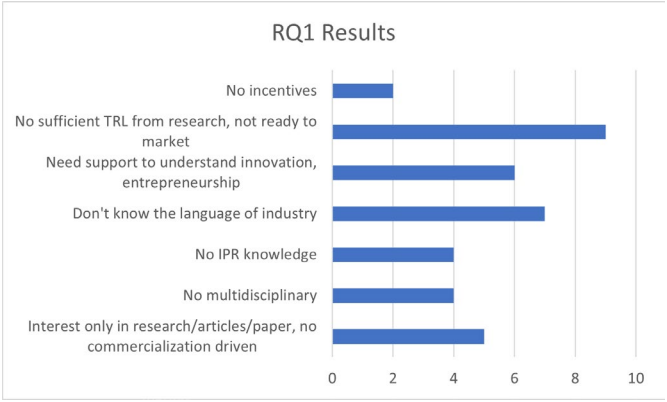

Figure 3: RQ1 answers from participants

Nine participants noted a lack of a sufficient Technology Readiness Level (TRL) in research, suggesting that the outcomes are not yet ready for market commercialization and a clear link with the lack of knowledge on IPR (4 answers). Seven participants expressed a lack of familiarity with the language and dynamics of the industry. Six participants highlighted the need for support in understanding innovation and entrepreneurship and other skills to build the innovation thinking approach, to move away from the interest in only scientific research articles. Lastly, two participants indicated a lack of incentives for innovation within the university environment.

3.2.2 Actions that should be taken to increase the innovation potential in universities

The RQ2 – 'What are the actions to take to increase the innovation potential in universities?' motivation lies in the appeal to identify specific actions that can be implemented at both the organizational and employee levels

to foster and enhance innovation within universities. The results (represented in Figure 4) present the recorded responses and corresponding numbers that highlight various strategies and actions needed to promote engagement with businesses and foster innovation within universities.

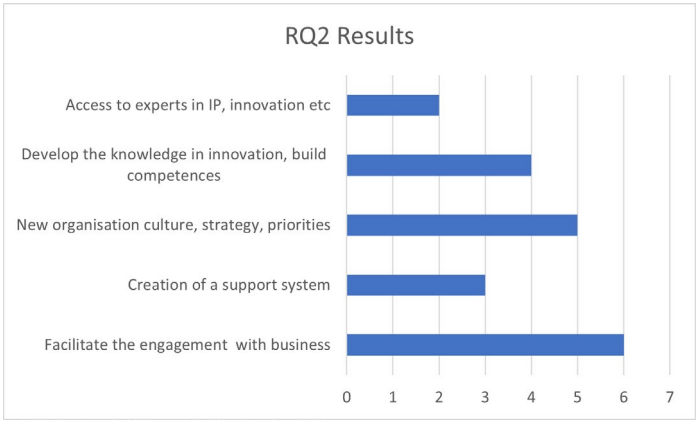

Figure 4: RQ2 answers from participants

Six participants emphasized the importance of facilitating engagement with industry and businesses in day-to-day research. Five respondents highlighted the importance of cultivating a new organizational culture, strategy, and priorities. Four respondents stressed the need to develop knowledge in innovation and build competencies. Other answers emphasized the creation of a support system, and the need to access resources such as experts in intellectual property (IP), innovation, and related fields.

3.2.3 Measures/instruments of innovation in an academic environment

The motivation behind RQ3 'What are the means/instruments of innovation in an academic environment?' intends to identify and understand the various drivers, tools and instruments that can be employed to foster innovation within an academic setting according to the participants at the round table discussions. The results (represented in Figure 5) present the recorded responses and corresponding numbers that highlight the means and instruments of innovation within an academic environment.

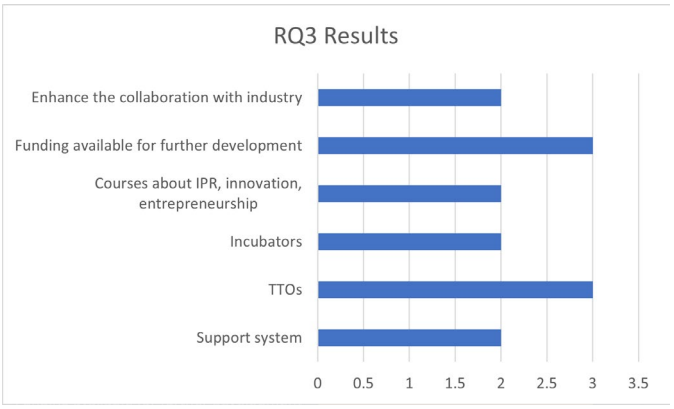

Figure 5: RQ3 answers from participants

Three participants mentioned the significance of Technology Transfer Offices (TTOs) and the other three respondents emphasized the lack of availability of funding for further development. Two participants emphasized the importance of a support system. Two participants highlighted the role of incubators in fostering innovation and others highlighted the need to enhance collaboration with industry. Similarly, two participants mentioned the importance of offering courses and programs focused on Intellectual Property Rights (IPR), innovation, and entrepreneurship.

3.2.4 Actions and measures as strategy steps for the next 6 – 12 months

The Q4 is a question addressed to the participants to propose actionable solutions for overcoming the barriers and challenges identified. The motivation for using this Q4 lies in the desire to identify and recommend specific actions and tools that can be implemented in the short-term to medium strategy to facilitate the transition of

universities towards a sustainable innovation approach. Recognizing the urgency and need for immediate progress, this study aims to explore and highlight the initial steps that universities can take within a defined timeline to foster sustainable innovation.

Our results (represented in Figure 6) present the recorded responses and corresponding numbers that highlight recommended actions and means to foster sustainable innovation within universities and answers given by the participants at the round table.

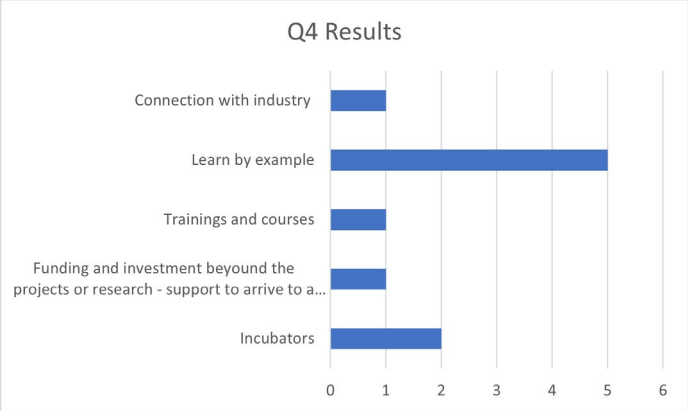

Figure 6: Action Question 4 Answers from participants

Five participants emphasized the importance of learning by example by creating ambassadors from the researchers who followed the innovation path. Two participants emphasized the importance of incubators for nurturing collaboration with industry and creating innovative ventures and startups emerging from academic research. Other participants stressed the value of training and new skills, stronger TTO offices with experts in the field of innovation and commercialization.

4. Discussion and Conclusion

The paper discusses the barriers, drivers, and supportive actions that HEI could implement in their strategies and activities for implementing sustainable innovation in their research and education for their students and academic staff. The findings in this study underscore the importance of various means and instruments in fostering innovation within HEI. The four research questions were posed to the participants with the specific motivation to determine the barriers that research and education organisations are facing; determine the needs that they have in switching to innovation thinking, the actions that they need to take and the tools that should be used to reach better outcomes. The sub-sections are following the structure of the Research Questions.

4.1 Problems/Barriers That Universities Face in Sustainable Innovation

Through the investigation of barriers hindering the implementation of sustainable innovation in HEI, we have identified key insights that can inform strategic interventions and foster innovative thinking within the institutions. From the theoretical part, the findings show the gaps in planning, applicability, and resistance (Gkrimpizi, Peristeras and Magnisalis, 2023). Similarly, the academic stakeholders emphasize they lack time, consistent funding and strategies for innovation (Hall and Lulich, 2021) and the universities are not oriented to the commercialization of knowledge (Barber, et al., 2013). Even more, they lack the language of industry and innovation literacy and dynamics of the industry (MacKeogh and Fox, 2009). Equally, many participants noted unfamiliarity with industry language and dynamics, as well as the prevalence of low TRL levels where research often stagnates due to inconsistent funding and strategies. Moreover, they emphasise that the academic focus and evaluation as of now is on research and publications and not driven by commercialization. The findings of the barriers and problems HEIs face in introducing sustainable innovation thinking underline the multifaceted nature of barriers hindering its implementation.

4.2 Actions That Should be Taken to Increase the Innovation Potential in Universities

The study's exploration of actions to increase innovation potential, such as fostering engagement with industry and cultivating a new organizational culture, contributes to the academic discourse on the triple helix model of university-industry-government relations (Etzkowitz and Leydesdorff, 2000). Furthermore, it is essential to equip students and researchers with skills and resources in innovation, entrepreneurship, IPR, and multidisciplinary approaches, while fostering a culture that recognizes and rewards innovation as a research outcome. Where

now in most universities only scientific papers are formally recognised as research outcomes leading to an absence of incentives for researchers to integrate sustainable innovation in their fields. The participants' emphasis on engagement with the business sector, interdisciplinary collaboration, and the development of entrepreneurial mindsets among researchers and students aligns with the growing body of studies and authors advocating for a holistic approach to innovation in academia (Correia, et al., 2024).

4.3 Measures/Instruments of Innovation in an Academic Environment

The study shows that, in addition to the need for stronger TTO offices, access to adequate funding is crucial for supporting the progression of innovative ideas from concept to commercialization as many of them tend to have a lower TRL and that is making the commercialization path harder. While some organisations recognise the support of the TTOs as drivers for innovation others are still lacking the systems or the instruments used are too weak. The TTO support system (Weckowska, 2015; Morawska-Jancelewicz, 2022) should ensure access to experts in IP, innovation, business, commercialization, and related fields. Other measures that have been highly recommended by the participants are training, courses and programs focused on IPR, innovation, and entrepreneurship to equip researchers and students with the necessary knowledge and skills to navigate the innovation landscape effectively. From the theory and interviews, we can see that collaboration with industry stakeholders is important for fostering the development of innovation hubs, (Siebert, Wasserman and Fisher, 2019) knowledge exchange and joint research initiatives. Those collaborations are enhancing universities' innovation capabilities and ensuring the relevance of their research. Furthermore, a supportive system in the HEIs, including incubators, provides resources and mentorship to accelerate entrepreneurial ventures stemming from academic research and has been highlighted as important by the participants, which aligns with the studies and research looking at academia as an entrepreneurial ecosystem and support systems for innovations. (Correia, et al., 2024). Additionally, by exploring the means and instruments of innovation in an academic environment we show valuable insights on effective strategies to be implemented for overcoming barriers and creating an environment that stimulates innovation.

4.4 Actions and Measures as Strategy Steps for the Next 6 – 12 Months

The practical recommendations provided in this study offer valuable insights for university strategic managers, administrators, and policymakers aiming to foster a vibrant culture of innovation. The proposed actions and short-term strategies, acting like drivers that the study identified in the discussion with the participants are providing actionable recommendations to accelerate the transformation of universities' innovation culture and practices such as:

- To create Ambassadors for Innovation: identify researchers who have successfully navigated the innovation path and can serve as a model for others; promote their success stories.
- To establish Incubators to nurture collaboration with industry and to incentivize and support innovative activities such as startups emerging from academic research.
- To develop training and courses for researchers and students with target programs in the development of competencies in innovation, entrepreneurship, and IPR.
- To improve access to additional funding through better industry collaboration and investment to support the development and commercialization of research with a lower TRL.
- To strengthen the TTO and the support system to provide guidance and resources for researchers and innovators.
- To cultivate a new organisational culture by developing strategies that prioritize innovation within the HEIs and support risk-taking and creativity among researchers and students.

Overall, this study shows that there is not just one way to bring more innovation and commercialization of research created on the HEI, but it is a mix of actions and tools that universities have to take to cultivate a culture of sustainable innovation, drive impactful research outcomes, and contribute to solving societal challenges while advancing economic development. As for future work, there are several avenues for further exploration. Further research in the field could continue the study and conduct use-case studies to examine real-life examples of universities successfully implementing sustainable innovation practices, thus providing valuable insights into effective strategies and their outcomes. Additionally, investigating the role of policy frameworks and government support in facilitating sustainable innovation in universities would contribute to understanding the broader institutional context.

anyacitu@tu.ac.th

Abstract: The rapid evolution of digital technologies has significantly impacted how libraries operate and serve their communities, leading to a transformative shift in library services internationally. Despite the widespread acknowledgment of this digital shift, there remains a substantial gap in understanding of how libraries are adapting to these changes, particularly in terms of integrating digital innovations to enhance user access and engagement. This study aims to bridge this knowledge gap by examining the directional trends of library development in the context of digital transformation. By analysing library services in three regions - Europe, the United States of America, and Asia - critical adaptations and innovations are identified that are shaping the future of library services. The goal is to illuminate the current landscape and propose strategic directions to help library stakeholders with planning and implementation.

Keywords: Library trends, Library transformation, Library services innovation, Community engagement, Sustainable evelopment

1. Introduction

Recently, the advent of digital technology has fundamentally altered the information access and management landscapes, heralding a new era of rapid global change. These advancements have transformed business operations and societal interactions by influencing infrastructural and functional paradigms of libraries. As institutions of knowledge transmission, libraries are now at a critical juncture, requiring comprehensive adaptation to remain relevant and effective in today's digital-centric world (Thiruppathi, 2024).

Initially, the transformation in libraries was primarily reactive, responding to broader digital shifts that were reshaping industries. Innovations such as digital databases, e-books, and online access points became fundamental, yet integration of these technologies varied widely (Chowdhury, 2010). This disparity in adaptation highlighted significant gaps in library services, with many institutions struggling to align their offerings with evolving demands from patrons. (Borgman, 2003; Lankes, 2011, Lal et al., 2022; Nie, et.al., 2022).

The digital era presents challenges and opportunities for libraries: the rapid pace of technological change demands continuous learning and adaptation, often straining existing resources and capabilities (Abdin, et.al., 2023). Yet these technologies also offer unprecedented opportunities to enhance service delivery, expand resource access, and innovatively engage with communities (Aharony, 2019; Sain & Negi, 2023). In this context of transformation and challenge, the present research examines how libraries in Europe, the United States of America, and Asia are navigating these changes.

This situation compels a need for understanding specific adaptations and innovations that libraries are implementing in response to digital transformation and social movements. By identifying common challenges which they face and successful strategies, insights into the evolving role of libraries in a data-driven age may be discerned. The goal is to provide a clear, comprehensive view of how libraries can harness digital technologies to thrive, enhancing their service as essential sources of knowledge for all generations.

The following sections will explore the literature on economic, technological, social, and environmental changes in libraries, establish a methodology for this study, and discuss findings in detail. A set of recommendations will be formulated to guide library stakeholders in strategic planning and implementation.

Research Objective

The primary aim of this study is to discern and systematically understand library growth and development trends in response to digital technological advancements. By investigating how libraries in different regions adapt to, and integrate, these technologies, common challenges and successful strategies will be identified to potentially inform future developments in library services. There is a special focus on 1) assessing the impact of digital technologies on library service models in different geographical contexts; and 2) identifying key trends in digital adoption and innovation in libraries that enhance service delivery and user engagement. By setting targeted

objectives, actionable insights may be provided to enhance the academic discourse on digital transformation in libraries and practical guidance for their strategic development.

2. Literature Review

The literature review explores the intersection of digital transformation and library services, highlighting significant trends, challenges, and innovations that have emerged in the library sector as a response to technological advancements and social movements. This review synthesises existing research to build a comprehensive understanding of how digital technologies are reshaping libraries. Library development content and perspectives in economic, technological, social, and environmental changes for different regions are all considered.

2.1 Digital Transformation in Libraries

Digital transformation in libraries encompasses a wide range of technologies, from automated management systems to digital archives and electronic resources (Anuradha, 2018). Connolly, et al. (2019) indicate that in addition to being about the adoption of digital instruments, digital transformation also involves rethinking library operations and services to enhance user interaction and information access. Libraries are increasingly adopting digital platforms to boost outreach and interactivity with users (Smith & Wong, 2019). While the benefits of digital transformation are clear, challenges are also substantial. Many libraries face technological, financial, and human resource constraints that hinder full-scale implementation of digital initiatives. In addition, continuous training and development are needed to educate library staff in new technology (Eje, & Dushu, 2018; Han et al., 2016). Privacy and security concerns related to digital services also pose ongoing challenges (Saha, 2024; Bright et al., 2020).

2.2 Enhancing Library Services Through Digital Innovation

Digital innovations have allowed libraries to transcend traditional boundaries, offering services such as remote access to collections, digital lending, and virtual reference services (Papy & Jakubowicz, 2018). Wu & Chen (2012) and Ekere et al. (2016) assert that these services have significantly increased user satisfaction and engagement. Internationally, libraries are currently emphasising digital technology use to facilitate access to information resources, augmenting user engagement (Lal et al., 2022; Eje & Dushu, 2018). Examples include creating digital collections; audiobooks; online databases accessible anywhere, anytime; self-service systems for borrowing and returning books and paying fines; as well as promoting user digital literacy and skills (Phanphai, et al., 2024). Dabas (2008) observes that digital technology library services are a development connecting all library stakeholders in an opportunity to access services equally. Kaur and Sharda (2020) and Nie, et.al. (2022) underline the use of cutting-edge technology such as artificial intelligence (AI) and robots in libraries of China as progressive library service quality advancement.

2.3 Access to Information Resources

Digital technologies are essential for enhancing access to information. E-resources, digital archives, and online databases are now essential components of library offerings (Gururaj & Arunkumar, 2014). The transition to digital access has potentially democratised access to information, making resources available to a wide audience without limitations of physical space or geographical boundaries (Strömqvist, 2023). Several nations in Europe, the Americas, and Asia are focused on providing universal and equal access to information by considering Open Access, as well as opening educational resources and online remote access to content and services (Ifla, 2022). One such service, digital preservation, makes it possible to store and safeguard data resources, extending their lifespan. Hazarika (2020) adumbrates methods and strategies, as well as advantages and disadvantages, of academic library digital preservation. Her findings may help libraries formulate digital preservation guidelines.

2.4 Sustainability and Environmental Practices

Library development trends broaden beyond technology and innovation to environmental friendliness and sustainability. Green library research is represented by Singh and Mishra (2019); Antonelli (2008); Ephraim (2003); Beutelspacher and Meschede (2020); Bincy and Vasudevan (2023); McElrath and Sutherland (2015); Rachman and Ratnasari (2022); Sudhakar (2023); Gupta (2021); Okojie and Igbinovia (2023); Beutelspacher and Meschede (2022); and Edwards (2011). These studies emphasise library sustainable development, prioritising environmentally friendly design, energy-saving technology, and minimising carbon footprints operationally while maximising positive environmental impact (carbon handprints). Policies and standards for environmentally responsible operations should be developed by educating users and society about sustainability.

2.5 Community Engagement and Inclusivity

Many modern libraries are developing into community centers, offering a wide range of services beyond the traditional scope of libraries. Moran, M. (2021) emphasises the importance of libraries in promoting community cohesion, increasing educational access, and celebrating cultural diversity. Inclusivity and access are essential for libraries to serve entire communities, especially the marginalised and underserved, including people with disabilities and other minorities.

2.6 Innovation in Library Services and Space Management

Khongmalai & Distanont (2018) generally define innovation as a tripartite concept, comprising: 1) industrial or organisational novelty; 2) development from extant knowledge; and 3) commercial potential for wide acceptance and use to benefit the economy, society, and the environment. In libraries, innovation is essential for developing and improving services to meet economic, social, environmental, and technological advancements. These changes potentially disrupt libraries, especially after the Coronavirus disease 2019 (COVID-19) pandemic, which marked a widespread shift to digital communication and learning. Awoyemi and Awoyemi (2021); Gholami et al. (2018); Lal et al. (2022) show that libraries are rapidly adapting to meet changing user needs by introducing new service models and employing space creatively (Sain & Negi, 2023; Ikolo, 2022). Many institutions have developed service innovations, such as the cashless library. Users may borrow materials, return them, and pay fines through convenient methods like quick-response (QR) code scanning. Some libraries are also using gamification concepts to heighten user engagement (Walsh, 2014; Adedokun, et al., 2021; Downie & Proulx, 2022). Simultaneously, library design strategies and flexible space may expand multi-purpose resource functionality. Libraries can also contain new sites emphasising hands-on learning and support innovation, such as makerspaces, launch pads, or coding clubs. These learning areas encourage creative knowledge exchange through experience of trial and error, leading to innovation. This aligns with the future direction of education, shifting from rote memorisation to a learner-centered approach. Creativity is promoted by encouraging critical thinking, logical reasoning, problem solving, and collaboration. Libraries may also serve as mental health support spaces for students, employees, and the community. One example of a new approach to library design management is the Life space concept proposed by Kornkaew, et al., (2024). The library is divided into four spaces: for learning, co-working, inspiration, and performativity. This innovative spatial arrangement has been shown to increase user satisfaction.

2.7 Business Model and Revenue Stream

Recently, libraries have faced budget cuts and closures. Rapid technological developments and a changing environment were accelerated by the COVID-19 pandemic. These led to increased demand for easy remote access to information and library services. In response, libraries adapted their business models. Bennett and Orr (2015); McCombs (2002); Munstedt (2019); Wilkinson (1998); Million and Haggerty (2020); Jennings and Garczynski (2020); Kumara and Sathish (2013) evaluate new business model development to generate revenue from multiple channels. Ghalavand, et.al., (2022) scrutinises different library types internationally to find multiple new revenue sources, including service fees, social network use, web space, e-commerce principles, marketing, and activity-based fundraising.

Despite extensive studies on the adoption and impact of digital technologies in libraries, there remains a gap in understanding of how these technologies are integrated into library strategies and operations across different regions. The long-term impact of digital transformation on library sustainability and community engagement also remains underexplored.

2.8 Funding and Support

Funding and support are critical for sustaining library operations and fostering innovation. Libraries in Europe benefit from EU grants and public/private sector partnerships, reflecting a collaborative approach to securing financial resources. In the United States, libraries use a combination of public funds, private contributions, and grants, along with advocacy efforts to secure funding. In Asia, library funding mechanisms vary by country, with significant investments in certain regions and impactful private philanthropy supporting high-profile projects. These diverse funding strategies enhance library services and infrastructure.

3. Research Design and Methodology

3.1 Research Approach

Qualitative research was done to obtain insight into library digital transformation strategies. This approach is suitable for exploring complex phenomena contextually, especially when boundaries between the phenomena and context are ambiguous (Yin, 2016). Qualitative methods facilitate a detailed examination of processes and outcomes associated with digital technology implementations in libraries.

3.2 Data Collection

Data was gathered as secondary data: concepts, theories, research, and articles related to library development; in-depth interviews with stakeholders, including administrators, librarians, and users; and observation. Each interview focused on the participant's experience with integrating digital technologies into library services. Document analysis included the examination of internal reports, strategic plans, and public documentation related to digital strategies and social movements of libraries. Purposive sampling targeted libraries that have undergone significant library development initiatives over the past five years. This ensured that findings would reflect the latest practices and challenges in library development. Libraries of different sizes and types were included to encompass a broad spectrum of operations and contexts.

3.3 Data Analysis

The data analysis process involved several stages:

- Data preparation: This stage involved transcribing the interviews and organising the secondary data, which included concepts, theories, research articles, and internal documents related to library development.
- Coding and categorisation: Using NVivo, a qualitative data analysis software, to systematically code the transcribed interviews and categorise the data into relevant themes. This process involved identifying recurring patterns and key themes related to digital transformation challenges and strategies in libraries.
- Thematic analysis: The coded data were grouped into broader themes reflecting the main aspects of digital transformation in libraries across the selected regions. This stage included analysing the data to identify trends, common challenges, and successful strategies.
- Result synthesis: The findings from the thematic analysis were integrated into a comprehensive narrative that highlights the critical adaptations and innovations shaping the future of library services. This synthesis involved comparing and contrasting the data across different regions to draw meaningful insights.
- Validation and interpretation: The results were cross-checked with existing literature to validate the findings and interpret their implications for library development in a technologically driven era. This stage ensured that the conclusions were grounded in both the primary data and the broader research context.

4. Results and Discussion

The findings were analysed from the data collected by interviews and document analysis. The results were organised by key themes identified in the thematic analysis, reflecting eight main aspects of digital transformation in libraries across the selected regions as shown in Table 1.

Table 1: Key trends identified

Dimension	Europe	United States	Asia
Digital Transformation	The development trend focuses on digitalisation, digital preservation, improving the e-infrastructure for researchers in the form of digital repositories to support the Open Science Data Cloud (OSDC) for widespread secure access to information resources. In addition, digital technology has been used to develop and improve digital access and access to collections,	Highlighting the shift towards digital mediums, libraries are increasingly leveraging electronic books and databases, alongside innovative digital technologies, to enhance service. This approach reflects a broader trend towards adapting library offerings to meet evolving digital needs of users.	Swift acceptance of cutting-edge technologies, including AI and robotics, alongside digital platforms in Asia, especially China. This trend underscores a regional proactive approach to integrating advanced technological solutions to expand library services.

Dimension	Europe	United States	Asia
	including library virtual reality applications.		
Sustainability	Libraries are increasingly relying on sustainability and environmentally friendly designs, aligning projects with broader European Union (EU) environmental policies. This shows a commitment to integrating green practices in library infrastructures.	An increasing emphasis on using sustainable practices in operational and construction phases, while launching community sustainability efforts. This shift reflects a growing library managerial commitment to environmental responsibility.	New incorporation of sustainability in design and function, prioritising green library initiatives. This is a significant move towards environmentally responsible library management and operations. The Green Library Award is presented in Thailand by the Thai Library Association (TLA), originally under the royal patronage of His Majesty King Bhumibol the Great.
Community and Cultural Focus	Libraries are expanding offerings to include multilingual collections and services, reflecting community linguistic diversity. In addition, hosting cultural and community-focused events boosts cultural preservation and community ties.	Libraries are evolving into vital community centers, providing an array of services, emphasising social support and educational initiatives. This evolution helps foster educational development and offers a wide range of social services to meet community needs.	Bolstering educational initiatives to preserve cultural heritage, libraries are essential resources for academic enrichment and preparation for competitive endeavors, supporting educational pursuits and cultural conservation.
Inclusivity and Accessibility	Ensuring access for all community members, including migrants and refugees, by providing multilingual resources. This commitment to inclusivity serves diverse populations. Many libraries have also explored Open Access through transformative agreements, such as The Finnish Consortium for Electronic Resources (FinElib), which collaborates with the publishers Nature Research and Association for Computing Machinery (ACM). Several nations are discussing fair data and online remote access to content and services.	Ensuring inclusivity, and accessibility as well as promoting diversity, equity and inclusion (DEI), libraries are designing services to cater to underserved communities. The goal is to foster an environment that is welcoming and equitable for all population segments.	Initiatives are being launched to address needs of diverse linguistic and cultural groups as well as enhancing accessibility for people with disabilities. These efforts vary across different regions, reflecting a commitment to inclusivity and adaptation of services to meet unique requirements of all community members.
Funding and Support	Mainly financed through public funds and EU grants, libraries also benefit from a longstanding tradition of public/private sector partnerships. Likewise, there is a model highlighting a collaborative approach to securing financial support and resources for library services and projects.	Libraries are financed by a combination of public funds, private contributions, and grants, with advocacy efforts used to secure funding. This financial strategy reflects a multifaceted approach to garnering support for library operations and initiatives.	Differences by nation in library funding are evident, with notable investments in certain regions. Impactful private philanthropy and corporate sponsorships also support high-profile library projects. This financial landscape showcases a diverse array of mechanisms to enhance library services and infrastructure.
Service Innovation	Libraries are innovating with alternative service formats such as pop-up and mobile libraries to extend their reach into underserved communities and implement digital book lending services. This innovation strategically shifts towards ensuring library service accessibility and inclusivity in diverse environments.	Libraries are introducing innovative services, including tool-lending and seed libraries, while incorporating onsite social services. This broadens library functions to diverse, community-centric services beyond traditional book lending, adapting to varied user profiles.	Libraries are leading the way with user engagement innovations, including deploying mobile library services, establishing online reading communities, and introducing café spaces in libraries. They also leverage technology to offer personalised services to patrons. This includes the creation of more interactive, user-centered library experiences.

Dimension	Europe	United States	Asia
Space Management	Repurposing historical structures for library facilities and integrating versatile, multi-use spaces for a variety of programs and gatherings. This strategy innovatively blends architectural heritage with contemporary library services, creating dynamic environments to support diverse community engagement.	Transforming library spaces to enhance flexibility and community orientation, incorporating coworking areas, meeting zones, and relaxation spots, while also embracing the use of outdoor spaces for extended engagement. This redevelops libraries into versatile, inclusive environments catering to a wide range of activities and community needs.	Advancing library architecture to blend technological advancements with versatile design, creating visually appealing environments conducive to learning. This drive offers functional educational spaces while prioritising aesthetic value through an inviting user atmosphere.
New Business Model	Investigating alternative financial strategies, such as crowdfunding for targeted initiatives, introducing membership dues for access to exclusive services, and forging collaborations with local enterprises to back specific programs. This proactive exploration of diverse revenue streams sustains and enhances library operations and offerings.	Shifting towards diverse financial resources, libraries are increasingly renting out spaces for special events, conducting fee-based workshops, and forming strategic alliances with corporate entities and nonprofit organisations. This trend boosts financial stability and expands service offerings through innovative collaboration.	Embracing the concept of mixed-use spaces, libraries are incorporating commercial areas such as cafés and bookstores to generate revenue. This model is supported by engaging in public-private partnerships to facilitate innovative projects. This approach helps ensure financial viability while enhancing the library's role as a community hub.

in libraries. These findings identify good practices and trends from Europe, the United States, and Asia, it is crucial to provide concrete strategies that library stakeholders can adopt to drive future developments.

Enhancing Digital Infrastructure

Invest in Advanced Technologies: Libraries should allocate resources to integrate advanced digital technologies such as artificial intelligence, robotics, and mobile applications. Upgrading existing systems and incorporating these technologies will improve service delivery and user engagement.

Staff Training and Development

Continuous skill enhancement: libraries must invest in ongoing training programs to ensure staff are proficient in the latest digital tools and technologies. Partnerships with educational institutions and professional organisations can provide accredited training opportunities.

Leadership training: promote leadership development programs to equip library managers with the skills needed to lead digital transformation initiatives effectively.

User-Centered Service Design

Personalised user services: utilise data analytics to gain insights into user behavior and preferences, enabling the creation of personalised services and recommendations.

Inclusive and accessible services: ensure digital services are accessible to all users, including those with disabilities, by incorporating assistive technologies and making digital content accessible.

Community Engagement and Inclusivity

Expand community outreach: develop outreach programs to serve underserved and marginalised communities, including mobile libraries, digital literacy workshops, and collaborations with local organisations.

Promote cultural and linguistic diversity: offer multilingual services and resources, and host cultural events and workshops to foster community engagement.

Sustainable Practices

Adopt green initiatives: implement sustainable practices in library operations, such as using energy-efficient designs, reducing waste, and utilising eco-friendly materials.

Digital preservation strategies: develop strategies for digital preservation to ensure the long-term accessibility and safeguarding of digital content.

Innovative Business Models

Diversify revenue streams: explore alternative revenue generation methods like crowdfunding, membership fees, and partnerships with local businesses. Libraries can also offer fee-based workshops, rent out spaces for events, and sell branded merchandise.

Flexible Space Management

Create multi-purpose spaces: design adaptable library spaces that can serve various functions, such as coworking areas, learning area, performative areas, and event venues. This includes using modern furniture and technology to support diverse activities.

Focus on user-centric design: implement design strategies that prioritise user comfort and convenience, creating inviting environments that encourage learning and collaboration.

5. Conclusions

This qualitative research study explored library trends and developments in Europe, the United States of America, and Asia. There, libraries are currently facing diverse challenges in the volatility, uncertainty, complexity, and ambiguity (VUCA) era. Libraries require guidelines and strategies for transformation in different dimensions, including digital technology, service innovation, information resource access, sustainability, community engagement, and inclusivity. In addition to maintaining accurate and reliable information services, libraries must also progress from traditional models. They should incorporate digital technology to develop service innovations and focus on user needs. Changing from the identity of a book or resource repository and reading space has led to exciting new possibilities internationally. Libraries should also prioritise sustainability, environmental- and user-friendliness, as well as diversity, equity and inclusion (DEI). Understanding these adaptation strategies will enable libraries to plan transformation strategies to support future use and achieve sustainability. Practically, the findings offer practical inspiration for library directors and policymakers to help prioritise investments and design programs to maximise the benefits of digital transformation.

6. Limitations and Future Research Directions

The present study may be limited by focusing on libraries that have already adopted digital technologies. Future research could explore libraries in the early stages of digital transformation to provide a fuller picture of the transition process.

Abstract: Environmental degradation is one of the main challenges in today's world. Impact on the environment can be reduced through the introduction of clean and more efficient technologies. And innovation plays a crucial role in this process by replacing old equipment and methods. There are different ways how researchers understand sustainable innovations and sustainable innovation ecosystems. The terms "sustainable" and "sustainable development" have become very widely used in recent years. Sustainability is crucially important for the development of regions and national economies. Existing literature on the topic of sustainable innovation ecosystems includes vague and ambiguous definitions of sustainable innovation, as well as ways to measure it. A number of studies analyse the impact of different factors on conventional innovations and eco-innovations. However, not enough research has been done on the effects of innovations on all three dimensions of sustainable innovations, which are economic, environmental, and social. The aim of the article is to define whether governmental policies that promote innovation and sustainable development lead to environmental, social, and economic improvements in the EU countries. Our study uses the Eurostat data for 27 European Union countries. The literature review will include studies on sustainable innovation ecosystems. In the second chapter, we will describe the sustainable innovation ecosystems and ways to measure the sustainable outcomes of innovations. We study sustainable innovation ecosystems on a national level. We use partial least squares structural equation modeling (PLS-SEM) to determine the influence of governmental policies on sustainable outcomes, with product and process innovation as mediating variables. Under sustainable outcomes, we mean the economic, social, and environmental improvements on a national scale. The analysis is based on applying a quantitative method with empirical data using SmartPLS software. The results demonstrated a significant direct impact of governmental policies on innovation, as well as on environmental and social outcomes. However, they showed no indirect impacts connected to innovations. The results contribute to the current state of knowledge on sustainable innovation ecosystems and give policymakers valuable insights on factors that influence such ecosystems.

Keywords: Sustainable, Environmental policy, Eco-innovations, Governmental innovation, Firms, EU, PLS-SEM, SmartPLS

1. Introduction

Increasingly concerned with the deterioration of the environment and the quality of human life, caused mainly by society's profit orientation (Tran et al., 2023), environmental and sustainability research has become one of the fastest-growing fields today. In the field of environmental issues, research has focused, for example, on consumers' green intentions and behavior (Hoang & Tung, 2024) or the green activities of companies, for example, the banking sector (Cardona Valencia & Calabuig Tormo, 2023). In the field of sustainability, current literature has focused mainly on factors that can determine the green behavior of companies (Horbach et al., 2023; Kotkova Striteska et al., 2024), how the government sector can support corporate initiatives in sustainability (Karman et al. 2024a; Sein and Darfo-Oduro 2024), and circular economy practices (Karman et al., 2024b). The main reason for this boom can be considered the threat to ecological stability (White et al., 2021), which represents a significant threat to human health (Bouchoucha, 2021) and social well-being (Omri et al., 2022), which stimulates interest in sustainable practices and innovation (Dmytrenko et al., 2024).

"Environmental degradation" includes climate change (Nguyen et al., 2023), biodiversity loss (Tan et al., 2022), pollution, and natural resource depletion (Ali et al., 2021). Addressing these issues has become a priority for researchers, policymakers, and industries. There is a growing emphasis on sustainable solutions across sectors. Innovations in technologies and practices are crucial in mitigating environmental degradation (Arranz, 2020; Durán-Romero et al., 2020). Sustainable innovations addressing environmental, economic, and social issues are essential to holistic development (Purvis et al., 2019). These innovations increase productivity and competitiveness while ensuring environmental protection and social well-being (Zhang et al., 2021). Sustainable innovation ecosystems involving diverse stakeholders are fundamental for sustainable growth (Durán-Romero et al., 2020; Janahi et al., 2022).

However, the literature (Purvis et al., 2019; Wei et al., 2022) reveals a lack of consensus on definitions and metrics for sustainable innovation, leading to confusion and research gaps. Many studies have examined the impact of various factors on traditional innovation and eco-innovation (Baeshen et al., 2021), but comprehensive research on the three-dimensional effects of innovation—economic, environmental, and social—is scarce.

Our study assesses whether government policies promoting innovation and sustainable development lead to improvements in these three dimensions in EU countries. Using Eurostat data from 27 EU countries, we evaluate the efficacy of government policies in promoting sustainable outcomes. Advanced analytical techniques, such as partial least squares structural equation modeling (PLS-SEM), and empirical data through SmartPLS software, enable a nuanced understanding of the relationship between government policies and sustainable outcomes. This approach explores the mediating effects of product and process innovations on achieving sustainability goals. The anticipated results will provide insights into sustainable innovation ecosystems and guide future policy and research directions in sustainable development.

The rest of the paper is organized as follows: Section 2 reviews the literature on governmental policies and sustainable innovations. Section 3 describes the data and methodology. Section 4 presents the results and discussion. The final section concludes with a summary of contributions and suggestions for future research.

2. Theoretical Background

2.1 Sustainable Innovations

The term "sustainable" has become a buzzword in recent years (Brink, 2022). The Brundtland Report (1987) of the United Nations defines sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs". Sustainability is crucial for the development of regions and national economies. However, "sustainable" often causes confusion by being used synonymously with 'eco-friendly" (Nill & Kemp, 2009; Karakaya et al., 2014; Wei et al., 2022). True sustainability includes economic, social, and environmental dimensions, known as the "three pillars of sustainability" (Purvis et al., 2019). Boons et al. (2013) pointed out that sustainable innovation is a three-dimensional concept. Eco-innovation, reducing negative environmental impacts (Horbach et al., 2012), is part of sustainable innovation, which improves performance in all three sustainability aspects (Boons et al., 2013). Mazaheri et al. (2022) and Hermundsdottir and Aspelund (2021) include all three pillars in their assessments of market-based instruments and firm competitiveness, respectively.

Despite the belief that environmental protection hinders economic growth, both are interconnected. Economic growth provides financial resources, while the natural environment underpins economic activities. Both are crucial for societal well-being. Innovations promote sustainability by saving money and reducing pollution (Gunarathne, 2019). Efficient production methods exemplify how economic growth and environmental protection can coexist. Innovation, a goal of sustainable development by the UN, influences production processes and end products. Gunarathne and Peiris (2017) found that eco-innovations positively impact economic and social indicators. Innovations that reduce energy consumption and enhance recycling foster both environmental and economic sustainability, preserving financial resources (Ashford & Hall, 2010). Innovations for social sustainability include healthier working conditions and creating jobs for disadvantaged groups.

2.2 Role of Policymakers in Enhancing Sustainability

Porter and Van der Linde (1995) were among the first to study the influence of environmental policy on innovativeness, proving the positive impact on competitiveness and sustainability. According to Demirel and Kesidou (2019), three main drivers for innovation are market pull, technology push, and regulation stimulus. Hojnik and Ruzzier (2016) highlighted regulatory pressure as a driver and barrier for eco-innovations, noting companies invest in environmental innovations only if economically beneficial. Government regulations, alongside technology push and market requirements, are key innovation determinants (Horbach et al., 2012). Díaz-García et al. (2015) noted innovation is driven by internal and external factors, including government regulation.

Researchers (Ramanathan et al., 2017; Cohen and Tubb, 2018) recognize the positive impacts of governmental policies on reducing greenhouse gas emissions, though overly restrictive policies can have adverse effects (Mulatu, 2018; Wolde-Rufael and Mulat-Weldemeskel, 2021). Firms lack incentives to innovate if policies are too lenient (Ben-David et al., 2021). Studies in the EU (Neves et al., 2020) and OECD (Martínez-Zarzoso et al.,

2019) countries show stringent environmental policies positively influence carbon dioxide emissions. Governments enhance eco-innovations through measures like environmental taxes (Bashir et al., 2020), emission trading schemes (Zimmermannová et al., 2019), and subsidies (Gerarden, 2023). Regulation efficiency depends on internal (management, human resources) and external (government pressure and support) factors (Chu et al., 2018).

2.3 Approaches to Measure Sustainable Innovations

Gunarathne (2019) attempted to define a framework for measuring sustainable innovation, dividing indicators into economic, social, and environmental directions. Rauter et al. (2019) developed the Sustainability Innovation Performance indicator with four dimensions: social, environmental, process efficiency, and product sustainability. Gunarathne and Peiris (2017) highlighted the difficulty of finding a universal measuring system due to the complexity of sustainability dimensions. They used economic indicators like output and cost, environmental indicators like reduced land use, and social outcomes like projected salary increases. Measuring social benefits remains challenging, partly due to data availability. Common indicators for measuring sustainability in innovations are summarized in Table 1.

Table 1: Examples of sustainable innovation indicators

Economic	Social	Environmental
Profit from the sale of new product	Increase in employees' income thanks to new technology	Energy saved
Cost savings from the adoption of new technology	New workplaces created	Water saved
Increase of firm's worth	Taxes paid increase	Air, soil, and water pollution decreased
New consumers and suppliers	Safety improvements	Waste reduced

3. Hypotheses Development and Methods

This study draws upon the existing literature that emphasizes the multifaceted nature of sustainability (Purvis et al., 2019) and the integral role of governmental policies in fostering innovation within firms. It is evident from the review that while environmental, economic, and social dimensions of sustainability are interconnected, the impact of governmental policies through innovation acts as a critical mediator in achieving sustainable outcomes. Studies highlighted in the theoretical background, such as those by Porter and Van der Linde (1995) and others, demonstrate a positive correlation between regulatory frameworks and innovation in the corporate sector. These findings suggest that well-designed government interventions can catalyze advancements in sustainable practices among firms. Given this backdrop, the study formulates its hypotheses to systematically investigate the direct and mediated influences of governmental policies on the economic, environmental, and social outcomes of European firms. The hypotheses aim to capture the dynamic interactions between policy-driven innovation activities and broader sustainability goals, thereby contributing to a deeper understanding of sustainable innovation ecosystems within the European Union. We establish the following hypotheses:

> *H1: Governmental policies have a positive influence on the economic outcomes of European firms through innovation.*

This hypothesis builds on the evidence suggesting that public procurement for innovation and other policy instruments enhance firm-level economic performance by fostering innovation outputs and outcomes, thus supporting broader economic sustainability (Stojčić et al., 2020).

> *H2: Governmental policies have a positive influence on the environmental outcomes of European firms through innovation.*

Reflecting on the regulatory impacts of initiatives like the EU Emissions Trading Scheme (ETS), this hypothesis posits that environmental regulations effectively induce firms to adopt eco-friendly practices, thereby aligning with environmental sustainability objectives (Martin et al., 2016).

> *H3: Governmental policies have a positive influence on the social outcomes of European firms through innovation.*

This hypothesis is grounded in the findings of Ludvig et al. (2018), who explore the potential of EU and national policies to support social innovation in rural areas. Their research underscores the significant impact of these

policies on enabling community-oriented innovations, which cater to vulnerable social groups and address societal challenges at large. The effectiveness of such policies in promoting participatory inclusion and supporting the social fabric of rural communities highlights their critical role in achieving social sustainability. The influence of innovations as a tool for sustainable development was, in particular, proven by Loučanová et al. (2022), who studied the innovativeness of Slovak SMEs. Skare & Porada-Rochon (2022) proved that innovation is a crucial factor in reaching sustainable growth on macro and micro levels through the application of energy efficiency measures.

This study employs a quantitative approach to assess the influence of governmental policies on the sustainability outcomes of European firms. Utilizing a robust dataset, primarily sourced from Eurostat, we examine the domains of Science and Innovation alongside Sustainable Development. Additional data regarding the Human Development Index (HDI) is derived from the United Nations database. These datasets provide a comprehensive view of the innovation landscape across the European Union, allowing for nuanced analyses of policy impacts on firm performance.

To analyze the relationships posited in the hypotheses, Partial Least Squares Structural Equation Modelling (PLS-SEM) is employed using SmartPLS 4.0 software. This method was chosen for its ability to handle complex models and small samples effectively, which is particularly pertinent given that the dataset comprises observations from all 27 EU member states.

The dataset was rigorously prepared by removing empty and missing values to ensure the integrity of the analysis. PLS-SEM was applied to evaluate the impact of independent variables on dependent variables through mediating variables, providing insights into how governmental policies influence sustainability outcomes at the firm level. By structuring the methodological approach around these components, the study aims to provide a thorough understanding of how governmental initiatives in the realm of innovation and environmental regulation can drive sustainable development within the European business sector. The study's variables are carefully defined to capture the multifaceted nature of governmental policies and their impact on firm-level innovation and sustainability outcomes. These variables are categorized into latent and manifest types, as detailed in Table 2.

Table 2: Variables description

Latent variable	Manifest Variable	Type	Source
Environmental policies (GP)	Public R&D expenditures as % of GDP	Independent	Eurostat
	Total taxes as % of GDP		
Governmental innovation (Innov)	Enterprises with process innovations (as % to all)	Mediating	
	Enterprises with product innovations (as % to all)		
Economic (Econ)	FDI per capita	Dependent	
	Employment rate		
Environmental (Env)	Recycling rate		
	Circular material use rate		
Social (Soc)	Income distribution		
	Corruption Perception Index (social)		
Control (Ctrl)	GDP per capita	Control	
	Human Development Index		UN

4. Results and Discussion

The following Figure 1 and Table 3 describe the results of the SEM model.

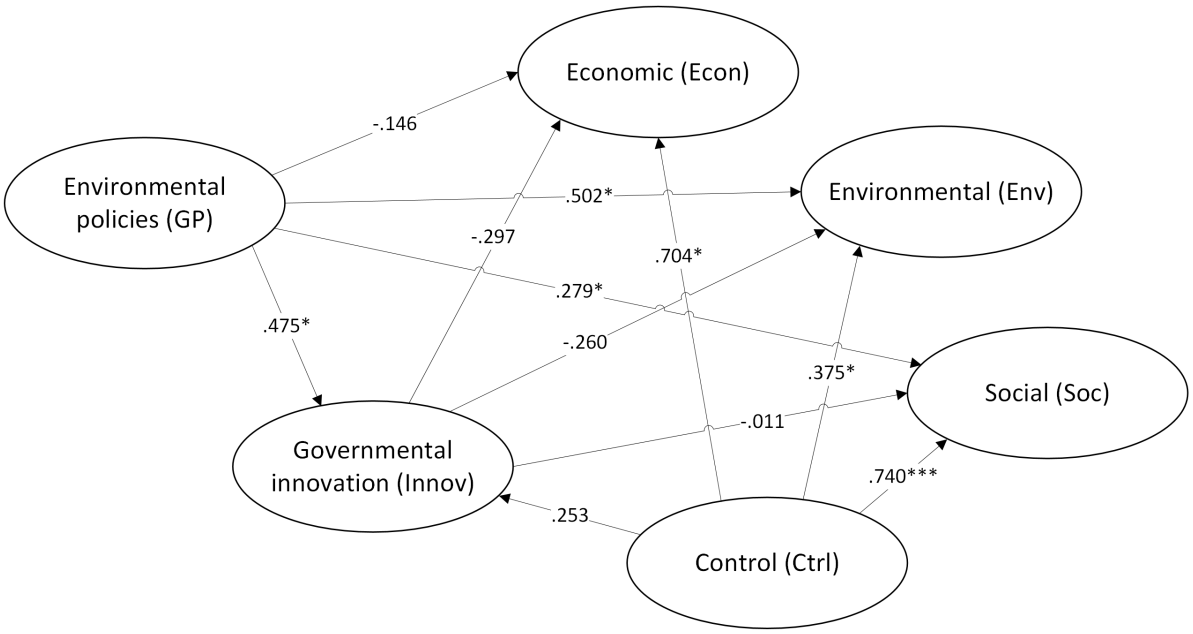

Figure 1: Bootstrapping results for the SEM model

Note: * p < 0.05; **, p < 0.01; ***p < 0.001; solid line = direct relationship, dashed line = indirect relationship.

Table 3: Direct Effects

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values	
GP -> Econ	-0.146	-0.466	0.450	0.325	0.745	
GP -> Env	0.502	0.503	0.208	2.415	0.016	*
GP -> Innov	0.475	0.516	0.186	2.550	0.011	*
GP -> Soc	0.279	0.260	0.121	2.298	0.022	*
Innov -> Econ	-0.297	-0.094	0.384	0.772	0.440	
Innov -> Env	-0.260	-0.250	0.240	1.087	0.277	
Innov -> Soc	-0.011	-0.001	0.129	0.086	0.931	
Ctrl -> Econ	0.704	0.797	0.330	2.136	0.033	*
Ctrl -> Env	0.375	0.363	0.189	1.986	0.047	*
Ctrl -> Innov	0.253	0.207	0.226	1.120	0.263	
Ctrl -> Soc	0.740	0.750	0.116	6.408	0.000	***

*Note: * p < 0.05; ** p < 0.01; ***p < 0.001.*

The results of the SEM analysis indicate that government environmental policies (GP) have a positive direct impact on environmental (Env) and social (Soc) outcomes. In contrast, the data reveal that government environmental policies do not exert a notable effect on economic outcomes (Econ). It was also found that government policies have a positive effect on innovation (Innov). However, these innovations do not further affect any outcomes (Econ, Soc, Env). With regard to the control variable (Ctrl), the analysis demonstrated a significant positive effect on all three sustainable outcomes (economic, environmental, and social), with a specifically significant impact on social indicators. At the same time, the impact of the control variable on innovation was not statistically important.

As previously indicated, government policies do exert an influence on innovation. However, the impact of innovation on economic, social, and environmental outputs is not statistically significant. To further substantiate or refute the hypothesis that the innovation variable plays a mediating role, we conducted an indirect effects analysis. The results of this analysis are presented in Table 4.

Table 4: Indirect Effects

	Original sample (O)	Sample mean (M)	Standard Deviation (STDEV)	T statistics (|O/STDEV|)	P values
GP -> Innov -> Econ	-0.141	-0.049	0.189	0.744	0.457
GP -> Innov -> Env	-0.124	-0.131	0.143	0.868	0.386
GP -> Innov -> Soc	-0.005	-0.002	0.073	0.072	0.942
Ctrl -> Innov -> Econ	-0.075	-0.018	0.141	0.534	0.594
Ctrl -> Innov -> Env	-0.066	-0.044	0.088	0.748	0.454
Ctrl -> Innov -> Soc	-0.003	0.001	0.041	0.069	0.945

*Note: * p < 0.05; **, p < 0.01; ***p < 0.001.*

The results show that none of the indirect effects of government environmental policies (GP) through innovation (Innov) on economic (Econ), environmental (Env), or social (Soc) outcomes were statistically significant. These findings suggest that innovation does not function as a significant mediator in the relationship between government policies and these outcomes. Similarly, the control variables (Ctrl) through innovation did not have a statistically significant indirect effect on any of the outcomes. This confirms that the direct effects of government policies and control variables are crucial to understanding their effects on outcomes.

Results showed that governmental policies have a positive impact on innovations and on environmental and social outcomes. The stimulating effect of governmental policies on innovation was proved, in particular, by Horbach et al. (2012), Díaz-García et al. (2015), and Martin et al. (2016). Nevertheless, no effect of innovations or of governmental policies through innovations was recorded. Thus, our result is different from those of Loučanová et al. (2022) and Skare & Porada-Rochon (2022), who stated that innovation is crucial in achieving sustainability. Therefore, all our hypotheses were partially confirmed. Hypothesis number one was proven for the direct impact of governmental policies on innovations. Hypotheses number two and three were confirmed for the impact of policies on environmental and social outcomes. However, none of the hypotheses were proven fully, as there was no mediating effect of innovations in the selected countries. Thus, our outcomes contradict the results of Stojčić et al. (2020) for economic outcomes but partially confirm the results of Martin et al. (2016) and Ludvig et al. (2018) for environmental and social outcomes, respectively. The positive impact of environmental policies on environmental outcomes was also concluded by Martínez-Zarzoso et al. (2019), Wang et al. (2020), Wolde-Rufael and Mulat-Weldemeskel (2021), and Albulescu et al. (2022), who proved that governmental policies, in particular R&D expenditure, reduce the environmental pollution. Besides that, this study confirms the impact of governmental policies on innovation, which was approved by Stojčić et al. (2020). At the same time, results also disapproved of the statements made by Porter and van der Linde (1995), who proved the positive influence of governmental policies on economic performance. Control variables have a higher influence on sustainable outcomes than governmental policies do. However, governmental policies are more efficient in promoting innovation.

5. Conclusions

The article is an important contribution to the field, previously rarely studied – sustainable effects of innovations. Previous papers on the topic concentrate mainly on the theoretical side of sustainable innovations without measuring their real-life application. In our study, where we tested whether innovations lead to the achievement of sustainable outcomes, we came to the conclusion that governmental policies positively influence three types of indicators only directly and not through innovations. Innovations turned out to be not significant in improving the sustainable development indicators considered. So far, to the best of our knowledge, no similar studies have been done. For policymakers in the EU countries, our results show, that innovativeness doesn't necessarily mean sustainable outcomes. Nevertheless, the results also show that, despite the absence of indirect effects, governmental environmental policies are efficient not only in stimulating environmental indicators but also in improving social standards and innovativeness. Also, no matter what's the level of innovativeness, HDI and GDP per capita lead to sustainable improvements. For business strategies, the results mean that firms have to weigh various factors when introducing innovations.

Our research has certain limitations, as our data is restricted by the availability of indicators in the Eurostat database. For future research, we suggest studying the other indicators that are used to measure sustainability. For example, health indicators could be studied as social outcomes, GHG pollution levels as environmental, and GDP change as economic. Results for such indicators may differ from the results for indicators we used. Innovations could also be studied at the enterprise level, considering the effects of other governmental policies, like, e.g., environmental taxes.

Faculty Participation in Technology Commercialization: The Roles of Process, Policies and Career

Wenlu Du and Kent Neupert
Boise State University, Idaho, USA

wenludu@u.boisestate.edu
kneupert@boisestate.edu

Abstract: Technology commercialization has become an increasingly important activity for European and U.S. universities. Among the reasons for this importance have been declining government financial support for public universities, greater accountability to funding agencies, and increased expectations for commercialization revenues. Combined with recent economic uncertainty, the search for additional revenue sources has accentuated the need to better involve faculty in successful technology commercialization efforts. Thus, university administrators and technology managers face challenges in attracting, engaging, and retaining faculty participation in this effort. This paper reviews the relevant literature to understand how tenure and promotion policies can incentivize or disincentivize faculty members from pursuing technology commercialization projects. Prior research has focused primarily on the determinants of performance and benchmarking issues while faculty career path choices have been neglected. We address this gap in the literature by considering technology commercialization, faculty choice, and institutional policies in tandem. We conducted a systematic review of relevant literature on faculty involvement in technology commercialization and identified incentives and impediments for pursuing technology commercialization. Next we developed research hypotheses drawn from the literature review to assess faculty attitudes and activities, and their career development stage, based on the literature. Data collected through surveys will be used to test the hypotheses. We propose that the choice to participate in technology commercialization is a risk-payoff decision for faculty that depends on their career stage and subject matter area of work. As the faculty member becomes more secure in their position, such as tenured, the perceived risk of participation declines while the perceived reward value of incentives increase. As this perception changes due to career stage progress, we expect that faculty will be more inclined to participate in technology commercialization activities. We discuss how choices involving technology commercialization projects relate to a faculty career path and institutional technology commercialization policies, and how these policies are used to promote faculty participation in technology commercialization projects.

Keywords: Technology commercialization, Public policy, Promotion and tenure, Innovation, Academic entrepreneurship

1. Introduction

Successful university technology commercialization requires faculty, university administrators, and students to work together to form a company. Over recent years, many universities have promoted entrepreneurial training programs to engage graduate and doctoral students. Federal agencies such as NSF's I-Corps program have also promoted postdocs and faculty engagement in technology commercialization through formal training processes (Wright, Siegel, and Mustar, 2017). Thus, graduate-level students, postdocs, and faculties are becoming increasingly aware of the opportunities.

Having strong programs in place at the national level to support technology commercialization, such as NSF's STTR, SBIR, and I-Corps programs, can provide researchers with the support, training, and funding necessary to move ideas from the lab to the market. The internet, DNA amplification, 3D printing, magnetic resonance imaging (MRI), and Lasik eye surgery are just a few examples of world changing inventions supported by NSF programs (nsf.gov, 2024). Similarly, a university that has a capable, experienced, well staffed, and well funded technology commercialization unit can be a foundational conduit of innovations that are successful in the market and yield millions in licensing royalties for the university. UCLA received US $1.6 billion in royalty fees, patent income, and reimbursement payments from its development of Xtandi, an innovative prostate cancer drug, before selling future royalty interests for US $1.14 billion and potential additional payments based on future Xtandi sales (UCLA, 2016). As universities face financial uncertainties, having sources of royalty revenues can offer support for research and technology commercialization programs.

An extensive literature review of incentives and impediments for faculty engaging in technology transfer and commercialization indicates that royalties, patenting and licensing, publications are the biggest drivers to incentivize faculty participation, while misaligned reward systems and conflicts of interest are significant impediments to faculty participation.

2. Theoretical Background

Since the Bayh-Dole Act in 1980, academic entrepreneurship in the context of technology transfer and commercialization has become an important activity function for European and U.S. universities for various

reasons. This includes greater accountability to funding agencies, declining government financial support for public universities, and increased expectations for commercialization revenues. Additionally, recent economic uncertainty exacerbated the search for additional revenue which includes increased faculty involvement in successful technology commercialization.

2.1 Organizational Level Factors Affecting Participation in Technology Commercialization

2.1.1 National programs

National policies and programs to support technology transfer and commercialization have been offered by various federal agencies but until recently have received limited attention by academic entrepreneurship researchers. With recent changes to university funding models, academic entrepreneurship in the context of technology transfer and commercialization has become an increasingly important matter for universities.

In the US, the Bayh-Dole Act in 1980 opened a path for universities to commercialize their federally funded research. However, universities did not develop programs to facilitate technology transfer and commercialization until years later. As US universities have become more responsive to the benefits of technology, programs for promoting and supporting technology transfer on campus have become prevalent (Mowery et al, 2001). Similarly, other countries have adopted national programs to support faculty entrepreneurship, such as France's national program that allows university faculty, previously constrained, to set up university affiliated ventures (Mustar and Wright 2010). Similar national programs are Germany's EXIST (Ayoub, Gottschalk, and Müller, 2017), Canada's NRC Industrial Research Assistance Program (Niosi, 2006), and the NSF I-Corps program in the US (Huang, Fay, and Sheridan, 2017). Other related national programs designed to support academic entrepreneurship and technology commercialization include funding, such as the NSF SBIR/STTR in the US (Toole and Czarnitzki 2009; Siegel and Wessner 2012), innovation agencies and funding programs in France and the UK (Mustar and Wright, 2010), science parks, research centers, innovation awards programs, and entrepreneurship training programs (Hayter et al, 2018).

2.1.2 University programs and policies

On a university level, we consider the various programs and policies that universities provide for faculty academic entrepreneurs to encourage and support technology transfer and commercialization. Programs vary in implementation and results (Degroof and Roberts 2004; Wright et al. 2009) with some efforts were found to encourage licensing, related revenue sharing, and startups (Siegel et al. 2003a; Muscio, Quaglione, and Ramaciotti. 2016), while others were found to be discouraging (Markman et al., 2004).

For example, organizational incentives for participating in technology commercialization can be effective, such as a favorable royalty distribution formula in a licensing transaction that is shared with the faculty member who develops new technology (Link, Siegel, and Bozeman, 2007; Markman, Gianiodis, and Phan, 2008; Friedman and Silberman, 2003; Owen-Smith and Powell, 2003). Encouraging efforts can be expanded to include sharing royalty and licensing income with faculty, internally investing in technology transfer projects through internal funding or investing, and establishing relationships with local industry partners through research projects and student engagement. University technology transfer offices (TTOs) can serve a role in connecting inventors and commercialization oriented faculty with external industry partners interested in such projects. Other units on campus can help with related aspects such as patenting, copyrighting, licensing, and funding.

From a policy perspective, recognizing efforts to secure government or external funding for technology commercialization projects, such as NSF I-Corps, SBIR and STTR award programs, and private foundation support can encourage faculty participation. However, recognition is uneven across campus as some academic units, such as sciences and engineering, more often recognize TC efforts than other academic disciplines. Also, universities benefit from such external awards through financial support for the project and finance and administration (F&A) overhead charges that can be used to support university TTO units.

Unintended problems can occur due to inappropriate staffing and compensation practices of the TTO (Siegel, et al., 2003a,b), including a high turnover rate of technology licensing officers that can undermine the development of long term relationships between the university and industry, and insufficient business and marketing experience of TTO staff (Siegel, 2018; Markman, Siegel and Wright, 2008), which can be further complicated by differences in culture and perspective between faculty and staff and those in private industry (Palmintera, Joy, and Lin, 2007).

2.2 Individual Level Factors Affecting Participation in Technology Commercialization

It is important to consider faculty perspectives when reviewing technology transfer and commercialization programs as faculty perspectives may not align with university expectations, commercialization projects may take away valuable faculty time from teaching and research, or faculty may put their academic responsibilities ahead of industry concerns and project deadlines (Palmintera, Joy, and Lin, 2007). Also faculty perspectives may differ regarding whether a project is an opportunity or worth the effort. For example, untenured faculty may feel that participating is risky if technology transfer activities are not officially considered in faculty tenure decisions (Hamilton and Schumann, 2016; Renault, 2006). Female faculty members, tenured or not, may feel a bias against their efforts as male and tenured faculty members are more likely to engage in all types of technology transfer (Link, Siegel, and Bozeman, 2007). Also, the need for faculty researchers to publish as a requirement for tenure and promotion may conflict with the corporate need for confidentiality (Palmintera, Joy, and Lin, 2007).

Within the context of this project, we consider the different activities a faculty member has over their career such as teacher, researcher, administrator, along with the various nonwork roles they may have such as spouse, partner, parent, and community member, each of which represent additional responsibilities and commitments.

2.3 Influence of Faculty Career Stage on Participation in Technology Commercialization

There is a well developed research stream regarding careers, and in particular, the careers of academics (Zacher et al, 2019). However, few have addressed the influence of faculty career stage on the propensity to engage in technology transfer and commercialization activities.

Zacher et al (2019) characterized a career as the sequence and combinations of work-related roles people occupy across their lifespan (Arthur, Hall, and Lawrence, 1989; Super, 1980) and then distinguished career development as the process by which both individuals and their employers manage various tasks, behaviors, and experiences within and across jobs and organizations over time, with implications for employees' work-related identity (Brown, 2002; Greenhaus, Callanan, and Godschalk, 2000). For our purpose, Zacher et al's (2019) distinction highlights that career development research focuses on how individual and contextual factors influence changes in a person's career over time.

It is important to note that academic career development research and practice addresses scholarly-trained individuals at various ranks and employment arrangements (Baldwin and Blackburn, 1981). Within this study, our consideration is the interplay between the faculty member's activity choices at various stages of their career in regard to the policies and programs they encounter in their workplace organization. Most academic faculty engage in research, teaching, and administrative roles throughout or in particular phases of their careers. For instance, a professor may begin their career doing research, teaching classes, and later in their career taking on administrative roles, such as department chair or dean, and these roles may change based on changing circumstances faced during their career. Another important characteristic noted by Zacher et al (2019), originally observed by Roach and Sauermann (2010), is that compared to other occupations, academics typically have high intrinsic work motivation and a "taste for science" (p. 422) and they are more willing to accept a relatively lower salary, putting high value on working conditions that provide independence and flexibility. This is important when we later consider how faculty members evaluate career choices regarding technology transfer and commercialization.

Following Zacher, et al. (2019), we consider social cognitive career theory (Lent and Brown, 1996; Lent, Brown, and Hackett, 1994) and life-span, life-space theory (Super, 1980; Super, Savickas, and Super, 1996) as important frameworks for this study. Both are used in career development research and include content and process aspects of career development (Brown and Lent, 2016; Lent and Brown, 2013). We first discuss social cognitive career theory followed by a discussion of lifespan, life-space career theory.

Social cognitive career theory (SCCT) focuses on the development of career interests, making career choices, and individual and contextual influences on career behavior (Lent et al., 1994; Lent and Brown, 1996). The theory emphasizes individual agency, or a person's ability and motivation to influence their environment and their own career development. SCCT emphasizes the motivational roles of self-efficacy, outcome expectations, and performance goals and holds that self-efficacy and outcome expectations work in conjunction with ability by influencing the types of performance goals that people set for themselves.

Three important aspects are:

1. *individual characteristics and personal resources* which include demographic characteristics, personality traits, as well as relatively stable abilities, beliefs, attitudes, and motivation,
2. *contextual influences on career development* that include working conditions, social support, networks, career development programs and specific interventions, specific academic disciplines, professional societies, and societal and cultural contexts, and
3. *active regulation of behavior* in the context of career development or career choices and effort to achieve career goals (Lent et al., 2002), including actions related to academic career development, such as goal setting, long-term planning, specific strategies, and feedback (Zacher and Frese, 2018).

The important aspects of SCCT for this project are the roles of self-efficacy, outcome expectations, performance goals, and how self-efficacy and outcome expectations work in conjunction with ability, in part by influencing the types of performance goals that people set for themselves.

Next, we consider life-span, life-space theory (Super, 1980; Super et al., 1996) to identify additional important aspects of academic career development. Like SCCT, lifespan, life-space theory also considers individual and contextual characteristics, but its primary focus is on different life and career stages, as well as the work and nonwork roles that people occupy across their lifespan.

Based on lifespan, life-space theory, Zarcher, et. al, (2019) included two additional themes: (1) academic career development in and across different career stages, and (2) academic career development related to different work and nonwork roles. Regarding career stages within the developmental perspective of lifespan, life-space theory, Zarcher, et. al, (2019) reviewed studies that focus on distinct career stages, including early, middle, and late career (Slocum and Cron, 1985), as well as career stages involving growth, exploration, establishment, maintenance, and decline, and included a lifespan developmental approach to academic career development (Fasbender and Deller, 2017; Ng and Feldman, 2012).

Regarding work and nonwork roles, a central tenet of life-span, life-space theory is that people may occupy multiple work and nonwork roles at a single point in time and across their careers and lives (Super, 1980), which includes the academic career development of people in different life roles, such as professor and parent, and in several specific roles within the work context, such as a professor in teaching and administration roles.

3. Research Hypotheses

Based on the above discussion of technology transfer programs and policies and faculty career stages, we propose the following research propositions:

Hypothesis 1a: Organizational level factors positively and negatively affect faculty participation in technology commercialization.

Hypothesis 1b: Faculty career stage will moderate the effect that organizational level factors have on faculty participation in technology commercialization.

Hypothesis 2a: Individual level factors positively and negatively affect faculty participation in technology commercialization.

Hypothesis 2b: Faculty career stage will moderate the effect that individual level factors have on faculty participation in technology commercialization.

4. Methodology

In general terms, the methodology employed in this study will use survey questions based on the theoretical model constructs and relationships to query faculty at US universities on how organizational level factors, individual level factors, and career stage influence their participation in technology commercialization.

Figure 1 below shows the hypothesized relationships in the theoretical model.

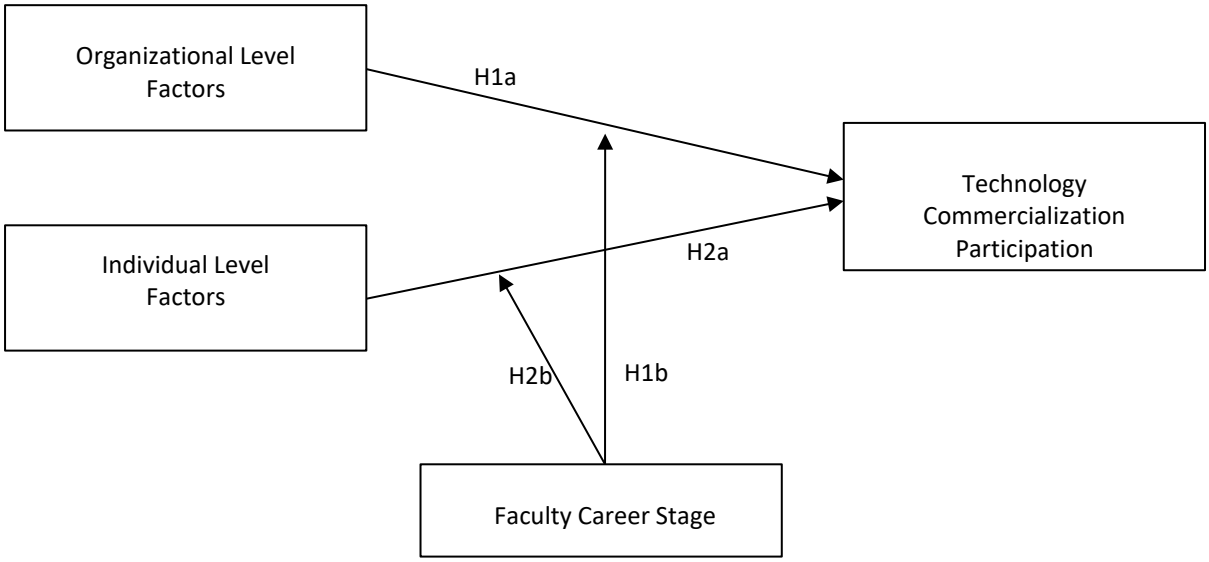

Figure 1: Theoretical model of the relationships between organizational and individual level factors on technology commercialization participation as moderated by faculty career stage

4.1 Operationalizing Key Concepts

For the purpose of this project, we define "technology commercialization" as the process of conveying results stemming from scientific and technological research to the marketplace and to wider society, along with associated skills and procedures. Examples of technology transfer include but are not limited to filling an invention disclosure, filing for a patent, copyright, or trademark, attempting to secure a licensing agreement, launching a startup or university spinoff, and other similar activities.

To operationalize "organizational level factors", faculty will be asked about their views regarding factors such as, but not limited to, university technology transfer and commercial programs and policies, prevalence on campus of national technology commercialization programs, such as NSF SBIR/STTR and I-Corps, sponsorship and funding relationships related to technology commercialization with private agencies on campus, technology transfer unit activities, university promotion and tenure policies related technology commercialization, and the general organizational climate relating to technology commercialization on campus.

To operationalize "individual level factors", faculty will be asked about their views regarding factors such as, but not limited to, entrepreneurial identity, role identity salience, ambivalence, supervisor championing, recent technology commercialization efforts, and technology commercialization intentions. Also, faculty will be asked about demographic characteristics, including but not limited to their age, gender, marital status, race/ethnicity, immigration status, highest education degree, scientific field or academic discipline, current position, tenure status, and years of experience.

To operationalize "faculty career stages", we will use a stage classification model developed in prior research and used in government job classifications. Based on Super's (1980) developmental dimension of the career lifespan theory, it is a widely accepted career development theory, and often applied to academic careers (Arthur, Hall, and Lawrence 1989; Lent and Brown 2013; Zacher et al., 2019). Moreover, academic positions are commonly structured in a four-tier system ranging from doctoral studies, postdoc and junior positions, lower-level senior to higher-level senior positions.

We will use a measure of career stages developed by Euraxess, a European Union backed platform listing vacancies for academic positions from countries in Europe and elsewhere, and adapted by Mantai and Marrone (2023) for a study of academic disciplines. The four career stages are:

- R1: First Stage Researcher (up to the point of PhD), includes research assistant and PhD roles
- R2: Recognised Researcher (PhD holders or equivalent who are not yet fully independent), includes post-doc, lecturer and senior lecturer roles
- R3: Established Researcher (researchers who have developed a level of independence), includes associate professor roles
- R4: Leading Researcher (researchers leading their research area or field), includes full professor roles

This four-tier structure is based on the European Commission (2011) framework and is common in academic careers world-wide (Fumasoli, Goastellec, and Kehm, 2015). This four category structure corresponds well to the stages discussed in the life-span, life-space theory (Super, 1980; Super et al., 1996), and is used to classify career stages in this study.

4.2 Survey and Data Collection

We will recruit faculty respondents from a range of academic faculty members from various disciplines, research areas, universities, and locations. We will develop a survey using accepted or adapted questions to test the hypotheses proposed as described above. Item responses will use a Likert scale. Survey questions and items will be pretested for validity and reliability. Surveys will be administered through a qualtrics-type platform. Data will be analyzed using statistical analysis software.

5. Discussion

Technology commercialization may never progress or come into existence without the human researcher's involvement. It is the participation of academic entrepreneurs and faculty researchers who provide the spark of ingenuity and vision of what can be that create innovation and take those ideas through development to viability. In this study we look to better understand how these individual faculty members view technology commercialization activities of the course of their career. Despite the importance of understanding the human players in this process, research into this area is sparse. Most of the work looking at the faculty member's professional and private lives focus on work life balance in terms of the organizational support for aspects of an employee's personal life (Balven, Fenters, Siegel and Waldman, 2018; Beauregard and Henry, 2009; Estes and Michael, 2005). The recognition of a faculty member having multiple roles at one time and over a career, roles that may conflict with each, has received only scant attention. Balven, et al. (2018) note that faculty concerns about not having enough time available for both academic and entrepreneurial activities highlight the importance of how organizational level factors may affect academic entrepreneurship.

6. Conclusion

In this study, our hypotheses are that the faculty career stage will moderate the effect both organizational and individual level factors have on faculty participation in technology commercialization. We proposed that faculty choice to participate in technology commercialization is a decision that depends on their career stage and is affected by both factors. In this paper we review relevant literature, offer research hypotheses, and describe how we will test our hypotheses. The relevant literature indicates that future work in academic entrepreneurship considers how processes regarding work life and role balance are swayed by university policy. Despite the importance of understanding the human players in this process, research into this area is sparse. This study seeks to address this gap in academic entrepreneurship and technology commercialization literature.

Challenges of Preparing Students for International Entrepreneurship in the era of Artificial Intelligence

Tiit Elenurm
Estonian Business School, Tallinn, Estonia

tiit.elenurm@ebs.ee

Abstract: International entrepreneurship competencies in the era of rapidly developing artificial intelligence focus more than earlier on stepping out of one's comfort zone, asking the right questions, assessing the reliability of information sources, and developing cross-cultural teamwork readiness. The purpose of this research is to prepare students for collaborative learning situations where generative artificial intelligence tools have become widely available. The main research question is: What are the challenges in different types of entrepreneurial team-based action learning projects in the context of artificial intelligence? Learning concepts based on collaborative learning and improving the international networking readiness of students are presented. Practical implications of time zone differences, trust building and conflict management in international teams are analysed based on the experience of X-Culture projects. We compare the opportunities and challenges of applying generative artificial intelligence such as ChatGPT-4, Microsoft Co-pilot and Google Gemini Advanced when developing learners' own international business ideas to learning from international teamwork to assist foreign start-ups in entering new markets. Gaps in skills to apply human collaboration for critically assessing artificial intelligence summary answers and identifying possible hallucinations when comparing new potential foreign markets were revealed. Artificial intelligence applications can be used to form global student teams based on the similarity of entrepreneurial self-development visions of team members. Still, experimenting with prompts in these applications can also enhance readiness to compare the pros and cons of different international entrepreneurship concepts and intelligent questioning skills for coaching and consulting. Students can chat with AI in a role-playing manner that helps them understand how to manage cultural differences in international entrepreneurship teams. Online action learning driven by tasks of start-ups is an essential tool in the entrepreneurial learning approach that prepares students to understand the value and limitations of generative artificial intelligence tools for international entrepreneurship. This paper contributes to understanding the challenges in action learning of students for international entrepreneurship and ways to overcome these challenges in the era when generative artificial intelligence tools are changing learning and international entrepreneurship practices.

Keywords: International entrepreneurship, Collaborative learning, Networking, Online teamwork, Artificial intelligence

1. Introduction

Innovative entrepreneurial teams that involve members and partners from different countries are essential for developing international entrepreneurship. Educators at business schools should support learners by applying culturally inclusive educational technologies (Akinrinola et al, 2020). Thompson (2017) explained how digital tools make learning processes more interactive and enable international collaboration. Collaborative learning should prepare students for entrepreneurial team formation and combine online and face-to-face learning to develop a mindset, skills, and practice for starting a new venture. Still, such learning can support life skills even if learners do not start a new business during their studies (Neck and Corbett, 2018). Artificial intelligence (AI) applications such as ChatGPT-4, Microsoft Co-pilot, and Google Gemini initiate new opportunities and challenges in digital collaborative learning. These applications can facilitate learning by asking smart questions and reflecting on the responses in an interactive learning process (Rospigliosi, 2023).

Developing students' critical and reflective thinking skills is essential for preparing future entrepreneurs to make better decisions by using AI tools for informed reasoning (Bell & Bell, 2023). A pedagogical challenge is to distinguish the original work of students and artificially generated work (Gao et al, 2022), but a broader challenge is to assist students in understanding the role of individual entrepreneurs and international entrepreneurial teams in future situations where AI applications will be widely used for business idea generation, international marketing and communication.

Integrating entrepreneurship education with international business learning in international teams can be a tool for learning through student enterprises or assisting entrepreneurship practitioners in screening and entering new foreign markets. Both types of learning by doing create readiness for more innovative and internationally scalable start-up activities after university studies. However, collaborative action learning often requires the readiness of students to leave their comfort zone to experience interaction with new partners in new situations.

Teams in the digital workplace need to combine human communication and collaboration with new AI-enabled technologies (Lane et al, 2024). Students must be prepared to contribute to international entrepreneurial teams with diverse compositions and involve members from different countries and cultures. Our objective is to

identify the learning opportunities and challenges of entrepreneurial team-based digital action learning projects in the context of artificial intelligence.

2. Literature Review

Already some years ago, the entrepreneurial education discourse identified different departure points for entrepreneurship education (O'Connor, 2013). Applying learning by doing through practical venture creation and business idea implementation is a suitable framework if the student enterprise team is ready to jump-start such a process and their sector-specific resource base can be created during studies. Learning for future entrepreneurship by exploring development opportunities and crucial decisions of successful entrepreneurs in various countries, studying different types of entrepreneurship, including social entrepreneurship, and new business opportunities in emerging industries and the green agenda for regenerative futures (Camrass, 2020) is, however also operational for students to broaden their interdisciplinary knowledge base and to create their international network before launching a real start-up initiative.

In collaborative learning, students participate in small-group activities in which they share their knowledge and expertise. During the 1970s and 1980s, cooperative learning dominated as the general term for group-based learning in the research literature. However, since the beginning of the 1990s, collaborative learning has become a more popular term (Strijbos and Martens, 2001). Johnson et al (2007) explained how learning in groups is influenced by social interdependence. Dania and Griffin (2021) use the term "collaborative learning communities" when studying social media and collaboration solutions in the classroom. Collaborative learning can be implemented in a face-to-face classroom environment, but social media can also give input to collaborative learning. Social media has become influential in the daily lives of many students, and adoption of it for self-development may motivate entrepreneurial intentions (Do et al, 2020). Networking is a core entrepreneurial capability in attaining necessary resources, knowledge, and information (Morris et al, 2013). Elenurm (2012) explained how co-creative, individually innovative and imitative entrepreneurial orientations influence the networking needs of students. Innovative start-up businesses apply network learning to achieve their space in international markets (Caseiro and Coelho, 2019). In the era of AI, global networks that students develop in social media can be used to find inside information about emerging trends in foreign markets that generative artificial intelligence applications are not able to present. Although trained on massive, curated datasets, generative AI answers to prompts do not reflect recent developments in the marketplace after their training has finished, and new entrepreneurship trends are not documented in their online dataset used for training. AI collaboration with humans is the key to addressing new challenges and opportunities created by generative AI (Budhwar et al, 2023). The convenience of using ChatGPT and other AI applications could result in overreliance by its users, making them trust the answers provided by ChatGPT without critical thinking. Compared with traditional search engines that provide multiple information sources for users to make personal judgments and selections, AI generates summary answers for each prompt. Although utilising ChatGPT has the advantage of increasing efficiency by saving time and effort, users could get into the habit of adopting the answers without rationalisation or verification (Fui-Hoon Nah et al, 2023). Generative AI can generate seemingly correct responses that include misinformation as an outcome of hallucination. Susarla et al (2023) regard hallucination, including references to non-existent literature sources, as a serious challenge in the use of generative AI for scholarly activities.

Collaborative learning focuses on knowledge co-creation (Vuopala et al, 2019). In the AI era, knowledge co-creation assumes an understanding of what type of information humans representing different kinds of knowledge can add to prompt answers given by AI. The open innovation approach assumes collaboration and engagement with a wider variety of participants (Chesbrough, 2017). Forming an effectively performing founding team is among the most complicated tasks in building a new venture. The founding members of a start-up often represent different backgrounds and experiences and have varying expectations about their roles, leadership sequence and remuneration structure (Shepherd et al, 2021). Shah et al. (2019) stressed that in addition to complementary competencies of team members, common skills such as critical thinking, joint problem solving, sharing essential values, and mutual trust are necessary for effective entrepreneurial team functioning. Effectuation assumes that entrepreneurs use available resources, knowledge, and network connections as the starting point of their business initiative to develop and implement their business vision in adaptive ways and continuously modify their prediction and control space for future success (Sarasvathy, 2023). Building on the effectual approach for start-up team formation (Sarasvathy and Botha, 2022), ChatGPT's use for founding team creation as a pedagogical intervention is demonstrated by Hammoda (2024). After choosing the business idea of their team, students were asked to prompt ChatGPT for advice on the ideal founding team composition, the characteristics of the founding team or key members and suggested split of equity among

them. Students were advised to use different combinations of keywords and sentence structures until ChatGPT provided them with a satisfactory enough answer. Such use of AI could lead to rethinking the original business idea as the result of competencies suggested by AI for pursuing this business initiative.

Open innovation assumes the networking efforts of innovators to find early users and product development ideas outside their organisation. Rapidly internationalising small and medium-sized enterprises from emerging economies should also use a wide range of internal and external network sources (Puthusserry et al, 2020) during their post-entry business development stages. Collaborative learning can focus on a team's own entrepreneurial start-up development or engage learners in projects where student teams solve problems faced by entrepreneurs already operating in practice. Contributing to solving practitioners' problems enhances critical thinking (DeSimone and Buzza, 2013). AI-human collaboration challenges and solutions depend on the role of creativity, information search, critical thinking and teamwork in different directions and stages of entrepreneurial learning. There is a research gap in the field of specifying challenges of using AI in collaborative entrepreneurship learning and understanding opportunities to apply IT tools for developing international entrepreneurship skills.

3. Methodology of Pilot Research for Identifying Artificial Intelligence Opportunities and Challenges

Educational action research examines and reflects the potential and challenges of educational practices centred on learning projects in different formats and with various internal and external partners (Mandrup and Jensen, 2017). Collaborative inquiry for knowledge generation is methodologically well-positioned for studying academic and practice-based development and change initiatives based on new learning tools (Shani et al, 2023). The methodological departure point of our approach to identifying opportunities and challenges of AI applications in collaborative knowledge co-creation is a comparison of learning processes, where students start ideation for their entrepreneurship development journeys in student enterprise teams or contribute as a team to finding international business development opportunities for entrepreneurship practitioners. We discuss AI use in two types of collaborative learning projects where the author has been involved: X-Culture global teams, where Estonian Business School students have participated and the author's short course for students at Université Catholique de Lille on Doing business in the Baltic countries. The literature overview serves as the basis for formulating the following questions to compare these collaborative learning practices.

- How can AI applications support creating diverse and well-performing teams for project work?
- To what extent can AI applications enhance creativity and open innovation for entrepreneurship?
- What are the challenges of AI-human team collaboration in these projects?

4. AI Opportunities in X-Culture Global Projects

The global X-Culture https://x-culture.org consortium has been able to involve business students from more than 150 universities in 40 countries. X-Culture organisers allocate students to virtual project teams following the principle of geographical and cultural diversity of each team. Students have to build their team consensus on the international business opportunity challenge they choose to solve together by working online for a period of two and half months. Students must pass the pre-test to demonstrate their knowledge of online communication, knowledge-sharing tools, and X-Culture rules. Creativity in X-Culture is needed for identifying new international business opportunities that match the needs of enterprises they have chosen for their online project work and also for aligning knowledge-sharing styles of students from different cultures and for finding the best online collaboration tools, including social media applications, in situations where team members never meet each other in a physical space. There is no direct face-to-face contact with the client enterprise during project work. In fact, even more than a hundred teams may choose to prepare a report for the same enterprise. X-Culture team reports are graded by lecturers representing all universities where team members study. X-Culture coordinators divide students into virtual teams to represent as many countries as possible in each 5-6 student team to enhance cross-cultural learning. If students could specify their future entrepreneurship visions before forming teams, AI could be used to consider the similarity of future entrepreneurial self-development vision in the team formation process. That would make X-Culture teams more similar to start-up teams that usually involve team members pursuing similar business development visions. Research on X-Culture teams has demonstrated that teams which have more task conflicts during their first weeks of teamwork when they have to conduct industry analysis and choose concepts for assessing the international competitiveness of the project enterprise and tools for comparing foreign markets present at the end of their project better reports than teams, where team members do not recognise and address such conflicts (Elenurm and Fabritius, 2023). Using different

AI application prompts, such as "What are concepts and tools for comparing potential export markets?" gives student team members a broader mental space to specify additional prompts for comparing the pros and cons of each tool for a specific export product and service. Training by experimenting with specific prompts is a way to learn from task conflicts constructively and, at the same time, develop broader intelligent question-asking skills that are relevant for chatting with AI but also for consultancy and coaching.

Post-project self-reflection of X-Culture team members has indicated that some students are stressed when communicating with team members representing different work cultures and time zones. Extensive use of WhatsApp and other online messaging tools creates pressure to respond rapidly to inquiries from students living in a different time zone. To prepare students for the challenges of global online teamwork, we have asked them to write a review of relevant research papers that address these challenges and ways to be successful in online teamwork. AI applications add to such preparation a role-play dimension, asking students to describe the role of some potentially problematic team member from their point of view and making, for instance, a prompt "ChatGPT, imagine you are representative of a high-context culture. How can I collaborate with you on an online team project as a person from a low-context culture?" If needed, this conversation could be continued by asking, "Imagine that you, as a person from a high-context culture, do not follow the agreed deadline. How can you explain it?" to focus on specific challenges. When all team member in the online teamwork process compare their prompts to AI about possible cross-cultural teamwork challenges and answers they received from AI, they will improve their ability to understand potential differences of team members from other cultures. That is a way to avoid dysfunctional relationship conflicts.

X-Culture final reports demonstrate that although universities have usually set guidelines for compiling reference lists in written works, many students do not understand the importance of using in-text references in the era of AI. In some universities, AI use is officially now allowed. However, team members still use it to generate their sections of reports without giving reference to the application they use to compile their text. Without in-text references, a reader has difficulty checking if some fact statement is based on a reliable information source or if AI hallucinated it. Using AI tools allows students to save time in compiling a report, but teams should be guided to check the existence of the original sources of the summary text generated by AI. Training critical thinking to assess the reliability of information sources is essential when applying AI in online global teams. We have challenged some teams' generic final report texts by making ourselves a prompt to AI to compare export markets of a product chosen by a team. When presenting the AI answer to this team, we asked them to explain how their team report has used insider observations by their team members about new market trends that generative AI cannot access. Such discussion aims to lead students to understand their advantages as humans in international entrepreneurship compared to present generative AI applications and to be prepared for AI-human information exchange in future entrepreneurship initiatives.

5. AI Opportunities in a Short Region-Focused International Business Course

Doing business in Baltic countries in Lille (France) was a short 3-day course that involved only student teams of one French university. The final assignment of this course was preparing and presenting pitches about new French export products to a Baltic country chosen by each student team and proposing how their student team can find a start-up from a Baltic country to exercise entrepreneurship by assisting this start-up to develop their business in France. When developing their entrepreneurial ideas for promoting French export products, students relied heavily on well-known French food and beauty brands already available in Baltic countries. Students were encouraged to use prompts in AI chats such as "Which are competitors of French Camembert cheese in Estonia?". Both ChatGPT-4 and Gemini Advanced highlighted potential competing cheese types. Still, Gemini Advanced stated: "…hard to give precise brand names of competitors without knowing your specific location within Estonia." MS Co-pilot gave links to the Estonian Dairy Association webpage on cheese and some other web links for further market research. However, sharing information with students about webpages and online shops of the main Estonian retailers appeared to lead them more rapidly to identify competing brands and pricing info that AI applications did not reflect.

When searching for information about start-ups as potential cooperation partners from Baltic countries, start-up databases of these countries were introduced to students. Start-up Estonia database https://ecosystem.startupestonia.ee/intro states that its extensive information is gathered in cooperation with the digital deal room Dealroom.co, and AI is applied to gather data from public sources such as social media, domain & trade registers, job boards, analytics about web & mobile app usage, news articles in 30+ languages and investor portfolios. Students needed some instruction and training to navigate this database. In the context of identifying entrepreneurial cooperation opportunities, students mainly focused on start-ups that can offer French clients

online B2B software for logistic and recycling operations or online services for hotel and property management. The short format of the *Doing Business in the Baltic Countries* course demonstrated that general generative AI applications are helpful in structuring the key issues for assessing opportunities and competitiveness factors in foreign markets. However, AI, in its present general format, could only serve as a gateway for further analysis of time-sensitive data about foreign markets, such as retail prices of products. Specialised AI applications appeared to be more useful in finding cooperation partners for entrepreneurship. However, instead of writing a chat prompt, combining relevant search criteria was essential to dig out relevant information from such databases.

6. Discussion of Pilot Research Results

As an attempt to compare our two pilot research examples with broader suggestions of researchers and entrepreneurship developers, we applied three generative AI tools. The prompt based on the title of this paper was used: "How to prepare students for international entrepreneurship in the era of artificial intelligence? Answer should be a maximum 100 words". Gemini Advanced AI (2024, March 31) answered: "Here's how to prepare students for international entrepreneurship in the AI era (within the word limit):

- *AI Fluency:* Teach AI concepts, tools (coding and no-code), and how to leverage AI for market analysis, product development, and scaling a business.
- *Global Mindset:* Foster cultural understanding, international market knowledge, and adaptability to diverse business landscapes.
- *Critical Thinking:* Emphasise evaluating AI outputs, understanding its limitations, and making ethical decisions about its use.
- *Problem-Solving:* Focus on identifying real-world problems and using both AI and traditional methods to design innovative solutions with global appeal.
- *Collaboration:* Encourage collaboration with individuals from diverse backgrounds and expertise, including AI developers."

MS Co-pilot (2024, March 31) answer to the same question reflected as essential directions: soft skills and integrating AI with human skills, fostering collaboration between technology and human expertise. ChatGPT-4 (2023, March 31) gave a less structured answer. It, however, added to Gemini and Co-pilot answers interdisciplinary learning, understanding cultural differences and global market trends. Its answer text also stressed practical experience through projects, collaboration with AI-driven companies and fostering innovative mindsets and ethical considerations in AI deployment.

7. Conclusions for Further Action Research on AI Applications in Entrepreneurial Learning

At this research stage, we only have the first pilot experience of testing and discussing AI applications in learning processes that contribute to developing further action research agenda. AI applications open several new opportunities in the context of international entrepreneurship. AI prompt results can help young entrepreneurs in structuring their search for further information. AI can play a digital role as a potential new customer, competitor, or devil's advocate to identify the risks of a new entrepreneurship initiative. AI can be used to reflect and compare essential competencies, roles, and ways to overcome collaboration challenges in cross-cultural and digital teams. At the same time, students should be aware of generative AI hallucination features and be directed to checking and critically analysing the reliability of reports and research papers that have served as input for AI-generated answers to their prompts. A practical implication is the need to train database navigation and referencing skills. Entrepreneurship students should understand situations more profoundly, where AI answers should be compared with relevant research papers or updated media reflecting recent international business trends. Prompt writing for human-AI interaction is an essential skill to be trained. This skill can also be applied to interviewing entrepreneurship professionals and potential clients. New international entrepreneurship initiatives require time-critical specific data to choose countries for export. Such updated data is often missing in the text corpus used for training AI. Young entrepreneurs should understand both the present limitations of generative AI and its future potential to build up their careers in the AI era.

The limitation of the present paper is that it compares only two AI application use cases related to international entrepreneurship and business learning without a representative sample. However, the conclusions of this pilot AI application experience confirm Gemini's answer and Co-pilot's suggestions about soft skills and ChatGPT-4 focus on understanding cultural differences and global market trends through practical experience. Our use cases contribute to explaining examples of AI-driven opportunities and challenges for more extensive action research in future.

Abstract: Since 2020, numerous guides and tools have been available for designing, planning, and running hackathons in fields such as software engineering, ICT, and healthcare. However, a substantial gap is observed in the post-event phase of hackathons' life cycle, directly affecting the sustainability of results. This bears significant implications for hackathon events per se, as well as for ecosystem stakeholders, in medium-term and long-term perspectives. This paper addresses the issue of low valorisation of hackathon-derived solutions and assists their direct exploitation. We aim to provide a framework for hackathon organisers, managers, policymakers, and intermediary bodies maximising impact of such events. To achieve this, we investigate the relationship between event-level success and ecosystem-level impact. We draw upon the practices and data from the ENTREPRENEDU project hackathons, a Horizon Europe-funded program coordinated by the E. Amaldi Foundation. This series of hackathons, held in three different countries, helped identify key aspects for further investigation and served as the groundwork to define/frame our research question. We conducted literature review, examining papers and reports to explore how hackathon-derived knowledge is valorised within entrepreneurial and innovation ecosystems. Our research aimed to identify how the already known success factors of a well-designed event contribute to the sustainability of outcomes and assess their relationship. We link hackathon success indicators juxtaposed to relevant factors. While acknowledging the complexity and multifactorial nature of innovation process and knowledge diffusion, we believe that our study advances the potential for hackathons' greater impact by providing a cohesive framework.

Keywords: Entrepreneurial ecosystems, Innovation, Hackathon, Ideation, Impact

1. Introduction

Hackathons have emerged as a prominent strategy to spur innovation and collaboration within entrepreneurial ecosystems. These events serve as dynamic platforms where entrepreneurs, developers, and subject matter experts convene to tackle complex challenges, often with a focus on harnessing the principles of open innovation.

Open innovation has become a pivotal concept in the realm of entrepreneurship, particularly for small and medium-sized enterprises (SMEs). This paradigm shift from closed to open innovation, as articulated by Chesbrough (2003), emphasises the importance of collaborative efforts and external partnerships in driving innovation. SMEs, which constitute approximately 90% of businesses and over 50% of employment globally, face unique challenges due to their limited access to resources such as funding, infrastructure, and specialised knowledge (Chesbrough and Bogers, 2014). Consequently, the adoption of Open innovation practices is crucial for their survival and growth, particularly in times of crises.

Substantial prior research concerning the continuation of hackathon outcomes and abundant overviews provide insights on the different types (Kollwitz *et al.*, 2019; Heller *et al.*, 2023), approaches (Chau, 2023), event structure and design (Kohne, 2019; Pe-Than *et al.*, 2022). The typical event management structure is roughly distinguished in three phases. Preparation, operation and follow-up (Kohne and Wehmeier, 2019).

Despite the wealth of available knowledge, hackathon follow-up phase is often neglected while this is precisely the time where considerable added value can arise (Kohne and Wehmeier, 2019). 35% of projects show some continuation activity post-hackathon, though only 5% of projects continue for more than five months (Nolte, 2020). The importance of sustaining hackathon outcomes has been identified, but it is essential to understand effective approaches and practices to be applied after the event completion (Medina and Nolte, 2020). These remarks raise notable implications on the affecting factors and expected outcomes of hackathons. Our work

aims to offer recommendations to support the organisation and execution of hackathons that achieve sustained success.

To explore our research question, we held a mixed-method study blending multiple sources of evidence as reports, case study analysis and participant observations from the ENTREPRENEDU hackathons to triangulate data and to increase the richness of information (Yin 2017). Qualitative data has been used to gain a more accurate picture of the dynamics of social relations that take place in inter-organisational projects, by examining the phenomenon of interest in its real-life context (Eisenhardt and Graebner 2007; Yin 2017).

We received observations through involvement in the jury committees, facilitation of local events and team coaching. We also conducted informal interviews and took field notes during the events to capture feelings and reactions related to emerging issues (Bertello *et al.*, 2022). Furthermore, the examination of multiple-case studies allowed us to gain significant insights from other relevant events through comparative review and provided a strong basis for theory building (Eisenhardt and Graebner 2007; Yin 2017). All data extracted during the hackathons gave us the opportunity to delve deeper into the participants' intentions and expected returns. We elaborate on the experience, insights and knowledge gained in the following section.

2. The ENTREPRENEDU Hackathons

The ENTREPRENEDU project launched an ambitious initiative to foster entrepreneurship and innovation in Europe through three hackathons with the brand name 'HackTheBusiness'. These events, held in Italy, Bulgaria, and Greece from June 2023 to March 2024, were designed as real business challenges to solve issues including DeepTech, space technologies and technologies for sustainability. Participants received live support from mentors and attended a total of 16 workshops, which enabled the 3 'HackTheBusiness' to generate a total of 94 business ideas.

Out of these 94 business ideas 13 winners (4 from the first two events and 5 from the last one) got awarded to participate to an exclusive Mentoring and Business Acceleration Programme of 60 hours, where experts from the ENTREPRENEDU consortium provided entrepreneurial education on several topics (e.g. Business Model Development, Crafting a Unique and Competitive Value Proposition, Investment Pitch, etc.) incorporating best practices from the events to support their continuation.

Participation in the HackTheBusiness and in the Mentoring Programme had the primary goal to equip participants with the necessary knowledge and tools to transform their ideas into successful business solutions. By organising these hackathons in low to moderate innovation countries, the project ensured a diverse mix of participants, stakeholders, and industry sectors, facilitating valuable interactions with innovation experts across Europe.

Table 1: ENTREPRENEDU hackathons per country

Place	Date	Vertical	Business Ideas	Individual Questionnaire Responses
Rimini, Italy	15-17/06/2023	DeepTech	30	9
Athens, Greece	25/11/2023	Space	35	37
Sofia, Bulgaria	26-27/03/2024	Sustainability	29	16

Source: Author's own processing on available data

The completion hackathons marked the conclusion of the project's second stage "Cross-Fertilisation and Challenge Generation" introducing the twelve teams to the "Venture Building Program". Though the format of each Hackathon varied to better fit the context, seize local opportunities, better involve local multipliers and stakeholders and address participants needs, all three hackathons were based on a common structure.

The overall satisfaction from participants of the ENREPRENEDU hackathons was high, revealing a generally positive experience. Most participants appreciated the collaborative atmosphere, access to mentors, and the opportunity to innovate. Few participants highlighted the need for better organisation and clearer communication regarding event logistics and expectations. Unique learning experience and the networking opportunities provided were among the deciding factors. Still the prospect of valorasition remained unclear.

Based on the experience gained from the three hackathons and the literature review presented in the subsequent section, we aim to develop a grounded approach that includes the most important factors for

assessing the success of hackathons. More critically, this approach will emphasise the sustainability of the projects generated during these events.

3. Hackathons' Success and Sustainable Impact

According to Nolte *et al.* (2018), hackathons, data dives, codefests, hack-days, sprints, and edit-a-thons have gained significant attention from both practitioners and researchers. These events, typically lasting between 24 to 48 hours, bring together diverse teams to engage in rapid problem-solving and innovation, often within a competitive framework.

The impact of hackathons on startups can be profound, offering numerous benefits such as networking opportunities, skill development, and the rapid prototyping of ideas. Hackathons serve as a microcosm of the open innovation environment, encapsulating the principles of collaborative innovation, external engagement, and problem-solving under constrained timelines (Hossain and Kauranen, 2016). In their work, Rexhepi, Hisrich, and Ramadani discuss the breadth of cooperation and its impact on startups' innovation performance. They highlight that engaging with a variety of partners—ranging from customers to competitors—enhances a startup's ability to innovate. This is because diverse inputs can stimulate creativity and lead to the discovery of novel solutions (Rexhepi *et al.*, 2019). Hackathons embody this principle by bringing together participants from various backgrounds to work on common challenges, thereby broadening the innovation landscape for participating startups.

Startups participating in hackathons often gain exposure to potential partners, investors, and customers, thereby enhancing their market visibility and credibility. The collaborative nature of hackathons enables startups to tap into a wider pool of expertise and resources, which can be instrumental in overcoming their inherent limitations. Furthermore, the intensive, goal-oriented atmosphere of hackathons can accelerate the innovation process, leading to the rapid development and refinement of new products and services (Huang *et al.*, 2013).

To further elaborate on the matter of impact we must provide a definition of the term within the hackathon setting. In general, 'results' are defined as the top three elements of the result chain: outputs, outcomes and impact (Belcher and Palenberg 2018). However, while outcomes and impact are distinct concepts, they are interconnected. Outcomes describe the objective changes resulting from a planned intervention. Impact, on the other hand, captures the stories, experiences, and feelings of people or society because of these changes. Table 1. displays the main differences.

Sustainable outcome means something that goes on for an extended amount of time, rather than peaking and then waning. Hence, for success to be sustainable, it must have a longer time horizon. A successful hackathon might be just hacking, just training, or both hacking and training (Tauberer, J. 2017). In this regard, success might refer to short-term goals, solely like the successful implementation of the hackathon. Of course, the completion of the event alone does not guarantee lasting impact of the outcomes generated within it. This is clear, since hackathons are not destined to provide complete solutions rather than test assumptions and quickly advance to conclusions (McIntosh and Hardin, 2021). Meanwhile, impact is a dynamic concept which presupposes a relationship of cause and effect. Impact can be measured through the evaluation of the outcomes of actions, be that an initiative, a set of initiatives forming a policy, or set of policies which form a strategy (Fedorciow L. and Bayley J., 2014).

Table 2: Distinction between event success and impact

Outcome	Success	Impact
Level	Event	Ecosystem
Effect	Short-term	Mid-and-Long-term
Scope	Focused	Broader
Measurement approach	Objectively and subjectively	Objectively and subjectively
Evaluation	Measures activity and satisfaction	Measures activity continuation and spin-off, new activity, and behavior

Source: Authors' elaboration

In measurement terms, outcomes are typically predefined and can be objectively measured using quantitative metrics. Impact, on the other hand, can be quantitative, qualitative, and subjective, often based on people's

feelings or experiences, making it more challenging to quantify. Impact can be measured for all activities and in its simplest terms refers to the long-term effects of an individual, organisation, or policy actions/interventions on stakeholders, such as customers, beneficiaries, sponsors and society at large. Therefore, measuring impact refers to the process of evaluating the effects of the activities/interventions of an individual/organisation on people, the environment, society or the economy (Fedorciow L. and Bayley J., 2014).

3.1 Hackathon Success

Hackathons are recognised as a strategy for open innovation and entrepreneurial intention, highlighting the importance of open data and investments for the success of hackathons, particularly in aiding startup development (Schaedler *et al.*, 2022). In a study conducted by Juell-Skielse *et al.* (2014), it was found that only one-third of developers who participated in open data hackathons reported completing their projects. To address this issue, open data hackathons should involve entrepreneurs and venture capital firms as jurors. These jurors would be aware of the motivations driving the participating developers. Consequently, at the end of digital competitions, developers could engage in open discussions about their apps, pitch them to investors, and potentially secure funding (Lee *et al.*, 2016).

According to Soltani *et al.* (2014), six critical factors contribute to the success of hackathon contests. Firstly, problem definition is crucial. A well-defined problem area ensures that participants understand the challenge they need to address. If organisers fail to explain the problem clearly, participants may struggle to develop the desired solutions. Secondly, the type of return offered to contest winners serves as a significant motivator. The rewards influence the types of participants who sign up and their commitment throughout the contest. Thirdly, team diversity is essential for success. Collaboration among team members with diverse competencies and skills enhances the development of appropriate digital solutions. Fourthly, effective mentorship plays a vital role. Clear communication of expertise from mentors to participants positively impacts project outcomes. Fifthly, jury knowledge is important for ensuring a fair evaluation process. Jurors with sufficient subject matter knowledge can provide informed assessments of the projects. Lastly, entry requirements need to be clearly defined. These requirements set the tone for the hackathon and help participants prepare adequately for the contest. Together, these factors create a structured and supportive environment that fosters innovation and effective problem-solving during hackathons.

Furthermore, interdisciplinary collaboration is essential for successful hackathons. Teams with members from different backgrounds have an advantage in developing innovative solutions, as explained by Yoo *et al.* (2009). Additionally, the success of the event depends on having a jury composed of individuals with strong academic and professional backgrounds. Organisers must carefully select the best solutions to achieve their desired outcomes.

Rosell *et al.* (2014) emphasised the importance of ideas and team formation in hackathons. They observed that teams were formed either before or during the hackathon, often using social media platforms like Facebook. Participants could post their hackathon ideas and connect with others to form teams. This collaborative approach ensured that everyone contributed to one or more ideas, forming teams around specific concepts. The flexibility to form teams even on the day of the event allowed for dynamic collaboration and idea exchange.

3.2 Key Factors Affecting Hackathon Impact

Nolte *et al.* (2018) conducted a detailed study focusing on the outcomes of corporate hackathons, which have unique characteristics compared to their collegiate or civic counterparts. The study investigated five teams from Microsoft's One Week hackathon, one of the largest corporate hackathons globally, involving over 18,000 employees and 4,700 projects. The researchers aimed to understand how activities before, during, and after the hackathon influenced the continuation of projects and the perceived impacts on participants' skills, careers, and networks. In their study, Nolte *et al.* (2018) identified several critical factors that influence the continuation of projects initiated during hackathons. These factors are essential for understanding how to sustain the momentum and ensure the long-term success of hackathon projects.

Firstly, meticulous preparation is crucial. Teams that engage in thorough preparation before the hackathon, such as defining clear goals, assembling the right team, and understanding the problem space, are more likely to continue their projects post-event. Pre-hackathon activities like team-building exercises, preliminary research, and stakeholder engagement contribute to a stronger foundation for the project. Secondly, having a clear and shared vision among team members ensures that everyone is aligned with the project’s goals and motivated to see it through. Projects with well-defined objectives that resonate with all team members are more likely to be pursued further. Effective leadership is another vital factor. Teams led by individuals who are committed to the

project and possess strong leadership skills tend to perform better. Effective leaders can inspire team members, delegate tasks efficiently, and navigate challenges. Leaders who see the hackathon as an opportunity for career advancement often invest more effort and resources into the project, increasing the likelihood of continuation. The composition of the team also plays a significant role. Recruiting team members who are passionate about the project and eager to learn new skills contributes significantly to the project's continuation. Teams with a diverse mix of skills and expertise are better equipped to handle the various aspects of project development and implementation.

Post-hackathon dissemination is critical. Actively promoting the project within and outside the organisation after the hackathon can attract additional support and resources, facilitating its continuation. Leveraging networks and connections made during the hackathon to secure further collaboration and investment is crucial. Aligning the project with existing product lines or the strategic goals of the organisation increases the likelihood of continued support. Ensuring that the project fits within the broader organisational context and addresses relevant business needs enhances its chances of being adopted and scaled. Engaging relevant stakeholders, such as potential users, customers, and internal champions, early in the process helps validate the project and secure buy-in. Establishing mechanisms for regular feedback from stakeholders ensures that the project remains relevant and adaptable to changing needs. Finally, structured follow-up activities, such as mentorship programs and incubation support, are vital for maintaining project momentum. Ensuring that teams have access to necessary resources, including technical infrastructure, financial support, and expert advice, is crucial for the project's continuation.

Hackathons also face several challenges. A significant issue is the disparity of intentions to continue projects after a hackathon and their actual continuation. Factors contributing to this gap include the lack of follow-up activities, insufficient stakeholder involvement, and the difficulty in maintaining momentum post-event. Ensuring the long-term sustainability of hackathon projects requires addressing these challenges through strategic planning and support from organisations hosting the events. Despite their growing popularity, the factors of projects continuality from the Hackathons organisation perspective receive limited attention from the research community.

In Table 3 we summarise the outcomes or success indicators on both event level and ecosystem level. We distinguish the most significant indicators to be considered in planning a hackathon (note that there is not a direct correspondence between factors in the two columns of Table 3).

Table 3: Outcomes/success indicators

Hackathon event	**Hackathon sustainability/impact**
Technical artifacts (Medina, 2020; Chau, 2023)	Projects continued (Kohne, 2019)
Non-technical artifacts (Medina, 2020; Chau, 2023)	Collaborations continued (Medina, 2020; Chau, 2023)
Number of participants (Kohne, 2019)	Teams continued (Kohne, 2019)
Number of teams (Kohne, 2019)	Number of jobs created (Kohne, 2019)
Number of Press mentions (Kohne, 2019)	Inquiries for solutions (Frey F.J., Luks M., 2016)
Money raised (Kohne, 2019)	Accelerated innovation process (Lifshitz- Assaf, 2020)
Participant satisfaction (Heller *et al.*, 2023)	VC investments (Kitsios and Kamariotou, 2023)
Entrepreneurship (Medina, 2020; Chau, 2023)	IP out licensing and Patent selling (Rexhepi *et al.* 2019)
Awareness about theme (Medina, 2020; Chau, 2023)	
Learning (Medina, 2020; Chau, 2023)	
Networking opportunities (Medina, 2020; Chau, 2023)	
Ideas generated (Medina, 2020; Chau, 2023)	
Fostering existing enterprise (Medina, 2020; Chau, 2023)	

Source: Elaborated from Kohne and Wehmeier (2019), Rexhepi *et al.* (2019), Medina and Nolte (2020), Chau (2023), Heller *et al.* (2023), Kitsios and Kamariotou (2023)

In Table 4 we provide a summarised depiction of factors contributing to events success or greater sustainability/impact. The factors are listed independently of stage of the event lifecycle, including planning, execution, and post-event follow-up, offering a comprehensive overview to guide future hackathon organisers

and researchers. The selection of factors accomplished by reviewing the most relevant papers discussing the deciding factors in a systematic approach.

Table 4: Success factors in literature

Factors	Hackathon event	Hackathon sustainability/impact
Dissemination	✓	
Entry requirements	✓	
Problem definition	✓	
Compensation/award	✓	
Team composition/Skills diversity	✓	✓
Organisers' support	✓	✓
Mentoring	✓	✓
Jury engagement	✓	
Stakeholders' engagement	✓	✓
Career-promoting ideas		✓
Project feasibility		✓
Post-event incentives		✓
Follow-up program		✓

Source: Elaborated from Soltani *et al.* (2014), Nolte *et al.* (2018), Kohne and Wehmeier (2019), Pe-Than *et al.* (2020), Heller *et al.* (2023)

In order to cater for these factors key decision must be taken at the appropriate time. In Table 5 we show when these decisions should be taken and how they relate to the success factors outlined above.

4. Discussion and Propositions

Building on the experience gained throughout the implementation of the three ENTREPRENEDU hackathons, we propose a framework that contributes significantly to the ongoing conversation on enhancing hackathon outcomes and sustaining their impact over time. This framework extends the success factors identified by Soltani *et al.* (2014), emphasising the critical importance of the follow-up period in maximising the impact of solutions generated during such events. By incorporating considerations for relevant criteria from the planning phase onwards, this updated classification aims to optimise both the immediate outcomes and the long-term viability of hackathon-generated innovations.

The findings of this study underscore the multifaceted role of hackathons in fostering innovation within entrepreneurial ecosystems. By integrating existing literature and analysing the outcomes of the ENTREPRENEDU project, we have identified critical factors that influence the sustainability and impact of hackathon-generated projects. Our study clearly delineates the distinction between immediate success and medium- to long-term impact, emphasising the necessity of considering both aspects in the planning and execution of hackathons.

The disparities between immediate success and long-term impact, as outlined in our study, call for a re-evaluation of how hackathons are perceived and organised. Success should not only be measured by the immediate outputs but also by the enduring impact on the broader ecosystem. This broader perspective encourages organisers to adopt a more holistic approach, integrating sustainability considerations throughout the hackathon lifecycle.

Our findings also contribute to the ongoing discourse on the role of temporary organisations, such as hackathons, in fostering innovation. By highlighting the importance of follow-up activities and sustained support, our study suggests that hackathons should be viewed not as isolated public relations, promotional or encouraging events but as integral components of the innovation ecosystem. This perspective is supported by recent studies that emphasise the need for ongoing engagement and support to ensure the long-term success of innovation initiatives (Adamczyk, Bullinger, and Möslein, 2012; Briscoe and Mulligan, 2014).

Table 5: Key decisions in designing a hackathon

Key Decisions	When and How (methods/tools)			Factors affected and level of impact	
	Before	During	After	Event	Ecosystem
Goal / Objectives	Pre-hackathon survey			Problem definition, Dissemination, Stakeholders' engagement	
Theme	Theme definition			Problem definition, Stakeholders' engagement	
Type and Approach	Competitive/ cooperative, Physical/ Virtual/ Hybrid, Open/ Closed/ Dedicated			Dissemination, Compensation/award	
Stakeholder involvement	Involve sponsors, speakers, coaches, mentors, jurors, co-organisers			Dissemination, Problem definition, Stakeholders' engagement, Project feasibility	
Specialised preparation	Warm-up sessions, tutorials, training, specialised hardware, access to licenses and team meetings			Dissemination, Entry requirements, Stakeholders' engagement	
Duration / breaks	Overall timeline including dates and times (start, end and potential overnight breaks) for each day.			Organisers' support	
Ideation	Brainstorming, targeted questions and idea clustering			Mentoring, Organisers' support, Project feasibility	
Recruitment and team formation	Website with basic information about the event. Pre-event registration form. Promotion and advertising carefully select participants.			Dissemination, Entry requirements, Career-promoting ideas, Team composition/Skills diversity	
Agenda	Agenda that outlines which activities will take place at which point in time.			Organisers' support, Mentoring, Stakeholders' engagement	
Judges and Mentors	Organisers create a mentoring strategy, recruit mentors and support them to execute the developed strategy. Mentors support participating teams based on this strategy.			Mentoring, Jury engagement, Project feasibility	
Continuity Planning	Provide an environment for participants that fosters the desired outcome.			Post-event incentives, Follow-up program, Career-promoting ideas, Project feasibility

4.1 Practical Implications

For practitioners, the proposed framework offers actionable insights into how hackathons can be designed and managed to maximise their impact. Hackathon organisers can use this framework as a guide to ensure that both immediate outcomes and long-term sustainability are considered from the outset. This approach can lead to more successful hackathons that not only generate innovative solutions but also contribute to the development of a vibrant entrepreneurial ecosystem.

Policymakers and funding bodies can also benefit from the insights provided by this study. The identified success factors and sustainability metrics offer a valuable tool for evaluating the potential impact of hackathon projects. By considering these factors, policymakers can make more informed decisions about which projects to support and how to allocate resources effectively.

Educators and academic institutions can leverage the findings of this study to enhance their curricula by incorporating hackathons as experiential learning opportunities. By doing so, they can foster entrepreneurial thinking and collaboration among students, preparing them for success in innovation-driven environments.

4.2 Future Research Directions

While this study offers valuable insights into the factors that influence the sustainability and impact of hackathon-generated projects, further research is needed to validate and refine the proposed framework. Future studies could focus on testing the framework in different contexts and with different types of hackathons to assess its generalisability. Additionally, research could explore the specific mechanisms through which post-hackathon support influences long-term outcomes, providing a deeper understanding of how to optimise these activities.

Another promising area for future research is the role of stakeholder involvement in hackathons. While our study highlights the importance of involving stakeholders early in the process, more research is needed to understand how different types of stakeholders contribute to the success of hackathons and how their involvement can be optimised. Finally, longitudinal studies that track the outcomes of hackathon projects over time would provide valuable insights into the factors that contribute to their long-term success.

The Debt Dilemma: Driver or Brake of Innovation in the EU?

Tomáš Fišera and Bernard Vaníček
University of Pardubice, Czech Republic

tomas.fisera@upce.cz
bernard.vanicek@upce.cz

Abstract: In the current economic environment, the issue of increasing indebtedness is receiving considerable attention. This article delves deeper into a comprehensive analysis of how different forms of debt – from households to corporations to governments – affect innovation performance within the European Union (EU). Since the EU includes 25 different countries, it provides a rich background for this analysis covering the period from 2013 to 2021. By applying regression analysis techniques on a large dataset, this study offers a new insight into the complex relationship between indebtedness and innovation performance. A key part of this analysis is the Global Innovation Index, widely recognized as a metric for evaluating innovation performance among nations. The empirical findings of this study reveal a subtle dynamic: while government debt appears to be a drag on innovation performance, private sector indebtedness, including both households and non-financial institutions, shows a positive effect. This dichotomy underlines the crucial importance of implementing responsible fiscal policies that prioritize the promotion of innovation without jeopardizing financial stability. In addition, the research highlights the importance of fostering collaboration between the public and private sectors, supporting university research, and developing innovation incubators to create a robust innovation environment. In addition, this study not only clarifies the current status, but also identifies areas requiring further research, such as research into other factors influencing the innovation environment. However, it is important to acknowledge the limitations associated with the current understanding of the relationship between debt and innovation. These limitations underscore the need for continued refinement of methodologies and investigation of other factors that may influence this interaction, thereby providing fertile ground for future research efforts. In conclusion, this study contributes to a deeper understanding of how debt dynamics shape innovation outcomes in the EU context.

Keywords: Debt dilemma, Innovation performance, European Union

1. Introduction

In the current global economy, innovations constitute a fundamental pillar of economic growth, sustainable development, resilience, and, notably, financial stability (Di Caro and Fratesi, 2018; Hysa et al., 2020; Shen et al., 2022). A country's ability to innovate and adapt to new technologies and market conditions not only determines its position in the international market but also significantly influences the quality of life of its citizens. Innovations bring benefits such as increased efficiency, the creation of new jobs, and the promotion of sustainable practices essential for addressing current economic, social, or environmental challenges.

Following the importance of innovation, many countries turn to financing research and development through debt (Croce et al., 2019; Fan et al., 2022). This trend raises the question of whether a higher level of debt truly benefits innovation performance or poses a potential risk to the country's economic stability. In the context of the European Union, where economic conditions and innovation capacities of individual member states vary significantly, this question is particularly relevant.

The aim of this article is to examine the relationships between debt indicators and innovation performance in EU countries, with the goal of identifying how household, non-financial institution, and government debt affect countries' ability to generate innovations. Previous research has only marginally addressed the issue of various forms of debt and innovation, leaving a significant gap in knowledge that we aim to fill. Specifically, we address the question of whether there is a connection between higher debt levels and better innovation performance, and if so, what type of debt has had the greatest impact on innovation in the EU in recent years.

Our research offers a new perspective on the so-called debt dilemma, i.e., the dilemma between further indebtedness in favor of innovation performance and the concurrent risk of financial collapse. We see our contribution in clarifying the impact of different forms of debt on innovation performance in EU countries, being among the few to include in the analysis the direct relationship between household debt and innovation performance. At the same time, we reveal a gap in current research – what is the impact of current restrictive fiscal policies on innovation performance? And finally, we discuss possible recommendations for policymakers regarding future forms of innovation support while considering the strengthening of fiscal sustainability due to growing global indebtedness.

This paper is structured as follows: Section 2 presents the latest findings from the known literature and hypothesis development, Section 3 briefly describes the methodology we used, Section 4 presents the results of

our research, which are then discussed in more detail in Section 5. Section 6 provides conclusions, including theoretical and practical implications, research limitations, as well as proposals for future research.

2. Literature Review and Hypothesis Development

Currently, we observe an unabated interest among regional policymakers in innovations, which significantly impact not only the economic but also the societal environment. Innovations are considered a significant factor in economic growth (e.g., Prokop and Stejskal, 2019; Hysa et al., 2020; Fan et al., 2022), sustainable development (e.g., Silvestre and Ţîrcă, 2019; Hysa et al., 2020), regional resilience (e.g., Di Caro and Fratesi, 2018; Bristow and Healy, 2020), and financial stability (Shen et al., 2022). It is important to note a certain synergy in the relationship between innovations and these key indicators – economies achieving higher levels of development, sustainability, resilience, and financial stability often excel in innovation (Lazaretti et al., 2019; Manzoor et al., 2023). Innovations not only contribute to strengthening these indicators but are also the result of their successful development.

The extensive positive effects associated with innovations necessitate the support of innovative activities. Considering current trends and policies within the EU (notably Horizon Europe and the European Fund for Strategic Investments), it is evident that innovation support is multifaceted and includes various initiatives aimed at digitalization, green transformation, and support for small and medium-sized enterprises (Henriques et al., 2022; Tabarés et al., 2022). Similarly, at the national level, there are various mechanisms for supporting innovation. Besides the, these include different forms of tax relief, national innovation strategies, support for university research, public-private partnerships, and in recent years, increasingly popular innovation incubators that provide startups and innovative firms with access to mentorship, networking, and funding (Cirule and Uvarova, 2022; Redondo et al., 2022). Their positive impact on innovation has been demonstrated in recent years, for example, in Spain and the Netherlands (Redondo et al., 2022) and in Latvia (Cirule and Uvarova, 2022).

In examining the dynamics between innovations and these indicators, it is legitimate to pay more attention to the area of financing. Justification for research in this area has been further reinforced in recent years by various crises that have had a significantly negative impact on the global economy and led to a dramatic increase in debt (Ellul et al., 2020; Wang et al., 2021). In terms of fiscal sustainability, it has been necessary in many countries to adopt restrictive fiscal policies. It has been shown that budget cuts in science and research, and especially the increasing taxation of corporations, hinder progress in this area, ultimately significantly limiting economic growth (Atanassov and Liu, 2020; Babina et al., 2023). Research in this area is currently highly relevant, particularly considering the global increase in public debt and the multifaceted effects of innovation. Despite this, there is still not enough scholarly resources that address this issue in detail. Moreover, it was not just public or government debt that increased; households and businesses also faced rising indebtedness. Alongside governments, examining the financial situation of households and businesses is entirely warranted – their improved financial situation enables the strengthening of innovative activity and supports the creation of new ideas and technologies (Poltorak et al., 2022). If households and businesses are less indebted and have stable incomes, they have more financial resources to invest in education, research, and the development of new products or services. Thus, while it might seem that there is a clear negative relationship between debt and innovations, this conclusion needs to be approached with necessary caution – it is one of many perspectives.

2.1 Innovation and Debt: Household Debt, Non-Financial Corporation Debt, General Government Debt

Household debt is currently a highly discussed topic in the economy, yet its direct relationship to innovations is scarcely explored in the current literature. Therefore, indirect exploration of the relationship, as indicated in the preceding section, seems appropriate. A generally accepted conclusion is the negative relationship between household debt and consumption, which is an integral part of aggregate demand and thus a significant source of economic growth. For example, Ji et al. (2019) in the context of Dutch households between 2006–2015, Du Caju (2022) in the Belgian economy between 2010–2014, and Wong et al. (2022) in a sample of 4730 households in Malaysia for the year 2019 reached this conclusion. As a result of lower consumption, it can then be expected that households will have lower demand for innovative products, effectively presenting a significant brake on innovative activity (Guiné et al., 2020). The direct relationship between household debt and innovations is approached by Bernstein et al. (2017), who, in the period of 2008–2012, highlighted a significant aspect in the American economy, where the negative impact of the financial crisis on households led to a fundamental influence on the productivity of innovative workers, resulting not only in a limitation of innovation performance but also in the exacerbation of economic decline. Thus, to some extent, we can indeed perceive a negative relationship between household debt and innovations. Based on these conclusions, we formulate the following hypothesis:

H1: Household debt has a negative impact on innovation performance.

In terms of innovation generation itself, the perspective from businesses appears most important. Recent empirical studies have shown that particularly innovative firms heavily rely on debt financing (e.g., Wu et al., 2016; Ernst, 2019; Geelen et al., 2022). Their innovation growth largely depends on whether and how broadly companies in each region have access to loans. In this regard, a positive relationship between the amount of corporate debt and innovation activity can be observed (Cumming et al., 2016; Geelen et al., 2022). These considerations are partially confirmed by Wu et al. (2016), who addressed the role of specific informal debt as an integral part of corporate debt. They demonstrated on a sample of 3,235 firms from 31 Chinese provinces that the relationship between informal debt and corporate innovations follows a reversed U shape, with an optimal level of informal debt. Concerning corporate debt, the dependence between its amount and potentially different impacts on innovations is often discussed. While excessive debt, often accompanied by a negative effect in the form of a rating downgrade, tends to limit corporate innovations, low debt, on the other hand, successfully stimulates them. This conclusion was demonstrated both in the EU context (Bonfatti and Pisano, 2020) and in China between 2016–2020 (Yao et al., 2022). However, it is not an entirely straightforward conclusion – there are studies that partially refute this belief – Geelen et al. (2022) for an extensive period from 1975–2010 in the American economy revealed that even with higher levels of corporate debt, innovation is supported. In this context, debt can stimulate innovations from new businesses, which outweighs the negative impact of debt overload on innovations in existing businesses (Geelen et al., 2022). Thus, while there may be some debate over the relationship between corporate debt and innovations, especially regarding the level of this debt, based on the findings, we establish the following hypothesis:

H2: Non-financial corporation debt has a positive impact on innovation performance.

Similarly to corporate debt, government debt may have an impact on innovations in the shape of a reversed U. Li and Zeng (2020) demonstrated that between 2011–2015, the increase in government debt had a negative impact on green innovations in Chinese industrial sectors. Similar conclusions were drawn by Zhang and Jin (2022) from 2011–2017, likewise in the context of the Chinese economy. The European perspective on this relationship, in turn, is offered by Coccia (2013), where in the environment of 27 European countries between 1995–2009, a significant negative impact of government debt was demonstrated not only on innovations but also on employment. Croce et al. (2019), in their research, additionally note that government debt significantly affects innovative companies compared to companies with low research and development activity. They confirmed this conclusion on quarterly macroeconomic data and data from selected American companies between 1975–2013. In fact, government debt through the growth of government expenditures can indeed effectively stimulate innovations, as it includes, among other things, expenditures on science and research; however, if there is insufficient revenue cover in the long term, government debt may represent a significant brake on innovation in the future (Coccia, 2013; Croce et al., 2019; Fan et al., 2022). The prevailing conclusions based on these findings lead us to formulate the following hypothesis:

H3: General government debt has a negative impact on innovation performance.

Drawing upon the findings of our comprehensive review of individual factors influencing innovation performance and the formulated hypotheses, we introduce a conceptual model for our study (see Figure 1)

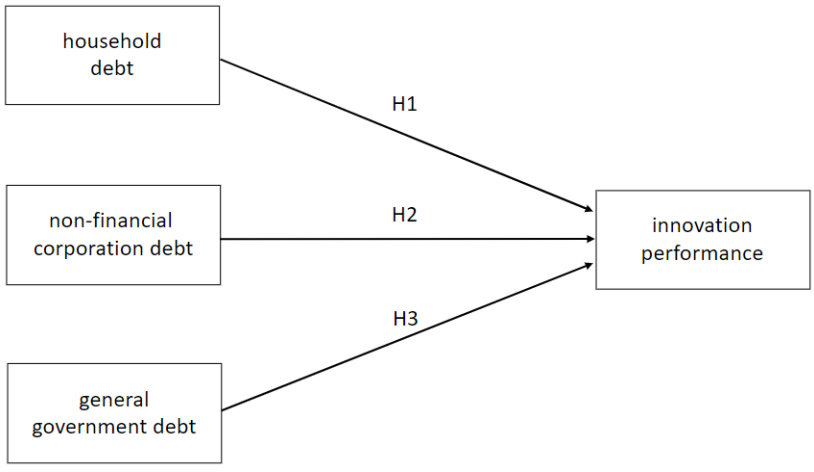

Figure 1: Research framework

3. Data and Methodology

To construct a linear regression model, we gathered data from 25 European countries. The data were collected from IMF and Eurostat databases for the years 2013-2021. Thus, we compiled a panel dataset spanning 9 calendar years, comprising a total of 225 observations. Specifically, our dataset includes the following countries: Austria, Belgium, Bulgaria, Croatia, Czechia, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, and Sweden.

The dependent variable in our regression model is the Global Innovation Index (GII) score. This index, ranging from 0 to 100, reflects the innovation performance of individual countries (Svačinová, 2020; Oturakci, 2023). The independent variables in this model are household debt (HHD), non-financial corporation debt (NFD), and general government debt (GGD). The control variable in this model is unemployment (UNE).

An overview of the variables used is provided in the following table (see Table 1).

Table 1: Overview of Variables

Type	Variable	Description	Unit	Source	References
Dependent	GII	Global Innovation Index	Score (0-100)	GII	Oturakci (2023)
Independent	HHD	Household debt	% GDP	IMF	Bernstein et al. (2017)
	NFD	Non-financial corporation debt	% GDP		Ernst et al. (2019)
	GGD	General government debt	% GDP		Coccia (2013), Fan et al. (2022)
Control	UNE	Unemployment	% of the population in the labour force	EUROSTAT	Coccia (2013)

As the first step of the analysis, it was necessary to normalize the data. Normalization was performed using the min-max method. After normalization, we could proceed to construct the linear regression model. The linear regression model was built using the Gretl software. In addition to the results, the calculation also included the coefficient of determination, which helps determine the appropriateness of using the linear regression model for our dataset. For a detailed procedure of this statistical method, see, for example, Darlington and Hayes (2016).

4. Results

From the results of the regression model, it follows that all independent variables we tested within the hypotheses emerge as significant. Furthermore, the coefficient of determination, with a value of 0.662, indicates a relatively high suitability of using the linear regression model on the input dataset.

Table 2: Results of the regression analysis

Independent	Coeff. Estimate	Std. Error	*t*-value	*p*-value	significance
CONST	0.308	0.026	11.960	9.81E-26	***
HHD	0.798	0.050	15.950	1.39E-38	***
NFD	0.254	0.055	4.671	5.22E-06	***
GGD	-0.217	0.069	-3.161	0.002	***
UNE	-0.372	0.073	-5.060	8.82E-07	***
R-squared 0.662					

Signif. codes:‘***’ 0.01;‘**’ 0.05;‘*’ 0.1

Based on the results presented in Table 2, we reject hypothesis H1, as even though the household debt indicator emerges significantly at a 99% level of significance, it is important to note the positive coefficient value, indicating that household debt positively influences the innovation performance of the state. Non-financial

corporation debt also emerges significantly at a 99% level of significance, likewise with a positive coefficient. In this case, hypothesis H2 regarding the positive impact of the debt indicator on innovation performance is confirmed. Finally, we also confirm hypothesis H3 regarding the negative impact of government debt on innovation performance, as this relationship is significant in our model at a 99% level of significance and has a negative coefficient value.

5. Discussion

Based on the established hypotheses regarding the impact of selected debt indicators on innovation performance in EU countries between 2013-2021, we can draw the following conclusions. Firstly, hypothesis 1 concerning the negative influence of household debt on innovation performance is rejected. It is worth noting that establishing this hypothesis was challenging, mainly due to the limited number of studies that have directly addressed this relationship. The lack of interest in this relationship may stem from the difficulty in proving the actual impact of household debt on innovation performance, implying the need for further research and analysis. We emphasize that in our model, the strength of this relationship is the greatest. By rejecting this hypothesis, we contradict the results of the study by Bernstein et al. (2017), which focused on examining this relationship in the context of the American economy between 2008-2012. Given the differing conclusions between our study and theirs, several questions arise: could the difference in results be attributed to changing trends during these periods, or the distinct characteristics of the American economy compared to EU countries? While the period 2008-2012 may more prominently reflect the impacts of the global financial crisis and economic recession, since 2013, the effects of this crisis may have been increasingly less pronounced in the economic development of individual countries. Furthermore, global economic growth in recent years has increasingly relied on innovation as a key factor supporting competitiveness and productivity. Considering the different specifics, policies, regulations, and approaches of the American and European economies is also pertinent. However, for more specific conclusions, it would be appropriate to conduct further research that examines these and other factors in more detail and their impacts on the relationship between household debt and innovation performance in different periods and regions.

We hypothesized, beyond our chosen indicators, that household debt negatively affects consumption (Ji et al., 2019; Du Caju, 2022; Wong et al., 2022), which a decline in would result in innovation constraints. However, this effect did not occur in our case. One reason may be that our study includes 25 EU countries, whereas the selected studies exclusively examined this relationship in one country. In this context, it is necessary to consider that the economies of individual countries are highly diverse, with different socioeconomic conditions, policies, and market structures. Therefore, the impact of household debt on consumption and innovation may vary in each country.

On the other hand, we confirm hypothesis 2 regarding the positive impact of non-financial corporate debt on innovation performance. This aligns with the findings of studies by Cumming et al. (2016) and Geelen et al. (2022). Thus, we lean towards the view that non-financial corporate indebtedness plays a crucial role in supporting innovation and technological development in the economy, even despite higher corporate debt levels. It is pertinent to mention the economic context with low interest rates in the global economy during the analyzed period, which provided businesses with broader and cheaper access to credit, undoubtedly stimulating their innovation performance.

While we do not directly refute the conclusions of any of the mentioned studies, it is essential to note some debate regarding the size of non-financial corporate debt and innovation performance – excessively high debt may have significant negative impacts on financial and economic stability in the future, whether at the level of companies, regions, or individual countries (Bonfatti and Pisano, 2020; Yao et al., 2022). In extreme cases, excessive corporate debt at the expense of innovation may lead to increased vulnerability of companies, which may face financial distress or even insolvency due to worsened market conditions. As a result, negative impacts such as increased unemployment, lower product supply, and overall reduced competitiveness can be expected. In terms of optimization in this area, solutions are available both on the side of companies, particularly in active debt management, monitoring, evaluation, and control of credit risks, and on the side of the government – support through financial instruments and programs that enable (not only) companies to finance their innovation projects without excessive indebtedness.

Government programs to support innovation are reflected negatively in the growth of government debt; therefore, it was necessary within hypothesis 3 to also examine the relationship of this indicator to innovation performance. We confirmed the findings of Coccia (2013) that the growth of government debt significantly limits the innovation performance of European countries. Like our other hypotheses, this one was also confirmed at

the 99% significance level, albeit with the lowest coefficient, which may indicate some diversification of this relationship across EU countries. The results of our study suggest that excessive growth in government debt may have serious consequences for the innovation environment (Coccia, 2013; Croce et al., 2019; Fan et al., 2022). Excessive government debt can lead to a limitation of available financial resources for investment in research and development on one hand and increased uncertainty and distrust in economic stability on the other hand. This trend can be particularly problematic in the long term, as a lack of investment in innovation may jeopardize long-term economic growth and the country's competitiveness. It is therefore essential for governments to carefully manage their public finances and ensure a favorable environment for innovative activities. In this context, Ege and Ege (2019) point out that a favorable innovation environment is not only subject to appropriate economic conditions (financing) but also to legal regulation, the political system, and social influences. If these pillars are suitably stimulated by public policy, innovation outputs can be achieved with significantly lower financial resources. This idea is also confirmed by a study by Muscio et al. (2015), which arrives at the innovation paradox, where higher government spending on science and research does not necessarily mean higher innovation performance. A typical example of this paradox is the long-term situation in Eastern European countries. Based on these findings, the future direction of innovation support policies should increasingly focus on supporting the circulation of knowledge (innovation incubators, support for university research) and the collaboration between the private and public sectors (Cirule and Uvarova, 2022; Redondo et al., 2022). When these sectors cooperate and share resources and know-how, it can lead to synergistic effects and enhance the innovation potential of the economy while simultaneously reducing pressures on the growth of public debt. In relation to fiscal sustainability, public financial support should serve more as a complement in stimulating the innovation environment in the future, with the goal of policymakers being to make it targeted and maximally effective.

6. Conclusion

Our study provides important insights into the relationship between debt indicators and innovation performance in 25 EU countries during the period 2013-2021. From the perspective of the debt dilemma, that is, whether debt is more of a driver or a hindrance to innovation, we conclude that this question is not straight forward and its answer is intertwined with many variables. In our case, it was revealed that while private debt (households and non-financial corporations) positively influenced innovation performance in EU countries, government debt, on the contrary, represented a significant brake on innovation. However, in terms of the clarity of these conclusions, it is necessary to note their possibly overly categorical nature, which leads us to the limitations of this research.

It can be assumed that by extending the analyzed period, especially to include the financial crisis, the results of our study would differ, and it would also be possible to discuss the impacts when including the years 2022 and 2023. These years can also be perceived in relation to our analyzed period as very specific regarding debt - innovation (lingering energy crisis, war in Ukraine and its impacts, etc.). Furthermore, it is necessary to emphasize that our study has its limitations due to the inclusion of 25 different EU countries with diverse socio-economic conditions, different levels of debt, and varying capacities for successful innovation. This fact affects the accuracy of our conclusions and implications in individual countries. In terms of methodology, we must also mention that our regression model was able to explain roughly 66% of the variability in the original data.

Future research should focus more closely on the direct relationship between household debt and innovation performance, as this relationship cannot be considered sufficiently explored in the current literature. In relation to fiscal sustainability, government budget cuts and potential limitations on science and research will continue to be highly relevant and discussed. Therefore, it is important to pay increased attention to this research issue. Similarly, it is pertinent to examine to what extent private debt positively influences innovation performance and from what level negative effects begin to prevail. This level is very likely to differ across countries, so it is necessary to consider the division of countries into different groups, for example, according to the GII score used. Similarly, one can consider the analysis of other factors, such as institutional factors, that may influence the debt-innovation relationship. Their significance may vary from country to country and they have a significant impact on the creation of a high-quality innovation environment.

The Evolution of Women Entrepreneurship in Turkey: Challenges, Opportunities, and Future Perspectives

Abdurrahman Gümrah
Selcuk University, Department of Management and Organization, Konya, Turkey

agumrah@selcuk.edu.tr

Abstract: This paper explores the dynamic landscape of women entrepreneurship in Turkey, highlighting its historical roots and the progress made over the decades, while also identifying persisting challenges and emerging opportunities. Women's entrepreneurship in Turkey, historically constrained by social and cultural barriers, has evolved significantly from the Ottoman era to the present day. This evolution has been influenced by major political and economic shifts, including the liberalization policies of the 1980s and recent digital transformations, which have expanded the scope for women's entrepreneurial ventures. Despite these advances, women entrepreneurs continue to face significant hurdles such as access to finance, societal gender roles, and limited networking opportunities. However, evolving government policies, international collaborations, and the increasing digitization of the economy present new opportunities for growth and integration into global markets. The study employs a comprehensive analysis of historical data, current statistics from the Turkish Statistical Institute, and literature reviews to offer a nuanced understanding of the trajectory of women's entrepreneurship. This paper aims to contribute to the discourse on gender equality and economic empowerment in Turkey, providing insights that could inform policy and entrepreneurial practice in the region.

Keywords: Women entrepreneurship, Economic development, Gender equality

1. Introduction

Women entrepreneurship in Turkey has a strategic importance in the economic and social structure. Entrepreneurship is not only limited to economic growth but also functions as an instrument of social transformation. Especially for women, entrepreneurship offers a great opportunity to gain economic independence, promote gender equality and build stronger social networks. However, in order to fully realise this potential, it is necessary to overcome the challenges faced by women entrepreneurs and to make effective use of the opportunities offered.

The history of women's entrepreneurship in Turkey dates back to the times of the Ottoman Empire, during which time there have been many changes. With the proclamation of the Republic, new doors were opened for women in education and working life, and the ground was prepared for women to take more active roles in social and economic life during the 1930s and 1940s. The wave of economic liberalisation and globalisation in the 1980s led to a significant increase in the number of women entrepreneurs. In the 2000s, digitalisation and technological developments have further strengthened women's presence in the business world.

In this entrepreneurial journey, women have had to contend not only with economic challenges but also with social and cultural barriers. Traditional gender roles, efforts to balance work and family life, and difficulties in accessing adequate financial resources are among the main barriers to women's entrepreneurship in Turkey. However, new opportunities offered through government support, international co-operation and digital platforms help women overcome these barriers and succeed in the business world.

This study aims to reveal the past, current situation and future perspective of women entrepreneurship in Turkey. In line with this purpose, the historical development of women entrepreneurship in Turkey is discussed in detail below. Today, the status of women entrepreneurship in Turkey is analysed in line with the reports published by the Turkish Statistical Institute. In addition, scientific research on women entrepreneurship in Turkey are discussed in the literature review section. Afterwards, obstacles and opportunities in front of women entrepreneurship in Turkey are discussed and various suggestions are made for the future in the conclusion part of the study.

2. Concepts of Entrepreneurship and Women Entrepreneurship

Entrepreneurship is the process of recognising and evaluating new business opportunities and transforming these opportunities into economic value. This process requires characteristics such as innovation, risk-taking and being proactive (Shane, 2003). Entrepreneurship is an important engine of economic growth and social welfare and promotes job creation, innovation and competition. Women entrepreneurship can be defined as entrepreneurial activities carried out by women. This field has received increasing attention in recent years and is of great importance for economic development and gender equality. Women entrepreneurs often face

more social and cultural barriers than male entrepreneurs. These include gender discrimination in access to finance, difficulties in balancing family and work life, and lack of adequate mentoring support (Brush, 1992; Carter, 2011). Research shows that women entrepreneurs' businesses significantly improve the well-being of their families as well as their contribution to society and the economy (Hughes, 2006). However, to fully realise this potential, the challenges faced by women entrepreneurs need to be overcome. Government-sponsored programmes, private sector initiatives and international collaborations have emerged as important tools to support women entrepreneurship (Jennings & Brush, 2013).

Explanations on the challenges faced by women entrepreneurs and the definition of the concept reveal that women face more and greater obstacles in starting and managing businesses than men. This situation necessitates defining women entrepreneurship as a special field and conducting detailed studies on this subject. Women entrepreneurs are defined as individuals who not only establish and manage their businesses, but are also innovative, creative and capable of gaining economic independence. Although this concept, which is interpreted in different ways by different authors, is often used synonymously with "businesswoman", women entrepreneurs do business on their own behalf and stand out as intelligent and independent individuals with high social awareness. While highlighting the unique challenges of women entrepreneurs in the business start-up process, it is emphasised that these women not only manage their businesses, but also stand out in the market with their innovative and creative approaches. These are women who are able to work independently under social security, who can take calculated risks by adapting to the market economy and offer products or services directly to the market. This definition shows that women's entrepreneurship has the potential to make a wide range of economic and social contributions and that women have the capacity to successfully manage personal, family and social roles (Keskin, 2014).

Promoting women's entrepreneurship is critical not only for economic but also for gender equality and social justice. In this context, supporting women entrepreneurship in developing countries such as Turkey plays an important role in achieving overall economic and social development goals.

3. Historical Development of Women Entrepreneurship In Turkey

Women entrepreneurship in Turkey has passed through important phases starting from the Ottoman Empire period. Women engaged in economic activities in the Ottoman Empire were generally involved in family businesses, but rarely engaged in independent entrepreneurship (Arat, 1994). With the establishment of the Republic, the post-1923 period initiated a transformation process that encouraged women to take more active roles in social and economic life. This process gained momentum when women were granted the right to vote and be elected in 1934 (Kandiyoti, 1987).

After the Second World War, women's participation in the labour force increased in Turkey, but this participation was generally limited to low-paid and low-status jobs (Acemoğlu & Ucer, 2015). The liberal economic policies and globalisation process of the 1980s brought a new perspective to women's entrepreneurship. During this period, there was a significant increase in the number of women entrepreneurs in Turkey and women-led enterprises were established in various industries, particularly in the textile and garment sectors (Güneş-Ayata, 2002).

While women entrepreneurship in Turkey has increased as a result of supportive policies of international organisations and export-oriented development strategies, women's participation in the labour force has increased especially after the 1980s. However, women's participation in economic activities has generally remained limited due to domestic roles and patriarchal relations. While economic difficulties and macroeconomic conditions have encouraged women to start their own businesses, these initiatives have generally been small-scale and family-supported. In recent years, policies and programmes supporting women's entrepreneurship have been implemented by various public and private sector organisations, thereby increasing the rate of women entrepreneurship (Soysal, 2010).

Studies conducted in the 1990s revealed that a large proportion of entrepreneurial women, who are mostly urban women, are in the trade sector and their education level generally remains at the high school level. While women entrepreneurs care more about social reputation compared to men, they are more cautious in taking risks. Studies on women's entrepreneurship in Turkey are ambiguous in terms of definition and scope, and no consensus has been reached on the definition of "entrepreneurial women". Moreover, when the educational attainment and employment status of women entrepreneurs in Turkey are taken into account, it is observed that while the educational attainment of self-employed women is generally low, the educational attainment of employers is higher. This situation emphasises the importance of educational opportunities for

the development of women's entrepreneurial skills (Yetim, 2002). Since the early 2000s, with the widespread use of technology and the internet, new business areas have opened up for women and paved the way for digital entrepreneurship. In this period, women entrepreneurs also found the opportunity to reach large masses by using social media platforms and established successful businesses in areas such as e-commerce (Ergene, 2020). In recent years, various incentives and loans have been offered by the state to support women's entrepreneurship, which has provided significant support to women in their business establishment and business development processes (Development and Investment Bank of Turkey, 2019).

4. Scientific Research On Women Entrepreneurship In Turkey

In this part of the study, some of the scientific research on women entrepreneurship in Turkey are included. In this context, summaries of the research in the literature and accessed within the scope of the research are given below in date order.

(Yetim, 2002) aimed to determine the qualifications and competences of women entrepreneurs as social capital. In the study, a questionnaire and face-to-face interviews with 224 women entrepreneurs in Mersin were used as a method. The scope of the study was determined as the socio-demographic characteristics of women, their knowledge and skill channels in the process of establishing and maintaining a business, and their tendency to co-operate. The results of the study show that women entrepreneurs are able to use social capital resources effectively and integrate them with their entrepreneurial qualities. Moreover, women's ability to use institutional information channels in particular supports organisation by increasing solidarity.

(Öğüt, 2006) aimed to examine the barriers to career advancement of women entrepreneurs and managers in Turkey, especially the glass ceiling syndrome. In the study, a comprehensive literature review and questionnaires on women entrepreneurs in Turkey were used as methods. As a result of the study, the existence of various social and institutional barriers that prevent women entrepreneurs and managers from rising to senior positions was revealed. In particular, the glass ceiling syndrome was found to be an important factor limiting women's career development.

(Soysal, 2010) aimed to address the obstacles faced by women entrepreneurs in Turkey and the opportunities created by them in a theoretical framework. The study emphasises that women entrepreneurs are potential forces that can make significant contributions to economic and social development and that policies and projects that will mobilise this potential should be prioritised. It is stated that encouraging women entrepreneurship, especially in developing economies, can pave the way for activating untapped potential and creating new jobs. However, it is stated that women face serious obstacles in their entrepreneurial activities and concrete steps should be taken to overcome these obstacles.

(Soyak, 2010) aimed to evaluate the access of women entrepreneurs in Turkey to microfinance services and the impact of these services. In the study, the activities of various non-governmental organisations in Turkey were examined and the socioeconomic results of these activities were analysed. The study analysed how poor and disadvantaged women entrepreneurs benefit from microfinance services and how these services affect women's participation in economic activities. The results of the study show that microfinance services increase the economic independence of women entrepreneurs and are an important tool for regional economic development. It was also found that these services strengthen social capital and co-operation among women.

(Sayın, 2011) aimed to describe the problems faced by women entrepreneurs in Aydın province and to offer solutions. As a method in the study, a survey was conducted for women entrepreneurs and the problems were analysed with descriptive statistics obtained from this survey. The scope of the study was determined to cover the difficulties of women entrepreneurs in business and social life and the micro and macro level effects of these difficulties. As a result of the study, the problems faced by women entrepreneurs were identified and suggestions were made for possible arrangements in business life. In particular, the recognition of Aydın Business Women's Association and its activities to support women entrepreneurs came to the fore.

(Güleç, 2011) aimed to determine the qualifications and competences of women entrepreneurs as social capital. In the study, a questionnaire and face-to-face interviews with 224 women entrepreneurs in Mersin were used as the methodology. The scope of the research focussed on women's socio-demographic characteristics, their knowledge and skill channels in the process of starting and sustaining a business, and their tendency to co-operate. The results of the study show that women entrepreneurs are able to utilise their social capital resources effectively and integrate them with their entrepreneurial qualities. Moreover, women's competence in using institutional information channels in particular supports organisation by increasing solidarity.

In her study (Keskin, 2014), she aimed to examine the situation of women entrepreneurs in Turkey and to reveal the current challenges and opportunities in this field. A detailed analysis of the existing literature and various data sources were utilised as methodology in the study. The study analyses the economic participation of women entrepreneurs and the obstacles they face. The study shows that women entrepreneurs make significant contributions to the economy but are unable to fully realise their potential due to gender-based barriers. The study emphasises that promoting women entrepreneurship is critical for social and economic development.

(Uluköy & Demireli, 2014) aimed to determine the effect of gender on entrepreneurship characteristics in their study. As a method in the study, a questionnaire form measuring the effect of gender on entrepreneurial characteristics was used and the data obtained were analysed. As a result of the study, it was found that some entrepreneurial characteristics such as risk-taking, vision, high achievement motive and communication skills did not differ between genders, but there were significant gender differences in self-confidence, tolerance to uncertainty, independence, opportunity evaluation, innovation, determination, leadership and internal control. These findings reveal the effect of gender on entrepreneurship and how this effect differs on various characteristics.

(Özyılmaz, 2016) aimed to determine the problems faced by women entrepreneurs who started to take a more active role in the business world with the increasing economic and social developments in the early 21st century and to produce solutions to these problems. Within the scope of the research, data were collected by conducting a questionnaire survey on 1,457 women entrepreneurs and face-to-face interviews with 32 women entrepreneurs across Turkey. As a result of the study, it was determined that the biggest motivation of women entrepreneurs was the desire to be the boss of their own business and to prove themselves. In addition, it was determined that family support is of great importance in the process of establishing a business, but they face financial and bureaucratic obstacles while running their businesses. When analysed regionally, it was found that women entrepreneurs in regions with low level of development faced more problems. As a result of the research, it was concluded that in order to develop women entrepreneurship, access to finance should be facilitated, social opportunities to support women in business life should be increased and regional support systems should be established.

(Aşkın & Barış, 2016) aimed to examine how women entrepreneurs benefit from social capital in Tokat province. Qualitative analyses and survey studies were used as methods in the study. The scope of the research was determined as evaluating the social networks of women entrepreneurs and the impact of these networks on business success. As a result of the study, it was determined that "strong ties" consisting of family and friends are important in the process of establishing and maintaining a business, but "weak ties" such as public institutions and non-governmental organisations are insufficient. In addition, as a result of the study, policy recommendations were presented for women entrepreneurs to increase business success by developing more social capital.

(Kutukız & Özden, 2018) aimed to measure the financial literacy levels of women entrepreneurs in Milas district of Muğla and to understand their financial knowledge, behaviours and attitudes. The study focused on the potential of financial literacy to increase individual and macro-level social welfare. In the study, the survey technique was utilised as a method and financial literacy levels and competencies were tried to be determined. As a result of the study, it was revealed that the participants showed various levels of competencies in financial knowledge and behaviours and how the economic participation of women entrepreneurs in particular was affected by this knowledge.

(Durukan, 2021) aimed to evaluate the role of KOSGEB in supporting women entrepreneurs in Turkey. In the study, compilation and document analysis were used as methods. The scope of the study was analysed within the framework of "Entrepreneurship Supports" provided by KOSGEB. As a result of the study, it was determined that KOSGEB offers various types of support for women entrepreneurs and that these supports make significant contributions to women's business establishment and maintenance processes. In particular, it has been determined that supports for women entrepreneurs contribute to economic development and increasing women's participation in the labour force.

5. Challenges to Women Entrepreneurship in Turkey

The challenges faced by women entrepreneurs in Turkey stem from social, economic and cultural factors. These challenges not only reflect the local specificities of the barriers that women face in the business world,

but also indicate wider gender inequalities. In this context, the challenges to women's entrepreneurship are discussed under four headings below.

5.1 Difficulties in Access to Finance

Women entrepreneurs in Turkey face serious obstacles in accessing financial resources for starting and sustaining their businesses. Research shows that banks and other financial institutions demand more assurance or collateral when providing loans to women (Aydın, 2018). In addition, the low rate of women owning property in their own name causes them to have difficulty in providing the necessary collateral to obtain loans.

5.2 Social and Cultural Barriers

Traditional roles of women in Turkish society function as a limiting factor for entrepreneurial activities. Stereotypical expectations about gender roles make it difficult for women to be active in business life and in some cases lead to social isolation in environments that support women's entrepreneurship (Koçer & Akgündüz, 2021).

5.3 Lack of Training and Support Services after Training

In Turkey, the number of training and mentoring programmes to ensure that women entrepreneurs have sufficient knowledge and skills to start and manage their businesses is insufficient. This situation prevents women from developing themselves in areas such as business management, marketing and digital skills and negatively affects business success (Demirer & İlhan, 2019).

5.4 Networking and Marketing Challenges

One of the important ways to succeed in business is to build strong professional networks. However, women entrepreneurs in Turkey have fewer networking opportunities than their male counterparts. This makes it difficult for them to expand the marketing and customer base of their businesses and limits their opportunities for sustainable growth (Günay, 2020).

6. Opportunities Offered by Women Entrepreneurship in Turkey

The opportunities and challenges faced by women entrepreneurs in Turkey are shaped by the country's unique socio-cultural and economic structure. A study by Kacar, Essers and Benschop (2023) emphasises that Turkey's location at the intersection of Western and Middle Eastern cultures creates a challenging and stimulating environment for women entrepreneurship. The study analysed how women entrepreneurs cope with social, political and institutional structures through mechanisms such as strategic distance and closed social positioning. Such strategies enable women to tackle the challenges they face in the entrepreneurial world and start their own businesses.

Regional differences further crystallise the barriers and opportunities for women's entrepreneurship. A study by Aslan and Gunes (2017) addresses the effects on economic growth of women entrepreneurs' insufficient participation in economic life in the Eastern and Southeastern regions of Turkey. Surveys of women entrepreneurs in provinces such as Bingöl and Diyarbakır who have benefited from state-supported KOSGEB and other incentive mechanisms show how these supports have helped women to start businesses. However, this study also highlights persistent problems such as access to finance, market recognition and high operating costs.

The perception of social support stands out as a critical success factor for women entrepreneurs. A study by Kapusuz, Çavuş, and Pekkan (2018) examines the gender perspective and dimensions of social support in social entrepreneurship in Turkey. The study documents how women and men assume different roles in both traditional and social entrepreneurship and how the perception of social support plays a determining role in entrepreneurial success. Understanding how gender roles and societal expectations are perceived by women in business and how this can affect their entrepreneurial potential has important implications for policy makers and community leaders. The opportunities available for women entrepreneurs in Turkey can be summarised as follows:

6.1 Government Support and Incentives

Government-sponsored organisations in Turkey offer various financial incentives and grants to support women entrepreneurs. Organisations such as KOSGEB provide special programmes for women starting new businesses.

6.2 Training and Mentoring Programmes

Entrepreneurship training and mentoring programmes offered by universities, NGOs and other organisations help women to increase their knowledge and skills in the business world.

6.3 Networking Opportunities

Various women entrepreneur networks and organisations provide platforms for women to share their experiences and build collaborations.

6.4 Digitalisation and Technology Access

The proliferation of the internet and social media platforms enables women entrepreneurs to reach a wide audience with their products and services.

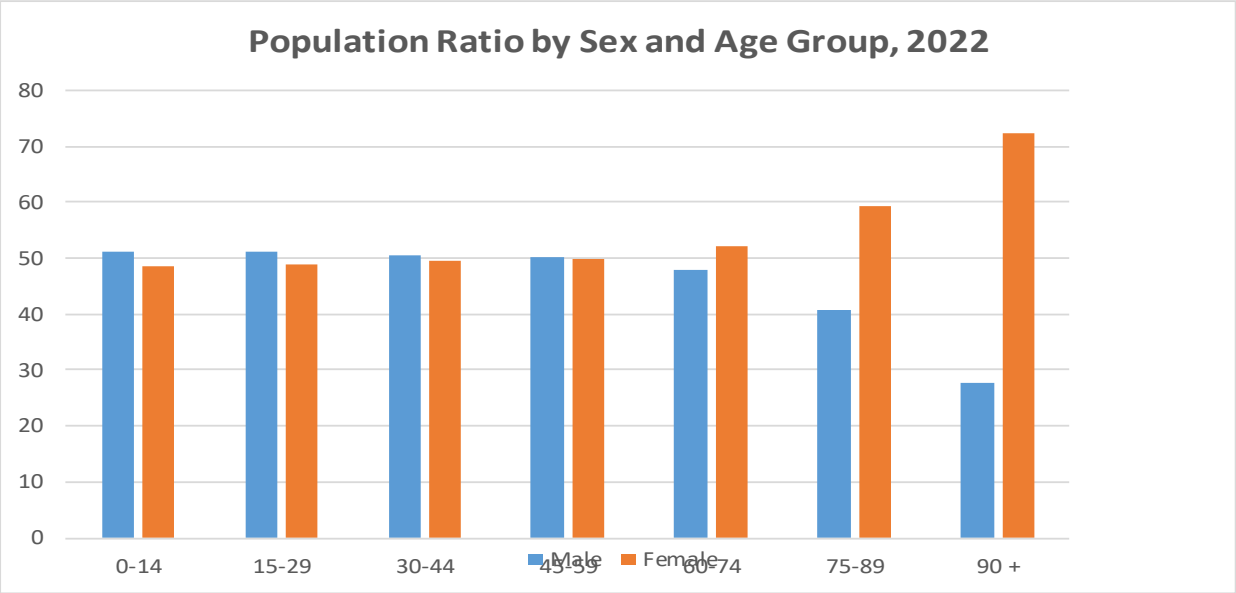
6.5 Access to Global Markets

E-commerce platforms and international trade fairs make it easier for Turkish women entrepreneurs to present their products to global markets.

6.6 Social Change and Awareness

Increased awareness on gender equality leads to greater acceptance and support for women entrepreneurs.

6.7 Opportunities in Innovative Sectors



Rapidly developing sectors such as health, education and technology offer opportunities for women entrepreneurs to start new businesses and innovate.

7. "Women Entrepreneurship in Turkey with Statistics"

In this part of the study, the current status of female entrepreneurship in Turkey has been examined using statistical data published on the official website of the Turkish Statistical Institute.

7.1 Population Ratio by Gender and Age Group (2022)

According to the results of the Address-Based Population Registration System (ADNKS) for the year 2022, the female population was 42,575,441 while the male population was 42,704,112. In other words, women constituted 49.9% of the total population, and men 50.1%. This proportional balance between women and men shifts in favour of women starting from the age group of 60 and above, due to the longer life expectancy of women. The proportion of the female population was 52.2% in the 60-74 age group, and 72.4% in the 90 and above age group. Below is a graph showing the population ratio by gender and age group.

Source: Turkish Statistical Institute (2014) – https://www.tuik.gov.tr/

Figure 1: Population Ratio by Sex and Age Group, 2022

7.2 Selected Indicators by Gender

Table 1: Employment Data by Gender Between 2008 and 2021

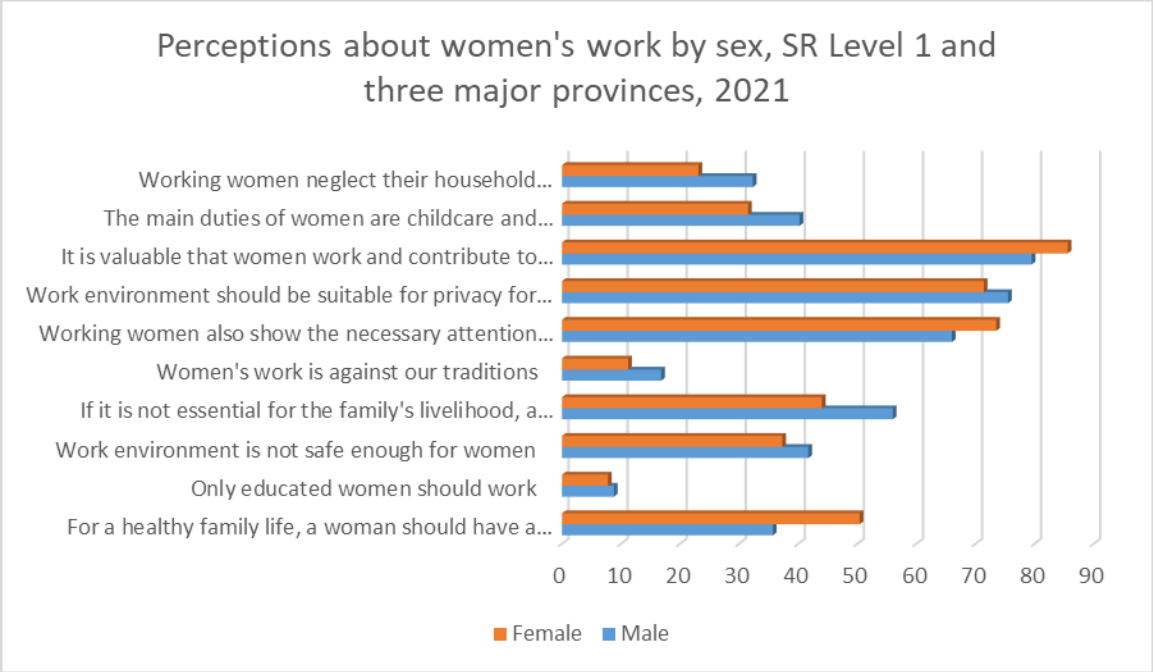
	Total	Male	Female
Illiteracy Rate Among the Population Aged 25 and Over	3,5	1	6,1
Higher Education Graduation Rate Among the Population Aged 25 and Over	23	25,1	20,9
Employment Rate (Aged 15 and Over)	45,2	62,8	28
Labor Force Participation Rate (Aged 15 and Over)	51,4	70,3	32,8
Unemployment Rate (Aged 15 and Over)	12	10,7	14,7

Source 1: Turkish Statistical Institute (2024)

The proportion of the population aged 25 and over with a higher education degree (college, master's, and doctorate) within the total population increased from 9.8% in 2008 to 23.0% in 2021. When this rate is examined by gender, in 2008, 7.6% of women and 12.1% of men aged 25 and over had a higher education degree. By 2021, this rate had risen to 20.9% for women and 25.1% for men.

7.3 Labor Force Participation Rate

The graph below shows the labour force participation rates in Turkey.



Source: Turkish Statistical Institute (2014) – https://www.tuik.gov.tr/

Figure 2: Labor Force Participation Rate by Gender and Educational Status, 2021

When examining the labour force participation rate by educational status, it is observed that women's participation in the labour force increases with higher levels of education. The labour force participation rates are as follows: illiterate women at 12.8%, women with less than high school education at 25.3%, high school graduates at 32.5%, vocational or technical high school graduates at 38.5%, and women with higher education at 67.6%.

According to the results of a family structure survey in 2021, when examining perceptions about women working, 82.6% of respondents believed that women's participation in work and social life is valuable. Breaking this down by gender, 85.6% of women agreed with this statement, compared to 79.5% of men.

Figure 3: Perceptions about women's work by sex, SR Level 1 and three major provinces, 2021

8. The Future of Women Entrepreneurship in Turkey

The future of women entrepreneurship in Turkey is shaped by various factors, including economic policies, technological advancements, educational opportunities, and progress in gender equality. Developments in these areas in the coming years could reduce the challenges faced by women entrepreneurs and encourage more women to join the entrepreneurship ecosystem.

8.1 Economic Policies and Incentives

It is anticipated that the government and private sector in Turkey will strengthen policies to support women entrepreneurs. These policies could include financial incentives, tax reductions, and special credit packages for women entrepreneurs. Additionally, investments aimed at facilitating women's ability to start and develop businesses will make entrepreneurship more appealing (Yıldırım, 2021).

8.2 Technological Advancements and Digitalization

The proliferation of digital technologies creates new business models and market access opportunities for women entrepreneurs. Women are expected to play a more active role in areas such as e-commerce, digital marketing, and social media management. These developments will enable women entrepreneurs to expand their businesses nationally and internationally (Demir, 2022).

8.3 Educational Opportunities and Business Skills Development

The number of educational programs available for women in Turkey to enhance their business skills needs to be increased, and the quality of these programs improved. Training in entrepreneurship, financial literacy, and technology usage can boost the competitive strength of women entrepreneurs (Özdemir, 2019).

8.4 Gender Equality and Cultural Change

Achieving gender equality in Turkey is critical for the future of women entrepreneurship. Modernizing perceptions of gender roles and the place of women in the business world will further encourage women to start and manage businesses (Aksoy, 2020).

These strategies are essential for empowering women in Turkey to engage more fully in entrepreneurship and for fostering a more inclusive economic environment.

9. Conclusion

This study has comprehensively examined the historical development of female entrepreneurship in Turkey, its challenges, and the opportunities it presents. Despite facing social and economic barriers, women entrepreneurs in Turkey have made significant progress in the areas of economic development and gender equality. The participation of women in the entrepreneurship ecosystem is increasing, especially due to advancements in technology and digitalization, which create new business models and opportunities for market expansion.

However, women entrepreneurs still face significant challenges, including access to financing, social and cultural barriers, and a lack of education and mentoring services. Overcoming these challenges is crucial and requires government-backed incentives, private sector initiatives, and international collaborations. Proposed solutions include providing more financial support for women entrepreneurs, expanding entrepreneurship training programs, and creating more opportunities for women to develop their professional networks.

The future of women entrepreneurship in Turkey depends not only on economic policies, educational opportunities, and technological advancements but also on progress in gender equality. These advancements will further encourage and support women in the processes of starting and managing businesses. Consequently, the role that women entrepreneurs will play in Turkey's economic and social development will depend not only on leveraging current opportunities but also on strategically and effectively addressing these challenges.

This study provides an understanding of the current state of women entrepreneurship in Turkey and lays a foundation for improvements in this field, also serving as a resource for future research. As in all studies conducted in the field of social sciences, this study has some limitations. First of all, the study was carried out in Turkey and taking into account the data of the Turkish Statistical Institute. Different results can be obtained by considering different data sets. Another limitation of the study is the time constraint. The study was carried out in line with the data available as of June 2024.

The Impact of Artificial Intelligence for Advancement in Entrepreneurial Education

Manisha Gupta[1] and Mamta Singh[1]
[1]Shri Ramswaroop Memorial College of Engineering and Management, Lucknow, India
[2]Chandragupt Institute of Management, Patna, India

herezmanisha@gmail.com
mamtakumar7@gmail.com

Abstract: The changing technology has advanced into new advents like Artificial Intelligence. This technology has diffused into the classrooms through chatbots like ChatGPT, Claude, Google Bard, YouChat, KoalaChat, ChatOn, Microsoft Binge and many others. The conventional softwares are only updated by humans while Artificial Intelligence can correct and remodel itself. Artificial Intelligence is assisting the entrepreneurial organizations and students in data analysis, automation and Natural Language Processing (NLP). It also helps the entrepreneurial organizations in strategic decision making and managing operations and accounts. This research focuses on the opportunities and challenges posed by Artificial Intelligence in the entrepreneurial education across various business schools. It examines the benefits of chatbots for educational purposes. It also studies the limitations of chatbots. It enquires about the business advice sought from chatbots. For this purpose, a survey was applied amongst students of entrepreneurial courses to analyze the impact of Artificial Intelligence in our classrooms. It is a study performed on 103 students enrolled in entrepreneurship courses at two management institutes of India between August, 2023, and December, 2023. The study focuses on the benefits of AI in areas such as assisting in classroom activities like such as market research, competitor analysis and legal aspects. It also aids the students in getting feedback for their assignments, preparing for examinations and rapid access to information. The research suggests that Artificial Intelligence is significantly contributing right from idea generation, planning, forecasting and progress evaluation of business plans to entrepreneurial students. It is extensively helping the entrepreneurial students in developing the business model canvas which assists them in designing the blueprint of the project, strategic management, and development of innovative business models. It also assists in improving the productivity and efficiency of students. This research would facilitate students, teachers and business schools imparting entrepreneurial curriculum inculcate Artificial Intelligence into the classroom studies.

Keywords: Artificial Intelligence, Chatbots, Entrepreneurial education

1. Introduction

Implementing Artificial Intelligence in educational curricula has been highlighted as one of the significant evolutions of the decade. Along with education, these technologies are adopted across multiple industries. They comprise of blockchain, artificial intelligence, the internet of things (IoT), and genomics (Chalmers et al., 2021). AI assists human beings in completing complex tasks with the help of digital technologies (Haenlein & Kaplan, 2019). In the Industry 4.0, artificial intelligence is playing a major role. It can be described as the assessment of the performance of tasks by algorithms and digital computers (Giuggioli et al., 2022). AI assists human beings in completing complex tasks with the help of digital technologies (Haenlein & Kaplan, 2019).

AI not only assists the conventional organizations, but also supports the creation of new enterprise. It helps decipher opportunities and generate new business ideas (Chalmers et al., 2021). With the help of AI, entrepreneurs can take strategic decisions, manage operations and accounts, and aid in sales function (Figueras, A. et al., 2019). Entrepreneurship implies an individual or a group of people joining together for a new venture. An entrepreneur bears most of the risk of the new business and also gets the major profits from the project. Entrepreneurship pertains to combining several skills including an understanding of financial and operational outlook with an approach towards innovation (Bańka, M. et al, 2023). Entrepreneurial education is a pedagogical process assisting institutional teachings that educate scholars to inspire them towards the formation of a new venture. It can bring about innovation, creativity and knowledge of industry. It facilitates decision-making, problem-solving, leadership, social responsibility, and ethics (Ala, M. et al, 2022).

The role of AI is rising with the growth of digital technology. Considering this, the Business schools are introducing AI into their curriculum (Govindarajan & Sikka, 2020). The introduction of AI including chatbots in entrepreneurial education would support instructors in drafting new curricula, devising teaching materials, assignment grading, handling student queries, and performing research activities. Scholars can formulate project outlines, get feedback on their assignments, prepare for examinations, and accumulate relevant information easily (Cribben & Zeinali, 2023).

The rising significance of AI in the business environment has made it imperative to investigate and apprehend the application of AI technologies in entrepreneurial education. We attempted to assess the impact of AI for advancement in entrepreneurial education on a target sample of 103 students enrolled in postgraduate entrepreneurship courses at a management institute in India between August, 2023, and December, 2023. This study appraises the role of AI in supporting entrepreneurial scholars in devising business model canvases and other curriculum-related activities. It presents the opportunities that entrepreneurial students achieve from using AI chatbots. It also brings out the limitations of AI chatbots. It suggests the business advice a student can extract from these chatbots for drafting business plans. This paper is extremely significant as it showcases the effectiveness of implementing AI into education.

2. Literature Review

Artificial Intelligence is a term coined by Mc Carthy in 1956. A contemporary annotation of artificial intelligence is "registering frameworks that can take part in human-like procedures, including, learning, adjusting, blending, self-rectification and the utilization of information for complex procedures. (Crompton et al., 2023). The education system is the support point for the development of any country. Artificial Intelligence has plentiful potential for the education system. As innovation has dug, its manner into our everyday life, the education system has transformed. Besides, implementing innovations in the education system is challenging (Tilak, 2020). Advances in the field of Artificial Intelligence have significant ramifications for the economy as well as overall society. These advancements have the potential, to influence both the creation and the quality of products and services (Iain M. Cockburn et al., 2019). Among the different Artificial Intelligence frameworks, the capability of chatbots has been featured by scientists, attributable to the easy-to-understand interface created, utilizing natural language processing (NLP) (Chang et al., 2020). Eventually, Artificial Intelligence and ChatGPT will mechanize the whole innovative client revelation and approval process. Certain business sectors, like online business, will adopt and evolve way sooner than we naturally expect (Chakraborty, U. et al., 2023).

Entrepreneurship education foundations effectively drive change in the education system by teaming up, with enterprises and setting up incubators and mentorship plans. It assists in the reconciliation, of the scholarly community and industry (Qing Mu et al., 2024). Educators should utilize Artificial Intelligence and Big data to improve their instructive practices in the curriculum. Artificial intelligence frameworks could be employed, in entrepreneurial education to give customized feedback to scholars on their business strategies and presentations. Scholars could acquire quicker admittance to pertinent data, for example, intellectual property, entrepreneurial finance, licenses, permits, or market data. Artificial intelligence chatbots, like ChatGPT, Microsoft Bing, and others could help scholars distinguish and decipher designs, in huge datasets, for a more viable evaluation of business plans (Mavlutova et al., 2020). The Entrepreneurial students benefit by gaining the knowledge of Artificial Intelligence which assists them in establishing startups and generating funding from Venture Capitalists (Gofman et al., 2024).

Lopez, T. and Qamber, M. (2022), performed a study on the benefits and drawbacks of implementing chatbots in higher education. Results revealed that students can rapidly explore through numerous data pertinent to them using chatbots. The disadvantages of chatbots presented by this study include the absence of human support when the chatbot can't answer complex queries or conditions requiring human contact. Lidén, A. and Nilros, K. (2020), studied that it is desirable to start with simple usage of chatbots and then progressively get to the next level. It is more useful for students to adopt the basic functionality of chatbots rather than complex procedures.

The utilization of ChatGPT in educational curricula and logical creation has raised worries about its exactness and ethical concerns (Stokel-Walker, 2022). Chatbots likewise, have restricted logical comprehension, which can prompt insignificant reactions when the inquiry posed is uncertain or fragmented. Moreover, it needs the presence of mind, prompting the conceivable error of specific words, when the authors use ChatGPT (Choi et al., 2023).

There is also a concern that employing Chatbots in educational curricula are a hazard to scholastic honesty and the discussion on "AI plagiarism" is continuous. Some have additionally seen that the scholars depending too intensely on chatbots to finish their assignments could become dormant (Stokel-Walker, 2022). Chatbots likewise, add to the spread of fabrication and create erroneous or one-sided responses. Many countries have banned the usage of Chatbots due to the nature of the information they access (Dwivedi et al., 2023).

Despite the ongoing constraints, if carried out in a controlled manner and under the direction of teachers, a fraction of these difficulties can be addressed (Kasneci et al., 2023). Chatbots might help scholars pursuing

entrepreneurial education, and teachers across disciplines in large number of ways, as it is examined in the following sections. Ample debate around the impact of chatbots in educational curricula is continuous (Kuhail, M. A. et al.). It means that there is a lot to check out how this innovation could be utilized, which will assist entrepreneurial scholars with meeting their learning goals, and protecting scholar uprightness.

3. Research Methodology

This research is based on a study of students enrolled in entrepreneurial courses at 2 institutes in India. The study examines the benefits of chatbots for educational purposes. It also studies the limitations of chatbots. It investigates the benefits of chatbots to develop a business model canvas. It enquires about the business advice sought from chatbots. A survey has been applied to investigate the impact of Artificial Intelligence on advancements in entrepreneurial education on a target sample of 103 students (out of which 50.5% of the students were females and the rest were male) of 2 institutions offering entrepreneurial courses. A structured questionnaire was sent to the entrepreneurial students through e-mails, WhatsApp, and physically between August, 2023, and December, 2023. The entrepreneurial student's responses were documented, evaluated, and analyzed. We collected the data to examine the efficacy of AI Chatbots in the educational curriculum on a 5-point Likert scale. The data were measured using Microsoft Excel and IBM SPSS Statistics.

4. Results and Discussion

The majority of the respondents have a positive response toward the use of AI chatbots in the educational curriculum. Out of 103 entrepreneurial students, 95.1% of these have used AI chatbots like ChatGPT, Microsoft Binge, Google Bard, YouChat, etc to assist them in their studies 37.9% got knowledge about AI chatbots through social media, 29.1% from known people, 26.2% from college, and the remaining through news. The most frequently used AI chatbot for educational purposes is ChatGPT which is 86.4% followed by Google Bard. Further, 74.8% of students agreed that the instructors in their college discussed AI chatbots in the classroom. Enquiring about the favourability of AI chatbots, 95.1 % of entrepreneurial students found chatbots beneficial for their educational curriculum.

4.1 4.1 The Benefits of Using Chatbots for Educational Purposes

The entrepreneurial students were examined about the benefits of using Chatbots for educational purposes. The questionnaire required participants to rate their responses on a scale of 1 (very poor) to 5 (excellent). The findings revealed that 62 students are positive about getting feedback for their assignments through chatbots. 63 students responded that chatbots are effective in preparing for examinations. 63 students agreed that chatbots provide rapid access to information. Thus, entrepreneurial students have a positive approach toward chatbots and consider them beneficial for their education purposes. Students can utilize chatbots to get prompt input on their work and get insight before they submit the assignments to the educator. Chatbots can offer valuable support to students to prepare for exams. It can assist in making flashcards, creating personalized study plans, role-playing, mnemonic, and better concept understanding. It assists students with getting information rapidly. Data can be assembled swiftly from different sources. It could also help in acquiring data about other organizations.

Table1: The benefits of using Chatbots for educational purposes

The benefits of using Chatbots for educational purposes	No. of students rated themselves 1 on Likert scale	No. of students rated themselves 2 on Likert scale	No. of students rated themselves 3 on Likert scale	No. of students rated themselves 4 on Likert scale	No. of students rated themselves 5 on Likert scale
Getting feedback for the assignments	11	7	23	39	23
Preparing for examinations	9	8	23	35	28
Rapid access to information	12	8	20	33	30

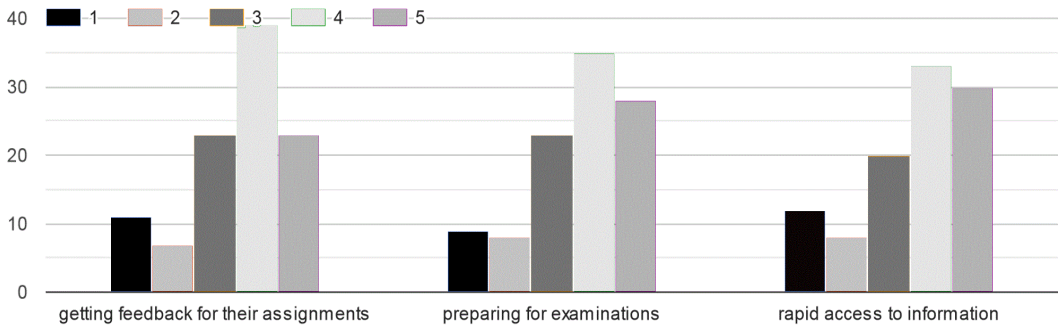

Figure 1: The benefits of using Chatbots for educational purposes

4.2 The Benefits of Using Chatbots to Develop a Business Model Canvas

The entrepreneurial students were investigated for the benefits of using chatbots to develop a business model canvas. The questionnaire required participants to rate their responses on a scale of 1 (very poor) to 5 (excellent). The findings revealed that 57 students responded positively to using the chatbots to generate new and creative ideas to develop a business model canvas. 54 students responded that chatbots assist in developing newer insights to identify and understand distinct variables. 64 students agreed that chatbots provide rapid access to information. 57 students believe that chatbots help in increasing student's productivity and efficiency. Thus, chatbots are of great help to entrepreneurial students in developing business model canvas. It helps think of ideas that will be innovative. It can be useful in the illustration of an existing business model that describes several concepts that made it successful. Chatbots assist in the creation of financial models, business plans, value propositions, SWOT analyses, and marketing plans.

Table 2: The benefits of using Chatbots to develop a business model canvas

The benefits of using Chatbots to develop a business model canvas	No. of students rated themselves 1 on Likert scale	No. of students rated themselves 2 on Likert scale	No. of students rated themselves 3 on Likert scale	No. of students rated themselves 4 on Likert scale	No. of students rated themselves 5 on Likert scale
Generate new ideas	15	8	21	40	17
Newer insights	11	10	27	37	17
Rapid access to information	11	8	17	40	24
Increase student's productivity and efficiency	12	6	28	37	20

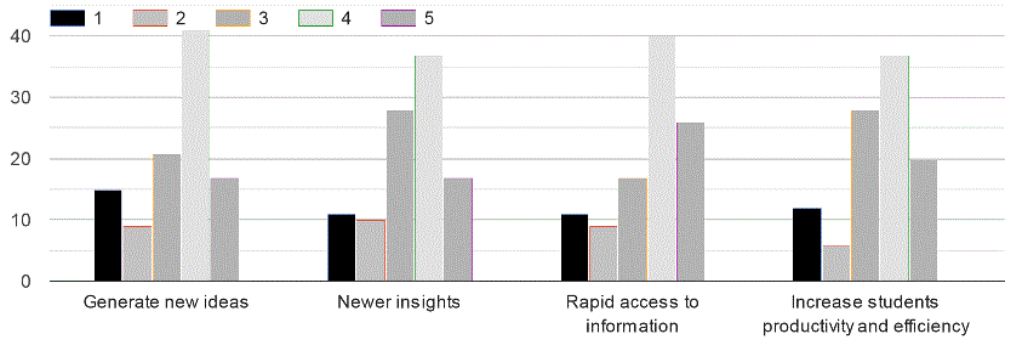

Figure2: The benefits of using Chatbots to develop a business model canvas

4.3 The Limitations of Chatbots to Improve Business Model

The entrepreneurial students were inquired about the limitations of using Chatbots to improve business models. The questionnaire required participants to rate their responses on a scale of 1 (very weak) to 5 (very strong). The findings revealed that the student's response to creativity as a limitation of chatbots scored a p-value of 0.485, which is insignificant. Thus, creativity is not a limitation of chatbots. As per, sources and accuracy of data as a limitation of chatbots, a p- p-value of 0.481, which is not significant, thus it is not a limitation. The student's response on getting specific and real-time data from chatbots, had a p-value of 0.488, which is not significant, thus it is not a limitation. Accordant with, wording a prompt correctly and asking specific questions, a p-value of 0.490, which is not significant, thus, it is not a limitation. Therefore, entrepreneurial students don't consider the variables that are discussed above as a limitation of AI chatbots to improve their business model. The students don't think chatbots lack creativity and provide standardized responses. It can provide real-time information about surveys/demand and statistics, which would aid in the customer development plans of a new venture. Chatbots recognize the wording of questions asked and respond accurately.

Table 3: The limitations of Chatbots to improve business model

Variables	N	Mean	Std. Dev.	t-test	p-value
Creativity	103	3.28	1.20	0.036	0.485
Sources and accuracy of data	103	3.24	1.10	0.046	0.481
Specific and real time data	103	3.22	1.20	0.028	0.488
Wording a prompt correctly	103	3.24	1.18	0.023	0.490

4.4 The Business Advice Usually Requested From Chatbots

The entrepreneurial students were inquired about the kind of business advice they usually request from Chatbots. The questionnaire required participants to rate their responses on a scale of 1 (Never) to 5 (Always). The findings revealed that 39 students are positive about getting suggestions on marketing for business advice. 46 students responded that chatbots help in competitor analysis. 47 students responded that chatbots assist in market research. 32 students agreed that chatbots facilitate legal aspects. 47 students responded that chatbots aid in social media and web design. Thus, entrepreneurial students are optimistic about getting distinct business advice from AI chatbots.

Table 4: The business advice usually requested from Chatbots

The overall benefits of using Chatbots in education	No. of students rated themselves on Likert scale	No. of students rated themselves 2 on Likert scale	No. of students rated themselves 3 on Likert scale	No. of students rated themselves 4 on Likert scale	No. of students rated themselves 5 on Likert scale
Suggestion on marketing	20	14	30	26	13
Competitor analysis	17	11	28	23	13
Market research	15	9	32	30	17
Legal aspects	18	15	32	21	12
Social media and web design	14	7	32	30	17

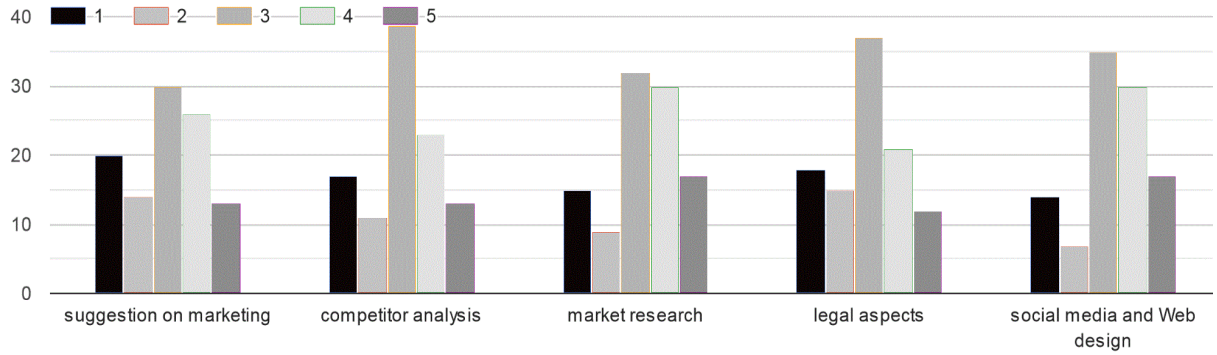

Figure 3: The business advice usually requested from Chatbots

5. Conclusion

The study established that the majority of entrepreneurial students are using AI chatbots for their educational purposes. Most of these students got information about these chatbots through social media platforms. Some students also got information about chatbots through people they know and from their college. Most of the students have accessed ChatGPT for their educational purposes.

The entrepreneurial students responded that getting feedback for their assignments, preparing for examinations and rapid access to information are major benefits of using Chatbots for educational purposes. It can assist in generating new ideas, developing newer insights, and getting rapid access to information to evolve a business model canvas. It also increases the productivity and efficiency of students. AI chatbots facilitate entrepreneurial students' business advice on marketing and competitor analysis. It also assists in market research and legal aspects. Chatbots provide valuable insights on social media and web design to develop business plans.

6. Limitations

Though our research studies the impact of Artificial Intelligence on advancement in entrepreneurial education, it is restricted to a small number of respondents. Secondly, it does not observe the impact of AI on entrepreneurial education from the point of view of the instructors in entrepreneurial institutions.

Abstract: Start-ups have become a pillar of EC' open innovation initiatives. With the aim of accessing start-up innovation, established companies (EC) use various corporate venturing modes. However, as established corporate venturing modes (e.g. corporate venture capital or accelerators) do not provide direct access to start-up innovation, the venture client model (VCLM) is receiving increasing attention in corporate practice. In the VCLM, ECs become paying customers of start-ups without taking equity - they become venture clients. In joint pilot projects, they apply start-up solutions to their products, processes or business models in order to solve relevant business problems and create strategic impact for increased competitiveness. The literature lists different EC using the VCLM such as BMW, Bosch, Continental, Daimler, Siemens, or ZF. This suggests that the VCLM is only used in EC with tens of thousands of employees, from Germany and in technology-intensive sectors such as automotive, mechanical engineering or telecommunications. On the other hand, GIMMY describes the suitability of the VCLM for any EC. However, in order to develop practical solutions to the challenges of the VCLM (e.g. slow purchasing, legal and IT processes or lack of acceptance of start-ups as collaboration partners), it is necessary to know the users (type of EC) of these solutions. Therefore, the aim of this paper is to characterize the EC using the VCLM with respect to industry, size and regionality.

Keywords: Venture client model, Corporate venturing, Start-up collaboration, Open innovation

1. Introduction

In times where rapid technology change and accelerated development cycles collide with limited resources established companies (EC) are seeking external sources of innovation to maintain competitive in global markets (Enkel & Sagmeister, 2021; Onetti, 2021). Therefore, "start-ups have become a pillar of […] [their] open innovation initiatives" (Moschner et al., 2019). Start-up ideas are not only more novel and beneficial to customers than those of EC, but they are also equipped with a substantial amount of venture capital to transform these ideas into innovations (Simon, 2019). In concrete terms, $285 billion of venture capital was invested in approximately 19,500 start-ups in 2023 (Teare, 2024). For EC these figures represent 19,500 innovations, which do not have to be developed in-house and $285 billion of R&D-budget which do not have to be spent. In the past EC have employed a variety of different corporate venturing modes such as hackathons, corporate incubators and accelerators or corporate venture capital to benefit from start-ups' significant innovation potential (Kurpjuweit & Wagner, 2020; Enkel & Sagmeister, 2021; Gutmann & Lang, 2022; Faria et al., 2018).

Nevertheless, as these modes are not ideally designed to integrate start-up innovation into the core business a growing number of EC started to adopt a new corporate venturing mode – the venture client model (VCLM) (Gimmy et al., 2017). Noteworthy examples of EC adopting the VCLM include such as BMW, Bosch, Continental, Daimler, Siemens, Telefonica, and ZF (Gimmy et al. 2017; Kurpjuweit und Wagner 2020; Mais et al. 2023). Applying the VCLM, they become paying customers of start-ups without taking equity - they become venture clients (Haarmann et al., 2023; Mais et al., 2023). In joint pilot projects, they apply start-up solutions to their products, processes, business models or IT-systems to solve relevant business problems and create strategic impact for increased competitiveness. Considering the recent emergence of the VCLM, EC are confronted with a multitude of challenges. These challenges encompass the design of a venture client strategy, process and organization; the creation of a start-up-friendly, open-minded corporate culture and internal awareness for the VCLM; and the implementation of the model itself (Gutmann et al., 2020; Kurpjuweit 2019; Corvello et al., 2021; Gimmy et al., 2017; Haarmann et al., 2023). The current state of literature provides a general overview about the model but does not offer comprehensive solutions to the mentioned challenges (Haarmann et al., 2023). To develop solutions that are relevant for EC, it is necessary to frame them in accordance with the EC' characteristics, such as company size, regionality or industry (Hevner et al., 2004). The literature indicates that

the VCLM is employed exclusively by EC with tens of thousands of employees, particularly those based in Germany and operating in technology-intensive sectors such as automotive, mechanical engineering or telecommunications. However, GIMMY states that the VCLM is suitable for any kind of EC (Gimmy, 2022). Consequently, the objective of this paper is to characterise users of the VCLM to create guidelines for future research. The research question that underlies this study is as follows:

What are the defining characteristics of established companies that use the venture client model?

The paper unfolds as follows: The second chapter commences with an overview of the VCLM and user companies as they have been described in the literature. Chapter three presents the underlying research design. The results are then presented and described in detail. Chapter 5 is concerned with the interpretation of findings from Chapter 4 and presents the limitations of the research and the implications for future studies in the field and for business practice. Chapter 6 provides a summary of the problem, procedure and results.

2. Theoretical Background

The VCLM was coined by Gregor Gimmy and Matthias Meyer at BMW (Gimmy et al., 2017; Gutmann et al., 2020; Haarmann et al. 2023). It distinguishes from other corporate venturing modes by three unique characteristics. Firstly, it contributes directly to an EC competitiveness and innovativeness by solving relevant business challenges (Mais et al, 2023). Secondly, to solve the business challenge, the EC purchases the start-ups product not its equity (Gimmy et al., 2017). Thirdly, to mitigate the risk associated with buying a less mature product from a less mature company (start-up) compared to established suppliers, the venture client and the start-up conduct a joint pilot project (Kurpjuweit & Wagner, 2020; Haarmann et al., 2023).

This results in manifold benefits for EC and start-ups. As the VCLM aims to solve challenges of business or corporate functions (venture clients) it ensures the integration of start-up solution into the core business (van der Meer et al., 2021). This is contrary to other corporate venturing modes such as incubators, where start-ups and corporate innovation managers develop ideas and prototypes together before approaching business unit managers (Kurpjuweit & Wagner, 2020). As these managers often do not have a useful application for the developed solution the integration into the core business fails (Kurpjuweit & Wagner, 2020). In addition, the connection to the core business results in another advantage. The VCLM is more scalable than other corporate venturing modes as the majority of the required resources (e.g. budget or staff to conduct the pilot project) are provided by the venture client rather than the venture client unit and are therefore less limited (Gimmy et al., 2017; Kurpjuweit & Wagner, 2020; Weiblen & Chesbrough, 2015). Furthermore, EC benefit from purchasing the start-up's product rather than its equity as well as the limited scope of the pilot project. This requires less capital and is consequently accompanied by a lower risk (Gimmy et al., 2017). Additionally, the pilot project offers EC the possibility to test start-up solutions quickly and adopt them to their specific needs (Kurpjuweit & Wagner, 2020, Veit et al., 2021; Gutmann & Lang 2022). Start-ups benefit especially from the pilot projects. They gain access to the extensive industry and technical expertise of the EC, get feedback on their product, improve their credibility through reference customers and receive renumeration for conducting the pilot project (Gimmy et al., 2017; Gutmann et al., 2020; Enkel & Sagmeister, 2021; Corvello et al., 2021; Gutmann & Lang 2022; Onetti, 2021). In addition, the start-ups preserve their autonomy as the venture client does not purchase its' equity (Mais et al., 2023; Faria et al., 2018). To solve relevant business challenges using the VCLM, EC follow a distinct venture client process. This process is divided in six process steps (see Figure 1).

Figure 1: Venture client process (Haarmann et al., 2023)

The process starts with the identification, detailing and selection of relevant challenges for the VCLM (Corvello et al. 2023; Haarmann et al., 2023). Based on the previously defined problem and the venture client unit scouts start-ups, pre-evaluates them and creates a longlist (Haarmann et al., 2023). In the "match" process the longlist gets evaluated by the venture client to create a shortlist. The start-ups included present their solution in form of a use case demo, which forms the basis for the final start-up selection by the venture client (Kurpjuweit et al., 2020, Corvello et al. 2023). Subsequently, the EC "buys" the start-up solution. This process step includes different legal, IT and purchasing processes (Haarmann et al., 2023). Thereafter, the pilot project is conducted, where the EC and the start-up build test and evaluate the developed prototype (Kurpjuweit & Wagner, 2020). In the final process step the EC has the option of continuing the collaboration in several ways. This includes development projects, (in-)direct purchasing, a venture capital investment or acquisition (Haarmann et al., 2023).

The literature on the VCLM is scarce. Systematic literature reviews by HAARMANN ET AL. and MAIS ET AL. identified only five dedicated publications on this topic (Haarmann et al., 2023, Mais et al., 2023). Other publications devote small sections to the VCLM without analysing it in detail. Consequently, there is a paucity of information in the literature about companies using the VCLM. There are only 15 companies in the literature that are described as users of the VCLM. However, a precise characterisation of the users of the VCLM is necessary to develop relevant solutions for corporate practice (Hevner et al., 2004). Figure 2 provides an overview of those EC mentioned in the literature. They are characterised by their industry, size in terms of revenue and employees as well as their affiliation to a venture client cluster (VCLC)[1].

Company	Industry sector	Revenue (in bn €)	Employees	VCL cluster affiliation	Source
Börse Stuttgart	Banks	8.9	700	No	Mais et al., 2023
Bosch	Industrial Goods & Services	88.2	134,000	Yes	Mais et al., 2023

Figure 2: Established companies using the venture client model

Characterising a typical venture client based on the current literature allows the following conclusion: A typical venture client is a German company operating in the automotive or mechanical engineering industry with more than 10.000 employees making 10 bn € in revenue, without an affiliation to a VCLC. However, the small data basis limits the validity of this statement. Furthermore, GIMMY states that the VCLM is suitable for all companies (Gimmy, 2022). Consequently, it is necessary to identify additional users of the VCLM and characterise them in order to tailor future research work specifically to the needs of these companies.

3. Research Design

A four-step research design is employed to characterise users of the VCLM (see Figure 3). This approach orientated towards the procedure for a systematic literature review, as outlined by Xiao & Watson (Xiao & Watson, 2017). While scientific publications are not the primary focus of this research and analysis, this transparent approach provides a comprehensive overview, establishes the foundation for the repeatability of the study, and minimises the potential for bias (Pati & Lorusso, 2018). The outcome of this research is the

[1] A VCLC is a collective of several EC, who decided to join forces and practice venture clienting cooperatively. Prominent examples are Stratosfare, BIND 4.0, Startup Autobahn or Combient Foundry. (Haarmann et al. 2023)

identification of 195 companies, which have been characterised according to their regionality, sector, size and affiliation to a VCLC.

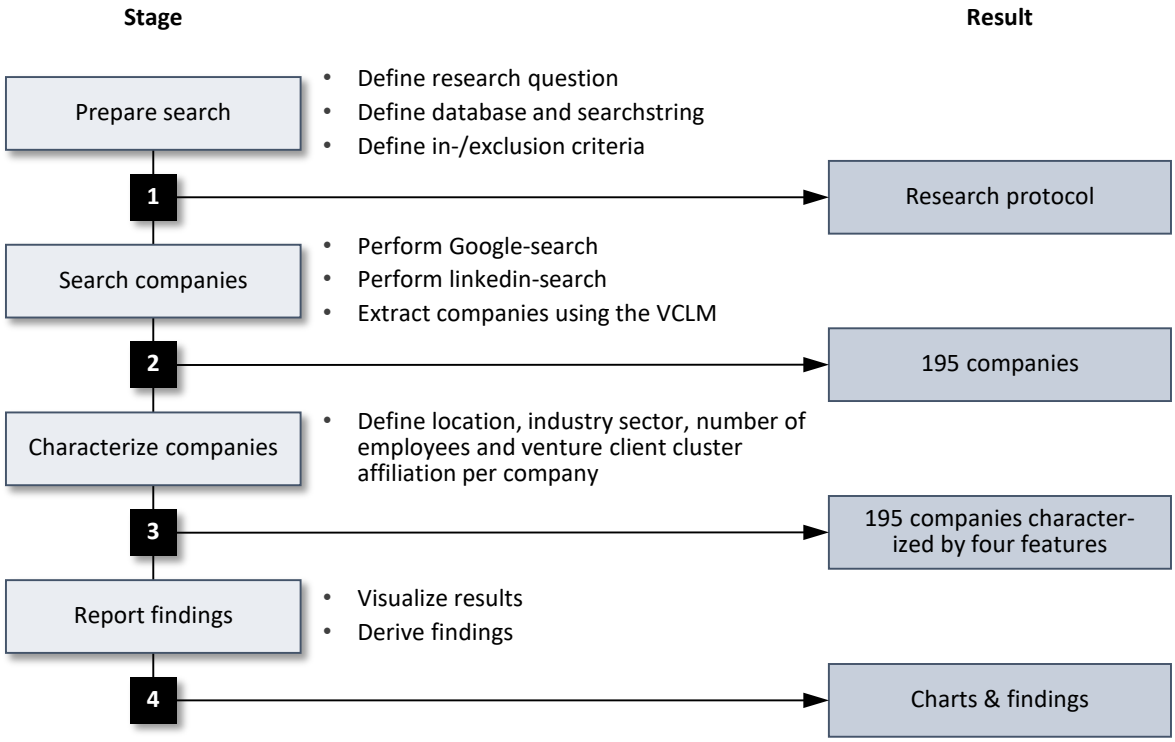

Figure 3: Research design

The initial phase of the research design concerns the formulation of the search strategy. To this end, the problem is first delineated and a corresponding research question is defined. Based on this, the database and the search string are defined. Given that only 15 user companies of the VCLM can be identified from the analysis of the scientific literature (see Figure 2), the more practically oriented databases "Google" and "Linkedin" are defined for the present analysis. Google can be employed to identify company websites, websites of venture client units (e.g. OTTO Dock6) or popular scientific or newspaper articles. Linkedin is suitable for identifying user companies via Linkedin posts or profiles of company employees who describe venture clienting as part of their field of activity. Similar search strings are defined for the two different databases. Results containing the terms "venture client" or "venture clienting" should be included. Indirect searches using terms such as 'corporate venturing' or 'start-up unit' are excluded due to the large number of results unrelated to the VCLM. Only when searching Linkedin posts the search string is supplemented by the hashtags "#ventureclient" and "#ventureclienting". The adjustment is made iteratively due to the high number of unspecific search results when using the initial search string. The inclusion criteria are defined as including all companies that explicitly describe the application of the VCLM. EC that are not to be understood as users of start-up technology are excluded. These include management consultancies, universities or VCLC.

In a second step, two people independently search for user companies of the VCLM according to the framework described above. Any discrepancies are discussed until a clear result is achieved. Figure 4 shows the procedure in the form of a flow chart. The Google search results in 9880 hits for articles after 01/01/2014 (year of invention of the VCLM) (Gimmy, 2017). However, only the first 200 hits are accessible via Google. All other results are not displayed. To include more results in the search, the search is split into two different queries with different time periods (period of the first query with 1970 hits: 01.01.2014 - 31.12.2018; period of the second query with 7910 hits: 01.01.2019 - 01.04.2024). As a result, 400 search results are included in the analysis. The search on Linkedin for relevant personal profiles yields 612 hits and 327 hits for relevant posts. However, similar to Google, Linkedin limits the accessibility of posts. Only posts from the last nine months are accessible. This gives a total of 1354 relevant articles, Linkedin profiles and posts. Using the inclusion and exclusion criteria, 195 companies can be identified as users of the VCLM.

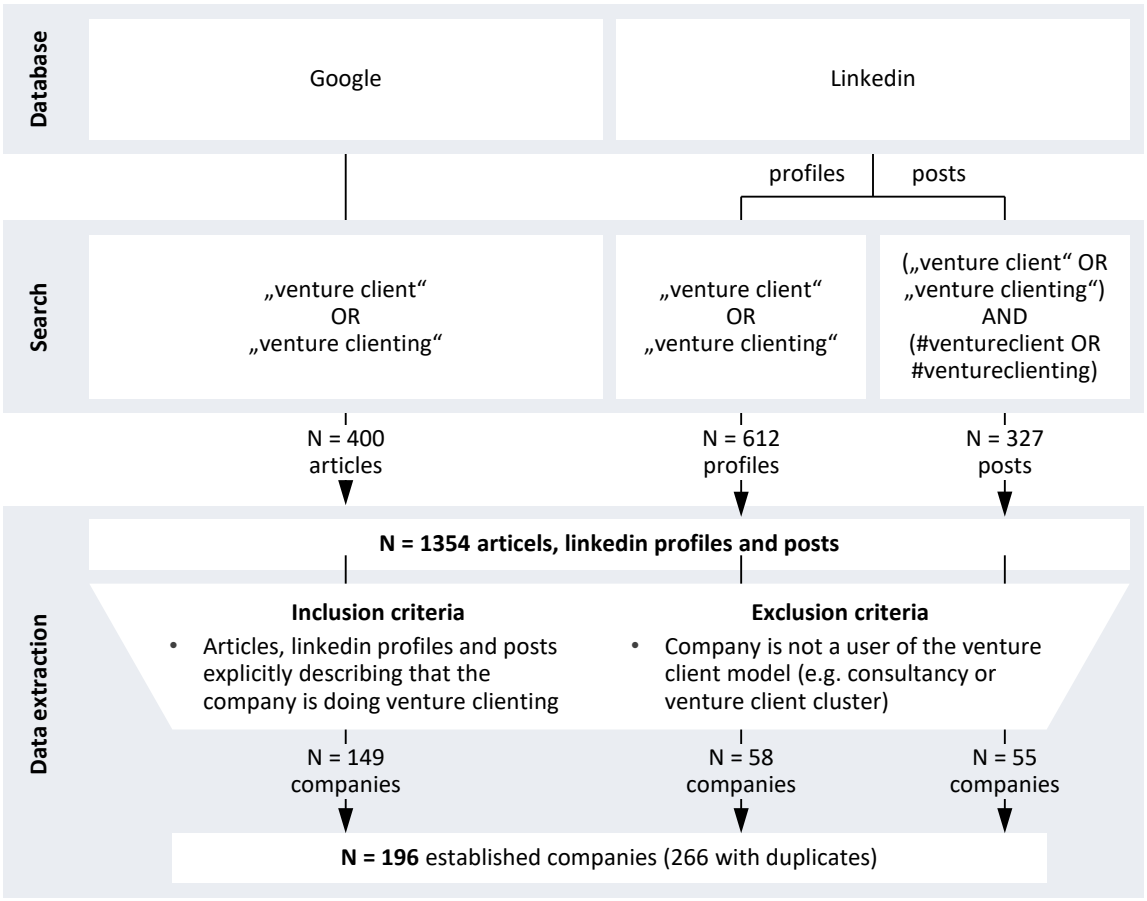

Figure 4: Flow chart of search and data extraction

In the third step, the identified companies are characterised according to the criteria of region, industry, size and affiliation to a VCLC. The companies' websites are used as a source of information. The Industry Classification Benchmark is used for industry characterisation at the supersector level (London Stock Exchange, 2024). No suitable schemes are available to classify companies by size. The OECD and other organisations classify companies according to the number of persons employed in categories 1-9, 10-19, 20-49, 50-249 and ≥250. However, since 98 % of the companies identified fall into the last category, this classification is not very useful. The same applies to the categorisation according to the annual turnover of the companies. Therefore, a categorisation according to Figure 7 is used.

In the fourth step, the results are visualised and implications are derived. The latter is done in a discussion between three scientists.

4. Results

A total of 195 companies with different characteristics were identified as users of the VCLM. This section presents and describes the distribution of the different characteristics of the regionality, sector affiliation and size in terms of number of employees. The last four dimensions are also evaluated in relation to cluster affiliation.

4.1 Regionality

Figure 5 shows the regional distribution of Venture Client users. The 20 countries shown are grouped on the x-axis into the three groups 'Europe', America' and 'Asia'. Within each group, they are shown in descending order of frequency. In addition, the companies' affiliation to a VCLC is shown in colour.

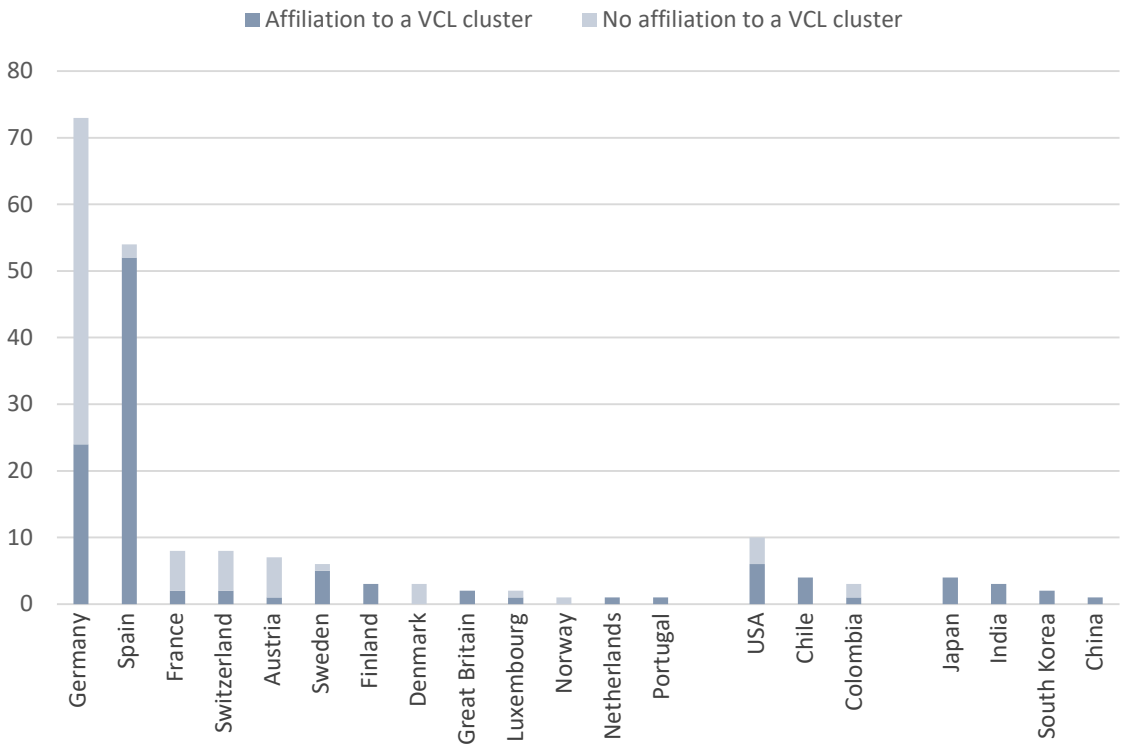

Figure 5: EC using the VCLM characterized by location of the headquarter

- Most user companies are from Europe (86%). The North and South America account for 9% and Asia for 5%.
- Within Europe and globally, most user companies are located in Germany (37%[2]) and Spain (28%[2]). In America, most user companies are located in the USA (5%[2]), while in Asia this position is held by Japan (2%[2]).
- In terms of affiliation to a VCLC, 46% are located in Spain and 21 % in Germany.
- Looking at the affiliation to a VCLC country-by-country it can be observed that 100% of the EC from Finland, UK, Colombia, Japan, India, South Korea and China as well as 96% from Spain and 86% from Sweden are affiliated to a VCLC.

4.2 Industry Sector

Figure 6 shows the distribution of Venture Client users by industry. The x-axis shows 18 different industry sectors.

- 27% of the user companies of the VCLM belong to the "Industrial goods & services" sector. This includes companies in the aerospace, electronics and, above all, mechanical engineering sectors. A further 20% can be assigned to the automotive sector and 9% to the "Basic Resources" sector. These include mining companies or manufacturers of paper, metal products or steel.
- Most companies belonging to a VCLC can be found in the “Industrial Goods & Services" (32) and "Automotive" (27) sectors. A further 14 companies belong to the "Basic Resources" sector, 9 to the "Food & Beverage" sector and 7 to the "Health Care" sector.
- The sectors in which the majority of companies belong to a VCLC are as follows: Health Care (100%), Food & Beverage (90%), Basic Resources (78%) and Automotive (71%).

[2]On a global level

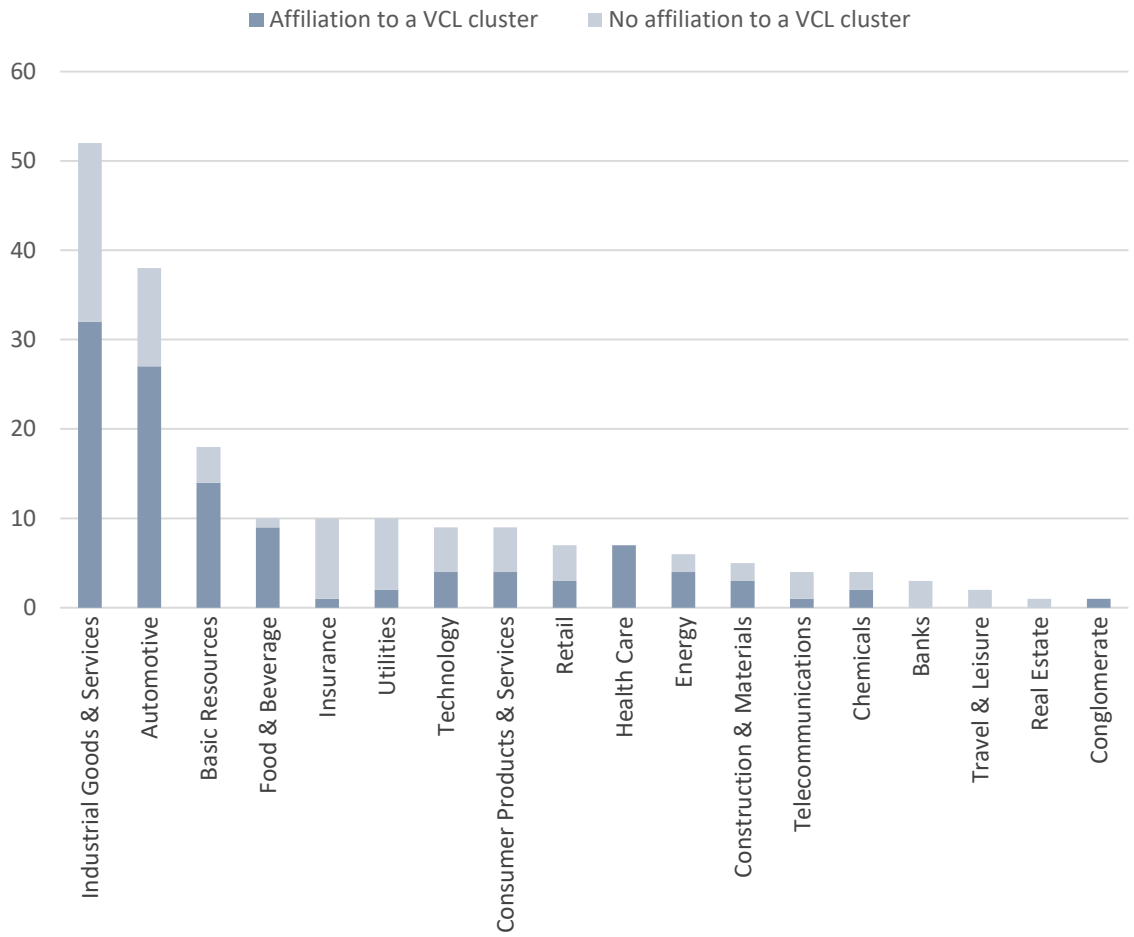

Figure 6: EC using the VCLM characterized by industry sector

4.3 Size

Figure 7 shows the distribution of user companies of the VCLM in terms of number of employees.

- 90% of user companies are almost equally distributed between the categories 1,000-9,999, 10,000-49,999 and ≥50,000 employees. 8% of user companies have 250-999 employees and 2% have less than 250 employees.
- Most of the companies (41) belonging to a VCLC fall into the category of companies with 1,000-9,999 employees. There are 31 companies with 10,000-49,999 employees and 25 of the companies with ≥50,000 employees belong to a VCLC.
- The proportion of companies belonging to a cluster per category shows that small user companies are most likely to be part of a cluster. 75% of companies with less than 250 persons employed and 88% of companies with 250-999 persons employed belong to a VCLC.

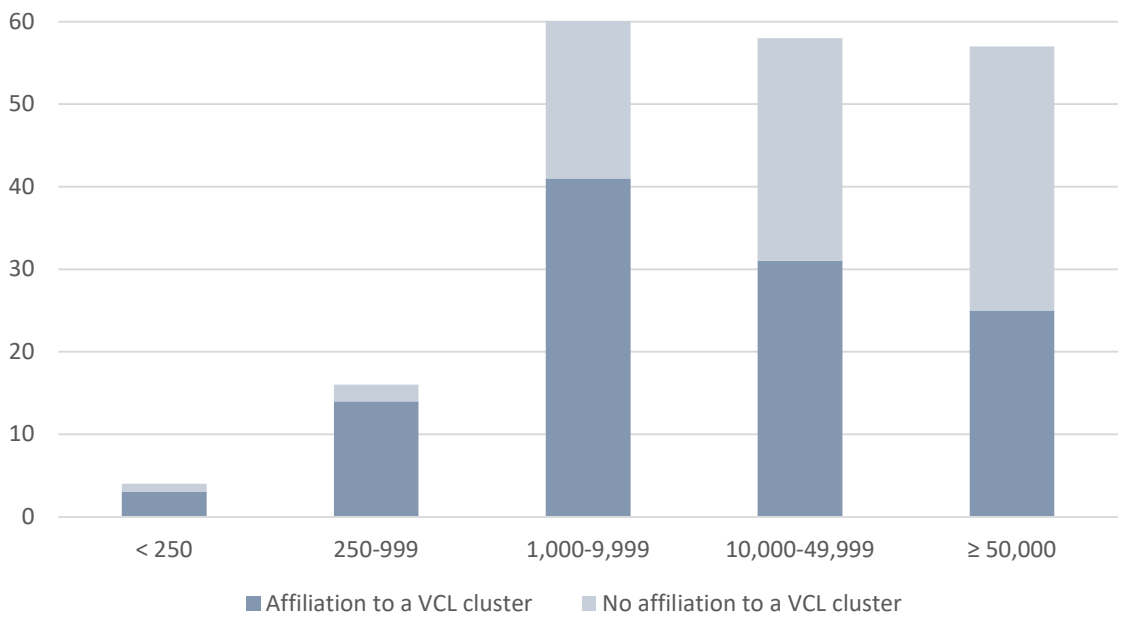

Figure 7: EC using the VCLM characterized by the number of employees

5. Discussion

Based on the literature, a typical user company of the VCLM can be characterized as follows: It comes from Germany, operates in the automotive or mechanical engineering sectors, does not belong to a VCLC and generates more than €10 billion in revenue with more than 10,000 employees. In contrast, the results of this study demonstrate that venture clienting is used in all companies regardless of their origin, industry or size. Nevertheless, various trends can be identified from the identified data. These trends and the hypotheses based on them are discussed below. Based on this, limitation as well as implications for research and business practice are derived.

There are various potential reasons for the regional concentration of user companies in Europe, particularly in Germany and Spain. First and foremost is the origin of the VCLM in Germany. The VCLM was invented at BMW and subsequently disseminated by the German consulting firm 27pilots. As the third largest economy in the world, Germany also boasts a considerable number of companies that are potential users of the VCLM and start-up technologies. Additionally, various VCLC are active in Germany, including Stratosfare, Startup Autobahn and TechFounders (Haarmann et al., 2023). These provide EC with knowledge for setting up the VCLM, take over individual steps of the venture client process (e.g. scouting) or the entire process, enable exchange between the cluster companies and thus help to lower the entry barriers to the application of the VCLM. Similar trends can also be noticed in Spain, Sweden and Finland, where approximately 90% of the user companies are part of BIND 4.0 (Spain) and Combient Foundry (Sweden and Finland) (Haarmann et al., 2023).

In addition to the strikingly high concentration in the countries already described the low number of user companies outside of Europe, and especially in the USA, is particularly noteworthy. The United States, with Silicon Valley as the world's leading start-up ecosystem, offers a wide range of start-up solutions and is also the world's largest economy, with many potential user companies. It is therefore reasonable to conclude that outside Europe and in the USA, the VCLM is not referred to by that name or that the use of the model is not communicated to the same extent as in Europe.

With regard to sector affiliation, there is a discernible increase in the utilisation of the VCLM in the industrial goods and services and automotive sectors. One possible explanation for this discrepancy is the industry structure in Germany, Spain, and other countries with a high prevalence of VCLM users. Conversely, it is possible that this accumulation results from the high application potential for start-up technologies in these sectors. Although all companies have a similarly strong potential in terms of their processes or IT systems, they differ in terms of the potential of their products. For instance, a car manufacturer may install a diverse array of sensors, software, or displays from start-ups within its vehicle. However, for a paper manufacturer, the possibilities are considerably more constrained. A review of the size of user companies based on the number of employees reveals a comparatively low prevalence among companies with fewer than 1,000 employees. This observation

allows for the drawing of several conclusions. Firstly, dedicated innovation management often plays a subordinate role in small companies. Secondly, small companies are equipped with limited resources, often having little or no dedicated innovation management staff with specific venture client knowledge. Furthermore, the costs associated with a pilot project of approximately 25.000 €, represent a significantly greater financial risk for smaller companies than for larger ones (Gutmann et al., 2020). Thirdly, smaller companies are less attractive to start-ups than larger ones, as they have less appeal as reference customers and potentially commission a lower volume. If smaller companies use the VCLM, they usually do so as part of a VCLC. The clusters address the aforementioned entry barriers by providing personnel capacities and knowledge on the subject of venture clienting, as well as through the increased appeal resulting from the collaboration of many companies.

This discussion of the results reveals three limitations: The search string, the database selection and the fact that EC do not necessarily disclose and promote their venture clienting activities on the internet. The online search was conducted with a focus on the search term “venture clienting”, as this is the predominant description of the corporate venturing mode in the researchers' region. The results show a low number of venture client users outside of Europe which may lead to the assumption that some user companies were not covered using this search string. This is also supported by the fact that for example the number of start-ups and large technology companies in the USA, offers great potential for venture clienting. The inability to find these companies practicing venture clienting outside Europe may be due to the different names are used for this corporate venturing mode in these regions. The second limitation is the selection of the databases for this search. Additional databases may lead to additional results. Moreover, the selected search engines limit their search results. Google limits the search results displayed to 200 per search query and LinkedIn only displayed the first 327 results when searching through the posts. Lastly, the willingness of EC to disclose their venture clienting activities displays a limitation. Although this can lead to a decrease in visibility for leading start-ups, EC may hide venture clienting activities due to their low maturity as the VCLM is comparatively new or to give competitors little insight into their innovation activities.

From a research perspective, three main areas of focus can be identified. Firstly, the spread of the VCLM outside Europe needs to be analysed more closely. Due to its role in the global start-up ecosystem and the global economy, the USA is of particular interest. It is important to examine whether other approaches of solving business challenges with start-up technology exist or whether this approach is not practised. Secondly, the existing challenges in the implementation and operation of the VCLM in EC must be addressed. When applying the VCLM, EC typically rely on the institutionalisation of the VCLM in the form of venture client units with dedicated strategies, processes and organisational structures. The systematic literature review by Haarmann et al. reveals a paucity of literature on the implementation of the VCLM. While the strategy for venture clienting is not addressed, there are some process descriptions at a high level of abstraction (Haarmann et al., 2023). MAIS ET AL. and MACHON ET AL. also provide a number of tools (e.g. criteria for start-up evaluation) for the application of the venture client process (Mais et al., 2023; Machon et al., 2023). The design of the organisational structure in the form of a venture client unit is described in only isolated observations from corporate practice (Kurpjuweit & Wagner, 2020; Enkel & Sagmeister, 2021). Thirdly, further research should focus on the establishment and operation of VCLC. In addition, solutions must be developed for the successful interaction of these clusters, especially with smaller companies. Here too, hardly any preliminary work exists. Only MACHON ET AL. provide a cursory overview of the functionality, advantages and challenges of the VCLC "Stratosfare" in their case study (Machon et al., 2023). Although this is a theoretical paper, two statements can be derived for practical application. Firstly, the VCLM is relevant across industries, countries and company sizes. In combination with the advantages discussed in section 2, managers of EC are encouraged to consider the potential of start-up solutions and the VCLM. Secondly, these managers, but especially the managers of smaller EC, should consider joining VCLC or seeking allies to form such a cluster. Consequently, the barriers to entry in the context of venture clienting can be reduced.

6. Conclusion

The objective of this paper is to provide guidelines for future research in the field of venture clienting. In order to identify the user companies of the VCLM and associated research, it is necessary to characterise them. A four-step research design was employed to identify 195 user companies. The results show that the VCLM is used by EC across all industries, countries and sizes. However, an analysis of the size of venture client user companies in conjunction with their affiliation to a VCLC provides a significant insight. Companies with fewer than 1,000 employees engage in venture clienting in collaboration with clusters. Potential drivers include the utilisation of external knowledge, human resources necessary for successful venture clienting and greater visibility and attractiveness for start-ups. Consequently, it is vital to investigate how smaller companies with limited resources

and a lack of familiarity with the VCLM can benefit from the model in collaboration with VCLC, and how these clusters should be structured. Companies with 10,000 employees or more are increasingly utilising the VCLM independently, establishing their own venture client units with dedicated strategies, processes and structures. It is similarly crucial to devise practical solutions to the challenges faced by these companies.

Abstract: This paper contributes to the entrepreneurship literature by illustrating the significance of social capital in shaping the identity of migrant entrepreneurs throughout various stages of the entrepreneurial process. The novelty of this research lies in highlighting the adaptability of the social capital role in constructing the migrant entrepreneurs' identities, enabling them to overcome challenges encountered in emerging contexts. By employing a thematic-content analysis method strengthened by narratives, we gain a comprehensive understanding of how migrant entrepreneurs interpret and enact their social capital in constructing their entrepreneurial identities. Our results reveal that EI construction is a dynamic process that ME navigate through the strategic use of SC. This involves the cultivation of both bonding and bridging social networks that provide crucial resources, emotional support, and access to diverse opportunities. Our results highlight that ME are engaged in a complex process of identity negotiation, where they must balance the preservation of their origin's cultural identity with the necessity to adapt to the entrepreneurial identity valued in the host country. This process involves a sophisticated interplay of adopting, adapting, and sometimes resisting the norms and expectations that define the entrepreneurial landscape they are operating within.

Keywords: Social capital, Immigrant entrepreneurs, Entrepreneurial identity, Identity construction, Emergent context

1. Introduction

Although the entrepreneurship literature has already embraced the role of social capital (SC) in investing and embedding valuable resources for entrepreneurs, meanwhile the association between identity construction (IC) and SC remains largely unexamined, particularly in studies of migrant self-employment. Indeed, entrepreneurial identity (EI) research acknowledges the centrality of context for both constructing and enacting EI. As Radu-Lefebvre et *al*., (2021) noticed, EI research should revolve around two overreaching themes: the interplay of EI and temporal context; and the mechanisms for (re)constructing and losing EI. Drawing on these insights, this paper aims to explore the role of SC in shaping the IC of ME throughout the different stages of their adventure abroad. The following question guide our study: How does SC structure the IC of ME during the different phases of the entrepreneurial process?

Current research into the EI construction of ME has revealed several gaps that offer opportunities for further exploration. There is a notable lack of longitudinal studies that track the evolution of EI over time, which could provide deeper insights into the dynamic changes these identities undergo in response to varying economic and social conditions (Eimermann and Kordel, 2018). Thus, we aim to investigate the migrant entrepreneurial trajectory regarding the relevance of SC, on one hand and the EI construction, on the other hand. To do so, we deploy a qualitative design through in-deep interviews with 32 ME who made career transitions from developed and developing contexts to an emergent one. We draw upon narratives that synthesize the migrant entrepreneurial story with regard to SC and IC. Our aim is to capture the temporal evolution of ME' EI with conjunction of the SC accumulated over time by embracing a longitudinal approach that is appropriate for understanding "who entrepreneurs are? And "who they might want to be?".

The study begins by establishing the theoretical foundation, discussing key concepts of SC and identity within the framework of migration and entrepreneurship. A comprehensive literature review will then synthesize existing research, highlighting the gaps that this study intends to address. Our methodology section outlines the data collection methods employed, as well as the sample description and the research design. Following this, we present and interpret our findings, which reveal how ME leverage SC for their IC. The discussion section contextualizes these findings within broader theoretical and practical implications, emphasizing the dynamic interplay between SC and migrant EI in an emergent context. Concluding remarks summarize the key insights, acknowledge the limitations of the current study, and propose directions for future research.

2. Literature Review

2.1 Entrepreneurial Identity Construction Among Migrant Entrepreneurs

ME often reconstruct their identities to align with the host country's entrepreneurial norms and expectations, a transformation that is crucial for both their business success and social integration. This identity reconstruction is viewed as a dynamic process, heavily influenced by continuous interactions within their networks, which facilitate their integration into new economic and social environments. Eimermann and Kordel (2018) discuss how international lifestyle ME in new migration destinations utilize their transnational networks to negotiate identity and entrepreneurial practices in response to local conditions. Similarly, McKeever et al., (2015) highlight how these interactions help ME navigate and integrate into new settings by leveraging SC in ways that reshape their EI. Radu-Lefebvre et al., (2022) further enrich this understanding by highlighting EI as either a "Property" or a "Process". In the "Property" perspective, EI is seen as a stable set of characteristics that entrepreneurs bring into their new ventures, influencing decision-making and resource acquisition. Conversely, the "Process" perspective views EI as continuously negotiated and evolving through social interactions and contextual engagements. This perspective underscores the fluid nature of identity among ME as they adapt to new cultural and business environments, actively shaping and reshaping their identities in response to changing circumstances.

The construction of EI is significantly influenced by intersectionality, where gender, ethnicity, and class converge to shape the individual experiences of ME. Ozasir Kacar and Esser (2019) highlight how Turkish migrant women in the Netherlands experience their entrepreneurial journeys through the lens of these intersecting identities, influenced by the broader socio-political tensions and policies of the host country. These external factors create complex opportunity structures that either enable or restrict the entrepreneurial activities and identity construction processes of migrants. Empirical studies such as those by Smith et al., (2023) and Giazitzoglu and Korede (2023) provide insights into how ME navigate identity conflicts and manage the dual pressures of aligning with cultural norms of their communities while also adapting to the mainstream market expectations. These studies highlight the role of adaptive identity strategies in overcoming the challenges posed by dual cultural expectations. Furthermore, the entrepreneurial environment of the host country, including market conditions, societal norms, and regulatory frameworks, plays a pivotal role in shaping the entrepreneurial identities of migrants.

2.2 Social Capital Role in Constructing Migrant Entrepreneurs' Identities

SC is pivotal in entrepreneurship, especially for migrants who navigate unfamiliar and new economic landscapes. Putnam (2000) defines SC as the aspects of social organization, like trust, norms, and networks, which enhance the efficiency of society by facilitating coordinated actions. SC for ME refers to the cumulative assets derived from networks of relationships that these entrepreneurs can mobilize to access various resources, information, and support systems necessary for business initiation and growth in a new environment. SC for ME includes two dimensions:

- Bonding SC: Strong ties within one's own ethnic or cultural community, providing emotional support, trust, and cooperative norms that facilitate mutual assistance among community members (Putnam, 2000; Light & Dana, 2013; Kleinhempel et al., 2022);
- Bridging SC: Weaker, more diverse ties that extend beyond one's immediate community to include a broader range of contacts across different social, ethnic, or economic groups. These ties are crucial for accessing new opportunities, broader markets, and resources outside the ethnic enclave (Putnam, 2000; Kleinhempel et al., 2022).

Explaining how SC influences the entrepreneurial activities of migrants was the subject of recent studies that focus on different aspects of migrant entrepreneurship, converging on the importance of both intra-community (bonding) and inter-community (bridging) SC and addressing various contexts from forced migration to diverse migrant experiences in different geographical settings. For example, Williams and Krasniqi (2018) explored how forced migrants utilize both human and SC to engage in entrepreneurial activities, particularly focusing on Kosovan migrants. Their findings suggest that SC, especially from host country networks, plays a pivotal role in enabling entrepreneurial endeavors among migrants. Moreover, Ljungkvist et al., (2023) noticed that transnational entrepreneurs often rely on complex networks that span multiple countries to access resources, information, and markets. This transnational SC not only facilitates business operations in the host country but also strengthens connections with the country of origin, supporting bi-directional flows of capital, goods, and information. Yet arguably, the research conducted by Kleinhempel et al., (2022) critically examines the role of

SC at various stages of the entrepreneurial journey, focusing on its impact on venture creation across different European regions. Their findings reveal that SC significantly influences the formal establishment of ventures, indicating its crucial role in mobilizing external resources and accessing necessary networks during the early stages of business setup.

3. Methodology

This study employs a qualitative design to comprehensively explore how SC shapes the EI of ME throughout the entrepreneurial process. Bruner's (1991) approach to understanding human cognition and behavior through narratives provides a powerful methodological framework for investigating our research question. Bruner emphasizes that narratives are essential tools through which individuals interpret their experiences and the world around them. In the following paragraphs, we will describe how we implemented the narrative method to collect data and outline the characteristics of our sample.

3.1 Data Collection: Selecting Narrative Methods

Bruner's seminal paper "*The narrative construction of reality.* Critical inquiry (1991)", discusses how individuals use narratives not just to tell stories but to make sense of their lives and construct their reality. Bruner argues that narratives are an essential part of human thought and are fundamental in how people understand the world and themselves. Using Bruner's framework, we explored how entrepreneurs narrate their journey, which in turn can reveal the underlying values, beliefs, and experiences that drive their business actions. To do so, collecting data through narratives involves several key principles, three of them were used in this research that we summarize as follows:

- Narrative interviews: Before conducting our narrative interviews, an initial contact with our participants was made via email or phone, followed by a detailed information sheet about the study's objectives. We conducted 32 in-depth semi-structured interviews in order to encourage ME to tell their stories in a natural, unrestricted manner. This format helps to capture the richness of their experiences and the personal significance they ascribe to those experiences. We asked open-ended questions to elicit detailed responses, enabling participants to construct and reconstruct their narratives during the conversation.

We begin the interview with a broad, open-ended question designed to encourage the participant to start telling her/his story. We asked her/him to describe how she/he started her/his business and to recount a significant event in her/his life that push her/him to launch her/his business outside her/his home country. After the initial step, the participant narrates her/his story with minimal interruption, we listened actively and intervened only sparingly, mainly to encourage the participant to elaborate or clarify points.

- Storytelling sessions: We organized three storytelling sessions where some of our ME (19) shared their experiences in a more informal or communal setting. Our objective was to provide insights into the collective narrative and shared meanings within the community of ME established in an emergent context.
- Document analysis: We collected personal documents such as letters, diaries, autobiographies, or even social media posts that contain narrative content. These sources can provide authentic, unsolicited expressions of personal narratives (Bruner, 1991). Analyzing such documents helped us understand how ME represent their identities and experiences over time.

3.2 Sample Description: A Panel of 32 Migrant Entrepreneurs

This study targets ME who have launched their businesses outside their home country, establishing themselves in Tunisia, within the last ten years. This population is chosen because of the unique challenges and opportunities they face in integrating into a new business environment, making them ideal candidates for studying the impact of SC on EI construction. We excluded from our sample the entrepreneurs who have not started a business but are only in the planning stages, the migrants who have lived in the host country for more than ten years, as their experiences might differ significantly from more recent migrants in terms of SC integration and businesses that are not independently owned and operated by the migrant (e.g., franchises, branch of a family business not directly managed by the migrant).

We have approached the Agency for the Promotion of Industry and Innovation (APII) as well as the International Organization for Migration (IOM) to recruit our participants. Additionally, we utilized the Facebook social media platform, including the Expats in Tunisia page, and consulted associations like Terre d'Asile in Tunisia to broaden

our sample. As a consequence, our sample contains 32 ME, this number is determined based on the principles of qualitative research, where the aim is to reach data saturation (Miles and Huberman, 2003).

3.3 Research Design: The Thematic-Content Analysis Method

Narrative interviews were audio-recorded and subsequently transcribed verbatim to capture the full detail and nuances of the narratives. The analysis of these interviews can be done through various methods, including thematic analysis, structural analysis, or a narrative inquiry approach. We utilized the thematic content analysis method to generate themes and sub-themes, aiding our understanding of the specificities of each story and how ME enact their SC in constructing their entrepreneurial identities. To do so, we relied on the methodology developed by Miles and Huberman (2003) to identify, analyze, and report patterns (themes) within data.

4. Results

After exploring the typologies of SC involved in the migrant entrepreneurship experience in an emerging context, and the various initial and emerging identity profiles of the ME, we selected themes that correspond to the components of our coding grid, which are derived from the literature review. Ultimately, three general themes were identified:

- Contextualization of the use of SC by ME;
- The typologies of SC present in the entrepreneurial trajectory of ME;
- The initial and emerging identity profiles of ME.

According to Bertaux (2016), this process involves identifying the logic of the trajectory, therefore, we opt for sequential analysis of syntheses, described as "a processive approach that shows how to group individual trajectories by examining the flow of events and states specific to the life of each individual" (Miles and Huberman, 2003: 315-316). The entrepreneurial trajectory of the ME in our sample can be structured around three essential stages: the pre-project stage, launch, and operationalization.

Table 1: Social capital and entrepreneurial creation stages by migrant entrepreneurs

Stages	Description
Pre-project stage	19 out of 32 interviewed ME decided to start a business in Tunisia following a meeting or an invitation from a trusted person, or a business opportunity. The others (13) moved to Tunisia due to political instability in their home countries. Once there, they took advantage of entrepreneurial opportunities that arose.
Project startup phase	All 32 ME succeed to start their projects, despite initial difficulties in the migrant entrepreneurship experience in Tunisia. This was possible thanks to the help provided by and through the SC they solicited or already had. This phase lasts on average one year and culminates in the project's implementation. All 32 ME managed to launch their projects thanks to the contribution of existing (28 ME) or solicited (4 ME) SC.
Operationalization of the project	After the project startup, ME envisage three scenarios: The first involves minor crises or recurring daily difficulties. The second involves a major crisis that may hinder project development. The third scenario sees no crises at all. During this stage, 18 ME had an easy start due to their SC, using various relationships to navigate challenges.

As outlined in the table 1, the stages of the migrant entrepreneurship process in Tunisia highlight the importance of SC from the first phase of the process to an end that results in either the creation of a sustainable business or the abandonment of the project. In order to better understand how SC shapes the identities of ME, we will begin our results' analysis by contextualizing the use of SC by the ME of our sample.

4.1 Contextualizing the use of Social Capital by Migrant Entrepreneurs

The entrepreneurial experience of the interviewed ME appears to be divided into several parts. The contribution of SC as an assistant in the majority of cases is validated, but it varies from one case to another; it turns out that there is sometimes a strong representative of this variable that significantly influences the progress of the creation process and even its realization and sustainability. In other cases, we notice that SC consists of networks of strong and weak, acquired or solicited relationships that extend a helping hand to ME in their entrepreneurial journeys within an emergent context.

The recourse to SC stems from a specific context unique to each ME. Generally, encountering a problem or difficulty spurs the development of a network of relationships or the search for a resource through held or acquired SC. 26 narratives have revealed that difficulties related to business creation (mainly access to information), are one of the main reasons for resorting to SC. Furthermore, it is observed that the language

barrier, particularly the lack of knowledge of the Tunisian dialect, has caused numerous problems for the majority of participants. Finally, we note that negative emotions are very frequently mentioned by ME. These difficulties act as primary triggers pushing ME in Tunisia to pay particular attention to SC; without it, the business creation process in Tunisia could be seriously hindered.

Table 2: Data structure for the contextualization of social capital for migrant entrepreneurs

First-order concepts	Second-order themes	Verbatims
Project execution difficulties	-Institutional complexities and obstacles	"*When you are in your own country, you know the rules; in Tunisia, if you don't know the rules, the risks increase. This is compounded by the language issue and cultural differences*"
		"*It took me 8 months to establish myself, it's very complicated in Tunisia*"
		"*Administrative paperwork is extensive in Tunisia, with many procedures to fulfill, and it takes a considerable amount of time to complete everything that is needed. Sometimes, I was tempted to abandon the process*"
		"*We know little about the Tunisian market for renting an office, for fitting out, and for furnishing and acquiring office equipment*"
	-Access to information - Lack of proficiency in Arabic language and Tunisian dialect	"*The prerequisites are first of all the language... the Tunisian dialect*"
Emotional regulation	Negative emotions (fear, loneliness and isolation)	"*When you come to Tunisia and you don't have SC, you feel you don't have a pillar, you don't have a relay, you can't move forward with your project. It's a loneliness mixed with excessive uncertainty and anxiety*"
		"*I come with French beekeeping experience and the first thing I hear here is: 'it's not like that here!' and it's depressing!"*

4.2 Typologies of Social Capital in the Entrepreneurial Trajectories of Migrant Entrepreneurs

In order to identify the extent of SC in the evolution of the ME' identity, we focus on the intervention of different forms of SC, as specified by Putnam (2000), during the various phases of the business creation process. Our findings indicate that ME predominantly utilize bridging SC while overlooking the bonding aspect. In the following table, we summarize the data structure related to the use of bonding and bridging SC by ME.

Table 3: Data structure of the typologies of social capital used by migrant entrepreneurs during their entrepreneurial trajectories

First-order concepts	Second-order themes	Verbatims
Bonding social capital	- Strong ties with own's community (family, friends; foreigners and other ME);	"*I followed my husband, trusting him and also his partner. I left everything behind: my job, my family, and I came to a country that was unknown to me*"
		"*There is also a young person who comes from France and who has studied management here and who also helps to organize all this*" noticed a French ME who adds "*My French migrant friend who was a beekeeper provides us with wax, propolis, and other products from the hive, and in return, I give him my essential oils*"
		"*I can say this very clearly: I believe that without my wife, I would not have been able to endure. When you arrive as a migrant, there is a welcoming environment, but you do not arrive alone; you arrive with who you are, and she is an integral part of who I am. I cannot imagine achieving anything here without her by my side. It is evident. She provides emotional support, but not only that...*"
Bridging social capital	- Getting the support of local communities in terms of procedures, norms, *etc.*;	"*Local contacts are a prerequisite for the success of project initiation*"
		"*Our local partner prepared a workspace suited to our activities and provided us with equipment at the best quality-price ratio*"
		"*Initially, when I arrived, I had no particular idea about taking care of all this, but there were two young women at that time... it was my first Tunisian acquaintance; they are still with me in this lab*"

First-order concepts	Second-order themes	Verbatims
	- Cultural convergence	"*Our Tunisian partner prepared the ground, gave us information, introduced us, and explained the culture, language, and knowledge, this is was particularly insightful for us*" "*A wonderful partnership with a dynamic, ambitious, and competent Tunisian who understands your approach and can easily adapt and communicate with you. Just the relationship we needed!*" "*The intellectual level, their training in biology in Tunisia and my studies in pharmacy in France only brings us closer and facilitates communication between us. We speak the same language and use the same codes*" "*At our first meeting, I was impressed by 'D's vision and the quality of his work. I felt that we had many common goals and values. We exchanged ideas, discussed challenges in our fields, and realized that we could achieve much more together*" "*For me, it's very important that there's reciprocity in mutual enrichment: she brings as much to me as I bring to her*" "*In addition to commercial success, 'D' and I form a sincere friendship, and we support each other in our personal and professional challenges. Our collaboration inspires other entrepreneurs in Tunisia and beyond, demonstrating the benefits of a successful partnership based on complementarity and shared values*" "*She brought a local touch and a deep understanding of the Tunisian market, and we brought our French expertise*" "*SC is about meeting, working together, and enriching exchanges with one another, where we can count on each other. When it's time to get to work, the group gets going and we achieve something*"
	- Reciprocity and trust	

4.3 Initial and Emerging Identity Profiles of Migrant Entrepreneurs

The conceptual generation of the theme "identity profiles" primarily allows us to discern an initial identity for ME, reflecting their identity traits at the time they decide to migrate and engage in entrepreneurship in Tunisia, that is, at the beginning of the experience. Subsequently, various emerging identities appear throughout the entrepreneurial journey, displaying characteristics that vary according to individuals and contexts.

Table 4: Data structure of the identity profiles (initial and emergent) of migrant entrepreneurs

First-order concepts	Second-order themes	Verbatims
Initial identity characteristics	- Name change; -Professional trajectory;	"*I was called (a French name)*" "*I chose pharmacy because it's a liberal profession. I did not want to work within a hierarchy; I want to take risks, but not too many*" "*I had succeeded in creating and developing several successful businesses in France*" "*I resigned from my job as a journalist*"
Emerging identity characteristics	- New first name; -Mastery of the Tunisian dialect; - Behavioral change.	"*I am now called 'A' an Arabic name very much appreciated in Tunisia, and I am proud of it. I adore my new name*" "*Today I am called (a Tunisian name) and I am happy with it; it allows me to feel Tunisian*" "*The language, Tunisian, was not a big obstacle for me; socializing allowed me to improve the Tunisian dialect day by day*" "*I make myself very small and let 'D' handle things*" "*I become a chameleon and adapt*" "*Certainly, I feel that I have changed because it does shape you to be here, to also be confronted*"

5. Discussion: How Migrant Entrepreneurs Construct Their Identities With the Help of Social Capital?

Our findings indicate that throughout the entrepreneurial journey in Tunisia, the identity of ME is in continuous flux, this notion is supported by Smith et al., (2023, p.1), who suggest that an entrepreneur's identity, in general, is closely tied to, and even shaped by, the unpredictable entrepreneurial journey with its ups and downs. Three categories of emerging identities arise from our analysis:

- Personal identity, which is "the person's unique sense of the self" (Postmes and Jetten, 2006: 260);
- Relational identity, which evolves over a prolonged series of interactions between the individual and their environment, thus presenting itself as a dynamic system (Kunnen and Bosma, 2006);
- Entrepreneurial identity, which comprises the behaviors and elements that characterize individuals when they perform entrepreneurial functions (Wagenschwanz, 2020). This identity is crucial for entrepreneurs throughout their journey, confronting them with the persistent question of "who am I" and it forms a strong bond between the entrepreneurs and their business, establishing a profound connection between the entrepreneur's identity and the often-unpredictable fluctuations of the business (Karagozoglu, and Wincent, 2019).

These three identities are in constant change, and the research results allow for a better understanding of their evolution throughout the three stages of the migrant entrepreneurship process in Tunisia. Each type of identity is composed of a set of components. Following the comparative analysis, we have identified for personal identity components such as first name, profession, and religion. For entrepreneurial identity, we have emphasized entrepreneurial skills. Given that entrepreneurial identity addresses the question of what the entrepreneur does rather than who they are (Smith et al., 2023: 2), we have attributed to the initial state of the 32 ME the notion of "initial identity," which encompasses the three aforementioned forms of identity: personal, entrepreneurial, and relational. This framework helps illuminate the existing dynamics throughout the migrant entrepreneurship process in Tunisia.

A significant element in the IC of ME appears to be the desire for continuity, this element consistently emerges in the discourse of our interviewees, who often mention their origins (family, first name, initial entrepreneurial skills, former profession), indicating that a connection to one's origins marks the beginning of the ME' identity formation process and that there is a willingness of ME to maintain continuity with their previous identity. Indeed, this idea is also shared by Christensen and Newman (2024), who emphasize in their research the importance of the initial identity associated with the migrant entrepreneur's previous life. They rely on acculturation psychology and the foundational identity theory to suggest that newly arrived migrants reflect on prioritizing their identity linked to their past and the level of connection they wish to establish in their new community.

Thus, the IC among the interviewed ME gains momentum from this "initial identity" and follows a surge of negative emotions such as fear, loneliness, and anxiety, as expressed in the collected narratives. Indeed, while crises and challenges related to creation are triggering events, it is also important to consider the concerning psychological state and negative emotions identified in the thematic analysis and confirmed during the comparative analysis. Thus, each time ME encounter a difficulty during the entrepreneurial process, they are plunged into an identity crisis that particularly affects their initial entrepreneurial identity. Subsequently, throughout their entrepreneurial journey in Tunisia, the encounter with inherent obstacles and challenges to the project, both during the project launch phase and during its operationalization, compels ME to rely on others, thus immersing them in a continuous process of identification. It is through this dynamic that the identities of ME are constructed and distinguished, and new ME' identities emerge. In this vein, we highlight the effort made by ME to preserve or develop the initial EI, of which the initial entrepreneurial skills represent the indicative characteristics of the ME identity change. Therefore, if these factors evolve negatively, ME must react in association with their network to address this imbalance. This idea aligns with the findings of Urban et al., (2022) on the importance of professional and entrepreneurial experience in predicting entrepreneurial success and thus the importance of preserving the EI in case of imbalance during a crisis. Thus, if the EI is threatened by the onset of crises and difficulties related to the entrepreneurial project or difficult access to information, or managing negative emotions following these issues, it is important to understand how ME manage these difficulties, as identity threats can harm the progress of their entrepreneurship, or even lead to the total abandonment of their business. To overcome these challenges, ME resort to or solicit adequate SC for the situation, they undertake a process of identity work that triggers the process of their IC.

Identity work, being the process by which the individual construct her/his own identity over time and through various contexts (Rostron, 2022), implies that humans are capable of consciously engaging in self-doubt and are consequently able to shape and redefine their own identity. We find that various variables of personal identity have been adjusted to facilitate integration and connection to Tunisians or migrants in Tunisia within the framework of a self-defined identification. Among these variables, we mention:

- The language;
- First name;
- Family;
- and behavior change.

6. Conclusion

The results of the sequential synthesis analysis conducted on the ME in Tunisia and its relationship with SC show that the role of SC in this experience begins very early in most cases, serving as a motivational factor, whether Tunisian or foreign, for migration and entrepreneurship during the pre-project stage. This corresponds to a migrant entrepreneurship of opportunity. This idea aligns with that of Foroozesh et al., (2018), who emphasize the importance of certain factors related to the migrant, such as SC, during all the stages of business creation in the host country through the guarantee of a presence and long-term support of family members, their relational network, and the resources at their disposal. This is the principle of "bounded solidarity" as described by Parsons (1949). We also identify some ME who are compelled to migrate to Tunisia due to the political, social, and economic instability caused by war in their country of origin (Syria, Lybia). In this case, the ME does not require SC to be motivated to migrate.

When ME encounter few or no obstacles in their entrepreneurial journey, they do not need to mobilize SC. These entrepreneurs do not show affinity towards local actors (self-referential identification) and do not seek to associate with them (self-defined identification). This is disidentification, which is associated with negative evaluations (Pratt, 2000). Furthermore, having a minimum of SC in the absence of crises during the operationalization of the entrepreneurial project results from ambivalent identification characterized by simultaneous positive and negative evaluations (Pratt, 2000), where ME choose to exploit their network of relationships and identify only with the positive elements while rejecting the negative aspects of SC.

In this study, we have elucidated the significant role that SC plays in shaping the EI of ME. Our findings reveal that both bonding and bridging social capital are indispensable in providing emotional support and practical business advantages, which are crucial for the integration of migrants into new market environments. This dual aspect of SC not only fosters personal growth but also facilitates access to vital resources and networks that enhance business operations and market reach.

Despite its contributions, this research has limitations, primarily related to its specific context. A comparative analysis across various emerging contexts would be more informative. We recommend expanding the analysis to include other emerging contexts by examining additional dimensions of SC that may differently influence the EI of ME. Additionally, future research could benefit from a quantitative design that integrates personality traits as a moderating variable between SC and IC among ME.

Abstract: The *technology audit* enables the assessment of the technological capability and thus the technological maturity of an RTO. It focuses on the analysis of the research activities in the R&D service areas of the RTO. This allows for a comprehensive understanding of the technologies used, the research competencies, the technologies developed, and the established technology partnerships of the RTO. Since 2017, technology audits have been conducted to evaluate the technological maturity of Brazilian SENAI innovation institutes (ISI). In the last seven years, 41 audits have been completed, providing ample opportunity to extensively test and refine the methodology. As experts 46 technology auditors from 17 different institutions participated. The extended duration and involvement of numerous experts facilitated continuous improvement of the methodology, necessary processes, and roles as well as needed materials. Two rounds of technology audits were conducted between 2017 and 2023. In the first round until the end of 2019, all 23 operational ISIs were audited, with 15 undergoing re-audits in the second round by the end of 2023. In this paper, the results of the application of the technology audit to assess the technological maturity of Brazilian Innovation Institutes is described. The objective of this evaluation of the application, which this paper undertakes, is to exemplify and verify the methodology of the technology audit. To this end, the background of 26 Brazilian SENAI innovation institutes is outlined to contextualize the use of the technology audit in these RTOs. Subsequently, aggregated results from 41 conducted technology audits are described, and concluding implications for the method are derived.

Keywords: Technology audit, Technological maturity, Technology assessment, Technological capability, Technological resources, Technological competences, Technology evaluation, Strategic technology management, Research and technology organizations

1. Introduction

Around the world, developed nations have found a way to strengthen their national innovation ecosystems over time with a variety of complementary entities playing important roles together, in order to foster economic growth. Among those players, RTOs (Research and Technology Organizations) have taken a very important role of creating bridges among those entities that create knowledge (e.g. universities), those entities that apply knowledge to innovate (e.g. companies) and those entities interested in promoting the efficient use of knowledge for impacting societal and economic development (e.g. governments). (Hecklau et al. 2020)

For accomplishing that difficult intermediation role, RTOs must learn and professionalize their businesses to integrate and deal with scientific discoveries and developments from universities, translate such knowledge into viable applications for client companies, and sensibilize government and decision-makers about important and strategic business opportunities, interpreting their impact on society and economy. Therefore, the proper strategic positioning and execution of such a role in the innovation ecosystem requires continuous development of technological and management competences by multidisciplinary teams, as well as deep networking capabilities with partners and clients. (BMBF 2022; Arnold et al. 2010; Breznik 2015; Kröll 2007; Figueiredo 2014; Zehnder 1997)

Within the Brazilian innovation ecosystem, SENAI decided in 2012 to launch an ambitious program for fostering the increase of national industrial competitiveness, by planning and implementing new RTO structures under its broad set of unities spread all over Brazil. Since its creation in 1942, as a private entity guided by industry, but with non-profit orientation, SENAI has always served the Brazilian industry with high quality technical and technological educational services. The extension to further technological businesses (e.g. metrology and

consultancy services) came along time (around the 80s) with the industrial need for precise quality control in production environments. With the development of global innovation chains and strategies in this new century, it was time for SENAI to also expand its portfolio of "applied technological services" to the Brazilian industry with dedicated applied research centers, thus creating the SENAI Innovation Institutes (ISI) in direct cooperation and governance with CNI (National Confederation of Industry), with the Brazilian government and supported by investments from BNDES (National Development Bank).

The initial creation of 26 new applied research institutes by SENAI in 2012 had a deep inspiration in the well-known German Fraunhofer model and counted with the direct partnership of Fraunhofer IPK for such a challenging implementation. This successful partnership supported the expansion of the network to 27 current operating SENAI Innovation Institutes, which are guided and frequently evaluated with global best practices for R&D management. Among such practices, technology audits have been structured, conducted and evolved over time, in order to assess the technological capabilities of SENAI innovation institutes from the point of view from external experts, who are regularly dealing with, or have already become known global references in their technological fields. (Kohl et al. 2020; Kohl et al. 2015)

This paper intends to provide further information on the methodology behind such technology audits, as well as the results and impact for SENAI over time with its application among its innovation institutes as a guiding instrument for continuous improvement within a challenging and dynamic innovation ecosystem. For this purpose, a methodological approach was chosen that focuses on the description of the theoretical orientation and the extensive practical application of the technology audit as well as on a comparative analysis of the quantitative results. The research contribution of the paper lies in transparently documenting the development of a fit-for-purpose and application-oriented method for the technological assessment of RTOs and testing its suitability in application in order to improve the method based on the research results.

2. Technology Audit for Research and Technology Organizations

The Technology Audit represents a systematic methodology designed to analyze and evaluate the technological maturity of Research and Technology Organizations (RTOs), identifying opportunities for enhancement and initiating optimization processes. This audit employs a standardized procedure incorporating various models, such as the maturity model and assessment dimension model, alongside tools and templates, to facilitate a structured evaluation of the RTO being audited. (Hecklau et al. 2022b)

To obtain the necessary insights for assessing the technological maturity, all technological areas within the RTO are examined. A targeted approach involves selecting and discussing specific, representative research activities conducted in these areas. This approach provides a comprehensive overview of the organization's research activities through the analysis of a limited number of research and development projects, focusing on both past and current research endeavors. The analysis emphasizes the technologies and competencies utilized and the technological outcomes, such as prototypes, which are crucial for evaluating technological maturity based on predefined assessment dimensions. (Hecklau et al. 2023; Hecklau et al. 2022b, 2022a) To assess the technological maturity, an appropriate benchmark is selected for comparison (Werner und Sourder 1997). The auditor's expertise and the organization's research activities form the basis for the evaluation. The auditor outlines the international state-of-the-art in the relevant technological areas and employs the organization's research achievements, such as tangible results from internal projects, as a benchmark. (Hecklau et al. 2022b)

For the assessment of the dimensions, a technological maturity model was developed, comprising different levels. This model serves as the foundation for evaluating an RTO within the scope of the technology audit. The spectrum includes various gradations. Each level is described individually and specifically for each of the assessment dimensions to ensure a high degree of standardization and comparability between different RTOs. To this end, a technological maturity model has been created, consisting of five levels. It starts with maturity level 1, representing insufficient technological maturity, and culminates at maturity level 5, representing very high technological maturity. The technological maturity model is visualized in the following figure 1. (Hecklau et al. 2022b; Hecklau et al. 2023)

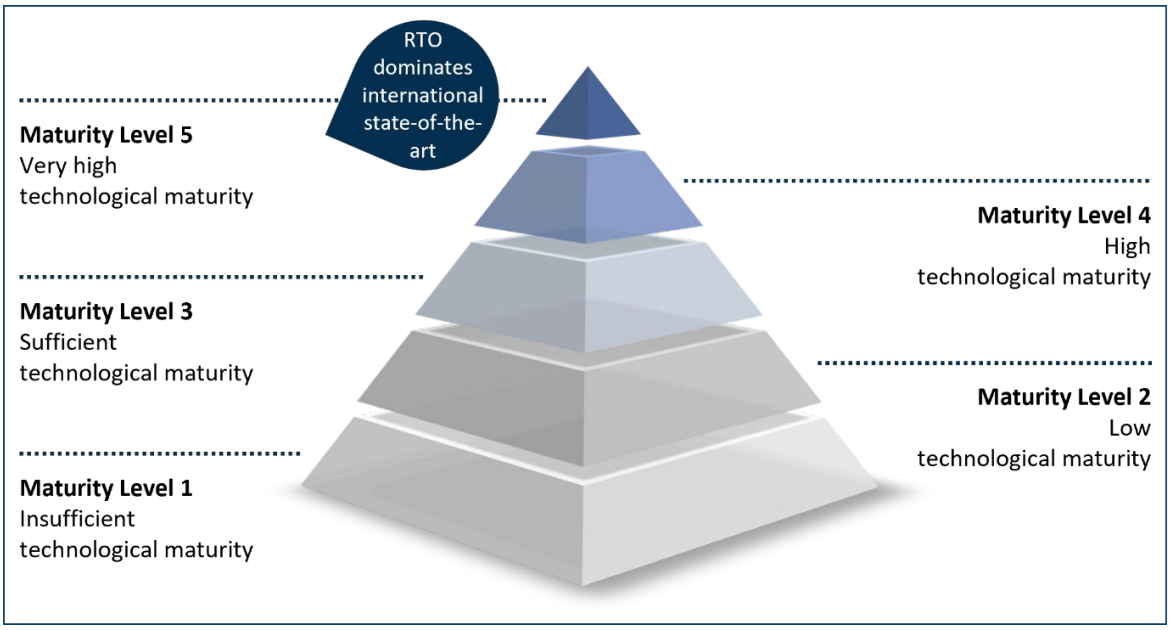

Figure 1: Technological Maturity Model for RTOs

3. Results of 41 Technology Audits at Brazilian SENAI Innovation Institutes

Since 2012, the Brazilian national training service SENAI has been setting up 26 innovation institutes. Under the umbrella organization of Brazilian industry CNI, SENAI is pursuing a network strategy in the development of these applied research institutes, which envisages the establishment of nationally operating institutes with different focus areas in different regions. Figure 1 below provides an overview of all operational SENAI innovation institutes and their respective research focuses.

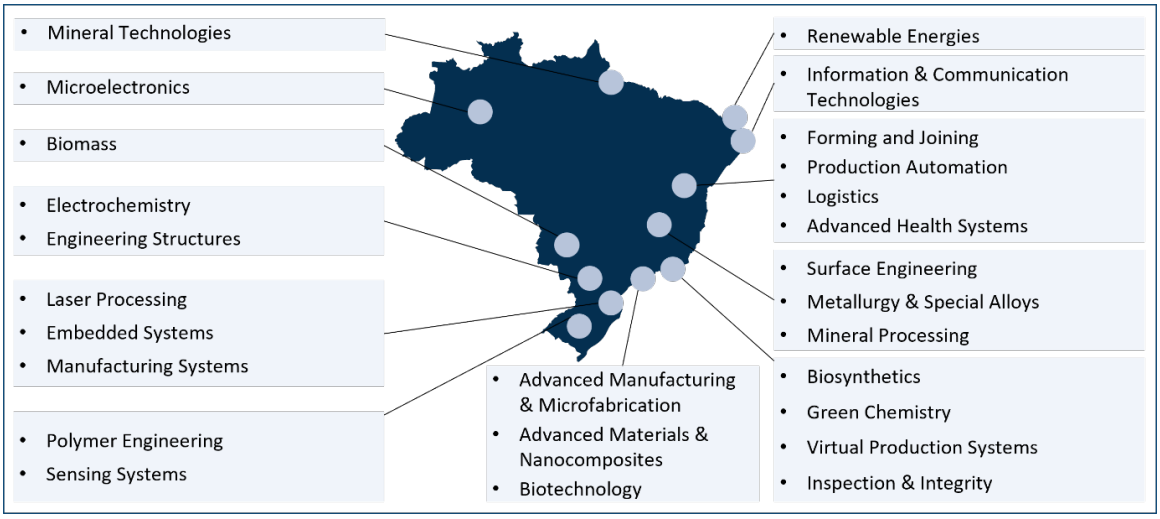

Figure 2: Overview of 26 SENAI Innovation Institutes in Brazil

The institutes offer research and development for Brazilian industry and have a broad thematic and technological focus. They are already an integral part of the Brazilian innovation system. The network is growing steadily and can be seen as a successful example of a large-scale initiative to establish an innovation structure.

All of the 26 operational ISIs were initially technologically audited for the first time between 2017 and 2022. Two rounds of technology audits were conducted between 2017 and 2023. (Hecklau et al. 2019) Due to the Covid-19 pandemic, no audits were performed in 2020, and all audits in 2021 were conducted entirely digitally. In the first round, which concluded at the end of 2019, all 23 operational ISIs at that time underwent technological audits. Of these, 15 ISIs underwent the technology audit again in the second round, which concluded at the end of 2023. Additionally, three new ISIs were audited for the first time in 2022. Figure 3 below provides an overview of the timeline of all technology audits conducted on the Brazilian Innovation Institutes since 2017.

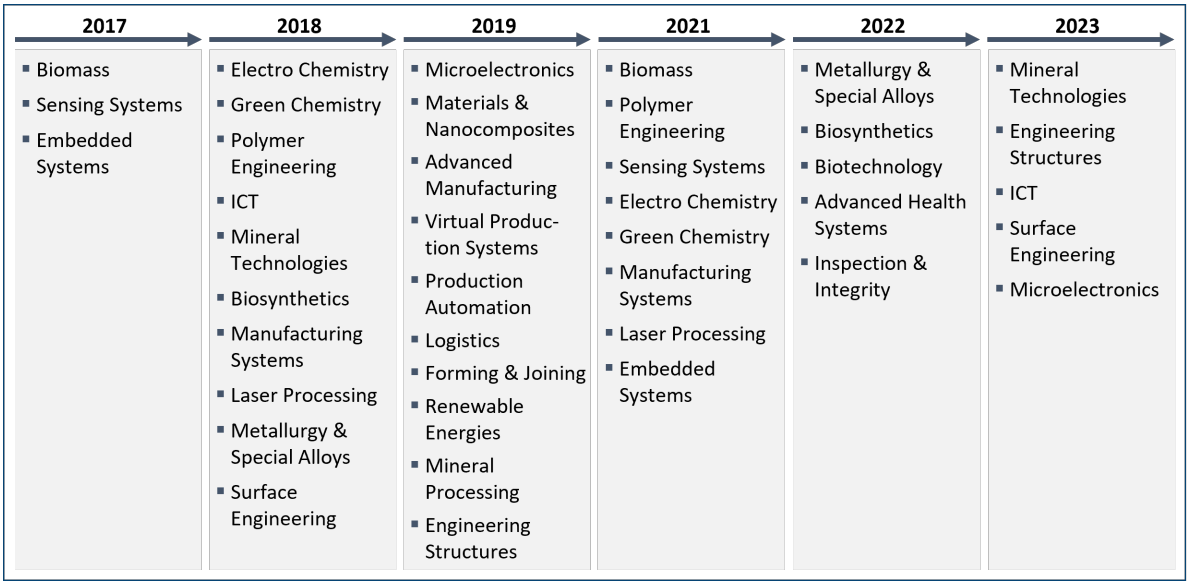

Figure 3: Timeline of 41 Technology Audits at the Brazilian SENAI Innovation Institutes

Valuable insights were gained during the application of the method in this first run. In addition to the method's potential for improvement, results on technological maturity were identified that illustrate the strengths of the methodology and are briefly described below.

3.1 Overall Results

During the first audit round, the assessments of the technological maturity levels by dimension were on average below the threshold value of 3. The technology base was assessed with an average of 2.85, the dimension of products and services with 2.75 and the collaborations with 2.5. A rating of 3 indicates that an institute has sufficient technological maturity to carry out all the research activities it aims for and offers. It has been shown that many ISIs are not able to offer all the intended services and products in all the planned research areas. As a result, the defined research portfolio of the network of ISIs could not be offered to Brazilian industry in its entirety. The audit also revealed that the technology base and products & services were better developed overall than the technological maturity in the area of cooperation. This can be explained by the fact that, particularly in the first years of the network's development, high investments were made to build up the necessary infrastructure and technical resources. The technology base was therefore the best developed compared to the other two dimensions, as the results of the audits show. It is also evident that the ISIs were not yet able to fully translate the inputs available to them into innovative research results at this early stage.

From 2021, the ISIs audited for the first time were subjected to a further technological audit in order to better understand developments at the institutes. To this end, a total of 15 selected ISIs were audited again by 2023. In order to ensure the highest possible degree of comparability, an attempt was made to use the same auditors as in the first round almost across the board. This reapplication of the method has also enabled continuous improvement of the method. One of the most important revisions to the method took place in 2022 in the form of the further specification of the assessment aspects and the introduction of a weighting and an assessment of the dimensions with decimal digits in order to enable even more precise gradations in the assessment.

The evaluation and comparison of the results of the 15 double-audited ISIs revealed significant improvements in all three dimensions. For the first time, these re-audited institutes were able to achieve an average rating of at least 3 in all dimensions, which proves that the network of ISIs as a whole has sufficient technological maturity to carry out research activities. The best rated dimension continues to be the technology base (3.6). The improvement compared to the first round is +0.7 points. The increase in the technology base can be explained by further major investments in the equipment and infrastructure of many ISIs. The products & services dimension (3.2) also improved (+0.5 points), which indicates the improved outputs of the ISIs. Despite these optimizations in the output dimension, it is clear that the now solid technology base (3.6) does not yet result in innovative solutions to a comparable extent (3.2). The lowest rated dimension is still cooperation (3.0), which nevertheless also shows a high improvement rate of +0.6 points. Due to the Covid-19 pandemic in particular, the ISI network cooperated more closely in order to build up joint capacities and knowledge, e.g. for corona tests. Figure 4 below shows the results of both rounds of technology audits for the 15 ISIs audited twice.

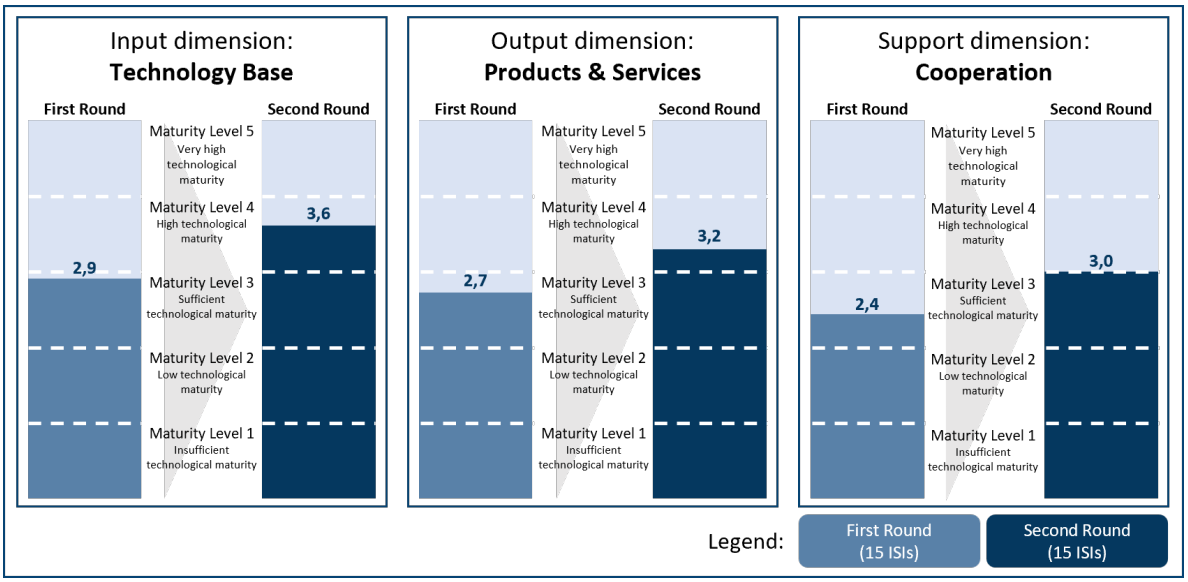

Figure 4: Comparison of Results of Technology Audits

The results of the three dimensions of Technology Base, Products & Services and Cooperation are explained in more detail below.

3.2 Results in Dimension "Technology Base"

The good overall assessment of the technology base can be explained by the high investments made by the Brazilian development bank (BNDES). The reasons for the significant average improvement in the technology base from the first (2.9) to the second round (3.6) at the 15 ISIs where both audit rounds were carried out are that further basic and specific technologies were introduced in the years between the audits. In addition, the skills of employees were stabilized and further improved, e.g. through training or by hiring new employees. Finally, the evaluation of the audits has also shown that the ISIs are aware of future technological developments and that they have a strategy in place to further develop skills, equipment and infrastructure accordingly.

Basic strategies and measures that have proven to be effective in optimizing the technology base in the course of the two audits are

- the installation and commissioning of all technologies already acquired and the search for potential innovative products and services based on unused equipment;
- the strategic purchase of specific equipment if required;
- focusing on the maintenance of existing technologies, laboratories and infrastructure;
- developing effective retention strategies to ensure that the required skills and experience remain within the ISI network;
- further developing the technological skills of ISI staff;
- and the recruitment of a highly skilled, innovative workforce capable of developing cutting-edge technological solutions.

3.3 Results in Dimension "Products & Services"

With regard to the products & services dimension, the results show that the ISIs are able to develop innovative research results to a certain extent. The ISIs were able to improve in the output dimension from the first (2.7) to the second audit round (3.2) and, as of 2021, had a sufficient level of technological maturity on average to transfer state-of-the-art technologies into new and customized products and services. However, there is still room for improvement in the degree of innovation of the products developed. Furthermore, although the ISIs are able to anticipate potential new technological solutions, the successful implementation and realization of the technological roadmaps are not consistently pursued.

Here, too, basic target-oriented strategies and general measures for improving the products & services dimension were identified:

- focusing on the acquisition of large and complex research projects in order to create the opportunity to develop innovative technological solutions by providing sufficient funding and time;

- improving the level of innovation of technological products and services, e.g. by
- *integrating knowledge, ideas and solutions from partners such as ISIs, universities and industry partners;*
- *increasing efforts to carry out pre-competitive applied research activities (from market pull to technology push);*
- the follow-up of technological roadmaps to ensure successful implementation and realization.

3.4 Results in Dimension "Cooperation"

Cooperation was assessed as sufficient at network level. Its maturity level has improved on average from the first (2.4) to the second audit round (3.0). Internal cooperation between the ISIs is at an expandable level, but is sufficient to jointly develop ideas for new technological products and services. In particular, cooperation to combat the covid-19 pandemic has significantly improved this dimension.

Cooperation with external R&D partners and service and technology providers for the integration and use of external technologies takes place to a limited extent. At an international level, there are only a few partners for the joint implementation of research activities and the development of innovative technical solutions.

Strategies and general measures to optimize cooperation that have proven effective in the double audit are

- the search for valuable win-win partnerships with other ISIs, universities, industrial partners, etc. in order to incorporate their knowledge, competencies, ideas, technologies, etc. and thus
- *increase the degree of innovation of its own technological solutions;*
- *close own technological gaps;*
- *close gaps in the skills and experience of its own employees;*
- *jointly develop innovative technological ideas;*
- take advantage of local cooperation between ISIs in the same city/campus and build on their own local strategies without neglecting the overarching guidelines and goals of the entire ISI network;
- to strengthen international cooperation for the joint implementation of research activities in order to become more visible within the international innovation system.

4. Conclusion and Implications Improvement of the Technology Audit

The application of the technology audit method to assess the technological maturity of Research and Technology Organizations in Brazil has shown important implications. Over a period of seven years, the method was applied intensively and comprehensively in 41 audits, providing valuable insights and experience on its effectiveness.

Based on the results of the 15 ISIs audited twice, it can be concluded that technological maturity has fundamentally improved in all dimensions. In addition to the general further development of the ISIs, the strong result is also attributable to the recommendations of the technology auditors from the first round. The recommended measures were largely taken into account and implemented, thus supporting the systematic development of the ISIs' technological maturity.

This broad application of the technology audit methodology has demonstrated that the technology audit is an effective tool for assessing the technological maturity of Research and Technology Organizations. Based on the findings, several directions for further development of this method can be identified to enhance its applicability and validity.

A central aspect for future development lies in further detailing the existing maturity model. This could involve incorporating significant Key Performance Indicators (KPIs) that measure specific aspects of technological and organizational maturity, thus providing a more nuanced picture of an RTO's technological maturity. The technology audit was specifically developed and tested for Research and Technology Organizations. A potential extension could involve adapting and validating the method for other organizations (e.g., universities) engaged in research and development. This would not only increase the scope and relevance of the method but also test its robustness and flexibility in different institutional contexts. Another important development perspective involves adding further evaluation elements and aspects. The dynamics of the national innovation system, in which RTOs operate, are subject to continuous changes. These changes could impose new requirements on the evaluation criteria. Therefore, it is essential that the evaluation elements and aspects consider specific developments in the innovation system to ensure the relevance and timeliness of the assessments.

Action or Reaction? Entrepreneurial and Market Orientation for Implementing Circular Economy Practices in German SMEs

Antonia Hoffmann and Nils Marticke
School of Management – Chair of Management Accounting, Technical University of Munich, Germany

antonia.hoffmann@tum.de
nils.marticke@tum.de

Abstract: Circular Economy (CE) is one of the most promising practices in sustainable business development and achieving climate targets. Small and medium-sized enterprises (SMEs) play a significant role in this context due to their predominance in many countries and their associated ecological impact. Although studies indicate that CE offers various environmental and economic benefits, its implementation within SMEs remains relatively low. While SMEs face multiple challenges and barriers, there remains a lack of insights into the factors that can accelerate CE practices. A promising approach to overcoming these challenges involves strategic orientations. This study examines two specific strategic orientations, market orientation and entrepreneurial orientation, and their relationship with CE implementation in SMEs. Therefore, survey data from 757 German SMEs were analysed using multiple linear regression, which resulted in multifaceted insights. Both market orientation and entrepreneurial orientation positively influence CE implementation. Market orientation and entrepreneurial orientation demonstrate varying joint relationships, with entrepreneurial orientation acting as an enabler in the mediation between market orientation and CE. This study contributes to a deeper understanding of the relationships between various factors influencing the implementation of CE practices in SMEs. In particular, it provides the basis for further research into the interplay between market orientation and entrepreneurial orientation and their joint influence on CE. Practitioners in SMEs should not only integrate market orientation and entrepreneurial orientation as a holistic approach but, more specifically, seek to establish a culture that encourages innovativeness and risk-taking and deepen further marketing efforts throughout the organization to facilitate CE implementation. This ultimately leads to ecological sustainability and financial improvements in SMEs.

Keywords: Circular economy, Strategic orientation, Marketing orientation, Entrepreneurial orientation, Small and medium-sized enterprises

1. Introduction

Circular economy (CE) is regarded as one of the most relevant approaches in transitioning businesses towards sustainable practices (Murray, Skene, & Haynes, 2017). It is increasingly recognized as a transformative approach to sustainable development, changing the traditional linear economic model of "take, make, dispose" into a regenerative system that aims to minimize waste and use resources efficiently (Ellen MacArthur Foundation, 2013, p. 2). The Ellen MacArthur Foundation further emphasizes that CE can significantly address climate change, reduce biodiversity loss, and curb environmental pollution. Despite the numerous benefits a CE is purported to offer, its implementation remains relatively low (De Pascale et al., 2023). While previous literature mainly examined the reasons for the lack of implementation of CE in larger companies, there is a clear gap in the effects of small and medium-sized enterprises (SMEs) on CE implementation (Madrid-Guijarro & Duréndez, 2024). SMEs are regarded as one of the most promising contexts for applying CE practices (Al-Awlaqi & Aamer, 2022).

Prieto-Sandoval, Jaca, and Ormazabal (2018) indicate that SMEs can achieve several benefits and opportunities by embracing CE practices, such as enhancing brand reputation, reducing operation costs, business expansion, increasing productivity, environmental recovery through lower CO2 emissions, and gaining a competitive edge. But the researchers also reveal that the primary motivation of SMEs to adopt CE is the potential to save costs, rather than build brand reputation or respond to regulatory pressure. However, SMEs are lagging behind in the development of sustainable measures (Álvarez Jaramillo, Zartha Sossa, & Orozco Mendoza, 2019). Effective implementation of CE relies on various internal and external organizational elements (Prieto-Sandoval et al., 2018). Strategic orientations play a promising role in overcoming these challenges and facilitating the implementation of the CE in SMEs (Kirchherr, Reike, & Hekkert, 2017; Schmidt et al., 2021). Specifically, market orientation (MO) and entrepreneurial orientation (EO) are regarded as positive influencers on CE implementation in SMEs (Saari et al., 2024; Schmidt et al., 2021). MO thereby reflects the degree to which strategic market planning is influenced by customers, competitors, suppliers, and governmental agencies, while EO refers to the priorities that companies set for identifying and leveraging market opportunities (Shane & Venkataraman, 2000). Although several studies have already suggested a positive relationship between these two strategic orientations and CE implementation, it is nonetheless observed that strategic moves

towards CE by SMEs remain an under-researched topic (Cullen & De Angelis, 2021), which this study aims to further illuminate. This paper contributes to the literature by answering the following research questions: *Do MO and EO facilitate CE implementation in SMEs?*

2. Theoretical Background and Hypotheses

While CE gained prominence in the 1970s, academic interest in the field has intensified recently with numerous reviews, concepts, and practical guidelines (Geissdoerfer et al., 2017). The probably best-known definition in recent years is by the Ellen MacArthur Foundation (2013, p. 7), which defines CE as „an industrial system that is restorative or regenerative by intention and design." The Ellen MacArthur Foundation further argues that CE promotes the use of renewable energy and shifts the focus from a buy-and-consume model to a user-centric approach that emphasizes durable products, embraces modularity, and eliminates waste through products optimized for disassembly and reuse. A popular concept for implementing CE was developed by Bocken et al. (2016); Konietzko, Bocken, and Hultink (2020), who created a framework to guide designers and business strategists in transforming from a linear economy to a CE. The authors refer to four types of the cycling of resources: slowing resource loops aims to extend the life of products and resources, thus reducing the total number of products made and disposed of over time; narrowing resource loops involves using less material and energy throughout a product's lifecycle; closing resource loops focuses on creating a cycle where materials are reused, remanufactured, or recycled at the end of their life, transforming waste into a resource for new products; regenerate comprises the use of non-toxic materials and renewable energies, as well as the regeneration of natural ecosystems. Overall, CE offers enormous potential for SMEs, but they still face many challenges that must be addressed. It is, therefore, essential to examine factors that can positively influence the implementation of CE in SMEs. As outlined in the introduction, the strategic orientations of EO and MO are regarded as possible enablers in the implementation of CE in SMEs (Al-Awlaqi & Aamer, 2022; Saari et al., 2024; Schmidt et al., 2021).

2.1 Market Orientation and Circular Economy

Theoretical origins primarily go back to the 1990s, when Kohli and Jaworski (1990, p. 1) initially presented MO as a construct to implement a marketing concept and argued that "a market-oriented organization is one whose actions are consistent with the marketing concept". While this model primarily focuses on the behavioural aspects of MO, Narver and Slater (1990) it focuses on the cultural approach within the organization and points out that a lived MO culture reflects that of the customer and the market. SMEs tend to develop closer relationships with their customers Coviello, Brodie, and Munro (2000), which makes the dimension of customer focus even more pronounced in SMEs. The regionality of the companies could explain this and since SMEs have an economic incentive to align their actions with their customers (Raju, Lonial, & Crum, 2011). MO is identified as a precursor to commitment to sustainability (Jansson et al., 2017), which in turn can be seen as a predictor of CE implementation (Hoffmann & Kühnhold, 2023). Regarding the impact of MO on CE implementation in SMEs, besides the mentioned study by Schmidt et al. (2021), the research investigated that MO can positively impact corporate social responsibility in SMEs (Raza, Liu, & Usman, 2019). Given the positive relationship between corporate social sustainability measures and CE implementation (Rondinelli & Berry, 2000), it is plausible to assume that MO similarly influences CE implementation in SMEs.

Overall, the literature provides a comprehensive overview of the influence of MO on CE implementation in SMEs, from which we derive the following:

Hypothesis 1. MO positively influences CE implementation in SMEs.

2.2 Entrepreneurial Orientation and Circular Economy

EO refers to the priorities that companies set for identifying and leveraging market opportunities (Shane & Venkataraman, 2000). Its roots trace back to the 1970s when Mintzberg (1973) observed that entrepreneurial firms were more inclined to take risks and were more proactive in the marketplace. Studies found that a strong EO significantly influences innovation and the creativity of new products in SMEs rather than in larger organizations (Yi, Amenuvor, & Boateng, 2021). Saari et al. (2024) indicate that EO can assist companies in implementing new CE-oriented business models and deriving a competitive advantage from them. Furthermore, research points out that CE-related challenges and EO can work together (E. A. Khan et al., 2022), and human resources-related aspects, such as EO, are crucial for adapting business models in the transition towards CE (Bertassini et al., 2021). Although various studies indicate a positive relationship between EO and CE implementation, there is a lack of research on the direct relationship in SMEs (Ferreira & Ferreira, 2023). However, the literature suggests a positive relationship between EO and sustainable practices

in general in SMEs. For instance, EO positively influences sustainable environmental development (Ayuso & Navarrete-Báez, 2018), commitment to sustainability (Jansson et al., 2017), and investment in sustainability initiatives (Mullens, 2018). Consequently, EO promotes sustainable practices in SMEs, which may also include CE. As a result of this assumption and given the amount of literature linking EO with successful CE implementation, SMEs with a distinct EO should be more likely to implement CE. Hence, we posit that:

Hypothesis 2. EO positively influences CE implementation in SMEs.

2.3 The Mediating Effect

Jansson et al. (2017) raised the question of the extent to which EO and MO might significantly impact each other. The literature suggests that MO could be an antecedent to EO in SMEs (Morgan & Strong, 1998). In particular, identifying customer needs and observing competitors' activities can facilitate a strong EO and promote proactive action in the market environment (Seilov, 2015). This aligns with other research highlighting that companies develop a strong EO when they are already market-oriented, enabling them to implement innovative projects that are not only inspired by the market environment (González-Benito, González-Benito, & Muñoz-Gallego, 2009). While empirical studies point towards a mediation effect of EO in relation to MO (Acar et al., 2013), there is still no empirical research that provides evidence for the positive influence within the context of CE and SMEs. To fill this gap and under the assumptions established in the previous chapters that MO and EO have a positive impact on CE in SMEs, that MO acts as an antecedent of EO, and that EO can further act as an enabler for MO, the following hypothesis is proposed (see Figure 1):

Hypothesis 3. EO mediates the positive relationship between Mo and CE implementation in SMEs.

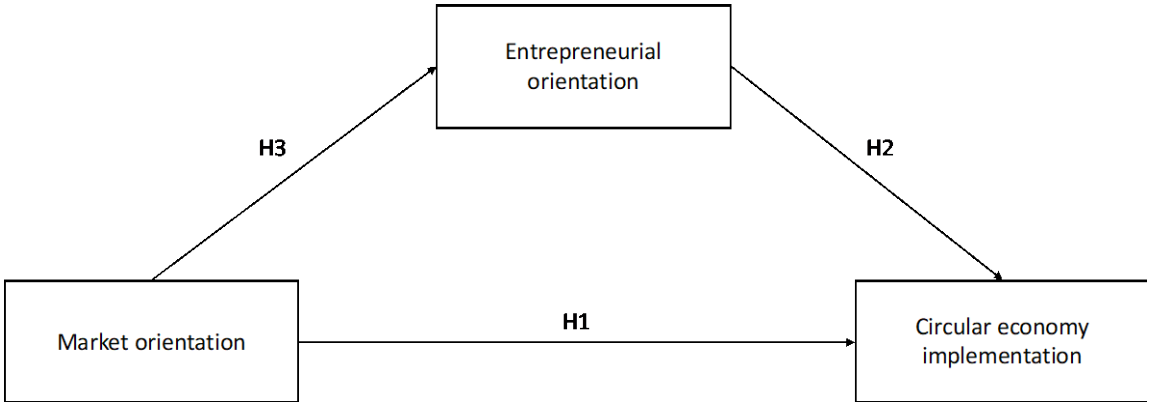

Figure 1: Research model

3. Methodology

3.1 Sample and Data Collection

We focused on German SMEs since they are well-suited for investigating CE (Schmidt et al., 2021). After certain pre-testing, a self-administered online survey was distributed via email to contact 15,034 German SMEs. The data collection took place between August 2022 and September 2022. A total of 820 surveys were completed and returned from SME managers. In this study, only survey results that provided a valid response to all CE, MO, and EO items were considered for analysis. This reduced the number of valid and usable results to 757. Table 1 contains descriptive statistics of the sample.

Table 1: Descriptive statistics

Segment	**Frequency**	**%**		**Sales**	**Frequency**	**%**
Production	171	22.7		< €22,000	39	5.2
Services	344	45.6		€22,000 - < €50,000	52	7.0
Both	240	31.8		€50,000 - < €125,000	95	12.7
Total	**755**			€125,000 - < €250,000	105	14.0
				€250,000 - < €500,000	179	23.9

Gender	**Frequency**	**%**		€500,000 - < €2,500,000	225	30.1
Female	60	8.0		€2,500,000 - < €5,000,000	32	4.3
Men	688	91.4		> €5,000,000	21	2.8
Diverse	5	0.7		**Total**	**748**	
Total	**753**					
Firm age	**Frequency**	**%**		**Firm size (number of employees)**	**Frequency**	**%**
<= 5 years	66	8.7		1	149	19.7
6 - 20 years	222	29.4		2 - 4	210	27.8
21 - 35 years	233	30.9		5 - 9	217	28.7
>= 36 years	234	31.0		10 - 19	110	14.6
Total	**755**			20 - 49	54	7.2
				>= 50	15	2.0
				Total	**755**	

3.2 Measurement

CE, MO, and EO were illustrated in the theoretical foundation as constructs that also consist of sub-dimensions. This poses the challenge that dimensions of constructs are not directly observable, which means they are latent. Thus, it is necessary to operationalize them (Hair et al., 2019). In the following, the variables are introduced. Table 2 presents the study's variable measures.

Table 2: Item survey questions

Variable	**Item**	**Question**
CE	ce1_1	Do you design and develop products that can be easily repaired? (Spare parts and repair possibilities available, economic efficiency of repair given).
	ce2_1	Do you design and develop products that are easy to maintain (e.g., easy monitoring and control of functionality)?
	ce3_1	Do you design and develop products that are recyclable (e.g. easily separable)?
	ce4_1	Do you use products (not packaging) made from recycled material?
	ce5_1	Do you design and develop products that are biodegradable (e.g. no hazardous substances, fast decomposition)?
	ce6_1	Do you use products (not packaging) that are biodegradable?
	ce7_1	Do you use packaging that is biodegradable and/or reusable?
	ce8_1	Are there closed loops in production (e.g. return/recycling of product residues into production, waste as raw material)?
	ce9_1	Do you increase the material and energy efficiency of your business by achieving the same result with less material and energy input?
	ce10_1	Do you reduce your waste by passing on by-products (e.g. products resulting from a manufacturing process whose main purpose is to produce another product; production residues)?
	ce11_1	Do you procure by-products from other companies/organizations?
	ce12_1	Do you provide repair services for customers?

Variable	Item	Question
	ce13_1	Do you provide maintenance services for customers? (e.g. monitoring and control of product functionality)
	ce14_1	Do you use materials that have been used before (e.g. old products)?
	ce15_1	Do you rent and share tools, machines, or facilities/rooms?
MO	mo1_1	We periodically review our product development efforts to ensure that they are in line with what customers want.
	mo1_2	In our organization, marketing personnel spend time discussing customers' future needs with different functional departments.
	mo1_3	Data on customer satisfaction are disseminated at all levels of the organization on a regular basis.
	mo2_1	We are slow to detect fundamental shifts in our market (competition, technology, etc.).
	mo2_2	We are slow to detect changes in our customers' preferences.
	mo3_1	The customers' interests always come first, ahead of the level of profitability.
	mo3_2	This organization exists primarily to serve customers.
	mo3_3	The business objectives of our organization are driven by customer satisfaction.
EO	eo1_1	I introduced and favored many product or service innovations in my company
	eo1_2	I marketed very many new lines of products or services in my company
	eo1_3	I made minor changes in product or service lines offered by my company.
	eo2_1	I tend to strongly favor high-risky projects (with chances of very high returns).
	eo2_2	Owing to the nature of the environment, I favor bold and wide-ranging acts to achieve the company's objectives.
	eo2_3	I typically adopt a bold and aggressive posture in order to maximize the probability of exploiting potential opportunities.
	eo3_1	I am very seldom the first business to introduce new products/services, management techniques or operating technologies in my company.
	eo3_2	I typically respond to actions which competitors initiate rather than preceding them.
	eo3_3	I typically have a tendency to follow up competitors to adapt to the market rather than anticipating it.

Dependent variable – CE. The dependent variable CE was measured using 15 items on a 5-point Likert scale (1 = "currently not planned", 5 = "successfully implemented"). The items were based on O. Khan, Daddi, and Iraldo (2021) and were slightly adapted to reflect the specific conditions of the German SME market. In addition, the option "not possible in my company" was integrated to identify companies unable to implement CE practices. The holistic construct of CE (α = .79) showed a satisfactory value for Cronbach's alpha.

Independent – MO. MO consists of 8 items based on the scale by Jansson et al. (2017). The items were measured on a 4-point Likert scale (1 = "Does not apply", 4 = "Applies"). The holistic construct had a Cronbach's alpha slightly below the threshold of .7 (α = .64).

Independent – EO. EO was measured using nine items based on the scale by Khedhaouria, Gurău, and Torrès (2015). These items were rated on a four-point Likert scale (1 = "strongly disagree", 4 = "strongly agree"). The resulting holistic construct showed satisfactory internal consistency, which was supported by a sufficient Cronbach's alpha (α = .78).

Control variables. Following earlier research in the field of SMEs, we control for segment, sales, firm age, the number of employees, and gender (Saari et al., 2024; Schmidt et al., 2021).

4. Analysis and Results

4.1 Multiple Linear Regression Assumptions

Verifying certain model assumptions is essential to ensure an unbiased estimation of the regression models. The models were first checked for fulfilment with the four basic assumptions of the Gauss-Markov theorem, as set out by Urban and Mayerl (2018) (see Table 3).

Firstly, homoscedasticity states that the variance of the error terms must be constant across all observations. To test this assumption, the White-Test was used, which applies the squared residuals to test the null hypothesis, confirming the absence of heteroscedasticity (White, 1980). If the null hypothesis is rejected and heteroscedasticity is present, the use of robust standard errors is indicated (Long & Ervin, 2000). Most of the hypothesis models showed a p-value of less than .05, which indicates heteroscedasticity. To correct this assumption violation and achieve consistent results throughout the hypothesis models, robust standard errors were used, which are contained as a standard function in STATA. The second assumption, that the expected value of the error terms is zero, cannot be tested directly in practice. However, violating this assumption would not pose a significant problem for the quality of a hypothesis model (Urban & Mayerl, 2018). According to the third assumption, there should be no autocorrelation of the error terms, as they must be independent. The Durbin-Watson test (Durbin & Watson, 1950) was used to measure the autocorrelation of the error terms, whereby a value range of 1.5 to 2.5 is interpreted as an indicator of the absence of autocorrelation (Urban & Mayerl, 2018). The test results of all hypothesis models were within the prescribed range. Therefore, no corrections were necessary (see Table 3). The fourth and final basic assumption concerns the absence of multicollinearity, which is the perfect linear independence of the dependent variables. The Variance Inflation Factor (VIF) was used as a metric for verification, as a bivariate correlation test between two variables in a model with several independent variables might not provide sufficient information about multicollinearity (Urban & Mayerl, 2018). A VIF value of 1.0 implies the absence of multicollinearity, whereas a threshold value of 4.0 is considered good (Urban & Mayerl, 2018).

Table 3: Assumption tests of regression analysis

Hypothesis	Description	White-Test	Durbin-Watson-Test	VIF
H1	MO → CE	.00	1.86	2.19
H2	EO → CE	.00	1.82	2.20
H3	MO → CE	.00	1.86	2.19
	MO → EO	.00	1.97	2.19
	MO + EO → CE	.00	1.82	2.16

4.2 Regression Analysis

The results of the hypothesis tests with the multiple linear regression analysis are presented below. In a model containing only control variables and the independent variable CE, the segment has a statistically significant effect on CE implementation. SMEs exclusively offering services have a lower average level of CE implementation (ß = -.62, p = .00), whereas companies offering both products and services exhibit a higher level of CE implementation (ß = .43, p = .00). Sales and company age do not show a statistically significant influence on CE implementation, while the logarithmic calculus of employees indicates a negative, yet marginally non-significant influence at the 5% level on the dependent variable CE (β = -.10, p = .07). Male CEOs are associated with a higher average level of CE implementation compared to female CEOs (ß = .32, p = .01), whereas the effect for CEOs identifying as diverse is not statistically significant (model 1).

Hypothesis 1 addresses the influence of MO as a holistic construct on CE as a holistic construct. MO has a positive statistically significant effect on CE implementation in SMEs (ß = .32, p = .00), confirming hypothesis 1 (model 2). Hypothesis 2 relates to the influence of EO as a holistic construct on CE as a holistic construct. EO has a positive, significant influence on CE implementation (ß = .54, p = .00), thus confirming hypothesis 2 (model 3). The results are shown in Table 4.

Table 4: Results of regression analysis

CE (dependent variable)	**Model 1**	**Model 2**	**Model 3**	**Model 4**
Constant	ß	ß	ß	ß
MO		.32***		.32
EO			.54***	.79*
Segment (Production as base)				
Services	-.62***	-.59***	-.60***	-.59***
Both (Production & Services)	.43***	.42***	.40***	.40***
Sales (< €22,000 as base)				
€22,000 - < €50,000€	-.09	-.11	-.08	-.09
€50,000 - < €125,000€	-.07	-.09	-.06	-.07
€125,000 - < €250,000€	-.04	-.10	-.07	-.09
€250,000 - < € 500,000€	-.07	-.14	-.11	-.13
€500,000 - < € 2,5 mil.	.02	.01	.03	.02
€2.5 mil. - < €5 mil.	.12	.11	.05	.06
> €5 mil.	.07	.06	-.00	.01
Firm age (log)	-.03	-.02	-.03	-.02
Employees (log)	-.10*	-.13**	-.18***	-.18***
Gender (Female as base)				
Male	.32**	.33***	.14	.16
Diverse	.78	.77	.59	.59
Observations	740	740	740	740
R-squared	.21	.23	.28	.28
F	16.2***	17.6***	22.8***	2.6***

Note. *p < .10 **p < .05 ***p < .01; N = 757.

Hypothesis 3 states that EO mediates the relationship between MO and CE implementation. When testing the first step (total effect), the influence of MO on CE is positive and significant (ß = .32, p = .00). The second step, testing the indirect effect using bootstrapping, further indicates that the relationship between MO and CE implementation is mediated by EO (ß = .22, CI[.14, .29], p = .00). The third step, testing the direct effect, confirms a full mediation, due to a non-significant direct effect (ß = .10, p = .24), thus hypothesis 3 can be accepted. Detailed results are presented in Table 5.

Table 5: Results of mediation analysis

CE	**H6**
a coefficient (MO → EO)	.43***
b coefficient (EO + MO → CE)	.51***
Step 1: Total effect	.32***

CE	H6
Step 2: Indirect effect	.22***
95% conf. interval	[.14, .29]
Step 3: Direct effect	.10
Note: *** p<.01, ** p<.05, * p<.1	

5. Discussion and Conclusion

The focus of this study lies in the relationship between MO, EO, and CE implementation in SMEs. MO and EO positively relate to CE implementation (hypotheses 1-2). Furthermore, EO mediates the positive relationship between MO and CE implementation (hypothesis 3).

5.1 Theoretical Implications

5.1.1 Influence of MO on CE

The positive and statistically significant effect of MO on the implementation of CE in SMEs confirms hypothesis 1. This emphasizes the assumption that a high level of MO within an SME, which encompasses an integration of marketing within the whole organization and a comprehensive understanding of customer needs, competitor actions, and market trends, is helpful to implementing CE in SMEs. The results of this study further confirm those of the existing literature (Schmidt et al., 2021) and provide a more comprehensive understanding of the influence of MO on CE in SMEs. Furthermore, the results support the findings by Wasim et al. (2024) and thus extend this from the Scottish to the German context. Hence, This study bridges the research gap on whether a pronounced MO can facilitate the implementation of CE in SMEs.

5.1.2 Influence of EO on CE

The empirical findings in this study provide robust support for the proposed hypothesis 2 that EO has a positive and significant impact on the implementation of CE practices in SMEs. This outcome aligns with recent research and emphasizes the positive relationship between EO and CE-oriented practices (Bertassini et al., 2021; E. A. Khan et al., 2022; Saari et al., 2024). This underlines EO's role in encouraging an organizational culture that is open to innovation, taking risks, and the proactive pursuit of new business opportunities, which are essential for the successful implementation of CE. Furthermore, this study contributes to the understanding of the relationship between EO and CE implementation and extends the current literature by focusing on the context of SMEs, which has not yet been sufficiently examined (Ferreira & Ferreira, 2023).

A pronounced EO positively affects the implementation of CE, thereby empirically confirming the previous findings of the literature (Saari et al., 2024). This study provides significant value as it empirically demonstrates the positive relationship within the context of SMEs for the first time, responding to prior calls from the literature (Ferreira & Ferreira, 2023) and accordingly expanding the body of knowledge.

5.1.3 Mediating effect of EO

The confirmation of hypothesis 3 demonstrates that EO acts as a mediator in the relationship between MO and the implementation of CE in SMEs. The findings indicate that the positive influence of MO on the implementation of CE in SMEs depends on the presence of a pronounced EO. Thus, EO also serves as an enabler for MO (Acar et al., 2013). An explanation for this positive effect might be that the characteristics of EO ensure the insights gained from MO about the market and consumers are transformed into concrete entrepreneurial actions, thereby practically advancing the implementation of CE. This is in line with further research that indicated that a strong MO without a strong EO may focus on the customer but might not have the capabilities to meet their demands (Baker & Sinkula, 2009), which could be sustainability aspects such as the need for CE implementation.

This study makes a novel contribution to the understanding of the interplay between MO and EO in the context of CE implementation in SMEs. Thereby, it addresses the call from Jansson et al. (2017), who questioned whether EO and MO act jointly or if one variable influences the other. EO acts as a mediator in the relationship between MO and CE. This confirms the assumptions from studies in a similar environment (Acar et al., 2013) and extends the current literature by providing empirical evidence in the context of SMEs in the German market. It further indicates that MO acts as an antecedent for EO. In addition, insights into the complex relationship between EO and MO are obtained, providing a basis for future researchers to investigate.

5.2 Managerial and Practical Implications

In addition to a theoretical contribution, practical implications can also be drawn. Firstly, a pronounced MO within a SME is conducive to the implementation of CE. Accordingly, practitioners should strive to deepen their MO by integrating marketing efforts across the organization and developing a thorough understanding of customer needs, competitor actions, and market trends to adopt CE practices more effectively. SMEs should focus on creating and enhancing internal processes that promote cross-functional collaboration and strategic alignment towards sustainability objectives within the organization and not just by individual areas or departments.

Secondly, practitioners should strive to establish a strong EO culture within the organization, which is essential for implementing CE practices in SMEs. This entrepreneurial approach can lead to the development of new products, services, and processes that support environmental sustainability. In particular, practitioners should seek to foster a culture that encourages innovativeness and risk-taking to create the best possible environment for sustainability-driven practices, such as CE implementation. EO demonstrates a unique ability to positively impact all areas of the cycle, which will further support practitioners in reaching sustainability.

Thirdly, the combined focus on MO and EO should be carefully considered. The mediating role of EO suggests that a synergistic approach to integrating market insights with entrepreneurial actions is beneficial for SMEs. Practitioners should, therefore, strive to implement both strategic orientations within their companies to enhance CE implementation. In this context, it may be particularly valuable for practitioners to leverage their market and customer knowledge gained through a strong MO to promote these insights within a pronounced EO culture, thereby developing sustainable measures for CE practices.

6. Conclusion

This study expands the existing literature concerning factors that positively influence CE implementation in SMEs. Using linear regression, it specifically highlights the impact of MO and EO on CE implementation and the mediating effect. The findings reveal a positive relationship between MO and EO with CE implementation in SMEs. Besides making a significant contribution to the literature, this study also provides subjects for future research. It encourages future researchers to investigate the relationship between MO and EO further by focusing more on the sub-dimensions. Furthermore, this study provides practitioners with recommendations to facilitate the implementation of CE in SMEs. Besides integrating a distinct MO and EO, it encourages creating a culture that promotes innovativeness and risk-taking and deepens marketing efforts across the entire organization to advance the implementation process.

The Role of Cognitive Style in Influencing Entrepreneurial Self-Efficacy and Subsequent Entrepreneurial Intention

Salma Abbass Hussein and Hadia Abdel Aziz
University of Prince Edward Island, Cairo, Egypt

Salma.nader@uofcanada.edu.eg
Hadia.hamdy@uofcanada.edu.eg

Abstract: Cognitive style has been largely acknowledged to highly contribute to explaining variances in individuals' behavior. However, very few researchers studied the role of cognitive style in influencing entrepreneurial self-efficacy along the entrepreneurial intention process. Therefore, the purpose of this research is to study how differences in preferences towards linear, non-linear and balanced thinking style would affect individuals' self-perceptions towards entrepreneurial self-efficacy and subsequent intentions to create a new business. This study's findings reported that non-linear thinking style is negatively correlated to entrepreneurial self-efficacy which subsequently affects entrepreneurial intentions negatively. While linear thinking style was positively correlated to entrepreneurial self-efficacy which in return affects entrepreneurial intentions positively. Moreover, thinking style balance was found to be positively correlated to entrepreneurial self-efficacy that exceeds the magnitude of the Linear-Entrepreneurial Self-Efficacy relationship which subsequently affects intentions positively. Furthermore, the relationship between entrepreneurial self-efficacy and entrepreneurial intentions had higher significance and was stronger in effect for individuals with balanced thinking style than for those with linear and non-linear thinking style.

Keywords: Cognitive style, Entrepreneurial self-efficacy, Entrepreneurial intention

1. Introduction

Cognitive Style is one of the main variables that was derived from the individual differences psychology discipline. It has been given significant attention among researchers and practitioners specifically in the innovation and entrepreneurship field (Armstrong and Hird, 2009). This is because cognitive style is considered a main determinant of individual behavior as it affects the way people gather and process information, solve problems and make decisions. Thus, it affects people's choices. Accordingly, this clarifies the significance of cognitive style within the entrepreneurship context as it may affect many key behaviors that entrepreneurs face on a daily basis (Kickul, Gundry, Barbosa and Whitcanack, 2009; Barbosa, Kickul and Smith, 2008**,** Armstrong and Hird, 2009; and Krueger and Day, 2010). Despite the fact that cognitive style has been a very popular research domain in business and management during the past 40 years, it is still considered under-researched as more empirical research is (Armstrong et al, 2012).

In 1988, pioneers in research introduced the concept of Intentions to cognition research which played a very important role in managerial literature (Bird, 1988). Consequently, past researchers have been widely adopting the intentions variable in their empirical studies to predict subsequent behavior. This is because measuring actual behavior is considered difficult and requires long time intervals (Hattab, 2014; Barbosa et al., 2007; Ajzen, 1991). Accordingly, in the entrepreneurship field various entrepreneurial intention models emerged to explain the factors that spur people to become entrepreneurs as this would help in fostering entrepreneurship (Linan, Rodríguez-Cohard and Rueda-Cantuche, 2011).

Over the past years, many entrepreneurship researchers have given considerable attention to examine the relationship between entrepreneurial self-efficacy and entrepreneurial intentions to start their own business. This is because entrepreneurial self-efficacy is believed to be a strong predictor of entrepreneurial intentions (Schlaegel and Koenig, 2014; Chen et al., 1998; Boyd and Vozikis,1994). Yet very few researchers studied the role of cognitive style in influencing entrepreneurial self-efficacy along the entrepreneurial intention process (e.g., Kickul et al., 2009; Barbosa et al, 2007). Although, the relationship between cognitive style and entrepreneurial self-efficacy is initially supported in the literature (Kickul et al, 2009; Vance, Groves, Gale and Hess, 2012), very little knowledge exists regarding how cognitive style would impact an individual's entrepreneurial self-efficacy and subsequent entrepreneurial intentions (Vanevenhoven and Liguori, 2013; Kickul et al, 2009). Therefore, this research effort stands to advance and contribute to the field of entrepreneurial cognition by initially studying the impact of cognitive style on entrepreneurial self-efficacy and subsequent entrepreneurial intentions. Moreover, this research aims to study how differences in individuals' cognitive styles either favouring linear, non-linear or balanced style would affect the relationship between entrepreneurial self-efficacy and entrepreneurial intentions to have a more vibrant picture of the processes that may lead to entrepreneurial behavior.

2. Literature Review

2.1 Cognitive Style

Allinson, Chell and Hayes, (2000, p.33) define cognitive style as *"a person's preferred way of gathering, processing and evaluating information"* that relates to creativity, problem-solving and decision making. Groves et al, (2011) classified individuals' cognitive style into three types, the first type is the non-linear "intuitive" cognitive style which embraces holistic thinking, creativity, experimentation, uncertainty, and freedom. The second type is Linear "analytical" cognitive style which is being driven by facts, data, rationality and being task oriented. The third type is a balanced cognitive style which is described as one being versatile in using either linear or non-linear thinking style depending on the situation at hand. It is worth noting that an individual's cognitive style may intentionally vary according to the unique constraints and conditions of a given situation (Groves et al, 2011; Allinson and Hayes, 1996).

Even though entrepreneurs were believed to have an intuitive thinking style as they are perceived to be creative and have high tolerance for ambiguity, it is suggested that both intuitive and analytical ways of thinking are needed to cultivate and stimulate the entrepreneurial capability. Olson and Bosserman, (1984) implied that in the early stage of the entrepreneurial process, entrepreneurs are more likely to employ the intuitive style as creativity and innovation are needed in identifying and capitalizing on the opportunity. While in later stages of the entrepreneurial process; planning, implementation and management phase, analytical thinking will be more prevalent. Therefore, it is proposed that entrepreneurs adopt both thinking styles when it comes to starting their own business. This means they have a great versatility in demonstrating either intuitive or analytical thinking style depending on the situation at hand and the various functional requirements needed for venture creation (Vance, Groves, Gale and Hess, 2012; Groves, Vance and Choi, 2011). Accordingly, this emphasizes the importance of balanced thinking style throughout the entrepreneurial process.

2.2 Entrepreneurial Self-Efficacy and Entrepreneurial Intention

Entrepreneurial self-efficacy (ESE) is defined as "the strength of confidence individuals have in their own abilities to successfully execute and perform various entrepreneurial roles and tasks" (Chen, Greene & Crick, 1998). Bandura, (1986) was the first to define self-efficacy as a task-specific construct meaning that it should be developed and evaluated with respect to specific tasks to enhance its predictive validity. The entrepreneurial process entails several tasks related to creating a new business such as searching for opportunities, planning for the new venture, marshaling resources, and implementing and creating the business (Vance et al, 2012; Kickul et al, 2009; McGee et al, 2009).

Entrepreneurial Intention is defined as "the conscious state of mind that precedes action and directs attention, experience and behavior toward a goal such as creating a new business" (Bird, 1988 as cited in Moriano, Laguna, Gorgievski and Stephan, 2012, p.5). It is worth mentioning that the prevailing intention models in literature employ self-efficacy as one of the critical antecedents of intentions (McGee et al, 2009; and Barbosa et al, 2007). Most of the widely adopted intention models are based on the most two popular theories in the literature. These two theories include a variable of self-efficacy; perceived behavioral control and perceived feasibility which were empirically found to positively predict entrepreneurial intentions in various studies. The first one is the theory of planned Behaviour developed by Ajzen, (1991) which has been extensively applied empirically (e.g., Ozaralli and Rivenburgh, 2016; Rauch and Hulsink, 2015). The second one is the theory of entrepreneurial event developed by Shapero and Sokol, (1982) which has been widely applied empirically as well (e.g., Walter and Block, 2016; Peterman and Kennedy, 2003). Furthermore, Entrepreneurial self-efficacy has been reported by various empirical studies to be a strong predictor of intentions and behavior as it is found to affect entrepreneurial intentions positively (Schlaegel and Koenig, 2014; McGee et al, 2009**;** Barbosa et al., 2007; Zhao et al., 2005; and Kickul et al, 2009). Based on the above discussion, the first research question and hypothesis are as follows:

"RQ1: What is the impact of entrepreneurial self-efficacy on entrepreneurial intentions?"

Hypothesis 1*: Entrepreneurial Self-efficacy positively correlates to entrepreneurial intentions.*

2.3 The Role of Cognitive Style in Influencing Entrepreneurial Self-Efficacy (ESE) and Subsequent Intentions

Cognitive style is believed to play an important role in influencing individual's entrepreneurial self-efficacy in the road to entrepreneurial intentions (Boyd and Vozikis, 1994; and Barbosa et al, 2008). More specifically, when individuals start to consider entrepreneurship as a viable career option, their cognitive styles may play

an important role in influencing individuals' self-perceptions regarding various skills required to create a new venture by nurturing some perceptions and hindering others. Barbosa et al., (2007) studied the impact of cognitive style on entrepreneurial self-efficacy. It was proposed that intuitive individuals will score higher than analytical individuals on the tasks of self-efficacy that reflects the early phase of the entrepreneurial process which is opportunity identification efficacy. On the contrary, the former will score lower than the later on the task of self-efficacy that occurs in later phases of the entrepreneurial process, and they are relationship, managerial and tolerance efficacy. Opposing to what was proposed; the findings reported that there was no difference found between intuitives and analytics on opportunity identification efficacy. This is because maybe analytical individuals think they could recognize opportunities with their analytical skills rather than intuition and gut feelings. Moreover, it was found that intuitive individuals scored lower than analytical individuals on relationship, managerial and tolerance efficacy. The previous findings are partially consistent with Olson's, (1985) notion that both intuitive and analytical thinking styles are most effective in different phases of the entrepreneurial process.

In a consistent manner, Kickul et al, (2009) examined the role of an individual's cognitive style in influencing their perceived entrepreneurial self-efficacy according to the specific phases of the entrepreneurial process that is often labeled as new venture creation process. The findings showed that an individual's intuitive cognitive style enhances his/her self-efficacy in the opportunity identification process as individuals possessing an intuitive cognitive style had higher confidence in their capabilities to identify and exploit new opportunities, whereas, they didn't have much confidence when it comes to evaluating those opportunities, marshaling resources and implementation. On the other hand, it was found that an individual's analytical cognitive style enhances his/her self-efficacy in planning, marshaling resources and implementation to create their new venture as individuals possessing an analytical cognitive style were found to have higher confidence in their competencies to evaluate opportunities, plan, marshal resources and implementation, whereas, when it comes to identifying new opportunities, they don't have much confidence in their skills (Kickul et al, 2009). Moreover, Vance et al, (2012) conducted an empirical study to test the correlation between thinking style balance and entrepreneurial self-efficacy. The findings reported that thinking style balance is significantly associated with all dimensions of entrepreneurial self-efficacy as all measures of efficacy were found to be significantly influenced by thinking style balance. Therefore, both constructs are believed to be important cognitions that highly contribute to entrepreneurial intentions and success. The past findings suggest that both analytics and intuitives may acquire different skills through their mastery experiences which will subsequently improve different types of self-efficacy that will eventually affect their intentions differently. Based on the above discussion, the second and third research questions and hypotheses are as follows:

"RQ2: What is the impact of cognitive style on entrepreneurial self-efficacy?"

> ***Hypothesis 2A:*** *Linear thinking style will positively correlate with entrepreneurial self- efficacy.*
>
> ***Hypothesis 2B:*** *Non-linear thinking style will negatively correlate with entrepreneurial self-efficacy.*
>
> ***Hypothesis 2C:*** *Balanced thinking style will positively correlate with entrepreneurial self-efficacy which exceeds the magnitude of the relationship predicted in H1.*

"RQ3: How would cognitive styles affect the entrepreneurial self-efficacy-entrepreneurial intentions relationship?"

> ***Hypothesis 3:*** *There will be a stronger and higher significant relationship between entrepreneurial self-efficacy and entrepreneurial intentions for individuals with balanced thinking style than for those with linear and non-linear styles.*

3. Methodology

3.1 Research Design and Sample

A total of 906 surveys were distributed of which 864 surveys were complete and usable. The survey was distributed to graduates from three private universities in Egypt: German University in Cairo (GUC), British University in Egypt (BUE) and Nile University (NU). The age of the target sample ranges from 20 to 26 years old. Regarding the gender distribution of the sample, males represent 30% of the sample and 70% of the sample were females. Moreover, 42.7% of the sample was unemployed as they were fresh graduates, whereas 32.8% of the sample was employed in salaried work. Furthermore, the sampling technique adopted was non-probability judgmental sampling which is a form of convenience sampling where the researcher selects a certain sample of the population based on who he/she thinks would be appropriate for the study (Malhotra,

2010). Finally, the questionnaire was distributed by integrating both online and offline data collection techniques within the time frame of June 2018 till the end of June 2019. It is worth mentioning that participants were informed that participation in the study is entirely voluntary, and confidentiality was guaranteed.

3.2 Measures

The scale adopted to measure cognitive style was Linear Nonlinear Thinking Style Profile (LNTSP) developed by Vance et al, (2007). It is a 26-item, four-dimensional, forced-choice self-report measure of decision- making style; 13 items measuring linear thinking style dimension while the other 13 items assess the nonlinear thinking style dimension. Whereas the thinking style balance score is calculated as the difference between total linear and total nonlinear scores (Ettlie et al, 2014). It is worth mentioning that there is an alternative approach to measure thinking style construct. For multiple groups comparison analysis, further classification/categorization of thinking style was made; the researcher created three groups (linear, nonlinear, and balanced) based on the spread of the difference scores (linear – nonlinear) (Ettlie et al, 2014). In this study, three groups were created, and they are categorized as follows: nonlinear thinking (difference score ≤ -1), balanced thinking (difference score= 0 through 9) and linear thinking (difference score ≥10).

While the scale adopted to measure entrepreneurial self-efficacy was the Entrepreneurial Self-Efficacy (ESE) Scale developed by McGee, Peterson, Mueller, Sequeira, (2009). It is a 19-item, five-dimensional self-report measure of entrepreneurial self-efficacy. Respondents were asked to voluntarily indicate on a 5-point Likert scale (1 = very little, 5 = very much) how much confidence they had in their ability to engage in each of the 19 entrepreneurial tasks. Furthermore, entrepreneurial intention scale was adopted from the Entrepreneurial Intention Questionnaire (EIQ) developed by Linan and Chen, (2009). It is a six-item, one factor, general pure intention measure built on Likert type scale assessing the degree to which individuals have seriously considered to become entrepreneurs. Respondents were asked to voluntarily read the statements and indicate on a 5-point Likert scale (1 = strongly disagree, 5 = strongly agree) their level of agreement or disagreement.

4. Results

Before conducting the data analysis, confirmatory factor analysis (CFA) for LNTSP, ESE and EI scales were carried out to measure the validity of the scales. According to table 1, the goodness of fit indices shows acceptable and satisfactory validity of the three scales. The CHI standardized is within the acceptable baseline. Moreover, all values of the six indices; Goodness of Fit Index, Normed Fit Index, Relative Fit Index, Incremental Fit Indexes, Tucker-Lewis Index, Comparative Fit Index are greater than 0.90, thus within the acceptable baseline as well. Additionally, the values of Root Mean Square Residual and Root Mean Square Residual Error Approximation are below 0.08 which is acceptable and indicates a very good fit of the three models (Hair et al., 2014).

Table 1: The Goodness of Fit Indices for Research Variables

	CMIN/DF	GFI	NFI	RFI	IFI	TLI	CFI	RMR	RMSEA
Required threshold	(2-5)	>.90	>.90	>.90	>.90	>.90	>.90	<.08	<.08
LNTSP Scale	2.271	0.975	0.930	0.916	0.960	0.951	0.959	0.020	0.038
Entrepreneurial Self-Efficacy Scale	4.136	0.960	0.944	0.923	0.957	0.940	0.956	0.065	0.06
Entrepreneurial Intentions Scale	3.326	0.994	0.996	0.989	0.997	0.992	0.997	0.009	0.052

Additionally, as shown in table 2 all research variables have shown acceptable and satisfactory reliability scores as Cronbach's alpha scores were (> 0.7) (Pallant, 2007). According to the below table the Cronbach's alpha scores of the Linear thinking style, Non-Linear thinking style, searching efficacy, planning efficacy, marshaling

efficacy, implementing efficacy and entrepreneurial intentions were as follows α = 0.796, α = 0.796, α = 0.707, α = 0.720, α = 0.778, α = 0.898 and α = 0.936 respectively. Another method was applied to test the reliability of the scale using Structure Equation Modeling (SEM) which is the Composite Reliability (CR). Composite reliability is intended to measure the internal consistency of the scale as well. The Composite Reliability scores of the scales have reported satisfactory and acceptable values (> 0.7) (Hair et al., 2014).

Table 2: Reliability for Research Variables

Dimension	Reliability Coefficient α	Composite reliability (CR)
Linear (Analytical) Thinking style	.796	0.870
Non-Linear (Intuitive) Thinking style	.796	0.870
Searching efficacy	.707	0.727
Planning efficacy	.720	0.739
Marshaling efficacy	.778	0.782
Implementing efficacy	.898	0.867
Entrepreneurial Intention	.936	0.898

As shown in table 3, the results show that there is a significant correlation between linear, non-linear and balanced thinking style and entrepreneurial self-efficacy at a significant level (P<0.01). It was shown that linear and balanced thinking style are positively correlated with entrepreneurial self-efficacy (r=0.121, 0.127) respectively. Yet, the magnitude of the Balance-ESE relationship is higher compared to Linear-ESE relationship. While non-linear thinking style was negatively correlated with entrepreneurial self-efficacy (r= -0.121). Thus, the previous findings provide support for Hypotheses 2, 3 and 4.

Table 3: Correlation between cognitive style and entrepreneurial self-efficacy

Correlations					
		self-efficacy	Linear (Analytical)	Non-Linear (Intuitive)	Balanced
self-efficacy	**Pearson Correlation**	1	.121**	-.121-**	.127**
	Sig. (2-tailed)		.000	.000	.000
Linear (Analytical)	**Pearson Correlation**		1	-1.000-**	.992**
	Sig. (2-tailed)			0.000	0.000
Non-Linear (Intuitive)	**Pearson Correlation**			1	-.992-**
	Sig. (2-tailed)				0.000
Balanced	**Pearson Correlation**				1
	Sig. (2-tailed)				
**. Correlation is significant at the 0.01 level (2-tailed).					

As shown in table 4, the results show that there is a significant positive correlation between entrepreneurial self-efficacy and entrepreneurial intention (p-value=.000, r=0.424). Thus hypothesis 1 is supported.

Table 4: Correlation between entrepreneurial self-efficacy and entrepreneurial intention

		Self-Efficacy	Entrepreneurial Intention
Self-Efficacy	**Pearson Correlation**	1	.424**
	Sig. (2-tailed)		.000
Entrepreneurial Intention	**Pearson Correlation**		1
	Sig. (2-tailed)		

Structural Equation Model Results for the Non-linear, Balanced and Linear Groups

Multiple group comparison analysis which is commonly applied in experimental research was conducted using structure equation modeling (SEM) to compare between the three thinking style groups, non-linear, balanced, and linear groups on the relationship between entrepreneurial self-efficacy and entrepreneurial intentions. Before presenting the multiple group analysis results, the goodness of fit indices of the model will be presented. The results of the model fit show that the model is acceptable and satisfactory in terms of overall goodness of fit measures. The CHI standardized is 2.078 which is within the acceptable baseline. Moreover, all six values of Goodness of Fit Index, Incremental Fit Indexes, Normed Fit Index, Relative Fit Index, Tucker-Lewis Index and Comparative Fit Index are greater than 0.95, thus all values are considered exceptional which indicates that the model is highly fit. Furthermore, the values of Root Mean Square Residual and Root Mean Square Residual Error Approximation are below 0.05 which are exceptional values as well and indicate an excellent fit of the model (Hair et al., 2014).

Table 5: Measuring the Goodness of Fit of the Model

	CMIN/DF	GFI	NFI	RFI	IFI	TLI	CFI	RMR	RMSEA
Required threshold	(2-5)	>.90	>.90	>.90	>.90	>.90	>.90	<.08	<.08
Model	2.078	0.993	0.988	0.976	0.994	0.987	0.994	0.015	0.035

According to table 6, the results showed that even though, the relationship between entrepreneurial self-efficacy and entrepreneurial intentions was significant across the three thinking style groups, the relationship was stronger in effect (beta=0.2>0.171, 0.161) and had higher significance (0.003>0.03, 0.047) for graduates with balanced thinking style than for those with linear and non-linear thinking style. Therefore, the previous findings provide support for hypothesis 5.

Table 6: The Regression Path Coefficient and the Standardized Path Coefficient between constructs in the model for linear, non-linear and balanced cognitive style groups

Dependent	Path	Independent	Non-Linear (Intuitive)		Balanced		Linear (Analytical)	
			Standardized Estimate	P-value	Standardized Estimate	P-value	Standardized Estimate	P-value
Implementing	<---	self-efficacy	0.154		0.396		0.273	
Marshaling	<---		0.536	0.026*	0.421	***	0.508	***
Planning	<---		0.679	0.024*	0.649	***	0.603	***
Searching	<---		0.719	0.024*	0.549	***	0.62	***
Entrepreneurial Intention	<---	self-efficacy	0.161	0.047*	0.2	0.003**	0.171	0.03*
*p < 0.05, **p < 0.01, ***p < 0.001								

5. Discussion

This study's findings were consistent with the literature review as the results indicate that the higher the analytical cognitive style, the higher the confidence level in performing the overall entrepreneurial tasks and thus the higher the entrepreneurial intentions. While the higher the intuitive style, the lower the confidence level in performing the overall entrepreneurial tasks and thus the lower the entrepreneurial intentions. Furthermore, the results reported that the higher the balance cognitive style, the higher the confidence level in performing the overall entrepreneurial tasks and thus the higher the entrepreneurial intentions. Yet, the magnitude of the Balance-ESE relationship is higher compared to Linear-ESE relationship.

One of the main objectives of this study is to assess how differences in cognitive style would impact the relationship between entrepreneurial self-efficacy and entrepreneurial intentions. The empirical results of the multiple group comparison supported the role of thinking style balance in influencing entrepreneurial behavior since the relationship between entrepreneurial self-efficacy and entrepreneurial intentions was stronger in

effect and had higher significance for graduates with balanced thinking style than for those with linear and non-linear thinking styles. This indicates that individuals with balanced thinking style would have higher chances of starting up their own businesses as they would have higher self-confidence in their abilities and thus higher entrepreneurial intentions compared to those with linear and non-linear thinking styles. The previous findings are somehow consistent with the literature as Ettlie, (2014) found that thinking style balance is more associated with innovative intentions and behavior than would non-linear and linear styles. Therefore, this research supports the claim in the literature that the more the individuals are capable of achieving a greater versatility in employing either linear or non-linear thinking, the more they are capable of developing entrepreneurial competences and thus demonstrating higher entrepreneurial behavior. This is because thinking style balance is a key component throughout the entrepreneurial process, thus it predicts successful innovative outcomes and capabilities (Ettlie et al, 2014).

6. Practical Implications

This research has important implications for *educators and program designers.* There is a widespread criticism in the literature that business education overemphasizes the linear thinking style, although the nonlinear thinking style is as important as the linear style in entrepreneurship and business education. Therefore, Entrepreneurship and business educators in universities should strive to develop a curriculum that endorse versatility by developing students' intuitive and rational thinking and design an evaluation system that recognizes both styles as well. Moreover, this research has valuable implications for *entrepreneurs* as well. One important implication of this research is to raise awareness and help entrepreneurs understand their own cognitive styles, allowing them to identify their dominant and auxiliary styles so that they could seek expert assistance through self-development training to further strengthen and develop their auxiliary styles to be able to enhance their thinking style versatility which would result in better innovative behavior. Finally, this research could be valuable to *venture capitalists and financial/investment institutions.* This research emphasizes balanced thinking style as an important criterion for identifying, screening and nurturing future entrepreneurs as it would give venture capitalist and financial/investment institutions valuable insights on the entrepreneurs' capabilities to outperform the entrepreneurial tasks in creating and managing businesses successfully.

7. Conclusion

This study supports the important role of cognitive style in affecting the road to entrepreneurial intentions as it was found that differences in individual's cognitive style would affect their self-perceptions towards entrepreneurial self-efficacy which subsequently affect their entrepreneurial intentions. The findings of this study pinpoint the significance of the new notion of balanced thinking style by verifying its positive role in stimulating entrepreneurial behavior and intentions. In conclusion, this research provides a better understanding of how differences in individuals' cognitive styles affect their paths to entrepreneurial intent, hence having a clearer picture of the process that leads to entrepreneurial intentions.

Social Entrepreneurship in the Japanese Context Through the Lens of a Social Entrepreneur's Experience

Yuko Inada
Business Design, St. Andrew's University, Osaka, Japan

yukoin@andrew.ac.jp

Abstract: Social entrepreneurship (SE) demand has increased globally, highlighting the importance of understanding the activities and processes involved to enhance entrepreneurial awareness and social well-being. This study examines the experience of a social entrepreneur in Japan who manages twin parenting and transportation, aiming to clarify the development of social entrepreneurial competency. The entrepreneur's eight-year state-up experience was shared through a book in 2022, a narrative lecture observed in November 2023, and interviews conducted in April and May 2024. These data were analyzed using Trajectory Equifinality Modeling (TEM). Throughout the creation of a bicycle for parents of twins, the entrepreneur faced conflicts with a partner during the prototype development and created a community for parents of twins through SNS and face-to-face events. The effectuation in these processes considers the essence of who you are, what you know, and whom you know. The entrepreneur focused on affordable loss, partnership creation, and maintaining flexibility despite unexpected challenges. She overcame these issues by studying social welfare at a university and business at community learning schools. Twin bicycles are a tool not only for transportation, but also for life. They are a symbol of an open-free mind given the constraints of society and are joyful in their own warm place for twin children, parents, and their communities.

Keywords: Social entrepreneurship, Social entrepreneur, Effectuation, Well-being

1. Introduction

Social entrepreneurship (SE) involves creating value for society as a whole, rather than for individuals, by developing better solutions for social issues, such as poverty, hunger, and environmental issues, while maintaining efficiency and sustainability over existing solutions (Phills, Deiglmerier, & Miller, 2008). SE belongs to the field of entrepreneurship (Bornstein & Davis, 2010; Martin & Osberg, 2007). Social issues have traditionally been addressed by the government; however, as social issues have become more diverse and complex, it has become difficult for governments to address them in a top-down manner. Economic fundamentalism instigates traditional entrepreneurs to be reluctant to address social issues that are not directly linked to profit. Nevertheless, human resources that undertake the challenge of creating businesses that combine broad perspectives, expertise, and the ability to identify and solve problems are required to find effective solutions to social issues. Accumulated solutions to these issues will eventually lead to measures that will move large governments and significantly impact society from the bottom up to realize a better society (Tanimoto, 2006; Yunus, 2010). There is limited understanding of the essence of SE. Therefore, this study investigates how SE is linked to the life experiences of social entrepreneurs. This study used a qualitative approach that combined document analysis, observation, and interviews. The key study participant was a social entrepreneur who had launched several novel and effective social businesses and services. The remainder of this paper is structured as follows: Section 1 provides a literature review of the main concepts of the entrepreneurial ecosystem. Section 2 provides a brief explanation of the analytical methodology used. Sections 3 and 4 present the results and discussion, while Section 5 provides the conclusion.

1.1 Entrepreneurship

Entrepreneurship is the creation of a business through opportunity acquisition, business development, self-employment, and venture creation and development (Fayolle & Gailly, 2008; Mahieu, 2006; QAA, 2012). One theory of entrepreneurship is effectuation, which is a practical approach. Sarasvathy developed a theory of effectuation by studying the decision-making processes of accomplished serial entrepreneurs when facing problems in their new ventures (Sarasvathy, 2001; Sarasvathy, 2008; Sarasvathy & Dew, 2005; Sarasvathy & Venkataraman, 2011). There are five principles of effectuation: 1) bird in hand, 2) affordable loss, 3) crazy-quilt, 4) lemonade, and 5) pilot-in-the-plane. A bird-in-hand approach refers to understanding who you are, what you know, and whom you know and then creating something new using these three existing tools. Affordable loss implies that commitments are made based on the extent to which a loss is possible. In crazy-quilt, a person negotiates with all parties willing to do the same so that partnerships can be formed. The lemonade approach highlights traits, such as not shying away from the unexpected, acknowledging uncertainty, and responding appropriately. The pilot-in-the-plane method implies that a person adjusts flexibly and produces results when faced with uncertainty. The person focuses on controllable activities rather than external factors, such as

socioeconomic trends, and work with humans as agents to drive business creation (Sarasvathy, 2008, 2015). The effectuation process is an evaluation of existing means of identifying who you are, what you know, and whom you know. A person then considers what can be done within their tolerance for loss and interacts with old acquaintances and new people to gain a commitment from their partners. Finally, the person arrives at new means and new ends and creates new companies, new products, and new markets (Read, Sarasvathy, Dew, Wiltbank, and Ohlsson, 2011).

1.2 SE

In a systematic review of SE, Miah, Lakner, and Fekete-Farkas (2024) showed an SE trend from 1998 to 2022. From 1998 to 2006, there was no activity. Since 2009, research on SE has grown, and the number of articles has consistently exceeded 40% per year since 2019. According to the author's corresponding country of residence, the United Kingdom contributed the most to the research, especially in social innovation and entrepreneurship, sustainable development and policy implications, and value creation in addressing global challenges. Spain and the United States followed with the number of SE research articles. Collaborative research has emerged from most European countries (the United Kingdom, Spain, Italy, Germany, and the Netherlands), the United States, and Asia (China, India, and Malaysia). Van Lunenburg, Geuijen, and Meijer (2020) showed rules and support of networks, financial aides, and knowledge as institutional factors. Social entrepreneurs' characteristics include willingness of ambition, desire to control, logic and entrepreneurial skills, leadership and dependency, geographical volume or influence on public discourses, political agendas and legislation, and level of social and sustainable impact in the framework of the social and sustainable initiative scale in 133 articles. SE research, including collaborative research, has expanded, and some characteristics of SE have been discovered.

SE is still poorly defined (Mairm and Martí, 2006). Austin, Stevenson, and Wei-Skiller (2006) define SE as an "innovative, social value creating activity that can occur within or across the nonprofit, business, or government sectors." Austin, Stevenson, and Wei-Skiller (2006) mentioned that SE revolves around addressing a specific social issue, and the choice of organizational structure should be driven by its effectiveness in mobilizing resources to tackle a problem. Instances of SE can emerge within or traverse nonprofit, business, or governmental sectors. According to Peredo and McLean (2006) SE aims to create social value and pursue goals, employ innovation, tolerate risk, and use limited resources. Bornstein and Davis (2010) mentioned that SE progresses from observation and experimentation to the institutionalization of innovative solutions, which are subsequently independently adopted. Bornstein and Davis (2010) described SE as a process aimed at solving social problems and categorized the history of SE. In the first stage, SE focused on three key objectives: identifying individuals with innovative ideas to achieve significant social impact, highlighting their work in society, and establishing support systems to facilitate their success. The emphasis then shifted toward organizational excellence and drawing upon business strategies and management principles to assist social entrepreneurs in building sustainable and impactful organizations. Today, the focus is expanding beyond individual founders and institutions to harness the transformative potential of all individuals and their interactions. Mairm and Martí (2006) mentioned that SE integrates economic and social value creation. SE drives social change by addressing societal needs. Although value creation encompasses both social and economic dimensions, the primary emphasis is on generating social value, with economic viability viewed as essential for sustainability. Additionally, it is crucial to recognize that the examples provided focus on SE in developing nations to underscore its global relevance or in developed countries, such as the United States, Canada, and the UK. Numerous studies have explored SE in the context of community development in these regions. Wang and Yee (2023) demonstrated that SE encompasses a broad spectrum of research areas, but the research output in the field tends to be diversification and decentralization. Therefore, it is important to investigate SE in a specific region.

Dees (1998) delineates the multifaceted nature of SE and highlights its diverse manifestations. E includes not-for-profit organizations, social responsibility in business operations, or not-for-profit organizations starting with profit or earned-income ventures. SE combines passion for a social mission with an image of a business-like discipline and innovation. It encompasses not only traditional not-for-profit organizations with alternative funding (Austin, Stevenson, and Wei-Skiller, 2006) but also for-profit ventures infused with social responsibility (Sagawa and Segal, 2000), a mix of profit and non-profit approaches (Dees, 1998), and a focus on social problems, transformation, and impact (Alvord, Brown, and Letts, 2004; Zahra *et al*., 2009). Moreover, SE creates social value rather than personal and shareholder wealth (Mairm and Martí, 2006; Martin and Osberg, 2007; Peredo and McLean, 2006). Furthermore, Dees (1998) describes social entrepreneurs as reformers and revolutionaries. In further expounding the 5 traits of social entrepreneurs delineated their modus operandi. First, a deep-rooted dedication to a social mission forms the cornerstone of their endeavors, driving them to create and perpetuate

social value. Second, they possess a keen eye toward identifying novel opportunities aligned with their mission, demonstrating a propensity to view challenges as prospects for positive change. Third, social entrepreneurs exhibit a relentless pursuit of innovation, embracing uncertainty, and leveraging failure as stepping stones toward progress. Fourth, they exhibit boldness in action and maximize scarce resources through strategic partnerships and collaborative ventures. Finally, social entrepreneurs display a heightened sense of accountability not only to their constituents but also to the outcomes generated by their initiatives. Tanimoto (2008, p.2) describes a social entrepreneur as "a person who finds a social need, starts a new business and promotes social innovation."

1.3 Authentic Social Entrepreneurial Leadership

Nakamura and Horimoto (2020) proposed a conceptual framework for authentic social entrepreneurial leadership development among Japanese women. Triggering life events plays a pivotal role in shaping women's entrepreneurial pursuits. These moments of crisis prompted deep introspection, compelling women to reevaluate their core values, origins, and significance. Through this introspective process, women clarify their values in relation to their professional aspirations. Self-efficacy has emerged as a key determinant contributing to a better society, and social space provides a platform for networking. However, social norms toward women's roles and enterprises and the lack of social networks make it difficult to start and maintain a business. To overcome this problem, an authentic social entrepreneurial leadership is required. Kernis (2003) suggested that the awareness aspect of authenticity entails understanding one's own needs, values, emotions, personality traits, and how these factors influence behavior. Liu, Leanne, and Grant (2015) mentioned that authenticity is related to leadership and leaders perform authentic leadership rather than they have or they are.

To date, little attention has been paid to the essence of social entrepreneurial and SE process in Japan. This study aimed to investigate SE as a key aspect of life and how it is linked to creating value and contributing to a community.

2. Methods

Yasuda *et al.* (2015, p. 32,33) explained the purpose of trajectory equifinality modeling (TEM). TEM focuses on the trajectory equifinality point and aims to write about the aspects of human behavior and development and the transformation and maintenance of choices and perceptions that lead to it, in terms of home and emergence, in historical, cultural, and social contexts and time.

Sato *et al.* (2006, p.257,258) have explained the history of TEM. It starts with the general system theory by Bertalanffy (1968), followed by the development of TEM theory around 2000, the conceptualization of TEM around 2004, and TEM as a qualitative method around 2005. In the first stage, the significance of the isochronous concept and the concept of multiple pathways are explained in the treatment of development in cultural psychology. Valsiner (2001) demonstrated the concept of equifinality, which is the core of TEM. Sato (2009) highlights that the history of TEM is intricately linked to a sampling methodology known as HSS (historically structured sampling), in contrast to random sampling. A sample system should reflect both the real-life experience of any person within an irreversible time and non-random sampling of individual cases, not the systematic practice of random sampling (Valsiner, 2009; Valsiner & Sato, 2006; Sato, 2007).

Yasuda *et al.* (2015) explained that the TEM conceptual tools include equifinality point (EFP), the point in a person's life where their actions and experiences are important to them in some way and are the focus of research; Bifurcation Point (BFP), the point at which a path originates or branches off; Obligatory Passage Point (OPP), an event that is experienced as essential to reaching the equinoctial point; Social Guidance (SG), the force that encourages the steps toward the equilibrium point; and Social Direction (SD), the force that hinders the steps toward the equilibrium point.

The researcher samples the businesses and experiences of interest as EFP. Data are collected and divided into the smallest units of interviewed or cursors, which will serve as the unit of analysis. The researcher then establishes BFP and OPP employing not only the information obtained through deception but also social, institutional, and cultural knowledge. The polarized EFP is then established. Finally, the researcher writes down the repairing events of the project they are interested in and draws a path to the two polarized EFP, charting them as a TEM and taking into account the multiple paths.

Sato (2007) suggests that the TEM theory provides valuable insights into understanding processes at three distinct levels. At the macro level, TEM offers a lens through which one comprehends the irreversible progression of time and the historical evolution of societies, social groups, and institutions. At the meso-level, TEM elucidates

the developmental trajectory of individual lives, encompassing the human life course. Finally, at the micro level, TEM sheds light on decision-making processes within the context of semiotically complex everyday situations influenced by various symbolic meanings and interpretations.

According to TEM, the "rule of 1 / 4 / 9" proposes a guideline for the number of researchers involved in a study. Specifically, one case is sufficient for delving deeply into the individual experience, whereas approximately four cases (up/down to one) offer insights into the diversity of experiences. Furthermore, approximately nine cases (up to one) enable the researchers to discern typologies or patterns of pathways. One social entrepreneur was selected to thoroughly investigate the process of developing competence through the startup creation process (Yasuda *et al.*, 2015).

Sato (2009) mentioned that the TEM method has a short history, and there were only a few studies using TEM in 2009. Studies using TEM have expanded self-reassessment in infertility treatment (Yasuda, 2005), young women's abortion experience (Yasuda *et al.,* 2015), nursing teachers' experience (Tanaka *et al.*, 2004), and career history (Nishino, Tubone, & Yata, 2020; Yamamoto, 2019; Okuyama, 2018).

In this study, a social entrepreneur was selected to explore the depth of the experience of forming competence by creating a state-up process. TEM, based on cultural psychology, is used to analyze and discover the process of entrepreneurial competence in the face of a lack of twin transportation. The author had the opportunity to listen to her lecture and interviews at a university in Japan in November 2023. Data were collected from Nakahara's (2022) experience and interviewed in April and May 2024. The author explained the purpose of the study and the participants provided informed consent.

3. Results

The process of Ms. Nakahara's SE is described in chronological order, starting with the birth of twins and continuing for eight years, through TEM analysis, as shown in Figure 1. The first period involved epic twin-rearing, the second period was longing and despair for twin bicycles, the third period was reactivation of twin bicycles, the fourth period was reaffirmation of the need for twin bicycles, and the fifth period was new activity as a non-profit as well as a profit-making company. A detailed chronological description of the experiences and perceptions during each period was provided.

3.1 Fierce Twin Parenting

Ms. Nakahara gave birth to her first son in 2003, followed by twins, the second and third sons, in 2010. During this period, [there was no time to spare or leave, and multiple births were psychologically and physically difficult. The mother was isolated from the rest of the society, and there was a lack of understanding of twin births in society and insufficient support from the local government] (SD1). She had experience raising singletons but was distressed by the differences between raising singletons and twins and keenly felt the difficulties] (OPP1). In particular, [not being able to go out freely with multiple children] (BFP1) became a burden for her. She tried to go out, using a stroller, and even used a bicycle to travel easily; however, she once fell over while carrying the twins on the front and back of the bicycle. After gaining such experience [looking for a commercialized twin bicycle] (BFP2), she could not find an off-the-shelf product, and it was impossible to manufacture a custom product. In other words, [an ideal commercial bicycle is not available in Japan] (OPP2). Under these circumstances, she chose to [commercialize twin bicycles herself] (BFP3).

> *Ms. Nakahara says, If I stop the twin bicycle now, the same problem will just repeat itself again. If I'm the closest to solving this problem and I'm just going to keep living, I know that raising twins is hard.*

3.2 Longing and Despair for Twin Bicycles

To commercialize the twin bicycles, Ms. Nakahara activated two things: first, she searched for a manufacturer of twin bicycles; second, she opened a personal blog to disseminate information. [The Amagasaki City bicycle network development policy was released] (SG1). To find a manufacturer, she researched the road traffic law and conducted prior research on design and patent rights. Through the experience of requesting and creating a prototype, she learned about the difficulties in creating a prototype. However, in the prototype, she recognized the joy of mobility and felt the pleasure of having her mind freed by it. Owing to concerns regarding the safety of the twin bicycles, the relationship with the manufacturer that created the prototype was terminated. The lesson learned from this activity was to continue to try to achieve her goals.

> *Ms. Nakahara says, There is nothing you can't do that you can imagine. I used the money I had saved at the time, and I decided to do it within that. I thought it would be interesting and fun.*

3.3 Re-Activating Twin Bicycles

Ms. Nakahara was [looking for a partner for the product from scratch] (BFP4). She re-examined the road traffic law and consulted the Japan Bicycle Promotion Institute. She also sought referrals to identify product partners. She learned how to create businesses at Amagasaki business support agencies. She gathered supporters through a blog and organized a test-ride event at the twin association.

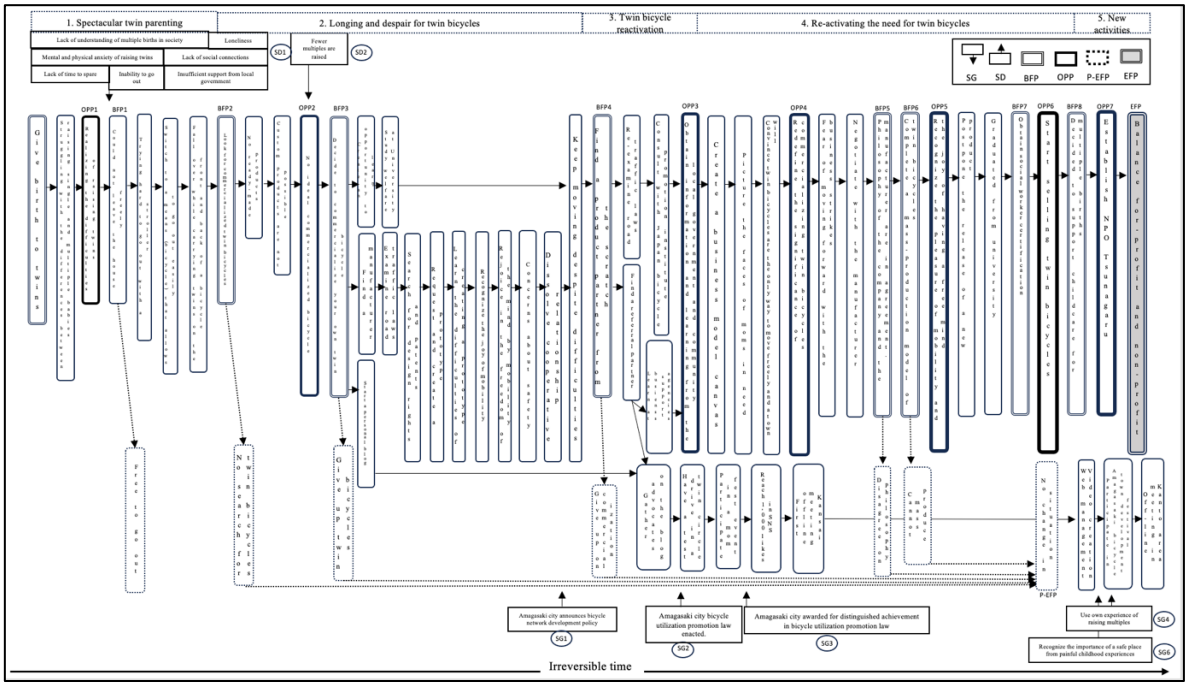
> *Ms. Nakahara says, I tried to stay close to mothers and just pick up the voice of their help where they would be using it.*

3.4 Recognizing the Need for Twin Bicycles

Moreover, [she obtained information and learned from the local government and community] (OPP3). While learning about the twin bicycles, she encountered the business model canvas, a tool for creating business plans that gave her confidence in visualizing the value proposition that she had implemented. In addition, her experience as a mother, who faced difficulties in achieving mobility with twin children, motivated her activities. She was convinced that the twin bicycles would allow her to move freely and of her own will. These encounters and activities allowed her to [redefine the significance of commercializing twin bicycles] (OPP4). However, a fear overtook her in moving on with the project. As a result of her continuous efforts, she was able to negotiate with a manufacturer of child sheets after receiving a pamphlet that she had created. [The manufacturer's philosophy matched] (BFP5). She attended a mother's event and obtained 1,000 likes on Facebook. She was able to connect with other parents of twins online; later, an event was held in Kansai for the first time. There is a clear demand for twin bicycles. [A mass-production model of twin bicycles is completed] (BFP6). [She recognized the joy of mobility and the pleasure of having a free mind] (OPS5). After graduating from university [she obtained her Bachelor of Social Work degree] (BFT7), she began selling the twin bicycles (OPP6).

> *Ms. Nakahara says, When an executive director of the company saw the twin bicycles, he said I wonder what kind of expression a mother of twins has. I thought this person would be fine because of the words that show care for people.*

3.5 New Activities



[After experiencing painful childhood experiences, she reaffirmed the importance of having a safe place to live] (SG4). [She used her own experience of multiple births] (SG5). [She decided to support multiple births] (BFT8). [She established the NPO Tsunagaru] (OPP6). [She implemented a balance between for-profit and non-profit] (EFP). She created a video to inform people about the twin bicycle initiative and provided accurate information about twin bicycles. She participated in the Amagasaki City bicycle town development fest and held face-to-face meetings with the parents of twins in the Kanto region.

> *Ms. Nakahara says, I would like to create a connection and freedom for parents of twins through a non-profit organization.*

The key processes involved in Ms. Nakahara's activities and social movements are listed in Table 1. EFP is a balance between for-profit company and non-profit organizations. The P-EFP is not a social change in the status of twin bicycles as a transportation or support activity. BFP includes 8 points. She was unable to go out freely and founded a commercial twin bicycle company. She decided to commercialize the twin bicycle, find a product partner, reach an agreement with the manufacturer, complete a mass-produced twin bicycle model, acquire a license to be a social worker, and support childcare for multiple children. The OPP includes the fact that she realized the difficulty of raising twins and realized that there were no ideal commercialized bicycles for twins on the market. She obtained information and learned from the local government and community, reconfirmed the significance of commercializing twin bicycles, recognized the joy of mobility, enjoyed having a free mind, started selling the twin bicycles, and established the NPO Tsunagaru. SG shows that she learned diverse perspectives and reflections at university, used the Amagasaki city bicycle network, reaffirmed the importance of a safe place through painful childhood experiences, and used her own experience of raising multiple children. SD shows a lack of understanding of twins in society, social connections, time, and support from the local government. Loneliness, mental and physical anxiety related to raising twins, inability to go out, and only a few people raising multiple children are affected by SD.

The results revealed several key characteristics of these social entrepreneurs, including notification of difficulties, willingness to create a better society, challenges for passion, personal resilience, empathy, knowledge, and networking abilities. Additionally, identifying social issues through problem-based learning and discussion has been highlighted as an effective approach to SE education. To foster a culture of SE in higher

education, it is essential to understand how to cultivate these key characteristics of SE and instill their values into future generations.

Figure 1: The process of Ms. Nakahara's action and social movement

Table 1: The key process of Ms. Nakahara's activities and social movement. Source: Author

Point	Explanation
EFP	Balance for-profit and non-profit
P-EFP	No social change in the status of twin bicycles as transportation and support activities
BFP	1. Can't go out freely 2. Find a commercialized twin bicycle 3. Decide to commercialize a twin bicycle 4. Find a product partner 5. Make an agreement with a manufacturer 6. Complete a mass-produced twin bicycle model 7. Acquire a license to be a social worker 8. Decides to support childcare for multiple birth children
OPP	1. Realize the difficulty of raising twins 2. No ideal commercialized bicycle on the market. 3. Obtain information and learning from the local government and community 4. Reconfirm the significance of commercializing twin bicycles 5. Recognize the joy of mobility 6. Pleasure of having a free mind 7. Start selling twin bicycles 8. Establish NPO Tsunagaru
SG	1. Use Amagasaki City Bicycle Network 2. Amagasaki city bicycle utilization promotion law enacted 3. Amagasaki city awarded for distinguished achievement in bicycle utilization promotion law 4. Reaffirm the importance of a safe place through painful childhood experiences 5. Use my own experience of raising multiple children
SD	1. Lack of understanding of twins in a society 2. Loneliness 3. Mental and physical anxiety of raising twins 4. Lack of social connections 5. Lack of time 6. Inability to go out 7. Inadequate support from local government 8. Only few people raising multiple birth children

4. Discussion

While SE spans a wide array of topics, research is often varied and spread across different areas. Thus, conducting research focused on SE within a particular region has become crucial to better understand localized dynamics. This study examined the process of the social entrepreneur Ms. Nakahara, who faced the issue of twin parenting and transportation in Japan. It aimed to clarify the process of entrepreneurial competency using TEM. TEM uses EFP, bifurcation point as BFP, polarized EFP, and OPP and describes SG and SD in an irreversible time. There are 5 periods for epic twin-rearing, the longing and despair for twin bicycles, the re-activation of twin bicycles, the reaffirmation of the need for twin bicycles, and the new activity as a non-profit as well as a profit-making company, is shown as EFP. As Tanimoto (2006) mentioned, the door to social issues through profit is not completely open; Ms. Nakahara also faced this challenge. She faced social issues and was challenged to overcome them by accumulating knowledge in universities and community schools and by networking with private and public community members. Twin bicycles evolved beyond mere transportation, representing liberation from societal limitations and offering a joyful, inclusive environment for twin children, parents, and their communities. Following the establishment of her twin-bicycle company, she launched a non-profit organization aimed at supporting families with multiple children and fostering community values.

According to Peredo and McLean's (2006) definition, Ms. Nakahara had a clear vision of creating social value by creating twin bicycles, recognizing opportunities, employing innovation, and considering risks with limited available resources. As Bornstein and Davis (2010) mentioned, SE progresses from observation and experimentation to innovative solutions; she observed mothers' behaviors on the road and listened to the real voices of mothers with twins. Making a mockup, she tried to look for manufacturers many times and experimented with creating prototypes. As Bornstein and Davis (2010) mentioned, SE describes a process aimed at solving social problems; Ms. Nakahara considered social issues seriously. She said, "the same problem will just repeat itself again if she does not take up the challenge to solve the issue."

Following Sarasvathy's (2008, 2015) five principles of effectuation, Ms. Nakahara reflected on her words and notes many times to know who she was and used her knowledge of SE, creating a business and community, demonstrating the bird-in-hand concept. She mentioned that she would create a business with her savings as an affordable loss. She used her parents-of-twins community and members of the community school where she studied business. Even though her work experience was as an office worker, she built and expanded her new twin family community like a crazy-quilt, both online and offline, and her supporters helped her find a manufacturer. Unexpectedly, she found her first partner to create the twin bicycles. However, her opportunity to learn about the law, mechanism of twin bicycles, and business creation was open, and she moved forward to the next step while making weak ties in the local community and government. Dreaming of having a twin bicycle, she adjusted flexibly to conflicts and produced results in the face of resolving the mobility of parents of twins in uncertain situations.

Her behavior adjusted for Dees's (1998) five criteria for social entrepreneurs. Her mission was clear and sustained social value for profit and non-profit organizations. She recognized new opportunities in spectacular twin parenting and pursued new opportunities to serve that mission. During the process, she improved the parents' well-being and satisfied herself as to well-being.

She adapted what she had learned in university and community schools regarding how to manage scarce resources through collaboration with others. Additionally, she learned about the laws, affordable loss, and philosophy for agreement with a manufacturer. All processes resulted in better mobility for parents of twins. Collecting the information from parents, she cared about her own needs, valued emotions mentioned by Kernis (2003), and learned and activated authentic leadership, as mentioned by Liu, Leanne, and Grant (2015).

Yin (1994) highlights the importance of a single case study. However, the main limitation of this study was its lack of objective thoughts and analyses. Another method, or a combination of analyses, can be used to understand the in-depth process of a social entrepreneur. Future studies should conduct longitudinal research on the SE process.

5. Conclusion

It is essential that SE research focuses on a specific area to gain deeper insights into entrepreneurial competency of SE. This study explores a crucial element of SE and its connection to life experiences of the social entrepreneur in Japan. Japanese society is still culturally closed to for-profit companies and open to government support in solving social issues. Ms. Nakahara suffered from community issues in achieving mobility as a parent of twins.

Her challenge with the new type of twin bicycle, which was officially supported by law, was a long journey. While creating a twin bicycle and building a twin community through social media and face-to-face events, she encountered conflicts with her partner. Throughout this process, she utilized effectuation principles by considering her identity, knowledge, and connections. She assessed affordable losses, formed partnerships, and adapted to sudden changes. She continuously learned to navigate these challenges while studying social welfare at universities and business in community learning schools. Twin bicycles have become more than simply a means of transportation. They symbolize freedom from societal constraints and provide a joyful and welcoming space for twin children, parents, and their communities. After creating a twin-bicycle company, she opened a non-profit organization to support multiple children and their parents and create value for communities. It is important to accumulate and use the life processes of social entrepreneurs for value creation in communities and for research.

Key Factors for Student Startup Success: Insights from Higher Education Professors

Artūras Jurgelevičius and Agota Giedrė Raišienė
Mykolas Romeris University, Governance and Business Faculty, Vilnius, Lithuania

a.jurgelevicius@mruni.eu
agotar@mruni.eu

Abstract: The study aims to identify and analyse the key factors of student start-ups from the perspective of higher academic institution professors. Entrepreneurial students in higher education face challenges such as limited funding, scarce resources, lack of business experience and struggling to balance academic commitments with their start-up ventures. Additionally, they struggle with navigating complex business regulations and often lack access to proper networks or mentorship. This research contributes to a better understanding of how the entrepreneurial ecosystem in higher education institutions can support student start-up initiatives to succeed. For the research, a survey was conducted targeting ten experts from higher education institutions engaged with business or entrepreneurial study programmes. The research used the content validation method and descriptive statistical analysis to evaluate the responses, focusing on measures of central tendency and variability to determine the degree of consensus among respondents regarding the 36 statements provided. The study results revealed that while respondents agreed on the importance of student attitudes towards failure and self-confidence, there was strong disagreement among them regarding the belief that non-business students have a lesser chance of creating a successful startup. Also, experts suggested that entrepreneurship education should place more emphasis on the development of students' entrepreneurial mindset, which is considered to be an essential quality for the uncertain journey of entrepreneurship. Finally, the survey results indicated that networking and experiential learning are crucial for startup development. This underscores the importance of scientific debate not only on innovative funding models but also on non-financial support systems that surpass traditional educational methods in higher education environments.

Keywords: Entrepreneurial learning, Start-ups, Student entrepreneurship, University start-up ecosystem

1. Introduction

A significant body of research conducted in recent years suggests that conventional methods of developing startups and innovative enterprises often do not yield high success rates. A variety of academic sources highlight that the failure rate among startups is notably high, with estimates that 90% of new ventures do not succeed (Bangdiwala et al., 2022; Subrahmanya, 2022). Further evidence suggests a challenging landscape for new businesses, with only around 8% managing to establish themselves successfully (Startup Genome, 2023). Additionally, it has been noted that up to three-quarters of ventures receiving startup capital do not progress past advanced developmental stages (Gosh, 2020). Similar findings on the high incidence of startup failures have been echoed in other scholarly work (Yusoff et al., 2019).

These studies identify the most common reasons for startup failures, including products that do not meet market needs, conflicts within development teams, poorly planned cash flows, lack of finance, inability to attract venture capital investment, failure to create a competitive advantage, inappropriate business models, and ineffective marketing strategies (Szathmari et al., 2024). Moreover, a study published in the Harvard Business Review states that the average age of a successful startup founder is 45 years old (2018). The high failure rate and these mentioned reasons for unsuccessful startup attempts suggest that founders often lack the knowledge, skills, and understanding of how the entire startup ecosystem functions and, fundamentally, what the supporting startup ecosystem framework should be in this entrepreneurial journey.

Besides being seen as theoretical and bureaucratic institutions, higher educational institutions are increasingly recognized for their pivotal role in fostering innovation and entrepreneurship among students. This evolving perception underscores the potential of academic environments to bridge the gap between theoretical knowledge and practical application, supporting the next generation of entrepreneurs. On other hand, students naturally lack life experience, professional skills and knowledge, and other qualities needed for successful startup building and scaling. Despite a wealth of scientific literature analyzing student entrepreneurship, debates among scholars continue, highlighting a gap in the efficient startup ecosystem and creation process. Creating an appropriate, effective, and impactful structure for facilitating startup ecosystems in academic environment continues to be a significant topic for research.

Thus, to identify and analyse the key elements within higher educational institutions' entrepreneurial ecosystems that contribute to the success of student start-ups, ten business school professors were surveyed

to gather empirical data. Only professors with practical and academic backgrounds in business and entrepreneurship were selected for the survey. To ensure the validity of experts' opinions, the content validation method was applied.

The paper is divided into five sections: The first section analyses a scientific literature on factors influencing the entrepreneurial ecosystem at an academic institution. The second section describes the research methodology. In the third section, the results of the experts' survey are analysed. The fourth section provides a discussion of the findings and propose entrepreneurial university ecosystem framework based on the perspective of business and entrepreneurship professors. Finally, the last section presents the conclusions and proposes recommendations for further studies.

2. The Theoretical Background of the Research

Students who try to start their own businesses or launch startups face many challenges, such as not having enough knowledge, skills, capital needed for idea execution, network, real-world experience, knowledge of the industry, and the right entrepreneurial mindset, which includes understanding emotions, being able to take risks, and being able to accept failures. On the other hand, universities are still perceived as institutions that prioritize theoretical learning over the practical training required to navigate the complexities of the business world. This perception presents a significant obstacle to fostering an entrepreneurial mindset among students and the creation of startups within academic environments.

Student entrepreneurship and startup launch are complex phenomena analysed extensively in academic studies. Table 1 presents the most prevalent research areas pertaining to student entrepreneurship within higher education institutions, as identified in scientific literature. Beyond formal entrepreneurship education, universities offer a variety of support mechanisms. Additionally, the personal traits of students significantly influence their perception of entrepreneurship, as well as their motivation and intention to embark on risky ventures. Some studies (e.g., Morris et al., 2017), highlight the ambiguity of funding for student-run startups, suggesting that university funding can be seen as more of a negative than a positive factor in facilitating such startups.

A substantial volume of literature examines the networks necessary for students. Networking is identified as a critical facilitator for acquiring resources, particularly in the early stages of startup development. A pivotal factor in fostering student entrepreneurial intentions and the successful launch of startups within an academic environment is the direct involvement of professors in the business and entrepreneurship education process. Research indicates that the professor's role has a significant and positive impact on student motivation to initiate new ventures.

Table 1: Factors Influencing Student Startup Success.

Factors	Key area of research	Authors
Formal educational programs	Studies in business and entrepreneurship enhance students' understanding of developing startups and contribute to increased efficiency.	Wang et al. 2021; Breznitz et al., 2019; Hahn et al., 2017.
Technology skills in entrepreneurship	The integration of technology skills in entrepreneurial education has been extensively analysed.	Karpenko, 2022; Haneberg et al., 2020
Entrepreneurial mindset, emotional intelligence and personality traits	Students' attitudes towards failure, risk tolerance, and comfort zones have been analyzed and identified as very important factors for their motivation and intentions.	M. van Gelderen, 2023; Daspit et al., 2021; Hägg et al., 2021; Kitsios et al., 2021
Supporting mechanism	Pre-accelerators, accelerators, and incubators can not only increase students' motivation and intention but also provide practical learning opportunities, mentorship, and networking.	Vardhan et al., 2022; Theodoraki, 2020; Lyken-Segosebe et al., 2020; Åstebro et al., 2012; Morris et al., 2017.
Alumni	Alumni entrepreneurship clubs can offer valuable resources to students, such as experience and networking opportunities, particularly in the early stages of startup development.	El-Awad, 2022; Landoni et al., 2021; Wright et al., 2017.
Professor's previous experience in business	An professor's previous experience in entrepreneurship can increase the motivation and intention of students to launch new startups.	Wraae et al., 2020; San-Martín et al., 2019; Diegoli et al., 2018.

Factors	Key area of research	Authors
Funding	Various financial support mechanisms can be provided at universities for students' ventures.	Hisrich et al., 2020; Morris et al., 2017; Choi et al., 2017; Klyver et al., 2013.

Source: Authors

In summary, while academic research offers valuable insights into the factors affecting student entrepreneurship, there is a paucity of literature that provides a more in-depth analysis of the ways in which these factors interact, their relative importance, and other practicalities of implementing student-led startup support structures within academic institutions. The current study bridges this gap by critically examining key factors such as comprehensive educational programs, the integration of technology skills, the cultivation of an entrepreneurial mindset, and the establishment of robust support mechanisms like accelerators and incubators. Despite the recognized importance of these elements, there remains an underexplored need to understand how they synergistically contribute to student's entrepreneurial success. For instance, while educational programs provide foundational knowledge, their effectiveness is amplified when coupled with technology skills that prepare students for the digital landscape of modern entrepreneurship. Similarly, fostering an entrepreneurial mindset through experiential learning environments like incubators and accelerators is crucial, yet the optimal balance and interaction between these supports require further scrutiny. Alumni networks and experienced faculty play pivotal roles in mentoring and providing practical insights, but their impact varies depending on the extent of engagement and integration with institutional resources. Moreover, financial support mechanisms are essential but must be strategically aligned with these factors to ensure sustainability and growth of student ventures. This study highlights the necessity for higher education institutions to adopt a holistic and integrated approach, focusing on the interplay between these factors to create an effective entrepreneurial ecosystem that not only supports but also enhances student-led startups.

3. Research Methodology

The research methodology was devised to collect data directly from the professors of business and entrepreneurship programmes who are most closely involved in the educational process. A content validation method approved by experts, combined with a descriptive statistical analysis approach, was employed with the objective of integrating insights derived from both qualitative and quantitative methodologies. This approach facilitated a more nuanced understanding of the entrepreneurial ecosystem within higher educational institutions based on professors' perspectives.

The research design and sample selection were carefully considered in establishing a solid foundation for choosing professors in a study on how higher educational institutions can promote startup creation. The profile of the professors was carefully considered in their selection process. All participants had between 5 to 30 years of experience teaching business and entrepreneurship subjects. Eight out of ten reported having previously run a business, and two had held CEO positions before transitioning to teaching. The professors were selected from a single business school located in Barcelona, Spain.

To capitalize on the benefits of the survey's results, the Likert scale was employed in the research. The Likert scale, a commonly used tool in survey research, has been the subject of various studies (Bhati et al., 2023; Yin, 2023). Various authors (Wu et. Al., 2017) suggest different point scales for Likert scale, however this scale typically ranges from 1, indicating strong disagreement, to 5, signifying strong agreement. The scale's structure is straightforward, assigning numerical values to each choice: 1 corresponds to "strongly disagree," 2 to "disagree," 3 to "neither agree nor disagree," 4 to "agree," and 5 to "strongly agree." The Likert scale is renowned for its ease of use and effectiveness in transforming subjective opinions, attitudes, and preferences into quantifiable data for analytical purposes.

The study type was qualitative with combination of quantitative techniques. Regarding the content validation process, there is a diversity of scholarly opinions on the ideal number of experts required. It has been proposed that a minimum of three experts is necessary to ensure effective content validation (Lynn, 1986). A comprehensive validation process requires at least three panels, including both content experts and laypersons (Rubio et al., 2003). Further research suggests that the ideal number of experts may vary significantly, from as few as two to as many as twenty, depending on the specific needs of the study (Walz et al., 1991). Additionally, others argued that the number of experts engaged should match the required expertise and research scope (Grant et al., 1997).

On the other hand, the specific number of experts involved in the content validation process should not be rigidly determined, even though many studies typically involve around 10 experts. This viewpoint is based on the challenge of achieving a unanimous decision within a large panel of experts. Conversely, having too few experts might result in limited information for the development of the instrument. Some authors suggest that an optimal number of experts is between 5 to 10. (Roebianto et al., 2023).

Engaging 5-10 experts offers a diversity of perspectives while remaining manageable in terms of data analysis and coordination. According to studies and scholars, including V. Rudzkiene (2005) it is posited that the evaluation of opinions from 10 experts correlates with a 95% reliability rate in their opinions. This approach is both efficient and sufficient for gaining a comprehensive understanding of the subject under study and for determining the validity of content. The literature review suggests that involving 10 experts is considered optimal for content validation purposes.

Questionnaire and results interpretation. Initially, a panel of ten experts with extensive backgrounds in entrepreneurship education was assembled. These experts were provided with a draft of the survey questions and asked to evaluate each item for clarity, relevance, and alignment with the research objectives. They provided detailed feedback on ambiguous wording, the appropriateness of the questions, and the overall structure of the survey. Based on their feedback, several iterations of revisions were made to the survey instrument. The refinement process involved incorporating suggestions to enhance question clarity, ensuring that all questions were directly relevant to the key factors being studied, and restructuring the survey for better logical flow. This rigorous validation process not only improved the reliability and validity of the survey but also ensured that it comprehensively captured the critical elements necessary for analysing the success factors of student start-ups in higher education contexts. Finally, the online survey was developed using the Google Docs tool. The questionnaire comprised both closed-ended and one open-ended question, designed to capture quantitative data and qualitative insights, respectively. 34 statements based on scientific literature review were formulated. The statements were analyzed based on descriptive statistics.

Data Collection. Distribution of the survey was supported by faculty members.

Data Analysis. Quantitative data were analyzed using the MS Excel software package. Descriptive statistics, including mean, median, mode, standard deviation, skewness, kurtosis, sum, standard error, range, minimum, and maximum values, were computed for this analysis. This approach enabled the identification of which statements received the most agreement and disagreement among startup founders, as well as how the data (responses) were distributed across each statement.

The top 5 scores, collecting both maximum and minimum sums, were identified to represent the extent of professors' agreement or disagreement with each statement. Subsequently, the standard deviation was calculated for these scores, isolating the top 5 maximum and minimum values. A comparative table was then created to correlate the maximum and minimum sums with the maximum and minimum values of standard deviation. This analysis enabled the identification of statements with the highest level of consensus (agreement) and those that were more contentious (disagreement), highlighting which statements were unanimously agreed upon and which ones were more debatable. The final results were presented in a table. Based on the professors' perspectives and a literature analysis, a framework outlining the elements that influence the success of student-run startups was proposed in the discussion section.

The choice to analyse the top 5 statements is a deliberate methodological decision that balances cognitive efficiency, practical significance, academic norms, and the need for focused, impactful communication of research findings. This choice is supported by established principles and practices in both quantitative and qualitative research.

Validity and Reliability. To ensure the content validity of the survey, a panel of experts from the fields of entrepreneurship and business research reviewed the survey. Feedback was incorporated to refine the questionnaire.

Limitations. This research may have several limitations. The findings might not be generalizable to all countries, types of universities, or various academic disciplines such as natural sciences, technology sciences, social sciences, and humanities. Academic institutions in each field possess their unique characteristics, and thus the insights provided should be interpreted with caution. For example, the factors contributing to startup success can differ significantly between fields like space technology, biotechnology, and software technology. In the case of space or biotechnology startups, funding may be a crucial factor, whereas it might be less critical for software startups. However, it is important to note that this research was specifically targeted at academic

institutions within the social sciences. Therefore, caution should be exercised when interpreting the results in the context of industry-specific startups, such as those in deep tech, within academic ecosystems.

4. Results

The results of research highlight the elements with the strongest agreement among professors, reflecting a consensus on the critical drivers of student startup success within academic environments. The minimal standard deviation for attitudes toward failure and self-trust, alongside high sum values, underscores a robust professors' consensus on these key psychological factors of entrepreneurship. These traits are seen not just as advantageous but as crucial for fostering entrepreneurial spirit within the educational system.

The high valuation of a constructive attitude towards failure and self-trust aligns with the literature that emphasizes the entrepreneurial mindset. This mindset includes both the resilience to endure challenges and the ability to view failures as lessons to be learned, instead of as unbeatable barriers. By cultivating such attitudes, professors can potentially improve students' persistence and adaptability in educational process, which are crucial in the volatile journey of entrepreneurship.

Supportive faculty, investor networking, and structured program elements like pre-accelerators, accelerators, and incubators reflect an agreement on the importance of community engagement and experiential learning. The emphasis on these areas highlights the professors' belief in the necessity of practical, hands-on involvement and real-world connections to cultivate successful student-led startups.

The focus on the role of practical experience of professors and structured programs like pre-accelerators and incubators suggests a strong belief in the power of guided experiential learning. These structured programs provide a sandbox environment for students to test theories and assumptions, iterate on their business models, and gain real-world experience in a relatively risk-free environment. They also serve as pathways for mentorship, where practitioners can impart practical wisdom and insights that are not readily derived from textbooks.

Networking is repeatedly highlighted, indicating the critical role of social capital in startup success. By facilitating connections with investors and experienced entrepreneurs, professors can bridge the gap between academic learning and the practical realities of the entrepreneurial ecosystem. This may enhance students' ability to secure funding, mentorship, and strategic partnerships, which are often pivotal for a startup's growth and sustainability.

Table 2 summarize top 5 statements with highest agreement among surveyed professors.

Table 2: Top 5 Statements with Highest Agreement Among Professors

No.	Statement	SD min	Sum Max	Coef.
28	A constructive attitude towards failure, viewing setbacks as learning experiences, is critical in developing student-run startups.	0,32	49	0,65
29	Trusting in oneself is essential for entrepreneurs; it fuels determination and is key to the success of student-run startups	0,32	49	0,65
8	The presence of supportive faculty and staff is pivotal in nurturing entrepreneurial activities, providing students with the guidance, mentorship, and resources necessary to turn innovative ideas into successful start-ups.	0,42	48	0,88
19	Networking opportunities with investors can foster successful student-run startup development	0,42	48	0,88
10	The active programs of pre-accelerators can significantly foster students' initiatives in developing start-ups.	0,48	47	1,02
11	The active programs of accelerators can significantly foster students' initiatives in developing start-ups.	0,48	47	1,02
12	The active programs of incubators can significantly foster students' initiatives in developing start-ups.	0,48	47	1,02
6	Professors' previous experience in business / entrepreneurship can significantly foster students' Start-up successful development	0,48	47	1,02

Source: Authors

Other selected statements where professors exhibited the least agreement, pointing to areas of contention regarding student startup success within academic environment. The highest standard deviation for the impact of the field of study on startup success indicates substantial debate among professors. This could reflect differing views on the relevance of non-business disciplines in cultivating entrepreneurial capabilities. The stark variance on the impact of non-business studies suggests a debate over the breadth of skills necessary for entrepreneurship, questioning the traditional business-centric model. The reduced focus on specific fields of study signals a call for curricular reforms that embrace a cross-disciplinary approach, equipping students with a wider entrepreneurial skillset. On the other hand, this also indicates that entrepreneurial studies alone are not sufficient for the successful development of startups.

Divergent opinions on legal support and the utility of dedicated physical spaces — such as labs and collaborative areas — highlight a lack of consensus on their roles in startup development. These elements, while recognized, may not be seen as central to the entrepreneurial process compared to other factors. This variability, especially where coefficients are high, suggests that the impact of these factors on student startup success is subject to interpretation and possibly dependent on individual institutional contexts. The professors' mixed responses here could signify the complexity of defining a one-size-fits-all approach to entrepreneurship education and indicate potential areas for further investigation and dialogue.

Differing views on the importance of risk-taking and comfort zone expansion point to a critical examination of how entrepreneurship education addresses personal growth versus business awareness. Varied opinions on student-run clubs reflect a critical look at their practical impact versus formal entrepreneurship programs. These disparities call for a critical re-evaluation of educational approaches to better align with the complex and dynamic nature of startup success.

Table 3 summarizes top 5 statements with lowest agreement among surveyed professors.

Table 3: Top 5 Statements with Lowest Agreement Among Professors

No.	Statements	SD_Max	Sum_Min	Coef.
4	The impact of field of study on students' start-up success: non-business students have less chance to create a successful start-up.	1,37	31	4,42
23	Providing students with dedicated physical space and infrastructure, such as rooms, corners, labs, and hubs, can significantly enhance their startup activities and success.	1,03	42	2,45
27	The willingness and readiness to step out of student's comfort zone often serves as a catalyst for students run startup successful development.	0.97	45	2,16
24	Student-run start-up and entrepreneurial clubs play a pivotal role in fostering a culture of innovation, providing peer mentorship, and offering a collaborative platform that can significantly boost the growth and success of student-led startups.	0.95	43	2,21
20	Legal and regulatory support, including trademark, patent, and company registration, can foster startup development within higher educational institutions	0,82	40	2,05

Source: Authors

In summary, the research indicates a strong consensus among professors on the significance of psychological factors like a positive attitude towards failure and self-trust for student entrepreneurial success. These traits are considered essential for encouraging an entrepreneurial spirit in academic environments, aligning with the literature on the entrepreneurial mindset focused on resilience and learning from failure.

There is also agreement on the value of community engagement and experiential learning through support from faculty, investor networking, and participation in structured programs like pre-accelerators, accelerators, and incubators. Such programs are seen as vital for providing practical experience, mentorship, and real-world business model testing.

However, professors showed less consensus on the influence of the field of study on startup success, suggesting a debate over the necessity of a business-focused curriculum versus a broader, cross-disciplinary approach. Opinions also varied on the importance of legal support and dedicated physical spaces, indicating these may be more institution-specific in their impact on startups.

Furthermore, the research calls for a re-evaluation of entrepreneurship education, considering divergent views on the roles of risk-taking, comfort zone expansion, and the effectiveness of student-run clubs compared to formal programs. This underscores the necessity for a comprehensive startup support framework within higher educational institutions to effectively address the complexities of entrepreneurship.

5. Discussions

Based on scientific literature analyses and empirical survey of professors, it is possible to structuralize and propose the elements of ecosystem for entrepreneurial higher education institution. The framework depicts various factors that influence a startup ecosystem within an academic environment, plotted along two axes. The Y-axis represents the level of influence of provided elements of the startup ecosystem, and the X-axis represents likelihood of student startup success within academic institution.

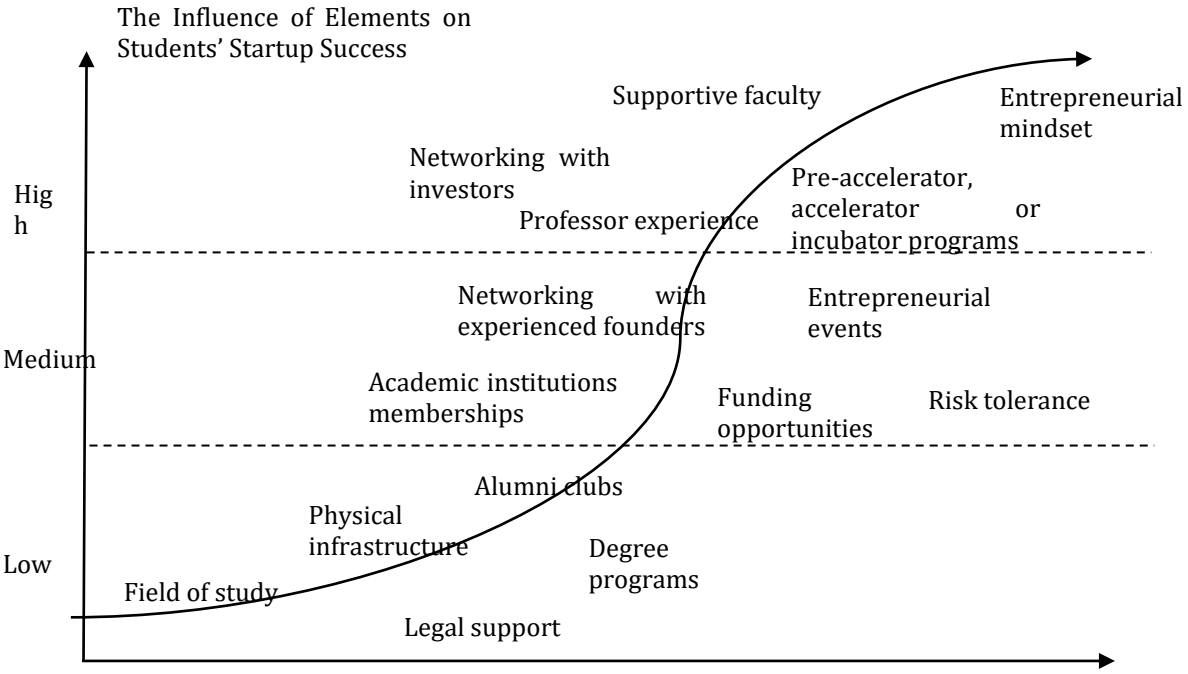

Figure 1: Framework of Influential Factors in Student Startup Success within Academic Institutions (authors creations)

The framework underscores a shift from traditional academic achievements to a more holistic and network-oriented approach in fostering successful student-led startups. The presence of accelerator and incubator programs suggests the university's role is not just educational but also as an ecosystem builder, facilitating students' practical business skills and risk tolerance.

This framework reinforces the idea that while foundational academic offerings like field of study and infrastructure are necessary, they are not sufficient. Instead, the emphasis should be on creating a robust support system through mentorship, networking, and a campus culture that promotes and understands the nuances of entrepreneurship.

6. Conclusion

The key following findings highlight the complex nature of entrepreneurial success in higher education and the necessity for institutions to adopt comprehensive, inclusive, and practical approaches to support student start-ups:

- The study revealed that entrepreneurial attitudes, specifically towards failure and self-confidence, are crucial for the success of student start-ups. Professors agreed that fostering a constructive attitude

towards failure and encouraging self-trust are essential psychological factors that significantly influence entrepreneurial success.

- There was strong disagreement among respondents regarding the belief that non-business students have a lesser chance of creating a successful start-up. This indicates a need for a more inclusive approach that supports students from diverse academic backgrounds in their entrepreneurial endeavours.
- Experts suggested that entrepreneurship education should place more emphasis on the development of students' entrepreneurial mindset. This mindset, which includes resilience, risk tolerance, attitude to failure and adaptability, is considered essential for navigating the uncertain journey of entrepreneurship.
- The survey results indicated that networking opportunities and experiential learning are vital for the development of student start-ups. Practical learning environments such as pre-accelerators, accelerators, and incubators, along with mentorship and real-world connections, are critical components of a supportive entrepreneurial ecosystem.
- The findings underscore the importance of not only innovative funding models but also non-financial support systems that go beyond traditional educational methods. These support systems are vital for creating a nurturing environment that can help student entrepreneurs succeed.

The results of the conducted research yield several theoretical and practical implications.

6.1 Theoretical Contribution

The findings from the presented framework contribute to entrepreneurial theory by emphasizing the critical role of social and human capital in the success of student startups. They suggest that while foundational academic elements such as field of study and physical infrastructure are important, the intangible assets gained through networks and mentorship are more influential. This highlights a potential shift in entrepreneurial theory toward the significance of an educational institution's social infrastructure over its physical or traditional academic offerings. By reinforcing the value of experiential learning, faculty support, and an entrepreneurial culture, these findings can inspire a revaluation of how educational policies and programs are structured to cultivate successful student entrepreneurs, providing a blueprint for future theoretical exploration in the realm of student entrepreneurship and entrepreneurial university ecosystems.

6.2 Practical Implications

The findings and proposed framework could guide academic institutions in designing policies and programs that prioritize these high-impact elements, therefore creating an environment where student-led startups can thrive. Integrating this framework into the research would provide a deeper understanding of what contributes most significantly to the success of student entrepreneurs and would likely resonate with the broader academic and entrepreneurial communities. Based on the findings, the following practical recommendations are proposed for higher education institutions to foster successful student start-ups a) Integrate comprehensive entrepreneurial courses that combine theoretical knowledge with practical applications, b) Incorporate technology skills training into entrepreneurship programs, c) Develop workshops and seminars focused on resilience, risk management, and learning from failure, d) Establish and maintain pre-accelerator, accelerator, or incubator programs, e) Create platforms for current students to connect with successful alumni entrepreneurs, f) Hire and support faculty with real-world entrepreneurial experience, g) Develop funding programs such as grants, loans, and venture capital partnerships specifically aimed at student ventures, H) Encourage cross-disciplinary collaborations and courses that combine business, technology, and other relevant fields.

6.3 Future Research Developments

Several constraints could affect the applicability of this study's results. Its conclusions may not universally apply across different nations, university models, or academic sectors, including the natural and technological sciences, as well as the social sciences and humanities.

Furthermore, as the elements indicate, the nature of student-led startups in academic environments is quite complex. The results are based on the perspectives of professors. It's important to highlight that the ecosystem comprises a variety of stakeholders, so developing a research methodology that includes the viewpoints of other key players—such as investors, corporate partners, experienced founders, and the students themselves—would be beneficial.

Moreover, the findings and proposed framework based on professors' perspective could be used as a foundation for developing hypotheses for further research, such as exploring the causal relationships between these elements and the actual success of student-run startups.

Abstract: In response to the growing imperative for sustainable entrepreneurship, this study investigates the efficacy of integrating targeted sustainability content into an action-learning-oriented international entrepreneurship course. This case study aimed to evaluate the impact of integrating sustainability content into an existing entrepreneurship course focusing on food-related business ideas to enhance students' sustainability literacy and understanding of sustainable entrepreneurship. Self-reflection protocols of two consecutive student cohorts of the same course were compared before and after the curriculum modification. The results clearly show that both student groups have built up many competencies, and significant knowledge of, entrepreneurial skills. However, the first group built up fewer skills in sustainability. The findings serve as an essential insight for entrepreneurship lecturers who aim to enhance entrepreneurial and sustainability skills among their students, as well as a thorough understanding of impact entrepreneurship. They receive helpful advice on which content to add to their existing entrepreneurship courses to emphasize sustainability.

Keywords: Entrepreneurship education, Impact entrepreneurship, Sustainable entrepreneurship, Social entrepreneurship, Project-based education, International collaboration

1. Introduction

A significant challenge in teaching-learning nowadays is to encourage entrepreneurship among university students (Ratten & Usmanij, 2021; Rauch & Hulsnik, 2015). Another priority is the development of critical competencies for sustainable development within universities (Barth et al., 2007). Therefore, integrating sustainability is a challenge that universities are beginning to address (Salleh et al., 2019). Strengthening students' entrepreneurial mindsets and creating positive social and environmental benefits is a crucial goal (Severo et al., 2019). The authors aimed to emphasize this goal in the entrepreneurship course they had been teaching for seven semesters. Even though they had told their students to make sure the business ideas they developed during the course should have a positive impact on society or the environment, most teams came up with "classic" business ideas focusing on economic aspects only. Therefore, the lecturers decided to include additional sustainability content into the course and to measure the before-and-after learning success. The results provide practical insights for entrepreneurship lecturers who also seek to emphasize sustainability in their entrepreneurship courses.

After explaining the theoretical foundation of this research, the methodology is described. This is followed by the results of the empirical research which are discussed, by implication, regarding both theory and practice. Finally, the limitations of this research are outlined, future avenues for research are presented and conclusions are drawn.

2. Theoretical Foundation

Acquiring sustainability competencies is essential for students and faculty to deal with sustainability topics and to create impact. Education for sustainable development is paramount and the challenges and potentials of this field need to be recognized (Leal Filho et al., 2018). Several studies show examples of combining entrepreneurial and sustainable learning goals into the curriculum (Grimm & Bock, 2022; Krzywonos et al., 2023).

However, integrating sustainability aspects to enhance the environmental or social impact of student business ideas should not be a task by faculty alone. Student involvement in curriculum development is essential and can positively influence the effectiveness and relevance of educational programs. Bovill et al. (2011) suggest that engaging students in curriculum design can increase engagement. They are more likely to develop a sense of ownership for their studies when actively involved in curriculum design. Furthermore, student engagement in

curriculum development may result in enhanced academic performance and a greater enthusiasm for learning (Heller et al., 2010). Additionally, project-based learning approaches focusing on sustainability topics can create societal and environmental impact driven by students (Rajan et al., 2019). Figure 1 shows the theoretical foundation for this research.

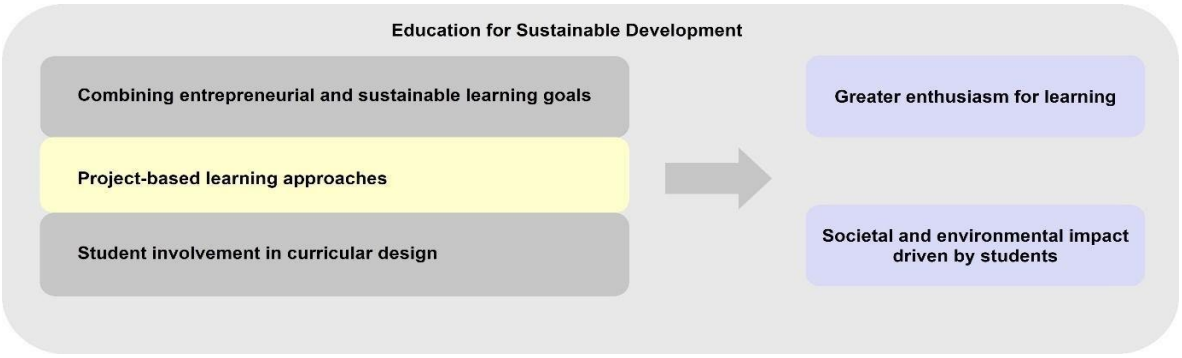

Figure 1: Research framework (source: Own illustration)

The authors aimed to combine entrepreneurial with sustainable learning goals and to involve their students in this effort within an existing project-based, international, and multidisciplinary entrepreneurship course. They wanted to determine whether they could enhance students' sustainability competencies by explicitly adding additional sustainability content and measuring the before-and-after of two consecutive courses. The authors asked the following research question: What is the effect of integrating sustainability content into an existing entrepreneurship course?

3. Methodological Approach: Case Study Research

Coming from a critical realism philosophy and an abductive approach to theory development, mixed method research was chosen using a case study (Yin, 2018). Two consecutive entrepreneurship courses (before and after adding more sustainability topics) served as a comparison for this real-life setting; hence, it was a longitudinal study (Saunders et al., 2023).

3.1 Case Study Setting

The case study's entrepreneurship course was launched in the winter term of 2020 by the Munich University of Applied Sciences (HM). The instructors from the Business School and the Faculty of Applied Sciences and Mechatronics jointly offered an entrepreneurship course focusing on Food and Agriculture, targeting students from their respective departments. The course embraced a problem-based learning approach. Students were tasked to develop an innovative business idea for an existing problem in Food and Agriculture. The lecturers and their business network brought in the challenges to solve. Universities can foster learner-to-content engagement and promote active participation in sustainable initiatives by including real-world projects that build technical and critical thinking skills (Martin & Bolliger, 2018). In the following semester, the course was opened for students from two partner universities: King's College in Kathmandu, Nepal, and Durban Technical University in South Africa; thus, apart from being interdisciplinary, the course became international. The semester after, subject-matter expertise in Food was brought with a lecturer and students from Wroclaw University of Economics and Business in Poland, and the course switched to a flipped classroom format. The theoretical underpinnings of the course were delivered via videos that the lecturers had recorded and provided on sce.academy, the Massive Open Online Course (MOOC) platform of the Strascheg Center for Entrepreneurship (SCE), the entrepreneurship center of HM. Students prepared themselves by watching the lecture material before class, which allowed for more coaching and discussion time during classes. Successful founders in Food and Agriculture were invited to give impulse speeches about their as entrepreneurs. Even though the authors continuously emphasized that students should aim for business ideas that impact the environment or society, students often came up with business ideas focusing solely on the economic aspect. Thus, the lecturers decided to add additional sustainability content to the course and measure whether this would raise sustainability literacy and result in business ideas with more impact.

3.2 Changes to the Course Content to Emphasize Sustainability

To create a basis for a sustainability definition and a setting for the course in terms of what impact means, the authors added a flipped classroom lecture on Sustainable Development Goals (SDGs, https://sdgs.un.org/goals),

following Popelo et al's (2022) advice to align institutional capabilities with global sustainability efforts like the SDGs and the quest to develop courses and activities that focus on the implementation of SDGs in university teaching (Botes et al., 2014; Brugmann et al., 2019).

Additionally, the authors looked at the results from the self-reflection protocols from the summer cohort to assess what type of sustainability content to add. The students were asked (apart from their module assignments regarding their business idea) to write a self-reflection protocol on several predefined questions regarding their learning success and acquired competencies during the course. This self-reflection was marked and resulted in 10% of the final grade. 26,3% of the students mentioned that they needed some slides or introduction material to the topic of sustainability. As one participant phrased it: "There was no basic introduction to the topic of sustainability." (Summer23_RP Food - Reflection 6, Pos. 29). Another recommendation from students was to ask guest speakers to discuss about more sustainable management within their startups.

The authors took this feedback and added two new videos (on Sustainable Business Models and Circular Business Models) and two new readings on Impact Business Models to the flipped classroom platform, taking into consideration Collado et al.'s (2021) advice to develop programmes that focus on innovation for environmental sustainability to create a long-term effect on students' positive ecological behaviours. Sady et al.'s (2019) suggestion to organize extracurricular activities to develop impact-oriented competencies was incorporated by inviting students to participate voluntarily in the Start for Future community (https://startforfuture.eu) to get even more international exposure and inspiration from other student teams and coaches. All this additional content was integrated into the course to increase sustainability literacy among students (Albinsson et al., 2020). The next step was to evaluate whether student-perceived sustainability literacy has been increased via the course.

3.3 Data collection and Analysis

Data was collected from participating students from Nepal, Poland, and Germany of the summer term 2023 (19 participants) and winter term 2023/24 (25 participants) via self-reflection protocols. Inspired by the EntreComp Entrepreneurship Competency Framework (Bacigalupo et al., 2016) and the GreenComp European sustainability competence framework (GreenComp, 2022), the self-reflection protocols contained three open questions and five closed questions. The closed questions were collated with Excel. The open questions were analysed using Kuckartz's (2018) qualitative content analysis with the support of MAXQDA. Qualitative content analysis is a technique whereby text, voice, or visual data is categorized by developing and using a systematic coding scheme to enable quantitative analysis (Saunders et al., 2023, p. 584). For this paper, only text data from the self-reflection protocols of the two student cohorts was used.

In the first step, the first author coded 20% of the total material and developed a coding system. The main categories from the coding system were developed deductively, derived from the questions themselves: "What have you learned about entrepreneurship and innovation? How can this knowledge be useful for your future life?" built the main category "Learning outcome entrepreneurship." The questions "What have you learned about sustainability? How can this knowledge be beneficial for your future life?" built the main category "Learning outcome sustainability." Finally, the question "What has not been addressed in this course to address sustainability and foster positive impact generation?" built the main category "Not addressed to foster positive impact generation." The sub-categories for these three main categories were developed inductively and in-vivo during the coding process, and one main category emerged during the coding process: "Other learning outcomes." After the first coder had developed the basic coding system, all authors gathered to discuss it and applied it to two additional protocols. During this process, slight changes to the names of the codes were made, and a new main category, *Influencing factors*, was added, as well as the sub-code *Adaptability*.

The artificial intelligence functionality called "automatic coding" from Atlas.ti 2024 was used to develop a coding system compared to the one created manually. This exercise delivered 674 codes in total. The authors concluded that the level of detail was too high and that the intended aggregation of meaningful categories was not addressed adequately. Therefore, this logic was disregarded. Instead, another artificial intelligence functionality in Atlas was used: coding based on the research question. This exercise delivered 839 codes, and the authors agreed that three of them were meaningful and an excellent addition to the coding system and were therefore added: *Broadening understanding*, *Applicability*, and *Perseverance*. A codebook was created where each code was assigned a definition and an anchor example, making it easier for the authors to discuss the coding system. All changes to the coding system were captured in the logbook functionality of MAXQDA for traceability and reliability. After inter-coder reliability was ensured, the first author manually coded the remaining self-reflection

protocols of the summer and winter cohorts. Finally, the coding system consisted of five principal codes and 13 subcodes. Figure 2 shows the coding system.

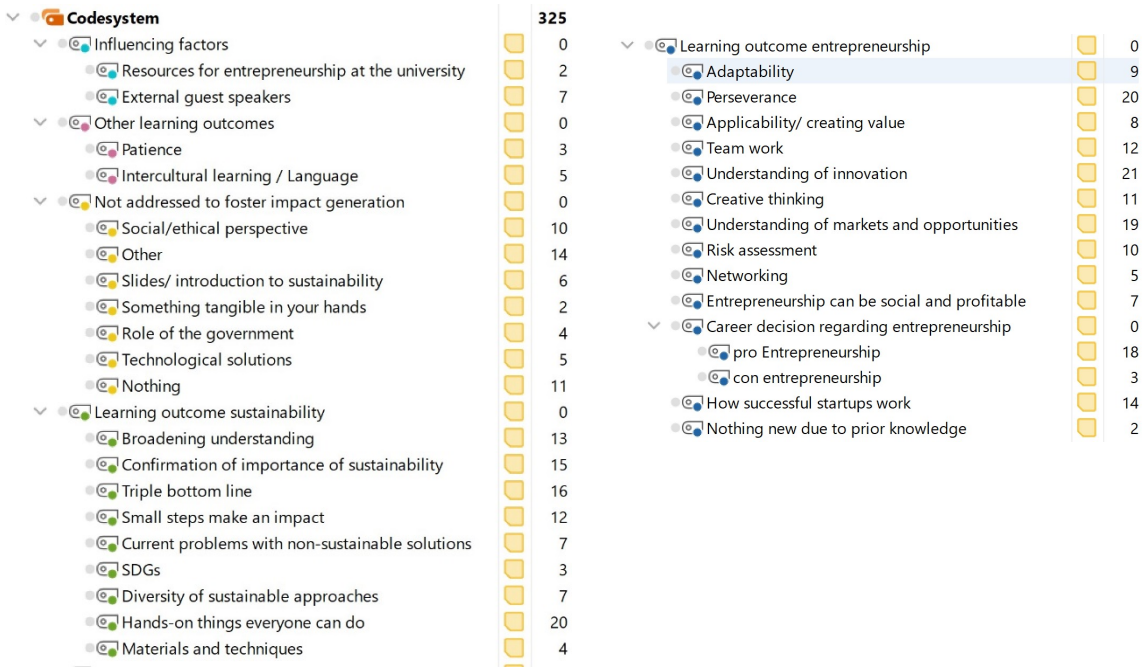

Figure 2: Coding system overview (source: own illustration from MAXQDA)

Besides analysing the open questions with qualitative content analysis, the authors looked at the five closed questions from the self-reflection protocols to answer the research question. Students answered the following questions in a Likert-scale-5 format referring to the skills they had developed during the course.

- How would you rate your knowledge of sustainability in startups?
- How would you rate your knowledge of eco-design?
- How would you rate your knowledge of social sustainability?
- How would you rate your knowledge of life cycle assessment?
- How would you rate your knowledge of Sustainable Development Goals?

The answer spectrum ranged from 1 = I have no idea to 5 = I am an expert in this topic. One student from the winter cohort still needs to fill out these questions. Therefore, N was 24 in the winter and 19 in the summer cohort.

4. Results

To answer the research question: *What is the effect of integrating sustainability content into an existing entrepreneurship course?* The following three questions from the self-reflection protocols were analysed with MAXQDA and compared regarding the two different student cohorts:

- Which topics should be included in this course to address sustainability and foster positive impact generation?
- What have you learned about sustainability? How can this knowledge be beneficial for your life?
- What have you learned about entrepreneurship and innovation? How can this knowledge be beneficial for your future life?

To compare the results of the two cohorts, all analyses were run for summer and winter term students separately. Analyses were run quantitatively first. In a second step, the codes that differed between the summer and winter cohorts in frequency were analyzed qualitatively using the interactive segmentation matrix from MAXQDA, as suggested by Rädiker and Kuckartz (2019). Figure 3 shows a crosstab for proportional code frequency as a quantitative comparison of the two cohorts. Percentages are according to N (meaning multiple mentions within one student protocol are not counted).

Regarding *Influencing factors* or *Other learning outcomes*, nothing surprised the authors concerning the two cohorts. In terms of what was *Not addressed to foster positive impact generation*, 36% of respondents from the

winter cohort mentioned that the social/ethical aspect of sustainability should be further strengthened. On the other hand, 32% of the winter cohort stated that they learned something about the triple bottom line (meaning the holistic view of the environmental, social, and economic dimensions of entrepreneurship; see Baumast and Pape, 2022). Roughly the same percentage in both cohorts mentioned that nothing was missing (26,3% in the summer and 24% in the winter cohort, respectively). Still, the authors will take this feedback and integrate more social and ethical emphasis in the upcoming classes.

Summer Cohort	Total	in % of N

Source: Own illustration from MAXQDA.

Figure 3: Crosstab for proportional code frequency of summer and winter cohort

For *Learning outcome sustainability*, as anticipated, students from the winter cohort gained a broader understanding of sustainability (44% versus 10,5% of the summer cohort) and a more decisive confirmation of the importance of sustainability (44% versus 5,3%). The triple bottom line was mentioned roughly equally, as a few slides on that topic had already been provided during the summer term. However, students in the winter cohort felt more strongly that small steps towards sustainability can make an impact (32% versus 15,8%). They better understood the diversity of sustainable approaches (20% versus 5,3%). With regards to SDGs, this was not mentioned at all as a learning outcome in the summer term, but 12% of students from the winter cohort mentioned it after the authors had integrated a dedicated module on SDGs. This clearly shows the positive effect that the integration of additional sustainability content had on the respective learning outcomes of students. It also becomes apparent when looking at the *Learning outcome of entrepreneurship.* Students from the winter cohort mentioned more frequently (24% versus 5,3%) that learning for them was that entrepreneurship could be social **and** profitable. They also mentioned much more often (56% versus 15,8%) that they could imagine pursuing an entrepreneurial career. This might be because they were amazed by the impact their business ideas could have and inspired to help shape a better future. This is well described by the following two quotes from winter semester participants: “This knowledge has empowered me to consider entrepreneurial ventures with a focus on sustainable practices, fostering innovation that addresses pressing environmental and social issues like

for example, the electricity problem the people in South Africa encountered." (WS 23-24_RP Food_Reflection 12, Pos. 19). "Moving forward, I am excited to apply the knowledge gained from this course. I am eager to begin conceptualizing, designing, and eventually launching an app that facilitates eco-friendly food delivery." (WS 23-24_RP Food_Reflection 13, Pos. 7).

The only other difference between the winter and summer cohorts regarding the learning on entrepreneurship was that the summer term students emphasized teamwork much more (42,1% versus 12%). The authors assume this is because the summer course took place on-site and the winter course remotely. Therefore, the summer cohort had more direct team interaction, get-togethers after class, joint breakfasts, etc. However, this effect cannot be attributed to the course content. The other learning outcomes on entrepreneurship were similar in both groups. Similar to typical entrepreneurial competencies outlined in literature (Green Comp, 2022), they were: Adaptability, Perseverance, Applicability, Teamwork, Understanding of innovation, Creative thinking, Understanding of markets and opportunities, Risk assessment, Networking, and How successful startups work. On a side note, there were also a few students whose takeaway from the class was that they are sure never to pursue an entrepreneurial career. This is a fair point, and this realization is appreciated. One student from the winter cohort phrased it pointedly: "I probably will not bring any new inventions onto the market in the future, as it was very nerve-wrecking for me." (WS 23-24_RP Food_Reflection 2, S. 2)

To summarise, the results from the qualitative content analysis show that the level of knowledge gained in entrepreneurship was similar among the two groups. In contrast, the knowledge gained in sustainability was higher in the winter cohort after adding additional content. This cohort gained a broader understanding of the diversity of sustainability, the SDGS, the triple bottom line, and a more decisive confirmation of the importance of sustainability. Students felt more empowered to take small steps towards sustainability and were more inclined to pursue an entrepreneurial career and develop business ideas with impact. The social/ethical aspects of entrepreneurship should be further emphasised in upcoming cohorts.

The quantitative part of this study focused on five specific areas: sustainability in startups, eco-design, social sustainability, life cycle assessment, and the Sustainable Development Goals (SDGs). Tables 1 and 2 show the results of the two cohorts; each student rated themselves in this knowledge before and after participating in the course.

Table 1: Learning outcome summer cohort, n=19 (source: own illustration).

Before	10	9	2	3	0	1,92		2	1
After	0	3	12	7	2	3,33	1,42	3	3
How would you rate your knowledge of social sustainability?									
Before	3	3	13	3	2	2,92		3	3
After	0	1	5	15	3	3,83	0,92	4	4
How would you rate your knowledge of life cycle assessment?									
Before	6	10	7	1	0	2,13		2	2
After	0	2	9	12	1	3,50	1,38	3	4
How would you rate your knowledge of Sustainable Development Goals?									
Before	3	4	10	4	3	3,00		3	3
After	0	1	6	12	5	3,88	0,88	4	4

For the area of eco-design the knowledge gain was roughly the same for both cohorts. For all other aspects, the Average Delta was higher in the winter cohort, especially for the knowledge in life cycle assessment (Delta 1,38 points versus 0,79 points) and sustainability in startups (Delta 1,42 points versus 1,05 points). The knowledge gained on SDGS was only slightly higher in the winter cohort. The Median and Mode analysis also shows a larger knowledge gain for the winter cohort for all areas except for eco-design. These figures are in line with the results from the qualitative content analysis. After adding dedicated lectures on circular business models, SDGs, and specific questions for founders of sustainable startups, the additional knowledge gained by the winter cohort was expected. Interestingly, knowledge gain in social sustainability was even lower in the winter cohort than in the summer cohort. This emphasizes the need to add more of this content in upcoming cohorts of this course.

The research question can be answered as follows: Integrating additional sustainability content into the course material increases students' knowledge. They have a broader understanding and are more eager to apply their knowledge about sustainability to business ideas and future entrepreneurial ventures.

5. Discussion

The results of this case study have implications for theory and practice and possibilities for future research, which are described below, as well as certain limitations.

5.1 Implications for Theory

This study clearly shows a positive effect on students' learning outcomes on sustainability and a deepened desire to pursue impact business models or a future career in impact entrepreneurship, ultimately resulting in societal and environmental impact driven by students. There was also greater enthusiasm for learning among students who developed impact business models as they felt that their actions could lead to positive change. This effect was achieved after entrepreneurial and sustainable learning goals were combined in the curriculum; students were involved in course development based on their feedback in self-reflection protocols and via a project-based learning approach. This is in line with the suggested theoretical framework. It can be further developed and tested and signifies a small contribution to the vast area of Education for Sustainable Development.

5.2 Implications for Practice

The case study reveals hands-on practical implications for the authors as lecturers. It confirms that adding sustainability content encourages students to develop more impactful business ideas during the course and beyond. Based on the qualitative and quantitative analysis results, stressing the ethical and social dimensions is important. Therefore, in the upcoming winter term another flipped classroom video dedicated to this pillar of

sustainability will be added. Additionally, specific challenges will be chosen for students to address social problems within food and agriculture, such as the precarious working conditions of tomato pickers in Italy and asparagus pickers in Germany.

5.3 Limitations

Even though the findings may inspire other lecturers to adapt their entrepreneurship curriculum to emphasize sustainability, they can only be generalized to apply to some university teaching settings (Saunders et al., 2023, p. 214). Regarding reliability, intercoder-reliability (Goldenstein et al., 2018, p. 103) was given in that all three authors agreed and applied the developed coding system, which was additionally cross-checked and enhanced with the artificial intelligence functionality of Atlas. In terms of overall research design, as with any case study, the research is not replicable as the same cohorts of students cannot be retested. Other consecutive courses could replicate the research with the same research questions and methods, but other research teams might come to different conclusions. Semantic validity was ensured as the self-reflection protocol questions were specially developed to answer the research question. Construct validity was ensured in that the setting of the case study was clearly described, and all analysis steps, development of the coding system, etc., were noted in a logbook (Goldenstein et al., 2018, p. 104). Given the fact that both qualitative and quantitative data were used, triangulation was ensured. As the authors are teaching this course themselves, objectivity was not reached. Other researchers with an outside perspective might have come to different conclusions.

Students rated their knowledge before and after the course. However, the evaluation was conducted after the course was finished. This might result in a particular bias as students might have wanted to show the lecturers that they did gain additional knowledge through the course. Asking the *before* questions at the beginning and the *after* questions at the end of the course should be considered for upcoming self-evaluations. Also, the numbers of students in both cohorts, with 19 and 25, respectively, are relatively small for a quantitative comparison. The validity of the data should therefore be treated with caution.

5.4 Future Research

With regards to other lecturers and courses, based on the results of this case study, the following hypothesis can be generated: If dedicated sustainability modules are added to existing entrepreneurship courses, the competency gain in sustainability is higher, resulting in a higher impact of students' business ideas and a higher desire to pursue a career in impact entrepreneurship. This hypothesis could be tested in a quantitative longitudinal study at other universities where students and lecturers are asked to evaluate the level of impact of their developed business ideas on a scale before and after adding sustainability content and their willingness to work in an impact startup.

Another area of future research would be to analyse the business ideas of student teams in more detail to understand what they have been focusing on, how much they contribute to the different SDGs, how they could generate even more impact, and if any patterns emerge that would suggest specific topics that should beffurther emphasised during lectures. This could be done by interviewing student teams or conducting focus groups and by analysing them through qualitative content analysis (Kuckartz, 2018).

6. Conclusions

To conclude, this case study provides practical suggestions on emphasizing sustainability in the authors' entrepreneurship course, thereby contributing to the academic discussion on Education for Sustainable Development Goals. The results might serve as food for thought for other lecturers and pave the way for future research.

Dealing with Failure: The Media's Portrayal of Entrepreneurs in Croatia

Korina Kastela and Vlatka Skokic
University of Split, Faculty of Economics, Business and Tourism, Croatia

korina1.kastela@gmail.com
vskokic@efst.hr

Abstract: Entrepreneurship and stigma have been subjects of interest in various studies within the entrepreneurship field. The evidence suggests that societal stigma may lead to the stigmatization of entrepreneurs who have faced business failure, potentially influencing their strategic decisions and the likelihood of re-entry into entrepreneurship. Additionally, the liability of newness and the stigma of failure are critical factors that shape entrepreneurial dynamics and outcomes in different national contexts. The fear of societal judgment and negative perceptions can deter individuals from engaging in entrepreneurial activities, hindering entrepreneurial risk-taking and innovation, and limiting the growth and development of entrepreneurial ventures. The societal stigma associated with business failure in former socialist economies has been a significant factor influencing entrepreneurial activities in these regions. Research has indicated that socialist ideology historically stigmatized private proprietorship, associating it with negative connotations such as parasitism, exploitation, and profiteering. This lasting stigma has had implications for individuals pursuing entrepreneurial opportunities in post-socialist economies, impacting their perceptions and decisions regarding entrepreneurship. The transition from socialist planned economies to market-oriented systems has brought about changes in attitudes towards entrepreneurship. While socialist legacies may have initially influenced societal norms and perceptions of entrepreneurship, the emergence of market economies has led to a reassertion of entrepreneurship in these regions. Numerous studies indicate that the way media depicts entrepreneurs and their ventures plays a crucial role in shaping the attractiveness of entrepreneurship as a career choice and in developing social norms pertinent to the entrepreneurial spirit. In our research, we utilize qualitative content analysis to examine the representation of entrepreneurship, including the successes and failures of entrepreneurs, in Croatian media. The findings reveal a dominant adverse perception of entrepreneurship as a career in Croatia, with entrepreneurs frequently depicted as tycoons. Additionally, since the 1990s, entrepreneurs have faced stigma, and there appears to be no evident direction for improvement in this area.

Keywords: Entrepreneurs, Stigma, Media portrayal, Former socialist economies, Qualitative content analysis

1. Introduction

Stigma in the context of entrepreneurship has been a subject of interest in various studies, particularly in understanding its implications for entrepreneurial activities and outcomes. Stigma is broadly defined as a stain on one's reputation (Singh, Corner, and Pavlovich, 2015). It is a complex phenomenon occurring on multiple levels. At the macro level, social groups form collective judgments about the consequences associated with a specific stigmatizing trait. At the micro level, individuals who possess this trait are influenced to internalize society's broader judgments into their self-concept (Goffman, 1963).

Scholars primarily investigate stigma within the context of entrepreneurial failure (Cardon, Stevens, and Potter, 2011; Hegarty, Stephens, Gallagher, and Cunningham, 2020; Omorede, 2021; Simmons, Wiklund, and Levie, 2014; Singh et al., 2015). Although existing research shows that the stigma of entrepreneurial failure varies from one national setting to another (Singh et al., 2015), evidence from the former socialist economies of Central and Eastern Europe (CEE) demonstrates the complex interplay between former socialist and communist legacies and adopted neoliberal ideologies on entrepreneurship (Aidis, Estrin and Mickiewicz, 2008; Bohle and Greskovits, 2007; Djip, 2014). However, what remains underexplored is how societal stigmatization of entrepreneurship and entrepreneurs in post-socialist economies impacts entrepreneurial activity. We thus seek to deepen our understanding of entrepreneurial stigmatization beyond failure.

The study employs qualitative content analysis of published online media articles to investigate how entrepreneurship and entrepreneurs are positioned in Croatia, a former socialist economy. Media representations of entrepreneurs and entrepreneurship play a crucial role in shaping societal perceptions, influencing attitudes towards entrepreneurship, and contributing to the overall entrepreneurial ecosystem. Media stories and representations contribute to the construction of cultural norms and identities surrounding entrepreneurship. For instance, the portrayal of entrepreneurs as heroes or jesters, as discussed by Anderson and Warren (2011), can shape societal views on entrepreneurial behaviour and values, impacting the cultural positioning of entrepreneurs within society. Croatia is an appropriate empirical setting to explore the research question because the country has recently undergone significant economic and social transformations, transitioning from socialism to capitalism and achieving membership in the European Union (EU).

2. Overview of the Literature

In the context of entrepreneurship, stigma is investigated within the specific context of entrepreneurial failure. Singh et al. (2015) identify two research themes. The first stream deals with stigma related to bankruptcy (for instance Lee, Yamakawa, Peng, and Barney, 2011; Rawal and Sarpong, 2020), while the other research stream investigates socio-cultural aspects of failure stigmatisation. For instance, Begley and Tan's (2001) study found that the perceived high penalty for failures could lead to a greater scrutiny of entrepreneurial prospects, induced by the shame of failure in East Asian countries compared to Anglo countries. This highlights how the fear of failure and the stigma associated with it can impact entrepreneurial decision-making and risk-taking behaviour. Ferreto, Lafuente and Leiva (2018) explore the impact of entrepreneurial role models in reducing the fear of failure among individuals who have not yet engaged in entrepreneurial activities. The results indicate that exposure to entrepreneurial examples significantly diminishes the fear of failure in individuals not currently involved in entrepreneurship, demonstrating the importance of entrepreneurial role models as a key precursor to entrepreneurial engagement. Vaillant and Lafuente (2007) examine how various institutional contexts in Spain's regions shape the impact of specific social characteristics—namely, the social stigma associated with entrepreneurial failure and the availability of entrepreneurial role models—on the levels of entrepreneurial activity in rural areas with strong entrepreneurial heritage compared to those without such a tradition. The study's finding reveals a notable difference in the levels of entrepreneurial activity between rural areas in one region (Catalonia) compared to the others. This disparity is explained in relation to the unique influence of the social traits observed, "mainly due to the superior impact of positive entrepreneurial examples (role model effect)" (p. 332). In addition, the study confirms the negative influence of social stigma associated with failure on entrepreneurial activity. Simmons et al. (2014) explored the impact of stigma and business failure on entrepreneurs' career choices, underlining the societal perceptions that stigmatize failed entrepreneurs. Additionally, Shepherd and Haynie (2011) discuss the self-verification and self-determination view of venture failure stigma, providing insights into how entrepreneurs manage impressions in the face of societal views of failure.

However, in the context of former socialist economies during the transition period, the positioning of entrepreneurs and entrepreneurship has been a complex phenomenon. Aidis, Estrin, and Mickiewicz (2008) examined the development of entrepreneurship in Russia, highlighting the challenges posed by corruption and government intervention. The "grabbing hand" model of government intervention and the impact of corruption on private sector development contributed to a negative perception of entrepreneurship in the region. Estrin and Mickiewicz (2011) delve into the role of institutions and generational change in entrepreneurship within transition economies, providing insights into the evolving institutional, social, and cultural environment for entrepreneurs. This research shed light on the institutional dynamics that influence entrepreneurial behaviours and outcomes during the transition period. Namely, communism left a legacy of values and norms that are not conducive to entrepreneurship, and Estrin and Mickiewicz's (2011) findings suggest that the whole generational change is needed to bring the changes in values and attitudes necessary for entrepreneurship development. Fritsch, Bublitz, Sorgner and Wyrwich (2014) investigation examines the relationship between institutional transformation and the resurgence of entrepreneurship in East Germany. It took approximately 15 years for self-employment rates in East Germany to align with those in West Germany while the characteristics of East German self-employment continue to reflect traces of its socialist heritage, supporting the notion that informal institutions evolve more gradually than their formal counterparts.

Socio-cultural perceptions of entrepreneurship encompass views on the social legitimization of entrepreneurship. National culture, understood as a shared set of values and norms among a group, can foster entrepreneurship both through this social legitimization and positive attitudes towards it. In recent years, media representations emerge as a significant cultural factor influencing perceptions of entrepreneurship (Laguía and Moriano, 2021). A number of studies have shown that media portrayals of entrepreneurs and entrepreneurship influence the desirability levels of entrepreneurship as a career and the creation of social values relevant to entrepreneurial culture (Hindle and Klyver, 2007; Levie, Hart and Karim, 2010; Radu and Redien-Collot, 2008). Ljunggren and Alsos (2001, p. 2) describe the dual role of the media as both reflective and manipulative in relation to entrepreneurship. On one hand, the media play a significant role in shaping attitudes and promoting "role models"; on the other hand, they can also enforce and promote widely accepted social attitudes about entrepreneurship.

One of the few studies on media representation of entrepreneurs in the former communist economies of CEE reveals how the private sector in Belarus is portrayed as a "dangerous territory" where "businessmen have to be controlled" (Miazhevich, 2007, p. 1338). Consequently, entrepreneurs are often viewed as potential

disruptors, socially constructed as being "close to criminals... who... threaten the stability of the country and the morality of the nation" (p. 1339). Miazhevich (2007, p. 1346) argues that the “state's discursive practices not only reinforced the antagonism of entrepreneurs towards the state but also, by fostering an environment of general hostility within society, provoked the multiplication of out-groups within the business community itself.” In contrast, research from the UK and France shows that media articles depict entrepreneurs as dynamic, active pursuers of opportunities, and agents of change. In the UK, they are seen as key economic and social actors, while the French press describes them as a "miraculous alternative" (Radu and Redien-Collot, 2008, p. 286) to the challenges of globalization and unemployment. The study by Nicolson and Anderson (2005) explores the social construction of entrepreneurship through an analysis of myth and metaphor in media representations. The study uncovers various archetypes attributed to male entrepreneurs, including dynamic wolfish charmers, supernatural gurus, successful skyrockets, community saviours, and corrupters. This highlights the diverse and sometimes contradictory ways in which entrepreneurs are depicted in the media, showcasing the multifaceted nature of entrepreneurial identity construction. The study by Laguía and Moriano (2021) focuses on the perceived representation of entrepreneurship in the mass media and its impact on entrepreneurial intention. The research delves into how media discourses influence individuals’ perceptions, attitudes, and beliefs towards entrepreneurship, ultimately affecting their intention to engage in entrepreneurial activities. Their results point that perceived social legitimacy granted to famous entrepreneurs by the media was positively associated with attitudes and self-efficacy. Attitudes had the strongest connection to entrepreneurial intention, demonstrating the significant impact of media on shaping attitudes. Entrepreneurship has been a subject of increased interest in media representations over the last few years, particularly concerning gender roles and stereotypes. Studies have delved into how female entrepreneurs are portrayed in the media, highlighting issues of gender inequalities and the impact of such representations (Eikhof et al., 2013). The portrayal of male entrepreneurs has also been scrutinized, especially in the context of movements like #metoo, to assess if there have been changes in media depictions (Jernberg et al., 2020).

In former socialist economies, where the legacy of state control and economic transition has influenced entrepreneurial activities, media representation can play a significant role in shaping the narrative around entrepreneurship, promoting positive role models, and challenging stereotypes. The stigmatization of private proprietorship in socialist ideology has had implications for individuals pursuing entrepreneurial opportunities in post-socialist economies, impacting their perceptions and decisions regarding entrepreneurship. By investigating media representations of entrepreneurs in Croatia, this study responds to the calls to investigate broader societal factors that influence entrepreneurial behaviour and perceptions in post-socialist economies.

3. Methodology

To investigate the representation of entrepreneurship, including the successes and failures of entrepreneurs in Croatian media, this study adopts qualitative content analysis. Qualitative content analysis is a research method that involves a systematic and in-depth examination of textual data to identify patterns, themes, and meanings (Mayring, 2014). This approach includes both qualitative and quantitative methods, but all share a common feature—the systematic categorization of textual data to facilitate understanding (Hsieh and Shannon, 2005). After collecting all relevant published media articles, they were extensively reviewed and analysed by both researchers.

Our research focused on all available media articles using the following key terms: "entrepreneur," "tycoon," "entrepreneurship failure," "entrepreneur thief," "entrepreneur success," "entrepreneur politician." Twenty articles published from 2012 (the first year when online media articles were available in Croatia) to 2024 were selected and analysed. Articles which repeat the same story are excluded from the analysis (42 articles).

Analysed media articles with the source name, article title and publication year and dominant discourses are provided in Table 1.

Table 1: Analysed media articles

ONLINE MEDIA ARTICLES	TITLE OF THE ARTICLE & YEAR OF PUBLICATION	DOMINANT DISCOURSES
Slobodna Dalmacija	„Milanović: The way things are going, soon we won't have any salaries!; Employers: They don't like us; Čačić: Trade unions would be politicians“ (2012.)	negative attitude, bad laws and judiciary, administration, anti-business climate

ONLINE MEDIA ARTICLES	TITLE OF THE ARTICLE & YEAR OF PUBLICATION	DOMINANT DISCOURSES
Večernji list	„Croatian entrepreneurs have the opportunity to use EU support programs“ (2013.)	crisis and recession, poorly developed entrepreneurial culture
Al Jazeera Balkans	"The mysterious past of Croatian tycoons " (2014.)	favours, privileged conditions, stigmatised entrepreneurs, Ivica Todorić, Emil Tedeschi
Posao.hr	"The only obstacle when entering entrepreneurship was actually a mental one - we were afraid to leave the security of a large system" (2014.)	mental barriers, starting a business in Croatia
Tportal	„Croats enter entrepreneurship out of trouble“ (2014.)	high unemployment, no job opportunities, low motivation coefficient
Slobodna Dalmacija	„An entrepreneur is a class enemy for a Croat“ (2015.)	entrepreneurial nation, parenting, not standing out in society, job security
Poslovni dnevnik	" Tedeschi: Entrepreneurship is not a hob and an enemy, and a whole series of people were stigmatized in the 90s " (2016.)	stigma from the 90s, non-transparent business, corruption, violation of the rules of ethics and morality
tportal	"Here is how students evaluate the entrepreneurial climate" (2016.)	legal regulation, negative social attitude, stigma (tycoons), influence of family and friends
Lider	"Entrepreneurs, turn the fear of failure into an ally" (2018.)	failure, social stigma, bankruptcy, fear motivation
Netokracija	"In Croatia, only every 12th citizen decides to become an entrepreneur, can we change that as a digital community?” (2020.)	negative perception of entrepreneurship, risk, comfort, safe workplaces
Ekonomska klinika	"How Rimac brought success to the Croatian economy" (2021.)	the success of Mate Rimac, role models, new discourse on success
Večernji list	"Most enter into entrepreneurship out of necessity. It's a weak motivation" (2021.)	entrepreneurship in the Republic of Croatia is not important
Slobodna Dalmacija	"How did Mate Rimac succeed? An entrepreneur admired by the whole world in less than ten years earned more than 1 billion HRK" (2021.)	foreign investors, success story,
Hrvatska udruga banaka	"In Croatia, there is still a low level of research transfer to the business sector and a restrictive entrepreneurial environment" (2022.)	entrepreneurial environment, limitation, entrepreneurial imbalance, family life, cultural context
Weekend Media Festival	"Entrepreneur: public enemy number one" (2022.)	negative image in the society, negative public perception
Poslovni dnevnik	"Croatia is no longer a macho country for entrepreneurs" (2023.)	negative perception of entrepreneurs in the society
Netokracija	"Rimac invested in a startup of entrepreneur who "saved Rimac Automobile" 6 years ago!” (2023.)	positive success story
Večernji list	"Rimac sent a message to young entrepreneurs" (2023.)	an entrepreneurs can succeed in Croatia, global market, importance of networking
Zimo	"Croats want to be entrepreneurs, but the state doesn't make it easy for them" (2023.)	barriers to market entry, government non supportive policies

ONLINE MEDIA ARTICLES	TITLE OF THE ARTICLE & YEAR OF PUBLICATION	DOMINANT DISCOURSES
Forbers[HRV]	"We investigated how successful Damir Vanđelić, an entrepreneur in the political race, is in business." (2024)	personal resilience and background, political engagement, integration of business and politics

4. Findings

The analysis of articles reveals that society in Croatia still predominantly holds a negative view of entrepreneurship, as it did decades ago. Additionally, significant media attention is given to tycoons, which weakens society's inclination toward entrepreneurial activities. Recently, this focus has shifted to politicians who have turned into entrepreneurs, where the discourse remains grounded in potential negative connections between these former politicians and corruption, as well as a favour-based economy.

Business Daily in two of its articles points out that there is a low perception of entrepreneurship in Croatia. In its second article from 2016, it recounts a speech by Emil Tedeschi at the EY Entrepreneur of the Year award ceremony, where he emphasized the need to highlight successful entrepreneurs to remove the stigma from the 1990s, which is still prevalent in Croatian society. Furthermore, entrepreneurship in Croatia is still seen as non-transparent, corrupt, and not aligned with morals and ethics.

A search of articles in Večernji List concludes that entrepreneurship in Croatia is not valued, and Croatians enter entrepreneurship out of necessity due to lower-paying jobs, not for a "better" life. Additionally, Večernji portrays a poor perception of entrepreneurship in Croatia. Articles from 2013 show how recession and crisis also affected entrepreneurship, but a poorly developed entrepreneurial culture is the main reason. Večernji also emphasizes Mate Rimac, who highlights how Croatia is now a good country for developing businesses, but young entrepreneurs should be open for global markets and share their ideas with others. In addition, the article transmits but does not engage in Rimac's call for cultural change, where he urges young entrepreneurs to apply for equity and sacrifice their ownership stake. This message reflects a new wave of thinking about entrepreneurship in Croatia and also media's shift in agenda. However, this was an isolated attempt.

Netokracija's articles describe the negative sides of entrepreneurship in Croatia in that Croatian society is described as comfortable. By this, they mean that Croatians, generally having a poor perception of entrepreneurship, prefer comfort and avoiding risk in such a way that they do not want to engage in entrepreneurial activities if they have a secure and well-paid job. Linked with Netokracija's articles, Slobodna Dalmacija in its articles from ten years ago also displays and confirms today's results on how Croatians have a poor perception of entrepreneurship, with a large emphasis on family upbringing. More precisely, they emphasise it is important not to stand out in society, to be quiet and reserved, and to do a "safe" job without any possibility of bearing the risk of entering entrepreneurship.

Al Jazeera Balkans, on the other hand, portrays entrepreneurship through stories of tycoons. The focus is specifically on their rapid enrichment and the privileged conditions that allowed them to amass wealth and enter the entrepreneurial field. This narrative mentions Ivica Todorić, Emil Tedeschi, Luka Rajić, and Željko Kerum, among other 'famous' tycoons. The analysed article dates back to 2014. Even though many years have passed since the successes and failures of these 'tycoons', the media continues to reinforce the stigma of corrupt entrepreneurs from the transition period. Other articles from sources such as tportal, Weekend Media Festival, and the Croatian Association of Banks discuss the entrepreneurial imbalance and restrictive environment in Croatia. A significant emphasis is placed on the influence of family and friends in starting entrepreneurial activities; however, they also highlight a tendency towards family life and more secure jobs. A Forbes article describes the story of an entrepreneur who recently entered politics. Written almost like a biography, it lists all the achievements and educational background of the entrepreneur. This is the first article in the discourse on entrepreneurs and politics that does not suggest that entrepreneurs are successful solely because of their political connections.

The analysis reveals that Croatia continues to harbour a negative perception of entrepreneurship. Primarily, this perception is linked to the prominence of tycoons, who often dominate discussions about entrepreneurship. Moreover, the entrepreneurial stigma from the 1990s persists, further tarnishing the reputation of entrepreneurship as a viable career choice. Additionally, the cultural context in Croatia, which favours family life, secure employment, and comfort, significantly influences entrepreneurial activity. Evidence from articles spanning eleven years shows that Croatian society remains inclined toward safe jobs and is often discouraged from pursuing entrepreneurship by family and friends. Furthermore, a pervasive fear of failure is closely

associated with this preference for a comfortable lifestyle, as individuals are reluctant to engage in 'unnecessary' risks when secure employment options are available that do not demand extra effort.

5. Discussion

The findings from the qualitative content analysis of Croatian media articles reveal a persistent stigmatization of entrepreneurship, rooted deeply in the socio-economic transformations and cultural legacies from the socialist era. This stigma is multifaceted, primarily reflecting historical prejudices against private enterprise and a contemporary association of entrepreneurship with negative traits such as corruption and privilege. The portrayal of entrepreneurs as tycoons or politically connected figures suggests a continuing narrative where entrepreneurs are not just business innovators but are seen through a lens of scepticism and mistrust. Historically, socialist ideologies have stigmatized private ownership, equating it with exploitation and economic parasitism. This has long-term implications in post-socialist societies like Croatia, where transitioning from state-controlled to market-driven economies has been complex and fraught with challenges. The media's role in shaping the perception of entrepreneurship as risky or morally ambiguous continues to influence public attitudes, making the entrepreneurial career path less appealing. This is particularly poignant in the depiction of high-profile entrepreneurs who are often portrayed not as successful business figures but rather as opportunistic and corrupt. Interestingly, the case of Mate Rimac provides a counter-narrative. Initially, the media's focus on his achievements came with a sceptical undertone, but over time, as his success became globally recognized, the tone shifted towards a more positive portrayal. This highlights a potential turning point in media representation, where success can lead to a more favourable entrepreneurial image. However, such examples are exceptions rather than the norm, indicating that while individual success stories can challenge prevailing stereotypes, they do not necessarily overturn entrenched cultural attitudes.

The negative media portrayal has practical implications for entrepreneurial activity. The fear of being associated with failure or corruption can deter potential entrepreneurs from pursuing business opportunities, leading to a lower rate of enterprise creation and innovation. This is exacerbated by a cultural preference for stability and risk aversion, further compounded by the familial and social discouragement of entrepreneurial endeavours. The result is a self-perpetuating cycle where the lack of entrepreneurial activity reinforces the stigma, which in turn keeps the level of entrepreneurship subdued.

Moreover, the research indicates that despite Croatia's integration into the European Union and exposure to more liberal market economies, the legacy of the past continues to loom large. This suggests that changing the narrative around entrepreneurship is not merely a matter of economic policy but also of cultural transformation. Efforts to enhance the entrepreneurial ecosystem must therefore address these cultural perceptions directly, perhaps by promoting educational initiatives that redefine entrepreneurship, celebrating diverse entrepreneurial role models, and fostering a more supportive community for start-ups and business innovators.

In conclusion, while the stigmatization of entrepreneurs in Croatia reflects broader historical and socio-cultural dynamics, there is a window of opportunity to reshape public perceptions through strategic media engagement and community-oriented policies. The challenge lies in overcoming deep-seated stereotypes and fostering a new understanding of entrepreneurship that aligns with modern economic realities and the aspirations of a younger, more globally connected Croatian population.

6. Limitations and Future Research

The first limitation relates to the media agenda, which this research does not address. Prior studies have confirmed the potential for pro or anti-business biases in media coverage (Cardon et al., 2011), which may influence how specific events are reported. The second limitation concerns the availability of data; only media articles published after 2012 are available online, creating a gap in the analysis.

Regarding future research, it would be valuable to conduct a Critical Discourse Analysis (CDA) of published media articles. CDA is a method that explores how language, whether written or spoken, constructs perceptions of specific phenomena and thereby creates or perpetuates social inequalities, misuse of power, or domination within a social context (Weiss and Wodak, 2007). Additionally, studying the same phenomenon from multiple perspectives—including those of existing entrepreneurs and the general population—would help understand the impact of such perceptions on decisions to enter or exit entrepreneurship. Finally, understanding the nuances of entrepreneurship stigma in other former socialist economies is crucial for developing strategies to support and promote entrepreneurship in these contexts. By addressing and challenging existing stigmas, policymakers, educators, and business leaders can create a more inclusive and supportive environment for

entrepreneurship to flourish in these regions. The state can provide support through targeted educational campaigns that highlight successful entrepreneurial stories, implementing policies that reduce bureaucratic obstacles and provide financial incentives for start-ups, and establishing mentorship programs that connect aspiring entrepreneurs with experienced business leaders. Additionally, creating public-private partnerships to fund entrepreneurial initiatives and fostering a culture of innovation through state-sponsored incubators and accelerators can further help to dismantle the stigma and encourage a thriving entrepreneurial ecosystem.

Transforming Academic Libraries Into Hubs of Innovation and Entrepreneurship: A Case Study of a New Library Model

Orapan Khongmalai[1] and Anyanitha Distanont[2]

korapan@tu.ac.th
anyacitu@tu.ac.th

Abstract: In a data-driven era, academic libraries must evolve beyond traditional roles as spaces for reading and storing information resources to become platforms promoting learning, research, innovation, future skills, and entrepreneurship. Based on the triple helix model of innovation, this paper highlights the new library model in a case study aimed at transforming traditional academic library services into enterprising, innovation-driven activities. For over ninety years, Thammasat University Library has been located on Rattanakosin Island, an historical area of Thailand. More recently, the library business model has evolved to meet modern needs. This qualitative research uses a case study to explore library strategies to create space meeting requirements of diverse user groups: students, faculty, staff, alumni, businesspeople and the community, including older residents. Service innovations responding to user demands are prioritized by drawing on the expertise of librarians. These changes generate new revenue for the library and enhance the space design and use through the Life Space concept. Co-working spaces, learning areas, inspirational corners, and performance venues make the library a platform for inspiring creativity, learning, life enhancement, and business ventures. The Thammasat University Library has also become an innovative bridge linking university research with small and medium-sized enterprises (SMEs), facilitating knowledge transfer and research commercialization. These findings may serve as guidelines for academic libraries seeking to adapt the Library of Life approach to be centres catering to readers of all generations and stations in life.

Keywords: Library space design, Service innovation, Cluster theory, Triple helix model, SMEs

1. Introduction

Competing in the innovation economy instrumentalizes collaboration between universities and the private sector to hasten innovation development in developed and developing nations (Secundo et al., 2016). Universities help shorten delays in marketing entrepreneurial innovations, with technology transfer offices used as mechanisms for commercializing university research (Chais et al., 2018). Universities participate in transforming scientific and technological knowledge through industrial innovation (Ismail et al., 2018). However, the success rate of technology transfer remains low, including in the United States (Oliveira and Teixeira, 2010). Small- and medium-sized enterprises (SMEs) fail to transfer technology from universities due to different factors: investment limitations, extant SME production processes (Khongmalai & Distanont, 2022), and entrepreneurial intent to adopt technology transfer (Distanont, Khongmalai, & Kritpipat, 2018).

Recently, research has sought solutions for how universities and SMEs may collaborate to enhance innovation and business capabilities. In Europe, governments have continuously promoted SME-university collaborations, with SMEs participating in short-term strategies to join government projects annually. Others find benefits in long-term strategies of research funding at universities, resulting in diverse research and development (R&D) outcomes for each country (Bjerregaard, 2009). In some nations, universities lacking expertise in commercialization focus on transferring knowledge about innovation processes to empower SMEs by application through organizational innovation (Lundberg & Öberg, 2021). In Australia, micro, small, and medium-sized enterprises (MSMEs) often rely on generic university-industry knowledge through conventional channels such as short-term training and academic publications from libraries, which is adapted for business purposes, rather than engaging in university research collaboration. In addition, MSMEs emphasize the importance of knowledge transfer in the business ecosystem from national and international customers and suppliers (Zubielqui et al., 2015).

University libraries serve as other mechanisms for institutions of higher learning to drive innovation and entrepreneurship. Space is a valuable library asset as a study, research, and usage hub for intellectual properties. With the advance of digital virtual technology, the traditional model of providing book reading space has become partly outdated. Service models have transformed into anywhere, anytime libraries for users from all groups in addition to students (Chan & Spodick, 2014). University libraries have transitioned into flexible spaces where users hone skills according to their needs. These may include spaces for learning, research, social interactions, innovation, and innovative incubation (Li, 2006; Chan & Spodick, 2014; González-Solar and Fernández-Marcial, 2019).

However, university libraries are challenged by burgeoning subscription costs, necessitating cancellation of subscriptions with important publishers (Piwowar et al., 2018). Simultaneously, a demand for scientific papers is growing among students, researchers, and entrepreneurs. Therefore, a new Open Access trend in accessing scientific publications has emerged on platforms such as Sci-Hub, providing cost-free access to scientific publications (González-Solar and Fernández-Marcial, 2019). The increasing popularity of Sci-Hub emphasizes the need to access scientific publications for advancing R&D. From another perspective, a unique, specialized free access hub for scientific publications is a model that encourages increased readership (Ajani, et al., 2023).

In Thailand, the Office of SMEs Promotion (OSMEP), a government agency responsible for setting policies to promote MSME competitiveness, centrally links the public and private sectors. The OSMEP Annual Report 2021 indicates that Thailand's gross domestic product (GDP) grew by 1.5%, with SMEs contributing 5.60 trillion baht or 34.60% (OSMEP, 2021). This highlights the key role of SMEs in driving Thailand's economic expansion. OSMEP provides annual financial support to universities to develop SME business capabilities. However, SMEs still face challenges in accessing knowledge and research to continuously innovate business processes. One reason for this difficulty is the fragmented nature of research in Thailand, often distributed across faculties and research institutes in universities, transmitted by academic papers which are not easily translated into commercial applications. Therefore, OSMEP has collaborated with Thammasat University, a leading university in Thailand, to transform academic libraries into innovation and entrepreneurship hubs.

This paper investigates an effective model for transforming academic libraries into hubs of innovation and entrepreneurship, to become continuous collaborative spaces for researchers, business consultants, and SMEs. The main research targets comprise: 1) the ideal format for transforming academic libraries into hubs of innovation and entrepreneurship; and 2) factors adding to the success of building academic libraries into hubs of innovation and entrepreneurship.

2. Literature Review

2.1 Cluster Theory and SME Development

Porter (1998) proposes that a nation's ability to compete must start with companies as the smallest unit of the economic system. By increasing productivity, especially labor productivity, rather than just reducing costs, companies may achieve a competitive advantage. If several companies in an industry increase productivity, overall industrywide competitiveness is attained. When many industries increase productivity, national competitiveness is boosted. Porter (1998) defines clusters as a group of related companies and institutions in close proximity within the same field, linked by commonalities and complementarities. The geographical scope of clusters may range from regional to state or neighboring cities and countries. Thus, clusters cover different interconnected industries and other organizations required for competition, such as providers of specialized components, machinery, and services, including specific infrastructure. Many clusters also include government agencies, universities, research institutions, vocational training providers, standard-setting bodies, and trade associations which facilitate specialized training, education, data, research, and diverse forms of technical support.

Michael Porter's cluster theory provides a framework for understanding the concept of geographical clusters, which are concentrations of interconnected companies, specialized suppliers, service providers, and associated institutions in a particular field that are present in a specific location (Porter, 1990). According to Porter, these clusters promote increased efficiency, productivity, and innovation through several key mechanisms. First, proximity reduces the cost of transactions and information, allowing for better coordination and trust among businesses. Second, clusters stimulate competition and cooperation, which drives firms to enhance their own capabilities and innovate faster. This environment of enhanced competition and collaboration results in a more dynamic business atmosphere that is conducive to productivity improvements and innovation. Clusters also help companies to access specialized input, skilled labor, and complementary products, which are facilitated by the cluster's developed infrastructure and the regional focused educational and training institutions. In addition, being part of a cluster allows companies to directly access the latest information on technology and market trends, which can significantly enhance competitive advantage (Porter, 1990).

Abundant research examines cluster development as a strategy for building competitiveness in different contexts and dimensions (BCI Global, 2022; Abdin & Rahman, 2015; UNIDO, 2006; Porter & Bond, 2004; Doeringer & David, 1995). Porter (1998) argues that clusters influence competition in three key areas: 1) increased productivity of local firms located in the area; 2) driving the direction and acceleration of innovation; and 3) stimulating new business creation to expand and strengthen the cluster. Clusters enable members to gain mutual benefits and strengthen business operations. Developing clusters helps SMEs to leverage cooperation to strengthen competitiveness in their respective sectors. By coordinating activities in their sectors, SMEs may

achieve economies of scale surpassing the potential of standalone companies. Examples include bulk purchase of raw materials, shared use of machinery, and combined production capacity to fill large orders. These collaborative efforts translate into a competitive advantage for businesses in the cluster. This competitive edge stems from two main sources: 1) expanding business knowledge to cover areas such as design, quality control, and market-related data; and 2) building networks linking to a diverse range of technologies and other resources. Cooperation among SMEs enables entrepreneurs to focus on core businesses, resulting in overall improved production efficiency. BCI Global (2022) identifies nine key factors for developing successfully sustainable business cluster management as shown in table 1.

Table 1: Nine key factors for developing successfully sustainable business cluster management (BCI Global, 2022)

Key factors	Definition
Cluster formation	Creating robust entrepreneur communities is principally about shared space to promote collaborative work and knowledge sharing by facilitating collaboration through access to vital resources. In this context, shared space refers to physical spaces that encourage interactions and encounters among businesses.
Supportive authorities	Policymakers, governmental agencies, and local institutions are essential for building resilient entrepreneur communities.
Talent pool	Diversely talented stakeholders are key components for community building. Successful entrepreneurs, along with skilled personnel with expertise, experience, and diverse perspectives, enhance innovation, collaboration, and overall business ecosystem growth.
Education	Providing knowledge, skills, and resources to interlace businesses, teaching vitally promotes entrepreneurs and community building.
Advanced technology	Revolutionizing how entrepreneurs start, operate, and expand businesses.
Understanding market	Seeing how changes and opportunities occur, as well as responding to customer demands, are essential for entrepreneurial success.
Business networks	Creating entrepreneurial communities fosters cooperation, shares knowledge, and exchanges resources.
Capital	Access to funding sources enables entrepreneurs to invest in business infrastructure, hire skilled personnel, and seek growth opportunities.
connectivity	Building relationships and connecting entrepreneurs transforms entrepreneurial communities into potential clusters. In an increasingly interconnected world, entrepreneurs mutually rely on one another to access information, collaborate, and leverage diverse resources.

2.2 Triple Helix

The triple helix model of Etzkowitz and Leydesdorff (1995) emphasizes the interplay between three key sectors: universities, industry, and government. Collaboration among these entities can drive innovation through diverse channels, including joint university-industry research, policy and business collaboration networks, and establishing innovative experimentation spaces. These collaborative efforts facilitate accelerated market introduction of innovations, continuous improvement, and adaptation to evolving market and societal demands. The roles of the three sectors are interconnected and complementary: 1) universities help create and spread knowledge by academic R&D, generating new technology and innovation with industrial applications while contributing to workforce development by training graduates with required labor market skills; 2) industry uses current knowledge and innovations to develop new products and services, growing businesses and creating economic value to generate jobs and implement innovation; 3) government formulates policies supporting innovation and SME development by providing financial support, tax incentives, and measures to reduce barriers to business initiation and operations while encouraging investment and balanced competition.

Several research studies have applied the triple helix model of innovation as a framework for analyzing business competitiveness, innovation, and sustainability. Khouroh, et.al., (2019) and Dudin et al. (2015) found that cooperation promotes innovation, leading to competitive advantages and improved business efficiency. Etzkowitz and Ranga (2011) applied the triple helix model to analyze the emergence of innovation and business development. Ranga and Etzkowitz (2013) found that innovation stems from the three-partner relationship as well as the business-government relationship, as seen in industrial societies. Luengo-Valderrey, et al. (2020) and Lahi and Dervishi (2019) underlined that triple helix cooperation has positive economic, social, and environmental impacts. In addition, Sato and Okamoto (2019) emphasized the role of a conducive working environment in promoting sustainable innovation. Papagiannidis, Li, Etzkowitz, and Clouser (2009) found that the triple helix model is used to analyze business and cluster integration, while universities are increasingly involved in entrepreneurial activities, beyond their traditional roles as research and teaching institutions.

Universities have become resource providers for businesses, and the role of government has also changed. Apart from regulatory operations, governments now promote innovation and flexibility within legal frameworks through tax incentives, loans, and grants. Lahi (2019) found that universities significantly drive sustainability through triple helix cooperation. In sum, the triple helix model is essential for businesses to foster operational innovation, competitiveness, and sustainability.

2.3 The Evolving Role of Academic Libraries in Innovation

Recent scholarly discussions have increasingly recognized the transformative role of academic libraries in supporting innovation and entrepreneurship. Academic libraries are no longer seen merely as book and journal repositories, but as active partners in the innovation ecosystem. Institutions such as the Thammasat University Library are now engaging directly with SMEs to facilitate technology transfer and commercialization of research, embodying a new paradigm where libraries act as connectors between academia and industry (Li, 2006; Chan & Spodick, 2014). The academic literature suggests that modern academic libraries can play a pivotal role in fostering innovation by providing resources and spaces that encourage creativity, collaboration, and entrepreneurship (González-Solar and Fernández-Marcial, 2019). For instance, the modern university library model proposes an adaptive approach where libraries serve varied community needs, from digital learning hubs to innovation incubators (Li, 2006). This evolving role is supported by the triple helix model of innovation, which emphasizes the library's potential to act as a mediator and facilitator among the academic, business, and governmental sectors (Etzkowitz & Leydesdorff, 1995). By integrating these roles, academic libraries can significantly contribute to regional and national innovation systems.

3. Research Design

Qualitative single case study research was done. Yin (2018) and Creswell & Poth (2018) state that a case study is useful for answering the how and why questions about a social problem. The research process consisted of five stages as shown in Figure 1.

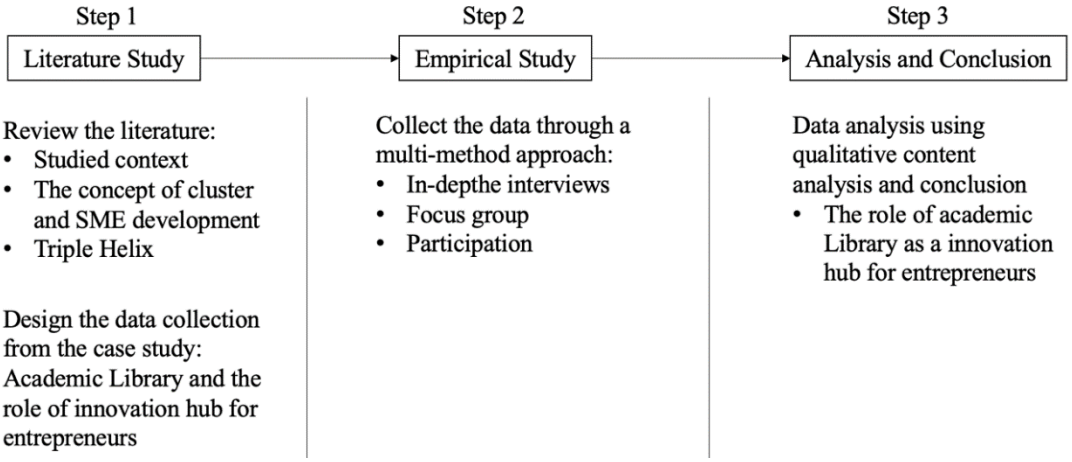

Figure 1: Research Process

The first step was developing a theoretical framework based on a literature assessment of the concepts of cluster and SME development and triple helix. The goal was to understand the overall subject and its context and design data collection from the case study, including question and structural design. This literature review defined the empirical study structure. The second step was an empirical study. Multi-method data collection included in-depth interviews, focus groups, and participation. Samples were stakeholders chosen for their expertise and participation in academic library and business development in Thailand. They were receptive and eager to cooperate with the study, which ensured rich empirical data for analysis. The third and final step was data analysis, using qualitative content analysis to interpret and draw conclusions from the collected data.

4. Results

4.1 Model Development

In Thailand, SMEs drive the economy, representing over 35% of the national GDP in 2022. They also serve as a significant employment source, accounting for 71% of total employment (OSMEP, 2022). However, the rapid pace of global development is profoundly impacting SMEs. To navigate this dynamic landscape and thrive in the face of change, all stakeholders, including SME promotion agencies, government entities, and SMEs themselves must proactively prepare and adapt. By embracing transformations, all parties may benefit from a changing

world. Thailand's strategy for sustainable economic prosperity develops the national industrial economy through business clusters to enhance economic competitiveness in manufacturing, trade, and services. From 2017 to 2022, The Thirteenth National Economic and Social Development Plan (2023- 2027) and the Fifth SME Promotion Plan (2023-2027) continuously implemented support and development for clusters to assist specific entrepreneurial groups with different needs. Distinct promotion and development guidelines are required for each SME group to create strong and sustainable clusters. Study results and data on cluster promotion guidelines in different industries (OSMEP & Thammasat University, 2023) indicated that from 2017 to 2022, OSMEP has promoted and raised the profile of prototype clusters. Over forty clusters promoted by the government pertain to the coconut and herbal industries, agricultural technology, durian, food processing, wellness tourism, future food, and e-sports & digital economy.

The concept of transforming academic libraries into hubs of innovation and entrepreneurship is based on the framework of the triple helix theory through tripartite collaboration between government, university, and SMEs. OSMEP acts as the government, SMEs represent the business sector, and the Thammasat University Library represents the university. In-depth interviews were done with nine participants, including three OSMEP administrators, three Thai Chamber of Commerce entrepreneurs, and three Thammasat University academic staff. Results revealed a conceptual model for transforming academic libraries into innovative entrepreneurship hubs based on the triple helix model (Figure 2) while indicating challenges and expectations of each party: 1) OSMEP aimed to create strategic business network connections. After completion of annual formal support programs, established business networks continued to foster connections and provide mutual support among participating businesses; 2) SMEs expected financial support for development from the government and knowledge and technology from universities for businesses, including product, marketing, and process innovation. Significantly, SMEs require suitable knowledge and technological operation backing through easily accessible channels; 3) Thammasat University Library strives to transform organizationally to link between faculties and the technology transfer office as well as to support innovation and entrepreneurship in physical and online spaces.

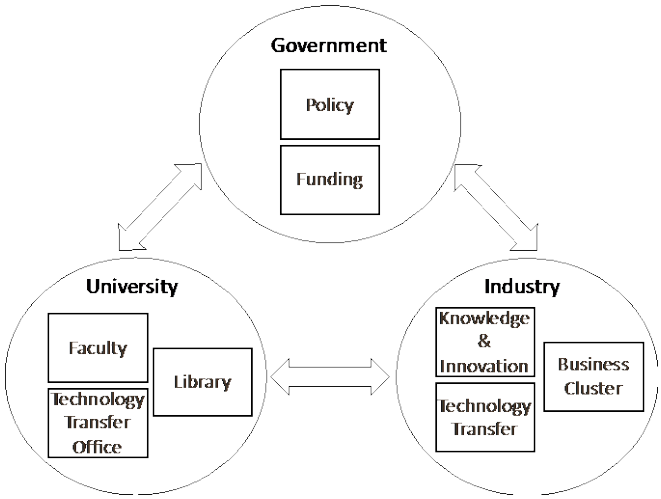

Figure 2: Conceptual model: innovation and entrepreneurship hubs based on the triple helix model

4.2 Model Testing

From October 2022 to September 2023, Thammasat University Library and OSMEP collaborated to develop business clusters by promoting MSME participation in the project to receive benefits for business development. Membership in the Thailand Business Cluster Platform included financial support for business development from OSMEP and access to diverse Thammasat University Library knowledge sources. Networking activities with other entrepreneurs in the same value chain were also offered. 162 MSMEs were chosen to participate in the project, including clusters of 55 in future food, 54 in wellness tourism, and 53 in e-sports and digital economy. Each business cluster participant received appropriate technology transfer upstream and downstream. For example, future food upstream businesses received technology transfer for vegetables, fruit, animals, and environmentally friendly chemical extractions. In addition, downstream businesses received technology for shelf-life extension, freeze-drying, spray-drying, ozone-drying, and encapsulation technology.

After closing this development project, focus groups were conducted with 23 stakeholders, including five administrators from government agency, nine university academic staff (three lecturers, three researchers, and three librarians) and nine from entrepreneurial clusters (three from future food, three from wellness tourism,

and three from e-sports and digital economy). Focus group investigated the format of transforming academic libraries into innovative entrepreneurship hubs through tripartite collaboration among the government, universities, and SMEs. Results indicated a new library model as innovative entrepreneurship hubs through three main service delivery mechanisms: 1) life space; 2) service innovation; and 3) Thailand business cluster platform (TBCP). The conceptual model for transforming academic libraries into innovation and entrepreneurship hubs is illustrated in Figure 3.

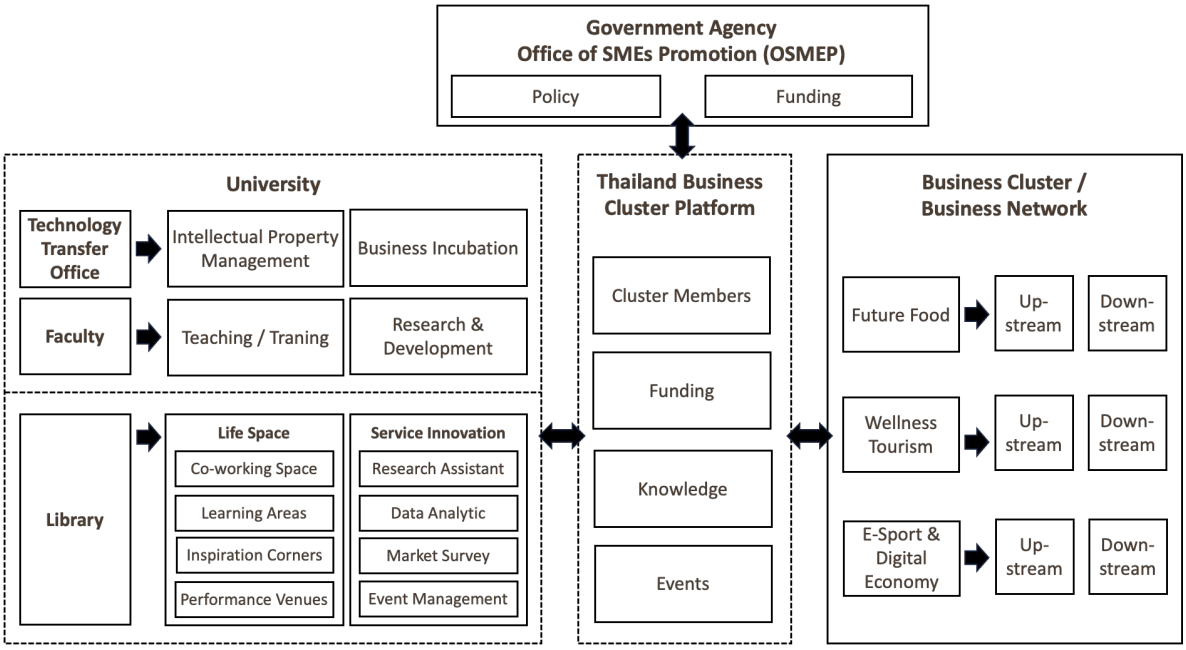

Figure 3: Model for transforming academic libraries into innovation and entrepreneurship hubs

A primary finding was the application of the Life Space Concept, which divided the library space into four distinct areas to meet different needs: co-working spaces, learning areas, inspirational corners, and performance venues (Table 2). These spaces were developed based on user feedback and needs assessments conducted through focus groups. A participant from the focus group remarked: "The inspirational corners have significantly enhanced our creative thinking process, making the library not just a place for reading, but for creating."

Secondly, Thammasat University Library introduced four service innovations to entrepreneurs, including research assistance, business data analytics, market survey, and event management (Table 3). The third mechanism was the Thailand Business Cluster Platform, providing an online connection between the business network and four key features: business; capital sources and state benefits; knowledge access; and event information (Table 4).

Table 2: Life Space Concept: zoning and definition

Life Space	Description
1. Co-working spaces	Designed to foster collaboration among students, faculty, and entrepreneurs.
2. Learning areas	Equipped with advanced technology to support learning and research activities.
3. Inspirational corners	Created to inspire creativity and innovation among users.
4. Performance venues	For events, presentations, and performances to engage the community.

Table 3: Service innovation: service type and definition

Service innovation	Description
1. Research assistance	Provides expert help for conducting and managing research projects.
2. Business data analytics	Offers data analysis services for market trends and making informed decisions.
3. Market survey	Conducts surveys to gather market insights for entrepreneurs.
4. Event management	Assists in organizing events promoting innovative entrepreneurship.

Table 4: TBCP: features and definition

Cluster platform	Description
1. Business clusters	Links entrepreneurs in the same value chain from upstream to downstream
2. Capital sources	Provides information on funding opportunities and governmental support.
3. Knowledge access	Links entrepreneurs to Thammasat University research, technology, and innovation.
4. Event information	Provides details about events fostering business collaboration and networking.

The TBCP presents multidimensional member data, including cluster, geographical area, and expertise. This enables interested businesses to easily find suitable partners. Thammasat University Library also works as a facilitator, organizing a business clinic day program to offer consultations, connecting SMEs with areas for improvement to leading companies and university experts. Experiments have shown that it facilitates business connections in the same business cluster. For example, in wellness tourism, a doctor who owns a rehabilitation center classified as a small-sized enterprise specializes in treatment and services, but faces challenges in scaling up the business. After joining a project between Thammasat University Library and OSMEP, the firm underwent quality screening and standards and were provided with business networking opportunities. They had an opportunity to discuss business with Sindhorn Kempinski, a world-class luxury hotel, and a business deal ensued. Sindhorn Kempinski created service innovations to offer inhouse rehabilitation services in their chain, with the rehabilitation center as service provider.

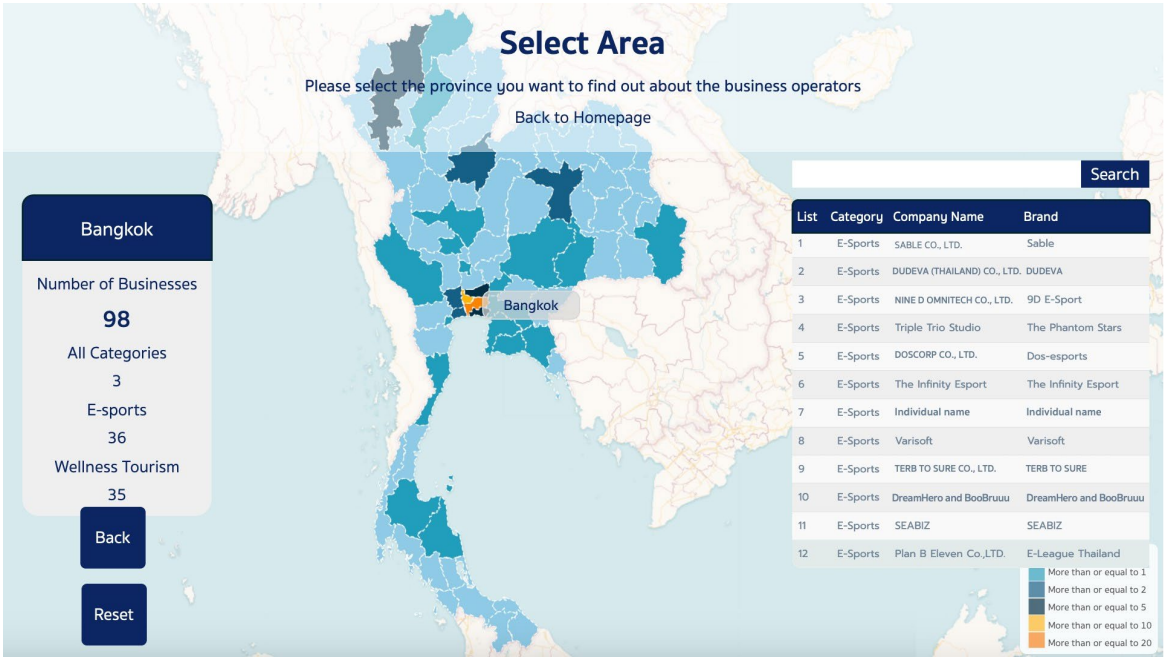

Figure 3: Thailand Business Cluster Platform (TBCP)

In sum, the Thammasat University Library has successfully transformed into hubs of innovation and entrepreneurship. The new model supports technology transfer, innovation creation, and entrepreneurship through collaborative efforts, innovative space design, and service enhancements. This approach aligns with global trends and provides a sustainable model for other academic libraries seeking to drive regional economic development and foster a culture of innovation.

5. Discussion and Implications

As a successful model, Thammasat University Library has transitioned from mainly providing book reading spaces to supporting technology transfer, innovation creation, and entrepreneurship. Several factors contribute to the success of this operation, based on the triple helix model and related components: 1) supportive authority from OSMEP participating in policy support and budget allocation; 2) education and technology provided by Thammasat University Library acting as a hub for gathering knowledge and technology to transfer to SMEs; 3) business networking, curated through initial project screening to produce a network of capable and trustworthy entrepreneurs; 4) connectivity through the TBCP facilitates searching for expert entrepreneurs in diverse fields

for collaborations; 5) shared facilities, as in the collaboration between a world-class hotel chain and small-sized rehabilitation center, allow resource-sharing such as hotel service areas and medical personnel. This enables service innovation for both parties without significant additional investment, increasing business opportunities for both parties.

This research aligns with Asian nations such as Korea, where research indicates that a main problem for SMEs is lack of technology and resources, including business networks. Universities solely serving as technology providers are inadequate. They must become network promoters in university-industry collaboration, strengthening regional business clusters to enhance SME competitiveness. Subsequently, different network formations occur among the regional business cluster members (Kim, 2018). SMEs can now receive more technology transfers for market innovation as they receive support and business engagement from cluster members. This study introduces a new approach to building a business ecosystem, departing from the traditional practice of creating collaborations among SMEs in the business ecosystem according to multi-level geographical advantage such as sharing the same state or nation (Zubielqui et., al. 2015). Instead, opportunities are proposed for creating business ecosystems based on business type, using the TBCP to transcend geographical limitations.

Linking the triple helix model and academic libraries integratively, comprising interactions between universities, industry, and government, helps transform academic libraries into hubs of innovation and entrepreneurship. In this framework, academic institutions such as the Thammasat University Library serve as nodes facilitating knowledge transfer and innovation. The library role extends beyond traditional services to support technology transfer, foster innovation, and encourage entrepreneurial activity. In this model, universities (represented by the Thammasat University Library) act as knowledge creators and transmitters, providing research, development, and educational support. Industry (represented by SMEs) uses this knowledge to develop new products and services, driving economic growth and job creation. Government (represented by OSMEP) formulates supportive policies, providing financial incentives and fostering a conducive environment for innovation and SME growth. This tripartite collaboration ensures that academic libraries become dynamic spaces that support continuous learning, innovation, and business development. By transforming into innovation hubs, libraries facilitate the interaction between researchers, entrepreneurs, and policymakers, driving regional economic development and promoting a culture of innovation.

These findings are in line with concepts discussed in the literature review, particularly the theories related to cluster development and the triple helix model. The role of Thammasat University Library as an innovation hub aligns with Porter's cluster theory, which emphasizes the benefits of geographically concentrated enterprises and institutions that collaborate to boost competitiveness and innovation (Porter, 1998). The library's engagement with SMEs and government bodies likewise reflects the triple helix model's call for university-industry-government collaboration as a framework for innovation (Etzkowitz & Leydesdorff, 1995). This study demonstrates how academic libraries can extend their traditional roles to become active participants in this model, contributing to the knowledge economy by facilitating knowledge transfer and innovation diffusion.

This paper revealed three important policies: 1) policy support: governments should consider policies that recognize and support the innovative roles of academic libraries in the national innovation system; 2) innovation funding: increased funding should be directed towards libraries to help them build the necessary infrastructure and services that support innovation and entrepreneurship; 3) partnership development: libraries should continue to foster partnerships with industry and government bodies to facilitate the effective transfer of knowledge and technology. Adopting these recommendations could significantly impact national innovation policies. Libraries could be acknowledged as central actors in the innovation ecosystem, essential for driving sustainable economic growth.

Aspects Considered Relevant in Higher Education Curriculum to PRODUCE Business Innovative Graduates

Sithembiso Khumalo and Tanya du Plessis
University of Johannesburg, College of Business and Economics, Department of Information and Knowledge Management, South Africa

skhumalo@uj.ac.za
tduplessis@uj.ac.za

Abstract: Higher Education Institutions (HEIs) have been tasked with the responsibility to generate knowledge through research and educate students and **PRODUCE** graduates with the capability to innovate and develop business innovation through entrepreneurial teaching. Therefore, it is significant for a university to align itself with the needs of the industry to **PRODUCE** graduates with the capability to **PRODUCE** business innovation. The purpose of this research was to determine aspects considered relevant in the Higher Education curriculum to **PRODUCE** graduates ready to develop business innovation and become entrepreneurs. The mixed-method research approach was deemed suitable for this research, therefore both qualitative and quantitative data were collected through the use of semi-structured interviews with 11 participants from the University of Johannesburg commercialisation units and an online questionnaire from 69 innovation experts from the South African Business Innovation Community (Innovation Summit), and the Innovation, Sustainability, and Visionary Leadership Group. The data collected was then analysed through descriptive content analysis and statistical analysis. This study is part of a PhD study completed in 2022 and only the results about the aspects considered relevant in the Higher Education curriculum to **PRODUCE** graduates ready to develop business innovation are presented and discussed. Based on the findings it is significant to note that aspects, such as creativity; originality and initiative; critical thinking and analysis; analytical thinking and innovation complex problem solving; and entrepreneurship are relevant and suitable for the university curriculum. In conclusion, more emphasis should be reflected in the Higher Education curriculum on these aspects mentioned above to **PRODUCE** graduates ready and capable of developing and producing business innovation. Higher Education Institutions should regularly implement interventions to improve their curriculum to best suit the needs of the industry or the business sector.

Keywords: Higher education institutions curriculum, Graduates, Business innovation, Entrepreneurship

1. Introduction

Universities play a significant role in promoting entrepreneurship, and innovation, ensuring that graduates are ready to contribute to the innovative industry, and thus they need to have university entrepreneurial structures (Rooke, 2017; Liu, Walley, Pugh, & Adkins 2020). Although there is no single definition for entrepreneurship, there are more common descriptions of what an entrepreneurial university is. An entrepreneurial university is an HEI that thrives through its curriculum design, teachings, research, support units, community engagement, Work-Integrated learning (WIL), and information management approach to build entrepreneurial leadership and business development skills with the involvement and support from external bodies, such as the government and commercial-driven entities (Chugh, 2013; Brink, Mearns & Du Plessis, 2014; Jameson & O'Donnell, 2015; Rooke, 2017; Liu et al., 2020). Entrepreneurial universities are purposefully designed to promote and support students and staff to be enterprising individuals, inventive and creative through teaching and learning, and through research. This is all in the pursuit to create and use knowledge across their boundaries (Jameson & O'Donnell, 2015). Most university students are deemed to not fit to contribute to business innovation after graduating from their studies, this means most of them lack innovative skills and expertise.

It is therefore significant for university to align itself with the needs of the industry to **PRODUCE** graduates with the capability to **PRODUCE** business innovation. This can be achieved through curriculum reassessment and design to suite some of the industry needs while maintaining its values and principles. This research paper aimed to determine aspects considered relevant in the Higher Education curriculum to **PRODUCE** graduates ready to develop business innovation or become entrepreneurs.

2. Literature Review

Entrepreneurial universities put more emphasis on ensuring that people in their pursuit to be innovators, creators, and enterprising minds, are well empowered through teaching and various other support systems. For a university to have entrepreneurial characteristics, depends on the extent to which innovators come up with innovative ways to improve the well-being of the world or their immediate society. Simply put, an entrepreneurial university is an institution that builds its environment with the intent to apply an

entrepreneurial mind-set and encouraging behaviours associated with an entrepreneurial culture, where even rewards are granted (Jameson & O'Donnell, 2015).

Jameson and O'Donnell, (2015) identified the seven pillars that entrepreneurial universities' practice can be evaluated on:

- Governance and leadership.
- People involved, along with the capacity of an organisation and the incentives or rewards.
- The development of entrepreneurship and its inclusiveness in the curriculum.
- Various pathways and support systems for entrepreneurs.
- The collaborative efforts between HEI and external business parties to exchange knowledge.
- The internationalisation of the entrepreneurship institution.
- The way the entrepreneurial university's impact is measured.

The focus of an entrepreneurial university is to ensure that acts of entrepreneurship are embedded within the institution's DNA, across the entire institution, concerning disciplines and management (Rooke, 2017; Liu et al., 2020). An entrepreneurial university is represented by the act of transforming the functions of an institution to more entrepreneurship-based operations that include psychological ownership (Chugh, 2013). This is to ensure the viability of innovations that can adapt to the changing business environment, society, and stakeholder needs, in a manner that is sustainable and improves the aspect of student experience (Jameson & O'Donnell, 2015).

Universities are different from other entities; due to the HEI promotion system and governance, research academics play vital roles in the process of entrepreneurship education (Simmons & Hornsby, 2014). University entrepreneurship can differ from corporate innovation spin-offs and other business ventures. The level of governance, competitiveness, motivations, and systems form clear performance indicators of academic entrepreneurship and sometimes they are complex. In other instances, some other commercialised innovations that are derived from university knowledge are never disclosed, be it due to the lack of a platform or of a structure or something else (Soltanifar, Hughes, & Göcke, 2021). Furthermore, universities may prefer to only engage in external businesses that are already existing and support them.

3. Methodology

This research paper presents a component of a larger PhD study, which was on innovation and commercialisation dynamics of entrepreneurial universities. A Signification Framework was used as a method for this research, this methodology refers to a structure for underlying systems, concepts, and text representing the world philosophies and perception of researchers, it is not normally utilised to represent the meaning and applied sensemaking (Deprez & Hanchar, 2017; Magoma, 2018). A Signification Framework aims to make sense through five elements namely, Presume, Predict, Prize, Perceive, and **PRODUCE**, with their unique meaning and purpose. This paper only reports on the data from the **PRODUCE** element, with its description meaning to lead to or cause a specified thing to happen or exist, this further refers to aspects considered relevant to PRODUCE graduates ready to develop business innovation. This paper is further supported by pragmatism as a philosophical paradigm, which allows the researcher to explore real-world practical ways that can work and improve university curriculum for the benefit of graduates.

A Mixed-method research approach was utilised for this study, data was collected using both qualitative and quantitative methods through semi-structured interviews with 11 participants from the University of Johannesburg commercialisation:

- Project Management Office.
- Commercialisation & Technology Transfer Office.
- UJ Centre for Entrepreneurship.
- UJ Izindaba Zokudla.
- Process, Energy & Environment Technology Station (PEETS).
- Technopreneurship Centre.
- PurpleGrowth.
- Close the Gap: Social enterprise.
- IKM alumni entrepreneurs.

Furthermore, an online questionnaire was distributed to 100 participants and a response was obtained from 69 innovation experts from the South African Business Innovation Community (Innovation Summit), and the

Innovation, Sustainability and Visionary Leadership Group. The population sample ranged from, company representatives, Managing Directors, academics, company founders, board member, Chief Executive Officers, government representatives, Chief Operating Officer, entrepreneurs, creative director, learning manager, filmmaker and editor, lead consultant, mentor, business analyst chief of section, mentor and Ambassadors from the Vice Chairperson in the Northern Lights Northern Conference of South Africa's Youth Committee, business development, marketing and sales. Descriptive content analysis and statistical analysis were used to analyse the data collected.

Permission was granted by the College of Business and Economics Research Committee (CBEREC) with a clearance code and a clearance number (IKM2018_023) was appointed. All research participants were given informed consent forms to obtain permission to conduct research and as part of ethical consideration.

4. Results and Discussion

The results address the research objective "To determine aspects considered relevant in the Higher Education curriculum to PRODUCE graduates ready to develop business innovation"? As mentioned above and described, the research participants were given the Signification Framework terminology where the element **PRODUCE** means "to lead to or cause (a specific thing) to happen or exist". Thus, this question or Signification Framework element refers to **PRODUCE**, that is, to lead to or cause a specific thing to happen or exist. Four options were given to the respondents: to no extent, to some extent, to a moderate extent, to a great extent. It is significant to note only a small portion and relevant qualitative data is integrated into this paper, this is to support the quantitative data presented. The 13 components shown on the category axis were:

1. Strategic information management.
2. Artificial intelligence.
3. Entrepreneurship.
4. Advanced business management.
5. Systems analysis and evaluation.
6. Big data and analytics.
7. Analytical thinking and innovation.
8. Creativity, originality, and initiative.
9. Technology design and programming.
10. Critical thinking and analysis.
11. Leadership and social influence.
12. Complex problem solving.
13. Emotional intelligence.

The results on each of these components are illustrated in Figure 1.

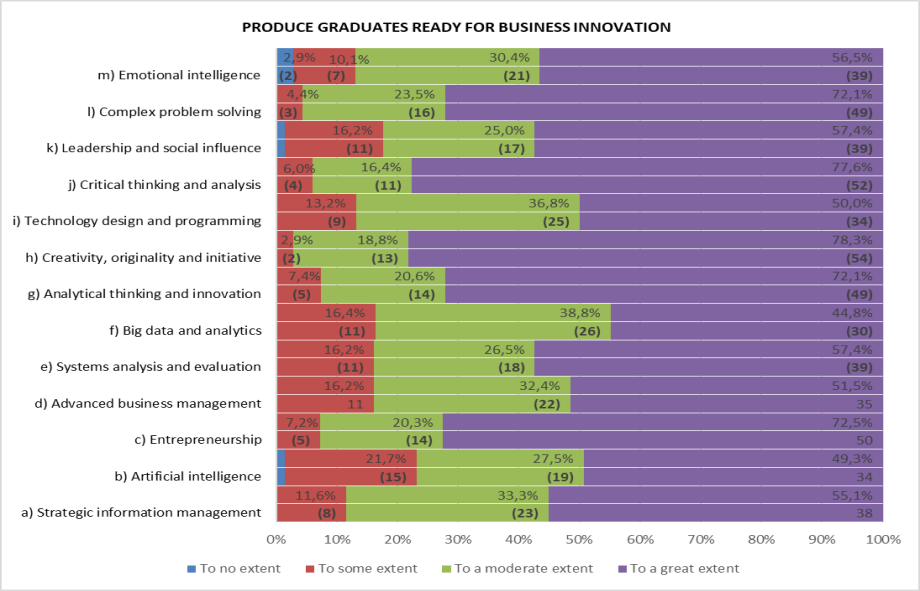

Figure 1: Aspects considered relevant in the Higher Education curriculum to PRODUCE graduates ready to develop business innovation (own source developed for this study, 2021)

The results in Figure 1 illustrate at a) on strategic information management, none of the participants indicated to no extent, 11.6% indicated to some extent, 33.3% indicated to a moderate extent, 55.1% indicated to a great extent. Figure 1 at b) on artificial intelligence, 1.4% of the participants indicated to no extent, 21.7% indicated to some extent, 27.5% indicated to a moderate extent, 49.3% indicated to a great extent. Figure 1 at c) on entrepreneurship, none of the participants indicated to no extent, 7.2% indicated to some extent, 20.3% indicated to a moderate extent, 72.5% indicated to a great extent. Figure 1 at d) on advanced business management, none of the participants indicated to no extent, 16.2% indicated to some extent, 32.4% indicated to a moderate extent, 51.5% indicated to a great extent. Figure 1 at e) on systems analysis and evaluation, none of the participants indicated to no extent, 16.2% indicated to some extent, 26.5% indicated to a moderate extent, 57.4% indicated to a great extent. Figure 1 at f) on big data and analytics, none of the participants indicated to no extent, 16.4% indicated to some extent, 38.8% indicated to a moderate extent, 44.8% indicated to a great extent. Figure 1 at g) on analytical thinking and innovation, none of the participants indicated to no extent, 7.4% indicated to some extent, 20.6% indicated to a moderate extent, 72.1% indicated to a great extent. Figure 1 at h) on creativity, originality and initiative, none of the participants indicated to no extent, 2.9% indicated to some extent, 18.8% indicated to a moderate extent, 78.3% indicated to a great extent. Figure 1 at i) on technology design and programming, none of the participants indicated to no extent, 13.2% indicated to some extent, 36.8 of the respondents indicated to a moderate extent, %50% indicated to a great extent. Figure 1 at j) on critical thinking and analysis, none of the participants indicated to no extent, 6% indicated to some extent, 16.4% indicated to a moderate extent, 77.6% indicated to a great extent. Figure 1 at k) on leadership and social influence, 1.5% of the participants indicated to no extent, 16.2% indicated to some extent, 25% indicated to a moderate extent, 57.4% indicated to a great extent. Figure 1 at l) on complex problem solving, none of the participants indicated to no extent, 4.4% indicated to some extent, 23.5% indicated to a moderate extent, 72.1% indicated to a great extent. Figure 1 at m) on emotional intelligence, 2.9% of the participants indicated to no extent, 10.1% indicated to some extent, 30.4% indicated to a moderate extent, 56.5% indicated to a great extent.

Analysis of aspects relevant to Higher Education curriculum considered to PRODUCE graduates ready to develop business innovation enabled the researcher to develop this study's Signification Framework PRODUCE element (cf Figure 1 illustrate that HEI should place more emphasis and consider creativity, originality and initiative, critical and analytical thinking, and complex problem-solving when formulating their programs. Further, Entrepreneurship should be another aspect considered by HEI when formulating their programs for producing graduates ready to develop business innovation. This discussion or interpretation is supported by participants that were interviewed, they of the opinion that universities should be able to train graduates on entrepreneurship to clearly understand the various dynamics around developing and running a business, innovation, and solution. Also, results from the interview coincided with the results of the questionnaire regarding entrepreneurship in the Higher Education curriculum.

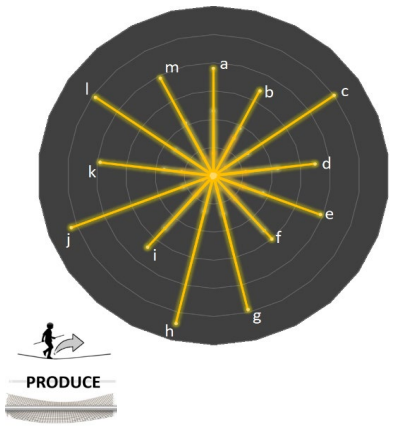
Participant 3 indicated:

> *"Look, **I think definitely business skills,** you know, how do you run a business, so all the things that I've just mentioned, **putting in place the governance issues that will make your business run smoothly.** When I started working on my own, someone said to me, as **an entrepreneur, she said to me, you need to make time to work for your business, and you can't always work in your business".***

Participant 5 indicated:

> *"[…] to get the entrepreneur to do stuff for themselves, you know, sort of coming in, and getting a lecture on how to, on how to plan your company, […]. in closing, **the universities have the ability to say look, we need to cultivate entrepreneurship amongst our students, if a student is selling textbooks by the grass leave him alone. Because once you put a stop to it, it stifles entrepreneurship, if students sell sweets in the corridors of universities.** I mean, most of those students that actually do that, it's a, it's a survival mode…for them, you know, I mean".*

Participant 7 indicated:



> *"[…] skills that the entrepreneur. So, it's being able to critically review your own solution, and seeing those shortfalls in the solution and then pivoting and coming up with an alternative.*

Participant 10 indicated:

> *"[…] **train entrepreneurs**. […] they must have an understanding [of] basic financial principle, strategic principles, marketing principles, business principles. That is the key thing, it's a holistic view. They need*

to know everything from how to form idea, the vision, mission, that strategic principles, they need to know how to sell it, which is marketing, they need to know how to drive the financial business and how to work out profit and loss and viability. And then obviously, yeah, that that for me is key. […] an entrepreneur must have leadership skills. An entrepreneur must understand how to communicate how to sell. They must know how the sales process they must know what behavioural [...]"

Next, Figure 2 demonstrates the PRODUCE intervention key; – looking at those aspects considered relevant in the HEI curriculum to ensure the readiness of graduates to develop business innovation. The area inside the polygon made by a to m points is a quantitative marker of the Produce Innovation so it can be further applied to other input data.

a) Strategic information management
b) Artificial intelligence
c) Entrepreneurship
d) Advanced business management
e) Systems analysis and evaluation
f) Big data and analytics
g) Analytical thinking and innovation
h) Creativity, originality, and initiative
i) Technology design and programming
j) Critical thinking and analysis
k) Leadership and social influence
l) Complex problem solving
m) Emotional intelligence

Figure 2: PRODUCE intervention key – Relevance of HEI curriculum (own source developed for this study, 2021)

Application 1: If HEI curriculum gives the highest priority to fostering creativity, originality, and initiative, but fails to include entrepreneurship, analytical thinking and innovation, critical thinking and analysis, and complex problem-solving in equal measure in all its teaching and learning activities, then the likelihood decreases of producing graduates that are able to develop business innovation. In this case, an intervention will be necessary, for example, programme review to align module outcomes.

Application 2: Although big data and analytics are relevant in the 4IR, it does not necessarily mean that its inclusion in the curriculum of an entrepreneurial university will **PRODUCE** the readiness of graduates to develop business innovation. An overemphasis on one aspect of the curriculum at the expense of other relevant aspects indicates that an intervention is needed.

Furthermore, it is noteworthy that artificial intelligence was rated the lowest, especially since the Fourth Industrial Revolution (4IR) is driven by artificial intelligence, as described by Mhlanga (2021), which has direct impacts on innovation and infrastructure development. AI seems to be the next big driver of change and will largely impact the industry and how innovation is harnessed, therefore the researcher thinks that AI should be considered significantly when HEI (re)formulates its programs.

5. Conclusion

There is a growing need for HEIs to develop graduates with an entrepreneurial mindset, innovative and capable of contributing to business innovation. This was addressed using a Signification Framework element **PRODUCE**, which produces an intervention key that addresses aspects considered relevant in the Higher Education curriculum to **PRODUCE** graduates ready to develop business innovation and entrepreneurship. The intervention key assists HEI through intervention benchmarks, to inform curriculum redesign. Based on the findings it is

important to note that aspects, such as creativity; originality and initiative; critical thinking and analysis; analytical thinking and innovation; complex problem solving; and entrepreneurship are relevant. Furthermore, it is noteworthy that based on the findings artificial intelligence was rated the lowest, this comes in specifically as 4IR is driven by artificial intelligence, as described by Mhlanga (2021), which has direct influence and largely depends on innovation and infrastructure development.

It is noteworthy to recognise that creativity; originality and initiative; critical thinking and analysis; analytical thinking and innovation; complex problem solving; and entrepreneurship should take precedence within HEI's curriculum to **PRODUCE** graduates ready and capable to develop business innovation and/or become entrepreneurs. This study allowed the researcher to understand which aspects are considered relevant for the HEI curriculum (to produce graduates with the capability to produce business innovation) and which they should consider when (re)formulating their programs.

Predicted and Prized Critical Skills for a Graduate to Produce Effective Innovation

Sithembiso Khumalo and Tanya du Plessis
College of Business and Economics, Department of Information and Knowledge Management, University of Johannesburg, South Africa

skhumalo@uj.ac.za
tduplessis@uj.ac.za

Abstract: Higher Education Institutions (HEIs) have been mandated with the task to train and produce graduates with the capability to contribute to the economy and improve societies through teaching and learning. Furthermore, they are tasked with the responsibility to produce graduates with the capability to produce innovations that change the world for the better. For a university to produce such graduates it would need to focus on the curriculum and ensure that the skills and knowledge taught are relevant to produce innovative graduates. The purpose of this research paper was to identify the predicted and prized skills that a graduate can use to produce groundbreaking innovations. This objective would yield guidance on the most critical skills that should be included in a BCom degree to produce graduates with the capability to produce groundbreaking innovations. This research employed a Mixed-method approach with the use of both qualitative and quantitative approach. Data was collected using semi-structured interviews with 11 participants from the University of Johannesburg commercialisation units and an online questionnaire from 69 innovation experts from the South African Business Innovation Community (Innovation Summit), and the Innovation, Sustainability and Visionary Leadership Group. Data was collected through descriptive content analysis with the aid of Atlas.ti and inferential statistical analysis. This study is part of a completed PhD study, the reporting is only on Predicted and Prized critical skills for a BCom degree graduate. Based on the results ideation, reasoning, problem solving, complex problem solving, critical thinking, creativity and analytical thinking are skills and competences predicted to improve innovation and produce graduates with the capability to innovate. Furthermore, based on the results critical thinking, judgement and decision making are very significant skills for a person with a BCom degree. In conclusion, HEIs should place more emphasis on critical thinking skills within the curriculum and complex problem-solving skills. These skills should not only be exclusive to certain programmes but throughout the entire HEI's curriculum.

Keywords: Commercialisation, Higher education institutions, Innovation, Curriculum, Signification framework

1. Introduction

Innovation plays a critical role as a catalyst for societal and economic growth. It is also a catalyst for wellness, and prosperity and significantly seats at the core of HEIs, Government, and the Business sector. According to Nelles, Wilton, Walsh, and Tim, (2023), "*The 2020 R&D Roadmap argued that fueling an efficient system of innovation will improve lives, services, and business right around the UK and beyond – creating a fairer, healthier more prosperous and more resilient society*". It is stated that innovation should be encouraged through various sectors, as it is essential for the future prosperity of a society and a significant key to enabling societies to achieve their objectives and in turn solve societal and global challenges related to security, biodiversity, and climate (Nelles, Wilton, Walsh, and Tim, 2023). In this case, it is significant to note that humans play an integral part in ensuring effective production of innovation and, hence should possess relevant skills conducive to producing innovation. It is with no doubt that HEIs play an important role in equipping graduates with the skills relevant to produce innovation, and this is achieved through their academic programs and degree programs, etc. People are arguably critical and key in Research and Development around innovation, therefore should be equipped with relevant skills through various initiatives.

It is significant to note that various initiatives and educational programmes enhance management, commercialisation leadership, and entrepreneurial skills that will ultimately contribute to innovation adoption, and growth in business innovation (Nelles, Wilton, Walsh, and Tim, 2023). These innovation skills are critical to support the development of an innovative workforce and enable the generation of entrepreneurs, government, and business leaders to drive innovation leadership and economic growth. In this case, therefore the purpose of this research was to identify the predicted and prized skills for a graduate to produce impactful innovations.

2. Innovation as a Concept

Innovation is the ability to create and introduce a new product or service in the market, or the improvement of an already existing product and service commonly referred to as the type of innovation that is radical and incremental (Katz, 2007:32). These four types are the overarching categories of innovation, namely product, process, marketing, and organisational innovation. These types of innovation are further categorised, for example, radical innovation, digital innovation, disruptive innovation, and other types of innovation. Some types

of innovation are commercialisable. Due to the dynamic nature of innovation commercialisation that often entails PM, it is important to unpack PM theory and innovation. For example, the type of innovation known as radical innovation can be referred to as a newly created product, incremental innovation can be described as the enhancement of an existing product, and radical innovation often has a high risk due to its nature of uncertainty and complexity (Katz, 2007:33).

Innovation can be categorised into different types of innovations that are generally key to the business strategy of a business for sustainable competitive advantage (Varadarajan, 2018:144). The different types of innovation are product innovation, marketing innovation, business model innovation, and strategic innovation. Generally, innovation can be defined as the introduction or implementation of a new or improved product, service or process, and new business practice (Varadarajan, 2018:149). Innovation can further be defined as knowledge that is used uniquely and differently, it could be a new way of thinking and innovation is normally the result of complex and dynamic interactions and learning processes by different stakeholders (Pellissier, 2012:4).

3. Innovation and Commercialisation Process

Innovation plays a significant role in business growth and the creation of new businesses; hence it is important to nurture innovativeness. Innovativeness can be described as the capacity of an invention or innovation to disrupt the business industry or create a shift in the business paradigm, specifically in the market structure of a particular industry or in science and technology (Varadarajan, 2018:150). There are various definitions of innovation, namely: innovation can be defined as the process of successfully Commercialising an invention; or innovation can be defined as the successful process of Commercialising an idea, product, or practice (Varadarajan, 2018:152). These definitions bring forth the importance of commercialisation of innovation (CoI). CoI can be defined as a process in which various connected steps are undertaken to successfully introduce a product or service to the market. Commercialisation can be executed by corporations and start-up businesses through various processes (Jordan, 2010:4).

The basic commercialisation process includes screening the ideas, measuring the objectives of the business idea and the deliverables of the business project, later the product is tested and validated until it is launched to the market (Jordan, 2010:4). It is important to nurture business ideas and innovation within universities. In the university context commercialisation can be described as an intellectual process undertaken by academics and students where ideas and knowledge are converted into businesses or commercial products and services (Razak & Murray, 2017:298). The success of commercialisation depends on the strategy implemented to introduce new ideas and innovations (Sibanda, 2021). Innovation networks and components play an essential role in the commercialisation of products and services (Razak & Murray, 2017:298). There are various components that play a role in ensuring the commercialisation of products and services, such as systems thinking for entrepreneurial universities, quality information for decision making, and design thinking in a complex environment. The section will focus on the methodology applied to this research.

The above-mentioned is important to note but it is equally important to note that various skills are required to achieve innovation with the potential to be commercialised or implemented by an employer. Whorton, Casillas, Oswald, and Shaw, (2017: 05) argue that critical thinking, creativity, customer service, teamwork, metacognition, and self-regulation are critical skills for the 21st-century workforce, furthermore, they recommend that leadership, cross-cultural knowledge, and competence, and ethics and integrity are among the most critical skills for the 21st-century workforce to be effective in the workplace and demonstrate innovation.

4. Methodology

The research philosophy was pragmatism due to the practical nature of the research project, as Saunders, Lewis, and Thornhill (2016:136-137), with an action research strategy, and mixed-method complex research approach. The methods were, semi-structured interview, and an online questionnaire. The population consisted of HEI entrepreneurial support units of a South African university, the University of Johannesburg (UJ), innovators and entrepreneurs in the ranks of UJ IKM alumni, business innovation experts represented by the delegates of the annual South African Innovation Summit, and the Innovation, Sustainability and Visionary Leadership Group. The sampling method for this study was non-probability sampling, that is, purposive. Purposive sampling is the deliberate and thoughtful selection of the right participants for the research project (Saunders, Lewis & Thornhill, 2009:237). The in-depth interview was analysed inductively using the qualitative content analysis method to obtain a rich understanding from interpreting data using thematic coding techniques. Interviews were conducted with various representatives from commercialisation units and entrepreneurs. Once the

analysis of interview data was completed, statistical analysis utilising descriptive techniques was used to analyse structured data obtained from the questionnaire.

To conduct research that is valid and undisputable, the phenomenon under investigation and the research methodology were subject to obtaining research ethics clearance prior to conducting the actual research. Since the phenomenon was the commercialisation dynamics of entrepreneurial universities, and the researcher is an employee of an HEI and has direct contact with the IKM field of research, the action research strategy was approved by the researcher's employer, the University of Johannesburg. Permission was obtained to use UJ as the research site. Furthermore, permission was obtained from the UJ College of Business and Economics Research Ethics Committee (CBEREC) to conduct research in accordance with the UJ Code of Academic Research Ethics (2007).

5. Results and Findings

Based on the results form the question on "To what extent do they predict that an individual's ability to be innovative will improve because of skills and competencies listed below. The four options given to respondents were: to no extent, to some extent, to a moderate extent, to a great extent, and 13 skills shown on the category axis were:

1. Analytical thinking.
2. Innovative disposition.
3. Active learning and learning strategies.
4. Creativity, originality, and initiative.
5. Technology design and programming.
6. Critical thinking.
7. Leadership.
8. Social influence.
9. Complex problem solving.
10. Emotional intelligence.
11. Reasoning, problem solving.
12. Ideation.
13. Systems analysis and evaluation.

The results on each of these components are illustrated in Figure 1.

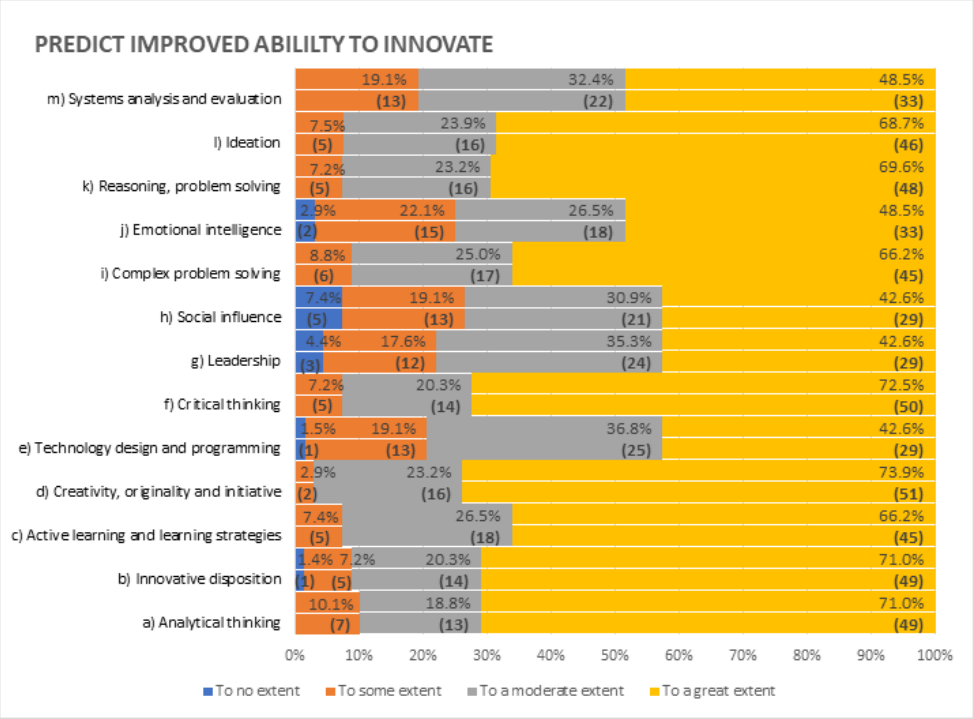

Figure 1: Skills and competencies predicted to improve ability to innovate (own source developed for this study, 2021)

Results from Figure 1, that is, the extent participants predicted that an individual's ability to be innovative will improve because of having certain skills and competencies, such as analytical thinking and active learning strategies, are illustrated in Figure 1. On analytical thinking, none of the participants indicated to no extent, 10.1% indicated to some extent, 18.8% indicated to a moderate extent, 71% indicated to a great extent. Figure 1 at b) on innovative disposition, 1.4% of the participants indicated to no extent, 7.2% indicated to some extent, 20.3% indicated to a moderate extent, 71% indicated to a great extent. Figure 1 at c) on active learning and learning strategies, none of the participants indicated to no extent, 7.4% indicated to some extent, 26.5% indicated to a moderate extent, 66.2% indicated to a great extent. Figure 1 at d) on creativity, originality, and initiative, none of the participants indicated to no extent, 2.9% indicated to some extent, 23.2% indicated to a moderate extent, 73.9% indicated to a great extent.

Figure 1 at e) on technology design and programming, 1.5% of the participants indicated to no extent, 19.1% indicated to some extent, 36.8% indicated to a moderate extent, 42.6% indicated to a great extent. Figure 1 at f) on critical thinking, none of the participants indicated to no extent, 7.2% indicated to some extent, 20.3% indicated to a moderate extent, 72.5% indicated to a great extent. Figure 1 at g) on leadership. 4.4% of the participants indicated to no extent, 17.6% indicated to some extent, 35.3% indicated to a moderate extent, 42.6% indicated to a great extent. Figure 1 at h) on social influence, 7.4% of the participants indicated to no extent, 19.1% indicated to some extent, 30.9% indicated to a moderate extent, 42.6% indicated to a great extent. Figure 1 at i) on complex problem solving, none of the participants indicated to no extent, 8.8% indicated to some extent, 25% indicated to a moderate extent, 66.2% indicated to a great extent.

Figure 1 at j) on emotional intelligence. 2.9% of the participants indicated to no extent, 22.1% indicated to some extent, 26.5% indicated to a moderate extent, 48.5% indicated to a great extent. Figure 1 at k) on reasoning, problem solving, none of the participants indicated to no extent, 7.2% indicated to some extent, 23.2% indicated to a moderate extent, 69.6% indicated to a great extent. Figure 1 at l) on ideation, none of the participants indicated to no extent, 7.5% indicated to some extent, 23.9% indicated to a moderate extent, 8.7% indicated to a great extent. Figure 1 at m) on systems analysis and evaluation, none of the participants indicated to no extent, 19.1% indicated to some extent, 32.4% indicated to a moderate extent, 48.5% indicated to a great extent.

Based on the results illustrated in Figure 1, creativity, originally and the ability to take initiative are the most significant skills and competencies that universities should put focus on, along with critical thinking skills, innovation disposition and analytical thinking. This finding coincides with the results of the interview. All participants described the importance of analysis, and two participants specifically mentioned the pitfall, lack of analytical thinking.

Participant 3 indicated:

> *"You see! Are you? Are you producing monthly financial statements? Or at least quarterly financial statements? Are you analysing your financial statements? Do you make the decisions about investing in business? Or are they just spending everything that's coming in?*

Participant 8 indicated:

> *"You know, the one thing I do not see it IRT analyses can do this is keeping, analysing, interpreting and wrinkles [sic], to constantly know exactly what happens with your stock, your inventory of cash flow, all of that, for customers, how many companies and often those kinds of entrepreneurs don't, you know, they are scared of that, because it's a data intensive thing".*

From the results of the questionnaire, creativity, originality, and initiative are the most predicted skill or capability linked to improved innovation, as illustrated in Figure 1, 73.9% of the participants indicated to a great extent. From the interviews conducted, one of the participants from the commercialisation unit emphasised creativity:

Participant 9:

> *"I think the best skill is creativity".*

Some of the entrepreneur participants interviewed, mentioned leadership and problem solving. Participant 1 indicated:

> *"[…], one of the main things is you need to be able to be a problem solver. Yeah. Because if you do not know how to solve a problem, you just be said, okay, you stand aside".*

Participant 5 indicated:

> *Okay, I think a big one for me, personally, is the ability to influence, so that talks directly to leadership, […] so, a big, big, big, big area of skill for me is that ability to influence to inspire and motivate.*

The **PRIZED** element was further informed by the results in Figure 2, from the participants when they were asked to what extent they prized the skills for a person with Bachelor of Commerce (BCom) degree obtained from a South African University; 11 skills were listed:

- Complex problem solving.
- Critical thinking.
- Creativity.
- People management.
- Coordinating with others.
- Emotional intelligence.
- Judgement and decision making.
- Service orientation.
- Negotiation skills.
- Cognitive flexibility.
- Design thinking.

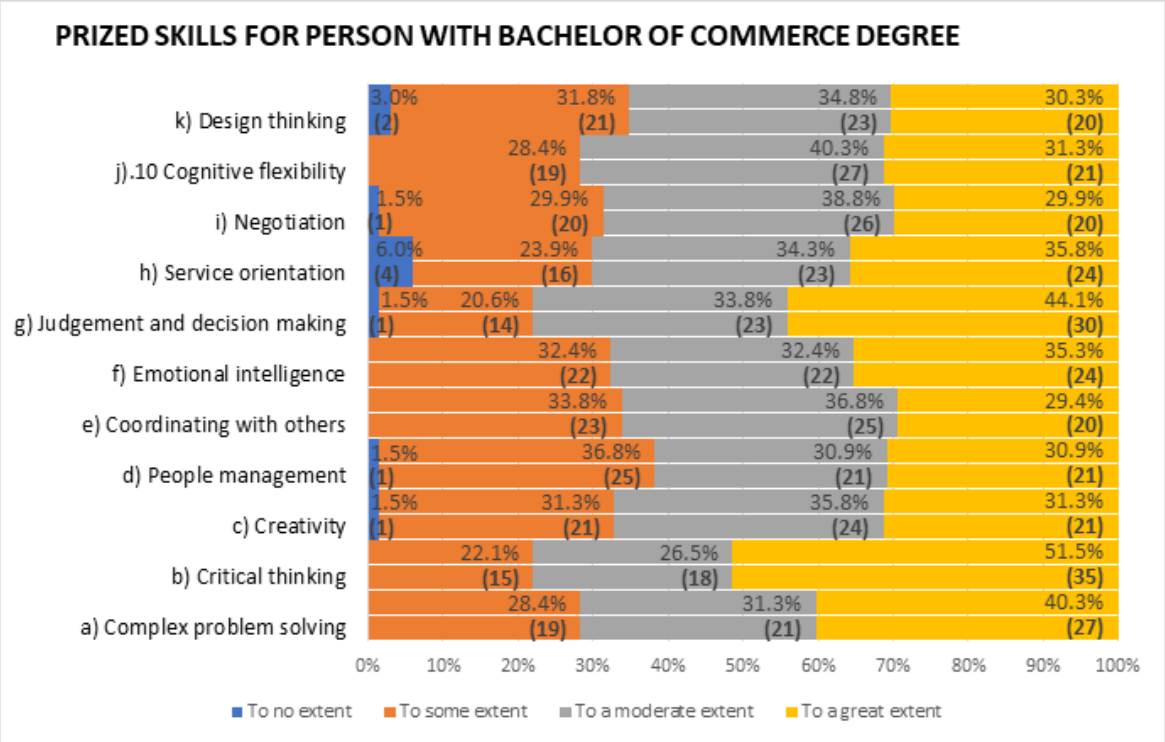

Figure 2: Prized skills for a person with a Bachelor of Commerce degree (own source developed for this study, 2021)

On Figure 2 at a), the first skill was complex problem solving, none of the participants prized to no extent, 28.4% participants prized to some extent, 31.3% participants prized to a moderate extent, and 40.3% prized complex problem-solving skill to a great extent. On Figure 2 at b), the second skill was critical thinking, none of the participants prized to no extent, 22.1% participants prized to some extent, 26.5% participants prized to a moderate extent and 51.5% participants prized to a great extent. This is a clear indication that entrepreneurial institutions should place value on instilling critical thinking within innovators and students specifically. On Figure 2 at c), the third skill was creativity. 1.5% of the participants prized to no extent, 31.3% participants prized to some extent, 35.8% participants prized to a moderate extent, and 31.3% prized creativity to a great extent.

On Figure 2 at d), the fourth skill was people management. 1.5% of the participants prized to no extent, 36.8% participants prized to some extent, 30.9% participants prized to a moderate extent, and 30.9% participants prized to a great extent the skill of people management. On Figure 2 at e), the fifth skill was coordinating with

others; none of the participants prized to no extent, in other words all participants to some extent prize the skill of coordinating with others. Of the participants, 33.8% participants prized to some extent, 36.8% participants prized to a moderate extent, and 29.4% participants prized to a great extent. On Figure 2 at f), the sixth skill was emotional intelligence, none of the participants prized to no extent, 32.4% participants prized to some extent, 32.4% participants prized to a moderate extent, and the majority (35.3%) prized emotional intelligence to a great extent. On Figure 2 at g), the seventh skill was judgement and decision making. 1.5% of the participants prized to no extent, 20.6% participants prized to some extent, 33.8% participants prized to a moderate extent, and 44.1% participants prized to a great extent.

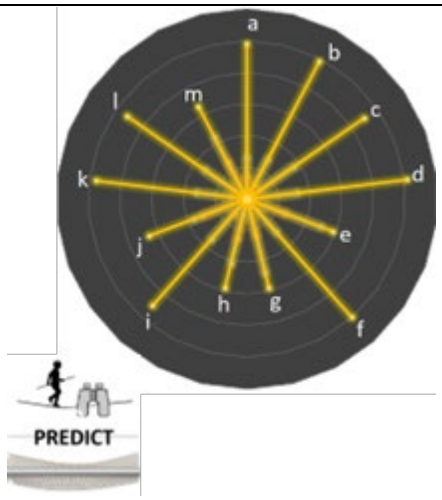
On Figure 2 at h), the eighth skill was service orientation. In comparison to other skills, a fair percentage of the participants 6% prized the skill of service orientation to no extent. Of the participants, 23.9% participants prized to some extent, 34.3% participants prized to a moderate extent, and 35.8% prized service orientation to a great extent. On Figure 2 at i), the ninth skill was negotiation, with 1.4% of the participants indicating that they did not prize the skill of negotiation, 29.9% prized negotiation skill to some extent, 38.8% participants prized to a moderate extent, and 29.9% participants prized the skill of negotiation to a great extent. On Figure 2 at j), the tenth skill was cognitive flexibility, none of the participants prized to no extent, 28.4% participants prized to some extent, 40.3% participants prized to a moderate extent, and 31.3% prized cognitive flexibility to a great extent.

On Figure 2 at k), the eleventh skill was design thinking. 3.0% of the participants prized to no extent, 31.8% participants prized to some extent, 34.8% participants prized to a moderate extent, and 30.3% prized design thinking skill to a great extent. By integrating the findings of the interview, the researcher had with innovators, entrepreneurs, and university commercialisation units, design thinking seems to be a critical skill to aid innovation and commercialisation and enable the creation of business products and services. For instance, these research participants who were interviewed from the commercialisation unit indicated as follows.

Participant 5 indicated:

> *"Your product must fit a particular niche is very, very important. And so, you know, what we call the design thinking stage, design thinking those kinds of exercises that need to happen earlier on. So, when people come in and say this is a great idea. You go through design thinking process only to discover that there is nothing here unless we do one, two three and four You know, or things like you will be successful. If for example, we introduced a product for free to get a consumer acceptance. And then at other components, other variables onto it value addition, and then start charging for those kinds of things".*

Participant 7 indicated:



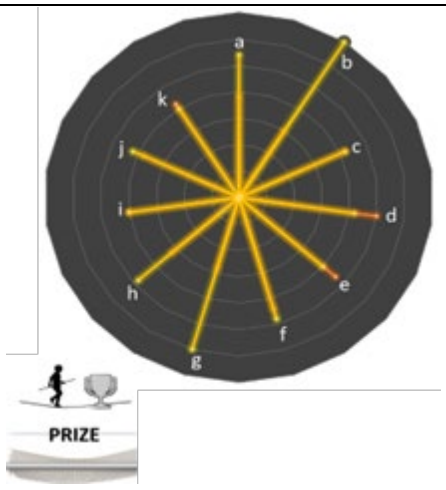
> *"So, we apply a lot of design thinking in our approach when we develop solutions. So, we very much solution orientated, and we have a requirement to ensure that whatever take all solution we want to take into an environment that it can succeed. You do that by developing as a minimum viable product. Like, testing it in that environment, seeing whether doing a bit of market research around it to see whether is addressing the problem".*

Participant 7 added:

> *"To demonstrate that the project is not feasible, that something is not feasible that they're trying to achieve. That is why we like the design thinking approach where you have a minimum viable product, before you spend a lot of money to develop a cheap and simple prototype, and to demonstrate that it can work. And then based on that, attract investment, and buy in and engage with potential buyers that would want that check to see if there's a real need within the market for it". […] So, there is this thing. Now this big thing now called design thinking […] So, my answer goes back to what I said earlier a lot of the work needs to be done in understanding the needs of the client and test the product pilot of the product with the clients to find out if they have real interest".*

The responses illustrated in Figure above indicate a fair response between some extent, moderate extent, and great extent, which indicated universities should place value on prized skills by finding balance in their curriculum. To find this balance, an intervention mechanism, such as a SIM system would then assist with the alignment of dynamic capabilities at the **PRIZED** element level. The results show that the most prized skills from among complex problem solving, critical thinking, creativity, people management, coordinating with others, emotional intelligence, judgement and decision making, service orientation, negotiation skills, cognitive flexibility, and design thinking, are critical thinking, judgement and decision-making skills.

Based on these findings, the researcher developed the **PREDICT** and **PRIZED** and of this study's signification framework (*cf* Figure 3 & 4).



a) Analytical thinking
b) Innovative disposition
c) Active learning and learning strategies
d) Creativity, originality, and initiative
e) Technology design and programming
f) Critical thinking
g) Leadership
h) Social influence
i) Complex problem solving
j) Emotional intelligence
k) Reasoning, problem solving
l) Ideation
m) Systems analysis and evaluation

Figure 3: PREDICT Intervention key – Skills that will improve ability to innovate (own source developed for this study, 2021)

Application 1: If an entrepreneurial university provides students with an environment that encourages the creativity, originality, and initiative of innovators during academic residency, the prediction is that their ability to innovate in the business environment will improve.

Application 2: If the HEI curriculum comprises teaching and learning of a variety of skills that will improve the ability to innovate, then intervention is not necessary. The **PREDICT** intervention key will flag an issue such as unbalanced attention to one skill at the expense of another skill, in which case intervention is needed. Leadership, 2) explorative culture, and 3) brand identity.

a) Complex problem solving
b) Critical thinking
c) Creativity
d) People management
e) Coordinating with others
f) Emotional intelligence
g) Judgement and decision making
i) Service orientation
j) Negotiation skills
k) Cognitive flexibility
l) Design thinking

Figure 4: PRIZE Intervention key – Skills for a person with a BCom degree (own source developed for this study, 2021)

Application 1: When the two most prized skills of a person with a BCom degree are 1) critical thinking, and 2) judgement and decision making, but HEI designs its assessments to test BCom students' ability to memorise

theory without practical application that requires critical thinking, judgement and decision making, then intervention is needed.

Application 2: If teaching and learning activities concentrate on people management and coordinating with others yet neglecting the other prized skills of a person with a BCom degree, then teaching and learning intervention is needed.

6. Conclusion

The quest to determine the skills required to produce graduates capable of producing graduates with the capability to innovate presents a research gap for this study to add value. This study aimed to add value by determining the most predicted and prized skills required within the university curriculum to produce graduates capable of producing effective innovation. It is significant to take note of the major skills HEIs should focus on to ensure that they ensure graduates are capable of creative thinking, problem-solving, critical thinking, negotiation, decision-making skills, and leadership. This would assist in getting a clearer understanding of the level of graduates' readiness and the skills universities should be focusing on to ensure that graduates can produce innovation and business growth. Whorton, Casillas, Oswald, and Shaw, (2017: 05) confirmed some of the skills from the results by listing critical thinking, creativity, customer service, teamwork, metacognition, and self-regulation as critical skills for the 21st century workforce. Apart from the skills determined from this, it further recommended that leadership, cross-cultural knowledge and competence, and ethics and integrity are among the most critical skills for the 21st-century workforce as stated by Whorton, Casillas, Oswald, and Shaw, (2017: 05).

In conclusion, it is significant for HEIs to put an emphasis and focus on skills such as creativity, critical thinking, ideation, innovation disposition, and analytical thinking within the curriculum to produce graduates capable of producing effective innovation.

A Literature Review: The Impact of Digital Transformation on Financial Performance

Florian Kidschun, Aadish Gandhi and Fabian Hecklau
Fraunhofer IPK, Division Corporate Management, Berlin, Germany

florian.kidschun@ipk.fraunhofer.de
aadish.gandhi@ipk.fraunhofer.de
fabian.hecklau@ipk.fraunhofer.de

Abstract: In recent years, digital transformation (DT) has emerged as a significant driver of organizational change, promising to revolutionize business processes, enhance operational efficiency, and ultimately improve business success. This literature review examines the empirical evidence surrounding the impact of DT on financial performance (FP) across various industries and organizational contexts. The review synthesizes findings from empirical research to provide insights into the mechanisms through which DT influences key performance metrics such as profitability, revenue growth and return on investment (ROI). Through a comprehensive analysis of existing literature, this review aims to contribute to a deeper understanding of the complex relationship between DT and FP and to provide valuable implications for both scholars and practitioners seeking to navigate the digital landscape effectively.

Keywords: Digital transformation, Financial performance, Impact, Literature review

1. Introduction

Digital transformation (DT) has emerged as a pivotal force reshaping industries worldwide. According to a survey conducted by (Gartner 2017), 91% of the businesses surveyed were engaged in some form of digital initiative, and 87% of senior business leaders say digitalization is a priority. This paradigm shift involves the integration of digital technologies into all aspects of business operations, fundamentally altering how companies create value, interact with customers, and compete in the marketplace. The advent of technologies such as artificial intelligence (AI), big data analytics, blockchain, the Internet of Things (IoT), and cloud computing has revolutionized traditional business models, leading to enhanced operational efficiencies, improved customer experiences, and the creation of new revenue streams (Matarazzo et al. 2021). Companies across various sectors are increasingly adopting digital transformation strategies to stay relevant in a rapidly evolving digital economy (Montagner & Reich 2018).

While the strategic importance of DT is widely acknowledged, its impact on the FP of companies remains a topic of extensive debate. FP, which includes metrics such as profitability, revenue growth and return on investment (ROI) is a critical measure of a company's success and long-term viability. Despite numerous case studies and anecdotal evidence suggesting the potential benefits of digital transformation, empirical research presents a mixed picture. Some studies highlight significant financial gains, while others report marginal or even negative impacts. This inconsistency underscores the need for a comprehensive examination of existing literature to better understand how digital transformation influences financial outcomes.

This literature review serves as a vital contribution to the existing literature by analysing only publications that provide empirical evidence of impacts of DT on FP. The need for empirical research in this domain is driven by several factors: Firstly, the outcomes of DT initiatives can vary significantly across different organizations. Factors such as industry context, company size, organizational culture, and implementation strategy can influence the success and financial impact of DT efforts. This literature review can help identify the conditions under which DT is most likely to yield positive financial outcomes. Secondly, limitations and complexities in measuring the impact of DT on FP can be identified. Traditional financial metrics may not fully capture the benefits of digital investments, such as improved customer satisfaction, innovation capabilities, or market agility. Empirical studies can develop and utilize appropriate frameworks and metrics to assess the realistic impact of DT on FP. Thirdly, the benefits of DT may not be immediately apparent. Longitudinal studies are necessary to understand the long-term effects of digital initiatives on FP. Such research can provide insights into the lag between digital investment and financial returns, helping companies manage expectations and plan their digital strategies more effectively.

2. DT and Financial Performance

DT can be defined as 'the process of organizational or societal changes driven by innovations and developments of the information and communication technologies (ICT)' (Bockshecker et al. 2018). It also incorporates manifold changes imposed by ICT in organizations, such as the development or alternation of business models,

sales and communication channels, customer relationship management and the digitization of a firm's offerings (Haffke et al. 2016). Consequently, DT describes the radical transformation of the organization via the formation of new technologies. In this regard, it evokes a holistic perspective that primarily emphasizes the integration of digital technologies in the various elements of the organization, but also includes underlying digitization and digitalization concepts.

Recent studies on DT demonstrate the complexity of this phenomenon and its impact on fundamental elements of companies' value creation, such as business processes (Grab et al. 2019) , technology infrastructure (Nwankpa and Roumani 2016), organizational culture (Pfaff et al. 2023), HR (Hegedűs 2020), products and services (Almaazmi et al. 2021), customer experience (Tolboom 2016), suppliers and partners (Fröhlich and Steinbiß 2020). Digital transformation is recognized as an obvious factor of business competitiveness in the modern business environment.

FP on the other hand, commonly measured through indicators such as revenue growth, profitability, return on investment (ROI), and market share, is a critical metric for evaluating the success of business strategies, including DT initiatives. Although having theoretically established that DT has an impact on FP, very few studies are able to investigate this empirically. There remains a paradox whether DT has a positive or negative impact on firm's FP. Despite having plethora of advantages DT does not guarantee profitability, because it incurs operating and integrating costs (Guo and Xu 2021). Some scholars claim that DT can have positive impact on FP when observed at a longer time span and given that high level of DT intensity is maintained (Gurumurthy et al. 2019, Mahssouni et al. 2023, Yonghong et al. 2023). Contrary to this, some authors argue that DT can have a degrading effect on company financials (Jardak and Hamad 2022, Bughin et al. 2019).

This underlines the need for a systematic literature review to explore and synthesize current research results on the impact of DT on FP of companies. By analysing empirical studies, this contribution aims to provide a holistic understanding of the relationship between DT and various FP metrics. Additionally, it seeks to identify gaps in the current literature and propose directions for future research, offering valuable insights for academics, practitioners, and policymakers.

3. Methodology

A systematic literature review (SLR) was conducted to explore the impact of DT on the FP of companies. The approach ensures a comprehensive, unbiased, and replicable review of existing literature and involves clearly defined stages: identification of relevant studies, selection of studies based on predefined criteria, data extraction, and synthesis of findings. The following research questions guide the literature review: What are the key factors of DT that influence FP? What financial outcomes are associated with DT initiatives?

A comprehensive search strategy was devised to identify relevant academic articles, books, reports, and other sources related to DT and FP. Multiple electronic databases such as Emerald insights, ScienceDirect, Scopus, and Google Scholar were searched using keywords such as 'Digital transformation,' 'Digital maturity,' 'Financial performance,' and 'Business performance and digitalization', 'ROI of digital transformation'. Boolean operators (AND, OR) and wildcards were used to refine and expand the search. Lastly the "snowball" method was used to identify appropriate academic sources by exploring the references of other relevant research. Next, articles were screened based on predefined inclusion and exclusion criteria to ensure their relevance to the research topic. To ensure the relevance and quality of the reviewed studies, the following inclusion and exclusion criteria were applied: Only peer-reviewed journal articles, conference papers and reputable industry or consulting reports, written in English and published after the year 2015 were considered, that focus on the impact of DT on FP. Next, quality assessment of the extracted data was performed. In order to do this, studies were assessed based on their robustness, sample size, relevance as well as quality and type of data.

4. Analysis of Empirical Studies Investigating the Impact of DT on Financial Performance

The SLR delivered a total number of 12 empirical studies from the years 2016-2024, that rely on self-reported data as well as quantitative data, econometric, regression models and a variety of data sources like financial databases and annual reports. Most studies are geographically concentrated, especially in China and Europe, while some target diverse global regions. Their industry focus varies, with some studies focusing on specific sectors like manufacturing, while others cover broader industrial bases. The studies cover varying time frames (e.g., 2009-2019 for Zhai et al. 2022, 2015-2019 for Mahssouni et al.), their sample sizes vary significantly, from 92 observations (Jardak et al. 2022) to 2566 (Liu et al. 2023). Varied indicators and indices are used to measure

the level or maturity of DT (e.g., DESI dimensions, custom indices, Likert scales) as well as different FP metrics (e.g., ROA, ROE, Tobin's Q, profit margin), complicating direct comparisons of results.

Table 1: Analysed studies investigating impact of DT on financial performance

Author	Year	Title	Region	Sample	Time period	DT dimensions (input)	Financial performance metrics (output)	Data Source
(Barba-Sánchez et al. 2024)	2024	Effects of digital transformation on firm performance: The role of IT capabilities and digital orientation	Spain	246 answers from CEOs and owners of SMEs and Micro SMEs in the manufacturing sector	na	Digital orientation; Digital transformation; IT capability	Seven items addressing organisations' financial and non-financial results	Qualitative self-assessment
(Mahssouni et al. 2023)	2023	Dual Perspectives on Financial Performance: Analysing the Impact of Digital Transformation and COVID-19 on European Listed Companies	Europe	2179 cross-sectoral European Listed companies.	5 Years	Connectivity; Human capital; Integration of digital technology; Digital public services	ROA; ROE	Orbis database, DESI Index
(Zhang et al. 2023)	2023	The impact of digital transformation of manufacturing on corporate performance — The mediating effect of business model innovation and the moderating effect of innovation capability	China	255 Answers acquired from Senior and Middle level managers of Micro SMEs, SMEs and Large enterprises in the manufacturing sector.	5 Years	Exploitative DT; Explorative DT	Profit margin; Rate of return of sales; Operational costs; Market share	Qualitative self-assessment
(Liu et al. 2023)	2023	The Effect of Financial Digital Transformation on Financial Performance: The Intermediary Effect of Information Symmetry and Operating Costs	China	2566 cross-sectoral A-share listed companies	9 Years	Application of digital technology; Information system and digital platform; Data governance; Business and financial process reengineering; Smart finance	Tobin's Q; Operating Income; Operating Cash flow; Shareholding Ratio; Asset–Liability Ratio	Annual company reports, China Stock Market and Accounting Research database

Author	Year	Title	Region	Sample	Time period	DT dimensions (input)	Financial performance metrics (output)	Data Source
(Yonghong et al. 2023)	2023	The impact of enterprise digital transformation on financial performance — Evidence from Mainland China manufacturing firms	China	55 A-share listed manufacturing companies	7 Years	Digital IT architecture; Digital inputs; The extent to which digitalization is integrated with the industry	Inventory turnover ratio; Total asset turnover ratio	"Top 100 Value Creation of A-share Listed Companies in China's Equipment Manufacturing Industry" report, Annual company reports
(Jardakund Ben Hamad 2022)	2022	The effect of digital transformation on firm performance: evidence from Swedish listed companies	Sweden	92 observations from 23 listed companies from the Media, Banking and Manufacturing sectors	4 Years	Digital marketing; Digital product experience; e-commerce; e-CRM; Mobile and; Social media.	ROA; ROE; Tobin's Q	"Digital leader's reports", DataStream
(Zhai et al. 2022)	2022	Does digital transformation enhance a firm's performance? Evidence from China	China	Accounting and financial data acquired from 9614 cross-sectoral A-share listed companies	10 Years	Digital technology applications; Business model innovations; Innovation capability	ROA; ROE; Cost (Production cost/Total revenue); Turnover; Leverage; Equity multiplier (total assets/shareholder equity)	Annual company reports, China Stock Market and Accounting Research database
(Teng et al. 2022)	2022	Research on the Relationship between Digital Transformation and Performance of SMEs	China	335 Answers acquired from executive of Manufacturing SMEs	na	Digital technologies; Digital skills; DT strategy	ROI; ROE; Increase in sales; Return on sales; Gross profit; Net profit	Qualitative self-assessment
(Guo und Xu 2021)	2021	The Effects of Digital Transformation on Firm Performance: Evidence from China's Manufacturing Sector	China	2254 Listed manufacturing companies	10 Years	DT Intensity; Industrial DT maturity	Cost of obtaining unit revenues (operating cost + sales expense); ROA; Asset turnover rate; Asset-liability ratio; Equity concentration	Annual company reports, China Stock Market and Accounting Research database

Author	Year	Title	Region	Sample	Time period	DT dimensions (input)	Financial performance metrics (output)	Data Source
(Abou-foul et al. 2021)	2021	The impact of digitalization and servitization on the financial performance: An empirical analysis	USA & Europe	Financial data was acquired from OSIRIS data base and the data on DT was acquired using questionnaire for executives of the same 185 manufacturing companies	3 Years	Servitization; Digitalization	Revenue/Number of employees; Fixed assets turnover; Return on sales; ROI; General profitability of the firm; Market capitalization	Qualitative self-assessment
(Ragu Gurumurthy et al. 2019) Deloitte	2019	Uncovering the connection between digital maturity and financial performance	USA	1200 cross-sectoral organizations with a revenue of at least $250 Mil	na	Flexible, secure infrastructure; Data mastery; Digital savvy, open talent networks; Ecosystem management; Intelligent workflows; Unified customer experience; Business model adaptability	Net revenue; Net profit	Qualitative self-assessment
(Joseph K. Nwankpa und Yaman Roumani 2016)	2016	IT Capability and Digital Transformation: A Firm Performance Perspective	USA	167 Answers acquired from CIOs, VPs of IT and IT executive of cross sectoral Medium and Large sized enterprises	na	IT Infrastructure; IT business spanning; IT proactive stance	Profitability; Customer retention; ROI; Sales growth	Qualitative self-assessment

The comparative analysis of the studies on digital transformation (DT) and its impact on financial performance (FP) reveals a nuanced understanding of how various factors and contexts influence this relationship. In the following, the general approach, findings, and implications of each study are outlined to provide a cohesive overview.

Barba-Sánchez et al. (2024) examined the mediating roles of IT capabilities and digital orientation in the DT-FP relationship within 246 Portuguese manufacturing companies. Using qualitative surveys and multivariate analysis, they found that while DT significantly contributes to FP, its impact is heavily dependent on IT capabilities and digital orientation. Similarly, Nwankpa and Roumani (2016) focused on 167 US companies and discovered that DT mediates the influence of IT capabilities on FP (including profitability, customer retention, ROI, and sales growth) and innovation, underscoring the importance of IT capabilities in leveraging DT for better financial outcomes.

Mahssouni et al. (2023) utilized an econometric model to analyse financial data from 2179 listed European companies (2015-2019). They integrated financial variables (ROA, ROE) and non-financial variables from the DESI

index to capture DT maturity levels. Their findings revealed a 1% increase in digital capacities leading to a 58% improvement in FP, indicating a strong positive correlation. However, they also noted a negative relationship between the price-to-book value ratio and FP, hinting at the complexities of market perceptions.

In a study of 255 Chinese manufacturing companies over five years, Zhang et al. (2023) differentiated between explorative and exploitative DT modes. They found that both modes positively impact business model innovation and FP, highlighting the strategic value of tailored DT approaches. Teng et al. (2022) supported this by surveying 335 Chinese SMEs and finding positive correlations between specific DT dimensions ('Digital Technology', 'Digital Skills', and 'DT Strategy') and FP indicators (ROI, ROE, sales increase, Return on Sales, gross profit, and net profit).

Zhai et al. (2022) used extensive accounting data from Chinese A-Share listed companies (2009-2019) and demonstrated that DT enhances FP through better asset turnover, lower operating costs, and increased innovation success. Their textual analysis of annual reports showed that DT firms had a 0.33% better ROA compared to non-DT firms, translating to a 7.29% higher return. Liu et al. (2023) found similar positive correlations in Chinese companies, with DT improving FP by 1.1% and enhancing information symmetry while reducing operating costs.

Guo and Xu (2021) observed a U-shaped relationship between DT and FP in 2254 listed Chinese manufacturing companies (2010-2020). Their regression analysis indicated initial profitability dips post-DT implementation due to high costs, followed by increased profitability after five years, suggesting that DT benefits accumulate over time. Conversely, Jardak et al. (2022) found that DT negatively impacts FP in 23 listed Swedish companies, with high IT infrastructure investment costs outweighing benefits initially but positively influencing market valuation (Tobin’s Q).

Abou-Foul et al. (2021) explored the role of digitalization in enabling servitization and enhancing FP in 185 manufacturing firms in the USA and Europe. Their analysis showed that digitalization and data-driven solutions significantly improve FP and market offerings. In a broader scope, Gurumurthy et al. (2019) analyzed 1200 US-based companies, revealing a direct positive correlation between DT maturity and FP. Companies with higher DT maturity levels exhibited substantial growth in net revenue, net profit, sales from new products/services, and customer lifetime value, while also reducing costs for new product launches and customer acquisition.

Lastly, Yonghong et al. (2023) studied 55 listed Chinese manufacturing companies (2013-2020) and concluded that while DT positively impacts FP, there is an initial lag. Their multivariate model showed that profitability performance decreases initially, but as DT deepens, improvements in net sales margin, total asset return, inventory turnover, and asset turnover rates become evident.

In summary, while the studies show a general consensus on the positive impact of DT on FP, the extent and immediacy of these benefits are influenced by factors such as IT capabilities, digital orientation, the nature of the industry, and the maturity level of DT implementation. The temporal aspect is particularly critical, as initial costs and investments may obscure the immediate benefits, which tend to accrue more significantly in the long term. These study findings collectively underscore the complexity of the DT-FP relationship, necessitating a strategic and well-supported approach to digital transformation.

5. Discussion of Limitations

Most analysed studies are geographically concentrated, especially in China and Europe, with fewer studies covering diverse global regions. This limits the generalizability of findings across different economic contexts.

The industry focus varies, with some studies focusing on specific sectors like manufacturing, while others cover broader industrial bases, which can lead to sector-specific insights that might not apply universally. Qualitative surveys (e.g. Teng et al. 2022, Barba-Sánchez et al. 2024, Nwankpa & Roumani 2016) rely on self-reported data, which can introduce bias and limit the accuracy of FP assessments. While many studies establish correlations between DT and FP, causality is often implied rather than rigorously tested, leaving room for alternative explanations (e.g., firms already performing well are more likely to invest in DT). Moreover, there is a lack of a longitudinal studies observing the long-term impact of DT on FP. IT investments could take years to materialize and to be captured by performance indicators. Even though a series of studies inherit longitudinal data, they cover varying time frames (e.g., 2009-2019 for Zhai et al. 2022, 2015-2019 for Mahssouni et al. 2023), making it challenging to compare results across different economic cycles and technological advancements. All studies use varied indicators and indices to measure DT (e.g., DESI dimensions, custom indices, Likert scales), leading to inconsistencies in how DT's impact is quantified. Studies such as from Zhang et al. and Barba-Sánchez et al. explore mediating factors like business model innovation and IT capabilities, but more comprehensive models

are needed to understand the complex interplay between DT and various organizational dimensions. Other studies, such from Guo et al. 2021 and Jardak et al. 2022 rely on text analysis of annual firm reports to gain insights into company DT measures. Critical digital actions are never disclosed in these reports, therewith their validity stays ambiguous and needs further verification.

6. Conclusion

In conclusion, this SLR painted a comprehensive picture of the DT-FP relationship. While the positive impact of DT on FP is evident, the extent and timing of this impact are influenced by a variety of factors. Initial costs and market perceptions also play critical roles in shaping the outcomes. Therefore, companies aiming to leverage DT for financial improvement must adopt a holistic approach that considers these mediating factors and prepares for the potential initial costs and time-lagged benefits. By doing so, they can better navigate the complexities of DT and achieve sustainable financial success. The limitations discussed highlight the need for more geographically and sectorally diverse research, standardized measurement approaches, and longitudinal studies to better capture the dynamic effects of DT on FP. Addressing these limitations will provide a clearer understanding of how and when DT investments yield tangible financial benefits.

Power Outage Perils: Assessing the Impact of Load-Shedding on SMEs in Enoch Mgijima Local Municipality, South Africa

Konwaba Klishi
Walter Sisulu University, Komani, South Africa

kklish@wsu.ac.za

Abstract: This qualitative case study delves into the profound impact of load-shedding, the deliberate and temporary interruption of electricity supply, on small and medium (SMEs) in the Enoch Mgijima Local Municipality (EMLM) of South Africa. The study, conducted within an interpretive research paradigm and a qualitative methodology, provides a nuanced understanding of how institutional forces shape SMEs' behavior, decision-making, and overall functioning in the face of energy disruptions. The persistent power cuts due to load-shedding have had a substantial toll on the survival of SMEs in the EMLM, with businesses across diverse sectors, including hospitality, beauty, manufacturing, retail, and services, struggling to maintain operations. The study brings to light the multifaceted challenges SMEs face, such as disruptions to daily activities, equipment damage, and significant financial losses. It also presents a concerning trend of layoffs by SMEs in the region, contradicting the National Development Plan's (NDP) employment creation goals. The findings provide valuable insight for policymakers, researchers, and stakeholders, underlining the urgent need for collaborative efforts to develop tailored programs, promote alternative energy sources, and advocate for policies that prioritize the energy needs of SMEs. The study acknowledges limitations related to geographical specificity, temporary constraints, and data source reliance and recommends further research to extend the geographical scope, conduct longitudinal analyses, and incorporate diverse data collection methods. By addressing these limitations, further studies can contribute to a more comprehensive understanding of the broader challenges and potential solutions faced by SMEs amid energy-related crises.

Keywords: Loadshedding, Small and micro enterprises, Business operations, Sustainability, Renewable energy

1. Introduction

Over the past two years, the Enoch Mgijima Local Municipality (EMLM) has found itself under the scrutiny and intervention of the national and Eastern Cape Provincial government, prompted by a series of challenges plaguing its operations. As highlighted by the South African Parliament (2024), these challenges include deficiencies in record-keeping and a lack of robust systems to identify impoverished individuals accurately. Consequently, the municipality grapples with inadvertent benefit distribution to those ineligible, directly impacting its financial well-being.

Adding to the municipality's financial woes is a considerable debt owed to Eskom, as highlighted by the South African Parliament (2024). According to the South African Government News Agency (2024), EMLM bears the weight of a prolonged history of indebtedness, protracted legal battles, and persistent power interruptions. The aging and dilapidated electric infrastructure within the municipality stands out as a major contributor to these ongoing power disruptions (ibid), affecting communities across the board. The resulting struggle to maintain a consistent energy supply has created a ripple effect, hampering the business sector's ability to operate seamlessly and, in turn, impeding local economic development (Tokota, 2023).

Recognising the paramount role of energy in driving economic activities, as emphasised by Tembo et al. (2015), it becomes evident that a steady and adequate energy supply is crucial for any nation's economic development. This point is taken further by Bwalya (2022) who states that most economically productive activities rely heavily on a consistent energy supply. The International Energy Agency (IEA) reported in 2010 that over 20% of the global population, approximately 1.4 billion people, faced limited access to electricity, emphasising the worldwide significance of reliable energy access (IEA, 2010).

While global energy demands surge with increasing population, industrialisation, and economic activities, meeting these needs becomes a complex challenge. According to the World Bank (2017), power utility providers, often government-owned entities in emerging nations, struggle to expand their generation and supply capabilities at a pace matching the soaring energy demands. The obstacles identified by the World Bank (2017) include inadequate generation capacity, transmission and distribution infrastructure, low tariffs, high costs of supplying remote areas, and the financial instability of utility providers.

In the South African context, Eskom's financial concerns coincide with a growing crisis of continued power cuts, posing a substantial threat to the business sector. The repercussions of load shedding are particularly crippling for Small Medium-sized Enterprises (SMEs), which play a pivotal role in sustaining economic development and fostering progress in developing nations (World Bank, 2020). Mbomvu et al. (2022) emphasise the

socioeconomic importance of Small and Medium-sized Enterprises (SMEs) to the South African economy, asserting that their significance cannot be overstated. As asserted by (Maziriri and Chivandi, 2020; Charamba and Ladzini, 2021) these enterprises are increasingly being recognised as catalysts for economic growth, innovation, job creation, and overall development.

The Eastern Cape Socioeconomic Consultative Council (2021) sheds light on the pivotal role played by SMEs in the economy. The promotion and economic contributions of SMEs are rationalised based on three main reasons: serving as incubators for entrepreneurship development, innovation, and risk-taking behaviour; providing viable options for sustainable income in agricultural processing industries; and playing a crucial role in transitioning to agro-led industrial economies (Seda, 2019). Furthermore, SMEs contribute significantly to the development of societal productive capacity, absorbing economic resources at all levels and fostering interconnected, resilient economic systems for both small and large businesses.

2. Problem Statement

Since 2008, Eskom, South Africa's primary energy provider, has implemented power cuts, known as load shedding, attributed to issues such as inadequate and deteriorating infrastructure (Carlsson & Martinson, 2016; Kusakana, 2019; Winkler et al., 2020). This ongoing challenge has far-reaching consequences, extending beyond the realm of household activities to significantly impact business enterprises (Goldberg, 2015). Established businesses often manage these disruptions by resorting to alternative energy sources such as solar panels and wind turbines (Sgqolana, 2023). In contrast, emerging enterprises, particularly SMEs, grapple to secure alternative energy solutions.

An insightful perspective from Viljoen and Struweg (2016) reveals that a staggering 97% of businesses in South Africa are actively operating in the SMME category. These enterprises collectively contribute to over 60% of the national labour force, constituting approximately 45% of the Gross Domestic Product (GDP) (Chumucheka, 2013; Amoros & Moska, 2016; Borat et al., 2018). Thus, as mentioned above, SMEs, predominantly categorized as emerging businesses, hold a pivotal position in the South African economy and are acknowledged as critical drivers of economic growth (Bruwer, 2020). According to Ndiaye (2018) most economies worldwide, especially those in developing countries, depend heavily on SMEs. Hence these business enterprises are significant drivers of economic development. Bizcash (2023) agrees that SMEs are making a great contribution to economic growth as they contribute to economic diversity by bringing a diverse range of goods and services to the market. As a result of this diversification, the economy is less dependent on a small number of major companies and is, hence, more shock resistant.

In the context of the EMLM, the effects of load shedding are negatively affecting SMEs. These business enterprises are under massive strain. This strain affects SMEs in sectors such as hospitality, manufacturing, the beauty industry, construction, agriculture, and many more (Businesses, 2023; Sgqolani, 2023; Emalahleni et al., 2023). The Majority of SMEs in this area are micro and small (Jolingana, 2014). Therefore, they struggle to make an annual turnover of more than R150 000 (Eastern Cape Socio-Economic Consultative Council, 2021). Many of the SMEs purchase generators for the sake of continuing business. But that also costs them, as generators operate with petrol, so their operations have an added fuel expense.

Studies on SMEs exist. However, studies on the impact of load shedding on SMEs in the EMLM are scarce. This study aims to bridge the existing gap by examining the multifaceted effects of load shedding on the daily operations, financial health, and sustainability of SMEs in the EMLM. By shedding light on these intricacies, the research seeks to propose effective strategies and interventions to enhance the resilience and endurance of SMEs, ensuring their continued role as pillars of economic vitality within the local community.

3. Objective of the Study

The objective of this study is to comprehensively assess the socio-economic impact of load shedding on SMEs within the Enoch Mgijima Local Municipality, South Africa, with the aim of identifying challenges faced by SMEs during power outages and proposing viable solutions to mitigate their adverse effects on business operations.

4. Research Question

This study aims to unravel the intricate dynamics surrounding the effects of load shedding on SMEs within the Enoch Mgijima Local Municipality, South Africa. The study specifically answers the following question:

- How does load-shedding impact these enterprises' daily operations?

The research seeks to offer a comprehensive understanding of the challenges faced by SMEs in this specific geographic context. Through this, the study endeavors to contribute valuable insights to inform targeted interventions and strategies. By bridging this knowledge gap, the research aims to empower policymakers, local authorities, and business stakeholders in the EMLM to foster an environment that supports the resilience and growth of SMEs, ultimately promoting economic stability within the municipality.

5. Theoretical Framework

The study on the effects of load shedding on EMLM can be anchored within the Institutional Theory framework. Rooted in sociology and organizational studies, this theory provides a lens through which to understand how external institutional pressures influence the behavior and responses of organizations. In the context of this study, the institutional environment is shaped by governmental policies, regulations, and socioeconomic structures that directly impact the operations of SMEs during load shedding. Drawing on the works of institutional theorists such as Meyer and Rowan (1977) and DiMaggio and Powell (1983), the study explores how the institutional environment, represented by government interventions and energy policies, influences the adaptive strategies and resilience mechanisms adopted by SMEs in response to load-shedding.

Within the Institutional Theory framework, the study investigates the isomorphic pressures that lead SMEs to mimic certain practices and conform to institutional norms during energy disruptions. Additionally, it delves into the role of institutional entrepreneurs, such as local business associations or government agencies, in shaping the responses and strategies adopted by SMEs to navigate the challenges posed by load-shedding. By adopting this theoretical lens, the study contributes to nuanced insights into how institutional forces shape SMEs' behavior, decision-making, and overall functioning in the face of energy disruptions, offering a comprehensive understanding of the socioeconomic context within which these enterprises operate.

6. Methodology

This study employed a qualitative research methodology to comprehensively report on the impact of load shedding on SMEs in the EMLM. Qualitative research methodology in a social context offers a comprehensive view of social processes and human behavior. It also offers a means of learning about things like people's experiences, histories, and cultures (Bange et al.,2018). In the context of social research, qualitative research uses numerous techniques that include observations, focused groups, surveys, interviews, and archival research (ibid). In this study this methodology is justified by its suitability to assist in analysing the specific and current circumstances surrounding SME operation.

Embedded within an interpretivist research paradigm, this study explores the in-depth understanding and experiences of SMEs in EMLM. The foundation of interpretive research as a paradigm is on the idea that human experiences and the social context determine social reality (Rehman and Alaharti, 2016; Shah et al., 2013).

Utilising a case study design, this research aims to construct a thorough understanding of how load shedding impacts SMEs in the ELMM. Kuruppuge et al., (2020) state that researchers can assure methodological rigor in their studies and produce solid and informative findings by utilizing qualitative case study methodologies within an interpretivist paradigm.

This paper adopts an intrinsic case study design, as recommended by Hamilton and Corbett-Whittier (2014), to provide a detailed description of the situation. This approach ensures that the study does not merely serve insights but offers a thorough exploration of the phenomenon. By conducting an intrinsic case study, the researcher was able to acquire a nuanced and detailed understanding of the effects of load shedding on SMEs in the EMLM.

6.1 Population and Sample/Study Group/Participants

This study used a purposeful sampling technique to select the document used to generate data. The sample consisted of five newspapers, of which two were printed, and three were online. One newspaper focuses on the entire Eastern Cape Province, while the other three focus on the Chris Hani District, where the EMLM is situated. This type of purposeful sampling also has attributes of convenience sampling. It is convenient in the sense that the documents are easily accessible and reasonable to acquire.

6.2 Data Collection Tools/Instruments

The data generation tools that were used in this study were achieving and document analyses and observation. Archives that were used to generate data are copies of the local newspapers. While document analysis was

conducted on four online newspapers. In total, five sources were used to generate data. The five sources are the size of the sample for this study. Observations were also conducted for the purpose of collecting data. Observations were conducted at the 2024 Emalahleni Local Municipality Investment Summit; further observations were conducted during the Chris Hani SME forum. Observations allowed me to capture elements of the effects of load-shedding that were not reflected in the online and printed newspapers. Using more than one method of generating data is a form of triangulation. The researcher was able to validate the credibility of the data collected by means of triangulation. Bowen (2009) confirms that triangulation may assist the researcher in providing reliable data while minimizing the possibility of biases in the research.

7. Data Analysis and Ethical Consideration

The collected data underwent a meticulous examination and interpretation process employing content analysis techniques. The data was systematically analysed based on the year and dates of publication of the respective sources. This methodological approach proved effective in mitigating potential risks associated with labelling and coding errors. As Wolfe (1992) emphasised, a systematic and clear organisation of data significantly reduces the likelihood of inaccurate coding and labelling.

Notably, no explicit consent was required to conduct this research; however, the outcomes, feedback, and findings derived from the study will be made readily accessible online. Additionally, comprehensive presentations will be delivered SME forums within both the Chris Hani and Enoch Mgijima Local Municipalities. This proactive dissemination strategy ensures that the insights garnered from the research are not only accessible to a wider audience but are also tailored to benefit and engage the specific communities and stakeholders relevant to the study.

8. Presentation Documentary Data

This section delves into a comprehensive examination of data sourced from various documents, shedding light on the profound implications of power supply challenges, particularly the prevalent issue of load shedding, on Small Medium and Micro Enterprises (SMEs) in South Africa. The significance of this matter is indicated by its emergence as a leading cause of failure for SMEs in recent years (Jolingana, 2014). BusinessTech (2023) and Daily Dispatch (2023) provide corroborating insights, portraying a landscape where load shedding is actively undermining businesses throughout South Africa, affecting SMEs across diverse sectors.

Zooming in on the specific impact within the EMLM, Sgqolani (2023) and The Representative (2020) elucidate the severity of the crisis, detailing how SMEs in this geographical area are grappling with the relentless disruptions caused by ongoing power outages. Komani, a town nestled within the, EMLM emerges as a focal point of concern, as reported by Sgqolani (2023). Small businesses in Komani are navigating the harsh realities of load shedding, struggling to sustain their operations amidst the town's recurrent and pervasive power failures.

In the subsequent sections, we extract and analyse data from these documented sources, providing an in-depth exploration of the challenges specific business enterprises face within the EMLM. These narratives serve as poignant illustrations of the broader impact of load shedding on SMEs, highlighting the urgency for a nuanced understanding and targeted interventions to fortify the resilience of these enterprises in the face of ongoing power supply challenges. The following and the documentary statements:

- Anthony Marriot owns and runs a cleaning detergent business. The business is called Superclean Detergents. Anthony relays that the business is operating in tough situations, and it is difficult to increase prices because of competition. (Document from Sgqolani, 2023). Increasing prices is not an option, as it could drive the customers to the competition, adds Anthony (ibid).
- Darryl Westran, owner of The Repair Centre, said his appliance repair business is heavily reliant on electricity (Document from Schriebers, 2023).
- Rouche House in Komani has been without electricity for two weeks. This is killing the hospitality industry (ibid).
- Seamstresses mention that they have been changing business premises due to power outages. This move had to be made to meet targets and finish orders on time (Document from The Representative, 2020).
- All natural Poultry farms, which are situated at the borders of Enoch Mgijima and Emalahleni Municipalities, are struggling to meet consumer demands due to power shortages. This business has a backup generator, but it still struggles to keep the power due to low capacity of the generator

(Document from Emalahleni Local Municipality, 2023). Many times, rotten meat must be disposed of in this business enterprise. “Loadshedding is destroying the poultry business (Solundwana, 2023).

9. Discussions

It was found that the persistent power cuts due to load shedding in the EMLM have taken a substantial toll on the survival of SMEs in the region (Sqqolani, 2023; The Representative, 2020). This struggle extends across diverse sectors, encompassing the hospitality, beauty, manufacturing, retail, and service industries (Sgqolani, 2023; Chris Hani District Municipality, 2018). The multifaceted impact of load shedding on SMEs becomes apparent, showcasing businesses' widespread challenges in EMLM.

The article aligns its findings with the Institutional Theory framework by explaining how institutional forces shape SMEs' behavior, decisions, and overall functioning in the face of energy disruptions caused by load shedding. Through the lens of Institutional theory, the article provides nuanced insights into the socioeconomic context within which SMEs operate in the Emalahleni Local Municipality.

The study reveals that while some SMEs can afford to invest in generators as a means of power substitution, maintaining these substitutes proves to be a burdensome additional expense to their operations. Moreover, the escalating petrol prices further exacerbate the financial strain on these enterprises (Sgqolani, 2023). Consequently, SMEs in EMLM are compelled to lay off employees, presenting a concerning trend that directly contradicts the National Development Plan's (NDP) ambitious projection of creating 11 million new jobs in South Africa by 2030, with SMEs expected to contribute 60-80% to this target (Seda, 2019). This study, challenges the optimism of the NDP, revealing a stark contrast between its employment creation goals and the current reality in EMLM. The skepticism arises from the observed layoffs by SMEs in the region due to the detrimental effects of load-shedding, a trend that is not isolated and potentially indicative of broader challenges SMEs nationwide face (Sgqolani, 2023). Supporting this perspective, (Bushe, 2019) states that in South Africa, more than 70% of SMEs fail within the first five to seven years of operation, resulting in job and income loss, poverty, social ills, and unemployment.

The challenges contributing to the failures of SMEs are multifaceted, as identified in the findings. These challenges encompass a lack of business drive, limited access to markets, insufficient financial and non-financial support, and non-compliance issues, with the latter posing a considerable threat to the sustainability of these enterprises (Lo Ning, 2023). Thus, the discussion of findings not only sheds light on the direct impact of load shedding on SMEs in EMLM but also delves into the broader challenges that these enterprises grapple with, suggesting a need for comprehensive and targeted interventions to bolster their resilience and viability in the face of such adversity.

10. Conclusion

In conclusion, the study Power Outage Perils: Assessing the Impact of load shedding on SMEs in ENMLM, South Africa, highlights the profound and far-reaching consequences of power outages on the daily operations, financial health, and sustainability of these businesses. The findings emphasize that load-shedding is a significant challenge for SMEs in the region, particularly in sectors such as hospitality, manufacturing, and agriculture. The persistent power cuts have led to a ripple effect, hampering the ability of these enterprises to operate seamlessly and ultimately impeding local economic development. The study underscores SMEs' critical role in the South African economy, contributing significantly to the national labor force and GDP. However, their resilience is being severely tested by the ongoing power disruptions, which are causing significant financial strain and impacting their ability to maintain a consistent energy supply.

11. Recommendations

The research recommends that policymakers and local authorities in the EMLM develop targets and interventions to support the resilience and growth of SMEs. This includes enhancing the institutional environment by improving energy infrastructure and providing alternative energy solutions. Additionally, fostering a culture of innovation and entrepreneurship through initiatives such as training and mentorship programs can help SMEs adapt to the challenges posed by load-shedding. Ultimately, the study emphasizes the need for a comprehensive and multifaceted approach to address the impact of load shedding in the EMLM. By understanding the intricacies of this issue and implementing effective strategies policymakers can help ensure the continued vitality of these businesses and promote economic stability within the local community.

12. Limitations and Further Studies

While this study offers valuable insights into the effects of load shedding SMEs in the EMLM, it is important to acknowledge certain limitations that may have influenced the outcomes:

- Geographical Specificity: The study focused exclusively on EMLM which may limit the generalizability of the findings to other regions. Different economic, infrastructural, or regulatory contexts in other areas could yield varied impacts of load shedding on SMEs.
- Temporary Constraints: The study's scope was constrained by the available data, primarily derived from recent years. A longitudinal analysis would provide a more comprehensive understanding of how SMEs adapt to load shedding over an extended period.
- Data Source Reliance: The study heavily relies on documentary sources, potentially leading to a bias based on the perspectives presented in these documents. A more diverse data collection approach, incorporating interviews or surveys with SME owners and stakeholders, could offer a more holistic understanding.

13. Recommendations for Further Studies

Comparative Regional Analyses: Future studies could extend the geographical scope by comparing the effects of load shedding on SMEs in various municipalities or provinces. This approach would enhance the understanding of how regional disparities influence SME resilience to power supply challenges.

- Longitudinal Studies: Conducting longitudinal studies would enable a more nuanced understanding of the evolving dynamics between load shedding and SMEs over an extended timeframe. This approach could capture trends, adaptations, and the long-term impact on business sustainability.
- Sector-Specific Investigations: Delving deeper into specific sectors affected by load shedding, such as manufacturing, hospitality, or retail, could uncover sector-specific challenges and opportunities for resilience. This targeted approach would facilitate tailored interventions and policy recommendations.
- Policy Evaluation: Assessing the effectiveness of existing policies and support programmes to assist SMEs during power supply challenges could be a valuable avenue for further research. This evaluation could inform policymakers about the efficacy of current interventions and areas for improvement.

Towards Sustainable Strategies: Uncovering the Impact of Environmental Policies on Innovation Activities of Czech Firms

Milos Kolar
Department of Business Economics and Management, Faculty of Economics and Administration, University of Pardubice, Czech Republic

milos.kolar@upce.cz

Abstract: In recent years, there has been an increased emphasis on sustainable development worldwide, which has prompted governments to adopt environmental policies aimed at mitigating the adverse environmental impacts of economic activities. Among these strategies, the implementation of environmental policies has emerged as a key tool for promoting sustainable development. However, although these policies are created with good intentions, their impact on firms' innovation activities remains a matter of debate and research. The aim of this paper is to examine the impact of environmental policies on the innovation activities of Czech firms, with a particular focus on how these policies shape firms' strategies towards sustainable development. Given the growing emphasis on sustainability and environmental issues, it is necessary to examine how environmental policies can influence firms' overall innovation activities. 412 firms of different sizes were surveyed. And EU emissions trading and energy consumption emerged as the most influential variables with a positive impact.

Keywords: Innovation, Sustainability, Environmental policies, Renewable energy sources

1. Introduction and Motivation

During last 10 years, in addition to strict environmental regulations, the focus has recently shifted to renewable energy sources. Investments in renewable energy technologies such as solar, wind, hydro, biomass, and geothermal energy aim not only to achieve sustainability goals but also to drive significant technological and process innovations (Kiefer et al., 2020). These investments spur firms to develop new operational strategies and product lines that incorporate clean technologies, thereby enhancing both economic and environmental performance. Furthermore, proactive management and measurement of CO2 emissions are crucial in fostering green innovation. Firms that adopt these practices are often leaders in developing new, environmentally friendly technologies and processes (Frondel et al., 2017). The environmental behavior of firms, as discussed by Prokop et al. (2022), underscores the complex and sometimes contradictory nature of these strategies in product innovation, especially in Central and Eastern Europe. Additionally, Kotkova Striteska et al. (2024) emphasize the significant impact of factors such as employee engagement, ownership structure, and diversity on fostering eco-innovation.

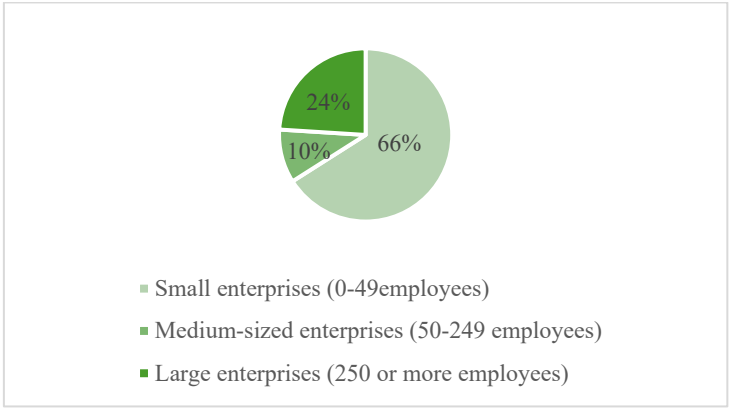
Renewable energy sources are pivotal drivers of innovation within firms, as emphasized by Johnstone et al. (2017). Kiefer (2020) supports this view, noting that investments in solar, wind, hydro, biomass, and geothermal technologies not only advance sustainability goals but also stimulate technological and procedural advancements. These investments encourage companies to develop novel operational strategies and product lines that leverage clean technologies. Similarly, proactive management and monitoring of CO2 emissions play a crucial role in fostering eco-innovation within firms (Frondel et al., 2017). Companies committed to reducing their carbon footprint are more likely to pioneer new technologies and processes that enhance environmental performance. This proactive approach aligns with firms creating innovative solutions that meet environmental standards while also providing economic benefits. As explained by Horbach et al. (2018), participation in the EU Emissions Trading Scheme (ETS) exemplifies this dynamic, presenting both challenges and opportunities. Firms participating in the ETS are compelled to innovate in emission reduction technologies, driving them to develop and implement solutions that both comply with regulatory demands and offer economic advantages. The ETS serves as an incentive for firms not only to comply with regulations but also to benefit from the trading scheme through innovative strategies. Ghisetti et al. (2015) point out that compliance with strict energy performance standards often pushes firms towards innovative solutions that improve their energy efficiency. Compliance with these standards pushes firms to develop new technologies and processes that not only meet, but often exceed these standards, thereby increasing their overall innovation performance. In addition, external audits of energy and water consumption, play a crucial role in driving innovation by identifying inefficiencies and comparing performance with industry standards, Carrillo-Hermosilla et al. (2020). Companies respond to audit findings by implementing innovative practices and technologies that significantly improve both process and product efficiency. Against above backdrop, the main motivation of this study is to answer the research question (RQ) as

follows: *RQ: How do a firm's internal environmental activities and environmental policies impact the development and implementation of product and process innovations?*

To address the main research question, this study utilizes data from the 2019 World Bank Enterprise Survey, focusing on a sample of 412 businesses in the Czech Republic. The paper investigates the impact of environmental policies on the innovation activities of Czech firms, including the EU Emissions Trading Scheme (ETS) and energy efficiency standards (Horbach et al., 2018). Certain environmental policies, like the ETS, can drive innovation by providing financial and reputational benefits (Ghisetti et al., 2015). Conversely, other measures, such as stringent audits and performance standards, may hinder innovation by limiting flexibility and creativity in product development (Carrillo-Hermosilla et al., 2020). This study aims to contribute to this discussion by providing empirical insights into optimizing environmental strategies and regulations to promote, rather than impede, innovation.

The rest of the study is structured as follows: next section presents data and methods. Next, results are presented and discussed. In the final part, main implications and limitations are mentioned.

2. Data and Method



2.1 Data Source

The study relies on data sourced from the 2019 World Bank Enterprise Survey (WBES). This global survey focuses on businesses, offering a representative sample from the private sector of the economy. It provides insights into companies operating in both the manufacturing and service sectors (Pezeshkan et al., 2016). The questionnaire covers a wide range of topics, including general characteristics, expenditures, employees, corruption, innovation, competition, performance measurement, and more (Prokop et al., 2022). Notably, one section of the questionnaire, the "Green module" contains questions pertaining to the environment, environmental policies and regulations, and the impact of business practices on the environment—a section crucial for this study (Prokop et al., 2021). The WBES is commonly utilized for similar types of studies (see Abdu et al., 2018). Firms are selected for the survey through a stratified random sampling approach (multistage sampling), with interviews conducted with business owners or top-level managers. In some instances, accounting and human resources personnel may also participate in the interviews to ensure more accurate responses.

2.2 Description of Selected Country

This study examines data from 412 companies situated in the Czech Republic, a Central European nation. The dataset utilized is from 2019, as more recent survey data was unavailable during the research period.

For Czech Republic, Figure 1 depicts the graphical distribution of companies according to size and economic activity. Size classification follows the European Commission's (2019) categorization, which divides companies into Small and Medium-sized Enterprises (SMEs). Small businesses employ up to 50 individuals, medium-sized enterprises employ 50-249 individuals, and companies with 250 or more employees are considered large. Economic activity classification is based on the ISIC classification, as outlined in the questionnaire. The questionnaire includes the following categories: Manufacturing, Construction, Wholesale and Retail Trade, Hotels and Restaurants, Transport, Storage, and Communication, Information Technology and Related Activities, and Others. Subsequently, the analysis results are interpreted, emphasizing significant determinants.

Source: Own processing based on WBES data

Figure 1: Size structure of companies in the Czech Republic

2.3 Description of Variables

The dependent variables have been selected based on current literature on product and process innovations in firms (Martínez-Ros, 2019). These variables indicate the adoption of product innovation and process innovation within the company over the past three years. To address the research question explicitly, the independent variables representing "internal environmental activities" and "external regulatory mandates" have been chosen. Internal environmental activities include self-supported renewable energy initiatives and proactive management of CO2 emissions. External regulatory mandates encompass participation in the EU Emissions Trading Scheme (ETS) and compliance with energy performance standards. These variables were selected to analyze how internal practices and external pressures influence innovation activities within firms.

- **Product Innovation**: During the last three years, has this establishment introduced new or improved products or services?
- **Process Innovation**: During the last three years, has this establishment introduced any new or improved process? These include: methods of manufacturing products or offering services; logistics, delivery, or distribution methods for inputs, products, or services; or supporting activities for processes?

The dependent variables in the study are binary, with values of either 0 or 1. A value of 1 signifies that the specified measure was implemented by the company within the last three years, whereas a value of 0 indicates that the measure was not implemented. The explanatory (input, independent) variables are also binary and were chosen based on a literature review. The Table 1 below presents the selected determinants.

Table 1: List of Independent Variables

Variable	Description	Category
Own renewable sources	*"Did this establishment use energy from its own renewable sources, such as power plants using solar, wind, hydro, biomass or geothermal energy?"*	yes = 1, no = 0
CO2 emissions	*"Did this establishment measure its CO2 emissions?"*	yes = 1, no = 0
EU emissions trading	*"Did this establishment participate in the EU Emissions Trading Scheme?"*	yes = 1, no = 0
Energy performance standard?	*"Was this establishment subject to an energy performance standard in its operations?"*	yes = 1, no = 0
Audit of energy consumption	*"Did this establishment complete an external audit of its energy consumption?"*	yes = 1, no = 0
Audit of water consumption	*"Did this establishment complete an external audit of its water usage? "*	yes = 1, no = 0
Audit of CO2	*"Did this establishment complete an external audit of its CO2 emissions?"*	yes = 1, no = 0
Energy Consumption	*"Did this firm monitor its energy consumption in the last 3 years?"*	yes = 1, no = 0
Certifications	*"Did this establishment have an internationally recognized quality certification ?"*	yes = 1, no = 0
Internal R&D	*"Did this firm incur expenses on its own research and development activities in the last 3 years?"*	yes = 1, no = 0

Moreover, the model includes the following control variables: Firm size, which has been established in prior studies as a significant determinant of firm eco-innovation. For example, Hojnik and Ruzzier (2016) found a significant relationship between product and process eco-innovation and firm size (Madaleno et al., 2020). The total number of employees is categorized according to the European Commission (2019) as small and medium-sized enterprises (SMEs) with up to 250 employees (assigned a value of 1) and large firms with 250 or more employees (assigned a value of 0).

Given the dichotomous nature of both the dependent and independent variables, binary logistic regression was deemed suitable for the analysis. This method is widely employed by experts in eco-innovation research, such as Marín-Vinuesa et al. (2020) and Moon et al. (2021), as it effectively elucidates the relationship between the dependent variable and a set of independent variables.

3. Results and Discussion

Results of the regression model are presented in the Table 2. The model indicates that own renewable resources have a negative impact on process innovation, while their effect on product innovation is slightly negative but statistically insignificant. These findings imply that transitioning to renewables can pose a burden on firms, primarily in terms of financial constraints, potentially limiting their capacity to invest in new process innovations. This observation aligns with prior research highlighting the initial costs and organizational adjustments associated with renewable integration (Cagno et al., 2015). Similarly, Kiefer et al. (2020) acknowledge the benefits of investing in renewables but underscore the considerable upfront costs involved. Conversely, participation in the EU Emissions Trading Scheme (ETS) positively influences product innovation, corroborating the findings of Horbach et al. (2018). This positive effect may be related to the financial and reputational benefits that participation in the ETS can bring to firms, allowing them to invest in new product innovations and improve their market position. The results show that energy performance standards have a negative impact on product innovation. This can be explained by the fact that energy efficiency standards may limit the flexibility of firms to develop new products as they have to meet specific requirements. This finding supports the need for further research to investigate how energy efficiency standards can be better integrated into corporate strategy to promote innovation instead of constraining it. Overall, this analysis shows that environmental policies and standards can have a mixed impact on innovation activities in the Czech Republic. While certain measures, like participation in the EU Emission trading, may foster product innovation, others, such as energy performance standards and external audits, could potentially hinder innovation. These findings underscore the importance of meticulously considering the design and implementation of environmental measures to effectively bolster firms' innovation potential.

The results indicate that monitoring of energy consumption, alongside energy audits, exhibits a positive albeit weakly significant impact on process innovation. This suggests that firms engaged in diligent monitoring and management of their energy consumption are more inclined towards innovation in process improvement. This finding aligns with previous studies highlighting the significance of effective resource management in enhancing innovation capabilities (Hojnik et al., 2022). On the contrary, findings reveal that conducting water consumption audits exerted a detrimental influence on both product and process innovation, indicating that stringent regulation in water management may serve as a barrier to innovation. This could be attributed to the heightened costs and administrative burdens incurred in complying with such regulations. This conclusion is reinforced by studies such as Costa-Campi et al. (2015), which underscore the potential adverse effects of stringent environmental regulations on innovation activities.

Table 2: The influence of determinants on product and process innovation in the Czech Republic

Determinant	Product Innovations		Process Innovation	
	B (Exp (β))	p-value	B (Exp (β))	p-value
Own renewable sources	-2.18957	0.2987	-0.68539	0.0641*
Measurement of CO2 Emissions	-0.56341	0.04078**	-0.20127	0.4178
EU emissions trading	0.57816	8.05e-05***	0.00549	0.8964
Energy performance standard	-0.37695	0.0024***	-0.05328	0.1180
Audit of energy consumption	1.52324	0.1179	0.518785	0.0825*
Audit of water consumption	-2.34948	0.0313**	-0.51320	0.0746*
Audit of CO2	-0.66400	0.3097	-0.29293	0.1698

Energy Consumption	0.15286	0.0211**	3.53899	0.0612*
Certifications	0.33685	0.7606	0.39488	0.2548
Internal R&D	0.10002	0.8517	-0.00258	0.9896

Legend: * significant at significance level P<0.1; ** significant at significance level P<0.05; *** significant at significance level P<0,01

The response to the research question indicates that both internal environmental activities and external regulatory mandates exert a notable influence on the development and implementation of sustainable product and process innovations in firms. While certain environmental policies, like participation in the EU Emissions Trading Scheme, may facilitate innovation by offering financial and reputational incentives, other regulatory measures could potentially hamper firms' innovation capabilities. For instance, stringent audits and performance standards might limit flexibility and creativity in product development (Ghisetti et al., 2015; Carrillo-Hermosilla et al., 2020). However, it's important to note that neither of the two indicators considered as regulations has a significant impact on process innovation, and regarding product innovations, one exhibits a positive effect while the other a negative one, thus emphasizing the nuanced nature of regulatory influences on innovation outcomes.

4. Conclusions

4.1 Summary of Findings and Implications

This study investigated the influence of various environmental measures on both product and process innovation within firms operating in the Czech Republic. The findings suggest a nuanced impact of these measures on firms' innovation endeavors. While participation in the EU Emissions Trading Scheme (ETS) emerges as a driver of product innovation, attributed to the associated financial incentives and enhanced reputation, internally driven initiatives like self-supported renewable energy initiatives and external water audits seem to impede innovation processes. This hindrance is likely due to the significant upfront costs and administrative complexities involved. Surprisingly, energy performance standards, ostensibly designed to bolster energy efficiency, appear to stifle product innovation, indicating the necessity for their refinement and better alignment with corporate strategies. These findings align with previous research, such as Gerstlberger et al. (2023), underscoring the intricate relationship between environmental regulations and innovation activities. Notably, the adverse impact of external water audits and reliance on renewable resources on innovation processes echoes the observations of scholars like Costa-Campi et al. (2015), who have highlighted the potential barriers to innovation posed by stringent regulatory frameworks.

It is essential for companies to carefully select their environmental strategies and objectives. Developing proactive approaches to adapting to environmental regulations and managing resources effectively is key. Increased investment in research and development, diversification of energy sources, and active involvement in shaping and complying with regulatory standards not only provide companies with innovation opportunities but also reduce the risks associated with energy dependence. With government support for an innovation-friendly environment, these measures enable firms to transition towards more sustainable operations with greater agility and efficiency. Policymakers need to recognize the importance of flexible regulations that stimulate innovation while facilitating a smooth transition to sustainability. This is not an instant but a continuous process. Polities should strive to establish a political culture (Gerstlberger et al., 2024). In addition, offering financial incentives, implementing training programmes and channeling investment into research on sustainable technologies are essential steps. These measures motivate and encourage sustainable operations and promote a culture of innovative thinking and sustainable practices in companies.

In order to effectively navigate and leverage environmental regulations, firms are advised to significantly enhance their investments in research and development (Krkošková, 2019). This will help to develop new technologies and processes that comply with environmental standards while encouraging innovation. his strategic move is supported by Prokop et al. (2019), who demonstrate that stringent environmental regulations can serve as a catalyst for innovation, enabling firms not only to comply with these regulations but also to gain

a competitive edge. This aligns with the Porter (1996) Hypothesis, which suggests that proactive environmental strategies can lead to dual benefits: regulatory compliance and economic gains through innovation.

In addition to prioritising regulation compliance and innovation, companies should diversify their energy sources. Horbach (2018) stresses the importance of mitigating the risks associated with the volatility of renewable energy sources by incorporating different types of energy. This strategy not only stabilizes energy supply but also reduces dependence on fossil fuels, thereby increasing energy security and sustainability. In addition, it is essential to invest in staff training in environmental management. According to Smith and others (2020), well-trained employees play a key role in successful sustainable practices, enhancing a company's environmental performance and aligning with its sustainability goals. Moreover, proactive environmental compliance is a way for companies to gain strategic advantage. Jones et al. (2021) point out that companies that anticipate and adapt to environmental regulations are better positioned to take advantage of new market opportunities arising from these regulatory changes. This proactive approach helps firms avoid penalties and take advantage of opportunities for innovation that arise as a result of new or evolving regulations. Finally, forming partnerships to support the development of sustainable technologies is essential. Zhang et al. (2023) discuss how collaboration with academic institutions and start-ups can facilitate cost sharing and risk mitigation in the development of new technologies. These partnerships can accelerate the adoption of sustainable technologies and practices, leading to a faster transition to sustainable operations.

It is imperative to approach this issue from the standpoint of policymakers, who must implement measures that not only encourage innovation but also ensure environmental sustainability, given the pressing challenges the world faces in terms of sustainability and environmental protection. Consequently, the following recommendations are formulated based on the findings of this study. The primary recommendation emphasizes the necessity of introducing flexible regulatory frameworks. Aghion et al. (2019) demonstrate that flexible regulations can stimulate innovation by providing firms with the leeway to experiment with new technologies without the looming threat of severe penalties. This approach is further validated by the analysis of Bento et al. (2017), which underscores that flexible regulation enables firms to adapt to evolving market dynamics and technological advancements.

Another thing policy makers could do is to provide financial incentives and support for companies investing in renewable energy and energy efficiency. According to a study by Gillingham et al. (2018), financial incentives such as reduced tax rates and subsidies can significantly increase investment in sustainable technologies. This view is supported by Zheng et al. (2020), who show that public funding of R&D plays a key role in accelerating the adoption of clean technologies. At the same time, global policy makers should launch campaigns to promote sustainability education and start supporting more of an innovation ecosystem that allows smaller companies to become involved in innovation processes, for example in conjunction with universities (Peterkova et al., 2022). Whitmarsh et al. (2018) highlight that education and awareness are key to changing public perceptions and behaviour in favour of more sustainable practices. Educational programmes can raise awareness of the importance of sustainability and motivate innovative thinking on environmental technologies.

The last recommendation concerns support for R&D. According to a study by Acemoglu et al. (2018), investments in research institutions and universities that focus on the development of sustainable technologies are essential to generate new solutions and innovations. This view is supported by research from Balsalobre-Lorente et al. (2018), who highlight the importance of collaboration between academic institutions and industry. For these reasons, it is clear that a combination of flexible regulations, financial incentives, investment in education, support for research and development, and the creation of platforms for knowledge sharing can contribute significantly to sustainable development and innovation in environmental technologies. Policy makers should consider these aspects when formulating strategies that address current and future environmental challenges.

4.2 Limitations and Future Research

This study has several limitations that future research could address. Firstly, the reliance on data from a single country, the Czech Republic, may limit the generalizability of the findings. Future studies could expand the scope to include multiple countries to enhance the robustness and applicability of the results. Secondly, the binary nature of the dependent variables used in the logistic regression model simplifies the complex nature of innovation activities, which may involve varying degrees of innovation intensity. Future research could employ more nuanced measures of innovation to capture these subtleties. Additionally, the study primarily focuses on the direct impacts of environmental policies on innovation, potentially overlooking the mediating effects of organizational culture, market conditions, and technological capabilities Yang et al. (2019). Future studies could incorporate these factors to provide a more detailed understanding of the mechanisms through which

environmental policies influence innovation. Lastly, as environmental policies and technologies evolve, ongoing research will be necessary to continually assess their impacts on business innovation, ensuring that findings remain relevant and that policy recommendations are based on the latest evidence.

Drivers of Intrapreneurial Innovation: A Study of Individual Innovative Behaviour in Organisations

Burcu Kör and Lucque Schmeitz
Research Group Financial-Economic Advice in Innovation, Utrecht University of Applied Sciences, The Netherlands

burcu.kor@hu.nl
lucque.schmeitz@hu.nl

Abstract: Organisations can gain a competitive edge through Intrapreneurial Behaviour (IB) by swiftly innovating and adapting to market changes. Research indicates that intrapreneurship plays a crucial role in the banking sector in achieving a competitive advantage. Organisations can enhance their intrapreneurial capability by leveraging Individual Innovative Behaviour (IIB). However, innovation in the banking sector is often constrained by strict regulations, high safety requirements, and a fundamental need for trust and stability. Therefore, it is important to embrace and stimulate factors that encourage and enable innovation. To our knowledge, research on how intrapreneurship can be stimulated and measured in the Dutch banking sector is currently lacking. Thus, developing indicators and metrics for measuring intrapreneurship in Dutch banks is essential. This study investigates the factors affecting IIB using a quantitative survey. Building on the connection between IB and IIB, IIB is treated as a dimension of IB. The perceived work context, comprising an organisation's entrepreneurial orientation and innovative climate, can empower employees' IIB in the digital era. This context encourages them to generate new ideas and engage in collaborative innovation without fear of failure, thus fostering IIB. Our study explores factors driving IIB, empowering employees to act as intrapreneurs through organisations perceived Entrepreneurial Orientation (EO) and Innovative Climate (IC), with Digital Maturity (DM) as a moderating variable. Data were collected in 2021 from the three largest Dutch banks, which hold over 43% of the market share. A snowball sampling method was used to reach Dutch bank managers knowledgeable about the study's key constructs. This method involved initial contact with human resources departments and managers within these banks. The survey was administered to 167 managers, yielding 125 usable responses (75% response rate). Results indicate that employees in the banking industry with high DM are more likely to engage in IIB when firms support EO strategies and IC, and when employees adopt self-leadership skills.

Keywords: Individual innovative behaviour, Entrepreneurial orientation, Intrapreneurship, Innovative climate, Digital maturity, Self-leadership

1. Introduction

The digital transformation has intensified competition (Nambisan, 2017), forcing organisations to adapt and innovate (Zhao et al., 2021). In this dynamic environment, intrapreneurship – fostering entrepreneurial activities within existing organisations – has become a cornerstone of innovation. Chen and Huang (2009) argue that organisational innovation hinges on the human capital of intrapreneurs, the individuals who fuel the creative process. Intrapreneurial innovation, driven by employee efforts, is essential for maintaining a competitive edge. Individual innovative behaviour (IIB) directly contributes to an organisation's success (de Jong and den Hartog, 2010). In complex sectors like banking, continuous improvement and adaptation are crucial to survive sudden changes (Shalley et al., 2004).

Despite the significant research interest in factors influencing IIB, a gap remains in understanding the specific individual and contextual motivators. Kör (2016) emphasises this need, echoing calls by Pratoom and Savatsomboon (2012) to identify the drivers of IIB. Our study aims to bridge this gap by examining the interplay between individual and organisational factors that influence IIB. We will explore how perceived Innovative Climate (IC), Entrepreneurial Orientation (EO), Digital Maturity (DM), and Self-Leadership (SL) skills interact to promote innovative behaviour. Furthermore, we investigate how perceived EO and DM influence the perceived IC, accordingly, fostering IIB.

An organisation's willingness to innovate is captured by its EO (Covin and Slevin, 1988). EO encompasses the strategic processes that guide entrepreneurial decisions and actions (Lumpkin and Dess, 1996). This strategic posture emphasises innovativeness, proactiveness, and risk-taking (Covin and Slevin, 1988). Employees who perceive a strong EO in their work environment are more likely to exhibit IIB (Amo, 2006; Kang et al., 2016; Kör et al., 2021). An additional driver of IIB is an organisation's IC. Li and Zheng (2014) and Bos-Nehles and Veenendaal (2017) highlight how such a climate fosters innovative behaviour by encouraging the sharing of diverse perspectives on practices, procedures, and behaviours. When organisations embrace creativity, innovation, and risk-taking, employees feel empowered to exhibit innovative behaviour themselves (Bos-Nehles and Veenendaal, 2017).

Digitally maturing organisations are more likely to foster environments conducive to innovation by encouraging and testing new ideas at all levels (Laužikas and Miliūtė, 2020). DM reflects a company's digital transformation status, involving innovation across all organisational levels through the adoption of digital technologies (Chanias and Thomas, 2016). Additionally, in today's fast-paced business environment, employees need to take greater ownership and make quicker decisions. This necessitates empowering self-directed individuals and teams, emphasising SL (Kör, 2016).

The rest of this article is organised as follows: the "Literature Review and Hypotheses Development". Subsequently, the method and results are presented. The final section discusses the findings, conclusions, limitations, and suggestions for future research.

2. Literature Review and Hypotheses Development

2.1 Intrapreneurship Top-down and Bottom-up Process

Studies (Revuelto-Taboada et al., 2023; Alamur and Gümüştekin, 2022) highlight the importance of intrapreneurship in the banking sector for achieving a competitive advantage. Intrapreneurship drives innovation, crucial for survival in fast-evolving markets. Despite strict regulations and safety requirements, fostering intrapreneurial innovation remains essential for the sector's success.

Intrapreneurship was first introduced by Pinchot (1965) and then by Drucker (1986), who highlighted the link between new opportunities, organisational growth, and economic prosperity. More recent studies have examined the relationship between intrapreneurship and firm performance (Neessen et al., 2019; Hornsby et al., 2013; Rauch et al., 2009) and its impact on innovation (Sinha and Srivastava, 2013). Bosna et al. (2013) claim innovation arises when employees contribute and implement new ideas. Antoncic and Hisrich (2000) describe intrapreneurship as an entrepreneurial activity, while Stevenson and Jarillo (2007) define it as a process initiated by individuals within an organisation. The former emphasises a top-down approach, focusing on the organisation's role, while the latter views it as a bottom-up activity driven by individual employees. Research indicates that intrapreneurship is crucial for gaining a competitive advantage in the banking sector (Revuelto-Taboada et al., 2023; Alamur and Gümüştekin, 2022).

Given that intrapreneurship contains an element of innovation (Rigtering and Weitzel, 2013), which in turn enhances competitiveness in today's digital age, and that innovation can be driven both top-down and bottom-up, there is a need to develop metrics and indicators to measure intrapreneurship. Additionally, it is important to explore whether an organisation's DM level influences these intrapreneurial initiatives.

2.2 Individual Innovative Behaviour

Employees are vital in generating and implementing new ideas to enhance products, services, and processes (De Jong and den Hartog, 2007). This concept, known as IIB, involves the creation, introduction, and application of new ideas within a work role (West and Farr, 1989). Key dimensions of IIB include idea generation, exploration, promotion, and realisation (De Jong and den Hartog, 2010; Scott and Bruce, 1994). Self-leadership (SL) is another critical factor influencing innovative behaviour; it refers to the process by which individuals guide, motivate, and direct themselves toward achieving desired goals (Kör, 2016).

SL empowers individuals to take ownership of their work and drive innovation (Jain, 2015). Research by Carmeli et al. (2006) shows a positive correlation between SL and innovative behaviour, as it enables individuals to take charge of their actions, thoughts, and behaviours (D'Intino et al., 2007; Heiss et al., 2010), ultimately boosting innovation and performance (Manz and Neck, 2004). Given the growing importance of SL in the digital age and its link to innovation and intrapreneurship, this study investigates the following hypothesis:

***H_1**: SL is positively related to IIB at work.*

2.3 Bottum-Up Process of Intrapreneurship

Antoncic and Hisrich (2003) classified the different concepts and definitions of intrapreneurship by distinguishing between EO (bottom-up) and corporate entrepreneurship (top-down). Gawke et al. (2019) state that an EO occurs when employees show initiative, develop innovations, and take certain risks for the company. Employees' EO makes organisations more agile, allowing them to better respond to external and internal changes in the company (Gawke et al., 2019). This type of intrapreneurship, based on employee behaviour, offers new insights that can lead to a sustainable competitive advantage. In addition, EO can help to create a dynamic, flexible, innovative, and competitive organisational structure, thus shaping the work

environment that leads to both organisational success (Zahra, 1986) and individual outcomes (Amo, 2006), such as innovative behaviour (Kang et al., 2016; Kör, 2016; Kör et al., 2021). In such a work environment (i.e., encouraging innovation, proactivity, and risk-taking), openness to change and support for innovative activities can be developed (Kör et al., 2021), in line with employees who are inspired by entrepreneurial organisations to be more innovative. Because they understand that being innovative is a desirable image and that exhibiting innovative behaviour will increase their status (Yuan & Woodman, 2010). In line with these arguments, it is hypothesized that:

H_2: *Perceived EO is positively related to individual innovative behaviour at work*

2.4 Top-Down Process of Intrapreneurship

A supportive work environment that fosters creativity is essential for organisational success (Imran et al., 2010). This environment, known as an IC, is influenced by employees' perceptions (Siegel and Kaemmerer, 1978). IC encourages behaviours like idea generation, collaboration, and participation (Patterson et al., 2005). When employees feel valued for their innovative contributions, they are more likely to engage in innovative behaviours (Bos-Nehles and Veenendaal, 2017). This positive perception encourages initiative, enhancing overall innovation (Runfeng, 2011). Thus, IC empowers employees to innovate, improving performance. This study examines the perceived innovative climate's impact within organisations, leading to the following hypothesis:

H_3: *Perceived IC positively related to IIB at work.*

Building on existing research linking perceived IC and IIB (Scott and Bruce, 1994; Ibrahim et al., 2018; Kruft et al., 2018), this study goes further by proposing that perceived IC mediates the relationship between perceived Entrepreneurial Orientation (EO) and IIB. While direct effects of EO and IC on IIB are hypothesized (Hypotheses 2 and 3), this study examines the indirect influence of EO through IC. Organisations with a strong EO encourage innovation by promoting risk-taking and creativity (Covin and Slevin, 1988), countering bureaucratic constraints that hinder innovation (Yuan and Woodman, 2010; Kör, 2016). When employees perceive a strong EO, it fosters a supportive IC where innovative thinking and participation are valued (Malik and Wilson, 1995), encouraging risk-taking and creativity, which ultimately enhance innovative behaviour (Bos-Nehles and Veenendaal, 2017). Therefore, we propose:

H_4: *Perceived innovative climate mediates the relationship between perceived EO and IIB at work*

2.5 Digital Maturity as a Moderator of Intrapreneurship

Companies that invest in and manage new technologies effectively outperform competitors (Fitzgerald et al., 2014). DM, the ongoing process of digital transformation, is not a one -time achievement but rather a continuous journey (Chanias and Thomas, 2016). Digital technologies are transforming businesses, fostering creativity, innovation, and competitiveness (Waheed et al., 2019). DM capabilities generate valuable ideas, promote innovation, and enable flexible working models. This, in turn, enhances the organisational climate and fosters innovative activities (Zhao et al., 2021). We propose that DM strengthens the relationship between perceived EO and IC. Essentially, digitally maturing organisations can leverage their capabilities to unlock the full potential of a strong entrepreneurial spirit, leading to a more innovative work environment.

H_5: *The effect of perceived EO on perceived IC moderated by perceived DM*

3. Methodology

3.1 Data Collection

This research takes a quantitative approach to understanding factors driving IIB. Data were collected from Dutch banks due to their critical role in supporting the nation's economy, which is highly digitalised and export-oriented (Kempen, 2021). The pandemic amplified the sector’s adaptability and need for innovation, making it essential to explore factors driving IIB to enhance digital maturity and economic resilience (Kempen, 2021; Marcu, 2021).

A survey in English was distributed in 2021 to employees at the three largest Dutch banks, covering over 43% of the market share (Statista, 2023). Using snowball sampling, initial seeds were selected from various departments and management levels to enhance diversity. Clear inclusion criteria were set for HR and managers to ensure a broad range of knowledgeable participants.

The survey, containing 45 Likert-scale questions (1-5), measured key constructs based on established scales. Distributed to 167 managers, the survey yielded a 75% response rate (125 usable responses). Participants included associates, managers, and senior managers, and were randomly selected with informed consent. Anonymity and confidentiality were assured throughout the study. The study used a survey with a five-point Likert scale (strongly disagree to strongly agree) for all constructs except demographics. Existing, validated scales were used in English (i.e., de Jong and den Hartog, 2010; Houghton et al., 2012; Covin and Slevin, 1988; Patterson et al., 2005; Rossmann, 2018).

The sample consisted of 50.1% females (n = 63) and 49.6% males (n = 62). Most respondents were aged 18-29 (36%), with an educational background of an undergraduate degree (52.7%), followed by a master's degree (40.2%) and Ph.D. (7.1%).

4. Analysis and Results

Data collected from the survey were analysed using SPSS Version 25.0. Before hypothesis testing, reliability and validity checks were performed. The study's hypotheses involved multiple regression, mediation, moderation, and moderated mediation effects. Conditional process modeling was conducted using Hayes' Process macro for SPSS (Hayes, 2017) to test these effects.

Mediation (Model 4) and moderation (Model 1) analyses were conducted using Hayes' PROCESS macro. The mediation model (Figure 1) quantified total, direct, and indirect effects using bias-corrected nonparametric bootstrapping with 5000 bootstrap samples (Preacher and Hayes, 2004). This robust method, recommended by Mackinnon et al. (2004), provides high power and accommodates smaller sample sizes without normality assumptions.

4.1 Reliability and Validity

To ensure construct validity, internal consistency, convergent, and discriminant validity were assessed (Table 1). Cronbach's α exceeded .7, composite reliability and average variance extracted were above .88 and .5, respectively, and factor loadings were above .5 with inter-construct correlations below .9. These results confirm the measures' accuracy in capturing the intended constructs.

Table 1: Cronbach's α, AVE, composite reliability and factor loadings

Construct	Cronbach's Alpha	AVE	CR	Factor Loading
SL	.73	.60	.91	.58 - .86
IIB	.85	.50	.88	.50 - .78
EO	.87	.54	.90	.55-.83
IC	.85	.65	.94	.72 - .93
DM	.86	.60	.92	.55 - .86

4.2 Testing of Hypothesized Direct and Indirect Effects

We analysed the data using multiple regression to test our hypotheses (Table 2). The results show significant positive relationships between perceived EO (β = .518, p = .000), perceived IC (β = .307, p = .000), and SL (β = .461, p = .000) on IIB at work, supporting hypotheses 1 to 3.

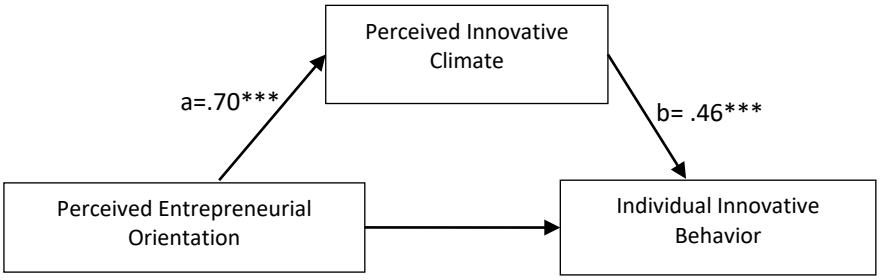

Table 2: The results of the regression analysis

Path	β	t	p	Adjusted R2	Hypothesis Results
SL →IIB	.433	5.326	.000***	.181	H1 Support
PEO → IIB	.340	4.016	.000***	.109	H2 Support
PIC → IIB	.475	5.984	.000***	.219	H3 Support

Notes: *p<.05; **p<.01; ***p<.001. PEO: Perceived EO, PIC: Perceived IC

Figure 1 shows the results of the mediation analyses using bias-corrected bootstrapping, as recommended by Hayes (2017); detailed results are in Table 3. Following Baron and Kenny's (1986) full mediation model, the independent variable indirectly affects the dependent variable through the mediator. The indirect effect of perceived entrepreneurial orientation on innovative work behaviour via perceived innovative climate (.33) was

significant (95% CI: LL .1706, UL .4716), supporting H4. Sobel's test confirmed full mediation by perceived innovative climate (z = 3.330, p < .001).

Direct effect, c'= .016, p>.05 after adding mediator

Indirect effect, c= .33

Notes:*p<.05; **p<.01; ***p<.001

Figure 1: The proposed mediator model

Table 3: Mediation Analysis

Variable / Effect	β	SE	t	p	95% Confidence Interval	
					LLCI	ULCI
PEO→IIB	.016	.112	.1429	.887	-.2049	.2367
PEO→PIC	.70	.064	10.8659	.000***	.5723	.8273
PEO→PIC→IIB	.46	.112	4.1576	.000***	.2429	.6845
Direct	.16	.112	.1429	.887	-.2049	.2367
Indirect	.33	.0763			.1706	.4716
Total	.34	.0848	4.0159	.000***	.1727	.5083

Note: Based on 5000 bootstrap samples, *p<.05; **p<.01; ***p<.001.

Our study examined how DM moderates the relationship between PEO and PIC (H5). Figure 2 illustrates this interaction using Hayes' process moderation. The analysis (model 1) revealed a significant interaction effect (β = .13, p = .005), indicating that the influence of PEO on PIC depends on the level of perceived DM. As shown in Figure 2, higher DM strengthens the positive relationship between EO and IC, supporting hypothesis 5.

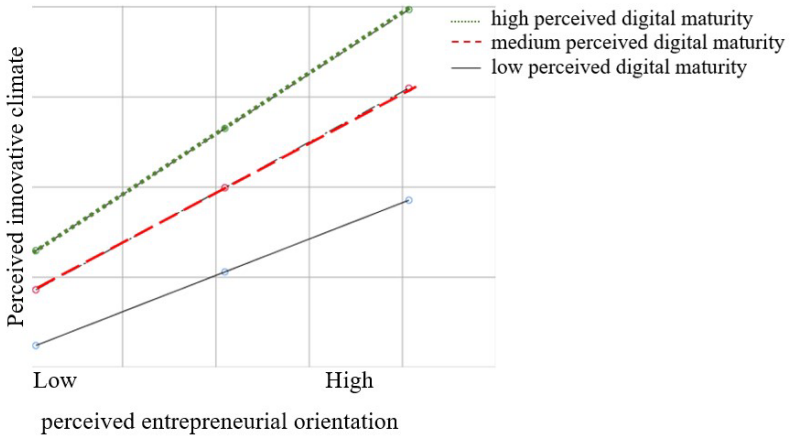

Figure 2: Moderation effect

5. Conclusion and Limitations

This study explores factors influencing IIB within organisations, especially in today's rapidly evolving digital landscape. The findings reveal a positive relationship between perceived EO and IIB. Employees who perceive their organisation as valuing innovativeness, proactiveness, and risk-taking are more likely to engage in

innovative behaviours. This finding aligns with previous research suggesting that entrepreneurial environments encourage "thinking outside the box" and proactive participation in the innovation process (Kör, 2016). Therefore, organisations should foster an environment that encourages these traits to boost innovation and proactive employee participation. The study also highlights the significant impact of perceived IC on IIB. IC leads to an increased positive perception of the employees on the innovative ideas and plans of the organisation (Kang et al., 2015). Organisations should create a supportive environment that values innovation, encourages open dialogue, and rewards proactive contributions. This can be achieved through strategic initiatives such as revising company policies, promoting collaboration, and recognising innovative achievements.

This study contributes to individual innovation research by investigating SL skills as an antecedent of IIB at work. Innovative behaviour is largely motivational in nature (Amabile, 1988; Tian and Sanchez, 2017), and, as such, likely to be stimulated by SL skills. According to Neck and Manz (1996), individuals can be trained to adapt and enhance their SL skills in order to improve their work outcomes, such as IIB (Carmeli et al., 2006). The findings show a positive relationship between SL skills and IIB at work. This finding is in agreement with the studies of Carmeli et al. (2006), DiLiello and Houghton (2006), and Kör et al. (2021), which found that IIB is influenced by the individuals' SL skills. Thus, the practice of SL strengthens the desired behaviour necessary for innovativeness within the organisation. During the COVID pandemic period, some of the employees have to work remotely, organisations need to motivate their employees in the way they would have done on the work floor. This is especially crucial in hybrid or remote work settings where self-motivation is key. Workshops, mentoring, and resources on self-leadership can empower employees to take initiative and drive innovation independently. Furthermore, the study reveals that perceived digital maturity strengthens the relationship between perceived EO and perceived innovative climate. The COVID-19 pandemic has underscored the critical role of digital solutions in banking, highlighting the need for both innovation and digital transformation (Yıldırım and Erdil, 2023). Our findings suggest that a high level of DM acts as a catalyst, amplifying the positive influence of a strong entrepreneurial spirit on fostering a culture of innovation. In essence, digital transformation strengthens the link between an organisation's entrepreneurial drive and its ability to create an innovative work environment.

This study offers valuable findings, but limitations exist. It relies on Dutch banking data, limiting generalisability. Snowball sampling was chosen due to challenges in accessing specialised respondents. To reduce biases, seeds were selected across departments and levels with clear inclusion criteria. Interviews could provide richer insights. Additionally, the data is from a single time point and sector. Future research should include a broader sample across industries and cultures. Despite these limitations, the framework can be applied in service, manufacturing, and automotive sectors.

Abstract: Management in the age of artificial intelligence (AI) presents unique challenges and opportunities, especially in the international landscape. The technology is constantly evolving, and managers need to adapt to the new landscape that is emerging to harness its potential while considering and anticipating the risks involved. AI can disrupt traditional leadership models by automating specific tasks and decision-making processes. This challenges managers to align with this new reality and use AI to drive innovation and productivity. In addition, managers must navigate and adapt to the evolving regulatory environment, understanding but also complying with regulations around AI, data protection, and privacy, while advocating for responsible and fair governance. While AI significantly impacts management processes, the academic literature on the subject is still emerging. This study aims to explore the challenges posed by AI and how international business managers can use this technology to drive decision-making and benefit their organizations. Ten interviews were conducted with senior executives from a range of industries to collect qualitative primary data. The findings show that AI can help with decision-making, automate many processes, and improve efficiency. Top managers can use AI tools to address many challenges more effectively, but they need to understand the ethical implications and concerns that continue to arise. The findings provide theoretical implications and practical recommendations for top managers using AI technologies. Senior executives should develop AI-focused strategies; as AI becomes more prevalent across industries, managers need to understand how to integrate AI technologies into their organizations successfully.

Keywords: Decision-making, Artificial intelligence, Technological innovation, Management challenges, International business

1. Introduction

Management in the age of artificial intelligence (AI) presents unique challenges and opportunities, especially in the international landscape. As innovation is an important part of modern business (Agoraki et al., 2024; Pistikou et al., 2024), technology is constantly evolving (Deirmentzoglou and Deirmentzoglou, 2020), and leaders must adapt to the emerging landscape to harness its potential while considering and anticipating its risks. AI can disrupt traditional leadership models by automating certain tasks and decision-making processes. This challenges leaders to adapt to this new reality and leverage AI to drive innovation and productivity. In addition, leaders must navigate and adapt to the evolving regulatory environment, understanding but also complying with regulations around AI, data protection and privacy, while advocating for responsible and fair governance (Peifer, 2022).

A primary concern is the ethical implications of AI. Managers should focus on understanding the potential risks and establishing guidelines to ensure that AI is developed and implemented in a responsible and inclusive manner (Jobin et al., 2019). Additionally, leaders need to develop a digital mindset in order to lead effectively in the AI era. This includes gaining knowledge and understanding of AI technologies, their potential applications, and their limitations. It also requires cultivating a culture of continuous learning and embracing change to adapt to the evolving AI landscape (Singh et al., 2022).

Managers need to consider the potential impact of AI on the workforce. AI may automate routine tasks. To ensure workers remain relevant in a technology-based economy, managers must anticipate changing skill requirements and provide opportunities to refresh and upgrade skills (Watson et al., 2021). In addition, effective managers will leverage AI technologies themselves. A.I. can help managers make decisions, automate administrative tasks, and improve workflow efficiency. By embracing AI tools, leaders can be more strategic, innovative, and better equipped to tackle complex challenges (Peifer, 2022).

While AI is having a significant impact on management processes, the academic literature on the subject is still emerging. The purpose of this study is to explore the challenges posed by AI and how international business managers can use this technology to drive decision-making and benefit their organizations. To achieve this, ten interviews are conducted with senior international business executives from a variety of industries to collect qualitative primary data. This study provides theoretical implications and practical recommendations for leaders using AI technologies.

2. Literature Review

Artificial intelligence (AI) is a major human effort to create machines that can act like a human. To achieve a refinement effort needs a contribution of many sciences such as psychology, philosophy and others, so that it can provide answers and solutions to questions and problems. AI is increasingly becoming a necessary tool for many organizations to be more competitive, efficient, and agile relative to their competitors, and to stay current in an ever-changing external environment. Most organizations use AI to optimize the quality of decisions, to gather new information and data, and to automate certain processes. Therefore, and according to the above, AI brings a new model to the work environment, as more and more organizational leaders are using it to make critical and important decisions.

A key concern of many researchers on AI is whether it will be able to make decisions on its own and replace human leadership. Some believe that a machine will never be able to replace the human mind, human nature, because these machines are still far from emotions. Therefore, leaders who use AI as a means to make decisions add empathy, so they can understand the emotions of those in command to make the best decision possible. What AI still lacks is critical thinking, as sometimes idiosyncratic problems arise that only the human mind in particular can successfully address (Jones, 2018).

The use of AI is causing significant changes for employees and managers alike, but it is also creating new challenges. These challenges fall into three main categories. 'strategic transformation process', 'skills and competencies', and 'culture and human-AI interaction' (Peifer, 2022). Leaders face significant challenges, as they need to be retrained to use it, to ensure transparency of AI, but also to form an ethical profile, as AI brings to a work environment the creation of new skills, which requires retraining of leaders, as well as the use of transparency, which creates a climate of trust between management and those managed. Having said all this, it is worth mentioning that in order to achieve the above, a leader with an open and evolving mind to the future changes that are increasingly invading everyday life is needed, as the use of AI is a necessity for the sustainability of an organization in a competitive environment (Smith and Green, 2018).

The use of AI has had a particularly significant impact on the way an organization is organized and operates. This continuous technological development logically has a significant impact on the modern leader. The functions of AI and its specificity to collect and process a large amount of data, helps to optimize decision-making in the areas of marketing, sales, production, understanding and human resource management by executives in charge of managing an organization (Canals, 2020).

The use of AI and new technologies in general is not enough to transform an organization. For a thoughtful and smooth transformation of an organization, an appropriate environment for employee adaptation should be created by the leader with the help of training for both the leader and the employees (Watson et al., 2021). Therefore, it can be understood that the role of the leader is becoming increasingly challenging due to the constant changes as management becomes more specific and complex (Heukamp, 2019).

Modern managers have to emphasize the constant development of new technological data, and the constant updating of his knowledge in the field in which he is located. They still have to acquire knowledge using AI for data exploration (Smith and Green, 2018). Then, they have to place significant emphasis on ethical issues that are increasingly arising as the use of AI becomes established in a work environment. Finally, it is clear that managers must be prepared to deal immediately with any internal or external crisis that may arise (Watson, 2021).

3. Methodology

To explore the challenges posed by AI and how international business managers can use this technology to drive decision-making and benefit their organizations, ten interviews are conducted with senior international business executives from a variety of industries in the European Union to collect qualitative primary data from a descriptive scope. Through semi-structured interviews, we gave interviewees the opportunity to elaborate

on their experiences and express their personal views on each question. The questions addressed the significance of AI in contemporary leadership and on managerial decision-making in international business.

In terms of the characteristics of the respondents, one individual is involved with the health sector, specifically a company related to health quality assurance and holds a senior management position. Two respondents are from real estate companies and hold CEO positions. One individual is from a global financial organization and holds a managerial position. Two respondents are from the tourism industry and hold senior management positions. One individual is from a real estate development and engineering company with a CEO title. There were also two respondents who hold senior management positions in a legal services consulting firm and an asset management accounting firm. The last respondent holds a senior management position in a public relations firm.

4. Findings

Data analysis was carried out in the native language of the survey participants to prevent any ambiguity or misinterpretation. Initially, the interviews were individually examined using an inductive approach (Thomas, 2006) before being compared with each other. The emerging themes were documented and summarized. The findings were grouped according to the following emerging themes.

4.1 Challenges and Opportunities Arising From the Integration of AI Technologies Into Management

The integration of AI technologies into management practices creates several challenges as well as unique opportunities. Some of the positives identified from its use include the ability for managers to deal with multiple crises simultaneously. However, there is a reluctance to synchronize AI systems with human resources, as more and more training is needed, which must evolve as fast as the technological data. The educational part to overcome the challenges, but also as an opportunity for staff training, is seen as a key element by all respondents. Of course, there are also some concerns, such as ethics, protection of personal data, but also managing the perception that members of a group have of artificial intelligence.

One of the challenges is to ensure that AI systems are reliable. AI technologies are heavily data-driven, and if the data used to train these systems is biased or incomplete, it can lead to incorrect decisions. Therefore, it is critical to carefully curate and validate the data used to train AI systems to ensure fairness and accuracy. Another challenge is the potential for job displacement. As AI technologies become more advanced, there is concern that some tasks traditionally performed by executives and crisis managers could be automated. This could lead to job losses and require individuals to upskill or retrain to adapt to the changing landscape.

However, there are also many opportunities arising from the integration of artificial intelligence technologies into leadership and crisis management practices. Artificial intelligence can provide leaders with valuable insights and predictive analytics, enabling them to make more informed decisions. For example, AI algorithms can analyze large amounts of data to identify patterns and trends, helping leaders anticipate and mitigate potential crises. They can also use AI technologies to improve communication and collaboration in crisis situations. Chatbots and virtual assistants can provide real-time information and support to people affected by a crisis, freeing up human resources to focus on more complex tasks. In addition, AI-powered tools can help coordinate response efforts, optimize resource allocation, and facilitate effective communication between different stakeholders.

AI can also assist executives and crisis managers with scenario planning and risk assessment. By simulating different crisis scenarios, AI systems can provide insight into possible outcomes and help leaders develop robust contingency plans. In summary, while there are challenges to be overcome, the integration of AI technologies into leadership and crisis management practices offers significant opportunities for improved decision-making, better communication, and more effective crisis response. It is important to approach integration carefully, ensuring ethical considerations and using AI as a tool to augment, rather than replace, human capabilities.

> *"The biggest challenges are around ethics, data privacy, and managing team members' perceptions of AI." (R1)*

> *“Ability to manage several crises at the same time - modern environment, constant updating of new technologies, integration, development and training of human resources, difficulty of human resources to adapt to constant changes and increasing speed of information and increasing workload due to constant need to train them.” (R2)*

4.2 The Impact of AI on Leadership Practices in Crisis Management

After an extensive analysis of all the responses, there is a positive sign in the use of artificial intelligence by leaders, but with caution. As for the positive elements, the extraction and analysis of a large amount of information and data in a short period of time, with a limitation of human error during the data analysis process. Improved predictive capabilities, such as the creation of realistic simulations and "scenario" planning, which allow organizations to better prepare for various scenarios and enhance their crisis management capabilities. which allow early detection of potential crises and risks. Again, there is a reluctance to invest in the education and training required to use new technologies. In all cases, however, there is talk of human leadership giving direction to management and decision making and leaving the analysis to artificial intelligence.

It is important to note, however, that while AI can provide valuable support, it should not replace human leadership in crisis management. Human judgment, empathy, and intuition are still critical to navigating complex and unpredictable crisis situations. AI should be seen as a tool to augment and enhance leadership practices, rather than a substitute for human decision-making. In conclusion, the impact of artificial intelligence on leadership practices in crisis management is significant. AI can enhance situational awareness, support decision-making, and facilitate resource allocation and coordination. By harnessing the power of artificial intelligence, leaders can be better equipped to effectively manage crises and mitigate their impact.

> *"AI enhances leadership and crisis management by providing powerful tools for data analysis, decision making, automation, and proactive planning. By leveraging AI technologies, leaders can more effectively navigate challenges, respond to crises with agility, and optimize various aspects of organizational management." (R7)*

4.3 The Extent to Which AI is Integrated Into Crisis Management Strategies and the Implications for Managerial Effectiveness

The key practices and strategies relate to basic understanding of AI, ongoing training, and how to integrate AI into a strategic plan in a safe and functional manner. Organizations can develop effective managers able to navigate the challenges and opportunities presented by AI by blending leadership development practices (e.g., training, adaptability, flexibility, communication) and crisis management strategies (e.g., regular testing and evaluation, crisis communication plan, post-crisis evaluation and learning).

When it comes to crisis management, AI can be used for a variety of purposes. For example, AI-powered chatbots can provide immediate and accurate information to the public during an emergency, helping to alleviate panic and provide guidance. AI algorithms can also analyze social media data to detect early warning signs of crises, such as natural disasters or public unrest, allowing authorities to respond proactively.

In addition, AI can help with resource allocation and logistics planning during crises. By analyzing historical data and current conditions, AI algorithms can optimize the distribution of resources, such as medical supplies or emergency personnel, to areas of greatest need. This can help improve response times and save lives. When it comes to leadership effectiveness, AI can provide valuable support to leaders in crisis situations. AI algorithms can analyze data from multiple sources, including sensor networks, social media, and news reports, to provide real-time situational awareness. This allows leaders to make informed decisions based on accurate and up-to-date information.

> *"Organizations can cultivate effective leaders capable of navigating the challenges and opportunities presented by AI by combining managerial practices (e.g., training, adaptability, flexibility, communication) and crisis management strategies (e.g., tactical testing and evaluation, crisis communication plan, post-crisis evaluation and learning)." (R4)*

4.4 Assessing Managers' Adaptability to Technological DevelopMents in the age of AI

In this rapidly evolving digital landscape, leaders must be open-minded and willing to embrace new technologies, including artificial intelligence. They should understand the potential benefits and challenges that AI brings to their organizations and industries. Adaptability in this context refers to a leader's ability to understand and leverage AI to drive innovation, efficiency, and growth. It involves being open to change, constantly learning about new technologies, and being willing to experiment and take calculated risks.

A key aspect of adaptability is a growth mindset. Managers should be willing to learn and unlearn, as AI technologies may disrupt traditional ways of doing things. They should be open to exploring how AI can

improve decision-making processes, automate routine tasks, and enhance customer experiences. In addition, leaders must foster a culture of innovation and encourage their teams to embrace AI. This includes providing resources and training to help employees develop the skills necessary to work with AI technologies. It's important for leaders to create an environment that encourages experimentation and learning from failure, as the implementation of AI may not always go smoothly.

It's worth noting, however, that adaptability does not mean blindly embracing every AI trend. Managers should also be critical thinkers and assess the ethical implications, potential biases, and risks associated with artificial intelligence. They should ensure that AI is used responsibly and in a way that aligns with their organization's values and goals. In summary, leaders' ability to adapt to technological developments, especially in the age of artificial intelligence, is critical to remaining competitive and driving innovation. It requires a growth mindset, a willingness to learn and experiment, and a focus on creating a culture of innovation. By embracing AI and harnessing its potential, leaders can position their organizations for success in this rapidly evolving digital age.

> *"The main challenges are: combining AI with the company's human resources, training employees in AI systems, proper use of AI, safety nets to protect the company's sensitive data, developing systems so that AI can be used. The above challenges can be addressed through training in AI and a full understanding of the risks involved." (R8)*

4.5 Identifying the Skills and Competencies Needed for Managers in the age of AI

From the analysis of the responses, it should be mentioned that managers should have a deep understanding of all the positive and negative aspects of artificial intelligence. In any case, as has been observed, there is a need for training and understanding of artificial intelligence by managers, as they will be asked to evaluate and choose to what extent and in what areas they will use this technology. They also need training to know how to use new technologies to increase efficiency and effectiveness. Managers need a solid understanding of the capabilities, implications, and ethical considerations of AI. Educating and training leaders in AI is integral to building a foundation of knowledge, skills, and ethics necessary for effective crisis management.

While AI can automate many tasks, managers need to connect with their teams on a human level. Emotional intelligence, including empathy, communication and collaboration skills, will be even more important in the age of artificial intelligence to foster trust and build strong relationships. Managers need to think strategically about how AI can be integrated into their organization's overall goals and objectives. They should identify opportunities where AI can add value, streamline processes, and improve the customer experience.

Artificial intelligence is a rapidly evolving field, and leaders need to be lifelong learners. They should keep up with the latest developments, attend conferences, participate in training programs, and work with experts to expand their knowledge and stay ahead of the curve. Implementing artificial intelligence often requires organizational change. Leaders should be skilled at managing change, including communicating the benefits of AI, dealing with resistance, and ensuring a smooth transition for employees. Overall, leaders in the age of AI will need a combination of technical expertise, adaptability, ethics, emotional intelligence, strategic thinking, continuous learning, and change management skills to effectively harness the power of AI and move their organizations forward.

> *“Managers must be technologically literate to make informed decisions about the adoption, integration, and governance of AI. Educating and training leaders in AI is essential to building a foundation of knowledge, skills, and ethics necessary for effective crisis management.” (R7)*

4.6 The Importance of Modern Leadership and Crisis Management in the age of AI

During the 4th industrial revolution, strong leadership is necessary that will redefine the meaning of the work of the human potential and through their continuous education will lead them to join creative groups that will pursue and achieve common goals. Modern managers will be called upon to face many crises, which they will achieve only through the practice of modern management methods. Artificial intelligence has the potential to help companies grow in depth. It provides the possibility of a more efficient utilization of resources. Modern leadership and crisis management are essential in the age of artificial intelligence. Artificial intelligence technologies are rapidly transforming our entire world, including industries, affecting the way organizations operate, make decisions and respond to challenges. Artificial intelligence can provide many benefits at the level of analysis and prediction. Managers who possess a combination of technical literacy, ethical acumen,

adaptability and strategic vision are able to harness the benefits of AI while effectively addressing the challenges and ensuring the responsible and sustainable use of these technologies.

> *"AI has the potential to help companies grow in depth. It offers the possibility of a more efficient use of resources and therefore the possibility of improving efficiency and effectiveness. The positives that AI brings will come at the cost of a reduction in human resources, which leaders should be able to manage as painlessly and effectively as possible. Developing systems, improving existing rules and practices, and protecting data are essential elements in the transition to the AI era." (R3)*

5. Discussion and Conclusion

This study demonstrates that AI is becoming increasingly useful for companies that utilize large amounts of data. However, it also creates significant opportunities and numerous challenges (Peifer, 2022). A significant challenge is the management and coexistence of AI with the workforce (Naqvi, 2017). According to the results of our research, the necessity of human leadership is evident because AI lacks human empathy. The deployment of AI will result in the creation of new job roles in the absence of human labor, a phenomenon that has been observed in recent years for a number of reasons. Furthermore, the utilization of AI can be considered an advisory tool for the leadership of an organization.

Moreover, our research shows that today's managers need to be properly trained in the use of AI machines, but they also need to stay abreast of new developments (Naqvi, 2017). Furthermore, the use of AI is particularly important in the operations of organizations for crisis prediction and management (Unhelkar and Gonsalves, 2020). Artificial intelligence has the potential to support decision-making and facilitate resource allocation. By harnessing the power of artificial intelligence, managers can be better equipped to effectively deal with crises that may arise.

This research has significant managerial implications as today's leaders need a combination of technical expertise in many areas to effectively harness the power of artificial intelligence and lead their organizations to success. Modern managers in international business will have to adapt to AI machines, with the caveat that the survey participants said they will use the machines in the right way to analyze data and treat human resources properly.

Future research can focus on more aspects related to AI and management. For example, future research can be conducted on the impact of cultural aspects) on managerial decisions (Agoraki et al., 2024; Deirmentzoglou et al., 2024) regarding AI, the role of organizational culture (Deirmentzoglou et al., 2020), and aspects regarding customer satisfaction (Deirmentzoglou, 2022). Finally, this research focuses on qualitative data, therefore, future research can utilize quantitative data.

jana.galera.matusova@ucm.sk

Abstract: The use of Instagram as a social media marketing tool in educational institutions is gaining more and more attention. This article explores the relationship between school size and a school's Instagram presence, activity, and engagement. Specifically, the investigation focuses on answering the question of whether larger schools are more likely to have an Instagram account, post more frequently, and generate higher levels of interaction. The paper examines the role of Instagram in social media marketing within educational institutions, focusing on the relationship between school size and a school's presence, activity and engagement on Instagram. The research addresses three main hypotheses. Namely, that schools that have higher pupil numbers are more likely to have an Instagram account, schools with higher pupil numbers are more likely to post on Instagram, and schools with higher pupil numbers experience higher overall interaction (in the form of likes and comments) on their Instagram posts. An empirical quantitative research method was used. Statistical validation was carried out using Pearson's correlation coefficient and data from 444 schools were analysed. The results confirmed significant correlations between the number of pupils and the likelihood of having an Instagram account, frequency of posts and overall interaction. The paper further explores the effect of post frequency on follower numbers, finding a relationship that the more posts the higher the engagement, this does not necessarily lead to higher follower numbers. In addition, the study examines the link between the number of followers and the number of posts published by Reels, revealing a correlation. This suggests that a larger number of followers predicts a larger number of posts by Reels. Nevertheless, this highlights the need for a balanced content strategy. The above findings provide important insights into effective social media marketing strategies for educational institutions. The value of this study lies in its practical implications for school administrators and marketing professionals aiming to strengthen their institution's social media presence. The study concludes by highlighting the key role of Instagram in educational marketing and offering evidence-based recommendations for optimizing social media strategies to achieve better engagement and visibility.

Keywords: Educational institutions, Social media marketing innovation, Instagram innovation, Innovation strategies, Educational institutions marketing

1. Home

In today's digital environment, where social media plays a key role in the complexity of marketing communications, Instagram is emerging as an essential tool for commercial businesses. Private educational institutions are facing escalating competition and increased expectations from both students and their parents, requiring a rethinking and adaptation of marketing communication strategies. Particularly in digital marketing, where there is constant innovative progress. Instagram, as a platform predominantly defined by visual content, offers educational institutions the opportunity of diverse content options. Successful communication through SMM and especially Instagram requires not only the creation of quality and consistent content, but also the implementation of follow-up analytics and continuous evaluation of success. Subsequently, it is possible to adjust marketing strategies in line with the preferences and behaviours exhibited by the target audience. The aforementioned adaptability of the entity responding to changes in a highly competitive digital environment is crucial for the success of entities, especially if they are private educational institutions.

2. Social Media Marketing (SMM)

In general, the use of social media in contemporary marketing communications involves a diverse interplay of advantageous opportunities and challenges, requiring a sophisticated and differentiated approach to differentiate oneself from the competition. In an ever-evolving landscape of algorithmic change and content saturation, marketing managers must maintain a state of readiness to adapt to diverse conditions (Khan et al., 2023). Marketing managers must create compelling content while maintaining user trust in business entities and moral principles. Leveraging real-time engagement, the capacity for viral content distribution, and the precision of targeting specific audiences present significant opportunities for extensive brand reach and active engagement, facilitating improved community relationships across market segments. Authors Vinayaka and Manik (2017) examined how Instagram influences marketing strategies. Their findings define that Instagram enables brands to establish and maintain communication with their target audience through engaging visual media. The authors further found that Instagram has a large target audience of users in which businesses can

find their supporters and create communities. Alhabash and Ma (2017) ranked Instagram first in terms of duration and intensity of app usage in their investigation, surpassing competitors such as Snapchat, Facebook, and X. One of the challenges facing marketers today relates to the widespread problem of content oversaturation. The proliferation of content creation across the population has led to an overwhelming influx of information that inundates consumers on a regular basis. The proliferation of posts, images and videos on social media platforms necessitates gaining a competitive advantage and creating content that effectively engages the target audience. To effectively address this challenge, according to the authors, marketers are required to not only deliver compelling and tailored content, but also demonstrate a deep understanding of the preferences, behaviors, and cultural propositions that define their respective target audience cohorts (Khan et al., 2023). Instagram, which serves as a social media platform, functions as a channel that facilitates the dissemination of personal information across public networks while also serving as a tool to promote business growth. The platform is expected to soon reach 3 million posts in a single day, highlighting its significant advertising market capacity estimated at US$350 billion (Siregar & Puspasari, 2023). One of the options that can be published on Instagram are the so-called reels, which are short videos produced on the platform, their main proposition being to grab attention as quickly as possible and to provide quick and engaging content. The target group of learners often watch said reels to pass the time or to relax, as these brief formats can instantly fulfill their quest for entertainment (Menon, 2022). Instagram itself offers various features for users, such as the ability to upload photos and videos, create short videos up to one minute long, use the "@" symbol to connect with other users by tagging their Instagram accounts, provide photo captions and captions for context, geotag posts to show location, use hashtags to facilitate content discovery and association, and use the "like" feature to acknowledge posts on the platform (Iva Fikrani Deslia et al, 2022, Krajčovič, 2024). Instagram allows to reach a wide audience in different locations without time or space constraints. The costs are reasonable compared to television advertising. Instagram can quickly spread messages and influence users and spread from one person to another. It influences behavior in personal satisfaction, usability, socialization, product awareness, and entertainment. There are risks to using Instagram for marketing, such as the rapid spread of negative messages. The high interactivity of social media, similar to comments, can pose challenges in marketing through Instagram (Deslia et al., 2022, Hudakova, 2023). Consumer engagement on Instagram is context-specific, with "likes" indicating engagement with brand posts. "Likes" are considered as a new indicator of user engagement with branded content, not just as a metric. The number of "likes" on a brand's Instagram page reflects its popularity among users. Studies show that "likes" can indicate consumer engagement behavior. The authors consider "likes" as acts of approval and sharing. Encouraging "likes" and sharing may maximize consumer engagement. This may lead to discovery of branded content in newsletters and continued "liking" of brand pages (Kim et al., 2021). Anagnostopoulos et al. (2018) have highlighted the role of Instagram in user interactions in marketing campaigns and enhancing an organisation's reputation through engagement, particularly likes and comments. They found that product-related engagement attributes were more significant than non-product-related attributes. According to the authors, Instagram is defined as an important social media platform offering unique visual experiences (Budge 2020; Özdemir and Çelebi 2017). Image platforms are valuable for communication and promotion on social media due to their ability to easily create visually appealing content (Rodríguez-Vera et al. 2024; Chábyová, Galera Matúšová, and Kubovics 2024).

2.1 SMM in Educational Institutions

Social media marketing has become an integral part of the marketing strategies of educational institutions and significantly influences the direction of that segment. The use of social media platforms such as Instagram, Facebook, and X allows educational institutions to communicate with a wider target audience, including younger age cohorts or international audiences, which can potentially improve brand perception and attract potential students (Barus, 2023). The integration of social media into education is not limited to promotional activities, but also extends to and connects with educational content. Project-based learning (PBL) methodologies in marketing education have shown that social media can be effectively used to build influencer brands, thereby increasing student motivation and engagement (Demirci et al., 2023). According to Wang's (2023) investigation, social media platforms such as TikTok have also demonstrated significant potential in marketing communications in terms of the content and interactions produced by educational institutions. Moreover, when used appropriately, they also offer social impact or competitive advantage to the entity. The content on social media should match the focus of the educational institution, which led to interaction with users according to the research of Sari and Muhammad (2024). Variety of content has been shown to be very useful in online marketing communication as it allows the engagement of a diverse target group, thus promoting user interaction and community development (Maryani et al., 2023). Diverse social media platforms highlight the multifaceted opportunity for their use in educational institutions, ranging from objectives such as increasing brand awareness

to empowering individuals in the form of employees through targeted campaigns and content. The authors of the studies conclude that social media marketing of educational institutions is a communication tool that can increase engagement, create and strengthen community as well as the overall image of the institution. The findings confirm that larger educational institutions tend to be more engaged on social media platforms due to their larger student populations, leading to increased user demand for information and communication activities. Specifically, the study by Weiss et al. (2018) highlights various characteristics of school size and structure that may indicate higher levels of engagement on social media in the form of platforms such as Instagram Based on the findings of the Pew Research Center (2022), we add to the findings that larger educational institutions tend to exhibit higher levels of engagement on social media platforms in order to foster more effective communication with larger audiences comprised of students and their parents. Research further shows that adolescents in the 15-17 age group are more likely to use smartphones and interact on social media, potentially leading to increased activity by the institution on social media platforms such as Instagram (Massarat, 2022). The authors define that media users on Instagram are predominantly high school age. That demographic represents a relatively elevated age group, with a significant portion using the popular social media platform Instagram. When examining this phenomenon, it is evident that categorizing individuals into distinct generational groups presents a challenge. Based on defining characteristics, generational cohorts are typically divided into six categories: veteran generation (1925-1946), baby boomers (1946-1960), generation X (1960-1980), generation Y (1980-1995), generation Z (1995-2010), and generation alpha (2010-present) (Amanda et al., 2024). Individuals belonging to Generation X were born during a pivotal era marked by rapid technological and informational advances. Conversely, Generation Alpha, who were born in an era characterized by ubiquitous digital technologies, exhibit a strong affinity for such tools.

3. Methods

The aim of the present study was to investigate how different factors related to the number of students and activity on schools' Instagram accounts affect the level of user engagement. The literature review involved a comprehensive search and a thorough critical analysis of existing academic sources to elucidate the key concepts of SMM with emphasis on the private educational institutions segment, to recognize current trends and to explore their linkages in the said segment. This was accompanied by a careful selection of mainly highly relevant database (Web of Science and Scopus) sources, their analysis and subsequent synthesis of the identified information. Scientific sources were used as secondary sources, which included peer-reviewed articles, academic publications, monographs, empirical studies and statistical databases. For the purpose of our scholarly study, we conducted quantitative research, focusing our attention on engagement rates in relation to the number of pupils, the number of posts and the number of followers on the schools' Instagram accounts. Using Zoomsphere, an analytics tool that provided us with comprehensive user interaction data, we examined 444 profiles of private educational institutions and collected information about their interactions on different types of posts. We collected data from the profiles over a period of one year from March 2023 to March 2024. We obtained the database of schools from the Statistical Office of the Slovak Republic. We created a list of educational institutions indicating their type (kindergarten, primary school, secondary school), number of employees and number of students. For the purpose of this research we used only data on the number of pupils and the type of educational institutions. We hypothesised that schools with larger numbers of pupils would have more active Instagram accounts.

We formulated the following hypotheses:

H1a: A school with more students is more likely to have an Instagram account. (Weiss et al., 2018), (Massarat, 2022)

H1b: A school with more pupils will have a higher number of posts on its Instagram account. (Dennen et al., 2020)

H1c: A school with more students will have a higher overall number of interactions (likes, comments) on its Instagram account. (Jiang & Monica, 2018)

H2: More posts on a profile lead to more followers (Ull et al., 2024).

H3: A larger number of followers on a profile leads to a higher number of Reels posts (Davaasuren et al., 2024).

Variables used:

- Number of pupils (numerical value) - cardinal variable

- Instagram account - possible yes/no answers (values were transcoded to 1 and 0), nominal variable
- Number of posts on Instagram profile - (numerical value) cardinal variable
- Number of interactions on Instagram profile included - (numerical value) cardinal variable

Statistical processing of the results was performed using SPSS 29 and MS Excel. Statistical methods were used, namely sum and mean were used in descriptive characteristics. The normality according to the values of the variables was verified by histogram and Gaussian curve fitting. Based on the results, Pearson's correlation coefficient was selected and used to verify the relationships because the nature of the variables was nominal and cardinal. The Pearson correlation coefficient uses the following verbal reasoning for the variable p: 0 - 0.1 - none - trivial relationship, 0.1 - 0.3 - weak relationship, 0.3 - 0.5 - moderate relationship, 0.5 - 0.7 - strong relationship, 0.7 - 0.9 - very strong relationship, 0.9 - 1 - perfect relationship - the variables are identical (Utheim Grønvik et al., 2016).

4. Results

The following section provides detailed results of our research findings. The results are systematically arranged and presented in a clear form to make them as easy to understand as possible. For better orientation and interpretation of the data, we have prepared a visualization, which is shown in Table 1. The first hypothesis was tested through Pearson's correlation coefficient. The value of Pearson correlation coefficient is p = 0.337 and Sig = 0.000. This is a positive (positive) moderate relationship, which means that there is a direct proportionality between the variables. The more students a school has the more likely it is to have an Instagram account. As the score of one variable increases, the other variable also increases. We accept the hypothesis H1a. The second hypothesis was equally tested through Pearson's correlation coefficient. The value of the Pearson correlation coefficient in testing hypothesis H1b was 0.224 and Sig = 0.005. The result indicates a positive (positive), weak relationship which means that there is a direct proportionality between the variables. As the school has a larger number of students the frequency of Instagram posts increases. As the frequency of one variable increases, the other variable also increases. H2b hypothesis by income. The third hypothesis was tested using Pearson's correlation coefficient. The value of Pearson's correlation coefficient was 0.271 and Sig = 0.003 in testing hypothesis H1c. From the result, a positive (positive), weak relationship can be concluded, which means that there is a direct proportionality between the variables. As the school has a larger number of students the total number of Instagram interactions increases. As the frequency of one variable increases, the other variable also increases, we accept the hypothesis H1c.

Table 1: Impact of pupil numbers on the Instagram component of schools' SMM activities

		Do they have Instagram?	Number of contributions	Total number of interactions
Number of pupils	**Pearson Correlation**	0.337**	0.224**	0.271**
	Sig. (2-tailed)	0. 000	0.005	0.003
	n	444	157	122
**. Correlation is significant at the 0.01 level (2-tailed).				
b. Cannot be computed because at least one of the variables is constant.				

The fourth hypothesis defines that the greater the number of posts on a profile the greater the frequency of followers on the profile. Verification was done through Pearson's correlation coefficient. The value reached the level of 0.271 and Sig = 0.01. The result indicates a positive (positive), weak relationship, which means that there is a direct proportionality between the variables. The more posts on the profile the greater the number of followers. As the frequency of one variable increases, the frequency of the other variable also increases. We accept the hypothesis H2.

Table 2: Impact of number of posts per profile and number of followers per profile

		Number of followers per profile	Number of contributions
Number of followers per profile	**Pearson Correlation**	1	0.205*
	Sig. (2-tailed)		0.010
	n	168	157
Number of contributions	**Pearson Correlation**	0.205*	1

		Number of followers per profile	Number of contributions
	Sig. (2-tailed)	0. 010	
	N	157	157
*. Correlation is significant at the 0.05 level (2-tailed).			

The fifth hypothesis defines that the higher the number of Reels posts the higher the number of followers on the profile. The verification of the chosen hypothesis was done through Pearson's correlation coefficient where the p-value reached 0.231 and Sig = 0.012.The result indicates a positive (positive), weak relationship, which means that there is a direct proportionality between the variables. The greater the number of Reels type posts, the greater the number of followers per profile. As the frequency of one variable increases, the frequency of the other variable also increases. We accept the hypothesis H3.

Table 3: Impact of the number of Reels posts on the number of followers per profile.

		Number of followers per profile	Post Type - Reels
Number of followers per profile	**Pearson Correlation**	1	0.231*
	Sig. (2-tailed)		0. 012
	n	168	117
Post Type - Reels	**Pearson Correlation**	0.231*	1
	Sig. (2-tailed)	0.012	
	N	117	117
*. Correlation is significant at the 0.05 level (2-tailed).			

5. Discussion

The results of the investigation reveal interesting insights regarding the use of Instagram in SMM of educational institutions. The analysis of the study provides empirical evidence that substantiates the defined hypotheses and as a result introduces new perspectives into the current trends of social media marketing of educational institutions. We tested the relationship between student enrollment and an educational institution's Instagram presence (H1a) and our results indicate a moderate positive correlation between student enrollment and the likelihood of a school having an Instagram account. The evidence we find suggests that larger schools exhibit higher Instagram activity. The result is consistent with sources analyzed that suggest larger educational institutions may have more resources to manage social media, which increases their ability to communicate effectively with their target audiences (Foroughi et al., 2022). Hypothesis H1b, a school with a larger number of pupils will have a higher number of posts on its Instagram account achieved a confirmatory positive result in the evidence, albeit a weak relationship between pupil numbers and frequency of Instagram posts. The weaker correlation implies that while the number of pupils influences Instagram activity, there are other factors such as the right content strategy or proper targeting that can influence the frequency of posts (Dennen et al., 2020). The number of students and the number of interactions in the relationship mediated the testing of hypothesis H2c. The analysis suggests a positive, weak correlation between the number of students and total interactions on the Instagram accounts of educational institutions. The result is consistent with previous research that finds that larger schools may receive more interactions due to the higher number of active students and parents on these platforms (Jiang & Monica, 2018). Another significant finding under Hypothesis H2 is that a higher number of profile posts correlates with an increased number of followers. The result complements and supports the claim that other factors such as a consistent strategy and content quality within content posting , which may ultimately increase engagement and expand profile visibility, are also at work (Li et al., 2021). Hypothesis H3 a larger number of followers on a profile leads to a higher number of Reels posts. The data analysis revealed a true statement that there is a positive weak correlation between the number of Reels posts and the number of profile followers. The finding suggests that interactive and visually appealing content such as Reels can help in increasing the number of followers in line with the importance of visual content in digital marketing communication (Hancerliogullari & Ceylanoglu, 2023; Wang, 2021). The analysis of the above sources shows that Reels with educational content are currently quite widespread. They offer attractive and entertaining content for the target audience. In the context of innovation, content in the form of Reels is one of the options for educational institutions. In doing so, it represents a way to reach the target group of learners on platforms where they spend a considerable amount of time. Our research defines the innovation potential in publishing Reels

mainly because they offer educational institutions the opportunity to present, for example, their unique culture, achievements and values in a way that is attractive to the target group. A limitation of the above study is its exclusive focus on private educational institutions. Subsequent research could expand the scope to public schools for a more comprehensive understanding of the use of social media in various educational sectors. In addition, the study's reliance on one platform (Instagram) presents a limitation that could bias the results. Future investigations should include different platforms such as Facebook, X, or TikTok, which could build on Krajčovič and Madleňák's (2024) research. Despite these limitations, the study provides valuable insights into the associations between student numbers, social media engagement and levels of user interaction, offering practical lessons for educational institution profile managers and digital marketing professionals.

6. Conclusion

The investigation provided valuable perspectives on the correlation between the amount of students and activity on the Instagram profiles of private educational institutions and their impact on user engagement rates. The results suggest that larger educational institutions are more likely to have an Instagram profile along with a higher number of posts and interactions. Equally, the findings suggest that a higher number of publications results in an increased number of followers and that Reels-style publications have a positive impact on expanding profile followers. These findings are consistent with previous findings and offer to add to the theoretical apparatus, as well as having potential implications for the practical realm in SMM educational institutions seeking to increase their social media presence and engagement. Despite the limitations of this study, it offers significant perspectives for educational institution profile managers and digital marketing practitioners and initiates opportunities for further exploration in this area.

Acknowledgements

The study was elaborated within the research project supported by Slovak Research and Development Agency No. APVV-22-0469- Roadmap of a digital platform providing AI (Artificial Intelligence) automation of decision-making processes in the field of communication strategy.

Innovative Content Production in Marketing Communication Through AI

Michal Kubovics
The Faculty of Mass Media Communication at the University of Ss. Cyril and Methodius in Trnava, Slovakia

michal.kubovics@ucm.sk

Abstract: The integration of artificial intelligence (AI) into marketing communications has changed the way businesses communicate with their customers. The present paper explores the potential of AI-driven systems to automate content creation, highlighting the role of AI in increasing customer engagement and strategic decision making. AI offers significant benefits by leveraging customer data to predict their behaviour, optimize marketing strategies, and personalize content. By systematically creating and evaluating content, AI enables marketers to customize messages to specific audiences, increasing the effectiveness of campaigns. The research employs a mixed methods approach that combines qualitative and quantitative analyses to assess the potential use of AI in content marketing. The qualitative aspect involves a thorough review of existing literature, identifying key trends and relationships in the use of AI for marketing communications. On the other hand, the quantitative aspect of the study involves a process of experimental validation using Python and APIs such as OpenAI and Graph APIs to automate content creation and measure its effectiveness. The findings confirm that AI can be utilized to personalize content using the input data in the form of brand-voice, target group, and the evaluation of current communication. The iterative process allows for continuous improvement of quality and relevance of content, which is important in the dynamic environment of marketing communications. The study highlights the importance of accurately defining the target audience and brand-voice, as the effectiveness of AI depends heavily on the accuracy of the input data. However, the study also acknowledges limitations such as the potential inconsistency of the content generated through AI and the challenges associated with maintaining a coherent brand-voice. Future research should focus on developing advanced machine learning methods to better understand context and improve the alignment of content with brand values and customer expectations. In conclusion, the integration of AI into marketing communications offers a powerful tool for businesses to optimize content creation, increase customer engagement, and achieve strategic goals in an increasingly competitive digital environment. AI's ability to create, evaluate and refine content in real-time provides a significant advantage and ensures that marketing communications remain adaptive and effective.

Keywords: Artificial Intelligence in marketing, AI-driven content creation, Personalization in marketing, Automated content optimization, Brand-voice integration

1. Introduction

The integration of artificial intelligence (AI) into marketing communications has revolutionized the way businesses communicate with their customers. By leveraging customer data, AI enables the prediction of future purchases and improves the overall customer journey (Brobbey et al., 2021). AI as a transformational technology offers the potential for partial automation of marketing communications that aligns and integrates the organization, thereby improving organizational performance (Allen et al., 2023). In addition to the above, AI solutions play a key role in marketing decision-making at different stages of the marketing process, offering valuable insights and improving strategic planning (Ljepava, 2022).

1.1 Target Group

According to authors Chaisatitkul et al. (2024), the target group plays a key role in generative AI content creation, such as ChatGPT and Dall-E. The research clarified that the focus group had a positive response to AI-generated stories and storyboards, finding them impartial and effective. The favourable perception substantiates the importance of integrating target audience feedback into the methodology of developing and evaluating AI tools in marketing. On the other hand, according to the authors of Ramos (2023), the correct specification of the target audience in the generation is paramount because AI depends on how well the target audience is defined and understood. Adequate segmentation of the target group allows AI to customize marketing outputs and ultimately improve the impact of campaigns. The authors agree that in the absence of a comprehensive understanding of the target group, AI would not be able to effectively personalize the customer experience and increase marketing effectiveness. Davenport et al. (2020) add to the complexity, stating that the target group is overall a key component of the effective application of artificial intelligence (AI) in marketing. AI can significantly increase the predictive capabilities and customization of marketing methodologies, but only if the target audience is accurately defined and researched. In the absence of a comprehensive understanding of the intended demographic, AI would be unable to produce relevant outputs and its marketing decisions would lack sufficient effectiveness.

1.2 Brand-Voice

The beginning of AI data-driven decision-making dates back to 1992 (Nagamachi et al., 2018). The fusion of AI and brand-voice is currently the future of social media marketing. AI tools, exemplified by Chat GPT, can significantly speed up the content generation process; however, it requires careful review and working with specialists to ensure that the content produced is aligned with the brand's core values. Maintaining the right brand-voice while using AI is critical for formulating effective marketing strategies (Murár et al., 2024). Defining the brand-voice is essential when developing content created with AI. The brand persona is an essential element that helps to ensure that the AI creates content that is consistent with the brand and its principles, preventing it from being vague and non-specific. The study highlights that in the absence of a well-defined brand-voice, AI-generated outputs can exhibit inconsistency, thus undermining brand communication and potentially leading to confusion among the intended audience (Hariri, 2023).

1.3 Content Production with AI

In the context of predictive content creation, AI capabilities extend to a real-time content management systems that can be instrumental in promoting and improving marketing communication strategies (Gupta et al., 2020). In addition, AI and machine learning-based prediction models, particularly deep neural network architectures, have shown potential in predicting and mitigating adverse crisis situations in business entities. Likewise, the defined models provide information to predict user behaviour on social networks, thus assisting business entities in targeting the intended group of users (Ronaghi et al., 2022). The application of AI in marketing communications is consistent with the broader spectrum of AI capabilities including prediction, recommendation, classification, recognition, natural language processing, and autonomous systems processing (Ballesteros, 2019). Creating personalized content is critical to establishing trust and customer engagement. It requires the right combination of strategy, creativity, and technology to engage users through generated content. The aforementioned capabilities are currently offered by AI (Dwivedi et al., 2021). The use of AI and machine learning for content generation can significantly increase the accuracy and personalization of recommendations as well as satisfaction of the target audience. The combination of ratings, metadata, and visuals such as book covers has been shown to improve the effectiveness of prediction patterns. This methodology optimizes the content generation process and increases user satisfaction, which is particularly important in the digital realm and online book transactions. It is clear from the findings of the source analyses that the customization of content is key to building reliability and customer engagement. An appropriate combination of tactics, ingenuity, and technology is essential to acquire high-quality customer perspectives and create content that meets customer requirements and inclinations (Lee et al., 2023). Prior to the full commercial deployment of sophisticated generative AI, the available options for content generation were limited. One example of this is SoMin.ai platform, which was able to generate potential targeting improvements based on exploring users' personality traits, which could potentially increase the effectiveness of marketing campaigns (Farseev et al., 2021). The sum of the findings is the recognition that current innovative AI technology could potentially target generative content creation in network marketing communications. Moreover, previous findings define that the generated outputs can effectively correspond with different user personality profiles and thus increase user interest and engagement. This underscores the versatility and adaptability of AI in addressing various marketing challenges and opportunities. In conclusion, the integration of AI into marketing communications has tremendous potential for predictive content creation, customer engagement and strategic decision making. By leveraging the predictive analytics and deep learning capabilities of AI, businesses can gain a competitive advantage in understanding consumer behaviour, optimizing marketing strategies, and responding effectively to dynamic conditions of the market. AI has greatly influenced the creation and management of content in marketing, proving its pivotal role in modern marketing communications. With the increasing amount of content across media, there is an increased need for its personalization, which is effectively resolved with the help of AI. It also enables the creation of content recommendation systems that improve the accuracy and relevance of marketing messages (Chintalapati & Pandey, 2022). AI enables marketers to quickly generate high-quality content, improving personalization and relevance while saving resources. Through the use of AI, marketers are able to personalize live customer encounters, increasing the likelihood of engagement and transformation, especially increasing the effectiveness of digital marketing methodologies. Incorporating AI into marketing communications facilitates sophisticated data exploration and focused communication, leading to improved customer engagement and more intentional decision making (Abdelmoneim & Feast, 2024). According to Senyapar (2024), AI's content creation capabilities enable the generation of consistent and compelling content in line with brand’s tone and goals, which speeds up the content production process. Incorporating AI into content production allows marketers to pinpoint relevant content for their audience and create a

personalized and captivating encounter without laborious manual content management. Personalizing marketing communications with AI increases customer engagement and satisfaction by delivering customized content and communications that are aligned with individual inclinations and activities. AI is revolutionizing content marketing by facilitating the generation of narrowly targeted content, leading to increased interaction and conversion rates. By exploring a vast data set, AI offers actionable analysis of effective content, enabling continuous improvement of marketing strategies and content creation. Examples of reputable companies showcase the effective application of AI-driven tactics to improve consumer interaction and create loyalty to the brand (Vasundhara et al., 2024).

2. Methods

The methods used are of mixed research design. The aim of this paper is to assess the structure of an AI-based system for automated training in the field of marketing communications with respect to social media. The theoretical framework was composed of mainly qualitative methodologies such as induction, deduction, and contribution analysis. The analysis of contributions involved a systematic review and evaluation of the existing literature to outline key concepts, emerging trends, and interrelationships related to the application of AI in marketing communications. The analysis was conducted in a systematic manner that involved careful selection of relevant sources, their critical evaluation and synthesis of the findings. Scholarly sources including peer-reviewed articles, academic publications, monographs, research papers and statistical databases were used as secondary sources. These materials provided the necessary theoretical structure and background for understanding and interpreting the phenomena and issues under study.

Based on the theoretical background, the following research question and hypotheses emerged:

RQ: *How can the use of AI in content marketing support the process of content creation and evaluation on social networks? (Huang & Rust, 2021)*

> ***H1:*** *The use of AI in marketing communications can provide a systematic approach to content creation, allowing content to be better tailored to the target audience based on data analysis and feedback. (Bashang & Puttanna, 2023)*
>
> ***H2:*** *The systematic deployment of AI in social content creation enables automated content generation based on predefined criteria and data from the target audience. (Gao et al., 2023)*
>
> ***H3:*** *Integrating AI into the process of evaluating and optimizing social content will ensure continuous improvement of content quality and relevance in line with current trends and needs of the target audience. (Haleem et al., 2022)*

The practical part includes quantitative approaches. In the context of the empirical research, a business entity from the e-commerce segment was selected for the analysis, with particular emphasis on the sale of book publications. The business provided the basic data required to conduct the experiment, which included comprehensive knowledge regarding the target demographic, the defined brand-voice, and access to the Facebook profile via an application programming interface (API). The data regarding the target group included both demographic and psychographic attributes, which were used for accurate segmentation. The brand-voice was defined in accordance with established criteria and the company's core values, ensuring consistency and authenticity of all communication outputs produced by the AI. Providing access to Facebook's social networking service via an API facilitated the automated collection of performance data on published posts.

Experimental testing of the model was conducted by using the Python programming language. Furthermore, APIs (Graph API, OpenAI API) have been used. The following section presents the results of the investigation.

3. Results

Based on the theoretical underpinnings and previous research the following diagram was defined to show a sophisticated and iterative process that clarifies the research question of the possibility of using AI in content marketing, and whether it has the potential to support the process of content creation and evaluation on social networks. The diagram begins by examining data derived from social networks and completes the cycle by evaluating the effectiveness of the content produced by leveraging AI. Each stage of the process is linked to the next, creating a cycle of continuous improvement of marketing outputs.

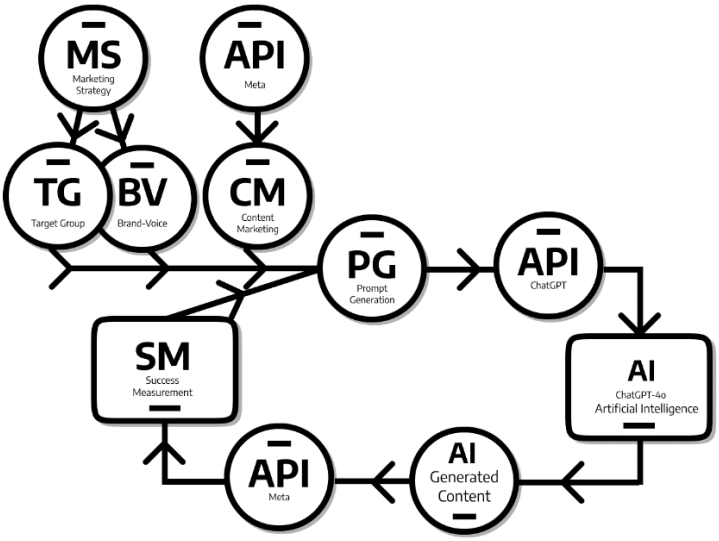

Figure 1: Diagram of the content generation process using artificial intelligence

The description of the individual parts is given in the following section, the defined diagram starts in the upper left part with the label target group (TG). The definition of the target group in this case is realized through the use of information obtained from the administration of social platforms, or from the documents of the currently selected strategic marketing plan. The result is the formulation of the most detailed description of the target group. For further processing, demographic data, such as age, gender, and geographic information, psychographic insights including interests, values, and lifestyle preferences, and behavioural patterns such, as purchasing tendencies and engagement with online material, need to be included in the formulation. Accurately defining the target demographic plays a key role in effectively modifying and creating content, thereby increasing the likelihood of successful conversions and active engagement. The following section discusses the theoretical underpinnings of brand-voice (BV). Brand-voice is addressed to the business and plays a key role in maintaining consistency in communication. The process involves defining tone, whether formal or informal style, including informative, entertaining, or inspirational, and values such as reliability, innovation, and sustainability. A coherent brand-voice fosters trust among the target audience and ensures that all content is easily identifiable and consistent with the core brand identity. The next part is the analysis of social media data in the context of content marketing (CM). The above step involves retrieving and reviewing data from social platforms through an API that can store the aforementioned available data. Said data include details of the posts that have achieved the highest number of reactions such as engagement, shares, and comments. The primary goal of this section is to understand what content and structure is getting the most response from the audience. By analysing the above stored data, it is possible to define the key elements of successful posts, preferred topics, and ideal time publications. The given section reflects H1 hypothesis, which can be positively supported on the basis of definition and experimental confirmation. The results suggest that a systematic and iterative approach allows for better customizing of content to the target audience based on data analysis and feedback. Contributions are part of conte nt marketing, which at its core involves the creation and dissemination of valuable, relevant, and coherent content, with the aim of engaging and retaining a specific target audience. Data analysis can yield the frequency and success rates of content types, such as text, images, videos, and other social media posts. The output is a textual form of the defined strategy, including what content is relevant. It is adapted to different platforms and channels to best align with the target audience's preferences. The next part is the generation of the prompt (PG), which is defined based on the data collected and the set objective. From the results of the data analysis and the set objectives, a prompt is formulated which acts as a proposition for content production through the use of AI. Prompts, by their nature, should be carefully designed to include precise and as detailed as possible instructions for the AI system. The next part, that is directly related to the prompts created and then sent to the AI, is defined by the description of the API that is used to communicate with the AI (e.g., ChatGPT). The defined prompt is sent through the Application Programming Interface (API) to establish communication with the AI. The API acts as a conduit to facilitate data transfer and verify that the AI has generated all the necessary data to create the content. The next section is devoted to content generation based on the input. After it is sent through the API, the AI generates the result in the form of content. For this reason, the next part of the diagram is named as AI generated content. AI such as ChatGPT has the ability to generate a variety of

content formats on social media. The output results in shareable content. The content material produced is then stored on specified social networks, for example Facebook, Meta's Instagram, using an API that also provides feedback and analytics regarding the effectiveness of the material. Data that can be analysed include metrics such as engagement rates (e.g. likes, comments, shares). The output of the above analysis provides valuable perspectives to refine the AI assignment in post-processing. Comprehensively, the above section in the diagram is presented as a success measurement (SM). The iterative process facilitates continuous improvement and refinement of content creation through AI by leveraging the analytical information and feedback obtained. Incorporating social networking and AI application programming interface (API) into the content generation and evaluation process ensures efficiency and relevance. Continuous updating in the form of a constant strategy and adapting content in line with prevailing trends and target group preferences are key elements of thriving marketing campaigns.

3.1 Experimental Validation

The process of developing and programming a system for content generation and evaluation using AI was as follows. According to the diagram, the process was followed chronologically. The first part focused on the analysis of the target audience. In the first step, relevant data sources such as social networks and internal marketing materials of the business entity were identified. From these sources, a baseline was extracted in the form of demographic and psychographic data of the target group. Subsequently, the brand-voice of the business entity was also defined. In accordance with internal materials and in collaboration with the marketing manager, a brand-voice was defined that encompassed the tone, style, and core values of the business entity. Afterwards, using the Python programming language, an interface was prepared in cooperation with the social network API. Specifically, the Graph API from Meta was used and connected to the business entity's profile. A script was developed to systematically collect data from the profile. The Python programming language was used to perform a thorough analysis. The metrics tracked were regarding engagement, the most effective types of posts, and the time preferences of the target audience. The summarized information was then used to generate a prompt. Next, prompt templates were defined, which were derived from the authors' previous analyses and predetermined parameters adapted to different content generation contexts. The textual content of the status was experimentally selected. An automated framework in Python was prepared to produce specific prompts dependent on the current target audience data, brand-voice and specifications of the content. The system used predefined templates and guidelines to formulate the prompts, which were then passed to the AI through an API (OpenAI API). The results show that the systematic deployment of AI enables automated content generation based on predefined criteria and data of the target group. The results provide sufficient evidence to support H2 hypothesis. Scripts were created to transmit the prompts and record back the generated texts. After receiving the responses from the AI, the texts were processed to comply with the established criteria for content that can be posted to social networks. All editing was done automatically. After the AI system created the content, it was then published to the Facebook platform using Meta's Graph APIs, which were integrated into the script. After the content was uploaded to the social network, the effect was then measured after 24 hours in the form of storing data metrics, including engagement. The engagement was evaluated via a specific number of reactions, such as likes and comments, which were used to get feedback on the performance of the content. Subsequently, the data were saved and the methodology of generating the creation commands could be improved again to enhance the overall system. As a result, according to the experiment, the model was validated. Based on the findings, it can be concluded that AI integration ensures continuous improvement of content quality and relevance in line with the current trends and needs of the target audience. The results of the investigation provide sufficient evidence to support H3 hypothesis.

4. Discussion

One premise of the investigation was the finding of authors Utku and Selcuk (2016). They defined content marketing as one of the most notable methodologies currently within corporate marketing practices in connection with AI. Consequently, the results of the present study support the stated research question and hypotheses that the integration of artificial intelligence (AI) into marketing communications provides significant benefits for the creation and evaluation of content on social networks. The analysis confirms that AI can provide a systematic and iterative approach to content creation, thereby enabling better tailoring of content to the target audience based on data analysis and feedback, which is also confirmed by Huang and Rust (2021). Gao et al. (2023) confirm that the implementation of AI in the content creation process allows for automated generation that aligns with the set criteria and data from the target group. The findings are in line with the conclusions of authors such as Allen and et al. (2023) who highlight the transformative potential of AI in marketing communications. Subsequently, the results of the experiment supported H2 hypothesis, which presumed that

systematic deployment of AI enables automated content generation based on predetermined criteria and data from the target group. Authors Ramos et al. (2023) add that the effectiveness of marketing campaigns can be increased in addition to the possibility of automation. They also add the need for precise definition of the target audience for successful implementation of AI in marketing. H3 hypothesis, which focuses on the continuous improvement of content quality and relevance through AI integration, was also supported. Analysis of the results shows that using AI to continuously optimize content based on retrospective data leads to improved marketing outcomes, which is consistent with the findings of Ronaghi et al. (2022) on the predictive capabilities of AI in crisis management and content creation. Despite these findings, some limitations should be noted. One is the relationship of the effectiveness of AI to the quality of the input data and the accuracy of defining the target group. As Chaisatitkul et al. (2024) state, AI can only produce content that positively resonates with audiences if the target audience is well defined, and their needs are accurately understood. The need for a comprehensive understanding of the target audience has also been highlighted in the work of Davenport et al. (2020), who warn of the risk of ineffective content personalization when demographics are insufficiently researched. Another limitation is the potential inconsistency in the content produced, especially when it comes to maintaining brand-voice. Murár et al. (2023) and Hariri (2023) point out that if the brand-voice is not clearly defined, AI may generate content that is not fully aligned with core values of the brand. In that context, it is crucial that future AI research and development include mechanisms to systematically verify the quality and relevance of the generated content. As Utku and Selcuk (2016) state, the future of marketing is likely to depend on AI's ability to not only generate content, but also to evaluate its effectiveness and optimize it in real time. This includes the need for advanced machine learning and natural language processing methods to enable AI to better understand context and adapt content to align with brand goals and customer expectations. Nevertheless, further research efforts are needed, for example, in the inclusion of additional variables on inputs and other parts of digital marketing, as well as technical improvements. This will ensure that AI is able to not only generate but also continuously improve content in line with the dynamic needs of the market and the expectations of target audiences.

5. Conclusion

The objectives of the study were met. This paper provides an assessment of the structure of an AI-based system for automated training in marketing communications with regards to social media. Research has proven that AI integration into marketing communications is possible and has the potential to influence future content creation in marketing communications. AI currently enables businesses to better understand their customers' needs and preferences and adapt their marketing strategies. Additionally, the dynamic approach that results from the use of AI, which involves real-time adjustments to content based on immediate customer feedback, ensures that marketing communications remain flexible and responsive to changing market conditions. The integration of AI in content marketing brings significant benefits to businesses. It enables better prediction, personalization, and optimization of marketing campaigns, ensuring greater efficiency and competitiveness in the digital era.

The Possibilities of Artificial Intelligence Usage in Loyalty Programs

Andrii Kushnarevych and Daniela Kollárová
University of Ss. Cyril and Methodius in Trnava, Slovakia

kushnarevych1@ucm.sk
daniela.kollarova@ucm.sk

Abstract: From the year 2022, when the GPT 3 model became publicly available, Artificial intelligence (AI) has been a buzzword in marketing. To say it still is influencing the field would be an understatement with new models and technologies continuously emerging and existing ones getting better and better. Loyalty programs as a sales promotion tool have also undergone big changes in recent years and AI is bringing new opportunities and challenges to the field. In this paper, we investigate the possibilities of artificial intelligence usage in loyalty programs. We aim to showcase the diverse opportunities through which AI can enhance loyalty program experiences. Among those usage opportunities we put specific attention on AI personalization and predictive modelling. By harnessing AI capabilities, organizations can possibly find new ways to enhance customer engagement, satisfaction, and build stronger loyalty. In this paper we are also looking at the current state of loyalty programs in the selected market and the way AI is being used in them. It is important to note that we approach the topic from two points of view – customers` and brands`. That means that we are trying to highlight how certain AI technologies can possibly improve customers` experience as well as how AI may be a helpful tool for businesses who want to manage loyalty programs. The final part of our article includes information on the suggested ways AI technologies may be implemented into loyalty programs based on the information provided in previous parts of the paper. Suggested implementation strategies are also appropriate as a starting point for further research, where every single technology would be researched more in detail. The main goal of this article is to provide readers with a comprehensive overview of the possibilities of how Artificial Intelligence can be used in the context of loyalty programs today. The article is theoretical-empirical and is based on external information from trustworthy sources as well as our own research of certain AI technologies in the context of loyalty programs.

Keywords: Artificial Intelligence, Loyalty programs, Personalization, Predictive modelling, Marketing communication

1. Introduction

In recent years, Artificial Intelligence (AI) has significantly influenced the landscape of marketing, and among other fields that have been affected are loyalty programs. AI's implementation into various marketing tools has turned it from an operational tool into a powerful force that has an opportunity to enhance customer interactions and operational efficiencies. The capabilities of AI in general and in marketing are giant, extending from simple automation of repetitive tasks up to analysing giant sets of information in real-time and providing deep insights into customer behaviour (Mirwan et al., 2023). In today's marketing environment it seems increasingly important to not leave AI technologies out of sight, but rather to explore its possibilities and increase the competitiveness of the brand on the market by rapidly reacting to technological advancements.

For brands in the current marketing environment strategic deployment of AI into their marketing strategies is not only about increasing the efficiency of the workers, but also about understanding their customers in-depth, up to an individual level, and thus providing personalized experiences and better customer experience in general. This is particularly present in loyalty programs, where AI's ability to analyse vast datasets can be used to personalize offers and communications that may be uniquely appealing to each customer, thereby enhancing engagement and loyalty. Workers of the marketing departments are now expected to leverage AI tools to fulfill their work more efficiently and develop a deeper understanding of market dynamics and consumer behavior, ensuring that their outcomes are as relevant as they may be. As AI continues to evolve, its integration into marketing strategies, especially loyalty programs, is expected to deepen, making it a necessary tool for researching, implementing and business growth. In this paper we aim to focus on AI in loyalty programs. Among the topics we want to research are AI capabilities in the context of loyalty programs, benefits brands and customers may get by using them and case studies of current AI usage in loyalty programs on the selected market.

2. Theoretical Background

Loyalty programs as a sales promotion tool have undergone many changes over the last decade. Those were mainly caused by external factors, mainly changes in customer behaviour, technology and data analytics. From basic punch cards that may be printed on a thick carton to complicated multilevel systems, loyalty programs today have become widely used tools that have the goal of increasing customer satisfaction, customer loyalty and return purchases. Since technologies have advanced profoundly, data analysis has become another

important part of loyalty programs, which lets businesses to better understand and foresee customer behaviour and actions. As a result, this provides brands with the opportunity to personalize those programs and personalize their parts according to individual preferences. We can also trace this approach becoming more and more used in other parts of marketing and marketing communication, making it not limited to loyalty programs, but rather a general trend to the changes in customer behaviour and expectations (*The value of getting personalization right—or wrong—is multiplying*, 2021). In recent years, progress in new technologies like AI and machine learning has pushed this trend even further, making it possible to create flexible programs and be more reactive to customers' needs.

It is important to discuss some basic aspects of AI as a technology in the communicated context. At the basis of the AI there is machine learning (ML) and its subset named deep learning (DL). Machine learning is the ability of the AI model to learn, predict or choose something based on the algorithm provided based on the data that it has to work with (Hamdan et al., 2023). The main idea of deep learning is to involve neural networks with different complexity levels with the goal of simulating the complicated decision-making of the human brain (Hosain et al., 2024). By leveraging these technologies AI models are capable of creating truly outstanding results and constantly keep evolving. However, another feature widely used in order to provide such results is natural language processing or NLP. It allows machines, and AI in our example to understand and interpret human language. By its usage, AI models are able to understand the sentiment or intents of the messages and thus provide an outcome that would take those things into account (Sharp et al., 2017). With the constant development of AI models, today many of them are also capable of computer vision which allows machines to see and interpret images in a similar way to humans, thus making it possible to appropriately work with not only textual, but also visual data inputs. These basics clarify how artificial intelligence works at a basic level and now we can look into how these technologies could be applied within a loyalty program setting.

3. AI Technologies in Loyalty Programs

Based on the technologies we mentioned in the previous chapter it is safe to assume that loyalty programs can benefit greatly from the usage of AI. Firstly, it opens the possibilities of creating loyalty programs that just wouldn’t be possible without an AI. By this we mean that due to the possibilities of data analysis and natural language processing that AI brings, unique, highly personalized loyalty programs based on a deep understanding of the customers may be created, which was much harder, or even impossible, to operate before. By personalizing the loyalty program itself, as well as its rewards, activities, tiers or other parts brand gets the possibility of making the relationship with the customers more personal, increasing their engagement and ultimately building loyalty which would make the customer come back over and over again to the brand. Additionally, AI can make the various operational parts of loyalty programs more efficient and user-friendly. As an example, it may help in handling reward distribution, gathering feedback, or better optimizing those processes, which leads to cost savings and better productivity.

Moreover, AI can assist in decision-making processes by analysing giant amounts of information and providing high-quality insights based on this information. For example, methods like predictive personalization enable brands to increase personalization levels at every step of a customer funnel, even without the exact data about the exact customer (Bhaskar et al., 2009). Thus, marketing activities, loyalty programs incentives and even marketing campaigns can achieve better results. Among other things, AI may play a crucial role in fraud detection within loyalty programs by leveraging its abilities to analyse data, mark certain activities as suspicious or fraudulent and communicate this in real-time with the brand in order to minimize the risks.

In this chapter, we want to describe in detail two of the potential AI usages in loyalty programs that, in our opinion, have the most usage potential as of today. Those two categories are personalization and predictive modeling. Starting with personalization, we find it important to mention customer segmentation as a closely connected term. In order to personalize the offer, many brands first need to segment their customers into appropriate groups (Allaway et al., 2014). Of course, the ultimate goal of AI in loyalty programs may be to create a unique personalization for every single customer, however, such a solution is very hard to implement, organize, and put into practice, and even if possible, for most brands such a solution will most likely not be the optimal one since it would require too much effort. On the other hand, AI may help to segment customers into relatively narrow groups with similar segmentation criteria, which allows brands to personalize on a broader scale while still keeping it personalized. It ensures that activities, incentives, promotions and messages are directed at certain customer segments, matching their requirements and interests.

On a general level, loyalty programs may use personalization to match experiences, offers, rewards, incentives and communications to the customer`s preferences based on the information collected about the customer. It

is important to note that personalization can be present in various ways, from a very simple personalized greeting to highly personalized offers at a certain time of the day. The goal is to make every customer feel special and appreciated. Personal touch may improve customer engagement with the brand and thus build a closer relationship (Bilal et al., 2024). In the context of loyalty programs, information up to a depth of scroll, or time spent on a specific part of the application can be analysed and used as valuable insights. Using machine learning algorithms can help in offering personalization instantly to the customers, for example, a customer who typically buys a certain type of product on a certain day or time of the day may be recommended another similar item or offered a discount on their next visit at this day or time. Another example can be, if the AI algorithm finds that a specific customer usually buys gifts at the start of May, then the loyalty program could proactively suggest gift options and unique offers during April. This way, not only customer needs are matched, but at the same time, the overall experience with the brand can be very positive, leading to building deeper connections and a feeling of mutual understanding. At the same time, such activities provide value to the customer at the right time, which increases the chance of purchase.

The second technology we`ve mentioned is predictive modelling. This technology takes advantage of using historical data collected from different sources, in our case mainly from loyalty programs to forecast the most probable future customer behaviours and preferences (Nsakanda et al., 2011). By leveraging this technology brands have unique opportunities to enhance strategic marketing and customer engagement efforts. Predicting future customer behaviours also mean it provides brands with an opportunity to predict customer churn, making it possible for brands to react swiftly to different triggers that may cause it, enabling them to intervene proactively, for example with personalized offers to retain those customers. Another possible implication is lifetime value prediction with the help of AI technologies, which may help brands estimate the long-term value of certain customers or groups of customers, as well as products or product categories, so the brands may focus their efforts on the most profitable products or groups of customers.

Another part that can be used in predictive modelling is sentiment analysis. In the online environment, it takes into account customer feedback, customer reviews, and even social media posts and sentiments used in them, which makes it possible for brands to adjust their strategies and communication in real-time in order for communication to be appropriate to the current customer sentiments (Liberati & Camillo, 2014). To summarize, the combination of personalization and predictive modelling in loyalty programs helps to enrich customer experience and improve the effectiveness of marketing campaigns. By accurately predicting and addressing customer needs, brands have an opportunity to develop targeted strategies that enhance customer satisfaction, increase retention rate and boost overall profitability.

4. Benefits to Brands and Customers

In this part of our paper, we want to briefly mention the ways in which AI usage in loyalty programs may benefit brands and customers. Firstly, we want to list the primary benefits for businesses, among which are:

- **Increased interaction and customer retention:** Based on the information provided above, it is safe to assume that personalization and other AI technologies are capable of increasing interaction, and, as a result, customer retention. Since in today's world customers expect personalization, its greater level can also cause a higher customer lifetime value, as well as loyalty improvements.
- **Operational efficiency:** AI, even in its current state is capable of automating many tasks within loyalty programs, from customer segmentation and incentives division to customer complaint service management. There are many tasks that may be automated by AI and thus reducing the need for manual work and funds required for it.
- **Data-based decision-making:** Since AI is capable of analysing giant datasets, it is capable of providing unique and in-depth insights into anything connected to brands` marketing activities. Based on those insights, brand managers can make better assumptions, and ultimately more profitable decisions that reflect the current state of loyalty programs.
- **Fraud prevention:** AI is useful in stopping fraud by recognizing and preventing fraudulent activities with the help of its data analysis and potential for harmful patterns detection, making sure that loyalty programs stay as safe and trustworthy for customers as possible.

It is also important to mention what benefits may AI in loyalty programs bring for the customers. Among them are:

- **Customized experiences:** Implementation of AI can offer customers personalized deals, suggestions and rewards matched to their individual tastes and buying preferences. Mostly it is the result of the above-mentioned ability of AI for in-depth personalization.
- **Greater convenience:** Since certain AI models are capable of not only working with text input but also visual or audio, technologies like voice control or visual assistance can bring greater convenience for their users.
- **Improved satisfaction:** If the purchasing process is more personalized and in the case a customer needs help there is a tool that is capable of providing it immediately, it is safe to assume that the general customer satisfaction would grow higher over time.
- **Trust and security:** Since AI is capable of fraud detection, it may provide a feeling of safety not only to the brands but also to the customers, since they would know that their information is stored safely.

AI in loyalty programs is beneficial for both brands and customers, with the advantages overlapping in enhancing engagement and efficiency. Brands gain from the operational efficiencies and strategic insights provided by AI, which result in cost savings as well as improved customer retention. Customers on the other hand may get the benefit of interactions that are more personalized and satisfying to make their experiences more rewarding. The inclusion of AI within loyalty programs gives a kind of win-win situation for both sides of B2C relations.

5. The Current State of AI Usage in Loyalty Programs on the Selected Market

We found it interesting to look at the examples of AI usage in loyalty programs on the selected market, and we decided to choose the US market as an object of our interest. In the United States, AI integration into loyalty programs is particularly advanced, with many leading brands leveraging this technology to enhance customer engagement and operational efficiency. The application of AI in loyalty programs typically involves different approaches, from personalization strategies, and predictive analytics to customer data management. In this chapter, we want to look at specific examples of how brands use AI in their loyalty programs.

Generally speaking, Starbucks approaches AI as the future of their marketing communication and tries to embed it into various activities of the brand. Deep Brew has become the center of this strategy, and mainly it is using AI capabilities for data analytics and to provide personalized customer experiences, including personalized marketing messages and personalized menu recommendations. This approach of making data-driven decisions is also used in their Starbucks Rewards program, in which, with the help of an AI, they are capable of identifying customer preferences and providing rewards that have a higher chance of being appropriate. Thus, they also aim to encourage return visits, enhance customer lifetime value and ultimately, build a strong loyalty towards the brand (Zaytsev, 2024).

The information they do analyse is not being used only for personalization purposes, but also serves as a great insight for their menu management or updating product offers. Most of their newest products, whether included in the regular menu or as a part of seasonal offers are created based on the information collected and analysed in order to make them as appropriate to the general public as possible. According to Kotorchevikj, the company has discovered from its data analytics that approximately 43% of tea drinkers prefer not to add sugar to their tea, while approximately 25% of users don't add milk to their iced coffee while drinking at home. Based on these results, two new products were created, that were aimed at customers with the above-mentioned preferences (Kotorchevikj, 2021).

As we can see, Starbucks is one of the companies that truly leverages the possibilities of AI and tries to take advantage of the technology in whichever form it is present today. It is also possible to find information about Starbucks planning or actively using AI while deciding on the new store location, employers management or drive-thru experience personalization. All of this makes this brand an interesting one to follow on the topic, and further research can be useful and insightful as an example of AI usage in a brand.

Another example of AI usage in loyalty programs can be found in Wyndham hotels & resorts. Their approach was a little different than in our previous example since they first decided to make a full renovation to make the loyalty program architecture fully cloud-native. They made it in order to automate various different systems they had in use, so they could be made more efficiently and with more precision. They also noted that previously, since their operations were related to manual data processes there was more space for potential human errors or inefficiency, which was eliminated by automation. This rework of the loyalty program also brought many benefits to their customers. They started using not only in-depth data analytics but also techniques of predictive modelling to anticipate not only customers' needs at this exact time but also what

they may search for in the near future. According to PwC, after automation was put in place, the satisfaction rate on both sides got bigger, with fewer issues appearing and their faster resolution (PricewaterhouseCoopers, n.d.).

The last example of AI usage in a loyalty program we want to mention in this part of our paper Is from Lyft, a ride-sharing service operating in the US. In their loyalty program Lyft rewards they started using AI algorithms in order to be able to detect fraudulent or potentially dangerous activities and to prevent them. Mostly they focused on analysing rider behaviours and trip data, and in case there were data inconsistencies with normal usage patterns, algorithms noticed that. Among such unusual behaviours were, for example, many rides taken from the same location or usage of multiple accounts with the goal of misusing promotions. After the algorithms noticed such activities, Lyft team was notified, had to look at the case, check its details and, if needed, take appropriate actions. This way, the company was able to ensure the loyalty program and its benefits stay effective as well as protect themselves from potential financial losses from misusing parts of it (Thurman, 2023).

While not part of a loyalty program as of yet, Lyft is another company that puts a big emphasis on AI usage in many parts of its business. For example, as of 2023, they have already used AI technologies for getting and providing more accurate times of arrival thanks to machine learning combined with real-time data analysis, optimizing ride routes based on the real-time information on other drivers' behaviours and events happening, predicting the drive destinations based on machine learning of previous information and coordinating rider pickup in the places it may not be so evident (Conlisk, 2023). Some of these technologies may be pushed even further and be implemented within loyalty programs. For example, predicting the ride destination may provide loyal customers with specific new recommendations based on the data about specific customers, their preferences, preferences of similar users etcetera. As of today, we find Lyft to be an interesting example of creative AI usage and a brand that deserves further research in this context.

As we can see, in our case examples were mainly connected to the hospitality industry, which was not defined in advance. However, this raises the room for further research on AI usage in loyalty programs in various industries and comparisons between them. Those examples emphasize how AI technologies are being effectively utilized to not only personalize customer experiences but also improve operations and data management in loyalty programs. The use of AI allows brands like Starbucks, Lyft and Wyndham to maintain a competitive edge by adapting to consumer needs rapidly and efficiently.

6. Challenges and Considerations

Since the adoption of AI into loyalty programs is still in its early stages and not much research has been done in this narrow context, it is natural that many challenges and considerations may occur. One of such challenges are ethical concerns, since the question of regulating AI technologies is still to be solved. Also, since many AI use cases in loyalty programs are centered around data analytics, machine learning and predictive modeling, concerns about data privacy and security of data handling are also present (Mogaji et al., 2020). If certain program collects more personal or sensitive data from the user, concerns about how ethical it is to use such information are also present. Last but not least, there is a risk of bias in AI algorithms, since many of them are making decisions based on the information collected and certain offensive or even discriminative decisions can be made on such basis.

Difficulties in adding AI to loyalty programs also lie in the technological factor - especially in making new AI technologies work well with present systems (Kutz et al., 2022). While currently, many AI tools offer their services on a subscription basis and only require input from a customer while all the computational work is done by the company itself, this solution may not be appropriate in our researched context. If the company wants to manage certain AI technology internally, it may become very expensive and hard to operate, making it a huge barrier, especially for small and medium companies that may not have enough resources at their disposal.

Often, a company's change aversion from inside its own structure can slow down the adoption process too. This could be because workers and management need time to adapt to new processes or technologies being introduced within their workplace, as well as the need for employees to learn new skills and optimize their work routine in the context of AI presence.

To effectively address these challenges, it is crucial to:

- **Practice AI transparency and collect customer consent:** It is crucial for brands to clearly explain the ways in which customer data is being used, analysed, and processed in any way, and the first step should be gaining their approval, which helps to establish trust, make the whole process clear, allow those, who don't want there data to be processed to do so and adhere to privacy laws which are constantly evolving.
- **Provide employee training and management corrections:** AI systems are influencing the work routines of professionals in different fields, and marketing is not an exception. Providing the employee team with thorough training and assistance may help them to get all the necessary skills and thus make the adoption process less complicated.
- **Manage AI systems audit:** Setting up periodic checks to make sure that AI systems are running free from prejudice and following moral rules seems to be crucial in the modern context of AI.
- **Choose scalable and integrable solutions:** Today, AI is the field that is developing very rapidly and new solutions are being created constantly. Selecting AI solutions that are able to grow along with the business, fitting in smoothly with the current structure as well as the vision of the brand may reduce future disturbances and increase the effectiveness of those AI solutions.

7. In Conclusion

In this paper, we tried to present the topic of how Artificial Intelligence can enhance loyalty programs through its various opportunities like data analysis, personalization and predictive modelling. We covered basic theoretical background on the topics of loyalty programs and artificial intelligence, usage of AI in loyalty programs, its benefits for brands and customers, the current state of AI usage in loyalty programs on the United States market, as well as challenges and considerations that companies face in the context of AI implementation into loyalty programs. We can state that the topic of AI usage in loyalty programs has not been researched enough yet, which provides many opportunities for further research. At the same time, in practice, some brands leverage AI capabilities on a decent level, while others may struggle to implement one due to the limitations or scepticism of new technologies.

However, in our opinion, it is clear that in the following years, the role and impact of AI on loyalty programs will only grow bigger, especially through new technological advancements and improvements in machine learning, natural language processing and real-time data analysis. There is also a possibility of more independent AI systems appearing, managing all parts of activities within the loyalty program on an automated basis. While it is hard to predict which direction this development will take in the future, it is clear that the technology is here to stay, and further research on the topic would be essential for its better understanding.

The Influence of Artificial Intelligence on Modern Marketing

Lenka Labudová
University of Ss. Cyril and Methodius in Trnava, Faculty of Mass Media Communication, Slovakia

lenka.labudova@ucm.sk

Abstract: This paper explores how Artificial Intelligence (AI) is reshaping the marketing landscape, using data primarily sourced from Statista. By analysing global trends up to March and July 2023, we aim to provide a clear understanding of AI's impact on marketing strategies and outcomes. We begin by examining the rapid growth of AI in marketing, including its market size, revenue, and the preferences of users worldwide. We also highlight the popularity of leading AI text tools among users, giving insights into their market dominance and adoption rates. In addition, we investigate the funding landscape for AI marketing-related startups, showcasing the industry's investment trends and innovation potential. Furthermore, we identify the most effective ways marketers are using AI and marketing automation, offering practical insights for professionals seeking to leverage these technologies. Our study also looks at where AI is being used in marketing, revealing the diverse applications that are shaping strategies globally. We delve into the tools and platforms driving AI integration in marketing and advertising, as well as the main tasks undertaken by professionals using generative AI. A key focus is on AI-assisted writing, where we outline how marketers are employing AI for content creation and its impact on efficacy. We also explore the perceived benefits of AI tools according to marketing professionals, providing actionable insights for decision-making. Lastly, we assess the effectiveness of chat-based search advertising, particularly among paid search marketers in the United States. Through a concise summary of our findings, this paper aims to offer a comprehensive view of AI's transformative role in marketing, providing practical insights for industry stakeholders navigating this evolving landscape. In conclusion, this research serves as a roadmap for marketers, entrepreneurs, and industry professionals, guiding them through the integration of AI technologies into marketing strategies and operations. By understanding the current trends and potential benefits of AI, stakeholders can adapt and thrive in an increasingly AI-driven marketing environment.

Keywords: Artificial intelligence, Marketing, Marketers, Text tools, Trends

1. Literature Background

Artificial intelligence (AI) in marketing is getting popularity due to the practical impact it will have in both the current business and the industry of the future. It is essential to conduct research studies with a wider scope and coverage on the application of AI in marketing, and it is also essential to conduct meta-analyses of previously conducted studies in order to determine the routes that future research should go. In the most recent decade, the development of artificial intelligence has contributed to an increase in the complexity of marketing. The utilisation of technology to its fullest potential in order to provide a superior experience for customers is the goal of artificial intelligence marketing, says Pathak et al (2022). In marketing, AI can be used to analyze data, identify patterns, predict outcomes, and automate processes. In today's world, every aspect of our lives is influenced by technology. The marketing industry is no exception. With the advent of technology, artificial intelligence (AI) has become an integral part of the marketing industry think Vlačić et al (2021 and add that AI is a set of algorithms and intelligent computer systems that can learn, think, reason, and perform tasks that typically require human intelligence. The role of AI in marketing is constantly evolving and its potential to provide businesses with an insightful competitive edge cannot be overemphasized. The authors Reddy et al (2023) understand that artificial intelligence (AI) Marketing produces automatic judgments relying upon information gathering and analytics, as well as other insights about population or socioeconomic tendencies which could impact promotional strategies. Artificial intelligence (AI) is widely used in advertising initiatives when efficiency becomes crucial. AI solutions understand how to successfully connect with consumers depending on information and consumer histories, then provide customized communications at the appropriate moment eliminating the requirement for promoting crew involvement guaranteeing maximum profitability. Lakshmi et al (2023) claim AI has several applications in marketing, such as: Personalization AI can help businesses create personalized experiences for customers by analysing their behaviour and preferences. AI algorithms analyse browsing and purchasing history, as well as other behavioural data points, to create a unique profile for individual. From there, these programs can curate content, advertisements, and recommendations tailored specifically to interests. While this may seem like a small convenience, it has the potential to revolutionize the way we interact with technology by creating a more intuitive and personalized experience.

Based on Haleem et al (2022) future marketers can use AI to create personalised experiences for their customers and develop marketing analytics techniques to target potential customers. Every interaction a prospect or consumer has with a product or solution is recorded and used to improve the product or service in

the future. There will be a better time for marketers to start experimenting with AI strategies to help them create highly personalised experiences for their customers. With AI poised to continue growing across all industries and segments, marketers should dedicate time and resources to experiment with strategies and ensure their marketing organisation is set up for continued success, both now and in the future. Kastenholz (2024) claims that despite initial concerns, AI has proven to be an invaluable asset in influencer marketing strategies. Rather than stifling creativity, AI has allowed marketers to focus more on strategy and innovative content by handling data analysis and trend forecasting. AI and human creativity complement each other, leading to more impactful and strategically sound campaigns. Moving forward, the successful integration of AI into influencer marketing will depend on brands and marketers balancing new technologies with ethical considerations and a commitment to transparency and authenticity. Achieving this balance can empower marketers and creatives, making their work more efficient and data-driven while enhancing engagement and innovation at the intersection of technology and human creativity. Lucas (2024) see that the integration of AI into marketing and advertising is fundamentally transforming how businesses engage and connect with their target audiences. AI has introduced a paradigm shift by infusing data-driven insights, predictive analytics, and personalized experiences into strategic decision-making, moving beyond traditional marketing approaches. This evolution goes beyond conventional outreach methods, allowing businesses to create more meaningful and tailored connections with their audiences. By processing vast datasets in real-time, AI provides a deep understanding of consumer behaviors, preferences, and emerging trends. This nuanced comprehension enables businesses to craft campaigns that are not only targeted but also intricately personalized, fostering a resonance that transcends generic messaging.

2. Methodology

The aim of the present paper is to determine the current state of artificial intelligence, specifically in the area of use by marketers, based on data from respondents. The data is drawn from Statista https://www.statista.com/, from year 2023. Figures and tables were processed and presented to illustrate key trends and findings, offering insights into the impact of AI on enhancing efficiency, creativity, and strategic optimization in marketing and advertising. The data presented in this analysis is derived from a comprehensive survey conducted in 2023, targeting marketing and advertising professionals globally. The survey aimed to explore the adoption and applications of generative artificial intelligence (AI) within the industry. In the first part of the paper, we focus on current views and knowledge in the field of artificial intelligence and marketing. This is followed by a brief methodology of the paper and the statement of the research questions. We then look at specific survey results, which we describe and outline possible future developments in the area under study.

Research questions set for the purpose of these paper are as follows –

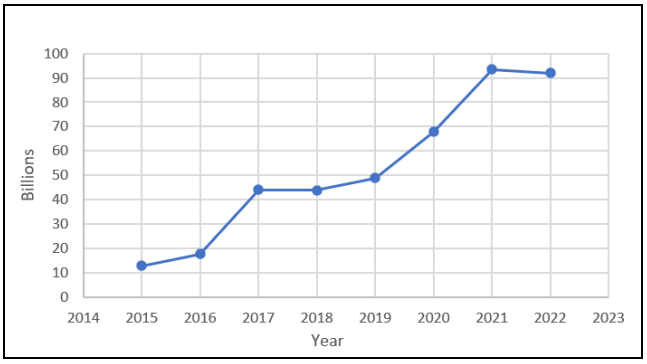
Is ChatGPT the most used AI text tools?

Exploring whether ChatGPT is the most utilized AI text tool is vital due to its relevance in current marketing trends. With AI increasingly shaping marketing strategies, understanding ChatGPT's prevalence provides crucial insights into the dominant tools driving AI adoption in marketing contexts

Is ChatGPT the most used AI tool for marketers?

As AI becomes increasingly integrated into marketing strategies, understanding ChatGPT's prevalence offers valuable insights into its role as a primary tool in content generation and customer interaction.

What are the biggest benefits of using AI tools for marketers?

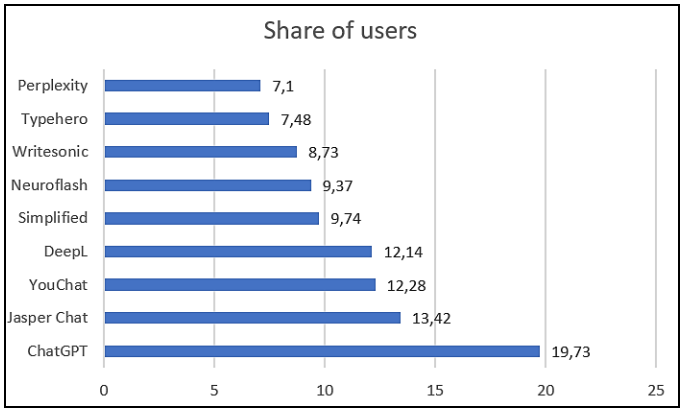


Exploring the biggest benefits of using AI tools for marketers is essential to capture the forefront of industry advancement. With AI rapidly transforming marketing practices, understanding its key advantages provides critical insights into maximizing its potential.

What are the most common tasks that marketers outsource for AI tools?

Investigating the most common tasks that marketers outsource for AI tools is vital to comprehend the evolving dynamics of marketing operations. As AI continues to revolutionize the industry, understanding which tasks are commonly delegated to AI tools provides valuable insights into workflow optimization and resource allocation.

3. Results

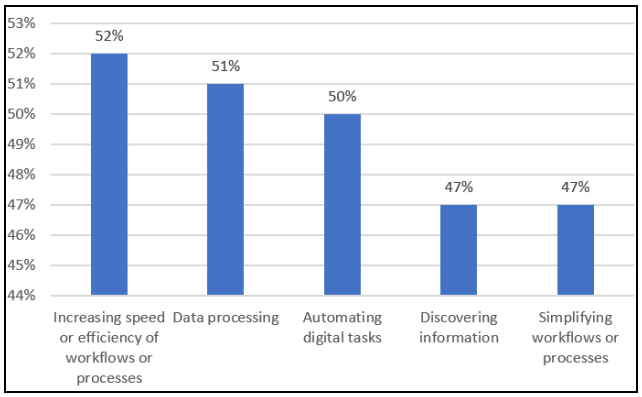


In this section, we take look into the results of a comprehensive survey conducted in July 2023, on the widespread adoption and diverse applications of generative artificial intelligence (AI) in the marketing and advertising landscape. Marketing and advertising professionals worldwide have embraced AI tools for a multitude of tasks, ranging from content creation to strategy optimization. The data presented here reflects the evolving role of AI in streamlining workflows and enhancing creativity within the industry. This analysis will delve into the specifics of how professionals are leveraging AI, including the leading AI tools used, the main tasks undertaken, and the benefits reaped from AI integration. By exploring these results, we gain valuable insights into the transformative impact of AI on modern marketing and advertising practices.

Source: Own processing based on https://www.statista.com/statistics/941137/ai-investment-and-funding-worldwide/

Figure 1: Global total corporate artificial intelligence (AI) investment from 2015 to 2022 (in billion U.S. dollars)

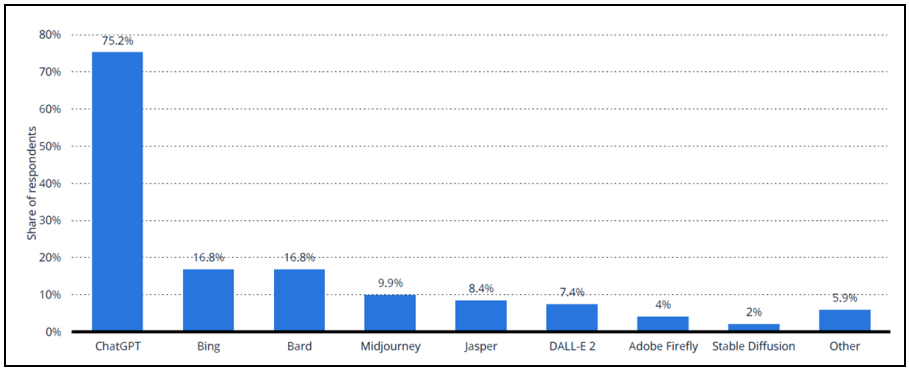
Global corporate artificial intelligence (AI) investment has seen a remarkable rise from 2015 to 2022. The data reveals a consistent upward trend, starting at 12.75 billion USD in 2015 and rising to 17.7 billion USD in 2016. A significant leap occurred in 2017, with investment reaching 44.08 billion USD. This trend continued with 43.81 billion USD in 2018 and 48.85 billion USD in 2019. In 2020, investment surged to 67.85 billion USD, followed by a peak in 2021 at 93.5 billion USD. Despite a slight decrease, 2022 remained strong at 91.9 billion USD. These figures illustrate the increasing significance of AI in corporate strategies, with the industry attracting substantial investments globally. This growth reflects a broader trend of businesses recognizing AI's potential to drive efficiency and innovation. The data underscores the importance of staying abreast of these investment patterns for companies seeking to remain competitive. The continued rise in AI investment suggests a bright future for the industry, with potential implications for various sectors of the global economy. Release date - April 2023, region – worldwide, survey time period - 2015 to 2022.



Source: Own processing based on https://www.statista.com/forecasts/1423975/world-generative-ai-text-tool-market-share

Figure 2: Leading generative artificial intelligence (AI) text tools market share of users globally in 2023

In 2023, the market for leading generative artificial intelligence (AI) text tools showcased a diverse landscape of user preferences globally. ChatGPT claimed the largest market share, with 19.73% of users opting for its



capabilities, followed by Jasper Chat at 13.42% and YouChat at 12.28%. DeepL, known for its translation prowess, held a notable share of 12.14%, while Simplified and Neuroflash attracted 9.74% and 9.37% of users respectively. Writesonic secured an 8.73% share, appealing to those seeking user-friendly AI text solutions. Typehero and Perplexity held shares of 7.48% and 7.1%, catering to specific user niches. This distribution highlights varying user preferences, with ChatGPT's leading position indicating widespread trust and adoption. DeepL's significant share underlines its reputation for accurate translations, while Writesonic's share reflects its user-centric approach. Overall, this market snapshot reveals a dynamic landscape shaped by innovation and a diverse range of user needs in AI text tools.

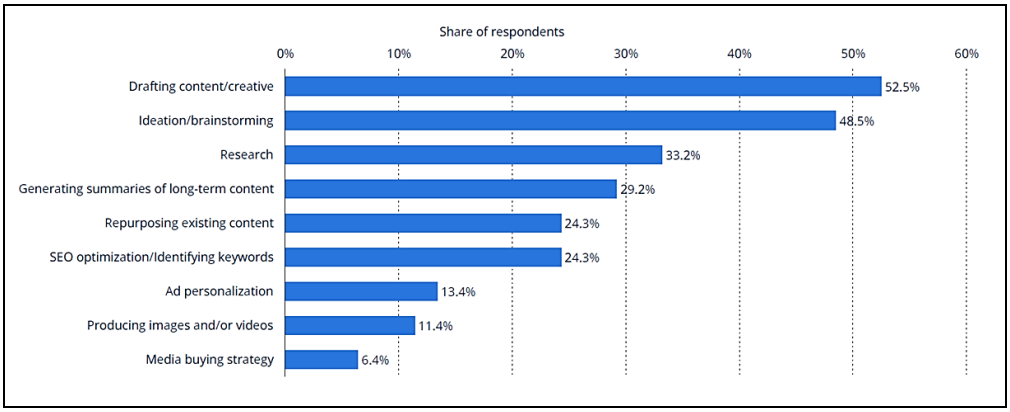
Figure 3: Leading benefits of using artificial intelligence (AI) tools according to marketing professionals in the United States as of June 2023



According to marketing professionals in the United States as of June 2023, several key benefits of using artificial intelligence (AI) tools have been identified. The leading benefit, reported by 52% of respondents, is the ability of AI to increase the speed or efficiency of workflows and processes. Close behind is data processing, cited by 51% of professionals, showcasing AI's role in handling and analyzing vast amounts of data efficiently. Automating digital tasks is another highly valued benefit, with 50% of respondents recognizing AI's capability to streamline repetitive tasks and improve productivity. Furthermore, 47% of professionals highlighted AI's role in discovering valuable information, indicating its capacity to sift through data and extract actionable insights. Simplifying workflows or processes was also cited by 47% of respondents, underlining AI's role in making complex tasks more manageable and user-friendly. The data suggests that marketing professionals value AI for its ability to enhance operational efficiency, data management, and task automation. The high percentages across these benefits indicate a strong recognition of AI's transformative impact on marketing operations. Marketing professionals are increasingly leveraging AI to optimize their workflows, process data more effectively, and automate tasks that would otherwise be time-consuming. Release date of the survey July 2023, region - United States, survey time period - June 2023, number of respondents - 281 respondents, age group - 18 years and older.

Source: https://www.statista.com/statistics/1405052/gen-ai-tools-used-marketing-advertising/

Figure 4: Leading generative artificial intelligence (AI) tools and platforms used in marketing and advertising worldwide as of July 2023

As of July 2023, the landscape of generative artificial intelligence (AI) tools and platforms used in marketing and advertising worldwide is dominated by ChatGPT, with an impressive share of 75.20% of respondents utilizing its capabilities. Following ChatGPT are Bing and Bard, both with equal shares of 16.80%, indicating their significant presence in the market. Midjourney and Jasper follow suit with shares of 9.90% and 8.40% respectively, showcasing their relevance in the AI tools space for marketing tasks. DALL-E 2, known for its image generation abilities, holds a share of 7.40%, demonstrating its niche within the market. Adobe Firefly, with a 4% share, and Stable Diffusion with 2%, cater to specific user needs within the marketing and advertising sector. The "Other" category, representing a variety of AI tools not specified, accounts for 5.90% of the respondents' choices. These figures highlight the dominance of ChatGPT as the preferred AI tool for marketing and advertising tasks globally. Its widespread adoption suggests a high level of trust and effectiveness among users. Bing and Bard's equal shares indicate a competitive landscape where multiple platforms are sought after for various functionalities. Midjourney and Jasper's shares suggest a moderate but significant usage among marketing and advertising professionals, possibly for their specialized features. DALL-E 2's presence underscores the importance of visual content generation in marketing strategies. Adobe Firefly and Stable Diffusion, although holding smaller shares, cater to specific needs within the industry, providing users with targeted solutions. The "Other" category's 5.90% share hints at a diverse range of AI tools and platforms utilized by marketing and advertising professionals for their unique requirements. Release date July 2023, region North America, Europe, Central and South America, survey time period - July 2023, number of respondents - 202 respondents.

Source: https://www.statista.com/statistics/1404764/gen-ai-uses-marketing-advertising/

Figure 5: Main tasks in which marketing and advertising professionals used generative artificial intelligence (AI) worldwide as of July 2023

In July 2023, marketing and advertising professionals worldwide utilized generative artificial intelligence (AI) for a variety of tasks, reflecting the diverse applications of AI in the industry. The most common task, reported by 52.5% of respondents, was drafting content and creative materials. This indicates a widespread use of AI in generating written content, such as articles, social media posts, and ad copy, to streamline the creative process. Ideation and brainstorming followed closely behind, with 48.5% of respondents utilizing AI for generating ideas and concepts. This suggests that AI tools are not only used for execution but also for the initial stages of content creation, aiding professionals in developing innovative strategies. Research emerged as another significant task, with 33.2% of professionals leveraging AI to gather information and insights efficiently. This indicates that AI is instrumental in processing vast amounts of data to extract valuable findings for marketing strategies. Generating summaries of long-form content was cited by 29.2% of respondents, showcasing AI's role in condensing complex information into digestible formats. Repurposing existing content, reported by 24.3% of professionals, demonstrates AI's ability to recycle and adapt content for different platforms and audiences. AI's role in search engine optimization (SEO) optimization and identifying keywords was noted by 24.3% of respondents, highlighting its importance in enhancing online visibility and content relevance. Ad personalization, mentioned by 13.4% of professionals, indicates AI's use in tailoring advertisements to individual preferences and behaviors. Producing images and videos, though lower on the list with 11.4%, signifies AI's role in creating visual content efficiently. Finally, media buying strategy, reported by 6.4% of respondents, shows that some professionals utilize AI for optimizing their advertising spending and placement decisions. Release date - July 2023, region - North America, Europe, Central and South America, survey time period - July 2023, Number of respondents - 202 respondents.

4. In Conclusion

This paper has provided a comprehensive overview of the landscape of generative artificial intelligence (AI) tools and their applications in marketing and advertising as of July 2023. The data presented reveals that ChatGPT stands as the undisputed leader among AI text tools, with an impressive 75.20% share of respondents utilizing its capabilities. This dominance reflects its widespread adoption and effectiveness in aiding marketing professionals worldwide. The analysis also shed light on the significant benefits of integrating AI tools into marketing strategies. The top benefits identified include increasing workflow efficiency (52%), data processing (51%), and automating digital tasks (50%). These findings underline the pivotal role of AI in enhancing operational efficiency and providing marketers with innovative solutions to navigate the complex landscape of modern marketing. Looking towards the future, the possibilities for AI in marketing are vast. As technology continues to evolve, AI is poised to play an even greater role in areas such as personalized customer experiences, advanced data analytics, and predictive marketing strategies. Marketers can leverage AI to gain deeper insights into consumer behaviour, optimize campaigns in real-time, and create highly targeted and relevant content.

In the evolving landscape of marketing, AI is driving transformative changes across various fronts. AI-driven content creation and curation are revolutionizing personalized customer experiences, allowing marketers to tailor content to individual preferences for heightened engagement and loyalty. Enhanced data analytics and predictive modelling empower more effective targeting and campaign optimization, ensuring that marketing efforts are precisely directed toward the right audience segments. The increased adoption of AI-powered chatbots and virtual assistants is reshaping customer engagement, providing personalized interactions and 24/7 support. Moreover, the integration of AI into social media marketing enables sentiment analysis and trend prediction, allowing marketers to stay ahead of the curve with real-time insights. As the industry progresses, there is a growing emphasis on AI tools for SEO optimization and keyword identification, reflecting the need to leverage AI's capabilities for enhanced visibility and relevance in digital landscapes. These trends collectively signify AI's profound impact on modern marketing strategies, offering unprecedented opportunities for efficiency, personalization, and strategic innovation. Possible recommendations for Marketers could be

- utilize AI tools like ChatGPT for drafting content and creative materials, enabling efficient and diverse content creation,
- explore AI platforms for ideation and brainstorming sessions, enhancing creativity and generating innovative campaign ideas,
- integrate AI tools for workflow efficiency, data processing, and automating digital tasks to streamline marketing operations,
- enhance data analytics capabilities by investing in AI-powered tools for deep insights into consumer behaviour and trends,
- continuously monitor AI trends and advancements in marketing technology to remain competitive and innovative in a rapidly evolving landscape.

Four research questions were set for the purpose of the paper -

Is ChatGPT the most used AI text tool?

ChatGPT is indeed the most used AI text tool according to the data, with an impressive share of 75.20% of respondents utilizing its capabilities. This signifies its widespread adoption and dominance in the market among marketing and advertising professionals worldwide.

Is ChatGPT the most used AI tool for marketers?

ChatGPT is the most used AI tool for marketers, specifically in the realm of generative artificial intelligence (AI) tools and platforms. Its share of 75.20% indicates its significant preference among marketing and advertising professionals globally.

What are the biggest benefits of using AI tools for marketers?

The biggest benefits of using AI tools for marketers, based on the data, are:

Increasing speed or efficiency of workflows or processes, data processing and automating digital tasks.

What are the most common tasks that marketers outsource for AI tools?

The most common tasks that marketers outsource to AI tools, as indicated by the data, are drafting content/creative, ideation/brainstorming and research.

The paper underscores the significant benefits of integrating AI tools into marketing strategies, with top advantages including increased workflow efficiency, data processing, and task automation. Looking forward, AI holds immense potential in revolutionizing personalized customer experiences, advanced data analytics, and predictive marketing strategies. Marketers are encouraged to leverage AI for content creation, ideation, workflow optimization, data analytics, and staying abreast of evolving trends to remain competitive and innovative in the dynamic marketing landscape. The paper also addresses four key research questions, confirming ChatGPT's dominance, its role as the most preferred AI tool for marketers, the significant benefits of AI tool utilization, and the common outsourced tasks to AI tools, providing valuable insights for industry practitioners.

Limitations of the research are as follows –

- The data and findings are based on information available as of year 2023. The fast-paced nature of AI and marketing technologies means that the landscape may have changed significantly since then. New tools and platforms may have emerged, altering market shares and the benefits derived from these technologies.
- The sample sizes for some of the surveys are relatively small (e.g., 202 respondents for global generative AI tool usage). This may not be fully representative of the entire population of marketing and advertising professionals.
- The research primarily focuses on quantitative data (e.g., market shares, percentages of usage).
- Since the secondary data were used the research part does not provide detailed information on the survey methodology, such as how participants were selected, the survey distribution channels, or the response rates.

Paper does not represent the final research, but the primary analysis which will lead to detailed researching in this area. Future research can minimize current limitations by conducting longitudinal studies to track AI adoption and impact over time and expanding sample sizes for broader representation. Enhancing survey methodologies with detailed design transparency and mixed-method approaches will provide deeper insights. Comparative analyses of AI tools, focusing on features, performance, and user satisfaction, will highlight why certain tools are preferred. Addressing technological limitations and ethical implications, including data privacy and algorithmic fairness, will ensure a comprehensive understanding. Detailed ROI analyses and cost-benefit studies will elucidate the financial implications of AI adoption. Providing empirically backed future predictions and scenario analyses will offer grounded insights into AI's potential developments. Incorporating detailed case studies and user experience research will showcase practical applications and highlight best practices.

Entrepreneurial Spirit Paving the way for Successful AI Deployment in Knowledge Work and Organizations

Anna Lahtinen and Pirjo Saaranen
Haaga-Helia University of Applied Sciences, Helsinki, Finland

anna.lahtinen@haaga-helia.fi
pirjo.saaranen@haaga-helia.fi

Abstract: The rapid advancements in Artificial Intelligence (AI) have significantly shifted the landscape of work, altering the roles of experts and knowledge workers across various domains (Humala et al. 2023). This paper explores the pivotal role of key competencies – self-efficacy, job crafting, and proactivity – in navigating the technological transformation brought about by AI in work settings. The three key competencies were previously identified as the main building blocks of the entrepreneurial spirit that is necessary for the successful use of AI in knowledge work and organizations (Humala & Lahtinen 2023, Ruohonen & Humala 2022). The research paper draws insights from a quantitative nation-wide survey that was carried out among knowledge workers in Finland. The survey was conducted during February-March 2024, with the insights gained from 474 informants. The research was funded by The Finnish Work Environment Fund and conducted by Haaga-Helia University of Applied Sciences based in Helsinki. Results show that while the integration of AI in knowledge work environments generally supports self-efficacy, job crafting, and proactivity, the effects are varied, showing both enhancement and, in some cases, diminishment. The findings indicate that AI's positive influence is most pronounced among those engaged in high levels of knowledge-based tasks and who maintain a positive outlook toward new technologies. This research also highlights some disparity in experiences between different groups, particularly between younger and older knowledge workers with early- and late-careers as well as those in different work positions, pointing to the need for tailored organizational support to ensure equitable benefits from AI technologies. The research reveals that AI can significantly foster proactivity in the workplace, particularly when employees are equipped with sufficient information and resources. Ultimately, this exploration aims to provide insights into developing AI-supported business models that not only leverage the human entrepreneurial spirit but also foster an inclusive environment that enhances organizational competitiveness and innovation.

Keywords: Artificial intelligence, Knowledge work, Self-efficacy, Job crafting, Proactivity,Eentrepreneurial spirit

1. Introduction

Rapid advancements in Artificial Intelligence (AI) have transformed the work landscape, offering substantial opportunities to enhance efficiency and productivity, and altering the roles of knowledge workers. These workers are crucial to core and support functions within organizations and externally, linking and managing tasks, stakeholders, and interest groups, and their roles often require multidisciplinary collaboration across functions such as HR, communications, IT, and administration. Yet, research on factors influencing AI adoption in knowledge work remains limited (Aunimo et al 2023), and the effective digital transformation depends on adept change management (Alasoini et al 2022). The perceptions and communications of knowledge workers about AI critically influence its organizational integration (Kärnä et al 2020).

Central to this are self-efficacy, job crafting, and proactivity, which have been identified as essential for successfully integrating AI in work settings (Humala & Lahtinen 2023; Ruohonen & Humala 2022), and that affect the roles of self-directed change agents of knowledge workers (Kärnä et al. 2021; Ruohonen & Humala 2022). These competencies foster entrepreneurial spirit and enhance AI use.

This research investigated how these competencies manifest among Finnish knowledge workers in relation to AI use, analyzing survey data from 474 employees across multiple sectors. The research question was as follows: To what extent does the use of AI a) impact knowledge workers' experiences of self-efficacy in the workplace, b) enable or restrict job crafting within organizations, and c) affect employees' proactivity in the work community?

The research was part of the "AIE – Artificial Intelligence as a Promoter of Equality" project by Haaga-Helia University of Applied Sciences. The paper discusses related work (Section 2), methodology (Section 3), research results (Section 4), the implications of findings for research and management practice (Section 5).

2. Related Work

AI refers to a machine's ability to mimic and utilize skills traditionally associated with human intelligence, such as reasoning, learning, planning, or creating (European Parliament 2023). Practically, AI involves advanced analytics based on machine learning combined with automation. Its applications are widely relevant for

knowledge work and include, for example, AI-enhanced predictive analytics, sales forecasting, customer segmentation, legal document analysis, automated financial advising, personalized educational platforms, project management optimization, and data-driven research analysis.

The discourse has primarily centered on the transformation brought about by automation in manufacturing contexts (Leesakul at al 2022). However, the landscape is now expanding as AI technologies facilitate the automation of tasks traditionally performed by knowledge workers (Coombs 2020; von Richthofen, Ogolla & Send 2022). AI impacts the daily tools that are in use of knowledge workers, such as in Microsoft Office applications, email, and the human-like text production in ChatGTP or similar interaction software. Moreover, AI implicates wider changes in knowledge work, as it already skillfully mimics skills traditionally associated with human intelligence, such as reasoning, learning, planning, and even creating.

The term "knowledge work" lacks a uniform definition. It is frequently used to contrast with manual labor, emphasizing roles that rely on specialized expertise and knowledge (Nonaka, I., Toyama, R. & Konno 2000; Pyöriä 2005). Knowledge workers process, analyze, and apply information to produce and develop services (Drucker 1999). Various definitions of knowledge work compiled by Pyöriä (2005) emphasize the multifaceted skills required, the complexity of the tasks, the handling of abstract information, extensive education, and continuous on-the-job learning. For the purposes of the present research, knowledge work was interpreted to involve activities related to the creation, modification, processing, and dissemination of information and knowledge (von Richthofen, Ogolla & Send 2022).

Recognizing and enhancing the competencies, agency, and collaboration of knowledge workers is essential for leveraging AI to create value and support operational effectiveness in organizations (Kärnä et al. 2023). Knowledge workers have a cross-disciplinary business, technological, and social expertise (Jalonen et al. 2019), which is especially important in technology adoption. Understanding, helping, and empathetic capabilities are key – besides technological skills (Frey & Osborne 2017; Kilpi 2016).

The entrepreneurial spirit is linked to the concept of intrapreneurship, which refers to an entrepreneurial approach within an existing organization (Heinonen 2001). An entrepreneurial approach enables individuals and groups to initiate, develop, and successfully manage changes and innovations involving uncertainty and complex situations, thereby achieving personal satisfaction (Heinonen 2001). The entrepreneurial spirit, deeply rooted in internal entrepreneurship, naturally extends to embrace three key competencies: self-efficacy, job crafting, and proactivity. Previously, Humala & Lahtinen (2023) identified these skills as fundamental components of the entrepreneurial spirit required for successful AI implementation in knowledge work and organizational settings. Moreover, these competencies enable knowledge workers to act as self-directed change agents within their organizations, as discussed by Kärnä et al. (2021) and further elaborated by Ruohonen & Humala (2022). As a result, these competencies are vital for knowledge workers as they integrate AI into their roles and navigate the technological shifts in their work environments.

Research by Humala & Lahtinen (2023) demonstrates that the self-efficacy of knowledge workers is enhanced under certain conditions. These include access to training and receiving positive, constructive feedback, which bolsters confidence. Clarity in job roles, adequate resources, and reliable support from the community also play crucial roles in fostering this empowerment. This increased self-efficacy manifests as a boldness towards adopting new technologies such as AI. Utilizing AI allows these workers to customize their tasks, minimize redundancy, and engage in projects that are both personally rewarding and advantageous to their teams.

Moreover, fostering proactive behavior in knowledge workers proves more effective when their abilities are acknowledged, they are encouraged to think independently, and their contributions are actively sought and valued. The cultivation of three critical "super competencies" can inspire individuals and introduce new aspects to their roles, shaping how their employment evolves with the integration of AI (Humala & Lahtinen 2023).

The present research built on these previous discoveries and advanced the understanding of the role of the entrepreneurial spirit – investigated via self-efficacy, job crafting and proactivity – in AI deployment.

3. Methods

3.1 Research Design

A quantitative survey was designed to gain insight into the research question via three hypotheses. First, it was hypothesized that the use of AI in organizations improves the sense of self-efficacy among knowledge workers as they learn to adapt and utilize new technology in their work (hypothesis 1). Second, it was proposed that

the use of AI increases the possibilities for job crafting as routine tasks are automated, freeing up time for more creative and personally inspiring tasks (hypothesis 2). The third hypothesis was that the use of AI promotes proactivity among employees, and the information and resources provided by the organization support anticipatory and independent work (hypothesis 3).

The five dependent variables were Likert-scale variables that measure the hypotheses 1 - 3. Independent variables were person-related variables, such as work position, education, gender, and age. Organizational size was an additional organization-related variable.

3.2 Data Collection

The data was collected through an online survey during the period between 14 February 2024 and 22 April 2024. The Webropol survey tool was used, and the survey was available in both Finnish and English languages. The survey link was distributed among the members of several trade unions employing knowledge workers in Finland and among employers known to employ knowledge workers in office settings.

Furthermore, the contact details of private and public organizations were compiled from Selector's company database, employing a wide selection criterion to include micro-, small-, medium- ja large-size organizations across different sectors. In this manner, the survey was distributed to 28,724 employees within the database.

As a result, 484 responses were gathered. The public link to the survey form and data can be obtained by contacting the authors. Out of 484 responses, 10 subjects were excluded from the analysis, as they were retired, full-time students, on parental or caregiving leave or unemployed. The remaining 474 were included in the analysis as they were at present active in work life.

3.2.1 Demographics of respondents and their involvement with knowledge work

Out of 474, 92.0% reported having a full-time job, 4.9% were entrepreneurs or self-employed, and 3.2% were working part-time. The demographics of the informants is described in Table 1. As can be observed, 64.6% of respondents were female, and the biggest age group is that between 51 and 64 (40.7%), followed by the age group of 41 - 50 (35.4%). The most common levels of education were a higher university degree (master) and university of applied sciences (bachelor) – both represented by 32.7% respectively.

Table 1: Descriptive statistics of the demographics of the respondents.

Variable	Frequency	Percentage
Gender		
Male	150	31.6 %
Female	**306**	**64.6 %**
Other	4	0.8 %
Prefer not to say	14	3.0 %
		Age
30 and younger	21	4.4 %
31-40	87	18.4 %
41-50	168	35.4 %
51-64	**193**	**40.7 %**
65 and older	5	1.1 %
Education		
No vocational education	1	0.2 %
Vocational course or similar (6 months - 2 years)	3	0.6 %
Lower secondary vocational qualification (e.g., vocational school or trade school)	40	8.5 %
Upper secondary vocational qualification (e.g., nursing school, business school, technical institute)	43	9.1 %
University of applied sciences (e.g., Bachelor of Business Administration, Bachelor of Engineering)	**155**	**32.7 %**

Variable	Frequency	Percentage
Higher university of applied sciences	58	12.2 %
Lower university degree (e.g., Bachelor of Arts)	11	2.3 %
Higher university degree (e.g., Master's degree, MBA, Master of Engineering)	**155**	**32.7 %**
Postgraduate education (Licentiate, Doctorate)	8	1.7 %
Position		
Manager (supervisor)	145	30.6 %
Specialist (senior expert)	75	15.8 %
Professional (expert)	**197**	**41.6 %**
Clerical support worker	42	8.8 %
Service and sales worker	7	1.5 %
Other category of worker	8	1.7 %

The respondents were categorized according to their reported involvement with knowledge work. Most informants identified as knowledge workers (51.7%), whose work involves processing, analyzing, and managing information. 19.6% were specialized knowledge workers, whose work is deeply concentrated on the expertise of a specific field of knowledge and its application. Knowledge work pioneers (12.9%) perceived themselves as experts, who promote the use of information in innovative ways and serve as an example to others in knowledge work. 14.8% were partial knowledge workers, with knowledge work being a small part of their job, but not the main task. The remaining five respondents (1.0%) did not see their job essentially being related to processing, analyzing, or managing information.

3.2.2 Respondents' personal innovativeness in IT

The scale for personal innovativeness in IT (Tran et al 2021) was employed to establish behavioral attitudes towards and acceptance of new technologies, as this has been shown to impact behavioral intentions to adopt AI. The results were observed across four variables.

Variable 1 measured the general awareness and interest in emerging technology products. Most respondents (48.5%) agreed that they keep an eye on emerging technology, with an additional 18.8% strongly agreeing, suggesting a high level of interest in new technologies. Variable 2 focused on the proactive adoption of new technologies. Here, responses were more evenly distributed across the spectrum, with 30.6% agreeing and another 31.0% somewhat agreeing that they try out new technology products earlier than others. However, a notable 5.7% strongly disagreed, indicating some reluctance.

Variable 3 assessed the willingness to accept new technological innovations. This item showed a strong positive response, with 55.5% agreeing and 34.8% strongly agreeing that they are generally willing to accept new technologies, reflecting a very favourable attitude towards technology adoption. Variable 4 explored proactive behaviours toward learning new technologies. Nearly half of the respondents (46.4%) agreed that they would look for ways to operate a new technology product upon hearing about it, and 10.8% strongly agree, indicating a proactive approach towards understanding and utilizing new technologies.

Overall, the results suggest that the informants displayed a relatively high level of personal innovativeness in IT, with a strong inclination towards adopting and engaging with new technologies.

3.2.3 Respondents' use of AI at work

Language, text, and speech recognition tools were the most widely used AI applications, with 75.5% of respondents indicating their usage. These tools, which include technologies like ChatGPT, Google BARD/Gemini, and Grammarly, help in understanding, translating, and creating text from inputs or speech. Visual content design tools were used by 40.1% of the respondents, including applications like Canva, Adobe Firefly, and Dall-E, which assist in designing and producing images, patterns, and videos. Predictive data analytics tools were utilized by 35.7% of participants, with tools such as Google Analytics and IBM Watson Analytics offering support in data analysis, providing insights and forecasts that enhance decision-making processes.

AI-based applications developed internally within organizations or tailored for specific organizational needs were used by 24.9% of respondents. Customer service and experience tools were employed by 23.6% of respondents. Recruitment and HR management tools were used the least (5.1%). Other AI Applications were mentioned by 4.2% of respondents, which might include niche or less common AI tools not listed in mainstream categories.

No experience with AI-based applications was reported by 12.4% of respondents, highlighting that despite the widespread adoption of AI, a notable fraction of the workforce remains unexposed to or unaware of the use of these technologies.

3.2.4 Organizations represented by informants

The typical informant was employed by a large private company (51.5%). The second-largest body of informants worked for medium-sized companies (23.4%). Small companies were represented by 11.8% of informants and micro companies by 13.3%.

The respondents represented approximately 247 different organizations. This was inferred from the number of different domains of the emails voluntarily given by 262 respondents. Among the 262 responses, there were 137 different corporate domains (not including Gmail, Hotmail and similar services). Thus, it can be inferred that among the total sample of 474, there were approximately 247 different organizations. The exact figure is not available due to the anonymity of the respondents.

The informants represented over 16 different industries, with a large proportion of the service sector, both in miscellaneous category (13%) as well as specialized services, such as education (12%), information and communication (11%), financial and insurance activities (10%), administrative and support services (9%) and others. Manufacturing companies (12%) were also well-represented.

3.3 Data Analysis Methods

In comparative data analysis, the researchers applied subgroup means, crosstabulations and Spearman's rank correlations (r) because the dependent variables were measured on ordinal scale (Likert). The significances of the relations were tested with non-parametric tests and Spearman's rank correlation test. Significance level (p) was set to 5.0% in statistical tests. The significance level of the correlation coefficient was indicated with the upper indexes ** for the $p \leq 0{,}01$ or * for $0{,}01 < p \leq 0{,}05$.

The relations were analyzed and tested as follows. For independent variables measured at a nominal level (such as work position, gender, and education), and dependent variables measured on an ordinal scale (Likert scale), the analysis was conducted using subgroup means and/or cross-tabulations. The statistical tests employed were non-parametric tests, including the Mann-Whitney U test for pairwise comparisons and the Kruskal-Wallis test for comparisons involving more than two subgroups.

For independent variables measured as scale variables (such as age, organizational size, and the averaging variable of personal innovativeness in IT), and dependent variables measured on an ordinal scale (Likert scale), the analysis was conducted using Spearman's rank correlations coefficient, tested with Spearman's rank correlation test.

Additionally, an averaging variable was created from the four variables measuring the personal innovativeness in IT (see Section 3.2.2) by calculating the mean value of the responses for each informant. The internal consistency was high, with Cronbach's Alpha being .834. The reliability of the research was supported by the ability to duplicate the results should the research be repeated in comparable conditions.

3.4 Impact of AI on Self-Efficacy Among Knowledge Workers

The AI impact on self-efficacy is distributed across a spectrum ranging from negative to positive. Overall, these results indicate that while a small percentage of individuals felt a decrease in self-efficacy due to AI (4.4%), a notable proportion reported positive effects (46.2%), and the largest group perceived no change (49.4%). This suggests a generally neutral to positive reception of AI in terms of its impact on individual self-efficacy in the workplace.

Further analysis showed that the more one's work involved knowledge-based tasks, the more one perceived that AI use had a positive impact on one's self-efficacy ($r=0.204^{**}$). Also, the more positive the attitude towards the use of new technologies, the greater the perceived improvement in self-efficacy, which was enhanced by the use of AI ($r=0.302^{**}$).

Based on this dataset, there was no impact of age and gender on self-efficacy. In both cases the results were not statistically significant and without allowing for a generalized correlation across age groups (r=-0.044; p=0.342) and gender (p=0.905). Similarly, the length of career and the organizational size did not have an impact in this sample, with r=-0.047, p=0,340 and r=0.025, p=0,592 respectively.

Informant's work position had an impact, with notable differences in several categories. Managers and senior experts experienced more positive work effect from the use of AI compared to clerical support workers (p=0.009 and p=0.005 respectively). Managers found more positive effect in comparison to experts (p=0.013).

Compared to experts, their more senior and specialized colleagues – senior experts – perceived stronger positive effects (p=0.010). Similar pattern was identified in the analysis of the second question related to self-efficacy that asked to evaluate the impact of the use of AI on ability to cope with challenging tasks in one's work (p=0.050).

Moreover, while a small fraction saw a decline in their self-efficacy in coping with challenging tasks (1.1%), the overall impact of AI was largely neutral (56.1%) to positive (42.8%). A significant portion of respondents felt that AI had improved their capability to manage difficult tasks at work, reinforcing the notion that AI can be a beneficial tool in enhancing individual work capabilities, especially among those who are already inclined towards embracing new technologies.

Further analysis reinforced the notion that the more the person identified with knowledge work, the more positive impact AI had on one's ability to cope with challenging task (r=0.175**) and, therefore, somewhat increased self-efficacy. The analysis slightly reinforced the conclusion that informant's age (r=-0.122**) and career length (r=-0.102*) correlated inversely with the self-efficacy: with the increase of informant's age and career length, there was a decrease in self-efficacy. Respectively, younger informants' self-efficacy increased with the AI use. The organization size (r=0.025, p=0.583) and gender (p=0.831) did not impact self-efficacy. The results in terms of informant's age and career length offered statistically significant correlation, indicating that the result was generalizable, while the conclusion for organization size was relevant for the sample in question.

3.5 The Role of AI in Enabling and Restricting Job Crafting Within Organizations

A fraction of respondents perceived a negative impact of AI on job crafting (2.3%). This suggests that for a minority, AI may impose limitations on their ability to personalize work tasks. Most respondents, 61.4%, reported "No change" in their ability to tailor their work, indicating that for most, AI did not interfere with or enhance their job crafting capabilities. A significant proportion of respondents observed positive effects of AI on job crafting (36.3%).

The more one's work involved knowledge-based tasks, the more one perceived that the use of AI had a positive impact on opportunities for job crafting (r=0.174**). Attitude towards the use of new technologies correlated with the experience of AI increasing job crafting (r=0.268**). Similarly to the results observed in respect to self-efficacy, informant's age (r=-0.134**) and career length (r=-0.099*) impacted job crafting inversely, with statistically significant negative correlation. In this sample, organizational size (r=-0.005, p=0.911) and gender (p=0.196) did not impact job crafting opportunities. In comparison to clerical support workers and experts, senior experts experienced higher increase for the opportunities to tailor their own work due to the use of AI (p=0.005; p=0.033).

3.6 Influence of AI on Employee Proactivity in the Work Community

A minor portion of the respondents noted a detrimental effect of AI on their proactive behaviors (1.7%). This indicates that AI may limit initiative-taking in a small subset of the workforce. The predominant response, from 64.6% of the participants, was "No change" in their level of proactivity due to AI use. For most employees, AI has neither hindered nor facilitated their propensity to engage proactively at work. On a positive note, a significant number of participants reported improvements in their proactivity due to AI (33.7%). These responses underscored the potential of AI to enhance proactive behaviors in the workplace.

Similarly to self-efficacy and job crafting, employees with higher involvement in knowledge work (r=0.162**) and stronger positive personal attitudes towards new technologies (r=0.252**) experienced increased positive change in proactive and initiative-taking approach in work with the use of AI. In this research sample, informant's age (r=-0.013, p=0.777), length of career (r=-0.006, p=0.891) and organizational size (r=0.033, p=0.476) did not have a notable impact, and nor did gender (p=0.301). With AI use, proactivity increased more

in managers and senior experts in comparison to clerical support workers (p=0.015 and p=0.004 respectively), in managers in comparison to experts (p=0.034) and in senior experts in comparison to experts (p=0.008).

The results indicated the connection between proactive behavior and sufficiency of information and resources provided by the employer, enabling employees to be proactive and take initiative in using AI in their work (r=0.242**), with the slight increase in proactivity with the positive perception of the organizational support.

4. Discussion and Conclusion

This research explored the implications of AI on entrepreneurial spirit manifested through three key competencies – self-efficacy, job crafting, and proactivity – within knowledge work environments. The findings supported the proposed hypotheses and suggested a nuanced spectrum of effects, with a predominantly neutral to positive impact on self-efficacy and more considerable variance in the influence on job crafting and proactivity. Aligning with previous literature, the results showed that AI facilitates an enhancement of these competencies under specific conditions, particularly when employees are provided with adequate information and resources, as was the case with proactive behavior.

The research corroborated prior studies on the role of self-efficacy, job crafting and proactivity as competencies reflective of entrepreneurial spirit and their positive connection to AI use (e.g., Humala et al 2023; Humala & Lahtinen 2023; Ruohonen & Humala 2022; Kärnä, Nikina-Ruohonen & Humala 2021). However, it also uncovered the multifaceted effects of AI in the workplace, including instances where these competencies are diminished.

A significant relationship between AI usage and increased self-efficacy, job crafting, and proactivity was particularly evident among those engaged in high levels of knowledge-based tasks and who held positive attitudes towards new technologies. Nonetheless, the data also indicated a degree of polarization among employees, especially between those at varying levels of involvement in knowledge-based work and personal innovativeness with IT.

Significantly, the results revealed that younger knowledge workers and those with shorter career lengths reported more pronounced experiences related to self-efficacy and job crafting. This underscored the need for enhanced support for older workers and those with longer careers in positively engaging with and developing AI capabilities. The support could include organizational measures, such as targeted training and the provision of suitable tools.

Moreover, the research found that proactivity in the workplace was moderately influenced by AI, with many employees experiencing increased initiative due to AI integration. This aligned with the hypothesis that AI can augment proactive behaviors, especially when supported by positive technological attitudes and sufficient organizational backing.

Interestingly, gender did not significantly influence the impact of AI on these competencies, suggesting that the effects of AI integration transcend gender boundaries and the opportunities for self-efficacy, job crafting and proactivity in the context of AI use are gender-equal among knowledge workers.

Previous research arrived at an uncertain outcome as to the relation between organizational size and the adoption of AI (e.g., Pumplun, Tauchert & Heidt 2020). This research found no significant correlation, suggesting organizational size was not a factor in how knowledge workers experienced the implications of AI use on their self-efficacy, job crafting and proactivity.

As a limitation, the research's reliance on self-reported data could introduce bias, and the diversity of organizational contexts suggests that AI's impacts are not uniformly experienced across different knowledge work roles.

Future research should aim to further delineate the conditions under which AI most effectively contributes to enhancing these competencies and to explore the longitudinal effects of AI integration across different sectors, organizational contexts, and knowledge work roles. There is also a need to monitor potential increases in employee polarization concerning AI impacts on entrepreneurial spirit.

The research results may be employed in organizational contexts to consider implementing supportive AI strategies that are inclusive and account for diverse employee experiences with technology, ensuring all workers are equipped to leverage AI benefits.

Innovating Sustainability: Digital Marketplaces as Catalysts for Circular Economy on the Reuse of Electronic Devices

Anna Lahtinen, Pirjo Saaranen and Sami Nykter
Haaga-Helia University of Applied Sciences, Helsinki, Finland

anna.lahtinen@haaga-helia.fi
pirjo.saaranen@haaga-helia.fi
sami.nykter@haaga-helia.fi

Abstract: This study delves into the synergy between innovation management, the circular economy, and the development of digital marketplaces, with a particular focus on the reuse of electronic devices. It highlights how digitalisation within the circular economy can spur innovation in managing the reuse of electronic gadgets through digital platforms. Drawing on a robust quantitative analysis of data from over 400 Finnish and Baltic companies, this research is pioneering in its holistic integration of these sectors, addressing the critical need for insights into the operational and managerial dynamics of circular economy digital marketplaces. Employing a comprehensive quantitative approach, our investigation uncovered significant insights regarding the perceived opportunities, challenges, and value-added features of these marketplaces for electronic device reuse. Environmental protection, cost savings, and enhanced recycling opportunities were identified as major advantages by participants. However, the study also pointed out significant barriers to effective marketplace operation, including IT system integration, organisational culture challenges, and resource limitations. A noteworthy contribution of this research is its elucidation of the influence of company size on engagement in the circular economy, pinpointing large and micro-enterprises as potential pioneers in this domain. It also sheds light on the business-to-business (B2B) dynamics within digital marketplaces, exploring the interactions among sellers, buyers, and service providers. Our findings underscore digital marketplaces as pivotal enablers for sustainable practices in electronic device reuse, whereas digital platforms may expedite the transition towards a circular economy. This aligns with principles of innovation management by promoting collaboration, minimising waste, and fostering new business models. The conclusion emphasises the digital marketplace not just as a platform for transactions but as a vital ecosystem enabler, providing a wide array of value-added services. It underscores the importance for businesses, especially in the electronics sector, to integrate circular economy principles strategically, leveraging digital marketplaces to achieve sustainability goals while gaining competitive advantages. The research has directly influenced the launch of a pilot digital marketplace for electronic product reuse, showcasing the practical application of its findings. This emphasises the study's role in advancing innovation management practices by demonstrating the transformative potential of digital marketplaces in promoting circular economy practices.

Keywords: Circular economy, Electronic devices, Digital marketplace, Innovation, Sustainability

1. Introduction

The transition towards a sustainable and circular economy represents one of the most pressing challenges and opportunities of our time. In the quest for sustainability, the role of digital innovation, particularly in the context of the circular economy, has gained unprecedented momentum. The focus on electronic device reuse within this context is both a necessity and an opportunity, given the rapid pace of technological advancement and the resulting environmental footprint. Our study ventures into this critical intersection of innovation management, circular economy principles, and digital marketplace development.

The proliferation of electronic devices, coupled with their short lifecycle, poses significant environmental risks, ranging from resource depletion to hazardous waste. The circular economy offers a promising pathway to mitigate these issues by promoting the reuse, refurbishment, and recycling of electronic devices, thus extending their lifecycle and reducing waste. Digital marketplaces, as platforms that facilitate the buying, selling, and exchanging of goods and services, emerge as powerful enablers in this regard. By harnessing digital technologies, these marketplaces can significantly lower the barriers to electronic device reuse, fostering a culture of sustainability and innovation.

Our research looks into how digitalisation can catalyse innovation in the circular economy, specifically through the lens of electronic device reuse. By conducting a comprehensive quantitative analysis of over 400 Finnish and Baltic companies, this study pioneers in uncovering the operational and managerial dynamics that underpin the success of circular economy digital marketplaces. We aim to highlight the perceived opportunities, challenges, and value-added features these platforms offer, and how they can be leveraged to foster environmental protection, cost savings, and enhanced recycling opportunities.

2. Related Work

The European Union has outlined that development of the circular economy is required to combat climate change (European Commission, 2020). The effective implementation of circular economy practices can offer meaningful positive contributions to addressing the current environmental challenges and economic opportunities to shape business sustainability (Geissdoerfer et al, 2018). The current advancements in EU legislation and the Circular Economy Strategy highlight the increasing role of producers in meeting the obligations related to managing the end-of-life of products. Extended producer responsibility (EPR) commonly involves waste reverse logistics, guiding the collection, inspection, and processing of end-of-life products to support circular economy efforts by closing material loops (Bening & Petri, 2024). Research indicates that firm-specific characteristics, such as the sector and type of circular business model adopted, significantly influence the formation of barriers to the adoption of circular economy practices, revealing distinct challenges across sectors and models that can impact the success of these initiatives (Brändström, Jazairy & Lindgreen, 2024).

In circular economy connecting with wider ecosystem is very important (Lacy, Long & Spindler, 2020). In circular economy value creation reuse of products, components and materials is an important part that needs to be encouraged widely across various operations (Cole, Gnanapragasam & Cooper, 2017). The data concerning the quality of a used product, component or material is usually the most important attribute when determining value (Rogers, Lembke & Benardino, 2013). Efficient value creation from used goods therefore requires sharing accurate data between the ecosystem stakeholders. The transition to the ecosystem circular economy requires different stakeholders to share and trade data and goods in circular value networks (Orko & Åkerman, 2019). Digital solutions can be harnessed to enhance material recycling, lengthen the lifespan, and increase the utilisation of equipment (Sinervo et al, 2022). This points towards an increased demand for contemporary solutions and tools that enable a circular economy, such as digital marketplaces.

Growing digitalisation of business processes, along with rapidly advancing technologies, provides ample grounds for digital marketplace solutions and their ability to operate on timely information, current supply-demand matching, and overall transparency (Berg & Wilts, 2019). Digital marketplaces are places of commerce in which sellers and buyers can trade almost anything (Rogers, Rogers & Lembke, 2010). Digital marketplaces have been identified to be promising technologies in value-creating networks between the manufacturing sector, the waste and recycling industry, and digital services (Blackburn, Ritala & Keränen, 2024; Berg & Wilts, 2019). Sharing data and selling goods via digital marketplace in real time enables stakeholders to evaluate the capturable value available before acquiring the assets available. Digital marketplaces also offer the means to reduce the transactional costs related to finding suppliers and buyers and creating the needed documentation regarding transactions (Berg & Wilts, 2019). Digital marketplaces, such as eBay, are very popular within the secondhand consumer market for selling used products such as cars, electronics, clothing, etc. In B2B setting the increased complexity in interactions, the lack of trust and high cost are barriers for establishing standardised online marketplaces (Mourtzis, Angelopoulos & Panopoulos, 2021). Successful implementation of a digital B2B marketplace requires implementing critical success factors that guarantee neutrality in managing the transactions, while maintaining trust between the actors (Bolocco, Perego & Perotti, 2010). In general, a circular economy marketplace operator should focus on finding the right type of buyers, in order to increase the likelihood of customers buying a used instead of new product (Mak & Heijungs, 2022). For their capacity to tackle these and related opportunities, digital marketplaces have been recognised as essential elements in the creation and sustenance of a circular economy (Lacy & Rutqvist, 2015).

Electronic devices represent a special interest in this context, as they constitute the increasing e-waste combined with the lack of established environmentally sustainable reuse and recycling practices (Santato & Alarco, 2022). Electronics and electronic devices refer to computers, mobile phones, remotes, and cameras – devices that use electric current to encode, analyse, or transmit information. The use of electronic devices is characterised by shorter life cycles, as they are replaced and disposed of at a growing pace (Tang et al, 2022). From the environmental perspective, the reuse of electronic equipment should be a priority, though economically the possibilities for value creation are diminishing over time (Hischier & Böni, 2021). As the value of used electronics equipment decreases strongly over time, the speed to complete the transactions becomes one key parameter to measure in the ecosystem.

Following quantitative methodology, the present research investigated the requirements and opportunities associated with the creation of the circular economy digital marketplace for the reuse of electronic devices. The research resulted in meaningful and applicable managerial and business contributions that translated into the launch of the marketplace pilot (2022).

The present research leapt into the future of digitalisation, and brought together three domains: the circular economy, digital marketplace development, and its application for promoting the reuse of electronic devices. The combination of the three has great practical and managerial potential, but to date remains under-researched. For the success of the green transition, there is an urgent need for further understanding of the requirements and opportunities related to circular economy digital marketplace creation and operation.

As opposed to the linear model of production, the circular economy aims to preserve the value of utilised resources and materials as long as possible, use them as frequently as possible, and produce as little waste as possible (Ellen Macarthur Foudation 2020). The concept covers all aspects of economic activity from resource extraction to production, storage, and consumption, ending with disposal or recycling. (Wilts, 2016). To reach this goal, circular economy digital marketplace may serve as an instrument for bringing together the needed scope of businesses, actors, and organisations, and involving them in the reuse of electronic devices. This is aligned with the digital platforms' operational models that represent networked marketplaces and exchange constructs (Berg & Wilts, 2019; MacAffee & Brynjolfsson, 2017).

The research adds value to the existing body of knowledge and management practice by providing insight into requirements and opportunities associated with the creation and successful operation of the circular economy digital marketplace for the reuse of electronic devices.

The research had pursued the hypothesis that the integration of digital marketplaces into the electronic device sector significantly enhances the efficiency and effectiveness of circular economy practices, primarily through improved matchmaking between supply and demand, reduced transaction costs, and the provision of a platform for the exchange of critical product information.

3. Methodology

This study's findings derive from a comprehensive quantitative dataset gathered at the outset of the project. Within the scope of this paper, we narrow our focus to a specific segment of the dataset, examining participants' perceptions of the opportunities and value-added features provided by the digital marketplace, challenges to its adoption, and their preferred role within the marketplace ecosystem. The research received financial support from the Helsinki-Uusimaa Regional Council, Finland. The data collection phase spanned from June to August 2021. We compiled the contact details of the participating firms from Selector's company database, employing specific selection criteria to guide our process:

- Finnish companies with less than 50 employees, incl. CEOs of the following industries: electronics and equipment manufacturers, wholesalers, retailers, and recycling companies;
- Finnish companies with 50+ employees, incl. CEOs and Marketing, IT, Sales, Purchasing, Production, Product Development and Communications Managers from all industries;
- Companies from Baltic countries with more than 5 employees, turnover more than 50 MEUR, industries included manufacture of electronic equipment and components, waste management and recycling, storage, other logistics, film, sound, video, radio and TV program production, communications and satellite communications, computer network services, and repair services.

On June 15, 2021, a survey was distributed to 14,422 organisations in Finland, and subsequently, on July 5, 2021, an additional 1,090 organisations from the Baltic region were included. Follow-up reminders were dispatched on June 22 and August 4, 2021. Out of the total, 404 organisations responded, yielding a response rate of 2.6%.

The survey was conducted using Webropol, an online survey platform. It featured a variety of question types, including single-choice, multiple-choice, and open-ended questions. To gauge the perceived opportunities and barriers within the digital marketplace for second-hand electronic devices, responses were collected on a five-point Likert scale ranging from "fully disagree" to "fully agree" (assigned values from 1 to 5), with an additional "don't know" option that was excluded from the analysis as a missing value.

The data from the questionnaire was analysed to identify trends among the participants and between different groups. Statistical analysis was performed using the SPSS software, employing both descriptive statistics and nonparametric tests (Kruskal-Wallis and Mann-Whitney U tests) to identify significant differences in responses based on the Likert scale across various groups. Spearman's rank correlation was utilised to examine the strength and direction of associations between ordinal variables, an approach necessitated by the non-normal distribution of the attitudinal data, as noted by Metsämuuronen (2017).

3.1 Profile of Respondents

Regarding the demographics of the participants, a vast majority of the surveyed organisations (97%) had operations in Finland, whilst one-third (33%) had operations in other European Union countries and one-fifth (20%) operated outside the EU. Notably, 66% of the organisations operated only in Finland and 18% operated in all listed areas. Of the responding entities, large organisations employing over 249 individuals accounted for one-third (34%), whilst nearly half (47%) were classified as medium-sized, having a workforce of 50 to 249 employees. The survey predominantly captured the perspectives of senior executives, who made up 57% of respondents, followed by middle management, representing 25%.

The composition of the respondents was diverse, with three-quarters (76%) coming from the private sector and 22% representing public sector organisations. The sectors in which these companies operated varied, including manufacturing (29%), services (21%), and trade, both retail and wholesale (15%), in addition to sectors focused on education, consultancy, or R&D (12%).

Technology usage was universal among the organisations, with all reporting the use of IT, computing, and mobile devices. Other prevalent technologies included entertainment electronics like televisions (77%), security systems (73%), and household appliances, such as washing machines and dishwashers (69%), along with measurement and testing equipment (64%) and other specialised professional electronics (62%). A small fraction (2%) were involved in the manufacturing or sales of electronic devices.

The study's validity and reliability were carefully considered. The coherence between the study's outcomes and its initial objectives underscores the accuracy of the measurements. Validity is further enhanced by the integration of literature review and comparisons with prior studies, establishing a connection with established trends.

Despite a modest response rate of 2.6%, the substantial number of respondents (404) deemed the sample convincing and representative, given the broad range of electronics used across the participating organisations. The study's reliability is underpinned by the potential to replicate the findings if the research were to be conducted anew under similar circumstances. Analytical methods were applied to ensure result consistency throughout the survey, and the internal consistency of the Likert scale responses reported was high, with Cronbach's Alphas ranging between .83 and .87.

4. Results and Analysis

The research results show that the circular economy is perceived as important, and businesses are prepared to pay attention to it. Companies tend to have a positive view of their own circular economy practices and believe that the circular economy is incorporated in the company's daily life and routine (81%). In practice, for customer and warranty returns, electronic equipment is mainly recycled back into raw material (56%), serviced and re-sold (49%) and destroyed (36%). As expected, IT and mobile devices circulate faster. More than 70% of respondents felt they would be willing to pay more for electronic devices if their repairs were easier.

The match of the digital marketplace with the internal systems was one of the prerequisites for getting involved in a systematic way with the platform. Security issues were highlighted to be of the outmost importance. Safety and security aspects were noted, including the evaluation of the functionality and integrity of the product for the buyer, enabling secure and environmentally friendly certified process. The platform was seen as the primary responsibility of IT managers and IT departments (51%), but almost all companies noted the current lack of a dedicated resource for this purpose.

4.1 Opportunities Presented by a Digital Marketplace for the Reuse of Electronic Devices

There were several key opportunities that companies perceived as the result of a digital marketplace for the reuse of electronic devices. The list was topped with the protection of the environment and reduction of the carbon footprint. These opportunities were closely followed by the perceived opportunities of utilising the marketplace to find new recycling opportunities and appropriate recyclers and users. (See Figure 1)

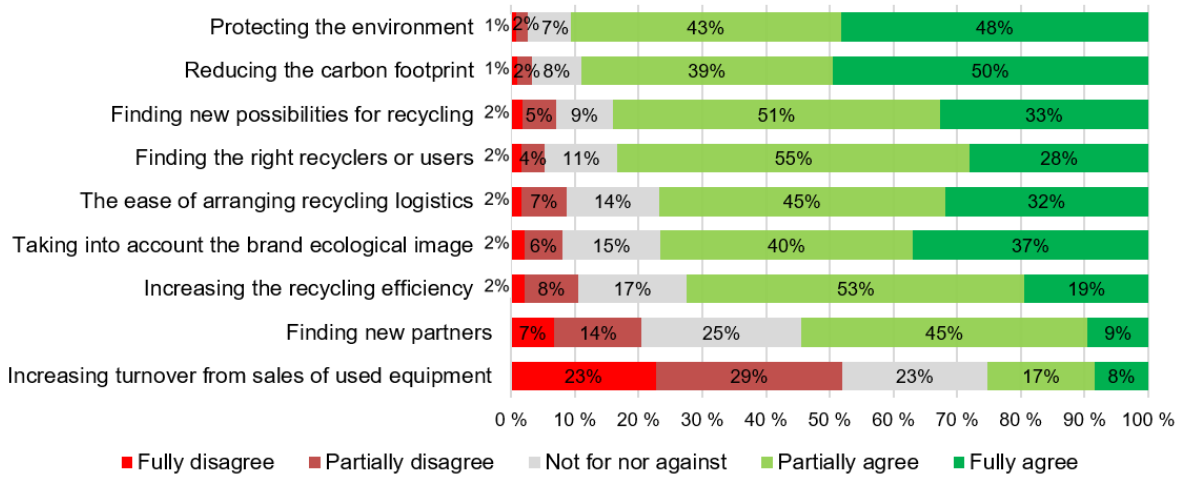

Figure 1: Opportunities for using digital marketplace for the reuse of electronic devices [Fig.: Taking the brand's ecological image into account; Increasing recycling efficiency]

Organisations in public administration saw greater opportunities than companies in two areas, including cost efficiency (p = .049) and finding new recycling opportunities (p = .036). The marketplace was perceived as an opportunity to find new partners mostly in public administration and service companies – and, in contrast, least in training, consulting, research and development companies (p = .039). Increasing turnover is perceived mostly as an opportunity in retail or wholesale companies and least as an opportunity in manufacturing companies (p = .009).

4.2 Value-Adding Features of a Digital Marketplace

The key added value for businesses in the marketplace was the ease of the process of reuse of electronics (72%), finding buyers and sellers (67%) and minimising costs (52%), but not necessarily the best possible price (only 19%). These value attributes translated into key motivations for using the digital platform and parameters sought by companies in a digital marketplace. When asked what services a digital marketplace should offer, it was most hoped that it would bring together buyers and sellers (85%), and well over half (67%) of the respondents wished for a sales service. The next most desired was to get up-to-date information on legislation (45%) and useful links (43%). A third (33%) wanted consulting services. (See Figure 2.)

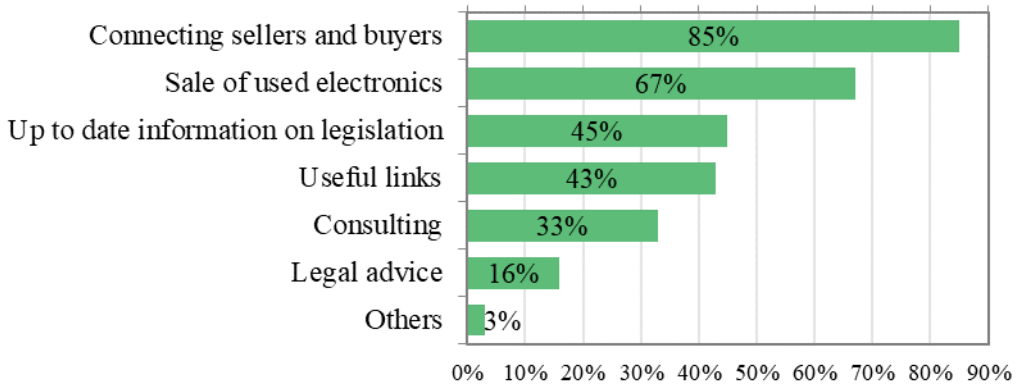

Figure 2: Digital marketplace for the reuse of electronic devices: Services desired by companies (n = 393, 1150 responses)

The respondents further elaborated on the specified digital marketplace features in their open-ended responses. The highlighted services included, for example, a donation service, erasing data on devices, responsibility information, and support in the case of disputes i.e., if the device does not work as required.

Respondents were asked what kind of product data they would like from electronic devices in order to purchase used electronic devices from the marketplace (see Figure 3).

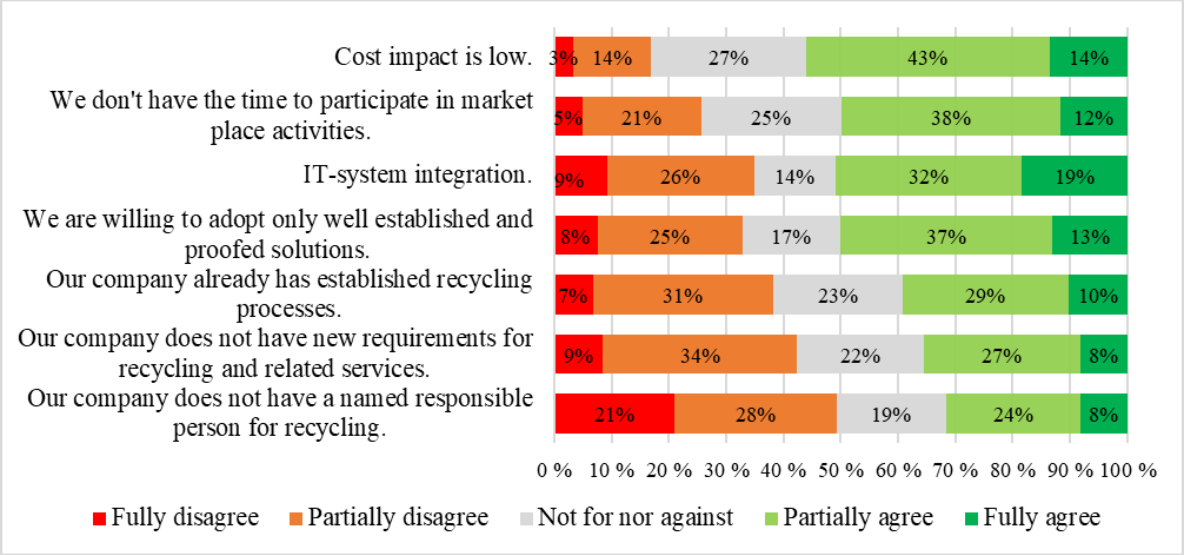

Figure 4: Main barriers in companies for using the digital marketplace for the reuse of electronic devices. [Fig.: well-established; Our company does not have a person designated for recycling responsibilities]

Other obstacles to the employment of the digital marketplace included, e.g. the following: lack of customer acceptance for the recycling of specific equipment, organisational culture (such as large organisation and respective slow decision-making), the lack of a recycling culture, resistance to change within the organisation.

4.5 Company Size Characterises Circular Economy Engagement

Interestingly, large and micro-enterprises (in contrast with SMEs) demonstrated greater motivation towards active engagement in the circular economy and respective marketplace – showing potential for this target group to serve as innovators and early adopters for the digital marketplace. Furthermore, larger companies renew IT and related professional electronics at a quicker pace than smaller companies. This indicates the digital marketplace matching opportunity, where larger companies sell used equipment to the smaller ones.

The interest of the respondents in co-operation with higher education institutions (willingness to actively engage in circular economy research and development activities), positively correlated with the readiness to participate in the digital marketplace. This correlation was noted among large enterprises (public ones included) and micro-enterprises – supporting the above argumentation for this target group as early adopters of the digital marketplace.

The perceived opportunities presented by a digital marketplace were impacted by company size too. Micro-enterprises saw more opportunity in increasing turnover from sales of second-hand goods ($p = .000$) and finding new partners ($p = .021$). Large companies identified more strongly with the opportunities in improving the cost of recycling ($p = .042$), and considering the image of brand ecology ($p = .000$) as associated with the reuse of electronic devices.

4.6 B2B Roles Within the Digital Marketplace Environment

The results of the present research show that in addition to company size, the roles that companies are willing to take on shape their involvement in a digital marketplace for the reuse of electronic devices. Most companies (87%) saw an opportunity in adopting the role of a seller in the digital marketplace. Half of the companies desired to engage in the marketplace in the role of buyers. Only about one-tenth identified with the role of repairer or service provider. Other possible roles that were indicated by the respondents included transportation provider, equipment calibrator, certification provider, information broker and others. (See Figure 5.)

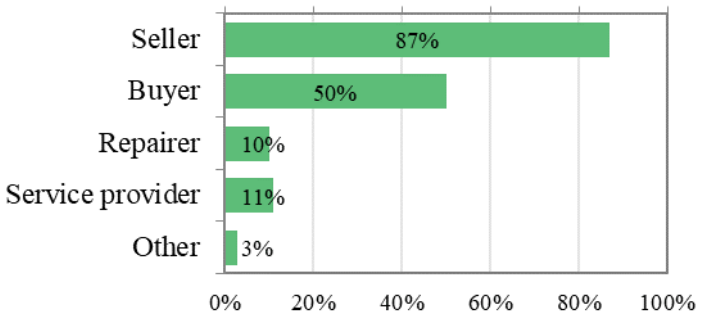

Figure 5: Preferred company role in the digital marketplace for the reuse of electronic devices (n = 374, 607 responses)

The companies willing to adopt the role of sellers mostly represented retail and wholesale businesses (98%). On the other hand, they were least ready to take on the role of a buyer (45%). Service sector companies hoped more for a seller's role (87%) than a buyer's role (46%). All other company types were quite evenly willing to adopt the role of a seller (79% - 86%) or a buyer (51% - 53%). (See Figure 6.)

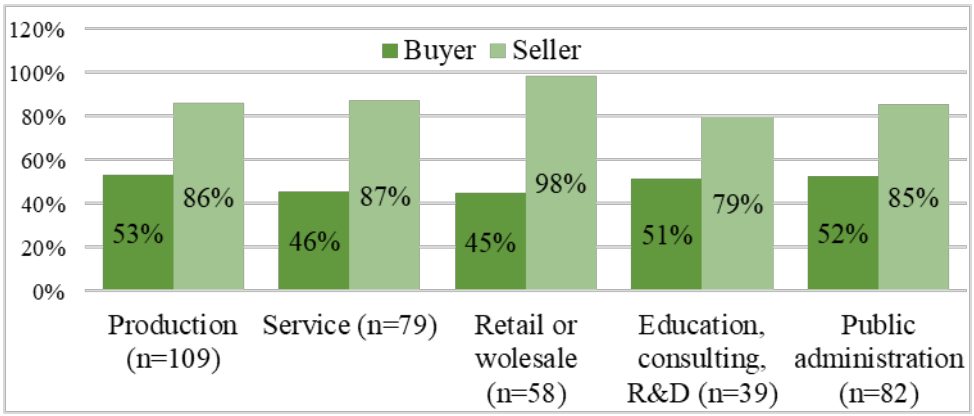

Figure 6: Desired role in the digital marketplace for the reuse of electronic devices by company type (n = 367)

When comparing companies using various types of electronic devices, it was found that all (100%) companies using agricultural electronic devices were interested in the role of a seller. Similarly, 92% of media production device users, 91% of hospital and laboratory device users, and 89% of security equipment users desired the role of the seller. The role of a buyer was most desired by users of agricultural devices (88%), measurement and testing devices (54%), media production devices (53%), and other industrial production or professional equipment (53%).

5. Discussion and Conclusion

Our research substantiates the proposed hypothesis, confirming that digital marketplaces significantly enhance circular economy practices in the electronic device sector. The analysis of over 400 companies indicated that these platforms simplify the buyer/seller matching process and are instrumental in facilitating device reuse. Companies valued the reduction in transaction costs and the exchange of crucial product information through these platforms, aligning with our hypothesis on their efficacy in improving circular economy efficiency.

The study explores the integration of circular economy principles and digital marketplace dynamics in electronic device reuse. Through a comprehensive survey, it identified strong business support for these practices, particularly the use of digital platforms for device recycling and reuse. Notably, businesses are actively incorporating circular economy actions into their daily operations. The marketplace is not only a transactional hub but also supports an ecosystem offering services such as legislative updates and consulting, proving vital for various company sizes.

This work has practical implications, demonstrated by Haaga-Helia University of Applied Sciences in Finland, which has leveraged these findings to pilot a digital marketplace for electronic product reuse, launched in 2022 with partner companies.

5.1 Managerial Implications

For managers and practitioners, this study emphasises the importance of integrating circular economy principles into business strategies, especially in the electronics sector. Adopting digital marketplaces for electronic device reuse aligns with sustainability goals and provides competitive advantages such as cost savings, improved brand image, and access to new markets. Managers should ensure these platforms are secure and user-friendly in order to facilitate broad adoption.

Digital marketplaces may be adopted by companies to support new business models and collaborative opportunities. Companies could adopt various roles within marketplaces such as, for example, service providers, certifiers, and information brokers. Collaborating with higher education and research institutions can advance sustainable reuse practices. The study stresses the need for ecosystem thinking in the electronics sector, promoting information sharing, and collaboration across individual stakeholders.

5.2 Future Research Potential

The research results suggest future investigation into digital marketplace design, including identifying key product categories for transactions, pinpointing business challenges they address, and understanding necessary services. It also explores the motivations behind companies' participation, paving the way for developing user roles and personas in order to engage a broader range of organisations effectively.

The intersection of circular economy principles with digital marketplace development offers fertile ground for further exploration. Future research could explore technological nuances, employing advanced data analytics, blockchain, and AI to boost transparency and efficiency, and examine consumer behavior regarding reused electronic devices. Cross-sectoral studies could assess the scalability of digital marketplaces across industries.

The study, originally focused on Finland and the Baltic countries, suggests expanding research to other European nations, integrating qualitative methods and service design with ongoing quantitative research.

In conclusion, digital marketplaces are transformative for the circular economy, serving as catalysts for systemic change by promoting device reuse. The study underscores the importance of innovation managers in fostering an ecosystem conducive to circular practices. This research not only highlights the operational and strategic requirements of circular economy digital marketplaces but also the collaborative efforts needed from all stakeholders to advance towards a more sustainable and resilient economy.

aelita.skarzauskiene@vilniustech.lt

Abstract: Sustainability and circular economy principles are increasingly important in civil engineering, as highlighted by the United Nations Environmental Programme in 2023 the construction activities represented 36% of global energy use in 2020. However, the sector's focus on reducing operational carbon overshadows the need for addressing embodied carbon from materials like cement, steel, and aluminium. To address this, a shift towards incentivizing all supply chain stakeholders and cultivating collaborative models is necessary. This research provides an initial scoping for the development of the Lithuanian Construction Materials Reuse Optimization (LSEPO) platform, a pioneering regional initiative fostering a marketplace for reused building materials. Such platforms are recognized for their potential to overcome sustainability barriers by utilizing digital technologies for efficient data management and stakeholder collaboration. Our research identifies a significant gap in the existing literature concerning effective stakeholder engagement strategies critical for the success of such platforms. To bridge this gap, we employed a three-tiered methodological approach: firstly, a semi-structured literature analysis delved into existing stakeholder engagement strategies within the circular economy. This review highlighted a fragmented understanding of incentives and collaboration dynamics across different sectors. Secondly, a content analysis of global material exchange and circular construction platforms provided insights into best practices, showcasing successful communication methods, innovative incentive models, and robust collaboration frameworks. Lastly, integrating these findings, our study proposes a conceptual stakeholder engagement framework tailored for social innovation in civil engineering, more specifically Lithuanian Construction Materials Reuse Optimization (LSEPO).Practical implications of our findings underscore the necessity for platforms like LSEPO to incorporate adaptive engagement strategies that are context-sensitive and inclusive, facilitating a broad spectrum of stakeholder inputs. The study demonstrates that effective stakeholder engagement goes beyond traditional communication methods; it requires a systemic integration of technological innovation and incentive alignment to promote sustained participation and collaboration. By providing a comprehensive foundation for the development of the LSEPO platform, this research not only aims to advance it as a beacon of social innovation and environmental stewardship within the civil engineering sector but also sets a benchmark for future initiatives aiming to embed circular economy principles effectively.

Keywords: Circular economy, Civil engineering, Co-creation, Stakeholder engagement

1. Introduction

In the quest for sustainable civil engineering, the circular economy (CE) emerges as a central framework, underpinned by alarming environmental statistics and a pressing need for systemic transformation. The United Nations Environmental programme (2023) report underscores the construction sector's substantial share of global energy consumption, sitting at 36% in 2020, and a similar proportion of CO2 emissions. Beyond these figures lies a more granular challenge: the reuse of building materials. Despite over 90% of a building's content being potentially reusable, the World Economic Forum (2014) revealed that only a meagre 20–30% of these resources find a second life post-demolition. The pathway to resilience, therefore, hinges on reshaping production and consumption patterns towards a circular model—a transition that not only mitigates environmental impacts but also boosts socio-economic indices such as GDP and job creation (Hieminga, 2015).

As the CE gains momentum, digital platforms emerge as powerful tools in the push for sustainable civil engineering. Digital technologies hold the promise of revolutionizing waste management and recycling processes by enabling predictive analytics and optimization that are crucial for the CE. Kovacic et al. (2020) argue that these technologies not only facilitate the reduction of waste but also streamline its reintegration into the production cycle. The capabilities of digital platforms to ensure traceability and foster confidentiality, transparency, and reliability are invaluable in enhancing the efficacy of circular projects and minimizing their environmental footprint (Charef, 2022). However, there remains a substantial gap in fully engaging the diverse array of stakeholders involved in the construction industry's lifecycle. The development and success of online

platforms are inextricably linked to effective stakeholder engagement, a component that is still not sufficiently leveraged in the sector. Addressing this, our research pivots to a question that is both pertinent and pressing: *How can the construction industry better harness digital platforms to enhance stakeholder engagement, thereby facilitating the adoption of CE principles?*

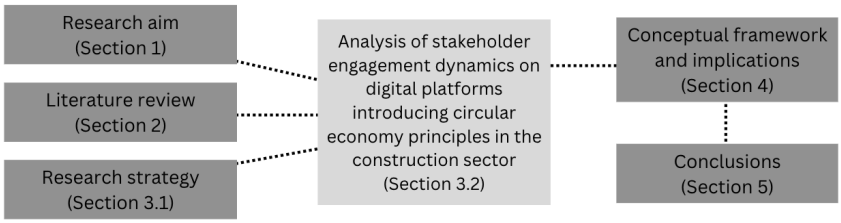

Figure 1: Logic of the inquiry

This inquiry delves into the current landscape of research, seeking to identify and bridge the gaps in stakeholder collaboration for a truly circular and sustainable built environment (see Figure 1). Through this exploration, we aim to articulate strategies that foster a more cohesive, informed, and proactive stakeholder community, which is vital for realizing the full potential of CE within civil engineering. The culmination of this research is to pave the way for the Lithuanian Construction Materials Reuse Optimization (LSEPO) platform, which aspires to become an example of social innovation and environmental responsibility, leading the civil engineering sector in Lithuania and the region towards a more sustainable and circular future.

2. Literature Review

The CE opposes the traditional linear economic model—a systemic shift advocated for by thought leaders in response to the unsustainable nature of current global consumption and production patterns. Historically, the global economy has been characterized by a linear "take-make-dispose" model, resulting in significant resource extraction, commodity volatility, and the generation of waste (Hieminga, 2015). The EC, conversely, proposes a paradigm where economic growth is decoupled from finite resource use, promoting the continual use of resources and minimizing waste. In the construction sector, however, the concept of CE remains nascent and fragmented. Various interpretations of CE exist (Kirchherr et al., 2017), and a coherent, universally accepted definition within the construction industry has yet to emerge (Adams et al., 2017). This has led to divergent initiatives, ranging from design for deconstruction, the hierarchy of construction and demolition waste management, to the development of secondary materials markets and urban mining. The transition to CE in construction is further complicated by a dichotomy in approaches: the top-down strategies led by policy and governance, contrasted with bottom-up initiatives steered by social innovation and grassroots movements (Munaro & Tavares, 2023). This dichotomy raises questions about the roles and responsibilities of various stakeholders in driving the sector towards circularity. Hence, understanding the heterogeneous landscape of stakeholder interests is paramount.

The investigations on the role of stakeholders in the CE within the construction sector is gaining prominence. Adams et al. (2017) identified a significant knowledge gap amongst key players such as customers, designers, and subcontractors concerning CE, highlighting barriers such as inadequate incentives for end-of-life design and unclear economic benefits. As Chinyio and Olomolaiye (2010) categorized, stakeholders can be internal, like project professionals and suppliers, or external like the public and government bodies, each wielding varying degrees of influence over organizational objectives and projects. The complexity of stakeholder relationships in construction projects is further magnified in CE due to the addition of roles such as demolition contractors and recycling plants, which contribute to a more complex supply chain network (Chen et al., 2022). Finally, Volk et al. (2019) developed a CE framework to encapsulate the intricate web of stakeholder interactions and material flows within construction, a domain often overlooked, impacting decision-making and policy formulation. This approach revealed that establishing clear communication channels and building trust between diverse stakeholders can foster stronger and more cohesive partnerships (Hart et al., 2019), which is essential for navigating the CE transition in construction.

The integration of information and communication technologies is recognized as a crucial enabler for CE within the construction sector (European Commission, 2020). They enhance information flow and communication among value chain stakeholders, a necessity for CE transformation identified by the Wuppertal Institute (Wilts & Berg, 2018). However, the role of specific functions of digital technologies in promoting circularity is still not fully understood (Wynn & Jones, 2022). The research gaps articulated by Wilts & Berg (2018) emphasize the

need for detailed information on the quality and quantity of secondary materials, the reduction of transaction costs, the consideration of externalities in pricing, and the integration of recyclability in product design. Addressing these gaps requires enhanced coordination among stakeholders and is critical for the successful implementation of CE in construction. Digital platforms (such as secondary material exchange platforms) are acknowledged as a important instrument for catalyzing stakeholder collaboration and accelerating the adoption of CE principles in the construction sector (Charef, 2022; Rodrigo, 2024). Yet, despite their potential, the dynamics of stakeholder engagement on these platforms remain underexplored in scholarly work.

Given the gaps in literature on stakeholder dynamics, several focal points for further analysis emerge: (1) *motivation for knowledge sharing and collaboration*: understanding the incentives for knowledge exchange is key to fostering collaboration (Adams et al., 2017). Platforms must provide robust systems for information sharing that align with stakeholders' interests and needs; (2) *collaborative decision-making functions*: identifying effective digital decision-making functions that can incorporate the diverse perspectives of the industry's stakeholders (Chen et al., 2022); and (3) *stakeholder engagement dynamics*: analyzing engagement strategies on digital platforms to determine their effectiveness in promoting CE practices within the sector (Hart et al., 2019). By addressing these three elements, the paper will explore the intricacies of stakeholder dynamics and their implications for advancing CE in the construction sector, aiming to inform the development of robust digital platforms that catalyze this shift.

3. Analysis of Stakeholder Engagement and Collaboration Strategies in Online Platforms

3.1 Methodological Approach to Platform Content Analysis

To ensure a nuanced understanding of stakeholder engagement best practices in the context of global material exchange and circular construction platforms, our study adopts a qualitative content analysis methodology. This approach is particularly suited for exploring complex phenomena within specific contexts, allowing for a rich, contextual comprehension of the core phenomena without striving for universal applicability. The qualitative content analysis method, as detailed by Kim and Kuljis (2010), enables the condensation of extensive raw data into meaningful categories and themes, fostering valid inferences and interpretations tailored to our research objectives. Our choice of this methodology aligns with its frequent application in studies that require an in-depth exploration of communication contents and stakeholder interactions, similar to ours. As Mayring (2004) suggests, this approach is inherently communications-centric, making it ideal for examining the dynamics of material exchange platforms. It provides a structured yet flexible framework to deeply explore the specific cases we have selected, which are crucial for gaining insights into the actors involved, the types of collaborative activities, and the pursued goals. Moreover, it allows us to discern and articulate the interconnections and synergies among various stakeholders effectively. By employing qualitative content analysis, our objectives are twofold: firstly, to extract and categorize critical aspects of stakeholder engagement, and secondly, to identify emergent patterns and synergies that may influence the effectiveness and sustainability of material exchange initiatives

Sample. In determining the selection criteria for material exchange and circular construction platforms, our study employs purposive sampling. This approach is necessitated by the inherent challenges in defining a complete universe of online platforms due to the absence of an obligatory registry for such operations. Consequently, constructing a strictly statistical frame for random sampling is unfeasible, aligning our methodology with the conditions described in studies like those by Pałka et al., 2024, and Bajaj et al., 2021, where similar methodological constraints are addressed. The platforms included in the study were selected based on the definition of material exchange platforms which encompasses platforms that enable stakeholders to connect and collaborate for material reuse and recycling (Wu et al., 2022; Caldera et al., 2020). The selection criteria for material exchange and circular construction platforms are as follows: (1) *interactivity* (platforms should foster open, inclusive, and collaborative engagement); (2) *contributors* (the platforms should be capable of involving a substantial number of participants); (3) *collective action* (platforms should facilitate collaborative actions among diverse stakeholders); (4) *data availability* (information about goals, metrics, and initiators should be publicly accessible on the platform's website) and (5) *sustainability impact* (platforms should demonstrate a measurable positive impact on sustainability, such as reducing carbon footprint, promoting energy efficiency, or contributing to the conservation of natural resources).

The selection was conducted through analysis of European Circular Economy Stakeholder Platform. The European Circular Economy Stakeholder Platform, launched in March 2017 by the European Commission and the European Economic and Social Committee, serves as a dynamic hub for stakeholders to accelerate the

transition to a CE in Europe through idea exchange, information sharing, and collaborative events including an annual flagship conference. The resulting sample of platforms together is presented in Table 1 below.

Table 1: Material exchange and circular construction platforms in the sample

Platform	Focus	Platform	Focus
SalvoWEB	Reclamation and re-use	Ecocycle	Construction demolition materials
BuildReuse	Construction and demolition waste	Restado	Reclaimed construction materials
Green Building Information Gateway	Green buildings	Circular Building Knowledge Platform	Circular buildings
Concular	Circular material flow	Rheaply	Resource utilization
Material reuse portal	Reuse of construction materials	Circular homes	Facilitation of circular renovations
Loopfront	Reuse of building materials		

Data collection procedure. Data collection began with the creation of a standardized data collection template (see Table 2 below). This template was segmented into (1) *motivation for knowledge sharing and collaboration*, (2) *collaborative decision-making functions* and (3) *stakeholder engagement dynamics* based on the insights of literature review on stakeholder engagement in CE. The team of researchers analyzed the content of the platforms, related websites and social media activity. Only publicly available data were collected for analysis. No information on the users of the platform were collected during the procedure. Data collection activities were conducted in the period from October, 2023 to January, 2024.

Table 2: Template for data collection

Element	Category	Subcategories & descriptions
Motivation for knowledge sharing and collaboration	Platform goals	The drive and incentives behind the sharing of knowledge and cooperative efforts, crucial for nurturing CE principles and sustainable practices in the construction sector.
	Key user/audience groups	User groups that are targeted for knowledge sharing and collaborative outreach (e.g., architects, general public, contractors, public officials).
Collaborative decision-making functions	Initiators and developers	Identify individuals and/or organizations that initiate decision-making systems i.e., who is in charge of the processes and what is the hierarchy of leadership.
	Strategic functions facilitating collective action	The environment or platform features that foster collaboration, like forums or project management tools. Subcategories like analytical tools, databases for material reuse, and BIM systems that aid in decision-making.
Stakeholder engagement dynamics	Engagement and collaboration strategies	Methods, processes and approaches that encourage trust-building and collaboration (e.g., transparency initiatives, stakeholder meetings, or community engagement strategies).
	Partnerships formed	Collaborative partnerships formed (e.g., joint ventures, industry-academia collaborations, or community projects).

Data analysis. Subsequent stages involved systematic coding of platform content and assessing the dynamics and design of the platforms based on the dimensions outlined in the Table 2. The coding was conducted using qualitative content analysis software Nvivo. A comparative analysis across the platforms then provided insights into best practices in stakeholder engagement and collaboration.

Limitations. While the methodology has been robustly designed, it is important to note its limitations. The heterogeneity of data available online presents challenges due to variability in content, semantics, and user interfaces. Additionally, the sample size, while curated, is not exhaustive and hence may not be fully representative of the broader landscape of such platforms.

3.2 Results of Platform Content Analysis

3.2.1 Motivation for knowledge sharing and collaboration

Understanding the incentives for knowledge exchange is key to fostering stakeholder collaboration. In this regard, the sample of material exchange and circular construction platforms is characterized by a diverse array of goals and objectives, ranging from the promotion of reuse and recycling to fostering collaboration and

community engagement. The objectives of the platforms, as outlined in Table 3, illustrate a commitment to collaborative value creation that extends beyond the traditional confines of economic gain. These platforms, by facilitating the exchange of reclaimed materials, providing analytics for green building, optimizing material flow through technological innovation, centralizing knowledge for circular construction, and offering digital tools for sustainable living, contribute to a broader value proposition. This proposition is multi-faceted, encompassing environmental stewardship, education, and community engagement, thus resonating with the missions of the respective organizations.

Table 3: Categories of platforms based on their core goals

Categories	Platforms in the sample	Description
Marketplaces for reclaimed materials	SalvoWEB Restado	Platforms in this category function as digital marketplaces that connect sellers and buyers of reclaimed building materials. They are pivotal in creating a supply chain for repurposed materials, thereby minimizing waste and encouraging the reuse of resources within the construction industry.
Green building analytics and reporting	Green Building Information Gateway (GBIG)	This theme encompasses platforms that aggregate and analyze data related to green building practices. They offer analytical tools for assessing sustainability metrics and facilitate the sharing of green building achievements, contributing to a data-informed approach in the construction sector.
Circular economy and innovation in material flow	Concular Ecocycle	Platforms under this umbrella utilize cutting-edge technology to optimize the lifecycle of building materials. Through innovative approaches such as artificial intelligence and proprietary recycling techniques, they support the CE by enhancing material traceability and reuse.
Centralized knowledge hubs for circular construction	Circular Building Knowledge Platform Material Reuse Portal	Included here are platforms that compile and disseminate information on circular construction. They act as centralized knowledge repositories, providing access to research, best practices, and policy information that underpins the shift towards sustainable construction methodologies.
Digital tools for sustainable living and construction	Circular Homes Loopfront	This category represents platforms that offer digital tools and resources for implementing sustainable and circular practices in living spaces and construction projects. They aim to empower stakeholders with the means to undertake environmentally conscious renovations and developments.

Additionally, based on the content analysis of the platforms in the sample, the audience and user base can be categorized into four pivotal groups, each contributing uniquely to the advancement of CE principles within the construction sector: (1) *construction industry professionals* form the backbone of these platforms, encompassing architects, builders, demolition contractors, and engineers who actively seek and list sustainable materials; (2) *regulatory actors and policy influencers*, including urban planners, local government authorities, and environmental NGOs, are integral to shaping the ecosystem; (3) *educational and research entities* such as universities and research institutions; and (4) the *end-users*, ranging from individual property owners and DIY enthusiasts to large corporate entities managing real estate portfolios. These groups represent within which circularity in construction is not merely an aspirational goal but an operational reality. The platforms in the sample showcase a synergistic network with heterogenous actors and resources is needed to push the industry toward a CE.

3.2.2 Collaborative decision-making functions

The architecture of decision-making and support systems within digital platforms for circular construction and material exchange reflects the leadership and vision that drives them. Understanding the entities behind these platforms is essential because their philosophy, strategic goals, and operational focus directly influence the way decisions are made and how the platforms are structured to support those decisions. The analysis of the platforms in the sample allowed to identify following groups of initiators/developers: (1) *visionary founders* are often individuals or small teams ignited by a passion for sustainability and circularity; (2) *dedicated non-profit organizations* emerge as a collective of like-minded individuals who, driven by a shared mission rather than profit, pool their resources and expertise to advocate for and implement circular practices; (3) *institutional developers* such as university labs, government-funded research projects, or initiatives backed by professional councils like the U.S. Green Building Council, harness academic rigor, policy knowledge, and a broad network of professionals to construct platforms that are rich in content and authoritative in their domain; and (4) *Corporate drivers* are companies like Holcim, which spearhead platforms with the aim of scaling circular technology solutions across global markets. The examination of digital platforms in the sample reveals a rich

diversity in the approaches to initiation and development, encompassing both grassroots, bottom-up movements as well as structured, top-down strategies. This diversity not only enriches the industry's capacity for innovation but also highlights the importance of tailored approaches that resonate with the unique contexts and stakeholders within the sector.

To fully grasp the transformative potential of digital platforms in fostering sustainability within the construction sector, it is also important to look beyond just the initiators and delve into the operational mechanisms these platforms employ. The ways in which they implement collective actions and drive the adoption of CE principles are as crucial as the vision that sparked their creation. Circular construction and material exchange platforms that have been studied demonstrate a variety of methods to galvanize collective action with Table 4 presenting a comparative view.

Table 4: Strategic functions facilitating the collective action

Platform	Matchmaking & marketplace	Educational & advocacy	Technological innovation	Community building
SalvoWEB	✓	✓		
BuildReuse		✓		✓
Green Building Information Gateway	✓	✓		
Concular	✓	✓	✓	✓
Material reuse portal	✓	✓	✓	
Loopfront	✓	✓	✓	✓
Ecocycle		✓	✓	
Restado	✓	✓		
Circular Building Knowledge Platform	✓	✓		✓
Rheaply	✓	✓	✓	✓
Circular homes	✓	✓		✓

Each function reflects a specific approach to catalysing collaboration and advancing the sector's objectives. More specifically, *matchmaking and marketplace* features create efficient channels between suppliers and consumers of reclaimed materials, fostering a transactional backbone that sustains the circulation of materials. In case of *educational and advocacy* functions, the efforts are made by the to not only share information but also to shape industry norms and influence policy, promoting broader adoption of circular principles and enhancing collective understanding and best practice dissemination. *Technological innovation* is another function identified which leverages cutting-edge technologies to bring transparency and efficiency to the lifecycle management of construction materials. Finally, *community building* activities are essential to forge and fortify the networks of practice and support, evident in platforms that offer collaborative forums and campaigns, strengthening the sector's social fabric and driving concerted action towards sustainability goals. Our findings highlight the diverse methods through which current platforms catalyse collaboration. Looking forward, there is a valuable opportunity to explore how these functions operate in practice, to refine them, and to innovate further. By doing so, future digital platforms can enhance their effectiveness in promoting the adoption of CE principles and in supporting the industry's transition to sustainable operations.

3.2.3 Stakeholder engagement dynamics

The content analysis suggests that the strategies for stakeholder engagement are not monolithic across these platforms; rather, they are as varied as the stakeholders themselves. After the analysis of platform content, our research group consolidated engagement and collaboration strategies of circular construction platforms into (1) *community and trust*: strategies that cultivate a cohesive user community through trust-building measures, such as codes of conduct and active engagement on social media. These methods aim to foster a sense of shared purpose and commitment to circular principles among all participants; (2) *education and resources*: this include efforts to develop and disseminate educational content, such as wikis, forums, and training programs. The focus is on empowering stakeholders with the knowledge and tools necessary to implement and advocate for circular construction practices effectively; (3) *policy and advocacy*: strategies

under this category aim to influence policy and promote industry collaboration. They involve engagement with policymakers, industry leaders, and other key stakeholders to align regulatory frameworks with the goals of the CE and (4) *technological empowerment and accessibility*: platforms leverage digital tools to facilitate stakeholder participation in the CE. This includes intuitive online marketplaces, digital documentation of materials, and platforms that provide clear insights into the environmental and economic impact of users' activities. These categories represent a strategic approach to engaging various stakeholders in a way that promotes collective action and supports the overarching mission of transitioning to a circular construction economy. Each platform's decision-making and support systems reflect an understanding that stakeholder engagement is not a one-size-fits-all solution. The diversity in approaches demonstrates a tailored approach to involving stakeholders in meaningful ways.

Finally, in the realm of circular construction and material exchange platforms, strategic partnerships play a vital role in expanding capabilities and enhancing the impact of these initiatives. Platforms have formed alliances across a broad spectrum of stakeholders, including salvage yards, consulting firms, sustainability experts, and academic institutions, each contributing their specialized knowledge and resources. These collaborations span from grassroots community organizations to high-level industry consortia, reflecting a commitment to shared CE goals. They include partnerships with technology providers to refine platform infrastructures, joint ventures with construction and demolition firms to optimize material reuse, and connections with policy entities to shape sustainable practices. Collectively, these alliances embody a concerted effort to integrate circular principles into mainstream construction processes.

4. Conceptual Framework and Discussion

The content analysis in the realm of circular construction and material exchange platforms highlights the necessity of customizing engagement strategies to the context and needs of diverse set of stakeholders. These findings resonate with prior research on stakeholder engagement in sustainable CE (e.g., Kujala et al., 2023; Re & Magnani, 2023). Based on insights outlined in the previous sections, the research team developed a conceptual framework focused on stakeholder engagement in the circular construction and material exchange sector (see Figure 2). The framework is based on series of stages that reflect the evolution and deepening of relationships between platforms and their stakeholders. These stages reflect the platforms lifecycle—from inception and community formation to growth and systemic impact—mapped against the types and levels of stakeholder engagement revealed by the data.

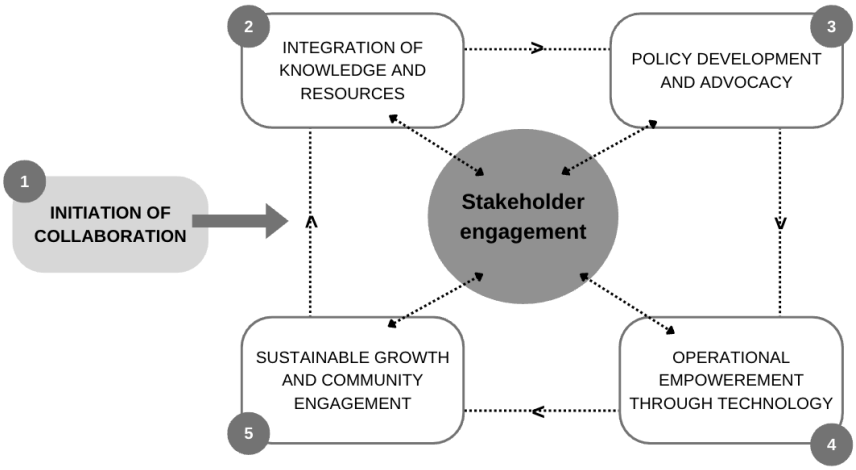

Figure 2: Conceptual framework for platform development

The stages of this framework mirror the lifecycle of platforms from their inception through to their systemic impacts, aligning with the lifecycle patterns and stakeholder engagement levels identified through our data analysis. This framework is deeply informed by the broader CE principles discussed in the literature review, including the shift from a linear to a circular model as advocated by thinkers like Hieminga (2015) and the varied interpretations and applications within the construction sector as examined by Kirchherr et al., 2017, and Adams et al., 2017.

- Initiation of collaboration: at this foundational stage, platforms establish trust with key stakeholders such as salvage yards and sustainability firms, which is critical as highlighted by Hart et al. (2019), who

note the importance of trust in fostering strong and cohesive partnerships. This stage involves setting up codes of conduct and community forums, essential for supporting future sustainable practices as seen in models discussed by Adams et al. (2017).

- Integration of knowledge and resources: this stage leverages educational content and training to enhance stakeholder capacity, akin to the approaches of platforms like BuildReuse. It reflects the necessity for continual resource use and minimal waste generation in CE, a concept outlined by the European Commission (2020).
- Policy development and advocacy: engaging with policymakers and influencers to shape the regulatory landscape marks a mature phase of engagement, aiming to effect systemic change—a strategy aligned with the top-down approaches discussed by Munaro & Tavares (2023).
- Operational empowerment through technology: utilizing technology to make participation in circular practices more efficient and scalable connects directly to the role of ICT as an enabler for CE as identified by Wilts & Berg (2018). Platforms enhance functionality through partnerships with technology providers, a crucial element for integrating recyclability in product design and reducing transaction costs.
- Sustainable growth and community engagement: this final stage involves expanding reach through strategic partnerships and fostering a community ethos, driving collective action toward sustainability goals. This stage embodies the bottom-up initiatives and the community-driven approach to CE transition discussed by Charef (2022) and Rodrigo (2024).

The theoretical implications of this framework highlight the essential nature of stakeholder engagement in driving the CE transition, particularly in the construction sector, where complexity and fragmentation often slow progress. Practically, this framework serves as a guide for digital platforms aiming to facilitate CE, providing a structured approach to stakeholder engagement that is vital for overcoming the barriers identified in the literature review. By addressing these, the framework contributes to closing the significant knowledge and practice gaps in the sector. More specifically, the proposed conceptual framework paves the way for the Lithuanian Construction Materials Reuse Optimization (LSEPO) platform, which aspires to become an example of social innovation and environmental responsibility, leading the civil engineering sector in Lithuania and the region towards a more sustainable and circular future. The emphasis is on cultivating an inclusive community from the start, as this underpins stakeholder buy-in and ensures the platform resonates with its user base.

5. Conclusions

This paper has offered a first look into the intricate dynamics of stakeholder engagement on circular construction and material exchange platforms. The findings highlight the diversity of engagement approaches, stressing the importance of customizing strategies to stakeholders' varying needs and contexts. This customization is paramount, as it ensures that platforms do not just exist as mere transactional hubs but evolve into ecosystems where knowledge, resources, and collaborative endeavors flourish. The research underscores the roles that different stakeholders play in this ecosystem, from material suppliers to policymakers, and from grassroots participants to corporate entities, all contributing to a shared vision of circularity and sustainability.

The paper proposes an actionable framework that delineates the evolving stages of stakeholder involvement, from the initial building of trust to the establishment of robust communities aimed at driving sustainable growth. This framework, distilled from a thorough content analysis, serves as a guiding instrument for the strategic development of platforms like LSEPO, paving the way for their adoption and impact within the circular construction landscape. By leveraging this framework, future platforms can harness the full potential of digital technologies to foster the principles of the CE in the construction sector. It invites future exploration into the functions and operations of such platforms, calling for a deeper understanding of how digital engagement can catalyze industry-wide change. Ultimately, this research serves as a stepping stone towards more comprehensive investigations that aim to bridge the current gaps in the literature and provide practical solutions for advancing sustainable practices within the construction industry.

This paper calls for future research to delve deeper into the operationalization of these functions and to explore the dynamic interplay between various stakeholders. Strategic partnerships, as showcased by the platforms, are pivotal for expanding capabilities and advancing CE principles. The research underscores the significance of these partnerships in fostering innovation, sustainability, and community engagement, ultimately contributing to a more resilient and circular construction industry.

andrea.rangone@polimi.it

Abstract: This study aims to investigate how the process of ecosystem emergence occurs with the advent of 5G technology, focusing on the challenges and opportunities for Mobile Network Operators (MNOs) in the enterprise market. For this purpose, an exploratory and qualitative multiple-case study was conducted, involving key players in the Italian 5G industry. The research analyses the roles and interactions necessary for creating a 5G ecosystem, emphasising the importance of cooperation among numerous stakeholders due to the complexity and specificity of 5G applications. The results indicate that 5G can be defined as an Enabling Technology (ET), However, it is still lacking the pervasiveness in terms of wide applicability associated with General-Purpose Technologies (GPTs). The successful development of a 5G ecosystem requires dual co-orchestrators: MNOs and intermediaries. MNOs alone are unable to properly manage the ecosystem due to the diverse and specific nature of 5G applications. Intermediaries by their side, provide essential technical and business expertise, supporting MNOs in creating value across various sectors. The study provides insights into the evolution of business models for companies leveraging 5G technology. It emphasises the need for strategic collaboration among stakeholders to maximise the potential of 5G, offering guidance for businesses on how to adapt and thrive in this emerging ecosystem. The originality of this study lies in its integration of two literature streams, the ecosystem one and the enabling technologies one. This research contributes to both literature streams by highlighting the co-orchestration model necessary for 5G. It underscores the challenges and characteristics of orchestrating an ecosystem driven by enabling technology, offering valuable perspectives for both academia and industry practitioners.

Keywords: 5G technology, Enabling technology, Ecosystem emergence, Orchestrator

1. Introduction

The fifth generation of mobile networks (5G) not only offers incremental performances to its predecessor 4G, but also opens possibilities for applications in the B2B market, unlocking multiple opportunities for both the offer and the demand sides. 5G, which can be considered an enabling technology (ET) (Teece, 2018; Gambardella et al., 2021), is struggling with its adoption, especially in the enterprise market, where it promises numerous opportunities but use cases with clear benefits have not been found yet. MNOs, the long-standing focal players in the telecommunications industry (Gooderham et al., 2022), are struggling to propose 5G business solutions, even if they are the actors supposed to drive this technology's adoption, especially in some countries, like Italy, where they own the main source of value for the system (e.g., 5G network frequencies' licences in mid-band 3.6-3.8 GHz). Yet, the 5G environment is complex, characterised by multiple players engaging in overlapping activities.

This complexity suggests that 5G business solutions could be developed through an ecosystem. Given its status as an ET, 5G can be applied across various verticals, yet MNOs often lack the specific competencies required to meet the demands of these diverse applications. The existing ET literature is sparse, particularly regarding how inventors and vendors of such technologies can create and capture value (Gambardella et al., 2021). While these technologies have traditionally been studied from a macroeconomic perspective, there is a growing interest in their strategic implications (Conti et al., 2019).

In recent years, ecosystem literature has increasingly focused on how companies adopt new technologies and the importance of co-creating value (Jacobides et al., 2018). Despite this, empirical investigations into the orchestration mechanisms in ecosystem emergence remain limited (Jacobides et al., 2018; Lingens et al., 2021; Thomas et al., 2022). This gap in the literature underscores the need to explore how the process of ecosystem emergence occurs in 5G technology.

Therefore, this study aims to analyse the emergence of the 5G ecosystem and to investigate the mechanisms of value creation and capture within this context. By integrating insights from the literature on ET and ecosystems,

this research seeks to provide a comprehensive understanding of the 5G ecosystem's structure, the roles of different actors, and the dynamics of their interactions.

To address this, the study poses the following research questions: How does the process of ecosystem emergence occur in the context of 5G technology? What roles do various actors play in the 5G ecosystem, and how do these roles evolve?

This study is original in its approach, combining two distinct literature streams, the one on ET and the one on ecosystems, to explore the strategic adoption of 5G. Unlike previous research that often focuses on discrete technologies targeting specific uses (Kapoor & Lee, 2013; Hannah & Eisenhardt, 2018), this paper examines 5G as a multifaceted ET with broad applications across various industries.

The main contributions of this study are manifold. First, it provides a framework to explain the mechanism of ecosystem emergence in the 5G context. Second, it offers a detailed representation of the 5G ecosystem, giving also practical insights for MNOs and other stakeholders on how to effectively navigate and leverage it. Finally, this study enhances the theoretical discussion on enabling technologies and ecosystems, contributing to academic knowledge of the two literature streams.

2. Literature Review

2.1 5G as an Enabling Technology

The concept of General-Purpose Technologies (GPTs) was introduced by Bresnahan & Trajtenberg in 1995, defining them by three key characteristics: pervasiveness, ongoing technical improvement, and enabling complementary innovations in various application sectors. Essentially, GPTs have a profound impact on the entire economy, continuously improve, and inspire innovations across diverse fields (Teece, 2018). The difference between enabling technologies (ET) and GPTs is the fact that the former are upgradable, adaptable technologies with widespread applicability but no measurable economy-wide impacts (Teece, 2018).

5G technology is widely recognised by scholars as an ET (Teece, 2018; Rathje & Katila, 2021; Adner & Lieberman, 2021). To become a GPT, 5G must become pervasive in use in multiple markets since the emergence of 5G is not solely confined to the telecommunications industry; rather, various vertical industries are poised to leverage wireless communication (Dolgui & Ivanov, 2022). In this context, it becomes imperative to pay closer attention to opportunities that extend beyond MNOs, even if they are the historical focal actor supposed to drive this technology's adoption (Ghezzi 2012; Ghezzi et al., 2015), especially in some countries where they own the main source of value for the system (5G network frequencies' licences in mid-band). According to Knieps & Bauer, 2022, the telecommunication ecosystem has become less MNOs-centric, and it encompasses a wide range of stakeholders with diverse goals and interests.

2.2 Interconnected Business Model and Business Ecosystem

The essence of the business model is to define how the company creates value, captures it and profits from its products or services (Teece, 2010). Scholars emphasise that the shift to interconnected business models offers a multi-level perspective, enabling analysis ranging from individual firms to broader network interactions, thus highlighting the intricate value architectures within commercial relationships (Jocevski et al., 2020). Furthermore, the interconnected business model perspective acquires particular significance when considered in relationship with digital technologies (Nylund et al., 2022). The "interconnected Business model" concept is closely related to previous discussions on business ecosystems and value networks (Jocevski et al., 2020).

Value networks can be seen as a system of interconnected and interplaying BMs of different firms operating in the industry (Ghezzi, 2013). Indeed, with the value network concept, value is co-created by a combination of players (individuals, groups, or organisations) in the network (Ghezzi et al., 2009; 2013). The ecosystem could be defined as a network of organisations that jointly create an innovative value proposition for the client that a single firm could not offer by itself (Lingens & Huber, 2021).

In the recent literature, value networks and ecosystems are treated by some scholars almost as synonyms (Clarysse et al., 2014), while others try to evidence differences between the two structures. Indeed, while an ecosystem can be visualised as a network, it stands apart due to its potential to span across various sectors and the presence of a set of distinctive, asymmetrical connections that are established at the group level by specific complementarity (Jacobides et al., 2018). Finally, some other researchers see the ecosystem concept as an evolution of a value network (Cavallo et al., 2021). Regarding value creation and capture processes, while constructs as value networks place emphasis merely on value creation, the ecosystem one focuses also on the

"demand side" and value appropriation (Cavallo et al., 2018). Indeed, within an ecosystem, value is collaboratively created, captured, and distributed to optimise the total value gained and allocated, benefiting not just the focal firm but also all participants within the ecosystem (Yrjölä et al., 2022). A point of contact between the two literature streams is the orchestrator figure, which is mentioned and considered crucial for the development of both value networks (Dellyana et al., 2018) and ecosystems (Adner, 2017), especially in the case of ecosystem emergence, where misalignment between the actors involved may generate high transaction costs (Cavallo et al., 2018; Thomas et al., 2022)

Therefore, a comprehensive analysis of this actor becomes essential when deep-diving into discussions about value networks and especially ecosystems. This involves exploring the specific role the orchestrator plays within the ecosystem and identifying potential actors capable of taking this role. Lingens & Huber (2021) highlighted that the orchestrator is the actor in charge of defining partner activities, with the most extensive overall view of the ecosystem, and the player capable of favouring alignment within an ecosystem as well as ensuring fair value sharing and proper value creation.

3. Methodology

The research is based on a multiple-case study (Eisenhardt, 1989) for investigating the process of 5G ecosystem emergence. One of the opportunities enabled by 5G is the establishment of 5G Mobile Private Networks (5G MPN). These networks comprise dedicated wireless infrastructure utilising 5G technology to furnish tailored and secure communication services for specific organisations or entities in different verticals (es. Manufacturing, Logistics, Healthcare). However, even though it represents a first concrete opportunity that does not require public coverage (which might require public funding intervention for implementation, considering the geographical extension and the type of investment), the market in Italy is currently stagnant. There are only a few proactive pioneering companies from different verticals that are investing to implement use cases. Moreover, 5G technology adoption signifies an important shift in the traditional value chain structure, requiring a high degree of collaboration among various entities. The exploratory multiple-case study approach included direct interviews with eight employees who worked on 5G at a strategic level within their company, representing three of the many types of actors present in the 5G B2B context: IT integrators, technology vendors and end users. It has been taken the choice not to include MNOs in the interviews since secondary sources and informal speeches regarding their role were exhaustive and consistent in outcomes. The companies were selected because they had already been involved in 5G B2B projects. Interviews were carried out during the solar year 2023 and the scripts were validated with industry experts before conducting the interviews. After having collected a significant number of quotes and data from 11 semi-structured interviews and more than 20 secondary sources (collecting 140 pages of transcripts and 527 minutes of interviews), a systematic analysis was conducted. A within-case analysis was carried out to gain familiarity with the data, and then a cross-case analysis was useful for comparing all the information gathered (Eisenhardt, 1989). Subsequently, quotes were grouped in first, second and overarching dimensions (Figure 1). Taking together the analysis based on informants' codes (1_{st} order) and the one rooted in academics-based themes (2_{nd} order), permitted a qualitatively rigorous illustration of the connections between data and the research topic (Gioia et al., 2013). Regarding the case selection, according to the Eisenhardt method, there is no rule about the number of cases selected (Eisenhardt, 2021), rather the selection must be driven by the possibility of observing the phenomenon under research. Here below the coding tree obtained from the interviews is reported (Figure 1).

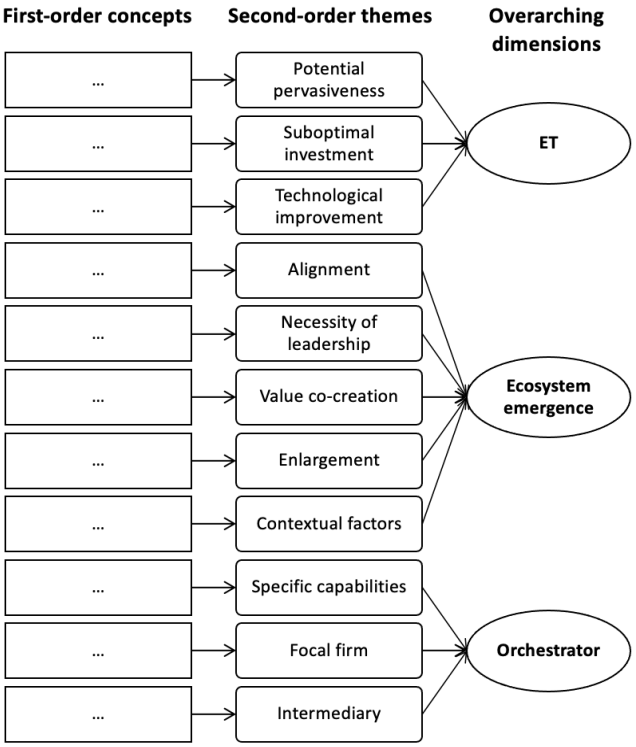

Figure 1: Coding tree structure

4. Findings

4.1 Enabling Technology

Practitioners unanimously recognise 5G as an ET, which facilitates novel solutions previously unattainable with other technologies, particularly in the enterprise sector. 5G enables the realisation of different deployments which are specific industry by industry. Based on what emerged from the interviews, it was possible to group the main activities needed for 5G deployment into three different layers: network infrastructure layer, network function layer, and service development layer. The first two include activities related to the physical deployment of the network, network hardware and software components, and network provisioning, which in the Italian case is only accessible by MNOs. The service development layer concerns all activities for providing connectivity and value-added services. As shown in Figure 2, although MNOs are the traditional focal actor of the industry, due to the numerous applications that 5G promises related to its ET nature, they don't possess all the complementary assets (both tangible and intangible) needed in the Service Development layer to manage the value proposition of the ecosystem. As mentioned by practitioners: "*It is the MNO who holds all the technology and infrastructure part, and so it is the one who can certainly be a bit of a leader, but it does not have the skills perhaps of others to provide solutions that are perfectly all-round*" (Network Architect 5G Network Solutions, IT Integrator 1). This is also evident from what end users have said, as they are proactively developing the first 5G MPN (Multi-Party Network) projects. The red arrows indicate that the flow of innovation originates from them, demonstrating that the value proposition is not as clear-cut.

4.2 Ecosystem Emergence

Considering that there is not a clear 5G value proposition and the actor's role is not defined, the 5G ecosystem is still in an emerging phase. This is recognised also by interviewees, especially concerning the fact that end users are proactively experimenting with 5G to understand how to leverage it. Due to the actual inability of the traditional focal firm to work alone due to the necessity of several complementary assets which differ among the different verticals, which is a new situation compared to the previous 3G and 4G technology, multiple actors need to collaborate to create value together. However, it is evident that, at the moment, the different players are not fully aligned. Therefore, the ecosystem lacks a single company acting as a leader which can align the different players towards a common value proposition and show end users solutions with an actual return on 5G investments. As stated by practitioners: "Probably the real problem is that there is no leader." (Senior Director, Technology Vendor 1).

4.3 Orchestrator

The proactive companies experimenting with 5G solutions would prefer a single contact point rather than many. However, none of the stakeholders involved have both the required business and technology competencies and all the other complementary assets needed. Who has the key resource (mid-band licences) struggles to be the sole orchestrator because 5G represents such an innovative technology that it is even difficult to design the correct value proposition oriented to value-added services rather than "just" connectivity. As mentioned by practitioners: "*The ability to translate business needs into technology requirements needed for the infrastructure is perhaps the biggest challenge MNOs have, because they are used to sell SIM connectivity*" (VP, Division Director - Communications, Media & Services, IT Integrator 2). Thus, there is an overlap between those who own the technology and the actual orchestrator, which, instead, appears as a dyad of actors. From the end user standpoint, among the actors with whom there have been the most interactions, two players have been recognised as possible orchestrators for the 5G ecosystem: the MNO, and the IT integrator. While the MNO is essential for every 5G project because it owns the network licences and has deep technology competencies, it is argued that it does not hold the necessary business capabilities to offer specific vertical solutions targeting end users' requirements. Even though recently telcos have been trying to acquire these competencies, they are struggling to do so because they have been focused on providing "just" connectivity. However, the real value coming from 5G adoption concerns the possibility of enabling several "value-added services" that end users still struggle to understand on their own, as just mentioned. Nevertheless, some interviewees recognise IT integrators as natural orchestrators since they possess technology competencies and complete business knowledge to cover the requirements of the different industries. However, also in this case their resources and competencies are not enough, due to the ET nature of 5G.

5. Discussion

Results revealed the chaotic actual situation in the 5G B2B context (Figure 2). There is overlap in value creation activities since different actors are trying to propose solutions, offering multiple services, also out of their core competencies. This perhaps is a symptom of the fact that there is confusion about the various possible 5G applications, and that supply and demand are struggling to find alignment, being the value proposition not clearly defined.

As stated in the literature, the missing element crucial for the emergence of ecosystems is alignment, which should be provided by the orchestrator, an actor also in charge of ensuring proper value creation (Lingens & Huber, 2021; Thomas et al., 2022). At the same time, findings suggest that the 5G B2B context is missing an actor with both deep technological and business competencies that can connect demand and offer and provide a solution which shows a real return to end users. This player, given the wide applicability of ET, should also have a specific understanding of multiple industries. According to interviewees, this firm would be the ideal orchestrator, however, no one seems to hold all the necessary characteristics.

Within ecosystems, the actor expected to be the orchestrator is the focal firm (Mann et al., 2022). In the empirical setting, this player is the MNO, since it stands in a central position, is linked to almost all the actors, and holds the main source of value (Cavallo et al., 2021). However, MNOs, even if they have all the necessary technology requirements, are missing vertical domain competencies to understand the context of the client and propose customised solutions to end users, especially because 5G is targeting multiple sectors. As evidenced by Stonig et al. (2022), in certain cases focal firms need to engage in organisational change to promote ecosystem creation. Results showed that MNOs have been trying to acquire business competencies, however, they struggled a lot and have not succeeded yet. The collected data suggests that the orchestrator role in the 5G ecosystem could potentially be assumed by intermediaries (es. IT integrator) because of their expertise in defining a list of use cases in the vertical target. However, these players do not own the key resources and do not possess specialised technology capabilities. As evidence, interviewees noted that the orchestrators from a technological standpoint are the MNOs, while from the business capabilities are the IT integrators. The MNOs can be referred to the focal firm, the intermediaries, as the co-orchestrators, as they establish and mediate relationships while bridging diverse knowledge, competency, and capability gaps (De Silva et al., 2018).

A tidier setting (Figure 3) emerges with respect to the actual situation, driven by the centralization of orchestration activities in the hands of two players, MNO, the focal firm, and an intermediary company.

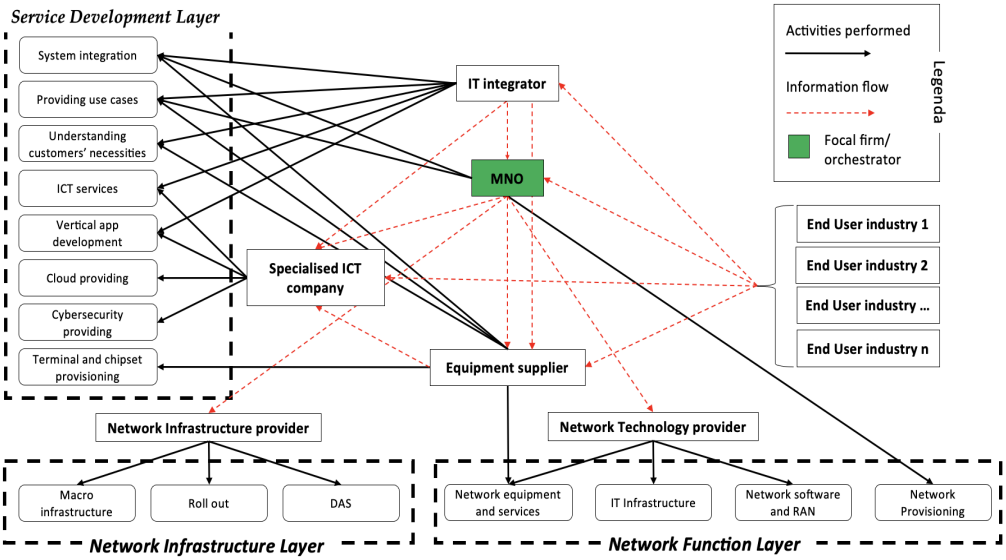

Figure 2: Actual 5G environment framework

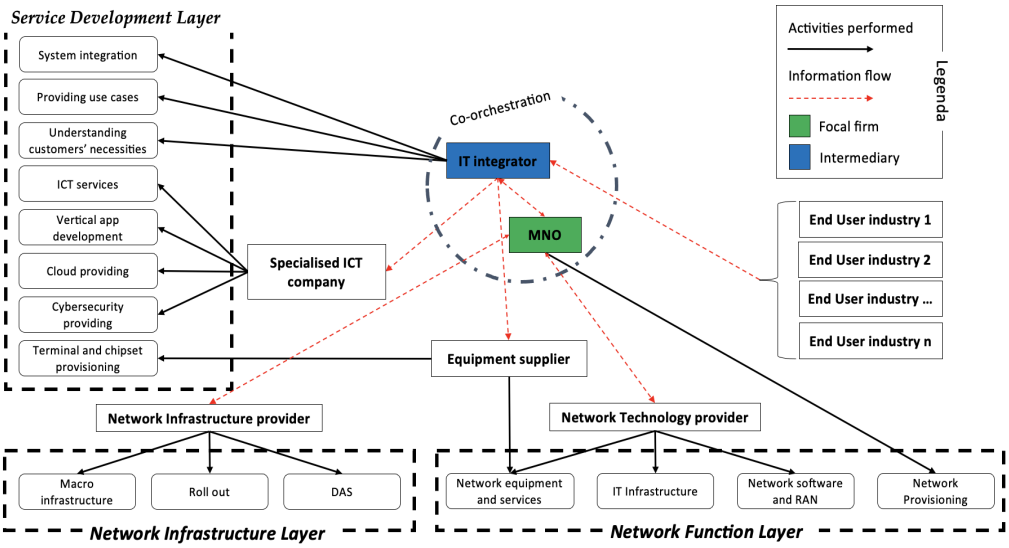

Figure 3: 5G ecosystem framework

5.1 Theoretical Contributions

The theoretical contributions of this research are manifold. First, this investigative empirical study contributes to the 5G managerial literature by providing modelling of the 5G ecosystem, corroborating existing studies (e.g. Teece, 2021; Bauer & Bohlin, 2022). Moreover, it provides the 5G managerial literature with a work that doesn't deal exclusively with the 5G technicalities, but the strategic adoption of such ET. Second, the research contributes also to the ecosystem and ET literature by showing that in an ecosystem based on an ET, due to the wide range of applicability, there is a lack of overlap between those who own the technology and the actual orchestrator since a single firm is not capable of taking on the role of orchestrator alone, but it needs to be supported by an intermediary. The focal firm, indeed, does not have all the capabilities to take the lead and, to promote ecosystem creation, needs either to engage in organisational change (Stonig et al., 2022) or to be supported by an intermediary. This actor, which has responsibility for connecting parties for collaboration (De Silva et al., 2018) and is characterised by cross competencies, can collect information from the customer, understand its needs and create tailored exhaustive solutions. In particular, a dyad of co-orchestrators is needed since overall, they hold the critical asset for the system and the alignment capabilities needed for the ecosystem to emerge. Indeed, for ETs it is important to provide the technology while knowing the multiple industries where it can be applied to foster cross-contamination among them.

Finally, this is also one of the few studies that examine the strategic adoption of an ET from an ecosystem perspective, considering that most publications regarding the structural alignment of a multilateral set of collaborating partners have often focused on discrete technologies (e.g., Kapoor and Lee, 2013; Bohnsack et al., 2024)

5.2 Practical Contributions

Managers and policymakers can benefit from this study in many ways too. To use ET effectively, firms must evolve their business models, focus on their core competencies, and accept their roles in the ecosystem by cooperating with other actors. MNOs should know it is more convenient for them, and preferred by the end user, to cooperate with IT integrators instead of offering end-to-end solutions. Furthermore, IT integrators should understand that it is impossible for them to autonomously orchestrate the ecosystem when they miss the critical resource. From the end user perspective, it emerges that, except for peculiar cases, it is convenient to refer directly to IT integrators, given the potential applications of an enabling technology are uncountable. Moreover, it is highlighted that what is slowing down the optimal commercialisation of 5G is not just technological improvement, but the lack of alignment of the various players from a business strategy perspective.

5.3 Limitations and Future Research Avenues

Given the limited existing literature on the subject, it was chosen to use an exploratory approach employing multiple case studies. Such qualitative research is potentially biased by the interviewer's or interviewee's interpretations, which might distort the final outcomes (Yin, 1984). Future research could analyse quantitatively with longitudinal data how ecosystem emergence occurs with ET. Furthermore, because of the limited data collection, while it has emerged that both actors are necessary to foster the development and adoption of ET, it has not been investigated how the two co-orchestrators can share the created value, introducing new challenges regarding the capture of value from these actors.

Moreover, the research is largely confined to a specific case, and the results may be closely tied to the unique characteristics of the selected context. Accordingly, conducting other research on actual ET could be an interesting avenue for confirming the takeaways of this investigation. Analysing these different technological landscapes might serve as an integrative approach to verify and expand the insights that emerged from this study, thereby enhancing the strength and generalizability of the conclusions.

6. Conclusions

This study examined the development of an ecosystem based on an ET. Driven by a lack of academic research on ecosystem emergence, this study offers a novel analysis of an ET from an ecosystem perspective through an exploratory case study. Qualitative research was conducted using multiple case studies on eight companies within the 5G context. The interactions among these companies were investigated to understand the dynamics of the emerging ecosystem. The key finding is that, in the case of an ecosystem based on an ET, the focal firm does not succeed in becoming the orchestrator alone, because it lacks familiarity with the end user’s business models, processes and specific context comprehension. Therefore, given the large breadth of applicability of an ET, there should be intermediary firms as co-orchestrators.

The Strategic Adoption of 5G Technology From a Business Model Perspective

Mattia Magnaghi, Antonio Ghezzi and Andrea Rangone
Politecnico di Milano, Department of Management, Economics and Industrial Engineering, Italy

mattia.magnaghi@polimi.it
antonio1.ghezzi@polimi.it
andrea.rangone@polimi.it

Abstract: Even if 5G is considered an enabling technology, its transformative potential and widespread adoption remain limited. This paper explores how Mobile Network Operators (MNOs) innovate their business models by leveraging 5G. Through an exploratory multiple-case study of Italian MNOs, key determinants concerning innovation in value proposition, creation, and delivery are obtained inductively from interviews and grouped into different 5G business model archetypes. These latter are "Advanced connectivity provider", "Vertical Service Provider", and "Orchestrator". The first focuses on offering 5G as an enabling technology on which end users can build their own applications. The second selects target industries and allows access to a specific service. The third doesn't own specific knowledge but it acts as the intermediary between a customer and a capable partner's network, ensuring that the project is carried out and targeting multiple verticals. The research provides both theoretical and practical contributions: from a theoretical standpoint, it contributes to the business model innovation literature by offering empirical work that investigates the strategic adoption of a new technological paradigm focusing on the architecture of the business model rather than a measurement of performance afterwards. Moreover, it contributes to the 5G literature with an empirical study that focuses on the strategic implications of the phenomenon rather than just the technical aspects, and to the enabling technology literature by offering a study that examines an enabling technology from a firm-specific perspective. From the standpoint of practitioners, it can offer managerial guidance on developing suitable 5G business models to promote technology adoption and maintain competitiveness by harnessing the potential applications envisioned with 5G.

Keywords: 5G technology, Business model innovation, Mobile Network operator, Enabling technology

1. Introduction

Advanced connectivity, especially 5G, is the pillar of digital transformation. The fifth generation of mobile networks (5G) not only offers incremental performances compared to its predecessor 4G, but also opens up possibilities for applications in the B2B market, unlocking multiple opportunities for both the offer and the demand sides. 5G has been recognized by scholars as an enabling technology (ET) (Teece, 2018; Rathje and Katila, 2021) and estimations suggest that focusing on its development in key sectors such as mobility, healthcare, manufacturing, and retail could lead to a substantial boost on the global GDP, with a potential increase up to $2 trillion by 2030 (McKinsey & Company, 2022). Therefore, the deployment of 5G may necessitate a shift in the attitudes of telecommunications stakeholders, particularly Mobile Network Operators (MNOs) (Cave, 2018; Lehr et al, 2021; Gooderham et al, 2022), who have traditionally held pivotal roles in the telecommunications sector (Ghezzi et al, 2010; Ghezzi et al, 2015). With the advent of 5G, MNOs can change the trajectory of their business model development, especially considering the ongoing price competition in the traditional consumer market, thus unlocking a multitude of possibilities. This becomes especially pertinent considering the potential deployment of private, standalone 5G networks across various industry verticals (Lehr et al, 2021).

However, both from a theoretical and practical standpoint, the prevailing approach to understanding the multifaceted nature of 5G has primarily been technology-centric. Furthermore, only a limited number of scholars have examined Emerging Technologies (ET) from a firm-specific perspective (e.g., Gambardella et al, 2021; Teece, 2018). Therefore, through an exploratory multiple-case study approach with the key informants of Italian MNOs, this paper aims to bridge this gap, offering contributions to both theory and practice. The research provides three business model archetypes related to MNO's 5G business model innovation configurations which contribute both to the managerial literature of 5G technology, as well as the literature about ET and Business model innovation (BMI). Practically, it improves managers' awareness and understanding about 5G strategic implications on a company.

The structure of the paper is as follows: In the second section, a literature review concerning 5G technology the literature about 5G MNOs' business model innovation is presented. In the third paragraph, the methodology used to answer the research question is reported. The findings are outlined in Chapter 4, followed by the discussion driving contributions both to theory and practice and conclusions (Chapter 5, 6).

2. Literature Review

2.1 5G Technology

According to the European Commission, 5G is "*the critical new generation network technology that will enable innovation and support the digital transformation*" (European Commission, 2023). In other terms, 5G represents a new and advanced technology with high potential and a broad portfolio of applications which it could enable (5G-PPP; 2016; Cave, 2018; Ahokangas et al, 2021). Furthermore, from an academic perspective, 5G technology is widely recognized by scholars as an enabling technology (ET) (Teece, 2018; Rathje & Katila, 2021; Gambardella et al, 2021) which is missing to become a General-Purpose technology (Bresnahan and Trajtenberg, 1995) due to the lack of pervasiveness on the overall economy.

Lee and Yu (2022) outlined three key distinctions that set 5G apart from its predecessors: (i) the capacity to connect networked products and services; (ii) the promise of providing extensive, high-capacity, highly reliable, and low-latency connectivity to support diverse scenarios; and (iii) the implementation of "scenario-based" slicing. Massaro and Kim (2022) concurred, emphasizing differences such as higher data rates, traffic density, reliability, user speed, lower latency, and connectivity for numerous devices, as well as lower power consumption enabling Internet of Things (IoT) applications. According to Bauer and Bohlin (2022) and to the main 5G-enabled applications described so far, 5G primarily targets the business and industrial markets rather than the mass consumer market traditionally served by MNOs.

Knieps and Bauer (2022) described local industrial networks as "natural experiments" toward innovative solutions. Consequently, 5G-enabled networks, such as smart manufacturing, agriculture, augmented maintenance, and safety monitoring, are garnering attention from entrepreneurs and companies due to their ability to address diverse needs under specific conditions. Therefore, the deployment of local and private 5G networks presents a tangible opportunity for both MNOs and new stakeholders across various sectors (Ahokangas et al, 2021). However, despite the several opportunities they can enable, there is still uncertainty regarding the 5G business case (Blind and Niebel, 2022), and the value creation mechanism from its adoption across different applications remains unclear (Dolgui and Ivanov, 2022). Massaro and Kim (2022) noted the absence of a "killer service" or application in both B2C and B2B contexts, with many solutions still in the research and development phase (Knieps and Bauer, 2022). Only once the value generation from 5G adoption becomes apparent can the technology be scaled up across diverse sectors (Dolgui and Ivanov, 2022).

Therefore, the emergence of this technological paradigm is not solely confined to the telecommunications industry; rather, various vertical industries are poised to leverage wireless communication (Vuojala et al, 2020). In this context, it becomes imperative to pay closer attention to opportunities that extend beyond MNOs, however, they are the historical focal actor supposed to drive this technology's adoption, especially in some countries where they own the main source of value for the system (5G network frequencies' licenses in mid-band 3.6-3.8 GHz) that they paid dearly.

2.2 5G MNOs' Business Model Innovation

As shown by Gooderham and colleagues (2022), MNOs have faced at least three phases during their existence. The first phase took place between 1990 and 2010 with 2G and 3G, where mobile operators based their business models on voice, messaging, and elementary connectivity (Lehr et al, 2021). The second phase regards the following decade, from 2010 to 2020, with 4G as the dominant technology, where internet connectivity became the major revenue stream for MNOs, instead of the previous voice and messaging. The third phase, which is the period between the previous time windows described and nowadays, is characterized by the advent of 5G and, according to the scholars, the following question arises: "Will this phase be the rebirth phase for MNOs?" The main solution drawn by several scholars regards all the 5G-enabled services MNOs could offer to enterprises and public players; therefore, it seems that the future of 5G lies in the enterprise, not in the consumer market (Lehr et al, 2021; Gooderham et al, 2022; Matinmikko et al, 2018; Cave, 2018). MNOs must be able to develop new capabilities which allow them to co-create digital solutions with business partners to have multiple revenue models (Gooderham et al, 2022; Matinmikko et al, 2018). Otherwise, the risk is that they will end up offering an undifferentiated and price-sensitive commodity. Therefore, already with earlier technologies, MNOs have adjusted their business models (Ghezzi et al., 2009; 2013); however, with the fifth generation, it seems that the development trajectory has changed strongly (Lehr et al, 2021), and the discussion about the best 5G business model for MNOs is still ongoing.

Furthermore, through a non-systematic search regarding the literature about Business Model Innovation (BMI) and technology, the need for greater structuring to intercept a relevant phenomenon emerges. First, as

mentioned by Foss and Saebi (2017), several studies retrospectively describe BMI when considering the adoption of specific technologies; however, it is not common to find predictive and theoretical perspectives. Such a gap addressed by the authors is also outlined by Tongur and Engwall (2014, p.534) when they explicitly affirm that "*further research is needed addressing the interrelationship between technology and business model innovation before, during, and after a technology shift occurs*". Accordingly, Baden-Fuller and Heaflinger (2013) introduce a similar concept from a more technological perspective, addressing the fact that often the impact of technology adoption is restricted to performance measurements; however, such a link with technology requires further investigation at a BM architecture level by understanding the mechanism to innovate BM through its components to create value.

Considering the gap emerged in the managerial literature where the need to investigate MNOs' business model innovation mechanisms becomes evident (Ghezzi et al., 2012; 2015; Knieps and Bauer, 2022; Teece, 2018; Rathje and Katila, 2021), and considering the fact that being still a junior GPT (Teece, 2018), 5G constitutes a promising case for exploring business model innovation during a technology shift, the research aims to shed light on the different strategies MNOs can adopt to successfully commercialize 5G by answering the following research question: How can MNOs innovate their business model by leveraging 5G technology?

3. Methodology

The research adopts an exploratory multiple-case study approach due to a clear literature lack. The research process starts with a state-of-the-art literature review and a research question design. Consequently, data collection was performed (Table 1).

Table 1: Data collection

Level	Data source	Origins	Data usage
Primary	4 first-round semi-structured interviews	MNOs' key Informants	Gaining an initial understanding
	4 second-round semi-structured interviews		Deepen topics
	4 "Telco per l'Italia" interviews	Youtube	Gaining initial understanding
Secondary	9 online articles	Online newspapers	Triangulation
	69 company's website pages	Company's website	

The sample was formed according to a 5G adoption/investment, market share, and segments 'broadness. We investigated the Italian context, where frequencies for 5G service provision are exclusively held by Mobile Network Operators (MNOs) who made investments in 2018. These entities are feeling an urgent need to commercialize the technology because they were the only ones able to invest in these frequencies due to Italian regulations. It is important to note that the successful deployment of 5G depends not only on strategic decisions by such private actors but also on 'exogenous' factors such as incentives for achieving public 5G standalone coverage, which, due to the vastness of the territory, cannot be addressed by a single player. However, one of the opportunities enabled by 5G is the establishment of 5G Mobile Private Networks (5G MPNs). These networks are dedicated wireless infrastructures utilizing 5G technology to provide tailored and secure communication services for specific organizations or entities in various sectors (e.g., Manufacturing, Logistics, Healthcare). They offer rapid data transmission, minimal latency, and reliable connectivity, which cannot be achieved with other technologies. These solutions can benefit from the fact that public coverage is not strictly necessary to leverage these cutting-edge solutions. However, the commercialization of 5G MPNs is still in progress or nearly stagnant, with only proactive pioneering companies from different sectors investing and attempting to implement use cases.

Therefore, to investigate our research question, the three biggest MNOs (Telco A, B, C) and a virtual MNO (Telco D) were chosen. The study aims at reaching theoretical saturation to contribute to theory development (Eisenhardt and Graebner, 2007). The research acquired knowledge through two rounds of interviews, whose questions were adapted according to possible research opportunities, interview videos (used to gain understanding and deepen the topics), online articles, and website pages (used for triangulation). Data collection was performed in parallel with data analysis to extrapolate the highest information quality. It follows (Gioia et al, 2013) and Grounded Theory's methods. Thus, initially, the concept was maintained adherent with the interviews and concept labelled. Then, the study groups them into second-order themes to elaborate on

similarities and differences. Lastly, the overarching dimension collects them into the highest conceptualization Figure 1). Initially, each case has been considered singularly. Then, a cross-case analysis was performed.

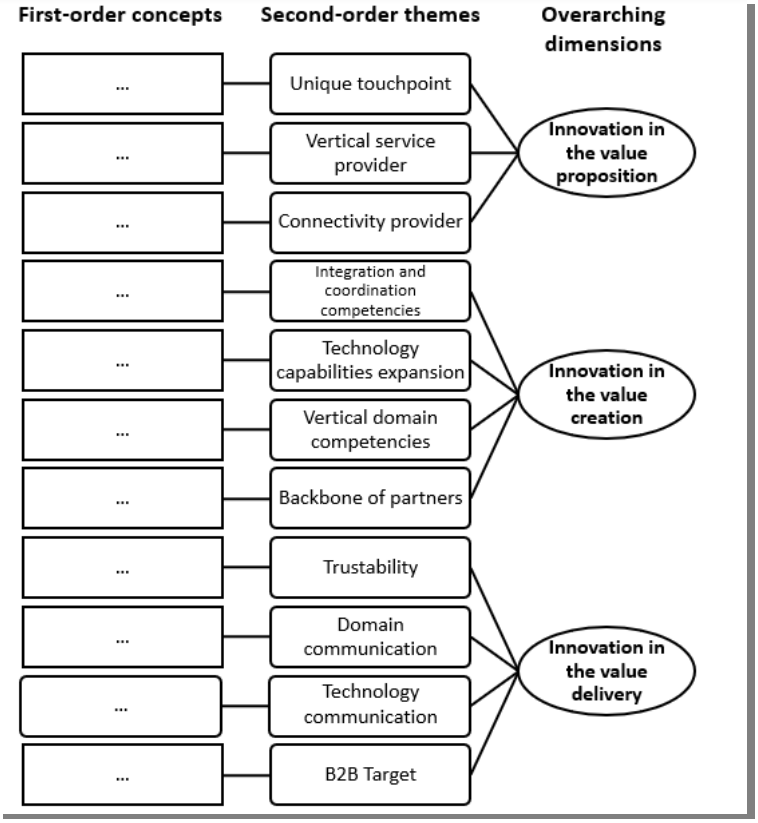

Figure 1: Coding tree

4. Findings

From the interviewees' words was possible to inductively obtain three overarching dimensions, namely the Value Proposition, Value Creation, and Value Delivery. Regarding the Value Proposition, three possibilities were obtained. The first regards a connectivity offer. "*We are telco operators, so we must bring enabling infrastructure*" (Telco A, Marketing Operative). Telco must fulfil performance requirements to make others able to develop services and products. 5G is a perfect fit due to its high performance and slicing nature. It may include a technology enlargement.

The second considers industry-specific service. "*5G enables solutions, use cases, both for consumer and business customers*" (Telco B, Head of Innovation & Vertical Solutions Business). The operator may address industry-specific needs without dismissing the connectivity business, escalating the value chain. The services may be sold "*on top of the connectivity*" (Telco D, CFO).

The last one embraces the referring point. "*We are the only one that can offer everything*" (Telco A, Marketing Manager in 5G & IoT Vertical Solutions). Telcos may position themselves as an intermediary in the service or product construction. "*It may be useful and interesting for a customer to have a unique partner*" that "*permits the customer to realize it most competitively*" (Telco B, Head of Innovation & Vertical Solutions Business).

Value Creation follows the Value Proposition needs. Given 5G applicability broadness, the MNO must establish a partnership network. Selecting a partner "*is a necessity, the innovation degree is very high, and the specialization is on the verticals*" (Telco B, Head of Innovation & Vertical Solutions Business). In particular, they may contribute to platform or application creation. Regarding the competencies, the research finds vertical domain competencies, transverse process competencies, and technology capabilities expansion. Targeting a specific industry requires "*a domain competence that is moved by the only technology components*" (Telco B, Head of Innovation & Vertical Solutions Business). Telcos can't be effective "*if you don't internally create that market knowledge*" (Telco C, Head of Innovative Concept Development & Scaling). The transverse process competencies regard more integration and coordination capabilities. "*You must act a bit as a coordinator between the competencies that are in the company rather than the ones offered by the third party*" (Telco B,

Head of Innovation & Vertical Solutions Business). The company may act as an intermediary between the client and the partners. Lastly, 5G changes the network abilities, adding elasticity, flexibility, and virtualization. 5G allows setting up "*system so-called BSs (Business Support) that are sufficiently configurable to answer to more aggressive speed and customization needs*" (Telco C, Head of Innovative Concept Development & Scaling). New competencies create new professional figures in MNOs, such as the specialist for the industry-specific ones, solution architect, and consultant for the transverse ones. In addition, 5G permits targeting a broad B2B segment. Even though the telcos can't turn B2C down, being their main revenue segment, "*5G is born for the industrial application*" (Telco C, Head of Innovative Concept Development & Scaling). Moreover, the company may require trustability building depending on the target market.

5G may profoundly change the relationship with the customers. The research identified two main approaches: passive and proactive. The Passive's mantra is "*You wait for customers to ask*" (Telco D, CFO). Therefore, the discussion focuses on keeping a stable relationship without investigating in-depth the real customer needs. On the other hand, "*more and more companies start seeing the operator as a partner with whom they can dialogue*" (Telco C, Head of Innovative Concept Development & Scaling). Thus, the Proactive requires a more complete customer engagement and dialogue.

Once the elements and current challenges related to the innovation of MNO's business models with the advent of 5G were defined, the authors attempted to aggregate the second-order themes into three different business model archetypes to outline three different directions based on what emerged from the interviews. Specifically, the three business model archetypes that were defined are: "Advanced connectivity provider", "Vertical Service Provider", and "Orchestrator". Figures 2,3,4 represent the Findings.

5. Discussion

In the first scenario, the so-called Advanced connectivity provider, the Value Proposition focuses on a connectivity offering and it may be complemented by other ICT technologies. In the Value Creation dimension, technology capabilities expansion is required without any new professional figures. Customers may be waited, given just the technology offers. Trustability can be automatically inherited from the current reputation in both market segments due to the MNO's position as a dominant player. In the second BM archetype, the "Service vertical provider", the main proposition will regard access to a service customized for specific vertical application domains. "*The operator is identified as who allows access to a service*" (Telco B, Head of Innovation & Vertical Solutions Business). It shifts the focus from connectivity and technological services to a service environment in which the customer may address different needs. It should require vertical domain competencies. A new professional figure may help the specialization in specific sectors. "*There are commercial figures called specialists that should be specialized in the single vertical*" (Telco A, Marketing Manager in 5G \& IoT Vertical Solutions). It is envisioned as a proactive relationship due to initial reputation issues and B2B customization demand.

In the final BM archetype, the touchpoint unicity is the main value proposition. Exploiting the partnership network, the telco may act as an intermediary and coordinator between the customer needs and the partners supplying. Thus, it requires strong transverse process competencies and dedicated professional roles able to judge the 5G overall solutions and it may guide the customer. Through "*dialogue availability*" (Telco A, Marketing Operative) and "*a higher engagement with the brand*" (Telco B, Head of Innovation & Vertical Solutions Business), the telco may establish a proactive relationship.

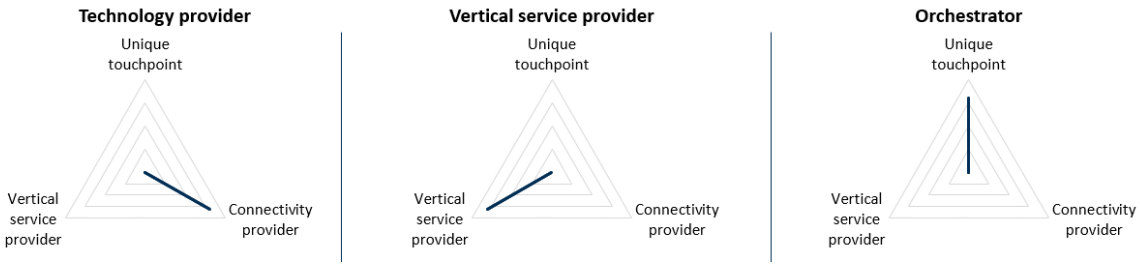

Figure 2: 5G MNOs' Business model archetypes: innovation in the value proposition

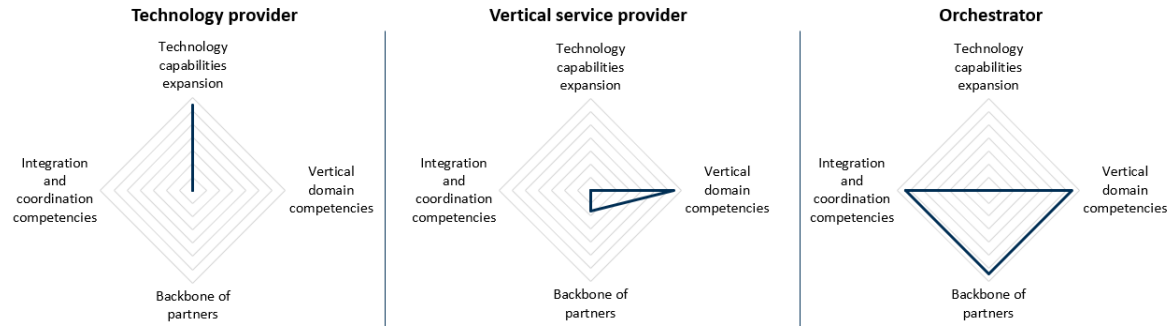

Figure 3: 5G MNOs' Business model archetypes: innovation in the value creation

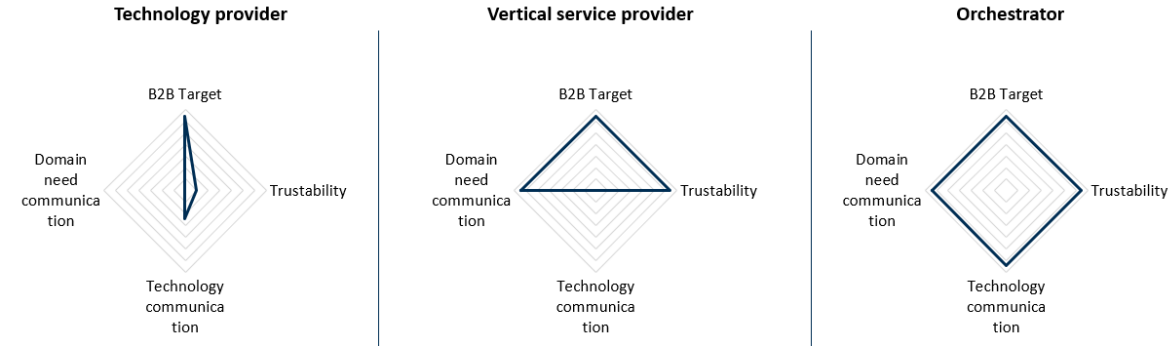

Figure 4: 5G MNOs' Business model archetypes: innovation in the value delivery

5.1 Theoretical Contributions

In opposition to the 5G technical literature in which the technologies and their impact or applications are well-defined, the 5G strategic adoption suffers from the building tools to evaluate and face decisions. If the technology research may be considered mature from different perspectives, the current 5G managerial literature appears fragmented and there is little evidence concerning the exploration of 5G strategic implications in terms of Business Model (Moqaddamerad and Tapinos, 2023) Therefore, the research contributes to the 5G literature by providing three different 5G BM archetypes based on key determinants concerning Value Proposition, Value Delivery, and Value Creation.

This research contributes to the servitization literature by presenting an empirical study on the challenges faced by technology providers in ET commercialization. In this context, the significance of the core technology diminishes due to difficulties associated with early adoption by pioneers in terms of optimal utilization. Therefore, transitioning towards Business Model (BM) servitization, as suggested by Tongur and Engwall (2014) and Sjodin and colleagues (2020), could represent a feasible option for commercializing ET already integrated into certain use cases offered to companies. In such cases, significant changes are required in the mechanisms of value creation, particularly concerning vertical domain competencies (Vertical Service Provider) or the ability to coordinate all other stakeholders (Orchestrator) in the conceptualization and development of use cases.

From a BM literature standpoint, the research contributes to the ongoing debate regarding the strategic impact of new technological paradigms from a BM perspective (Baden-Fuller and Haefliger, 2013; Foss and Saebi, 2017), particularly concerning value creation mechanisms (Teece, 2018; Sjodin et al, 2020) related to new digital technology-driven BMI archetypes (Ancillai et al, 2023). As a matter of fact, It provides an empirical study that attempts to address the interrelationship between technology BMI during a technological shift, rather than retrospectively (Foss and Saebi, 2017; Tongur and Engwall, 2014). Furthermore, due to the collected data, the impact of technology is not evaluated based on performance metrics, as is common in most studies, but rather on BM architecture (Baden-Fuller and Haefliger, 2013).

5.2 Practical Contributions

"*Facing a potential technology shift, [...] they must make a difficult choice that could profoundly affect their business model*" (Tongur & Engwall, 2014)". Given the choice spectrum and high investment, it is hard to coherently decide which path to follow, especially if they are just explorative attempts. The research may

guide managers' choices, depending on the selected strategy. Each archetype has distinct characteristics and addresses different visions and purposes. Model characteristics may provide a framework to assess future business models, unknown till now, and help the MNOs reposition themselves in new market positions. In the third scenario, the results highlight that continuing as a connectivity provider and even as a carrier represents the easiest path in terms of required resources and expertise. However, at the same time, MNOs may risk being "confined" to being a mere technological provider, struggling both to return on 5G investment (especially 5G licences) and to sell the technology itself. In the second scenario, there is a transition from "product," namely connectivity and SIM cards, to the “service”, namely the 5G use case. In this case, the most critical choice is how to define the vertical and internally acquire new resources to gain domain expertise. The third scenario is the one that would allow maintaining one's own expertise and being able to sell the application to the end customer. However, this could also be the most “ambitious” role for other players in the value chain, who could disrupt MNOs.

5.3 Future Avenues

Being a qualitative study, interviewers and interviewees processed questions and answers through a subjective interpretation. The research considered only two interview rounds due to limited resources and time availability. Additional cycles would have increased and granularized the findings. The study doesn't include the Value Capture mechanism due to the market and technology's immaturity. As reported in the “Findings” section, technology and knowledge sophistications drive the market.

Future avenues may amplify the research context and its generalizability. The Italian context presents strict regulations regarding transmission power and investments. It may be interesting to analyse distinct contexts to assess if the same perceptions and archetypes arise. Changing the player's perspective may improve generalizability. It is unlikely that OTTs, other service providers, and the demand will remain static in the market, especially after a performance power-up. Lastly, when the market reaches sufficient maturity, quantitative examinations may confirm or re-evaluate the current literature state-of-art.

6. Conclusion

5G serves as an enabling technology within the B2B sectors, presenting an opportunity for Mobile Network Operators (MNOs), key players in the telecommunications industry, to innovate their business models and uphold a central position in the sector. Through qualitative and exploratory research involving interviews with four Italian MNOs and three pioneering companies seeking to adopt 5G, three distinct business model (BM) archetypes have been delineated prescriptively. These archetypes are characterized by various configurations of determinants derived inductively from the interviews, pertaining to innovation in value proposition, creation, and delivery. Specifically, MNOs can opt to persist as "Technology providers," offering 5G as an enabling technology while leaving the task of understanding its use cases to end-users. Alternatively, they can commercialize 5G value-added services to companies integrating the technology into specific applications, positioning themselves as "Vertical Service Providers" by integrating into downstream verticals. Another avenue for MNOs is becoming the unique touchpoint or “Orchestrator” for 5G project development facilitating interactions among all involved actors as intermediaries. This research contributes to the limited body of literature analysing the adoption of enabling technologies from a firm-specific perspective and adds to the discourse on 5G by presenting evidence of its status as an Emerging Technology (ET) and offering an analysis of its business implications rather than solely focusing on technical aspects. Moreover, it contributes to the ongoing debate on the strategic impact of new technological paradigms from a business model perspective, particularly concerning mechanisms for value creation and capture associated with new, digital technology-driven BMI archetypes. From a practitioner's standpoint, this research offers managerial guidelines on developing appropriate business models to (i) promote technology adoption and (ii) maintain competitiveness while capitalizing on the myriad potential applications promised by 5G. Furthermore, this framework could assist MNO managers in evaluating potential directions for the commercialization of the technology itself.

Abstract: Agile approaches have been used in the software business for many years. However, the agile approaches can bring a lot of velocity to many other business areas. Many authors have reported that using agile business approaches instead of conventional business approaches has addressed the needs of productivity in the current era. For successful implementation of the agile business concept in a company, the maturity for using this approach should be evaluated. This paper presents the results of a survey which was carried out regarding agile business issues in the light of maturity. Specifically, the ability of companies to adopt agile approaches was assessed based on the five-level maturity model of which level 5 shows the highest maturity. The results show that most companies are mainly at level three regarding open innovation and business agility. It is recommended that companies should also focus on the actions required at levels four and five. Because of the content of levels four and five, we suggest that company strategies should be aligned with agile strategies based on the agile business concept. We also argue that corporate change management skills are needed to realize levels four and/or five.

Keywords: Agile approach, Maturity, Technology companies

1. Introduction

Technological advances, new consumer demands, and the market globalization have brought out about new opportunities and challenges for companies which try to adopt different approaches to stay ahead of competition. Agile software development is a popular approach which several companies adopt to transform their processes (Denning, 2018; Van Waardenburg et al., 2013) as it can improve their productivity, resilience, and product quality even when applied at a large scale (Ismail et al., 2011; Rigby et al., 2018). Several of the agile principles and strategies focus on software development companies- however, agile approaches can be integrated into several business and domains and positively transform them (Lindvall et al., 2004; Steindl, 2005).

Nonetheless, the way agile methods affect each company is unique (Fraser et al., 2006) and their successful integration is also influenced by numerous factors (Shahane et al., 2014). The profile of a company (Bottani, 2010), its culture (Tolfo et al., 2011), and the practices used to adopt agile methods (Gerster et al., 2019) are some of the factors that impact the degree at which agile approaches can effectively be integrated and which transform the existing practices and processes of a company. Due to the variety in which agile approaches influences companies, it is important to measure to what degree they have been adopted and integrated within companies (Choraś et al., 2020; Kanakaris et al., 2019). By doing so, companies would be able to develop a notion of business agility (Setiawati et al., 2022).

The aims of this paper are to reveal the status of the business agility maturity in companies especially in Finland. In the following sections we clarify the differences between agile methods in software development, business agility, and the maturity model used to assess the agility in an organization. Thereafter, the methodology used and the data analysis are presented. Finally, the results of this study are further discussed and conclusive remarks are provided.

2. Agile Methods in Software Development

An agile way of work starts with understanding agile software development. Agile software development was created as a response to the heavy plan-driven software process improvement approach (Siakas et al., 2005; 2006) at the end of the 1990s. The Agile manifesto (Beck et al., 2001) explained agile software and system development as light way business-centric, communicative, and fast developing of new software and systems. In agile software development continuous adaption is used in an iterative process for fast delivery of working software embracing changes in the requirements (often caused by a turbulent external business environment),

end-user participation (customers on board for understanding customer needs), and creative software developers (empowerment of software engineers, collective ownership, and team rotation) (Georgiadou et al., 2019; Siakas et al., 2005; 2006).

Agile methods have increasingly been used in software development since the creation of the agile manifesto in 2001 and focus on an iterative and collaborative process (Siakas et al., 2005, Berki et al., 2007; Siakas and Siakas, 2007, Baskerville, 2011), while business agility refers to a broader capacity of an organization facing a volatile, uncertain, complex, and ambiguous business environment to swiftly respond by adapting to changing circumstances, emphasizing overall adaptability and responsiveness (Girod et al., 2023, Ronzon et al., 2019). For distributed software development, which today is a norm, there are different challenges related to differences in time, location, and culture (Siakas & Siakas, 2006; Struciński et al., 2014; Lampropoulos et al., 2018).

Agile methods, as adopted in ICT companies, include certain features, such as (Beck et al., 2001):

- highest customer satisfaction based on continuous delivery of software:
- changes to software features are possible at any time of the development process,
- frequent delivery of software in the timescale from a couple of weeks to some months,
- nonstop interaction between users and developers in projects,
- good working environment for project work is needed,
- emphasis on face-to-face communication when running a project,
- working software as major measure regarding level of project success,
- promotion of sustainable development through agile processes,
- nonstop quality control that enhances agility,
- avoidance of complexity - simple ways of working,
- self-organizing teams enabling best results in different ICT throughputs, and
- intervals in design which, in turn, enable good effectiveness and behavior.

3. Business Agility

The concept of business agility has its roots in agile software development, but has mainly been discussed in other areas than ICTs. Two main approaches build on agile principles, the agile method used in software development and the use of agile principles to create an organization-wide (digital) transformation by accelerating the principles and facilitating digital change (Beretta & Smith, 2023). Beretta and Smith (2023) argued that “agile has become an organization-wide movement where firms are striving for excellence in business agility as they seek to adapt to the fast-changing business environment”. However, to satisfactorily adopt, promote, and integrate business agility approaches, there are several challenges and issues that must be addressed (Goodhue et al., 2009) When implementing agile approaches within an entire organization, significant cultural changes occur and focus is put on aspects such as leadership behaviors suitable for business agility, digital mindset, customer-centric thinking, alignment between business and IT strategy, as well as dynamic and innovative capabilities (Mkoba & Marnewick, 2022; Sidhu, 2023). Hence, the adoption and implementation of agile approaches require significant cultural changes (Iivari & Iivari, 2011).

According to Uimonen (2024), business agility should be implemented by companies to acquire good level of strategic risk management and dynamic capabilities. Dynamic capabilities involve agility and resilience, which are related concepts. With these concepts, it is easier to approach increasing uncertainty in companies’ environment. Shams et al. (2021) claimed that business agility is particularly crucial in multinational enterprises (MNEs) operating in culturally different host countries. They identified factors dealing with continuous change and uncertainty that affect agile route-to-market (RTM) decisions at micro-market levels for enabling strategic renewal and sustainability in socio-economic contexts. They created a conceptual framework that aligns strategic business agility with the integration of different operational areas, such as supply change, ICTs and production. Lakshman and Gonzales (2023) argued that multiculturalism in top management teams influences cultural intelligence on team-level. In MNEs, this endorses business model innovation and enhances organizational dynamic capability and strategic business agility. The results of a study conducted by Troise et al. (2023) regarding the performance of young innovative companies showed a strong relationship between entrepreneurial alertness and digital platform capability, organizational agility, and business model innovation.

The current turbulent business era with new tools, such as generative artificial intelligence tools, have brought more velocity to the business life (Kanbach et al., 2024). Hence, it is important to understand business agility and other related concepts in management theory, such as dynamic capabilities, strategic flexibility, market orientation, and absorptive capacity (Overby et al., 2006). Wang et al. (2022) suggested that innovative use of

chatbots are drivers for creating business agility and business sustainability. To obtain the benefits of business agility, companies should create and adopt flexible business models and processes and encourage all the involved stakeholders to pursue an agile way of working.

Singh et al. (2013) emphasized that the notion of business agility "has received neither a consistent treatment in the literature nor a coherent typology or theory of its meaning (i.e., what it is) and significance (i.e., why it matters) to guide a systematic program of research". Business agility refers to the ability of a company to adapt to changes in the business environment. Girod et al., (20923) argued that different disciplines have articulated different versions of the term, such as agile software development, marketing agility, supply chain agility, strategic business agility, and international business agility, conveying slightly different meanings. Nevertheless, the common notion of business agility in the different versions refers to complex and ambiguous concepts developed in rapidly changing environments regarding a company's capability to operate in a flexible way and to take advantage of their resources, such as technology, for efficiently identifying and addressing opportunities and threats (Mathiassen & Pries-Heje, 2006). Shams et al. (2021) stated that (strategic) business agility refers to the ability of an organization to renew itself, to adjust its strategic directions, and to develop novel approaches to create value when facing new developments (Shams et al., 2021). Troise et al. (2022) defined business agility as "a firm's ability to respond to the challenges posed by the changing and uncertain environment and to renew its business. Overby et al., (2006) divided business agility into two capabilities, namely sensing (the capacity of identifying and foreseeing potential future opportunities) and responding (doing the necessary changes for exploiting new opportunities). Information and Communication Technologies (ICTs) are enablers for quickly sensing environmental changes and as a result, increase the likelihood of responding to change. A competitive advantage is created. By having compelling responding capability companies can provide incentives for identifying emerging opportunities which, in turn, improves the company overall sensing capability. The way ICT capabilities directly affect business agility is twofold, namely through the process integration capability (alignment of processes for capturing data/information pertaining customers, orders, and suppliers) and the knowledge management capability (processing of key information and sharing it with decision-makers). Therefore, decision making based on swift information identifying opportunities and threats in combination with forward-thinking is a strong enabler of business agility. Ilmudeen (2022) proposed that IT-enabled dynamic capabilities impact on the innovative capability of an organization and its business agility. Similarly, Škare and Soriano (2023) prove statistically that there is a strong relationship between the national / industry level of digitalization and agility. Ilmudeen (2022) concluded that operational agility is achieved due to ICT enabled sensing, and subsequent responding by taking advantage of opportunities for innovation and competitive action. The results of a study by Ashrafi et al. (2019) indicated that business analytics strongly impact on business agility because information quality increases (sensing) and as a result, innovative capability also raises (responding). According to Perkin and Abraham (2017), Jeff Bezos, the founder of Amazon, has clarified the business agility in the following way: "In today's era of volatility, there is no other way but to re-invent. The only sustainable advantage you can have over others is agility, that's it. Because nothing else is sustainable, everything else you create, somebody else will replicate."

According to Perkin and Abraham (2017), business agility is needed in general because of four reasons. These are digital transformation (integration of digital technology into all areas of a business), increasing velocity (speed of meeting certain milestones), need for focusing more, and need for flexibility. The digital transformation means responding to the needs of humans through technology. Velocity refers to the faster development of products and services. Focusing means concentrating on the strategy of a company and customers' needs. Flexibility refers to the skills required to work in different ways based on business needs. Perkin and Abraham (2017) described the steps to agile business including phases, such as "personal", "principles", "process", "practice", and "pace".

4. Maturity Model for Business Agility

Maturity assessment is used to investigate the current maturity level of a certain aspect of a company. The aim of such an assessment is to facilitate stakeholders in identifying strengths and weaknesses, and in prioritizing actions for reaching higher maturity levels. A business agility maturity framework has been developed to illustrate the agility expertise and capabilities of an organization, by combining metrics in a number of areas of agility, thus, revealing areas of excellence and also areas for possible enhancement so as to attain the next level of maturity (Cox, 2021). The business agility concept is a strategic option for a company. A road map is essential in order for a company to become more successful. According to our literature review in previous sections, the literature provides what is needed in the adoption of business agility. However, these sources do not provide

road maps for the guidance for improving business agility in companies. Therefore, a maturity model analysis helps companies to improve business agility in their businesses.

Maturity models can offer crucial guidance to companies which in turn can lead to their business becoming more mature to successfully meet challenges and overcome competition. The maturity model examines capabilities in any company (Enkel et al., (2011). The maturity model for the business agility includes the following five levels (Cox, 2021):

Level 1: Siloed operations, command and control management, no business architecture, no or few documented processes, success based on individual performance, no measurements, initiatives poorly managed, mistakes are penalized, and using a keeping people busy policy.

Level 2: Work can be quantified, value is used for more productive work, the transparency and shared understanding of work, and evaluation some metrics are in use.

Level 3: Agile principles are adopted at the business level, strategic goals have incremental checkpoints to ensure that all work aligns with organizational goals, management is moving to servant leadership.

Level 4: All business results have relative targets and regular measures (including non-financial measures). Specifically, work, projects, and/or products should be able to start, pivoted (changed) and stop easily.

Level 5: Adaptive funding models have been used to allocate funds against value streams. Governance is aligned with value delivery. System thinking approach to business has been accepted. Work, systems, and value streams have been visualized in a way that renders their management more feasible.

5. Methodology

Using the maturity model as a basis for examining the business agility levels, a survey was conducted over the time period of spring 2023. The aim of the survey was to reveal the status of the business agility maturity in the companies especially in Finland based on employees' perspectives. The participants who were master students received a set of questions in the business agility context which focuses on maturity levels two to five. Three to four business related questions were included for each maturity level. The questions included in the survey for each maturity level are presented below:

- "How well the work has been quantified/measured as the activity which creates more value at your workplace?" (Level 2)
- "How well do you believe that added value has been understood as the source of better work?" (Level 2)
- "How well do you believe that there is transparency in the work activities at your workplace?" (Level 2)
- "How much you believe that there are metrics available for measuring the work success?" (Level 2)
- "How much you believe that agile principles and values have been accepted at your workplace?" (Level 3)
- How much you believe that strategic goals are connected to the real work at your workplace?" (Level 3)
- "How much you believe that your managers have attitude to serve (especially your customers/clients) in your workplace?" (Level 3)
- "How much you believe that all business results have targets and regular measures including non-financial measures in your workplace?" (Level 4)
- "How much you believe that how easily the new work can be started in your workplace? " (Level 4)
- "How much you believe that how easily old work can be changed or can be stopped in your workplace?" (Level 4)
- "How much you believe that funding for the most valuable things in your workplace can be possible?" (Level 5)
- "How much you believe that your administration is connected to the creation of value through the business at your workplace?" (Level 5)
- "How much you believe that system thinking has been adopted in the business at your workplace?" (Level 5)
- "How much you believe that work, systems and value streams are visualized and managed?" (Level 5)

After being given the above-mentioned claims, the participants were able to provide their comments on promoting open innovation. Particularly, the focus was on which aspects and elements promote open innovation and which ones hinder it.

In total, 61 master students, 32 females and 29 males, whose mean age was 34 years (range 20-55 years), participated in this survey. Particularly, 39 of the students, who participated were from three different higher education institutes in Finland while the other 9 were from a higher education institute in Germany and the other 13 from a university in Morocco. The respondents were full-time engineering professionals who participated in the technology organizations' leadership courses in their universities. They had mean working experience of 12 years (range 1-30 years). 16 respondents worked in operational level positions, 30 in mid-level positions (as an expert with responsibility), and 12 in executive positions (management). 28 respondents worked in ICT companies and other respondents worked in other technology areas including construction, chemical engineering, steel and zinc production. The respondents worked mostly in technology expert positions.

The survey for this study was voluntary and anonymous. The data collection process involved the use of an online questionnaire which was uploaded on the Webropol platform as well as the use of a paper-based one. The participants rated each item (variable) of attributes on a Likert scale of 1 to 5 where 1 meant "Done extremely badly" (Extremely low) and 5 meant "Extremely high" (extremely well). Statistical analysis was carried out using the Statistical Package for the Social Sciences (SPSS). The analysis followed a quantitative approach and focused on the average of the participants' responses and on the outcomes of T-tests.

6. Data analysis

To examine the participants' responses, their answers to each question of each particular maturity level were analyzed. Specifically, the average score for each question as well as the mean score of their responses to the questions related to a specific maturity level were examined. Of the total 5 maturity levels, levels 2 to 5 were included in this analysis. Since maturity level 1 does not showcase any significant proof regarding company business agility, it was not included in this study. In particular, Table 1 presents the questions and the average scores of responses of maturity level 2 and Table 2 presents the related information about maturity level 3. Table 3 represents the questions and responses relevant to maturity level 4. Finally, Table 4 showcases the participants' average scores and the questions related to maturity level 5.

Tables 1-4 (see next page) depict participants' average score for each question based on the 5-points Likert scale as well as the statistical significance (p) of each claim.

Table 1: Maturity level 2 questions and average score of responses

Question	Average
"How well the work has been quantified/measured as the activity which creates more value at your workplace?"	3.59
"How well do you believe that added value has been understood as the source of better work?"	3.49
"How well do you believe that there is transparency in the work activities at your workplace?"	3.48
"How much you believe that there are metrics available for measuring the work success?"	3.41
Mean of responses at level 2	3.49

Table 2: Maturity level 3 questions and average score of responses

Question	Average
"How much you believe that agile principles and values have been accepted at your workplace?"	3.16
"How much you believe that strategic goals are connected to the real work at your workplace?"	3.58
"How much you believe that your managers have attitude to serve (especially your customers/clients) in your workplace?"	3.62
Mean of responses at level 3	3.45

Table 3: Maturity level 4 questions and average score of responses

Question	Average
"How much you believe that all business results have targets and regular measures including non-financial measures in your workplace?"	3.38
"How much you believe that how easily the new work can be started in your workplace?"	3.48
"How much you believe that how easily old work can be changed or can be stopped in your workplace?"	3.03
Mean of responses at level 4	3.30

Table 4: Maturity level 5 questions and average score of responses

Question	Average
"How much you believe that funding for the most valuable things in your workplace can be possible?"	3.49
"How much you believe that your administration is connected to the creation of value through the business at your workplace?"	3.36
"How much you believe that system thinking has been adopted in the business at your workplace?"	3.03
"How much you believe that work, systems and value streams are visualized and managed?"	3.49
Mean of responses at level 5	3.34

Furthermore, to get a better understanding of the participants' responses, we created a sum variable for each of the maturity levels and compared the sum means using the T-test. According to Kolmogorov test, the responses data agreed with the normal distribution. For that reason, conducting statistical data analysis through T-test was deemed as an appropriate method. The related results are showcased in Table 5.

Table 5: Comparing means

Comparing means using T-Test	
Level 2 responses versus Level 3 responses	p=.751
Level 3 responses versus Level 4 responses	p=.249
Level 4 responses versus Level 5 responses	p=.957

The results show that in most companies, agile business practices are currently at level 2 to 3. However, the differences when proceeding from low levels to upper levels are not significant. The notable thing is that the respondents evaluated some features of agile business less significant in their organizations. These features were "How much you believe that agile principles and values have been accepted at your workplace?", "How much you believe that how easily old work can be changed or can be stopped in your workplace?", and "How much you believe that system thinking has been adopted in the business at your workplace?".

7. Discussion

As technologies become more advanced and complex, their role in companies is becoming more important. Companies have to effectively adopt and integrate ICT tools in their processes to stay ahead of the ever-increasing competitive global market. Agile approaches offer several benefits throughout the product or service development cycle. Although many companies use agile approaches, there is a great variety regarding the degree in which companies are able to fully integrate them. Employees have first-hand experience in many of the processes of a company. Therefore, their perspectives are closely related to the true capabilities of a company to integrate agile approaches.

Therefore, this study focused on the viewpoints of master student who were also working in technology related companies. Emphasis was put on levels 2 to 5 of the company maturity level. Specifically, the participants quoted that system thinking has not been effectively adopted at their workplace, that changing and stopping existing processes and practices that use the old ways is difficult, and that agile values and principles have not yet been accepted at the workplace at the level that they should. Additionally, the participants most agreed that managers have an attitude to serve, that quantifying/measuring their work adds value at their workplace, and that strategic goals are closely connected to the real work environment. From the results, it was revealed that the majority of the companies examined are currently at maturity levels 2 or 3. Hence, companies should focus more on further adopting appropriate practices and methods to improve their ability to effectively integrate agile approaches.

Moreover, our results show that the agile business concept has been moderately accepted in companies. We found that in three issues of our survey, namely i) "adoption of principles and values" ii) "changing work" and iii) "system thinking", more understanding is needed and this understanding can be achieved through training and changing management activities. These are fundamentals which can help companies to meet the need of velocity which has been argued in section 3 (Uimonen, 2024; Shams et al, 2021).

In the adoption of principles and values, the methods of change management are vital because of the cultural change as argued in section 3 (Goodhue et al., 2004; Mkoba & Marnewick, 2022; Sidhu, 2023; Iivari & Iivari, 2011). This should be introduced by the methods for example suggested by Kotter (1996) – this includes actions such as motivating, introducing short-term benefits, introducing long-term benefits, and rewarding employees. The same can be applied to issue two "changing work". Individual change is slow. Employees' attitudes toward change are challenging (Ahmad & Cheng, 2018). The third issue "system thinking" is vital for understanding the whole of the company. This can be organized during a company strategic meeting. Our suggestion to meet these challenges is the adaptation of Joiner's model of business agility (Joiner, 2019).

maria.lima@esce.ips.pt

Abstract: The choice to pursue an entrepreneurial path is the result of a complex cognitive journey. It's vital to comprehend this mental process as it unfolds during the educational phase, especially since entrepreneurship is now a potential career option for a growing number of students. This paper explores and evaluates entrepreneurial intentions (EI) and their antecedents among 132 students from College of Business Administration (ESCE), Polytechnic Institute of Setubal (IPS). To collect data, the research used part of the Entrepreneurial Intentions Questionnaire (EIQ) designed by Liñán and Chen (2009) with additional demographic questions. This paper also examines the role of age, gender, work experience and self-employment in affecting personal attitudes, subjective norms, perceived behavioral control and entrepreneurial intentions. The research is based on a study developed by Liñan and Chen (2009) that was applied in two different cultures: Spain and Taiwan. This research adds another comparison with students from Portugal and the results allowed the confirmation of the findings of previous studies concerning the relationship between the entrepreneurial intention and the personal attitude and perceived behavioral control.

Keywords: Entrepreneurship, Entrepreneurial intentions, Entrepreneuship education, Higher education

1. Introduction

It is recognized that an entrepreneurial career offers significant opportunities for individuals to achieve financial independence and benefit the economy by contributing to job creation, innovation, competitiveness and economic growth (Barba-Sánchez et al., 2022). Today's students are tomorrow's potential entrepreneurs, which may explain why a growing number of universities, spread across the world, offer entrepreneurship courses and programmes. Numerous studies have identified entrepreneurial intention (EI) as a highly influential predictor of entrepreneurial activities and behaviors (Krueger et al., 2000; Arasti et al., 2012). Consequently, contemporary research has increasingly emphasized EI over the broader field of entrepreneurship (Yu et al., 2021). Indeed, the utilization of EI as a foundational framework for research has increases since the early 90s, underscoring the pivotal role of EI in various contexts (Liñán & Fayolle, 2015).

Taking this into consideration, it becomes crucial to comprehend the factors that shape the EI of students, as this understanding is vital for nurturing their future entrepreneurial aspirations. Numerous scholars have conducted investigations to explore the variables influencing the EI of students in higher education. Cognitive and personality factors, including self-efficacy, individual attitudes, desire for achievement and behavioral control, wield substantial influence over students' intentions towards entrepreneurship (Nasip et al., 2017; Biswas & Verma, 2021). On the other hand, social and environmental researchers have identified elements such as previous experiences, family background, regional culture, and government support as pivotal factors that shape the EI of students (Ali et al., 2019; Tiwari et al., 2020).

The argument that entrepreneurship can be stimulated and developed by education has been gaining importance inside and outside the academic world. The number of studies dedicated to studying the influence of entrepreneurship education on EI is considerable and their conclusions are difficult to ignore. Given the very important position of entrepreneurship as a driver of socio-economic development, there is special attention among policy makers, educators, academics, and scholars as it is considered as a critical factor in fostering the socio-economic development of a country (Nowiński et al., 2019). Considering this, entrepreneurship education in higher education institutions (HEIs) plays an essential role in enhancing students' foundational entrepreneurial knowledge and various cognitive and non-cognitive skills. By doing so, it stimulates and encourages students to engage in entrepreneurial activities (Brüne & Lutz, 2020). This, in turn, serves as a

catalyst for motivating students toward entrepreneurship, contributes to improve entrepreneurship quality, and ultimately leads to entrepreneurial success (Galloway & Brown 2002).

Entrepreneurship education has become a prominent feature in the curricula of HEIs, not only in business schools but also in other areas (Kuratko, 2005). On the other hand, it should be noted that the teaching of entrepreneurship is not only carried out in HEIs, since in last years there has been a focus on teaching entrepreneurship both in high school, as well as in middle and elementary school. The rapid growth of entrepreneurship education in academia is proof that students who attend entrepreneurship courses have more intentions to create new businesses than students who do not participate in entrepreneurship education (Çera et al., 2021; Li et al., 2022). Formal entrepreneurial education has an impact on students' propensity to pursue a career as an entrepreneur (Shinnar et al., 2018).

2. Literature Review

2.1 Entrepreneurial Intention

The intention is a basic model for entrepreneurial behavior development and stands as the most reliable indicator of human behavior (Aamir et al., 2021). According to Ajzen (1991) and Sutton (1998), most socially relevant behaviors are under volitional control. Intention, therefore, can be considered an immediate antecedent of an actual behavior, an indicator of how hard individuals are willing to try, and an indicator of how much effort individuals are planning to exert in order to engage in a specified behavior (Kim & James, 2016).

EI has been extensively investigated in recent decades and continues to be of interest to researchers due to its importance for the development of many countries (Barba-Sánchez et al., 2022; Virasa et al., 2022). The literature on EI includes factors that influence it such as education (Thomas, 2023; Xu et al., 2023), personality traits (Kent et al., 2022), perceived ability (Sedeh et al., 2021) and teaching and training (Chaker & Dellagi, 2023).

Furthermore, entrepreneurship scholars have theorized that a series of external factors, such as the social, political and economic context influence EI (Doanh, 2021). Governments can intervene with financing schemes, tax policies and other support mechanisms that aim to mitigate market inefficiencies and promote entrepreneurship (Owen & Vedanthachari, 2023). Regarding the local context, several studies have focused on the capacity of certain resources, such as financial support (Sabri et al., 2023), entrepreneurship support services (Bazan, 2022) and human capital (Luo et al., 2022), can have in promoting EI.

Researchers Carr and Sequeira (2007) found that exposure to the family business serves as an important intergenerational influence on intentions to become an entrepreneur. Family characteristics have an implication in the emergence of new businesses, in the recognition of opportunity, in decisions to create a startup and in the mobilization of resources (Zaman et al., 2021). Likewise, previous exposure to entrepreneurship, both on the family and personal side, has an impact on EI. Exogenous influences (such as demographics, skills, societal traits, financial support and culture) affect attitudes and also indirectly affect intentions and behaviors to become entrepreneurs (Zaman et al., 2021). Family members in the business become a symbol for the entrepreneur and a source of financial and non-financial help. Likewise, family financial resources have a direct relationship with EI. It was observed that students with intentions of becoming entrepreneurs tend to be more qualified than individuals without entrepreneurial behavior. The experience of self-employment was directly related to students' EI (Gird & Bagraim, 2008).

A gender disparity has also been observed concerning entrepreneurial orientation (Villasana, Alcaraz-Rodríguez, & Alvarez 2016) as well as the motivation and intention to initiate one's own business (Hughes, 2003). The male students, as demonstrated by various empirical investigations (Dıaz-Garcıa & Jimenez-Moreno, 2010), tend to exhibit a stronger EI compared to female students.

Thus, recent studies have emphasized the need for an entrepreneurial attitude and intention as factors that determine entrepreneurial behavior (Cui & Bell, 2022). These factors can be greatly influenced by entrepreneurship education (Cui & Bell, 2022).

2.2 Entrepreneurial Intention and Theory of Planned Behavior

Based on the Theory of Reasoned Action (TRA) (Fishbein & Ajzen, 1975), the Theory of Planned Behavior (TPB) (Ajzen, 1988 and 1991) has become one of the most common psychological theories used to explain and predict human behavior (Carr & Sequeira, 2007; Kolvereid, 1996a; Maheshwari & Kha, 2021; Romero-Colmenares & Reyes-Rodríguez, 2022), including in the field of entrepreneurship (Liñán & Chen, 2009; Gieure, et al., 2020; Sampene, et al., 2022).

TPB has been validated as a robust and substantial theory throughout the various domains of human behavior (Cui & Bell, 2022). For example, TPB has been successfully applied to a wide variety of behaviors, such as organizational behavior (Wynn et al., 2021), health protection (Kim, et al., 2020), and purchasing behavior (Dorce et al., 2021).

The TPB establishes that intention is a consciously planned behavior (Bird, 1988; Krueger et al., 2000). Consequently, EI is considered an antecedent of the entrepreneurial behavior (Fayolle et al., 2006). Ajzen (1991, p. 181) defines intentions as "indicators of the difficulty that individuals are willing to try, of how much effort they are willing to exert, to execute the behavior". The stronger the intention to engage in a specific behavior, the more likely it will be to actually perform it (Ajzen, 1991). In other words, Ajzen (1991, 2002) maintains that intention is the immediate antecedent of behavior.

TPB becomes necessary due to the limitations of the original model in dealing with behaviors over which people have incomplete subjective control (Ajzen, 1991). In summary, the theory of planned behavior postulates that intentions have three conceptually independent determinants ("antecedents of intentions"), namely, personal attitude (PA), subjective norm (SN) and perceived behavioral control (PBC) (Ajzen, 1991). PA refers to the degree to which a person has a favorable or unfavorable evaluation or appreciation of the behavior in question. The term SN refers to the perceived social pressure to perform or not perform that behavior. As for PBC, this refers to the perceived ease or difficulty of carrying out the behavior. According to Ajzen and Fishbein (2004), the three theoretical antecedents should be sufficient to predict intentions, but only one or two may be necessary in any given application. In other words, the TPB states that the relative importance of the three factors can vary depending on the context. In a recent investigation conducted by Barba-Sánchez et al. (2022), they examined the components of the TPB within their research and their findings revealed that ATB and PBC exert a direct impact on the EI of students. However, it was observed that SN does not directly influence students' EI, but mediate the relationship between environmental awareness and ATB and between environmental awareness and EI.

Demographic characteristics and other characteristics related to the individual's background and environment are not directly addressed in the theory of planned behavior. This theory predicts that these factors do not have a direct impact on intentions, but an indirect impact through PA, SN and PBC (Kolvereid, 1996b; Krueger & Carsrud, 1993).

2.3 Entrepreneurial Intention Questionnaire

Liñan and Chen (2009) conducted research using a cognitive approach, employing an EI model. Their findings highlighted the need for further research to comprehensively understand the elements that influence individuals' perceptions of entrepreneurship. They also proposed the importance of conducting cross-cultural studies to gain deeper insight into how diverse cultures and values impact EI.

The model used by Liñan and Chen will be used in this research and is shown in Figure 1.

The hypotheses developed by Liñan and Chen are:

H1: Personal attitude positively influences entrepreneurial intention.

H2: Perceived behavioral control positively influences entrepreneurial intention.

H3: Subjective norm positively influences entrepreneurial intention.

H4: Subjective norm positively influences personal attitude.

H5: Subjective norm positively influences perceived behavioral control.

In the original model developed by Liñan and Chen, Hypotheses H6 and H7 are related to the influence of the country of origin: Spain or Taiwan.

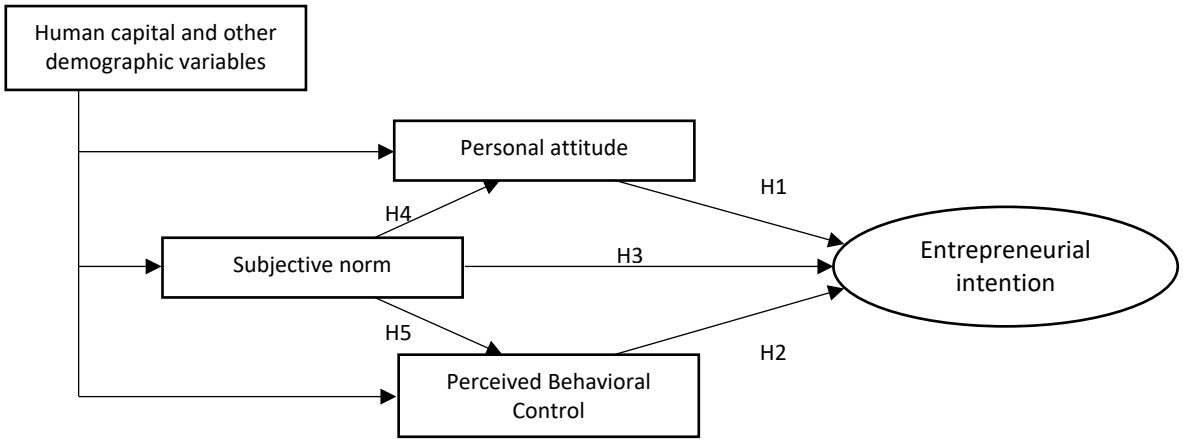

Figure 1: Entrepreneurial Intention Model by Liñan and Chen (2009)

Following the analysis of their data, Liñan and Chen (2009) reached at the conclusion that hypothesis H3 was not supported. Their core EI model, as proposed, received overall validation, except for the relationship between SN and EI (Hypotheses H3). Hypotheses H1 and H2 were confirmed, and it was established that SN indirectly influences EI through two pathways: one through PA (as confirmed by H4) and the other through perceived behavioral control (as confirmed by H5). Based on the findings of Liñan and Chen, this study intends to apply the entrepreneurship model to a sample of students from the Polytechnic Institute of Setubal (Portugal).

3. Methodology

Measures

This study used the Entrepreneurial Intention Questionnaire (EIQ) developed and validated by Liñán and Chen (2009). The questionnaire was specifically designed for applying the theory of planned behavior to entrepreneurship (Liñán & Chen, 2009; Liñán, 2008; Liñán et al., 2011). Initially tested with Spanish and Taiwanese samples, it has also been validated across various contexts, including both developed and developing countries (e.g. Hoda et al., 2021). The questionnaire comprised questions using a seven-point Likert scale (1=Strongly disagree to 7=Strongly agree) and nominal scales. The Likert scale questions assessed PA (5 items), SN (3 items), PBC (6 items) and EI (6 items). Nominal scales were used to measure gender (1=Male, 2=Female) and prior entrepreneurial exposure (whether respondents have work experience, or self-employment experience, with 1=Yes and 2=No).

Sample

The empirical analysis has been carried out on a sample of last-year students from College of Business Administration, Polytechnic Institute of Setubal, who attended the subject of entrepreneurship in the 2022/2023 school year. A total of 132 questionnaires were thus collected.

Student samples are very common in entrepreneurship research (Liñán & Chen, 2009) especially given evidence that university graduates between 25 and 34 years of age show the highest propensity toward starting up a firm (Reynolds, Bygrave & Autio, 2004).

To collect data, the research used part of the EI Questionnaire (EIQ) designed by Liñán and Chen (2009) with additional demographic questions (age, gender, course, labor experience and self-employment experience).

Entrepreneurial Intentions Questionnaire (EIQ)

The EIQ is an instrument developed by Liñan and Chen (2009) to measure EI and other variables such as PA, SN, and PBC.

Reliability and validity of the questionnaire were already verified by Liñán and Chen (2009) to ensure that each pool of questions is related to same subject and each subject corresponds to the required measure.

The questionnaire used in the research is divided into 2 sections. The first section identifies the profile of the respondents. In this section the main characteristics identified are: (1) the gender; (2) the age; (3) the course; (4) the work experience and (5) the self-employment experience. Section 2 comprehend the questions taken from the EIQ to measure, through a 7 Likert-type scale, the different constructs of the EI model (PA, SN, PBC and EI).

4. Results

As shown in Table 1, 51.5% of students are male and 48.5% are female and most are aged between 20 and 22 years.

The students participating in this study are from different courses, namely: Human Resource Management, information Systems Management, Marketing and Distribution and Logistics Management.

36.4% of the students surveyed indicated that they were pursuing a bachelor's degree in Distribution and Logistics Management, followed by Information Systems Management students (26.5%), Human Resource Management students (18.9%) and, finally, Marketing students (18.2%).

With regard to work experience, the majority (59.8%) reported having some work experience. However, only 19.7% of the total respondents claimed to have self-employment experience.

Table 1: Students' profile

	Frequency	Percentage
Gender		
Male	68	51.5
Female	64	48.5
Age		
20 – 22	95	72.0
23 – 25	24	18.2
26 – 28	5	3.8
≥ 29	8	6.1
Course		
Human Resource Management	25	18.9
Information Systems Management	35	26.5
Marketing	24	18.2
Distribution and Logistics Management	48	36.4
Work experience		
Yes	79	59.8
No	53	40.2
Self-employment experience		
Yes	26	19.7
No	106	80.3

Cronbach's alpha was employed to assess reliability, resulting in values ranging from 0.785 to 0.955 (Table 2). Convergent validity was measured using the Kayser-Meyer-Olkin (KMO) test, yielding a score of 0.856, and Barlett's sphericity test, which had a significance level of $p < 0.001$. Subsequently, based on the aforementioned test results, factor analysis was conducted. A Shapiro-Wilk test was performed to examine data normality. Consequently, the principal axis factorization extraction method was utilized. The analysis yielded a solution comprising four factors, for which the eigenvalues are requested to be greater than 1. The cumulative variance explained by these factors is 76.9 percent (Table 2).

As shown in table 2, item SN1 does not load strong enough for PA and item PBC1 also does not load strong enough for PBC. Consequently, these two items were excluded from the subsequent phases of the research. To gauge discriminant validity, correlation values among the various construct groups were analyzed. The results confirmed that each item has a strong correlation with its respective construct and not with others.

Table 2: Rotated Components Matrix

	Component			
Factor	**1**	**2**	**3**	**4**
PA1		0.578		
PA2		0.748		
PA3		0.840		
PA4		0.831		
PA5		0.639		
SN1

EI5	0.847			
EI6	0.844			
Percentage variance explained	53.6%	10.5%	7.2%	5.6%
Cronbach's α	0.955	0.913	0.883	0.785
	EI	PBC	PA	SN

Extraction method: Principal components analysis

When we examine the correlations between variables (table 3), it becomes evident that hypotheses H1, H2, H4, and H5 find support based on the strength of their correlation coefficients and regression values. On the other hand, hypothesis H3 is rejected. This is because the SN exhibits a relatively weak correlation with EI, standing at 0.399, and the regression coefficient of SN in relation to EI holds a significance value of 0.814, which exceeds the threshold of 0.01.

This findings are consistent with the findings of previous studies referred in literature review (Kolvereid 1996a; Kolvereid, 1996b; Tkachev & Kolvereid, 1999; Krueger et al., 2000; Liñán, 2004; Veciana et al., 2005; Fayolle & DeGeorge, 2006; Engle et al., 2010; Kautonen et al., 2015).

Table 3: Correlation Matrix

	PA	**SN**	**PBC**	**EI**
PA1		0.324	0.202	0.460
PA2	0.729	0.031	0.208	0.432
PA3	Average	0.065	0.148	0.147
PA4		0.101	0.101	0.384

Correlations (significant at 0.01 (bilateral))				
PA	1	0.411	0.693	0.837
SN		1	0.481	0.399
PBC			1	0.779
EI				1

A nonparametric test – Spearman's correlation was utilized to measure the strength of the relationships between demographic variables (age, gender, work experience and self-employment experience) and the constructs of the EI model (PA, SN and PBC).

Based on Table 4, there was a statistically significant low negative correlation between the PA and age (correlation coefficient = -0.363, p=0.000), and between the PBC and self-employment experience (correlation coefficient = -0.329, p=0.000). The relationships between the other variables showed negligible correlations with correlation coefficients ranging between -0.153 and 0.099.

Table 4: Correlation Test

			PA	SN	**PBC**
Spearman's rho	Age	Correlation Coefficient	-.363*	.033	.046
		Sig. (2-tailed)	.000	.000	.000
		N	60	60	60
	Gender	Correlation Coefficient	-.007	-.149	-.001
		Sig. (2-tailed)	.000	.000	.000
		N	60	60	60
	Work experience	Correlation Coefficient	-.153	-.090	-.080
		Sig. (2-tailed)	.000	.000	.000
		N	60	60	60
	Self-employment experience	Correlation Coefficient	.099	.031	-.329*
		Sig. (2-tailed)	.000	.000	.000
		N	60	60	60

*. Correlation is significant at the 0.05 level (2-tailed).

These results contrast with the results evidenced by Liñan and Chen (2009), who reported that gender, self-employment experience, and work experience had an impact on the constructs of the EI model.

5. Discussion

This study utilized the EIQ instrument, originally developed by Liñan and Chen (2009). In the original paper by Liñan and Chen (2009), a comparative analysis was conducted between Spain and Taiwan. The objective of this present research is to introduce a new comparison, this time with a sample of students from Portugal.

The EIQ questionnaire, which was validated by Liñan and Chen, proved to be comprehensive and provided ample data to assess the proposed model. The proposed model, rooted in the theory of planned behavior, assesses variables such as PA, SN, and PBC. In our study, demographic factors such as age, gender, and self-employment experience did not exhibit significant influence on the constructs of the EI model. In contrast, Liñan and Chen reported that gender, self-employment experience, and work experience had an impact on the model.

Considering both the prior utilization and outcomes of the EI model and the results of our current research, the model demonstrates robust support.

6. Conclusions and Future Direction

In this study, we present a model with the variables that influence EI among students from Polytechnic Institute of Setubal (Portugal). Our study builds upon the work previously conducted by Liñan and Chen (2009), which explored the same variables but in different cultural contexts, namely Spain and Taiwan. Our research extends this comparison to a third country, Portugal.

This study allowed the confirmation of the findings of previous studies that have demonstrated that EI is predicted by PA, SN, and PBC. The results achieved contribute to reinforce the application of the theory of planned behavior (Ajzen, 1991) and confirm the influence of cultural and social environment in human behavior. The results obtained in this study confirm the findings of previous studies that have demonstrated that EI is predicted by PA, SN and PBC.

The main limitations of this study are the non-representativeness of the sample, and therefore extrapolations should not be made. In future studies, it is suggested that the sample may have a greater number of higher education institutions, in order to cover students from different areas of education. On the other hand, it is also suggested to analyze other variables that may have an influence on students' EI, such as analyzing the influence of the family on the development of EI.

Abstract: Tourism-dependent countries like Cyprus, have been seriously affected by the shockwave that COVID-19 pandemic has generated to their sociocultural/economic fabric. One of the industries of Cyprus impacted is the wine industry. Indeed, the consequences of the pandemic have been reflected on various angles of the island's wineries; from the day-to-day operations to their overall strategy. Moreover, they influenced their relationship to tourism and the provision of wine tourist experiences. This is even more apparent in the case of small wineries. In this respect, the paper examines how tourism related wine enterprises, and more specifically, small wineries in Cyprus, handled the crisis and its impacts, through the analysis of the wine entrepreneurs' views. This study explores the dimensions of the pandemic imprinted on wineries' business and highlights the pertinent measures taken to deal with them. Additionally, it illustrates how wine tourist activities have been affected, enhanced, and reformed for the smooth wine tourist experience to be provided. To do so, exploratory research was utilized to collect data through secondary sources and face-to-face in-depth interviews with winemakers/managers/owners of small wineries in Cyprus. Findings reveal that the greatest challenge that small wineries faced, was the high degree of uncertainty, as Hotels, Restaurants, and Catering companies (HO.RE.CA.) were temporarily closed and consequently, the wine consumption related to tourist flows was reduced. Small wineries took a series of measures to handle the crisis, such as emphasizing communications through online media, improving the provided -tourist- experience in the wineries, or enhancement of direct marketing and distribution strategies. The paper concludes with recommendations for small winemakers to deal with the shocks of crises and for their sustainable competitive advantage.

Keywords: Wine tourism, Cyprus, Wine marketing, Covid-19, Wine industry, Innovation

1. Introduction

The pandemic of COVID-19 was among the most severe crises in the modern history that affected many sectors worldwide, including tourism and wine ones. Indeed, as Szolnoki et al. (2022) argue, the pandemic disrupted several dimensions of the wine-tourism industry including leisure, culinary, experiential, historical and cultural visits, making them rearranging their business model to adopt with the new circumstances, in order to, somehow, maintain their competitive position and remain viable. Considering that according to Gutiérrez-Escobar et al., (2021), wine is among the most widely consumed beverages worldwide, wine business has been severely impacted by COVID-19, with global revenues falling by more than 10% in 2020 (Lu, 2020). Many studies have been conducted in this area regarding the effects of COVID-19 on wine sales, consumption, and international commerce (Rebelo et al., 2021; Wittwer & Anderson, 2021). These studies highlight the challenging situation for the wine business and how it affected the wine market. Among the nations that the pandemic influenced their wine (tourism) industry was also Cyprus.

Tourism comprises one of the most important sectors of the economy for the island of Cyprus. Since its independence from the British Empire in 1960s, the government of Cyprus found on tourism the means for economic growth, sociopolitical stability and integrity, independence, and in expansion, improvement of the quality of life of the island's residents (Boukas, 2019). Indeed, Cyprus tourism has been steadily increasing, with minor fluctuations, in its recent history, while after 2010, tourist arrivals and revenues have been growing in an positive and steady pace (Boukas and Marneros, 2024); it is noteworthy that only in 2019 approximately four million international tourists visited the island generating €2.7 billion, (12.2%t of nominal GDP) (Cyprus Statistical Service, 2022). The wine tourism industry of the island follows also the same course.

Despite its small size, the island of Cyprus indicates a prominent wine tourism activity. Currently, there are 80 wineries, many of them capitalizing on the significant tourism activity of the island and providing wine tourism experiences, such as visiting wineries, tasting and learning the local wine culture or projecting the wine character of Cyprus through a series of festivals (Liasidou, 2018). In this respect, the wine villages of Cyprus are significant

attractions for wine tourism visitors that want to experience the unique varieties of the island, such as the Commandaria (a unique local ancient variety of sweet wine).

Nonetheless, as in any other industry, the wine tourism industry has been particularly negatively affected by the pandemic's consequences. Cyprus wineries experienced an unprecedentedly volatile climate following the COVID-19 outbreak. Businesses in the industry were extremely uneasy when the government of Cyprus declared a state of emergency in 2020, as hospitality facilities had to close down. Travel between wine areas and foreign visitor arrivals in those regions were prohibited under the state of emergency, which had the effect of significantly lowering wine consumption associated with tourist flows (Boukas and Marneros, 2024). In this vague landscape, the Cypriot wine tourism industry faced a unique crisis and it was necessary to adopt to the new circumstances, emphasising innovative products/processes.

This study explores the impacts of the pandemic on wineries' business strategy and operations and underlines their actions for handling the crisis, focusing on innovation not only on the wine tourism product development but also on other business activities. As such, the study illustrates how wine tourist activities have been affected, enhanced, and reformed themselves for the smooth wine tourist experience to be provided during and in the post-COVID-19 era. The paper concludes with a series of strategies that stress innovation in the business environment, that post-COVID19 wine-tourism industries in destinations with similar characteristics to Cyprus, can utilise in order for the more effective tourist experience to be formed and delivered.

2. Literature Review

2.1 Wine Tourism Industry Worldwide and Cyprus

Wine tourism is much more than a "food and beverage excursion" as it is associated with specific leisure activities and use of the tourist facilities of a given region (Nemethy, Lagerqvist & Walas, 2017). According to Hall et al. (2020) and Hall and Macionis (1998), wine tourism is characterised as a form of special interest tourism that includes visits to vineyards, wineries, wine festivals, and wine shows in wine producing regions. Marzo-Navvaro and Pedraja-Iglesias (2010), add other aspects, such as visiting local attractions or experiencing the indigenous lifestyle, for example, staying overnight in the vineyards.

In terms of the role of wine tourism to the wine destination's enhancement undeniably, it can be considered as a growing activity that contributes to the economic development of wine-growing regions (Hojman & Hunter-Jones, 2012; Molina, Gomez, Gonzalez-Diaz, & Esteban, 2015); the dynamic development of wine tourism has a positive impact on the creation of a strong brand image for wine destinations (Orth et al., 2012). Destination managers promote satisfying experiences to create an one-of-a-kind connection between the customer and the place where the wineries are located, so that improve their attractiveness. In this respect, the island of Cyprus has recognised the contribution of wine to its overall appeal and diversification of its tourism product (Boukas, 2019).

The Cypriot wine industry has gone through an evolution stage during the last decades, as there is a technological/equipment upgrade of Cypriot wineries, mainly because of more educated winemakers, subsidies from EU and Cyprus government aiming to improve competitiveness (Feilden, 2023). In terms of varieties, the wineries produce primarily red and white wines, but also offer rose and Commandaria. In addition, the wineries produce varietal wines from indigenous varieties and blended wines from indigenous and international varieties. The wines are produced from three indigenous varieties and eight protected designation of origin varieties. Wine production reaches 9 million litres, exports 1.5 million litres, and wine consumption rises to 16 million litres (An Overview of Cyprus 2023). In addition, the promotion of Commandaria and Zivania spirit which are ancient Cypriot wine produces, are among the prime products in wine tourism activities and enhance the wine tourism dynamics of the island (Cy statistics 2024). Nevertheless, the pandemic crisis of COVID-19 affected the competitiveness of the wine tourism product of the island but, at the same time, signified new innovative way/s that the wine tourism product is produced, promoted and delivered to its markets.

2.2 COVID-19: Impacts on the Wineries

The COVID-19 pandemic has largely changed wine tourism operations. Since the coronavirus emerged, the worldwide wine business has faced various challenges. For instance, Marco-Lajara et al. (2021), suggest that the Spanish wine sector has been hit, particularly on employment in wine-related economic activities, distribution routes, exports, and wine tourism. Similarly, Temperini et al. (2022) underlined the primary distribution channel management problems that small wineries faced, among them the lockdowns and the closure of the HO.RE.CA distribution channel, in order to comply with the policy regulations. As such, the pandemic actually created a

disruption in small wineries operations and brought to the surface challenges on various processes of wine (tourism) companies.

Indeed, the last years have brought a new reality for an industry that was traditionally based on promoting wine directly to the community and forging relationships with the end consumer and customer, mainly through the conventional way of selling. As Szolnoki et al. (2022) argue, COVID-19 significantly affected the financial condition of wineries, which they had to urgently find alternative ways of revenue generation for covering the overnight loss of many traditional sales channels such as cellar door, wine tourism events, culinary activities, travel retail, etc. The authors suggest that diversification of sales channels proved to be the foundation for resiliency. In this respect, today, businesses are almost forced to accept online platforms.

COVID-19 underlined the need for alternative and innovative ways and tools to perform traditional tasks and accelerated their implementation. For example, during the pandemic much more emphasis was placed upon technology. In fact, technology has changed the way consumers shop products, among them wine, much earlier from the crisis; with technology, wine buying became part of the online age (Halstead, 2013). Nonetheless, as Sigala (2023) argues, technologies and innovation were considered as necessity and have been instrumental for enabling the wine tourism industry to go through the crisis, re-start but also resetting its practices. This underlines why innovation may be among the few aspects that can improve a product's competitiveness.

2.3 The Role of Innovation for Wineries

Undeniably, innovation is a concept well-studied in the tourism literature. For instance, innovation has an important part on the diversification of many products, among them tourism (Benur and Bramwell, 2015). Nonetheless, it can also have an impact not only on the development of new products but also on the creation of innovative processes in tourism, such as the use of new technologies in the tourism production process or the co-creation of experiences (Boukas, 2021; Boukas and Ioannou, 2020). As Boukas (2021) argues, both innovative products as well as innovative processes can help products to grow and be fertile, providing equally spread benefits to various destination's stakeholders.

Regarding wine tourism, innovation can be met on various aspects such as at the production level through the cultivation/production of organic wines (Jones & Grandjean, 2017). Today a significant portion of the agricultural sector deals with organic products (Goodman, 2004). Consumers intend to pay more money for organic products as they consider them healthier, tastier and of higher quality, although many still confuse the concepts of organic, biodynamic and sulphur-free wines (Amato et al., 2017). In the same lines, alcohol-free or low-alcohol wine products, seem to hold an increasingly share of the wine market. This is mainly attributed to the scientific research published on the effect of alcoholic beverages on human health. As such, innovation could be beneficial for the creation of non-alcoholic produces for wine tourists.

Additionally, innovation is also seen on the packaging material and label on the bottle which may consist a differential advantage of the wine for the tourist. The packaging material and the label play an important role in marketing and act as a means of impression. Packaging that is innovative and convenient to manage is being launched in the wine market (IPSOS, 2018). In this aspect technology can be really helpful as it helps producing more innovative environmentally friendly materials, convenient to use.

Moreover, the evolution of technology and digitalisation had also affected the wine tourism product. Tourism, and wine tourism in particular, rely heavily on technology. Technologies have long been used to support, enhance, and revolutionise wine experiences and offers, as well as the operations of wine tourism stakeholders and wine tourists themselves. Blockchain, smartphone applications, social media and internet advancements, crowdfunding, and virtual and augmented reality were all projected to revolutionise and innovate the wine tourism business (Sigala & Robinson, 2019a).

Indeed, the use of social media and digital marketing has proven to be a valuable tool for the wine industry to increase brand awareness, engage with customers and increase sales (Obermayer et al., 2022). Digital marketing strategies such as social media advertising, email marketing and influencer marketing have become an essential part of the wine industry's overall marketing plan (Costa et al., 2021; Jeyamani, 2020). Wine tourism combined with social media can become an important tool for wine tourists/wineries. They can share their own experiences on social media, encouraging others to visit paving the way for a direct brand-customer interaction. Wine tourists may benefit from interacting with wineries of interest, further enriching their related searches (Cristófol, et al., 2020).

Overall, it is argued that innovation as expressed in various areas of wine tourism companies can play significant role for the winery and the wine destination's sustainable competitive advantage. This is even more evident in the case of crises, such as COVID-19 where many challenges and problems can arise into the surface. Therefore, there is a need to comprehend how wine tourism can be benefited from innovation during and post crisis for creating, improving or reorganising wine tourism practices.

3. Methodology

The paper is part of a preliminary study that aims to explore the role of Covid-19 on Cyprus wine tourism industry. In this regard, the study examines how Cyprus wine tourist companies have faced the impacts of COVID-19, focusing on their operations and strategy, and underlines pertinent actions for their recovery and post-crisis course, highlighting innovative practices. Finally, the paper suggests implications regarding management strategies that wine tourist companies could adopt, in order for them to gain and improve their competitiveness in a post-crisis environment.

In this respect, the key methodological approach utilised, was exploratory research through reviewing documentation about wine tourism in Cyprus, as well as face-to-face, in-depth interviews with seven managers/owners/representatives of Cypriot wineries from the areas of Paphos and Limassol, Southwest Cyprus (see Table 1).

Table 1: Profile of Interviewees

Respondent	Gender	Age	Area
1	Female	>40	Limassol
2	Female	> 40	Limassol
3	Male	> 35	Limassol
4	Male	> 40	Paphos
5	Male	> 55	Limassol
6	Male	> 55	Limassol
7	Male	> 55	Paphos

The interviews lasted on average between 1-1½ hours and were conducted in the premises of the interviewees. The wineries were selected based on an industry accessible list from the Ministry of Trade and Commerce and with the support of the Industry Group Oenognosia, Cyprus.

An interview guide was prepared for facilitating the process. The interviews were held in Greek language as all the respondents spoke Greek. All the interviews were recorded and transcribed verbatim in the Greek language. Afterwards, they were translated in English and analysed manually by each author independently. Data were analysed iteratively (Miles & Huberman, 1994) following a constant comparison method (Glaser & Strauss, 1967) for finding out emerging themes and distinguishing their relationships. Once theoretical saturation was reached, interpretations and coding themes by both authors were compared and a coding scheme that is suitable for the emerging data was prepared and followed.

4. Findings

4.1 Impacts of COVID-19 Crisis on the Operation and Performance of Wine Tourism Companies

Correspondingly to what happened to the rest world (Guedes et al., 2023; Niklas et al., 2022a, 2023b), in the case of Cyprus the pandemic hit both sales and visitation of Cypriot wineries. Based on the findings, the crisis has severely affected wineries' sales. As respondents indicate, the impact was noticed both on the visits as well as on the wine sales. Specifically, especially for smaller wineries that only provide wine to Hotel, Restaurant and Catering (HO.RE.CA.) establishments, the respondents underlined that since those companies had to remain out of operation because of the pandemic's governmental measures, they had to halt also their sales to them. As Respondent 3 indicated, a wine producer, producing only Commandaria, the winery faced a sharp reduction on sales both in house and in the retail (since they were no visits). As complemented, the reason for this is because sweet wine (i.e., Commandaria) is a particular variety mostly asked by Russian[1] tourists who, as stated, indicate

[1] Russian tourists possessed the second largest market of tourists on the island during that time.

a great preference for it. Since with the lockdowns there was not international travel to Cyprus there was also a fall on the Commandaria's sales, respectively.

In these lines, the majority of wineries stated that they faced significant decline in the overall number of visitors to Cyprus' Wine Routes/wineries, and also decrease in the number of wine tourists. This decline had a direct reflection on wine sales at the winery as well as wine consumption establishments. As Respondent 7 claimed: 'We did remain open but we struggled a lot as much of our operations depends on wine visits … the crisis was a serious test for our team's integrity and we were lucky that we remained strong". Similarly, Respondent 6 argued that neither their company nor the government were prepared for the consequences of such a crisis on their operations. This comes in alignment with the literature; as Kastenholz et al. (2022) argue, wineries had little advice about what should they do or amend in their practices regarding their operations and they had often difficulties in developing new marketing policies that could aid to overcome the fears of tourists.

Nonetheless, for the case of Cyprus, apart from the sales and visitation, the crisis did not appear to affect the actual production of wine. The surveyed wineries indicated that wine production was not impacted since demand for wine was increased from retailers (e.g., supermarkets). In contrast, the wineries did continue the production of the wines. Respondents indicated that there was no need to proceed with 'green harvest', and few of the wineries proceeded with distillation of fermented liquids (wines) to produce a local distillate called 'Zivania'.

Generally, the pandemic's consequences on Cypriot wine tourist companies followed the pace of all worldwide wineries. As the rest tourist activities on the island, wine tourism ones were significantly reduced due to the quarantine measures. Moreover, the high dependence of wineries on the hospitality industry challenged even more this situation. In an effort to deal with this enormous crisis, wineries on the island followed a series of measures, many of them innovative for them, to respond effectively to its impacts.

4.2 Responses to COVID-19: The Role of Innovation

Among the direct responses of the wine tourism companies was to perform several of their operations in an online format, transforming traditional activities (e.g., wine tasting, presentations, etc.) onto an online format. Actually, the majority of wineries tried to promote online sales, enhance virtual wine tasting, even searching new markets especially retail shops, but with scepticism, as for many of them, these practices were completely new. For instance, Respondent 2 mentioned that the online activities, such as online tasting, were something new for their winery and they had to train their personnel in this innovative way of doing business. Indeed, online operations were among the first measures adopted during COVID-19 period and many of these activities still continue today as a common practice from wineries. As Szolnoki et al. (2022) argue, in COVID-19 period there was an increasing tendency to perform online tasting for mitigating the loss from the policy measures. The authors argue that this was positively reflected both to the wine tourist experience, but also to the revenues of wineries. The authors conclude that online tasting will remain as an option for many wineries in the long term. In this regard, the online environment has created new opportunities to the wine tourism, something noticed also by the interviews.

In terms of distribution, the market moved from HO.RE.CA. industry to supermarkets but with no success as. As stated by Respondent 4, the problem with supermarkets was the low profit margin and long periods of payment. The respondent claimed that the cooperation of the small wineries with big supermarkets was not sustainable and viable for them, and hence they found that online distribution could be more vital. Moreover, wineries with strong distribution systems, especially after the pandemic, arranged to satisfy all their customers (HO.RE.CA.) in shorter periods of time. Instead, small wineries strangled and do strangle to distribute their wines in a short period of time due to their low(er) supply. Therefore, the dependence of HO.RE.CA. companies to big brands of wines has been increased. This left to the small wineries to concentrate more on direct sales, enhancing their options for visitation to their premises, especially after the pandemic period. As Respondent 7 indicates: 'One of the lessons gained from COVID-19 is that we had to find ways to be more independent'. As such, the interviews noticed a continuous turn of the smaller wineries towards wine tourism, and in this regard, this new tendency places wine tourism among the top alternative tourist activities on the island, where prior crisis its role was supplementary to the main tourist product, mass tourism. Interviewees argue that the opportunities provided by online activities such as sales or marketing ones, created a new environment with improved conditions to sell and market their products on newer, non-traditional for the island's tourism, markets, such as Germans.

In this respect, among the online operations used during the pandemic and afterwards was the enhancement of the wineries' activities in online platforms in which their actions and products are promoted. Respondents also indicated the growing utilisation of social media such as X (Tweeter), Instagram and/or Facebook (in alignment to the literature). As Respondent 7 claims: 'We had to remain alive… we use a lot the social media… many people know us from there and they recommend us to others'. Similarly, Respondent 1 suggested that the social media provided a good space for them to communicate with various publics such as visitors, official or even other companies. Indeed, as argued by Yu, Wang and Hanes, (2022, p. 75): 'In the era of digital economy, digitalisation has given the wine culture industry new vitality against the backdrop of COVID-19'. The authors complement that COVID-19 provided the opportunity for many wine tourism companies to utilise digitalisation not only to promote their produce but also open the gates to many people to know more about the unique culture of the brand.

To this end, another finding that has to do with innovation was the diversification of the Cypriot wine tourist product to new or unexplored prior the crisis, markets. All respondents indicated that they paid attention on the cultivation and promotion of the Cypriot indigenous varieties; furthermore, many wineries proceeded with small vinifications of local varieties; this gave a competitive advantage as they penetrated more seriously to the local market. One of the wineries stated (Respondent 2) that the promotion of 'Comandaria' and 'Zivania' is the flagship of Cypriot wineries with great benefits to 'ecotourism'. The pandemic gave the opportunity to wineries to search for new ways to focus on the local market. For instance, as mentioned, the home consumption has been increased, and the wineries performed many home deliveries during COVID-19. Additionally, some respondents claimed that they frequently organise events of various types (e.g., business, social, etc.) on their premises not only to increase their revenues but also to project the local wine culture to more potential visitors.

Finally, some wineries (i.e., Respondent 2 and 6) argued that after the crisis they try to value and further understand visitors. As suggested, since visitors are valued for their future continuous visitation, wineries try to understand what they want from the wine consumption and offer them enriching factors for creating a more enhanced tourist experience. For instance, as demonstrated, they ask the visitors about their preferences in tastes, offer them wine in appropriate glasses, and/or accompany them with the suitable food to enrich the taste. As Respondent 6 indicated: 'We try to listen to the visitor and make the experience together with him'. As such, in their effort to improve and differentiate their tourist experience, there is a tendency towards provided a more holistic experience to the visitor investing in co-creation (Boukas and Ioannou, 2020).

Overall, the interviewees argued that the most significant lesson gained from the pandemic, was that they realised their weaknesses and addressed more effectively their strengths; the interests of the company and the employees were aligned, as a result of empowering the team. Respondent 5 stated that every crisis makes the weak enterprises weaker and the strong enterprises stronger. The respondent concluded that even if the pandemic created a huge disruption on the landscape of wine tourism, it also indicated great opportunities that had to be seized. Indeed, as Boukas and Ziakas (2014) argue, one of the lessons of large crises is the realisation that the system of the crisis is chaotic and among the few responses that tourist destinations can do is to act quickly and think innovatively.

5. Conclusion and Recommendations

The study's findings are especially relevant to the Cyprus wine sector since they shed light on a volatile environment caused by the coronavirus pandemic. In reality, the study provides a significant contribution to the academic literature as it addresses the impact of the coronavirus on small island context and small wine enterprises, as well. From the survey it was found that the crisis highlighted the significance of the coherence among the employees of wine tourism enterprises, the importance to find out new ways to be independent such as more specific wine tourist products that emphasise locality to new markets (i.e., locals), and innovative elements that could be used for them to be more sustainably competitive, such as online practices in distribution and marketing and co-created wine tourist experiences. Finally, one of the major findings drawn from the research is a significant reorganisation of wine distribution channels, since domestic wine consumption and other channels expanded significantly.

To this end, the paper suggests that in order for smaller wineries to be more competitive in the long term, especially in traditional mass destinations, such as Cyprus, there is a need for them to concentrate on the destination's local identity, as a differential factor and/or expand in more alternative markets. Among the findings, it was found out that the majority of the small wineries invested in their local indigenous varieties, in order to be different in the global market, and this paid back; it is no surprise that the majority of sales regarding wine tourism come from 'Commandaria' or 'Zivania', that are both indigenous cultivations and varieties.

Towards this direction, the role of creative tourism is imperative not only to provide products (e.g., wine) and processes (e.g., specific production patterns) but also to provide complete experiences supported by co-created mutual involvement of the customer and supplier. Considering that wine making and consumption in Cyprus is part of its life and culture and has historic value, it can be concluded that the concept of creative tourism could be adopted in the production and delivery of the wine tourist experience. As Richards (2001) argues, creative tourism provides visitors the opportunity to develop their creative potential through active participation in learning experiences which are characteristic of the holiday destination where they are undertake (in this case wine tourist experiences). As such, the wine tourist experience in destinations similar to Cyprus, should incorporate all chronologic phases from the past, to the present and future of wine, should treat wine not only as a popular cultural product but a high cultural element with significant past and history (e.g., Commandaria), as well, and could emphasize the holistic experience through the incorporation of digitalization and virtual/online techniques, and the support of co-creation (Boukas and Ioannou, 2018, 2020). In this respect, the wine tourist experience can become richer and could help put wine tourism on the map of important activities in smaller destinations, among other traditional ones (e.g., 3Ss tourism).

Overall, this study concludes that small wineries and tourist companies in Cyprus proved to be quite strong during the crisis because of their direct response towards its consequences, as well as their investment in a large degree, on their strengths, capitalising opportunities provided to them such as new technologies, diversified distribution, and production orientations. The specific study is progressive and is based on a framework that incorporates various stakeholders such as entrepreneurs, policy makers, communities, etc. In this regard, a limitation of the study is that it focuses only on wine companies. Future research could shed light on the views of other stakeholders regarding their perceptions/reactions on the pandemic's impacts. Additionally, as this study is a preliminary examination, it concentrates only on the opinions of a small number of entrepreneurs. A greater sample size would provide a more representative image of the entrepreneurs' reflections. This is something that needs to be managed in future research. Finally, further research needs to analyse more the course of small wineries in small -island- destinations in the post-crisis era. In this respect, there is a need to expand on the examination of not only what the supply side (i.e., wineries and wine tourist companies) believes about the future of wine tourism, but also on the views of wine tourists themselves, in regards to how they perceive the 'newer' wine tourist experience, after the incorporation of innovative products, processes, and practices employed by wineries. This comparison, could allow identifying gaps for improvement of the future wine tourist experiences of smaller wineries in smaller destinations' context.
