Abstract: The scandalous fraud of the Theranos company and every step taken by its founder, Elizabeth Holmes, is well known in the media. In order to learn more about this topic and identify areas in which the company's management has fallen short, a variety of articles, newsletters, and papers were examined. The whole story of this enterprise was told by carefully putting in context what happened to Holmes in the workplace and in her personal life. In college, when she met Balwani, a romantic partner and important member of Theranos' management, the Stanford dropout began working on her company idea. Both were convicted of offenses connected to this type of business management. Five essential questions, as outlined by Lafley & Martin (2023), encapsulate the decision cascade that should be incorporated into any business plan. This essay attempts to explain Theranos' decision-making process in light of these considerations, complementing it with the strategic view defined by Porter's five forces. The facade of success that made it possible for investment to keep coming in while the technology did not make any progress was analysed too, divided into two parts: red flags and Elizabeth's crafted discourse about the company. Through this article, it is easy to conclude that Theranos' mismanagement was responsible for its collapse. With all that said, the following questions remain: Is there a bright future after a huge mistake? Perhaps a second attempt to help people with no ulterior motives? What will happen next? What can be expected?

Keywords: Elizabeth Holmes, Theranos, Fraud, Strategy

1. Introduction

Innumerable risks go with start-ups that aspire for quick growth via *blitzscalling*, such as Theranos' case, where it prioritises speed of growth over operational efficiency. When entering the high-tech products field, a company faces difficulties regarding technological uncertainty, potentially causing disconnection between customer needs and wants or even the product's value being dependent on complementary systems or network effects. The risk factor amplifies when unsustainable business models are adopted, unfinished product launches occur, and there is overspending and compromising ethics by fostering a culture of conformity and secrecy (Straker et al., 2021). Given this perspective, according to Carreyrou et al (2018), "Theranos' failure is a compelling saga about myopic personal ambition, bad faith inducement, an apparent dearth of strategic thought, the outdated use of design-as-decoration, fraudulent storytelling, and scientific impossibility". Such strong words always end up having a negative connotation and a strong impact on people's judgement of the company and the CEO herself. From the rise to the fall, various strategic factors and leadership decisions culminated in unravelling a case as mysterious as Theranos, where fascination meets doubt. Nevertheless, can it be seen just as a series of fraudulent mistakes, or is there a glimmer of hope that it was all just a misapplied strategy that, over time, has become an unstoppable snowball?

Thus, this work focuses on searching for the background that haunts this case. However, more than a fraud, more than a failure, this case can offer valuable lessons for companies to learn from mistakes and improve their performance to avoid meeting the same end. With that being said, this paper aims to provide an insight into the life story of Elizabeth Holmes (creator of Theranos), as well as an overview of the strategies adopted by this company during its years in business.

2. Methodology

In order to gain a deeper understanding of the Theranos case, this article aims to perform a detailed analysis based on various articles, as well as media publications and documentaries, including the well-known miniseries "The Dropout". This one-season miniseries covers a little of the entire process of the creation and downfall of the company, as well as Elizabeth's life so it was used as a complement to the writing regarding the path that this story took.

In general terms, the document can be divided into three essential parts, each of which requires the application of different information selection criteria. In the first phase, the search targeted heterographic articles and news

items, which are much more descriptive and factual. This would help to understand the emergence of the company, the story of Elizabeth Holmes, and the idea behind the creation of Theranos along the business, economic, and political context of the company so that the reader can be placed in the time and environment of the scandal. A more strategic view was considered in the second stage where articles related to business and technological practices were used to analyse Theranos' practices, strategic models, and ethics. Here, the reader can see through a strategist's eye and try to get more involved in the choices that led to failure, along with the seriousness of the consequences. Finally, in the last part, a more "subjective" look at the CEO's behaviour is considered, and a context is built for her success facade. Some interviews or even articles related to behavioural analysis are taken as examples. Please see the information on the various sources used as a basis for this work, as well as their main message (Figure 1). The most notable events concerning the company can be seen in the timeline in Figure 2.

Title	Reference	Type of reference	Main Message
Theranos phenomenon promises and fallacies	Eleftherios P. Diamandis	Article	Evaluates the promises, questions some of Theranos' promises, and mentions the dangers of putting a revolutionary technology on the market without proving its accuracy and efficacy with articles open to the public with the results

Elizabeth Holmes' Net Worth Plummeted to $0 After Her Imprisonment For Fraud	StyleCaster	Newsletter	Elizabeth Holmes net worth went from $4.5 billion to $0 after stealing more than $700 million
They Still Live in the Shadow of Theranos's Elizabeth Holmes	The New York Times	Newspaper Article	Shared examples of women who suffered unfair comparisons with Elizabeth Holmes only because they are women as well
Elizabeth Holmes and Theranos: A play on more than just ethical failures	Medina Williams	Newspaper Article	A resume on each step of the Theranos case, unravelling the crucial technical points behind the scandalous scene, that more than an ethical failure reveals some plays behind the scenes

Figure 1: Various sources regarding the Theranos' case and their main message

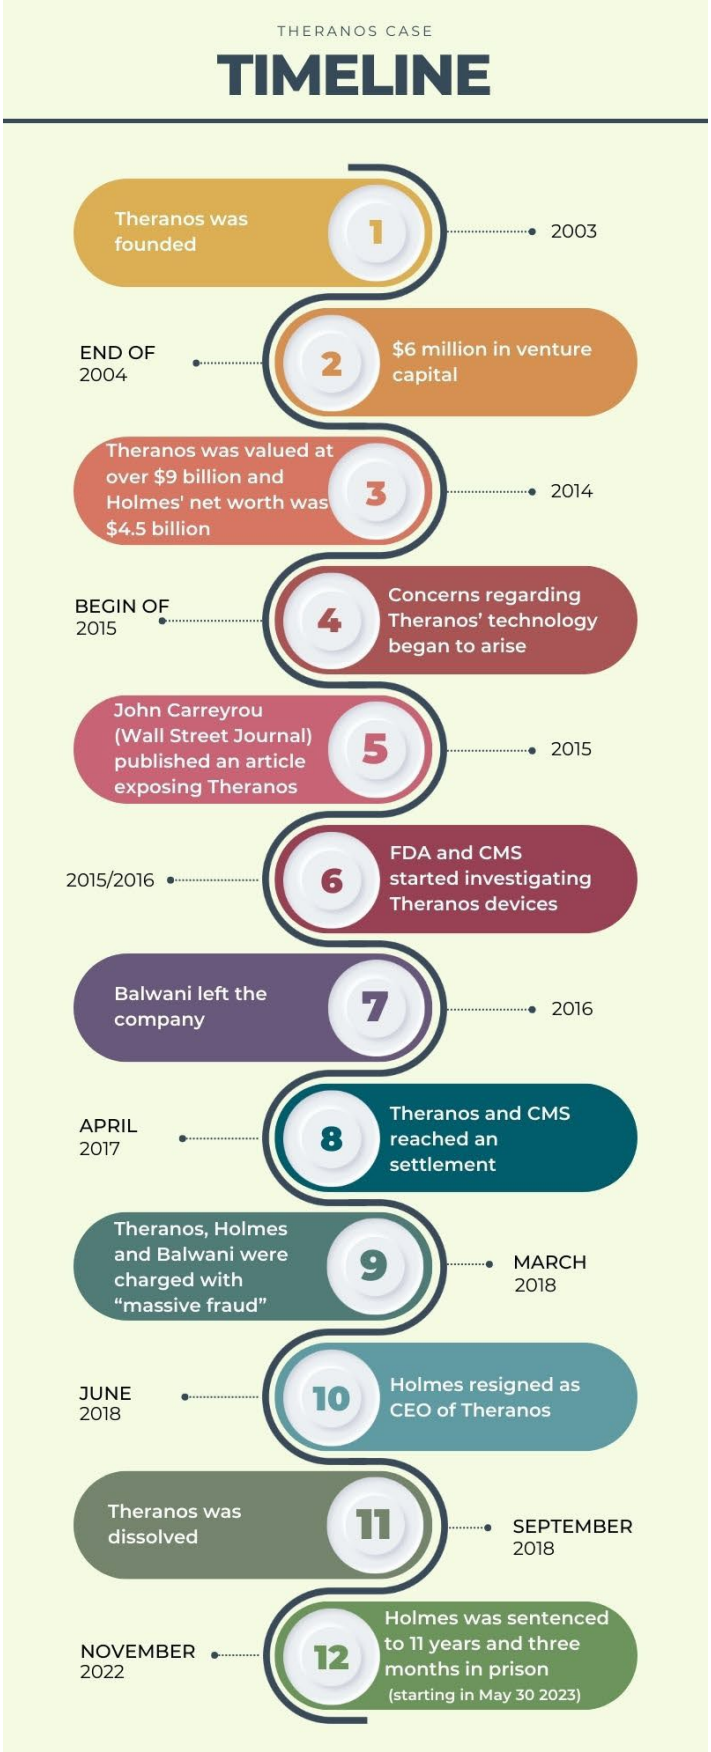

Figure 2: Theranos' most important events timeline

3. Background

3.1 How Theranos Became a Unicorn

Elizabeth Anne Holmes, born in 1984, started her entrepreneurial career with a firm providing coding translation software to Chinese institutions. After attending Stanford University, she collaborated with Channing Robertson, who later joined the board of Theranos (Donica & Biography.Com, 2023).

Her original concept was a tiny patch for drug delivery, but she later developed a novel blood test to change the healthcare system. During an interview, she claimed: "To me, there was nothing greater that I could build than something that would change the reality in our healthcare system today, which is that when someone you love gets sick, usually by the time you find that out, it is too late to be able to do something about it." (Jaffe, 2022). At the age of 19, Holmes started her startup company that ended up being rebranded as Theranos ("therapy" and "diagnosis" mashup) (Jaffe, 2022), (Mann, 2022). She stated that Theranos had developed technology that allowed tests for numerous diseases to be performed using a small amount of blood (Ranscombe, 2023) and could diagnose early-onset diseases that could be efficiently treated or prevented by offering quick and affordable lab testing to the public (Li & Diamandis, 2015). Theranos quickly developed exclusive techniques, including a nanometer tube for blood sample drawing called “nanotainer” and a lab apparatus for testing various diseases such as diabetes and cancer, using the same blood sample. Additionally, Theranos advocated for new laws to be passed in a few states so that the tests could be given out without a prescription. In biomedical engineering, patient independence, and ease of use of devices are increasingly valued, so the company’s proposals seemed very promising. Both technologies, globally estimated to be worth $52–57 billion in the early 2010s, would have completely changed the diagnostics sector (Donica & Biography.Com, 2023).

Channing Roberston introduced Holmes to prominent venture capitalists, who provide funding to companies with promising growth prospects in exchange for an ownership stake. By the end of 2004, she had raised about $6 million in venture capital and raised over $700 million for Theranos over the following ten years (Burgos & Hanson, 2023), which led to the company being valued at over $9 billion at its peak (2014). According to *Forbes,* Holmes' estimated net worth was $4.5 billion, making her the youngest self-made female billionaire in history at the age of thirty (Burgos & Hanson, 2023), (Donica & Biography.Com, 2023), (Jaffe, 2022), (Ranscombe, 2023). The company made her debut as a unicorn, i.e., a privately held business, customarily technology start-up recognised with a value of $ 1 billion or more, being rare and perpetually chased by investors looking for large returns (Straker et al., 2021).

3.2 The Beginning of the end

Theranos’ problems started due to its refusal to share information, and its lack of official press releases and websites, as its proprietary nature could expose the company to rivals. However, it struck several lucrative deals, such as one with Walgreens, so that Theranos could open labs for blood sample collection in almost 50 of the chain's locations and with expansion possibilities. Additionally, the company purported to collaborate with the US Department of Defense and major pharmaceutical companies such as Pfizer and GlaxoSmithKline, assertions that ended up being refuted (Burgos & Hanson, 2023), (Donica & Biography.Com, 2023).

Nick Bilton's Vanity Fair report revealed that Ian Gibbons, the chief scientist at Theranos, discovered several flaws in the company’s technology and warned Holmes that the tests were not yet ready for public use. Concerns about Theranos' technology reached a breaking point in 2015 when medical research professors questioned its viability (Burgos & Hanson, 2023). In the same year, the company was exposed by *Wall Street Journal* investigative reporter John Carreyrou, who began questioning the effectiveness of the Theranos machine (Mann, 2022). Carreyrou claimed the Edison blood-testing machines were unreliable in producing accurate test results due to the use of conventional equipment. The company's strict secrecy was also revealed by former employees, who claimed that although Holmes and President Ramesh "Sunny" Balwani knew about the drawbacks of the technologies being used, they forced employees to fabricate test results and false demonstrations by threatening them (Burgos & Hanson, 2023), (Donica & Biography.Com, 2023), (Ranscombe, 2023).

The Food and Drug Administration (FDA) and the Centers for Medicare & Medicaid Services (CMS) started looking into the case after the *Wall Street Journal* article was published. Theranos' "nanotainer" vial was declared by the FDA to be an "uncleared medical device" in October 2015, allegedly violating numerous FDA Title 21 Regulation infractions. In January 2016, the CMS began investigating a Theranos lab in Newark, California. After discovering anomalies in the lab's testing, it was shut down due to an "immediate jeopardy to patient health and safety". Months later, CMS prohibited Holmes from owning/running a clinical blood testing laboratory for two years. The company faced many other legal challenges and penalties from various organisations and

individuals (Burgos & Hanson, 2023), (Donica & Biography.Com, 2023). In April 2017, Theranos was fined $30,000 by CMS and banned from the blood-testing sector for two years, for focusing on technology development instead of processing clinical samples. That same month, a state fraud lawsuit was resolved by giving $4.6 million back to test-takers (Donica & Biography.Com, 2023). Holmes, Balwani (president and chief operating officer) and Theranos were charged by the US Securities and Exchange Commission in March 2018 for raising over $700 million "through an elaborate, years-long fraud". Holmes, despite not admitting guilt in her SEC settlement, agreed to pay a $500,000 penalty and relinquish majority control over Theranos. After many years of lawsuits and significant leadership changes after Balwani left the company and Holmes resigned as CEO in June 2018, David Taylor, also CEO of the company, declared on September 5, 2018, that Theranos would collapse. Holmes' net worth dropped from $4.5 billion to zero (Burgos & Hanson, 2023), (Donica & Biography.Com, 2023), (Jaffe, 2022).

3.3 Trials and Final Sentences

Holmes and Balwani were indicted on nine wire fraud and conspiracy counts in June 2018. In January 2022, the jury found Holmes guilty on three charges, totalling almost $145 million in transfers, and one conspiracy charge. In November, she was given an 11-year and three-month prison sentence starting on May 30, 2023. Balwani was obligated to reimburse $452 million (Donica & Biography.Com, 2023).

3.4 Some Relationships Work out, Some do not

Elizabeth Holmes, who ended her 12-year secret relationship with Balwani in 2016, decided to break the silence. She stated he was emotionally and sexually abusive and that he manipulated her into mismanaging the company. Although the two were indicted together, they were tried separately considering these accusations. Serving a 13-year term, Balwani was found guilty of all 12 crimes (Burgos & Hanson, 2023), (Donica & Biography.Com, 2023). However, Holmes met Billy Evans in 2017 and ended up marrying him. They had two children, in July 2021 and February 2023 (Donica & Biography.Com, 2023).

4. From a Strategist's Point of View

Theranos found itself in an unstable environment. Technological development is constantly evolving at an ever-increasing pace, competition is increasing daily, and the consumers' attention is easily lost to new products launched daily. Given these environmental factors, what set Theranos apart during its rise to the limelight (Lafley & Martin, 2013)? Visualising the company as an organisation where active decision-making is required, these choices can be seen as a decision cascade, where each step is interconnected and dependent on the other. Five important questions define the success of your strategy, so where did Theranos fail (Lafley & Martin, 2013)? During these checkpoints, Theranos' analytical framework for assessing competitive intensity on its key product will also be discussed following the five forces defined by Michael Porter (Porter, 1980) to reinforce the points that failed during the process.

4.1 Goals for a Winning Aspiration

When the question "What is your winning aspiration?" is asked, all the company's limits are already being tested, as well as the entire panorama of decisions made. Aspirations are statements that translate the ideal future, helping to turn concepts of winning into more defined concepts (Lafley & Martin, 2013).

When evaluating the internal rivalry (Porter's first force) that Theranos faced, it is important to recognize that diagnostics is a highly competitive field. This industry continuously seeks innovations and improvements in testing accuracy and efficiency, necessitating extensive networks and adherence to regulatory requirements, which intensifies the rivalry (Evans, 2023). In this context, Theranos aimed to revolutionize diagnostics by offering a multi-analytical test, challenging the traditional targeted and centralized diagnostic test paradigm (Diamandis, 2015). By introducing this groundbreaking idea, Theranos sought to disrupt the paradigm of laboratory medicine through a differentiation strategy as an innovative disruptor, allowing individuals to order blood tests from pharmacies. Holmes claimed to be "democratising" medicine and empowering patients by improving access to tests and enabling earlier detection of health problems (Fiala & Diamandis, 2018).

4.2 Where to Start the Fight?

In such a large sea of opportunities, the competitive field chosen will dictate the markets, customers and consumers, the channels chosen or even the product categories (Lafley & Martin, 2013).

Theranos focused on a specific area of the healthcare system: diagnostic and multi-analytical tests using blood samples. Given that the machine could diagnose several diseases and medical conditions, Theranos has

considered many possible consumers and customers. Theranos' battlefield consisted of fighting the usual procedures and allowing the patients to obtain a single container for all the exams in some selling point (e.g., pharmacies). This strategy would then play out in commercial outlets with wellness points and pharmacies (Fiala & Diamandis, 2018), (Westman, 2021).

Evaluating the second of Porter's five forces, the threat of new entrants, Theranos operated in a sector with high barriers to entry (Evans, 2023). The medical diagnostics industry requires adherence to strict regulatory standards, significant investment in research and development, clinical validation, and substantial venture capital. Additionally, differentiation is essential to become a market disruptor. Although Theranos initially managed to overcome these barriers, its fraudulent practices and failure to meet regulatory standards exposed its vulnerabilities, demonstrating that genuine barriers cannot be bypassed merely with capital and marketing.

Considering this, we must also examine Porter's third force, the threat of substitutes. Initially, Theranos mitigated the high threat of substitution through its differentiation. However, following the exposure of its fraud, only established companies with more reliable results could maintain a high threat of substitution, despite not offering the same advantages that Theranos claimed.

4.3 Choose the Fights and how to win Them

To determine how to win, the organisation needs to create a competitive advantage, which enables the establishment of a unique value and sustainable delivery that values the customers in a way distinct from the firm's competitors. Consequently, this leads to superior returns for the company (Lafley & Martin, 2013).

4.3.1 The miracle product

The first step was to create a distinctive biomedical device that no one in the market could match. In this way, a miniaturised clinical laboratory system was created that would do away with the need for several machines for different tests (Edison Machine) capable of carrying out tests over a wide range (Hutter & Lawrence, 2021), (Fiala & Diamandis, 2018). Inspired by her fear of needles, Holmes developed a finger prick blood acquisition system to incentivize collection, reduce needle discomfort, and decrease blood volume. The patient could speed up this process when collecting blood (buying the container at selling points) and receiving the results (in any room with an Edison machine) (Fiala & Diamandis, 2018). To round off this ingenious idea according to claims by Theranos, the cost of the tests would be 10% cheaper than centralised laboratory tests, with a faster allocation of results (Diamandis, 2015).

4.3.2 Incredible by sight, but does it work?

Theranos' offering fell in the lab-developed tests (LDT) category, which the FDA has little control over. This means that if a test is designed and used in a single lab, that lab can market the tests without the United States authority's approval. When the US Congress authorised the FDA to regulate medical devices, including in vitro diagnostic tests, in 1976, this "enforcement discretion" was established. Back then, LDTs were far more straightforward and intended for tiny patient populations, including those with uncommon disorders for which other diagnostics would not be accessible. To reinforce this type of play, Theranos also built some partnerships with the potential to spread the points of possible application of Theranos' point of blood collection. For example, through the deal with Walgreens, Holmes successfully lobbied state legislators to change laws allowing anyone to order laboratory tests without professional medical approval (Williams, 2022), (Parkins, 2019). The scenario seems to be ideal, but the lack of results that could prove the genuine technological innovation and the associated operational inefficiency put Theranos in disadvantage when it comes to the industry's rivalry, it could not sustain its competitive position against the well-established rivals.

4.3.3 From marketing to reality

When Theranos began executing its ill-advised plan, it focused on the human fear of late, inaccurate, and high-cost diagnoses, using it to promote and boost its business model. By advertising the possibility of the patient's control of their health, the Theranos' panel of routine laboratory tests would be the best choice "before it was too late". The message promoted by the company has opposed the evidence-based guidelines in the diagnostic methodology, which aim to minimise unnecessary and redundant testing for improved post-predictive and negative predictive value. While patient autonomy in medical care and direct-to-consumer diagnostics can be a good pathway in the healthcare system, shared decision-making with a trusted clinician is always necessary to support the system's core (Das & Drolet, 2022). The equipment provided by Theranos showed inaccurate results for an estimated one out of ten patients (i.e., patients testified that the tests wrongly diagnosed AIDS) (Jaffe,

2022). Consequently, many treatment decisions made for inaccurate diagnostics were applied, which is extremely dangerous (Das & Drolet, 2022).

Regarding Porter's fourth and fifth forces, customer power and supplier power, Theranos appeared to be in control of both variables (Evans, 2023). Theranos claimed that its technology reduced dependency on traditional lab equipment and reagents, and that the Edison machine provided accurate results, alleviating customers' concerns and offering privileges that traditional lab techniques could not. However, these claims were compromised, leading to a loss of credibility with buyers and reinforcing the importance of traditional lab work (the initial suppliers).

4.4 Strong Core Capabilities for a Strong Organisation – due Diligence

The capabilities of an organisation can be seen as the map of activities and competencies that support the where-to-play and how-to-win choices (Lafley & Martin, 2013).

Whether investing with personal cash or capital funds, a due diligence is essential to wise decision-making. Experts conduct profound assessments across multiple disciplines, encompassing topics such as the validity of the science or even the working hypotheses, for example, but the level of management and the management systems are two of the most crucial evaluations in a due diligence. Leadership and team functionality are essential factors after such important parts of the evaluation. Such a procedure significantly increases the likelihood of discovering dangers and strategies for mitigating them (Witek, Jr & Klein, 2023). A strong due diligence benefits both the firm and the investors allowing risks to be reduced without compromising genuine innovation. Theranos investors were scrutinised for their inadequate due diligence, frequently resulting from their fear of missing out on a well-publicized opportunity (Witek, Jr & Klein, 2023).

Under cross-examination regarding the office's due diligence lead, it was acknowledged that they had yet to examine patent applications, consult regulatory or legal professionals, or understand the many kinds of scientific testing found in review papers. Relying on Holmes and not wanting to "upset" her was stressed more than the usual extensive scrutiny associated with such big investments (Witek, Jr & Klein, 2023).

4.5 Management Systems

The final strategic choice of the cascade focuses on the management systems, since they are responsible for fostering, supporting, and measuring the strategy (Lafley & Martin, 2013).

4.5.1 From leader to employee

Regarding start-ups and organisations, the operation mode occurs in dynamic settings where they are subject to rapid changes and entrepreneurship colliding with the need for information. So, for a timely response to these market changes, information access must be well combined with work. As a parallel circumstance, the leadership is responsible for creating a culture that sustains high performance and integrity (Williams, 2022).

Unfortunately, Elizabeth Holmes's ambitious leadership failed to develop a governance structure that respected ethical values, while the company utilised a board of directors (BoD) structure which relied too heavily on management's word instead of fully comprehending day-to-day operations and overarching culture (Williams, 2022). By forcing out anyone who would ask critical questions, Elizabeth applied extensive control over the company's operations, including minimal accountability; she also tried to cultivate a persona modelled by Steve Jobs (Tourish & Willmott, 2023). Theranos' board composition comprised "formers", such as former senators, chief executive officers, and federal cabinet officials. The homogeneity of the group may be a factor, so it is less likely to probe topics and uncover potential issues. Nowadays, modern boards try to utilise a skills matrix and a board composition. Aggravating the lack of social diversity, the board was also short on biotechnology and medical expertise (Witek, Jr & Klein, 2023).

4.5.2 From employee to leader

When discussing character-based leadership, trust is the key component, and when it comes to Theranos, there are several examples of its absence. Over the years, there were several warnings from the employees due to the product's direction regarding the results achieved. During the trial testimony, it was revealed that a whistleblower in the company approached Balwani to warn him about the erroneous test results, but she was not taken seriously, and suffered the penalty of having her competence put into question. Adding to this testimony, a former lab director also testified that the firm's quality control program failed, which would have had an impact on patients. Holmes tried alternative explanations for the data, but he considered them implausible (Witek, Jr & Klein, 2023).

From this type of behavior arises the necessity to place some faith in the people working for the organization and establish an optimal practice of having various departmental leads presenting directly to the Board (Witek, Jr & Klein, 2023).

As a result of collective experience, most firms use clinician-scientists as advisors, and given the critical nature of biochemistry and laboratory science needed for Theranos' platform, it would have been essential that the professional staff involved could put the clear performance objective in order. After the resignation of the firm's lab director, the CEO's dermatologist was hired as one of two co-directors of the lab, who would spend less than ten hours working in the company (he considered it a part-time job) and never reviewed the lab's policy (Witek, Jr & Klein, 2023).

5. Facade of Success

5.1 The Signs Were Always There

How did this big lie go unnoticed for over a decade? Were there any warning signs? The first red flag is the lack of peer-reviewed or research articles about the 'revolutionising machine' developed by Theranos (Diamandis, 2015). No one was expecting this unicorn to tell the world about this innovative technology they invented, but they took it to the extreme and did not divulge any details about it. There should have been external quality assurance to monitor the blood testing data over sustained periods. It is incredible that a device in the medical field did not undergo any independent evaluations (Diamandis, 2015). Elizabeth and Theranos were questioned about it sometimes, but they always threw the "We have FDA approval" card, which was an easy way out, but the truth was that they had the FDA approval to test for herpes, and the remainder of the tests were not in the FDA field (Ho, 2021).

There were also red flags in the daily life at Theranos' headquarters. The work environment was characterised by employee isolation and high staff turnover, fostering a culture of fear. Scientists that were concerned with the company's practices and questioned its methods faced marginalisation and, in some cases, contract termination. They were also obligated to sign non-disclosure agreements (NDA) (The Lancet, 2022).

Given this environment description, it is safe to say that Theranos did not have a pleasant work environment, with many former employees reporting bullying, intimidation, deception, and cold-blooded threats (Ward, 2022). The former Theranos chemist, Erika Cheung, said that she had reservations about the company since day one and observed a pervasive atmosphere of paranoia and secrecy within the leadership, which was shown when all employees were mandated to sign an NDA when hired. The questions continued to pile up as time passed, and scientists were demanded to process samples around the clock, with the necessity of conducting tests multiple times to achieve the company's desired outcomes. The lack of interdepartmental transparency did no good to relieve Cheung's suspicions, as Theranos implemented a silo mentality in the company, which is a cognitive framework wherein the various departments within an organisation refrain from sharing information; this was done to maintain secret the absence of advancements in their product development (Ward, 2022).

Another example is the story of Tyler Schulz, who got an internship due to his grandfather's influence in the BoD. Tyler contacted Holmes via e-mail to expose the malpractices he saw in the laboratory testing. A few days later, he had a response from Balwani threatening him. The young man followed by leaving Theranos without signing an NDA and being one of the leading whistleblowers for John Carreyrou's piece, which brought down Theranos (Ward, 2022). However, the most tragic event of Theranos' toxicity is the sad story of Ian Gibbons, who committed suicide due to the pressure the company put on him.

When Theranos had a patent theft case involving Richard Fuisz, he noticed that Gibbons was almost in all patents filed by Theranos, so he had placed him to testify. This resulted in Gibbons facing a choice where he would always end up on the loser's side: or he would tell the truth and be fired by Theranos (losing his healthcare insurance, which he desperately needed due to previous cancer complications), or he would lie and hurt people's lives due to compacting with Theranos' lies. This situation made Gibbons nervous and depressed, which resulted in him taking his own life (The Lancet, 2022), (Ward, 2022), (Heaven, 2019), (Kirsch, 2022).

5.2 How to Legitimise Fraud

Even though all of this happened, Theranos was still one of the most beloved start-up stories in the entire USA, and they got more investment and endorsement from many powerful and important people in the country. For that to happen, Elizabeth Holmes' major role was to legitimise the company for outsiders because if the impression of the audience was positive, the company would continue to gain credibility and its image would

not be easily shattered. Theranos, like other firms involved in fraud, aimed to achieve legitimation as a goal (Ho, 2021). As Joutsenvirta (2013) stated, legitimation is "very much about discourse and ongoing struggles over meaning".

According to Ho (2021), 19 interviews with the Theranos CEO were analysed, and it is demonstrated that Holmes constructed a corporate image and cultivated an entrepreneurial personality cult to highlight a distinct market niche, foster a shared sense of identification, and normalise expectations. Albeit how did she "build a corporate image"? First, she started to paint a beautiful picture using abstract adjectives where Theranos was pioneering and life-changing: "We have an opportunity to do good in the world, […] by building a business as a vehicle for making a change in the world to help to shape our healthcare system and to shape it in such a way, in which we empower individuals to get access to information that […] means you do not have to say goodbye too soon" (Elizabeth Holmes Mission – *Fortune*) (Ho, 2021). Holmes' piece explores Theranos' ambiguous missions, highlighting their aspirations to positively impact the world, empower individuals, and effect global change. The use of abstract corporate goals may indicate a potential inability to support these claims with concrete facts. Then she communicated the idea that they were amongst the elites and therefore trustworthy, endeavouring to establish cultural resonance with the other corporations in Silicon Valley. Finally, she stated to the audience that Theranos was here to revolutionise: "Over the last 11 years, we have reinvented the traditional laboratory infrastructure" (Elizabeth Holmes Mission – *Fortune*) (Ho, 2021). Elizabeth attempted to instil in the people that they would change the reality of the US healthcare system; with Theranos' innovative blood-drawing technology, fostering a people-oriented image within the corporation (Ho, 2021).

6. Conclusion

With this article it was possible to understand the aspects behind the fall of Theranos, and that this tragic end could have been prevented. Even though the idea of the product that Theranos sold to the public was promising, the company was accountable for its own ending since an absence of ethics was registered. The corporation failed to act in a way that would have allowed it to implement its proposal in a just and compassionate manner. Besides, Elizabeth Holmes always tried to create a false image of herself, which in itself represents a major red flag because transparency and honesty were never valued. If all these values were to have been considered, Theranos would have had every reason to succeed.

After a careful analysis of the case in question, it emerged that Elizabeth Holmes is serving her prison sentence in a federal prison in Bryan, Texas and her scheduled release date is 29 December 2032 (1 year and 9 months before she completes the time given to her) (Silva, 2023). That said, and considering Holmes is leaving prison at a young age, what does the future hold for her? She told *The New York Times* that she still has ambitions to work in the biomedical industry: "I still dream of being able to contribute to that space", "I still feel the same calling that I've always felt, and I still think the need is there" (Silva, 2023). Will she try to return to the original idea? Will she bet on a new way of innovating in the same field? And if so, what support will she receive after what is considered a cold-blooded lie?

The fact that the information offered in this study is based on information that already exists and that there is always a chance that information will be conveyed biasedly are some of its limitations. Additionally, this is a situation in which conflicting viewpoints may emerge and obstruct the plain truth. We suggest personal interviews to be performed, if possible, in future research efforts, with Elizabeth Holmes and some of her former colleagues, at Theranos. To ascertain their views after the difficult court case and the consequences suffered.

Is Formalisation Enough to Achieve Growth in SMEs?

Giancarlo Medroa Delgado
Faculty of Administrative and Economic Sciences, University of Lima, Peru

gmeddel@ulima.edu.pe

Abstract: The objective of this research is to determine whether the formalisation (FORM) of small and medium-sized enterprises (SMEs) has an impact on the growth, and determine which aspects of SMEs management, when formalised, are associated with and contribute to the growth of these organisations. A survey was applied to 403 proxies of SMEs in Lima, Peru. A structural equation model was used to validate the hypotheses. The results indicate that there is a positive and significant association between the FORM of SMEs management and the growth of these organisations. The main finding of this research is to determine that the formalisation of SME management in Lima, Peru explains their growth by only 27%, leaving 63% explained by other factors that could be not only management aspects, but also aspects of the SME environment. State institutions, companies and academia should analyse the low economic contribution of SMEs from a broader approach and not only from the position that formalisation is the only reason for growth. Other aspects should be studied, such as education in management issues by entrepreneurs, development of collaborators' competencies, improvement in the efficiency in the management of State institutions, among other factors; and thus, find the appropriate mechanisms that contribute to the growth of SMEs. This research is the first to analyse, in a single study, whether the formalisation aspects of SMEs management contribute to their growth. Finally, this research has contributed to the construction and conceptualisation of the SME growth variable.

Keywords: Management formalisation, Informality, Growth, SMEs, Emerging country

1. Introduction

SMEs are the main source of employment in emerging countries (Wang, 2016). However, the economic contribution of these organisations in terms of gross domestic product (GDP) is lower than in developed countries, employment conditions are not in line with labor regulations, and there are high levels of informality in their operations (Vasilescu, 2016). Despite efforts to strengthen the SME sector, these enterprises face several financial and regulatory barriers, especially in emerging countries (Berger and Udell, 1998). SMEs are of considerable economic importance in emerging economies and play an important role in the economic development of these countries; however, the performance of SMEs and the factors that contribute to this performance have received limited attention. The role of SMEs is critical to any country, but their declining contribution to GDP in recent years has been a cause for concern.

The phenomenon of unregistered businesses is a major global problem that has generated a great deal of attention in recent years. It is estimated that a substantial proportion of businesses around the world are not registered at the time of their creation, and an even larger percentage operate in the informal sector, evading reporting their production and sales to the authorities (Williams et al., 2017). This trend has sparked renewed interest in business research, with a specific focus on the challenges associated with operating in the informal sector (Krasniqi & Williams, 2020). The lack of comprehensive data on the number of unregistered businesses makes it difficult to obtain accurate figures. However, conservative estimates suggest that at least half of all businesses are unregistered, with approximately two-thirds of businesses operating without registration at the time of their creation (Williams & Liu, 2019).

In this context, promoting the formality of Peruvian SMEs is a major task for the economic development of the country; in this way it will be possible to reduce inequality and poverty levels (Williamson, 2009). Regarding the impact of entrepreneurs choosing to operate formally, numerous research has consistently shown that firms operating in the formal institutional environment tend to show superior efficiency and performance compared to those operating in informal institutional frameworks (La Porta and Schleifer, 2008). It is evident that new legitimate firms not only demonstrate higher revenues and profits, but also employ more workers and require more capital investment compared to their informal counterparts (Fajnzylber et al., 2011). In addition, studies indicate that registering firms to formalise them can improve firm performance compared to unregistered firms (Demenet et al., 2015).

In conclusion, although there is an extensive literature that explores the challenges faced by SMEs and the formalisation (FORM) of these companies in emerging countries, the evidence regarding the assured growth resulting from FORM is still incomplete, since the various studies only measure specific factors of FORM and growth, but not a more complete model that reflects the real context of regulation and management challenges that Peruvian SMEs are facing. As mentioned above, there is a great interest in analysing the

problems of SMEs to identify mechanisms and policies to promote their growth, and the same interest is perceived in the intention to formalise SMEs in emerging countries; previous studies have developed the analysis of the FORM and its advantages from specific aspects such as the payment of taxes, the registration of the company before government institutions, and the generation of contracts and recognition of payments with its collaborators; there is no previous evidence that, if the FORM at an integral level of SMEs guarantees their growth, there is also no evidence of which aspects of the FORM guarantee it.

In view of the above, the following research questions are posed:

- What factors are considered for SME FORM?
- What are the FORM factors associated with SME growth?
- Is FORM decisive and sufficient to achieve SME growth?

2. Literature Review

FORM of SMEs has been shown to have a positive and significant impact on several aspects of their performance. Studies have confirmed that after FORM, SMEs experience higher levels of revenue, profits, employment and capital intensity (Yazdanfar and Öhman, 2015). Formal SMEs have been found to provide a considerable number of employment opportunities and contribute significantly to GDP in high-income countries (Gombarume, 2014). Moreover, FORM has been positively correlated with firm performance, especially in terms of the probability of belonging to the group of growing firms (Kraus et al., 2006). In addition, the literature has highlighted the economic benefits associated with SME growth, such as improved productivity, employment generation, and increased tax-to-GDP ratios, which ultimately provide a competitive advantage to the economy (Khan et al., 2021). It has also been highlighted that SMEs play an important role in promoting rapid economic growth, and to the development and stability of many emerging economies (Karadag, 2015).

On the other hand, access to credit is a crucial element for SME growth (Ogoi, 2017). It has been confirmed that SMEs face significant difficulties in accessing credit, especially in developing countries, hindering their profitability and growth. The critical role of SMEs in driving the private sector and global economies suggests the importance of addressing the challenges they face in accessing credit. Previous studies have highlighted the impact of financial literacy, management competence, and overall business climate on SME performance (Agyapong and Attram, 2019). In addition, financial management practices, including working capital management, accounting information and financial reporting practices, as well as capital structure management, have been identified as influential factors on the growth and profitability of SMEs (Musah et al., 2018). The ability to access credit has been found to be influenced by factors such as collateral availability, financial literacy and payment capacity, which significantly affect the competitive growth of SMEs (Onkundi et al., 2023). In this regard, the importance of access to credit for SMEs and the various challenges they face in obtaining financing is evident. To facilitate the growth and sustainability of SMEs, it is essential to address these challenges, including improving financial literacy, collateral availability, and financial management practices.

SME learning processes are often informal and accidental, which may not contribute to their long-term sustainability. To solve this problem, it is proposed to apply knowledge-based learning methods that provide a formal structure for learning within these organisations. Furthermore, Valentim et al. (2015), confirmed the positive effects of formal learning in the learning process of inter-firm alliances, supporting the idea of incorporating formal learning structures in SMEs. On the other hand, the literature often suggests that the competitive advantage of smaller firms arises accidentally due to their informal management (Cagliano et al., 2001). However, it is essential to recognise that SMEs have unique constraints that impede their ability to actualise their learning (Saad et al., 2017). Therefore, formalising the learning process becomes crucial for their sustained growth and competitiveness. Moreover, the positive impact of inter-firm cooperation on the innovative performance of SMEs has been highlighted (Rezaei et al., 2014), which further increases the need for structured knowledge-based learning methods. This suggests that FORM of the learning process can improve organisational learning outcomes in SMEs, further supporting the need for structured learning methods in SMEs.

The use of intellectual property, such as patents, trademarks, copyrights and design registrations, has been the subject of interest in relation to SME growth. While some studies have found that patents do not necessarily lead to higher economic and financial performance of firms (Agostini et al., 2016), others have highlighted the positive influence of IP activities on SME performance (Andries and Faems, 2013). Moreover, it has been observed that SMEs tend to use their patents more actively than large firms, indicating a possible positive

impact on their performance. The FORM of these protection methods is indeed a costly process, especially for SMEs with limited resources; the high cost of formal protection methods, such as patent applications, coupled with low innovation output and patent-related uncertainty, often deters SMEs from investing in these mechanisms (Rehman and Yu, 2018). This is further supported by the fact that patents are expensive, leading SMEs to be selective in deciding whether patent protection is necessary. Trademark registration is cheaper to obtain than patents, making them a more feasible option for resource-constrained SMEs (Agostini et al., 2016).

3. Theoretical Framework

3.1 Growth of Small and Medium-Sized Enterprises

SME growth is a major research topic in emerging countries; however, there is no consensus in the literature on how to define and measure growth in these organisations (Tehseen et al., 2019). There are different theories and different methods used in the literature to measure growth; some analyses have developed theoretical constructs, others have used direct financial information from organisations, and others have used indicators validated by international organisations. Studies have estimated the growth of SMEs using variables created from data from the entrepreneurs themselves, such as the level of sales, market share, cash flow, and number of workers (Tehseen et al., 2019). SME growth is also analysed and measured using subjective perceptions of the entrepreneur, i.e., with only the entrepreneur's idea that his or her business is successful and growing (Chowdhury et al., 2013). On the other hand, other research has used direct information from the firm, such as growth in the level of sales using over a specific time (Macas et al., 2013). While there is controversy about the ways in which firm growth can be measured, there is a consensus on the factors that influence growth; according to the theory of firm growth proposed by Penrose (1959), growth depends on the application of managerial knowledge and entrepreneurial capabilities of firm leaders, and how this knowledge and capabilities are applied to their organisations.

3.2 Economic Formalisation of SMEs

Previous studies have presented some approximations to the criterion of informality, but there is still no consensus or single idea of how to define this phenomenon. The economic FORM of SMEs is the process for reducing informality. To identify the elements of the economic FORM, the concepts proposed by Gërxhani (2004) will be used; in this study it was possible to identify 5 common criteria within informal organisations. The economic criteria are the following:

- Unreported income or tax evasion. This criterion considers all taxable monetary income not declared for the purpose of tax evasion (Schneider and Enste, 2000).
- The labor market (undeclared jobs, lack of social benefit payments, sub-minimum wage payments, poor working conditions). Other studies have also emphasised this criterion (Harding and Jenkins, 1989).
- Size of the activity (size of the organisation in relation to the number of personnel hired). It is stated that an organisation with less than 10 workers is an informal organisation (Ferraro and Rojo, 2018).
- Professional status (measured by the number of self-employed, family workers and domestic workers). This criterion considers all workers in conditions of underemployment in these organisations (Hart, 1970).
- Regulation or registration of an activity (considers government regulation). This criterion considers unregistered and unlicensed establishments (Swaminathan, 1991).

3.3 Access to Formal Credit and Transparency of Financial Information

It is confirmed that access to credit facilitates the growth of SMEs and, therefore, is a fundamental element for these companies (Beck and Demirguc-Kunt, 2006). SME financing is a relevant aspect for the financial management of an organisation, SMEs resort to formal financing such as loans from regulated financial institutions, and informal financing such as loans from friends, relatives or informal moneylenders. Resorting to informal banking where financing costs are very high, affects the cost of capital of entrepreneurs (Wasiuzzaman and Nurdin, 2018); it has been found that, in developing countries, high interest costs of financing is an obstacle to the growth of SMEs (Wang, 2016). The decision to use formal credit in SMEs, and not informal credit, is influenced by the financial infrastructure and tax regulation of each country, i.e., the decision to use formal credit is also influenced by factors exogenous to management (Lin et al., 2020).

Additionally, there is a behavior in SMEs called Opacity of Financial Information (OIF); this practice of these companies for not generating financial and commercial information is linked to young companies (Hyytinen

and Pajarinen, 2008). The lack of information of SMEs affects their performance, not only because of the lack of financing, but also because the managers of these organisations do not have the necessary information for decision making (Sarapaivanich and Kotey, 2006); there is even a certain fear and lack of motivation on the part of the owners of these companies to apply for financing because they consider that they do not have enough information for a formal institution to finance them. It is stated that entrepreneurs owning SMEs, in their first years of operation, must try to make their information transparent, if they have the economic growth of their business as a goal (Zambaldi et al., 2011). Formal banking considers OFI as a risky behavior, there is evidence that confirms that the probability of defaulting on loans is higher for SMEs with higher OFI, this probability increases when these companies have a weak credit history (Gao et al., 2020).

For a formal institution to finance a company, it must have accounting and economic information; most SMEs, especially the smallest ones, do not have this information (Britzelmaier et al., 2013), which makes it difficult to measure the level of intrinsic risk. In some cases, not knowing the level of risk of SMEs, above-average financing costs are assigned to them; in Peru, the average SME financing cost rate is 32.9% (Choy et al., 2015). Initially, it was confirmed that the probability that banks are more willing to grant credit is positively related to the quality of accounting information (Palazuelos et al., 2018). However, when studies began to identify that this relationship is valid only for companies that have audited financial information, the lack of OFI was not a determining factor for accessing credit and better credit conditions; in these cases, trust between institutions was the determining factor for accessing credit and better credit conditions.

3.4 Formal Learning

Traditional training methods in the work environment must be questioned, studies confirm the importance of using competence development strategies that are based on an integration of formal and informal learning (Kock and Ellström, 2011). The learning theory points out 2 types of learning; the first is formal learning that is characterised by being a planned learning, certified and developed in courses provided in higher education institutions; and the second informal learning is the one that is learned in daily work activities, where learning is given by the active participation of workers in the organisation's projects, as well as the rotation of personnel within the organisation (Marsick and Watkins, 2016). Prioritising formal learning can undermine the spontaneous nature of learning, claims that one type of learning is better or worse than another should be avoided, both types of learning can be applied in organisations, both have advantages (Malcolm et al., 2003).

3.5 Formal Methods of Intellectual Protection

The literature indicates that another way to formalise organisations is through the FORM of different protection methods. Intellectual property represents knowledge that can be protected by recognised rights, called intellectual property rights (IPR) that encompass elements such as patents, trademarks, design and copyrights. There is extensive literature that studies the importance of IPR use in the performance of SMEs (Jensen and Ebster, 2006). It has been determined that the use of PM such as patents, trademarks, copyrights and design registration positively influence the growth of SMEs (Jensen and Ebster, 2006).

Considering the above, this research work formulates the following hypotheses.

H1: FORM is positively and significantly associated with SME growth.

H2: Labor FORM is positively and significantly associated with SME growth.

H3: Tax FORM is positively and significantly associated with SME growth.

H4: Financial transparency is positively and significantly associated with SME growth.

H5: Formal learning is positively and significantly associated with SME growth.

H6: The FORM of intellectual property rights is positively and significantly associated with the growth of SMEs.

4. Methodology

For SME growth, 5 items will be used such as growth in sales, growth in personnel, growth in facilities, growth in product and service offerings, and growth in customer base (Altinay et al., 2016). The Tax FORM (FT) which indicates whether the firm started paying one or more of the following taxes: corporate income tax; and/or, value added tax (Berkel et al., 2022). Labor FORM (FL) measured by a situation where workers have a declared job; workers have employment benefits from local regulation; minimum wages required by local regulation are respected; and good working conditions are available (Gërxhani, 2004). Transparency of financial information

(TIF) measured by 5 items such as: budgeting the company's fiscal year earnings; accuracy of earnings forecast; analysts' forecasts differ from each other (i.e., their diversity of forecasts, the less variation the more transparency); auditors' supervision; displaying the company's earnings flow (Maffett, 2012). Formal Learning (FL) measured by the investment of hours dedicated to activities such as conferences, seminars, workshops and trainings to a company's workers in the last year of operation (Froehlich et al., 2020). Formal protection rights (IPR) used by firms such as patents, inventions, design right, trademarks, and trade name right (Päällysaho and Kuusisto, 2016). Responses for the constructs were measured via binomial scale, under a 2-point scale (1 = meets, 0 = does not meet).

Table 1: Descriptive statistics

	Freq.	%		Freq.	%
Number of employees per company			**Industry**		
Less than 10	*187*	*46.4%*	*Commerce*	*223*	*55.3%*

5. Results

5.1 Validity and Reliability

The conceptual model (Figure 1) was tested using Smart PLS 4.0, a sophisticated and widely recognised software tool). To assess the efficacy and reliability of the model, a comprehensive evaluation was conducted, including measurement of item loadings, internal consistency, reliability, convergent validity, and discriminant validity. The detailed results of these evaluations are presented in detail in Tables 2 and 3, which provide an overview of the model's performance.

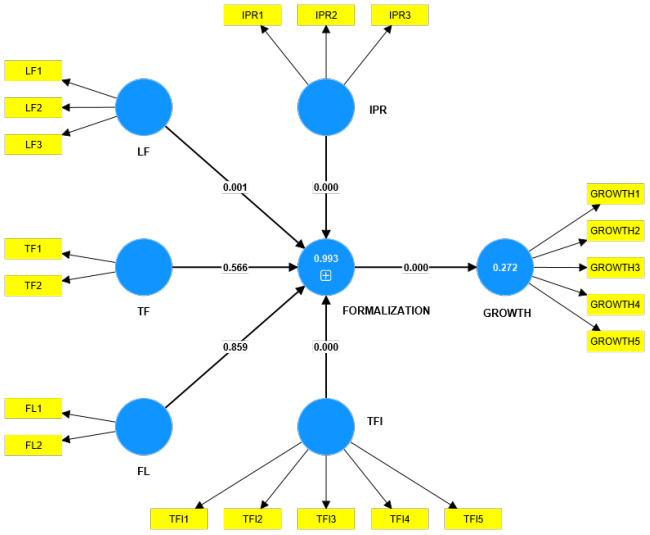

Figure 1: Structural Model

A crucial aspect that was examined during the evaluation was the loadings of the items used. It was observed that all item loadings exceeded the threshold of 0.50, which is considered statistically significant and indicative of convergent validity (Hair et al., 2014). This finding is very relevant and reinforces the validity of the model, as it demonstrates that the constructs investigated accurately measure the intended concepts.

Reliability was another important criterion evaluated in this study and was assessed using two widely accepted metrics: Cronbach's alpha and the composite reliability of the AVE. The results of these assessments revealed that the model exhibits a high level of reliability. Specifically, an AVE value equal to or greater than 0.5 and a

Cronbach's alpha indicator greater than 0.7 are considered indicative of an adequate model. In this case, all AVE values and Cronbach's alpha indicators exceeded these thresholds, which further reinforces the reliability and validity of the conceptual model investigated (Hair et al., 2014).

In addition to assessing the reliability and convergent validity of the model, an analysis was also performed to determine its discriminant validity. This analysis was intended to measure the differences between each construct and to assess whether they were distinct from each other. The results of the discriminant validity assessment were very encouraging, as they indicated that the square root of each AVE was greater than the correlations of the constructs.

Table 2: Measurement properties

Variable	Item	FL	Cronbach's alpha	CR (rho_a)	CR (rho_c)	(AVE)
Growth	GROWTH1	0.517	0.705	0.748	0.795	0.546
	GROWTH2	0.801				
	GROWTH3	0.810				
	GROWTH4	0.519				
	GROWTH5	0.632

5.2 Structural Equation Model and Hypothesis Testing

The coefficient of determination was 0.272 (see Figure 1), indicating a weak level of determination (Hair et al., 2014) generated by FORM. That is, there are other determinants for SME growth that will need to be the product of further research. The first hypothesis, H1, indicates that FORM has a positive and significant effect on GROWTH. Table 4 indicates that a positive and significant effect can be traced between the variables (β = 0.548; T-value = 15.060 and p = 0.000). Therefore, H1 should be accepted. The second hypothesis, H2, indicates that LF has a positive and significant effect with GROWTH. Table 4 indicates that a positive and significant effect can be traced between the variables (β = 0.355; T-value = 3.421 and p = 0.001). Therefore, H2 should be accepted. The third hypothesis, H3, indicates that TF has a positive and significant effect with GROWTH. Table 4 indicates that a negative and non-significant effect can be traced between the variables (β = -0.059; T-value = 0.575 and p = 0.566). Therefore, H3 must be rejected. The fourth hypothesis, H4, indicates that TFI has a positive and significant effect with GROWTH. Table 4 indicates that a positive and significant effect can be traced between the variables (β = 0.587; T-value = 6.107 and p = 0.000). Therefore, H4 should be accepted. The fifth hypothesis, H5, indicates that LF has a positive and significant effect with GROWTH. Table 4 indicates that a negative and non-significant effect can be traced between the variables (β = -0.017; T-value = 0.178 and p = 0.859). Therefore, H5 must be rejected. The sixth hypothesis, H6, indicates that IPR has a positive and significant effect with GROWTH. Table 4 indicates that a positive and significant effect can be traced between the variables (β = -0.017; T-value = 0.178 and p = 0.859). Therefore, H6 should be accepted.

Table 4: Hypothesis testing

	Coefficients	T-Value	p-Value	Hypothesis
FORM → GROWTH	0.548	15.060	0.000	H1 - Accepted
LF → GROWTH	0.355	3.421	0.001	H2 - Accepted
TF → GROWTH	-0.059	0.575	0.566	H3 - Not Accepted
TFI → GROWTH	0.587	6.107	0.000	H4 - Accepted
FL → GROWTH	-0.017	0.178	0.859	H5 - Not Accepted
IPR → GROWTH	0.416	4.763	0.000	H6 - Accepted

Note: Formal Learning (FL), Average Intellectual Property Rights (IPR), Laboral Formalisation reliability (LF), Tax Formalisation (TF), Transparency of Financial Information (TFI).

6. Discussion

The main finding of this research is to have determined that the formalisation of the management of SMEs in Lima, Peru determines their growth by only 27%, leaving 63% explained by other factors that could be not only management aspects but also aspects exogenous to the SMEs.

It was determined which specific management FORM factors contribute to the growth of SMEs. Among the most important, first and foremost, is TFI. TFI is among the most important management formalisation factors contributing to SME growth, as confirmed by the studies of (Tong and Serrasqueiro, 2020). It has been established that proper bookkeeping, financial reporting and management accounting practices are important for the survival of SMEs (Musah et al., 2018). Furthermore, the association between financial disclosure, transparency and firm performance has been found to be statistically significant, indicating that financial disclosure and transparency are significant determinants of SME performance (Musah and Padi, 2022). Formalisation of IPR, such as patents, trademarks, designs and copyrights, are confirmed to be specific management formalisation factors that contribute to the growth of SMEs, as could also be determined in the findings of (Jensen and Ebster, 2006). Trademarks play an important role in the growth of SMEs, as they are linked to the degree of product differentiation, product quality and overall firm performance (Agostini et al., 2015). Labor formalisation is confirmed to be one of the specific management formalisation factors contributing to SME growth; as stated in the study by (Dung et al., 2017) where he concludes that formalisation of labor relations can lead to increased productivity, improved working conditions and better access to finance; these aspects contribute to SME growth.

In addition, evidence has been found on the significant relationship between Tax Formalisation, Labor Formalisation, Registration Status, Transparency of Financial Information, Formal Learning and Intellectual Protection Methods, with the growth of SMEs. For example, the study findings (Ayyagari et al., 2007)

determined that labor formalisation, financial formalisation and registration formalisation are positively associated with SME growth; however, these relationships when measured separately fail to fully explain the dependent variable, i.e., they explain the growth variable in a weak way. Therefore, it is important to consider a holistic approach to SME growth that considers multiple factors, including formalisation in various areas, as well as other factors that contribute to SME growth.

On many occasions it has been stated that the main cause of the lack of growth of companies in Peru is the high level of informality; however, this research has contributed to shift the debate to other aspects of management, given that informality and, consequently, the formalisation of companies is not the main cause, or at least, it does not explain most of it. As supported by (Schneider and Enste, 2000) who affirms that there are other causes that can drive the growth of the informal economy in SMEs, such as higher taxes, high social security costs and government regulations.

Future research should focus on determining how formalisation is associated with other expected results of an organisation such as labor productivity, customer loyalty, business sustainability, among others. On the other hand, new studies should add efforts to determine what other factors generate the growth of SMEs and how these factors reinforce or correct the results of this research. Finally, future research can use the validated constructs of this research and apply them in other research related to business and economics.

Abstract: Corporate social responsibility (CSR) has been a field of interest over the past couple of decades. The challenges posed by rapidly evolving technology and frequently changing market conditions along with well-informed customers, have compelled firms to pay greater attention to their stakeholders and address social, economic, and environmental issues. This heightened focus on CSR reflects a growing perception that success transcends financial gains and encompasses broader benefits to communities and society. Moreover, there is growing recognition of the impact of internal CSR practices, which not only enhance a firm's reputation, assets, and customer retention but also significantly influence the well-being, engagement, and satisfaction of their workforce. Currently, for some firms, particularly multinational corporations (MNCs), promoting internal CSR practices becomes particularly complex amidst diverse workforces encompassing varied languages and cultures. This study, thus, explores the relationship between perceived CSR practices and workplace outcomes, including the mediating role of cultural diversity. Based on data collected from 211 employees in 19 different countries, the results reveal that perceived CSR effects on employee well-being, satisfaction, and engagement are driven by diversified cultural settings. Accordingly, these findings reinforce the urgency to delve deeper into the implications of cultural diversity within CSR frameworks.

Keywords: Corporate social responsibility, Cultural diversity, Employee engagement, Job satisfaction, Employee well-being

1. Introduction

A corporate concern for social and environmental responsibility has exponentially increased since firms have started to understand that they can reach a level of success by performing activities that contribute to the well-being of the communities and societies (Al-Ghazali and Sohail, 2021). In recent years, corporate social responsibility (CSR) has attracted the attention of organizations and started to become an important component of business. CSR can be considered as a complete range of policies and practices that are embedded into a company's operations and decision-making process. It reflects the organization's commitment to integrity and ethical conduct and may include considerations of business ethics, environmental sustainability, human rights, community engagement, and consumer and employee rights (Hsu *et al*., 2017).

Although the study of CSR is increasingly focusing on its results at the individual level (Donia and Sirsly, 2016), employees' perceptions and the real impact of the implementation of CSR strategies on them is still a path to explore (Aguinis and Glavas, 2019, Gotsch *et al*., 2023, Rodrigues *et al.*, 2024). Thus, this research aims to explore the effects of perceived CSR policies and practices on workplace outcomes, such as job satisfaction, employees' well-being, and employees' engagement, mitigating the existing gap in the literature at this level and extending previous studies (e.g., Cunha *et al.*, 2022, Rodrigues *et al.*, 2024).

As demonstrated in the extant literature, employees' perceptions of CSR play a central role in well-being and job satisfaction and are a key feature of the broader concept of decent work (Adu-Gyamfi *et al.*, 2021, Al-Ghazali and Sohail, 2021, Kim *et al.*, 2018). It similarly presents organizational-level advantages, such as increased employee engagement and commitment, which in turn will be more productive (Al-Ghazali and Sohail, 2021, Azim, 2016, Chaudhary, 2017, Ramdhan *et al.*, 2022). Thus, employees' satisfaction, well-being, and engagement through work prove to be a key piece for organizations, so this study will focus on workplace outcomes at the organizational level. By choosing these outcomes, we intend to contribute to a better understanding of the importance attributed by employees to CSR policies and practices, as well as to guide organizations so that they can manage them more effectively.

Grabner-Kräuter *et al.* (2020) point to the possibility of considering cultural diversity when implementing CSR practices, helping employees to achieve a level of integration, bringing them job satisfaction, and engagement, as well as enhancing their well-being (Neto *et al.,* 2018). It therefore indicates a research question to guide future research, which links perceived CSR practices, workplace outcomes, and cross-cultural dimensions of CSR (Ivanova-Gongne *et al.*, 2022). Adopting this view, we intend to shed light on this pressing question: *Can CSR perception towards cultural diversity affect employees' satisfaction, well-being, and engagement?* By answering this question, this research aims to contribute to expanding knowledge on this subject.

The remainder of this paper is structured as follows. Section two briefly characterizes CSR practices and then discusses the interrelations between perceived CSR, cultural diversity, and workplace outcomes. Section three introduces the data collection and analysis methodology used. The results are covered in section four and discussed in section five. The study closes with the implications drawn and suggestions for future research.

2. Theoretical Background

The employee perceptions of CSR are subjective including their interpretation of the organization's CSR activities which can differ from the actual activities employed (Azim, 2016). According to Tian and Robertson (2017), it is important to comprehend *how* and *when* employees perceive CSR practices, as the circumstances determine the impact on employees' engagement. The social identity theory (SIT) posits that a strong correlation exists between an employee's perception of CSR and how they evaluate the internal and external image of their company (Azim, 2016, Tian and Robertson, 2017). This theory suggests that when an organization's internal and external image positively affects identity, consciousness, and self-enhancement, an employee is more likely to view that organization's image as attractive, feeling that the firm's values are similar to their own (Tian and Robertson, 2017).

Therefore, employees are considered one of the most important stakeholders of any organization and must be prioritized, since the organization's success or failure can be strongly influenced by its workers (Azim, 2016). The top management team should consider employees' responses to CSR activities since they have the potential to transform the company's CSR expenses into value-adding investments (Aggarwal and Singh, 2021). Accordingly, CSR perceptions have a significant impact on employees' emotions because they are more likely to feel engaged in their jobs when they believe that an organization's CSR efforts are focused on improving society and the environment (Al-Ghazali and Sohail, 2021). Their perceptions of CSR activities, especially their judgment of how valuable the company's social responsibility initiatives are to its customers, society, and their own have an impact on the relationship they create with the organization (Al-Ghazali and Sohail, 2021, Lee *et al.*, 2013).

When CSR activities are fair and accurate with the organization's culture, employees can positively perceive those activities, thus they will be more committed and satisfied (Lee *et al.*, 2013). Indeed, firms that adopt CSR practices are seen as more attractive to bring the best employees, since socially responsible activities help to build a positive image and reputation (Al-Ghazali and Sohail, 2021). Employees experience a greater sense of job purpose and importance when the organization performs CSR. When they see their company engaged in the community's well-being, creating a positive image in society, they also want to be a part of it (Azim, 2016). CSR practices, when properly implemented, can have a positive impact on all company decisions, consequently, creating circumstances that would improve the working conditions (Kim *et al.*, 2018). Based on these findings, the present study's first hypothesis was formulated as follows:

Hypothesis 1: *Employees' perceptions of CSR have a positive effect on their satisfaction at work.*

Most employees are motivated and satisfied in the organization when they become aware of internal CSR practices regarding their well-being (Adu-Gyamfi *et al.*, 2021, Al-Ghazali and Sohail, 2021, Kim *et al.*, 2018). According to several scholars (e.g., Bryson *et al.,* 2017, Page and Vella-Brodrick, 2008, Sironi, 2019), social well-being (SWB) is used to describe the positive state of an individual's mind. It is measured by self-evaluations of an emotional state of satisfaction in different areas of life (Bryson *et al.,* 2017), usually defined as the feeling of happiness, derivative of personal fulfilment and expressiveness (Page and Vella-Brodrick, 2008). Thus, rising levels of SWB can impact an employee's physical health, elevate creativity and the ability to problem-solving, also encourage pro-social behaviour, and enhance the level of work engagement (Bryson *et al.,* 2017).

Based on the above, employees are more likely to support their company when they feel happy and satisfied. They may also engage in voluntary actions becoming involved in a reciprocal exchange to show their appreciation for the treatment they receive (Azim, 2016). The factors that can influence the feeling of well-being at work are the opportunities for employees to apply their abilities, the relationship with supervisor and co-workers, the chances of career progression, and job security (Sironi, 2019). A positive workplace promotes

employee productivity, prevents or reduces absenteeism, and labour turnover, and improves work performance (Adu-Gyamfi *et al.*, 2021). The current research thus included the following hypothesis:

Hypothesis 2: *Employees' perceptions of CSR have a positive effect on their well-being at work.*

CSR is one of the key factors in constructing employee engagement (Cunha *et al*., 2022) and has been solidly established in the literature as the organizational context, directly influencing the individual's *sense of belonging* (Lee, 2021). A recent research stream has found a positive relationship between CSR and employee engagement (Al-Ghazali and Sohail, 2021, Azim, 2016, Chaudhary, 2017, Ramdhan *et al.*, 2022). Job engagement refers to the psychological presence of the individual as an indicator of workers' commitment to developing their duties as members of the organization (Azim, 2016). Hence, they can perform to the best of their abilities because of the motivation and commitment that come with work engagement (Chaudhary, 2017).

A company is more likely to enhance employee performance while strengthening the organizational culture when prioritizing CSR goals towards its employees (Ramdhan *et al.*, 2022). Organizations that perform CSR can make their workers engaged because of their improved self-perception or increased sense of justice, which makes them respond by engaging in voluntary behaviour and positive attitudes at work (Azim, 2016). The effects of CSR on employee engagement will, therefore, depend on the level of employees' meaningfulness and sensemaking that they associate with CSR (Cunha *et al*., 2022). Accordingly, the present study's next hypothesis postulated that:

Hypothesis 3: *Employees' perceptions of CSR have a positive effect on their engagement at work.*

Many organizations are starting to be more concerned about managing workplace diversity because an organization that prioritizes diversity can expand its creative talent becoming more innovative and competitive (Al Amri *et al.*, 2019). According to Orsini and Magnier-Watanabe (2023), diversity has been defined as a combination of attributes that make a person different from others associated as gender, age, race, education, knowledge, religion, ethnicity, or culture. Cultural diversity is a significant phenomenon that impacts organizational cohesion and effectiveness along with social and political harmony (Lozano and Escrich, 2016), facilitating the exchange of information and providing a wider variety of opinions and knowledge (Dodd *et al.*, 2022). Consequently, managing cultural diversity is considered an extremely important strategy for organizations, requiring the integration of distinct values and beliefs (Lozano and Escrich, 2016).

Some studies provide evidence of cultural influences on CSR, but most of the CSR research is about the importance of diversity on the board of directors and how they influence CSR (Shatnawi *et al.*, 2022). Bocquet *et al.* (2019) indeed highlight that extant research provides limited insights into CSR and diversity challenges, although this subject is crucial for businesses, their primary stakeholders, and their employees. Comparatively to gender or ethnic variety, cultural diversity is less prominent, even though several scholars have investigated the impacts of an organization's board of directors' diversity, there has been limited research on cultural diversity's role in employees (Dodd *et al.*, 2022).

A diverse workforce allows the organization to implement CSR cultural-related activities that are compatible with its structure, supporting identity and moral standards (Bocquet *et al.,* 2019). Furthermore, cultural diversity among the board of directors improves and expands the understanding of employees' demands and supports more effective adoption of CSR policies that are created to meet those needs (Dodd *et al.,* 2022). By cultivating a climate conducive to CSR awareness, understanding, and implementation, cultural diversity engenders a virtuous cycle wherein CSR initiatives resonate with employees' values (Grabner-Kräuter *et al.*, 2020, Neto *et al.,* 2018), fostering a sense of organizational commitment and enhancing workplace outcomes, namely, employees' satisfaction, well-being, and engagement. Thus, the current study's last hypothesis was as follows:

Hypothesis 4: *Cultural diversity mediates the direct relationship between employees' perceptions of CSR and their (a) satisfaction, (b) well-being, and (c) engagement at work.*

The four hypotheses defined were incorporated into the research model (see Figure 1).

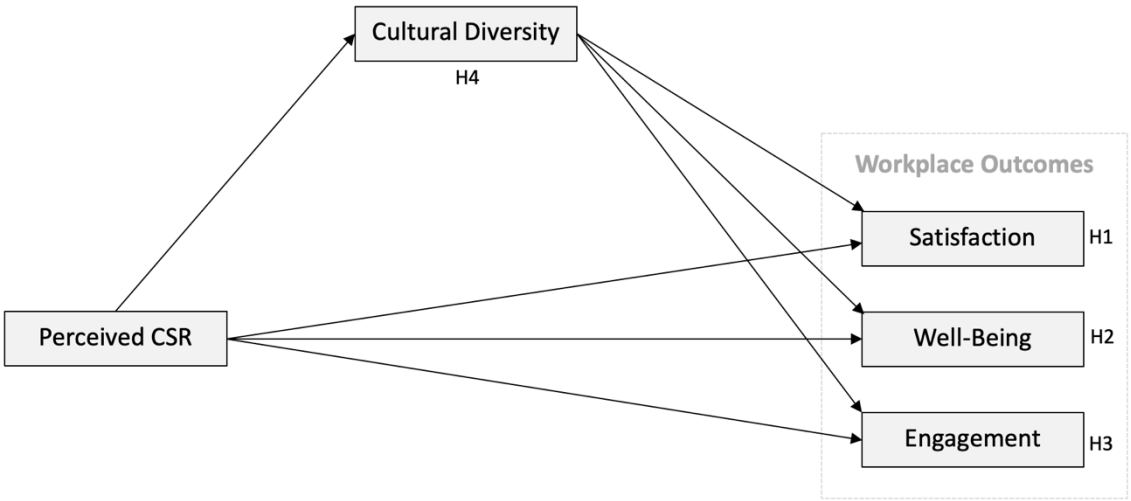

Figure 1: Research model

3. Methodology

3.1 Data Collection and Sample

To achieve the pre-defined objectives, data were collected via a large-scale survey of selected companies in the service sector that have CSR practices and a culturally diverse environment. The questionnaire was administered to international employees of four firms headquartered in the North of Portugal. We opted for a quantitative methodology applied to international employees who recognize the existence of CSR policies and practices in the organization where they work. In addition, variables such as gender, age, country of employment, seniority in the organization, possible managerial responsibilities, and sector of activity were controlled for, as these are variables that may influence the effects of CSR on employee outcomes (Rupp and Mallory, 2015).

A convenience sample technique was used to distribute the survey between April and June 2023 through the Amazon Mechanical Turk (MTurk) platform (English version). By the end of the data collection period, the sample included answers from 211 employees working in 19 different countries. Well-tested scales were employed and respondent confidentiality and anonymity were ensured to mitigate the common method bias. This bias occurs when data is collected from the same source and at a single time, causing variance to result from the measurement method, which can determine the relationship between two variables, leading to incorrect perceptions and affecting hypotheses testing (Podsakoff *et al.*, 2003). Accordingly, we also examined the potential common method bias in our data by resorting the Harman's single-factor test (Podsakoff *et al.*, 2003). The results indicated that no single factor accounted for the majority of the variance, suggesting that common method bias was not a significant concern in this study (Podsakoff *et al*., 2003).

Since our model simultaneously assumes a series of interrelated relationships, we apply structural equation modelling (SEM) rather than often-used multiple regression, which is restricted to examining a single relationship at a time (Cheng, 2001). Accordingly, we followed the recommendations of Marôco (2014) to validate the research model through a two-step strategy. First, the measurement model was validated by confirmatory factor analysis (CFA), and then the fitting coefficient and path coefficients were measured by SEM. Measurement model validation performed via an SEM-based CFA produces some additional advantages (e.g., more favourable psychometric properties) because the relationship between the constructs' indicators is studied jointly (Cheng, 2001) and because measurement error is considered when statistically analysing data (Lomax and Schumacker, 2004). We used SPSS 29.0 and Amos 29.0 for SEM analysis.

3.2 Variables

3.2.1 Dependent variables

The target variables were employees' satisfaction, well-being, and engagement at work. Employees' satisfaction was assessed using the scale developed by Macdonald and MacIntyre (1997). This scale includes ten items and focuses on the workers' reactions to the events rather than the events themselves. Participants were asked to rate their degree of satisfaction with their job on a 5-point Likert scale ranging from 1 ("strongly disagree") to 5 ("strongly agree").

Employees' well-being, in turn, was measured using the scale presented by Pradhan and Hati (2019). Since this research aims to assess the workers' perceptions of the aspects related to the workplace environment, we focused on *workplace well-being* and *social well-being.* On the one hand, *workplace well-being* includes five items work-life safety, employee assistance, employee growth, work facilities, and work climate (Pradhan and Hati, 2019). On the other hand, the *social well-being* dimension is defined as the degree of belongingness and attachment towards society, consisting of five items related to social acceptance, actualization, contribution, and integration (Pradhan and Hati, 2019). The researchers surveyed scored each item on a 5-point Likert scale ranging from 1 ("strongly disagree") to 5 ("strongly agree").

Engagement at work was determined based on the scale designed by Saks (2006) that investigates the relationships between an organization and its employees using the social exchange relationship model. The scale is divided into two dimensions to assess the employee's psychological engagement in their job and organization with five and six items, respectively. The answers were rated on a 5-point Likert scale ranging from 1 ("strongly disagree") to 5 ("strongly agree").

3.2.2 Independent variable

The explanatory variable was the perceived CSR. This was determined using the stakeholders-based CSR scale developed by Turker (2009) which includes four dimensions: (1) six items for social and non-social stakeholders (community and environment), (2) five items for CSR to employees, (3) three items for CSR to customers, and (4) two items for CSR to government. Responses were rated on a 5-point Likert scale ranging from 1 ("strongly disagree") to 5 ("strongly agree").

3.2.3 Mediating variable

The mediating variable was cultural diversity assessed through the benefits and threats of diversity (BTDS) scale developed by Orsini and Magnier-Watanabe (2023). The BTDS scale measures the *benefits* of cultural diversity which include the perception of diverse groups in society and the analysis of the social environment, each one comprising three items. Further, this scale also explores the *threats* that may arise from the inclusion of distinct cultures in the workplace comprising three items to assess symbolic threats and another three to analyse intergroup anxiety. The responses were coded on a 5-point Likert scale ranging from 1 ("strongly disagree") to 5 ("strongly agree").

4. Results

4.1 Factor Analysis

4.1.1 Exploratory factor analysis

To ascertain whether the factor analysis method can be used, two tests were performed: the Kaiser-Meyer-Olkin (KMO) test and Bartlett's test of sphericity. Having obtained good values for these tests, we proceeded with the exploratory factor analysis, where, for the extraction of the factors, the Principal Component Method was applied, using the Varimax factor rotation method, removing all coefficients below 0.5 (Marôco, 2014). Perceived CSR (PCSR) and cultural diversity (CD) were presented with three factors, while employees' satisfaction (EJS), well-being (EW), and engagement (EE) at work presented two factors. Furthermore, Cronbach's alpha (CA) values exceed the established threshold of 0.70 (Marôco, 2014). The CA found for these constructs, PCSR, EW, EJS, EE, and CD, were 0.931, 0.922, 0.915, 0.889, and 0.785, respectively.

4.1.2 Confirmatory factor analysis

Twelve models were designed in SPSS Amos with different numbers of factors, from a model with only one factor to the measurement models with the number of factors that emerged from EFA. Confirmatory factor analyses (CFA) were then performed on each model to understand the changes to model fit when a different number of factors were considered. As the number of factors increased and approached the respective measurement models, we found an improvement in model fit. Overall, the models presented an acceptable quality fit (see Table 1).

Table 1: Model fit summary

Constructs	χ^2/df	CFI	GFI	RMSEA
CD	2.938	0.940	0.901	0.096
EJS	3.778	0.935	0.895	0.115

Constructs	χ^2/df	CFI	GFI	RMSEA
EE	3.724	0.925	0.885	0.114
EW	2.618	0.962	0.931	0.088
PCSR	1.993	0.951	0.900	0.069
Norm*	< 5	≥ 0.95	≥ 0.95	< 0.05

*** Source: most conversative thresholds of Marôco (2014). CFI = comparative fit index, GFI = goodness of fit index, RMSEA = root mean square error of approximation.**

Associated with CFA, there are other validation measures – composite reliability (CR), average variance extracted (AVE), and discriminant validity – that were also determined. Besides Cronbach's alpha (CA), construct reliability is assessed considering the values of CR which should be higher than 0.70 (Marôco, 2014). In our study, CA and CR values were above the recommended thresholds (Marôco, 2014), ensuring the constructs' internal reliability. Regarding AVE, in our study, the constructs fulfilled the minimum recommended value of 0.50 (Fornell and Larcker, 1981). The correlations between each pair of constructs were also checked to ensure the values did not exceed the square root of AVE for each latent variable (Fornell and Larcker, 1981). The current results thus indicate that the measurement models have adequate convergent and discriminant validity.

4.2 Descriptive Statistics and Correlation Analysis

Table 2 shows the mean, standard deviation (SD), and correlation coefficients between the variables. PCSR is positive and significantly associated with the three variables that make it up the workplace outcomes (EJS, EW, and EE), and these variables are also associated with each other, which allows us to anticipate a possible confirmation of hypotheses H1, H2, and H3. Likewise, we also found a positive and significant correlation of CD with PCSR, EJS, EW, and EE, allowing us to anticipate a potential validation of H4 (a-c).

Table 2: Descriptive statistics and correlational analysis

Constructs	Mean	S.D.	1	2	3	4	5
1. CD	3.43	0.553	1				
2. EJS	3.65	0.769	0.475**	1			
3. EE	3.42	0.752	0.569**	0.794**	1		
4. EW	3.73	0.760	0.421**	0.879**	0.796**	1	
5. PCSR	3.78	0.636	0.469**	0.767**	0.717**	0.780**	1
**** p < 0.01.**							

4.3 Structural Model Analysis

We performed an SEM analysis (see Figure 2). This model presented reasonable global adjustment values (Marôco, 2014). Depending on the indicators, the adjustment values varied between acceptable (χ^2/df = 4.945) and sufferable (CFI = 0.858, GFI = 0.787). Therefore, this was the model that served as the basis for the remaining analysis. We began the hypotheses testing by analyzing H1, which represents the effects of PCSR on EJS (see Table 3). From the analysis of the results, it is possible to verify that PCSR has a positive and significant impact on employees' satisfaction at work ($p < 0.001$), lending support to hypothesis H1.

Next, hypotheses H2 and H3 were analyzed, which address, respectively, the direct effects of PCSR on EW and EE. We began by testing H2 which reflects the effects of PCSR on employees' well-being at work. We find a positive and significant effect ($p < 0.001$), confirming hypothesis H2. To test H3 the same reasoning was followed. From the analysis of these results, it can be seen that PCSR has a positive and significant effect on employees' engagement at work ($p < 0.05$), supporting hypothesis H3.

Table 3: Direct effects - H1, H2, and H3

Hypotheses	β	S.E.	ρ value	Result
H1: PCSR → EJS	1.152	0.103	***	Confirmed
H2: PCSR → EW	1.004	0.113	***	Confirmed
H3: PCSR → EE	0.292	0.142	0.039	Confirmed

Finally, we tested hypothesis H4 (a-c), which corresponds to mediation, through cultural diversity (CD), of the relationship between PCSR and workplace outcomes, namely, EJS, EW, and EE. For this we analyzed the indirect effect of PCSR on EJS, EW, and EE, mediated by CD. As can be seen from the analysis of Table 4, the indirect effects of PCSR on EJS, EW, and EE, mediated by CD, are positive and statistically significant ($p < 0.001$), offering support to hypothesis H4 (a-c).

Table 4: Indirect effects - H4

Hypotheses	β	S.E.	ρ value	Result
$H4_a$: PCSR → CD → EJS	1.235	0.127	***	Confirmed
$H4_b$: PCSR → CD → EW	1.232	0.115	***	Confirmed
$H4_c$: PCSR → CD → EE	1.142	0.131	***	Confirmed

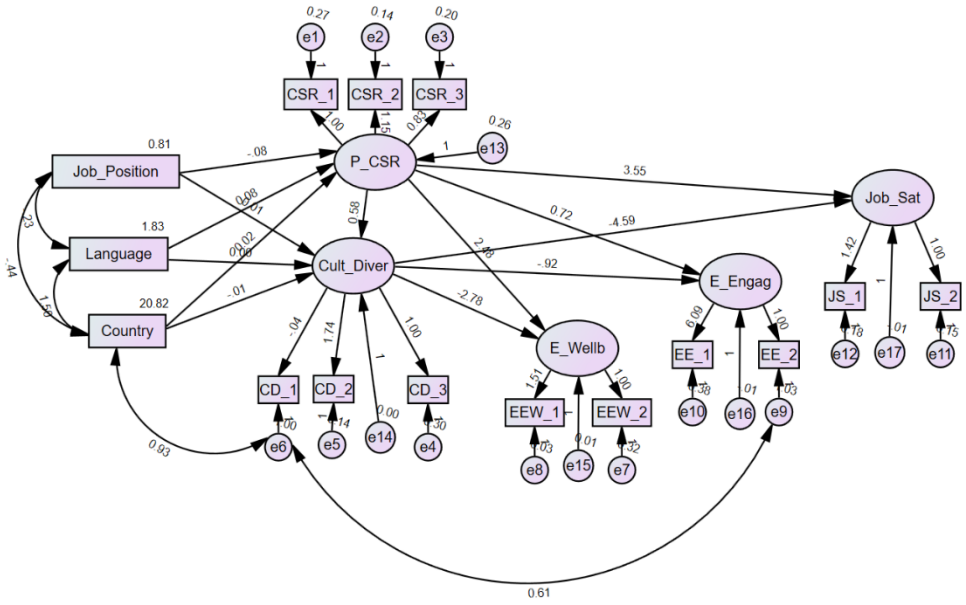

Figure 2: Structural model

5. Discussion

Consistent with what was indicated by the literature, that perceived CSR was positively related to satisfaction at work, our study allows us to prove this relationship (H1). We infer that employees' perceptions of CSR, by itself, influence how satisfied they feel at work. Employees are more likely to be engaged in their jobs when they believe that an organization's CSR efforts are focused on improving society and the environment (Al-Ghazali and Sohail, 2021, Lee *et al*., 2013). Therefore, the fulfilment of societal obligations by the organization fosters a psychological contract wherein employees feel valued and respected, thus enhancing their overall satisfaction and well-being in their employment.

The perception of CSR as more embedded, such as the inclusion of CSR in the organization's strategy and mission or the management and performance evaluation systems, positively affects employees' well-being, as tested in hypothesis H2. This relationship was also found in the correlation analysis, where there was a positive and significant association between PCSR and EW. As studied in the literature and according to SIT, the perception by employees that CSR activities are genuine and present in the organization's daily life drives the feeling of well-being through work (Adu-Gyamfi *et al.*, 2021, Al-Ghazali and Sohail, 2021, Kim *et al.*, 2018). CSR initiatives serving as outward manifestations of organizational values and ethics, bolster employees' perceptions of organizational integrity and moral standing when they impact employees more directly.

Likewise, according to the data collected, the perception of CSR as more embedded also has a positive impact on employees' engagement, which supported hypothesis H3. This result is understandable because employees who perceive their organization as socially responsible are more likely to identify with the organization's mission and values, leading to heightened engagement driven by a desire to contribute to its societal impact. This

alignment of personal values with organizational goals fosters a sense of purpose and meaning in work, enhancing employees' intrinsic motivation and engagement (Chaudhary, 2017, Cunha *et al.*, 2022).

Finally, it was possible to verify a positive and significant effect of perceived CSR in EJS, EW, and EE, through CD (H4). This relationship has been proved by Grabner-Kräuter *et al.* (2020) who pointed out that considering cultural diversity (CD) when implementing CSR practices, helps to achieve a level of integration, bringing job satisfaction and engagement, as well as enhancing well-being (Neto *et al.,* 2018). Also, in the analysis of correlations between variables, it was found that perceived CSR was positively associated with workplace outcomes (EJS, EW, EE) and CD. Thus, we prove that CD partially converts CSR practices' effects into higher levels of employee satisfaction, well-being, and engagement at work.

6. Conclusion

This study explored the relationship between perceived CSR practices and employees' satisfaction, well-being, and engagement, including the mediating role of cultural diversity. Our problem statement is of huge relevance because, as explored earlier, the positive effects of CSR implementation on employees are dependent on their perceptions (e.g., Bachrach *et al.*, 2022, Rodrigues *et al*., 2024). With organizations having an important role in shaping these perceptions, they should consider this when selecting, designing, and communicating their CSR policies and practices (Bachrach *et al.*, 2022).

Our results have theoretical implications including that companies focusing on diversity and inclusion as a part of their CSR strategy are better positioned to create effective, adequate, and harmonious workplaces. The significant mediating effect of cultural diversity emphasizes the importance of considering cultural nuances in CSR program design. Accordingly, these findings contributed to the empirical research of CSR and workplace outcomes by exploring the existing gap in the literature (e.g., Grabner-Kräuter *et al.*, 2020, Ivanova-Gongne *et al.*, 2022) of the actual process of *why* and *how* cultural diversity must be considered within CSR frameworks. Exposure to divergent cultural settings cultivates a heightened appreciation for social and environmental concerns, increasing employees' receptivity toward CSR initiatives. Such increased awareness is pivotal in shaping employees' perceptions of the organization's commitment to ethical conduct, thereby enhancing the salience of CSR within the workplace.

From a managerial perspective, the findings highlight that firms recognizing and accommodating cultural diversity in CSR practices will be able to foster a more inclusive and equitable work environment wherein all employees feel valued and engaged, regardless of their cultural mindset. According to this research, organizations should use CSR initiatives strategically, focusing on including CSR in the company's daily practices, going against a symbolic approach, and genuinely committing to their social and environmental responsibilities. Thus, for CSR policies and practices to be present in the organization's daily activities, managers should actively involve employees in designing and implementing CSR, by creating platforms for feedback and participation. These platforms will ensure that CSR practices are inclusive and reflective of the workforce's diverse needs. Concurrently, organizations should prioritize cultural diversity as a key component of their CSR strategies. This can involve implementing diversity training programs, promoting inclusive hiring practices, and fostering a workplace culture that values and respects diverse perspectives. By doing so, managers can enhance employee satisfaction and productivity, leading to a more harmonious and effective workplace.

The practical implications of CSR policies extend beyond individual firms and their employees, permeating broader institutional dimensions that warrant consideration. A notable consequence entails the potential metamorphosis of legal and regulatory frameworks. Proficiently executed CSR practices, such as those presented above, pose the potential to encourage government revaluation and refinement of laws, fostering an environment conducive to CSR implementation. Additionally, CSR initiatives have the power to establish new industry benchmarks and conventions, cultivating a *milieu* of ethical business behaviour on an institutional scale. As enterprises implement and showcase efficient CSR, these practices become an example to follow for others within the sector, catalysing the development of best practices.

Even considering the contributions made by this research, it is necessary to recognize that it also presents some limitations. The analysis only covered international employees working in four firms headquartered in the North of Portugal. Future research should compare data on other regions and even European nations to determine whether the current results apply to other contexts. The sample size could also be larger. Thus, future studies could obtain a more representative sample of the population employed in organizations with CSR practices and policies. Another limitation to be addressed is the short period that our data was collected. The questionnaire answers were gathered at a single point in time, which limited our ability to capture the dynamic nature of EJS,

EW, and EE. To comprehensively assess these dimensions, future research could perform data collection at multiple time intervals.

Abstract: Since Satoshi Nakamoto's first publication of the Bitcoin whitepaper in 2008, blockchain based technologies has gradually permeated various aspects of our lives. From the emergence of cryptocurrencies like Bitcoin to the development of platforms such as Ethereum, and the rise of phenomena like NFTs and Fan Tokens, the impacts of this technology has been diverse. While speculation surrounding these innovations persists, there exist successful use cases that have breathed new life into industries and enhanced customer interaction with established brands. One such domain where this is evident is the sports industry. Historically, sports teams, particularly football clubs, have sought avenues to capitalize on their fan base, aiming to diversify revenue streams. The advent of Fan Tokens has facilitated this endeavour, allowing teams to monetize fan engagement effectively. Consequently, an exploratory study comprising multiple case analyses was undertaken to examine how digital artifacts, exemplified by Fan Tokens, contribute to value creation within an ecosystem, fostering innovation and monetization for sports enterprises. The findings of this study elucidate the correlation between the characteristics of digital artifacts and the sources of value creation within an ecosystem. Furthermore, they underscore how these characteristics catalyse the formation of such ecosystems, thus propelling innovation and revenue generation within the sports industry.

Keywords: Ecosystem, Digital artifact, Value creation, Value capture

1. Introduction

In the ever evolving and closely interconnected landscape of contemporary digital society, the advancement of technology has brought forth novel digital tools that not only mirror technological advancement but also actively shape individuals' interactions with their surroundings. Particularly within the realm of sports, we encounter a domain marked by its broad appeal and emotional engagement. Sports serve as a universal language, transcending cultural and linguistic barriers. The fervour surrounding sporting occasions serves as fertile ground for the exploration and implementation of technologies aimed at amplifying the emotional bond between fans and teams (Fonti et al., 2023). Additionally, sports teams benefit from a vast supporter base that, owing to globalization and digital connectivity, can be accessed and engaged with globally, presenting a distinct opportunity for the implementation of technology solutions that enhance fan interaction.

An exemplary illustration of this phenomenon is the advent of Fan Tokens, which have heralded a new era in fan engagement by converting the traditional passive relationship into an active and personalized involvement. These tokens, often leveraging blockchain technologies, empower fans to directly partake in the team's dynamics and access exclusive privileges. This presents an avenue for entrepreneurs and established firms to capitalize on the opportunities afforded by these Fan Tokens, as identified in digital artifacts (Kallinikos et al., 2013), thereby devising innovative ways to monetize their customer base and offer novel services and value propositions (Autio et al., 2018; Sanasi et al., 2021; Silva et al., 2021). Nevertheless, despite the nascent exploration in literature regarding the potential of digital artifacts (Kallinikos et al., 2013; Ojala et al., 2023; Sanasi & Ghezzi, 2022) and the scrutiny of ecosystems and their internal dynamics (Adner, 2017; Felch & Sucky, 2022; Ghezzi et al., 2009), the assessment of a digital artifact's impact on ecosystem formation remains an uncharted territory. Consequently, this research endeavors to bridge the gap between digital artifacts and ecosystems by addressing the question: "How do digital artifacts enable the creation of an ecosystem?" Through an exploratory multiple case study, this research assesses how the introduction of Fan Tokens has facilitated the formation of ecosystems transcending the conventional boundaries between sports and technology, thereby fostering a synergistic relationship among technology providers, sports clubs, and fans.

This study contributes to existing literature in three key aspects. Firstly, it delves into how the inherent attributes of digital artifacts (such as Fan Tokens) have spawned new business prospects and avenues of engagement for technology providers. Secondly, it sheds light on how traditionally sports-centric clubs have embraced technological advancements through the adoption of these innovations, elucidating the activities and resources involved. Lastly, it examines the positive impact of digital artifacts on fan engagement and the

resultant creation and capture of value sources within and beyond the ecosystem stemming from the development and utilization of digital artifacts.

2. Literature Review

2.1 Ecosystem Theory

The ecosystem theory has encountered a proliferation of concepts, leading to redundancy and overlap across theoretical domains, resulting in confusion regarding the definition and value addition of an ecosystem perspective within a specific environment (Adner, 2017). Adner (2017, p. 4) defines an ecosystem as "the alignment structure of the multilateral set of partners that need to interact in order for a focal value proposition to materialize." Adner (2017) further distinguishes between ecosystem-as-affiliation, viewing the ecosystem as a community of associated actors, and ecosystem-as-structure, perceiving the ecosystem as a configuration of activities centered around a focal value proposition.

From Adner's definition, four elements characterize ecosystems: activities, actors, positions, and links. In ecosystem theory, the locus of value creation resides in the presence of interdependencies and complementarities among actors, contributing to the creation of a focal value proposition for customers (Kapoor, 2018). Complementarities denote an economic relationship between offers in terms of value creation potential (Felch and Sucky, 2022), while interdependencies represent a structural relationship between offers in terms of their interconnectedness for value creation and the impact of changes in one offer on the contribution of others to value creation (Kapoor, 2018). Kapoor (2018) also identifies three fundamental objects for an ecosystem: bottlenecks, complementors, and platforms. These aspects, including technology architecture, interdependencies, and integration systems, significantly influence value creation within an ecosystem (Kapoor, 2018).

Value creation mechanisms have garnered attention from various perspectives (e.g., Amit and Zott, 2001). Zott and Amit (2010) and Amit and Zott (2001) delineate the four sources of value creation: novelty, lock-in, complementarities, and efficiency. Amit and Han (2017) discuss new sources of value creation in a digitally enabled world where digital platforms and ecosystems play a pivotal role. Lepak et al. (2007) also contribute to the understanding of different types of value, distinguishing between use value and exchange value. Use value pertains to the quality perceived by customers concerning their needs (Bowman and Ambrosini, 2000), while exchange value refers to the monetary amount realized at a specific point in time (Bowman and Ambrosini, 2000).

2.2 Digital Artifacts Theory

Despite attempts by several authors to define digital artifacts (Ekbia, 2009; Zittrain 2008), only Kallinikos et al. (2013) explicitly outline their characteristics. Kallinikos and colleagues (2013) highlight the distinctions between digital artifacts and physical entities of non-digital constitution across dimensions such as editability, openness, distributedness, and interactivity. Additionally, digital artifacts are often embedded in mutable interdependencies with other entities in broader digital ecosystems and can generate other digital objects distributed in the same or other ecosystems, thereby linking with ecosystem theory (Kallinikos et al., 2013). These findings suggest the ever-evolving nature of digital ecosystems due to the incomplete and mutable nature of digital artifacts (Kallinikos et al., 2013). Ojala et al. (2023) develop a framework based on these characteristics to leverage digital artifacts for the internationalization of new ventures.

Thus, the concept of "ecosystem" has gained significant attention among scholars and practitioners, particularly in the past two decades (Adner, 2017; Jacobides et al., 2018). Moreover, several authors concur on the pivotal role played by digital artifacts (Kallinikos et al., 2013; Ojala et al., 2023) in ecosystem development. However, while the literature has elucidated the definition, structure, and internal dynamics of ecosystems, the question of how actors within an ecosystem (Adner, 2017) interact and align to create value in the presence of a digital artifact (Kallinikos et al., 2013) remains unanswered. Hence, this research will focus on how digital artifacts, through their characteristics, facilitate ecosystem creation. This inquiry is encapsulated in the research question: *How do digital artifacts enable the creation of an ecosystem?*

3. Methodology

This study utilizes a qualitative (Gartner and Birley, 2002) and exploratory research design employing a multiple case study approach (Yin, 1984; Eisenhardt, 1989; Eisenhardt & Graebner, 2007) to examine the emergence of ecosystems facilitated by digital artifacts. Specifically, the multiple case study approach is

selected because literature acknowledges its greater robustness compared to a single case study (Yin, 1984), and it facilitates the derivation of generalized findings, allowing for comparisons among diverse manifestations of the phenomenon (Eisenhardt & Graebner, 2007). The digital artifact (Kallinikos et al., 2013) serves as the primary unit of analysis (Yin, 1984), pivotal in the formation of an ecosystem wherein actors collaborate around a shared value proposition (Adner, 2017). In this study, the Fan Token, defined as a utility token (Glossario blockchain, 2022) created utilizing blockchain technology (Glaser, 2017; Nakamoto, 2008; Ante et al., 2023), is regarded as the digital artifact.

3.1 Case Sampling

In this study, a heterogeneous approach was adopted for case selection, aiming to encompass cases representing diverse patterns of behaviour, outcomes, decisions, and evolutionary stages within the analyzed process. Heterogeneity is pursued to recognize and compare various types associated with the same phenomenon, offering a comprehensive understanding of the involved dynamics (Yin, 1984). To implement this approach effectively, it was crucial to pre-determine the number and nature of cases to be examined (Yin, 1984). Following the identification of the research question, key stakeholders involved in the ecosystem were identified. These include technology providers responsible for creating and selling Fan Tokens, sports teams collaborating with technology providers to enhance fan engagement, and the sports team supporters, who are the end users of digital artifacts. Among the various types of sports teams engaged in Fan Token initiatives, the decision was made to focus solely on football clubs. This decision stems from the global popularity and widespread following of football, with approximately 3.5 billion supporters and over 250 million players across more than 200 countries. Additionally, football accounts for 40% of the overall market value of the sports industry, exceeding $500 billion in 2022 (Fonti et al., 2023).

During the initial phase of case study selection, a geographical criterion was applied, limiting the selection to European football clubs. This geographical focus was deemed significant due to the varying dynamics and opportunities within the Fan Token industry across different regions. To ensure accuracy and reliability, the official FIGC database was utilized. The research identified 70 football teams engaged with Fan Token platforms. To refine the selection process, the focus shifted to technology providers, aiming to identify the most prominent and established ones to narrow down the selection field for football teams. The selection criterion was based on the technology providers with the highest Fan Token market cap in the European landscape. Selection of Socios and Binance was prioritized to focus on companies with greater significance and impact in the industry, ensuring the analysis is more meaningful and representative, particularly in the European context. Moreover, Socios and Binance were chosen for their heterogeneity, with Socios representing a more diversified player and Binance a more focused one. From the numerous teams associated with Socios, Juventus FC, AC Milan, and Lega Serie A were selected as the subjects of study. This selection aimed to explore highly diverse cases to provide a varied representation of the Fan Token context in football. Among the two European teams partnered with Binance, FC Porto was chosen over S.S. Lazio to introduce a foreign team into the set of cases studied, offering a comprehensive and diversified overview of interactions between the platform and football teams, both domestically and internationally. Additionally, supporters were selected for AC Milan, Juventus FC, and FC Porto to better understand the overall environment surrounding Fan Tokens (see Appendix for further details on informants).

3.2 Data Collection

The data collection phase of the study employed a thorough strategy encompassing both primary and secondary sources to ensure data triangulation. Secondary sources such as YouTube videos, podcasts, whitepapers, and press releases were utilized to provide just confirmation to the primary sources, which include in-depth semi-structured interviews conducted with key informants. These 10 interviews, categorized into sections corresponding to the topics outlined in the literature review, were recorded, transcribed, and carried out in an interactive manner involving technology providers, sports teams, and sports team supporters. During the data collection phase, interviews with various stakeholders in the ecosystem were conducted while maintaining a neutral stance to uphold objectivity. Informants were perceived as knowledgeable agents, and the research aimed to conduct a generalizing analysis, treating the case studies as multiple experiments (Gioia et al., 2013). Following Yin's methodological approach (Yin, 1984), "analytical generalization" integrated existing theories with empirical evidence, contributing to a comprehensive understanding of the impact and dynamics of the digital artifact on the ecosystem. This approach allowed for flexibility in exploring emerging themes spontaneously. The richness of the dataset was further enriched by the inclusion of secondary data from external documents, ensuring a robust foundation for subsequent analysis.

3.3 Data Analysis

Following the completion of the data collection phase, the research progressed to the analysis and interpretation of the gathered data, aiming to develop a discussion based on the findings. Adhering to the "logic of replication" (Eisenhardt and Graebner, 2007), each case was treated as an independent experiment in both internal and cross-case analyses. The emphasis was placed on comprehending the ecosystem mechanisms and interactions facilitated by the digital artifact. Subsequent to the analysis of individual cases, a cross-case comparison was conducted to identify similarities and differences, addressing the research question. The analysis employed coding, utilizing an inductive Grounded Theory methodology (Glaser and Strauss, 2017). An inductive coding tree, incorporating constructed and in vivo codes (Glaser and Strauss, 2017; Gioia et al., 2013), was employed to capture the language of the informants, both from primary and secondary analysis transcripts. Through an iterative process, the codes were consolidated into first-order concepts, followed by a second-order analysis that aggregated the categories into overarching themes. This iterative process ultimately led to the development of an empirical model (Eisenhardt, 2023) illustrating how the digital artifact enables the creation of an ecosystem.

4. Results

Following an in-depth analysis of the results obtained from interviews conducted with key stakeholders across the ecosystem, a systematic process has been delineated concerning the development of Fan Tokens and their associated ecosystem by the involved firms. This process is delineated into two main phases: Phase 1 – *Focal Value Proposition Creation*, wherein the primary actors within the ecosystem synchronize their efforts in terms of aligning activities, resources, and competencies, envisioning, and exerting efforts to enhance the added value of the focal value proposition. Phase 2 – *Ecosystem Alignment Structure* involves the incorporation and activation of sports team supporters, who through the utilization of Fan Tokens, generate value for the technology provider (e.g., Binance and Socios) and for the sports teams (e.g., FC Porto, AC Milan, Juventus FC). Additionally, this phase encompasses the establishment of new partnerships with other actors (e.g., NFT Kings and Lega Serie A) for the provision of resources and inputs to develop complementary products aimed at delivering value to the sports team supporters.

4.1 Focal Value Proposition Creation

The catalyst for the formation of this type of ecosystem is the Fan Token. Both technology providers interviewed (Binance and Socios) have asserted that the Fan Token serves as the catalyst for establishing a new business venture. For instance, the Partnership Manager at Socios stated: "*As far as the token [Fan Token] is concerned, it was the simplest and most easily applicable decision at the time because it did not require a lot of effort.*" Additionally, the CEO of Socios, in a YouTube interview, mentioned: "*So, we decided to create an ecosystem based on blockchain in order to engage and monetize sports fans all over the world.*" During this phase, technology providers recognize the Fan Token as an opportunity to establish a new business unit (e.g., Binance) or initiate a new digital startup from scratch (e.g., Socios). Subsequently, they determine which technological infrastructure to utilize, whether leveraging existing infrastructure (e.g., Binance) or developing an entirely new one (e.g., Socios). As elucidated by the Head of Marketing and BD at Binance: "*There is no separate technical department. The technicians in Binance are generalists, so they carry out the tasks. As I mentioned earlier, at a technical setting level, the fantoken part is not different from the Binance core; it's essentially the same thing, but more focused on the fantoken.*"

During this phase, technology providers start collaborating with other actors to co-create the Fan Token, as explained by Socios' Partnership Manager: "*Together with the collaborative teams, we propose a poll, and once we decide on it and receive approval from the team, we upload that poll with all the associated experiences and rewards onto the platform.*" Throughout the alignment process between the technology provider and the actors, interdependencies are established, determining what each firm will provide to the other and vice versa, as stated by AC Milan's Associate Strategy Manager: *"...what we give Socios when we enter into a partnership with them is access to a fanbase of hundreds of millions of fans around the world... They have resources dedicated to Milan, we have a resource dedicated to Socios, and then we agree on what activities to do, when to do them...*".

4.2 Ecosystem Alignment Structure

In this phase, the overall structure of the ecosystem is nearly finalized with the involvement of sports team supporters and the inclusion of other stakeholders (e.g., Lega Serie A), who contribute relevant inputs to the ecosystem, as articulated by Lega Serie A's Partnership Manager: "*To conclude, with Socios, which is a very*

active partner and wants to activate a lot of users to make them interact in their platform, we did the activity related to matchball, so the NFC ball.". During this phase, the alignment structure is established where actors engage with each other to realize a central value proposition.

With the engagement of sports team supporters, the sports teams can interact with their fans through the capabilities provided by the Fan Token, as described by the Juventus FC's Head of Operations and Strategy: "*Then over time we saw that it works more what it involves. In fact, as we did on 'design your own shirt' which we then made, marketed and so on, you leave the grids much more open, but the ingredients you go for are controlled. So you leave space and you leave freedom…*". Additionally, they can now connect with fans worldwide, who were previously inaccessible to their favorite football team, as highlighted by AC Milan's Associate Strategy Manager: "*Now we are able to reach foreign fans such as fan from Turkey, Indonesia, etc., that previously was impossible to reach.*"; and FC Porto's Marketing Manager: "*So, for our fans across the world, we do think it will bring us new fans and share our image throughout the world…*".

With the opportunity to engage and reach a broader audience, both sports teams and other stakeholders, including technology providers, can extract value through the utilization of Fan Tokens and other digital assets (e.g., Matchball NFC from Lega Serie A, or NFTs), as stated by Juventus FC's Head of Operations and Strategy: "*On an economic level there was a huge benefit because we did a very important revenue sharing …So we benefit economically and in terms of value from what? From the fans! That's something we like anyway, it's a more direct channel…*". Moreover, sports team supporters themselves are more involved due to the interaction possibilities enabled by the Fan Token, as expressed by Subject A: "*I do believe that fan tokens can open an incredible door to the sporting world and not just to fans. As I said before, the ability to access luxury areas … made me realise the power of constant work and commitment in using tokens*".

5. Discussion

In our swiftly advancing digital era, where digital artifacts are supplanting physical counterparts (Kallinikos et al., 2013; Ekbia, 2009; Kallinikos and Mariategui, 2011), and the establishment of ecosystems (Adner, 2017; Jacobides et al., 2018) is imperative for both existing and emerging firms to thrive and innovate, there arises a crucial need to illuminate the connection between these previously disparate research realms. Furthermore, it is essential to examine this nascent phenomenon that is breathing new life into the sports industry with notable success stories, reshaping its rapport with customers (sports team supporters), and generating novel revenue streams alongside conventional ones in this "traditional" sector.

This study underscores that digital artifacts have the potential to foster the development of business ecosystems. Specifically, the attributes of digital artifacts (Kallinikos et al., 2013) facilitate the emergence of a business ecosystem (Adner, 2017; Jacobides et al., 2018) owing to their associations with mechanisms for value creation (Amit and Zott, 2001) and value capture (Lepak et al., 2007; Cortimiglia et al., 2011). Each of these attributes, and their correlations with value creation and capture mechanisms, exhibits distinct relevance within the two phases delineated in the preceding section (Phase 1 – Focal Value Proposition Creation, and Phase 2 – Ecosystem Alignment Structure).

5.1 Theoretical Contributions

The empirical model derived (Table 1) illuminates how the inherent attributes of digital artifacts (Kallinikos et al., 2013) can stimulate the activation of mechanisms for both value creation and capture (Amit and Zott, 2001; Lepak et al., 2007) within each represented phase. Put simply, the characteristics of digital artifacts can promote the establishment of a business ecosystem through their correlation with these mechanisms.

The characteristics of editability and openness inherent in digital artifacts (Kallinikos et al., 2013) encompass the ability to modify and update digital elements and to be accessible and modifiable by a program. These attributes can trigger sources of value creation, such as novelty and efficiency (Amit and Zott, 2001), during the initiation of interdependencies among actors in the initial phase of "Focal Value Proposition Creation". Through these characteristics (editability and openness), firms engaged in crafting a focal offer can innovate and enhance efficiency in conducting transactions with customers. Moreover, these features (editability and openness) facilitate the design and arrangement of elements constituting the focal value proposition (digital artifact), thus ensuring efficiency and novelty. This is achieved by reducing transaction costs through faster and easier transmission of information and enhancing transaction efficiency through instantaneous updating and modification of the focal offer. Additionally, these characteristics enable the creation of novel products that introduce new transactional methods and structures with previously unrelated parties, thereby eliminating inefficiencies and fostering new markets.

The characteristics of interactivity and distributedness associated with digital artifacts (Kallinikos et al., 2013) entail the ability for customers to interact with and activate functions embedded in the digital artifact and the nature of being borderless and distributed within a broader digital ecosystem. These attributes can activate sources of value creation, such as lock-in and complementarities (Amit and Zott, 2001), during the "Ecosystem Alignment Structure" phase (Adner, 2017). Through these characteristics (interactivity and distributedness), firms operating within the ecosystem can generate value for customers by leveraging lock-in and complementarity sources (Amit and Zott, 2001). Interactivity fosters increased lock-in value creation by facilitating customer retention and loyalty in repeat transactions. Meanwhile, distributedness fosters enhanced complementarity value creation by providing opportunities to reach various actors (e.g., customers, partners, etc.) without boundary constraints, enabling firms already within the ecosystem to establish new partner networks for co-creation and the provision of relevant inputs for complementary products.

Through customer interaction and access to complementary products worldwide, firms within the ecosystem can capture value from customer utilization of digital artifacts. By leveraging the utilization of digital artifacts by customers, firms can capture various types of value to augment their revenues, acquire new customers, and gain better insights into their audiences through data analysis.

To summarize these findings into the proposition that addresses the question underpinning this study:

The intrinsic characteristics of digital artifacts enable the establishment of an ecosystem through their associations with mechanisms for value creation and capture within each necessary phase for creating the respective ecosystem.

Table 1: Empirical model

Phases	**Characteristics of digital artifacts**	**Sources of value creation and capture**
Focal Value Proposition Creation	Editability and Openness	Novelty and Efficiency
Ecosystem Alignment Structure	Interactivity and Distributedness	Complementarity, Lock-in and Value capture

6. Conclusion

This study explored how digital artifacts can facilitate the establishment of an ecosystem. It was determined that digital artifacts, owing to their inherent attributes, have the capacity to stimulate mechanisms for both value creation and capture within an ecosystem. Furthermore, these attributes prove beneficial across each phase required for ecosystem development. In addition to this finding, the research contributes to enriching the Ecosystem theory. The motivation behind this study stemmed from a recognized gap in the literature between two previously disconnected streams: ecosystem theory and digital artifacts. Through this research, these two theories have now been integrated, laying the groundwork for future investigations.

The study employed an exploratory approach, utilizing multiple case studies involving a sample of four cases, identified with six companies and three sports fans interviewed. The sports business sector was selected as the industry of focus due to its distinctive characteristics (Fonti et al., 2023) and significant market value. Specifically, the application of Fan Tokens within the football industry (a subset of the sports industry) served as the foundation for addressing the research question. The result of this endeavour is an empirical model that aids in comprehending how to develop a business ecosystem by leveraging the attributes of a digital artifact.

In conclusion, this study has yielded new and original insights, albeit with limitations stemming from the small sample size and subjectivity inherent in qualitative research. Indeed, future studies could benefit from a larger sample size to facilitate more precise generalization of the findings. Nonetheless, the integration of ecosystem and digital artifact theories has opened up a new avenue for research, offering opportunities for the development of novel theories and frameworks.

Acknowledgements

We would like to thank Emily Matteuzzi, who helped us in this research and in the interviews conducted. We would also like to extend our acknowledgements to all the people we interviewed, who gave us their time and without whose contribution this study would not exist. Last but not least, we would like to deeply thank the

whole University, Politecnico di Milano, which has been our springboard for the future, and which allowed us to be the persons we are now.

Abstract: Deep tech start-ups, characterized by their focus on groundbreaking technologies and scientific advancements, face unique challenges that demand specialized support systems for their development and market entry. This paper presents a qualitative analysis based on ten interviews with managers of deep tech incubators, exploring the services offered, critical success factors, challenges and anticipated future changes. The services provided by incubators are comprehensive, ranging from technical and business mentorship to assistance in regulatory processes and access to financial resources. The study identifies that the success of deep tech incubators depends on customized support for start-ups, access to expertise and facilities, and a strong ecosystem and community network. Customized support ensures that the unique needs of each start-up are met, while access to technical resources and a vibrant network facilitates innovation and growth. Challenges such as cultural and mindset differences, operational difficulties, and regulatory navigation underscore the complex landscape in which these incubators operate. Anticipated changes within the next few years include a shift in investment focus towards projects with significant societal impact, an increase in international collaboration, and a deeper recognition of deep tech's role in solving global challenges. This paper contributes to the understanding of deep tech incubation, highlighting the support required to foster innovation in this sector. The insights from this study can inform policymakers, investors, and managers of deep tech incubators on fostering a conducive environment for innovation and growth in the deep tech sector.

Keywords: Incubator, Entrepreneurship, Start-ups, Deep tech, Start-up support

1. Introduction

The number of incubators has risen tremendously over the past 50 years and so has the number of research published on the topic. Incubators provide support services and resources to early-stage companies to help them grow and succeed. The definition and approach to incubators varies greatly and therefore, also the research is fragmented and the impact often difficult to compare (Aernoudt, 2004). As the landscape evolves, new models of incubation are emerging, tailored to specific industries and technologies, further diversifying their impact and reach.

A remarkable example is the so-called deep tech-sector, which has risen to prominence over the past decade. Start-ups in this sector work on disruptive technologies that require big capital investments and have traditionally long research and development processes (Kask & Linton, 2023). As with start-ups itself, also the number of incubators focusing on deep tech have increased.

There have been studies on the success factors of support programmes for start-ups in various contexts, for example general business incubators (Theodorakopoulos et al., 2014), accelerators (Mann et al., 2020) or science and technology parks (European Commission, 2014). We are not aware, however, of a study looking at the niche of deep tech-incubators. Therefore, we focus on deep-tech incubators with the following research questions:

- What is success for a deep tech-incubator?
- What are the success factors of deep tech incubators?
- What are challenges and barriers for deep tech incubators?
- What are the expected changes in the field of deep tech-incubators?

This paper firstly reviews literature on the state of knowledge and to clarify the different usage of the deep tech terminology, proposing an analytical definition. Secondly, the methodology is described on how the ten interviews were conducted and analysed. After, the results are presented followed by a discussion and conclusion.

2. Background

2.1 Towards a Definition of Deep Tech

The term deep tech has been used for about a decade by start-ups, venture-capital firms, and policymakers to indicate a special class of high-tech companies. Earlier uses of the term “deep technology“ do exist (Storms 1998,

Lee, 1999, Christensen 2002) but do not seem to be directly related to the current usage of this term. Despite its interest and wide usage, a discussion on the notion of deep tech is missing in the scientific (academic) literature. By comparing four definition attempts (Chaturvedi 2015; De la Tour et al. 2017; Portincaso et al., 2019; European Startups 2021) we notice that some basic aspects of deep technologies appear in all cases, but as a mix of business and technological characteristic attributes, for example the quality and novelty of the technology, its innovation potential, and the impact and the risk characteristics of the business built around it. However, a such characterization is in our view insufficient as clear, analytical, definition.

The other apparent feature in the current use of the term, is that per se it does not refer or restrict to a specific industry, although some industrial sector seems are naturally associated with deep technology, as shown in table 1 (Chaturvedi, Swati, 2015, Portincaso et al. 2019, European Startups 2021). We propose to systematise the existing definitions by defining deep technology based only on substantial features of the technology itself (intrinsic definition), and subsequently derive a definition of deep tech business, however keeping it separated of all the typical traits of it (characterization), which are usually but not always or not entirely associated to it.

Table 1: Own definition of deep tech for this research

Intrinsic Definitions: **Deep technology & deep tech business**	**Typical traits Deep tech business (Characterization)**	**Examples of Industry**
Deep technologies: based on substantial and unique scientific or engineering advances, either with protected IP or hard-to-reproduce. Deep tech-business: addresses an unmet market need or disrupts and existing market by leveraging on deep technology.	- Usually result of intense R&D. - Require a significant amount of capital in R&D and beyond: R&D, industrialization, commercialization - Take a long time to reach market-ready maturity - High market risk, as the market demand for the product is not proven - Expected to have a big impact (economic, societal, environmental)	- Advanced materials - Artificial intelligence - Biotechnology/life-sciences - Blockchain - Cleantech& energy - Drones and robotics - Medtech - Photonics and electronics - Space - Quantum Technologies

We adopted a definition of high-tech businesses that does not assume a high market risk, although it implies it as a usual trait. With the intrinsic definition we adopted, strictly speaking there is not a deep tech industry per se, but rather industries that are more or less likely to be impacted by deep tech technologies, and markets more or less likely to be entered or even disrupted by deep tech companies. Although similar traits are present in terms of technology development, market risk and needs for investment and business support, there is also a significant in-group diversification. For example, Biotech has a higher need for investment in all stages, while Artificial intelligence start-ups need relatively low financing in early phases. Hardware-oriented startups rely predominantly on non-equity funding until the prototype phase, while the needs of investment differ hugely in later phases (Portincaso 2019). We therefore propose a secondary categorization of deep-tech based enterprises based on their industry-related growth needs:

- Hardware: Advanced materials, drones and robotics, cleantech& energy, medtech, photonics and electronics, space, quantum technologies (sensing), computing hardware
- Software: Blockchain, quantum technologies (computing, simulations, quantum information), artificial intelligence
- Biotech: Biotechnology, life-sciences

2.2 Incubators

The terms incubator and accelerator have often been used interchangeable, as they both focus on the development of early-stage businesses. Taking the overall topic of deep technology into consideration, also the

term science park is added, as it is often used in connection with tech start-ups and has its own incubation programmes.

There are many definitions of incubators and the services a typical incubator offers, many of them similar. In general, "business incubation is regarded as an entrepreneurship development tool for promoting innovation, economic growth, and employment generation" (Theodoarkopoulos et al, 2014). Incubators support early-stage businesses in their development to become market-ready through a combination of offerings. The goal is to get proof-of-concept, set up the start-up team and minimise the risks around the newly founded company (Miller & Stacey, 2014). While there are differences in some aspect, such as the financing model, there are also typical recurrent traits in membership requirement and offer. Membership is usually open-ended, without a fixed duration, and the admission process is less strict. The following elements are usually offered by incubators (Bergek & Norman, 2008; Bone et al. 2017; van Weele, 2020):

- Shared office space and other physical facilities
- Shared support services (IT, admin, etc.)
- Business support: coaching, mentoring and training
- Access to the incubator's network
- Legitimacy and reputation

Accelerators offer many similar services like incubators, but usually have a fixed duration for which participants can apply until set dates and include a financial contribution of the accelerator, often in return for equity (Bone et al., 2017). Additionally, Cohen & Hochberg (2014) distinguish accelerators from incubators through "its intensity, the provision of a stipend and services and the cohort-based nature of accelerator program" with a highly selective admission process (Cohen & Hochberg, 2014; Bone et al. 2017). Accelerators can also be associated to different organisations. Early programmes were mostly set up by venture capitalists and business angels. Today, also governments, corporations, universities, or NGO's run accelerators. (Cohen & Hochberg, 2014) They mostly do not charge fees to the start-ups, but rather finance themselves through equity of the participants. Therefore, accelerators look for scalable businesses to finance their activities.

Science parks have the offerings of a traditional incubator, but typically also have additional services, especially on transfer of and collaborations within R&D as they focus on technologies as well (IASP, n.d.). Science parks may or may not have a focus on a particular industry, based on their partner institutions. The main technology sectors that are based within science parks are ICT & communications, biotechnology, computer science and hardware, electronics, software engineering, health & pharmaceuticals. (IASP, 2018) They are usually funded by the organisation that they are affiliated with and through private and corporate sponsors.

2.2.1 Success factors of incubators

Various success factors have been identified by scientific works on incubators:

- The selection and admission policy of the incubatees (Alzaghal & Mukhtar, 2017)
- The exit / graduation policy (Theodorakopoulos et al., 2014).
- The provided resources (often as shared office space and other shared resources)., including mentorship for example on regulations or technologies. (Theodorakopoulos et al., 2014; Alzaghal & Mukhtar, 2017)
- Access to capital, either through incubators' own fund or through relationships with business angels and venture capitalist (Theodorakopoulos et al., 2014)
- Networking opportunities (Alzaghal & Mukhtar, 2017; Mann et al., 2020)
- The competences of the team, the methodology and the organisational setup of the incubator (Theodorakopoulos et al., 2014).
- And lastly the monitoring of the performance of the incubated firms (Theodorakopoulos et al., 2014).

2.3 Deep Technology Incubation Programme

When compared to a traditional incubator, a deep-tech incubator shows major differences. The most evident is the focus: while many incubators do have a specific industry focus, deep tech incubators focus – as the name suggest – on deep technologies. Moreover, deep tech incubators have some additional services regarding to R&D and knowledge transfer, such as access to lab spaces. Also, deep tech incubators are connected to universities, research institutions or a corporate with a strong R&D-department, while none-deep tech incubators can have ties to universities or other corporations, but many also stand alone. A study analysed the needs of deep tech start-ups and where they would most likely go for to satisfy them (Harlé & Sousson, 2017).

Incubators and accelerators are the preferred partner for business knowledge and expertise, access to facilities and talent acquisition. For market access, the start-ups would choose corporations as partners, for funding business angels and venture capitalists, while universities are preferred for technical knowledge and expertise. Through the connection to universities and corporations, deep tech incubators can offer a broad range of the services required by deep tech start-ups.

In the present study we focus on deep tech incubators based on the following definition. Deep tech incubators:

- are an entrepreneurship development tool for start-ups that are based on substantial and unique scientific or engineering advances, either with protected IP or hard-to-reproduce, and address an unmet market need or disrupts an existing market by leveraging on deep technology.
- typically offer mentoring, training, office and lab space, access to the incubator's network, access to funding and technical support.
- are associated with a university or another research institution, including corporations.

3. Methodology

3.1 Sample and Data Gathering

This qualitative study focuses on European deep tech incubators. A sample of 23 incubators from 13 countries (list available from the authors) has been constructed. to include examples of incubators affiliated to European big science networks, as well as to leading research institutes or universities and with a clear history of success. The sampling also took care to be able to discriminate between incubation models, and to represent several of the major and most innovative European Countries. All incubators were contacted via e-mail and where possible via phone. Ten incubators agreed to be interviewed.

The interviews were semi-structured and were conducted online. The interviews lasted between 45 and 60 minutes. They were recorded and transcribed to allow a detailed analysis.

3.2 Measures of Variables

The survey was based on a questionnaire developed based on the research questions and the literature. The focus areas where the details of the interviewed incubators, their success factors as well as anticipated changes within the incubator, but also in the ecosystem.

3.3 Data Analysis Procedure

A qualitative content analysis of the ten interviews was done, using the software atlas.ti, which facilitated systematic organization and categorization of the extensive interview transcripts. A coding system was developed based on key themes and questions from the interview guide. The coding process consisted of multiple iterative stages, beginning with open coding to identify initial patterns. Through constant comparison and refinement, these codes were then organized into subcategories, allowing for a higher level of abstraction and thematic grouping.

4. Results

Based on the ten interviews, we analysed the services offered, definitions of success, success factors, barriers, and challenges as well as expected changes in the next five years.

The interviews reveal a comprehensive range of services offered by deep tech incubators. These services are designed to address both the technical and business aspects of start-up development.

- Access to technical resources and facilities as well as labs.
- Technical and business mentorship: These are mostly intense programmes tailored to the needs of the start-ups. A few take in cohorts on regular basis.
- Coaching for all legal aspects, specifically about the protection of intellectual property.
- Offering financial support directly to start-ups, including investments and guidance on securing additional funding. Increasing the investor readiness of the start-ups is also an important factor here.
- Assisting start-ups in finding a market for their ideas, transforming ideas into viable products, and identifying the most promising industries for their technologies.
- Help to develop a product that can be delivered to the market, training them in business aspects while they develop their technology.
- Networking and matchmaking with potential partners, investors, and customers.

- After the incubation phase, some incubators offer acceleration programs to further support start-ups in scaling their business, market validation, product marketing, and engaging with real customers.

4.1.1 What is success?

To understand success factors, we first have to look at what the incubators understand as success.

One of the most mentioned factors is the creation of start-ups, which can be measured in different ways. It is mentioned that the number of teams in the incubators, successful financing rounds and the survival rate of start-ups are used as measurement tools, of which the successful financing rounds seem most important as one interviewee said *"our number one metric is the capital raised by the start-ups that we support"* and another *"our success metrics are really the amount and the number of those series A capital raises"*. Also, reaching different stages in technology and market validation are considered, for example the readiness in technology, team, or business model.

A second important factor is job creation and the broader impact in economy and society that the incubator and its ventures have. Not to be neglected are the financial returns. The incubators can get shares in the ventures they support. With successful financing rounds and/or exits the incubators receive a financial reward that will allow them to continue with their operations. These factors show that success goes beyond financial measurements and also look at the impact on society or the number of start-ups that reach technological readiness.

4.1.2 Success factors

There have been many success factors mentioned and most are connected to the offered services.

Firstly, the connection to a collaborative ecosystem. In particular, institutes of higher education are crucial and with it comes access to expertise on the one hand, but also to facilities on the other hand, which can include labs and specialized equipment. This access can significantly reduce the capital required for the teams to develop their technologies. Partnerships to raise capital also come into play here, which can be business angels, venture capitalists or also organisations that provide grants. These two points are also part of a needed collaborative ecosystem, that should also have a strong network of start-ups supporting each other.

Secondly, a strong strategy in regard to intellectual property is also crucial, as it helps to protect the innovations and provides start-ups with a competitive edge in the market.

Thirdly, the selection of start-ups is important, as the start-ups are obviously the basis for the successful incubation. The two main factors are the technology and the team. Most of the incubators have strict selection processes and very low acceptance rate.

Fourthly, a customized approach in supporting the start-ups is essential as the needs of all of them are different. An important factor herewith is a pool of experts that contains subject matter experts on the technological side, but equally important also successful entrepreneurs, who can share their experiences and knowledge. One manager mentioned that *"also a success factor for me would be: are you responsible [as an incubator] and are you delivering what the team needs? Or are you just telling people that you are a good service provider?".* This leads to the success factor of how the incubator itself is organised. It needs a strong methodology with a strong team that accompanies and challenges the start-ups regularly to ensure that they reach their milestones.

4.1.3 What are the challenges and barriers?

The cultural and mindset challenges are a hurdle for the incubators. The teams are traditionally very diverse in terms of background and cultures. This can lead to difficulties in finding a common language. The mindset of the universities can also be a challenge on two sides. They have often slower processes and are less adaptable to the dynamics of a start-up, which can slow everyone down. Also, they sometimes lack the motivation to create spin-offs. This makes it difficult for the incubators to find the technologies and people within the universities. However, this seems to change recently. One manager mentioned that *"I can see that more and more academic people are interested in trying out to spin off a company or start the company. That has changed […] especially during the last five to six years so the newer generation is kind of interested in alternatives to the academic career"*.

Once the technologies have been found, there is the challenge of bridging the gap between the technology, its application by a start-up and the market access. In this factor, also a lack of business awareness of the founders plays a role. One incubator said that *"second, [and] I would even put it as even more important [success factor],*

is that business awareness of these teams is missing, the ability to understand how to generate or to create a company, how to create a business out of their ideas". It is therefore necessary for the incubators to find business-minded people that can join the teams.

The incubators also face operational challenges. One is the lack of space to accommodate the start-ups. Second is the team composition of the start-ups and their ability to keep up with the speed of the incubation programmes. And third is the funding for the incubators themselves, which are often partly dependent on government funding or on funds that are tied to a certain programme. This can be uncertain at times. Lastly, there are also regulatory challenges. The start-ups often face difficulties navigating regulatory environments, and incubators may struggle to provide adequate support in this area, despite having a voice in relevant ministries or governmental bodies. These challenges highlight the complexity of operating deep tech incubators, which have to find a balance between supporting the start-ups, ensuring financial sustainability, fostering a conducive cultural and operational environment, and engaging effectively with broader ecosystems and networks.

4.1.4 What changes are expected?

The interviewees expect several changes in the deep tech landscape in the next few years, highlighting shifts in investment priorities, technological development, and the broader ecosystem. The increasing recognition of deep technologies in addressing societal challenges will likely continue and lead to a shift in start-up-creation and investment towards sustainability. This includes the trend of having more "zebras" rather than "unicorns". Zebras are start-ups that are not solely focused on financial gains but prioritize a positive impact in the world. In regard to the investment, there is an expected shift towards an even longer-term mindset. The development of deep technologies can span over a decade or more and investors need to be ready to have a long breath.

Another expected change is towards even more internationalization and global collaboration of the incubators and their start-ups. A change from a competitive to a more collaborative mindset will happen. This should lead to a pooling of resources and expertise, which bring better and quicker developments. This is also seen as crucial to establish Europe as a global player in the deep tech landscape. These expected changes reflect a broader understanding of the need for innovation that not only offers financial returns but also addresses the pressing challenges facing society today. The emphasis on collaboration, societal impact, and long-term investment strategies indicates a maturing of the deep tech ecosystem towards more sustainable and impactful innovation.

5. Discussion

Firstly, the proposed definition of a deep tech-incubators has been confirmed as effective and useful by the interviews. In deep-tech incubators start-ups work on substantial and unique scientific and engineering advances that disrupt existing markets or create new markets altogether. The offerings can be summarized as proposed with mentoring, office and lab space, networking, funding, and technical support. Training has not been mentioned often but is based on the websites also part of the incubators. And lastly, they are all connected to a university or other research institution. Interestingly, the majority of incubators do not have focus industries, but is rather broad in the areas of deep tech. Therefore, the validated definition is:

> *"Deep tech incubators are an entrepreneurship development tool for start-ups that are based on substantial and unique scientific or engineering advances, either with protected IP or hard-to-reproduce, and address an unmet market need or disrupts an existing market by leveraging on deep technology. They typically offer mentoring, training, office and lab space, access to the incubator's network, access to funding and technical support and are associated with a university or another research institution including corporations."*

For the definition of success, it can be summarized that the number of successfully funded start-ups are the most important metric. This number of start-ups is a used metric in every incubator, including also derived indicators like start-ups reaching market readiness or that are established on the market (Doga-Mirzak & Naval, 2014); however, the strong focus on successfully funded start-ups and start-ups that reach later stage funding seems to be stronger in deep tech-incubators. A second component that becomes more important is the societal impact of the start-ups, which has been part of incubators focusing on sustainability. One metric that is often mentioned in the literature is the economic impact including the creation of jobs (Mubarak AL-Mubaraki & Busler, 2014), which has also been mentioned by the deep tech-incubators. Hence, success is defined very similar to traditional incubators with a stronger focus on later stage financing rounds and the impact on society.

One of the most important success factors for an incubator is the selection of its start-ups. This has also been confirmed in other literature on incubators and accelerators. (Theodorakopoulos et al., 2014; Mann et al., 2020). They build the basis and without them the best mentorship or networking opportunities will not help in supporting successful start-ups. For deep tech-incubators, this factor is even more important, as their start-ups have long research and development times and require large capital investments. Part of this is the importance of looking at the team and ensure that they are capable of developing the respective start-up. Therefore, all of the incubators have rigorous selection processes and low acceptance rates. However, there is no generally agreed way of selecting start-ups, neither in the interviews nor in the literature (Alzaghal & Mukhtar, 2017).

The connection to a research institution or a corporate is also seen as crucial for the incubators, which is less the case in traditional incubators, as they are often independent. This connection is crucial for two reasons. Firstly, it is a way for the incubators to source technologies and talents for their programmes. Secondly, as deep tech-start-ups usually need more than just a shared office space, it gives the start-ups access to research facilities, such as specialised labs, and expertise from the academic staff. These partnerships should then be part of broader ecosystem that the incubators can mobilize to get additional resources in. While the ecosystem is an important part of every start-up, strong connections to research institutions and other ecosystem players seem to be even more important for deep tech-incubators. The partnerships with universities have also been mentioned as a challenge. There is a reluctance to create spin-offs in certain departments or universities; however, it is mentioned that the newer generation of researchers is more open towards these possibilities.

There were other success factors mentioned. A strong strategy in intellectual property is also more needed in deep tech. While all companies have to think about the topic, it is often the technological advancement that have to be protected. Therefore, a traditional incubator with a less tech focus needs less resources in this area. The customized approach and the strong team and methodology are also a success factor for other incubators and do not seem to be specific for the deep tech-landscape. Thus, another important factor is that deep tech-incubators need a strong team to protect the research results of their start-ups.

The expected changes could influence the success factors in the future twofold. It will lead to more start-ups that focus on societal impacts and incubators need to find a way on how to deal with zebras instead of unicorns. Through the focus on impact and less on financial returns, there might be different investors needed or also a shift in the priorities of the investors. Also, a more collaborative approach around the globe means that it will become crucial to develop international networks for exchange of knowledge, resources, and talents. Thus, these two factors might be added to a list of success factors in the future.

6. Conclusion

This paper examines incubators that focus on start-ups in the deep tech space. It shows that the success factors are very similar to those of traditional incubators. They can be summarized as a rigorous selection process, strong ties to a research institution or company, a functioning local ecosystem including investors, a customized approach to incubation, and a working strategy regarding intellectual property. The operational set-up of the incubator, including its methodology and team, is also crucial. In the future, it is expected that incubators increasingly focus on societal impact and international collaboration.

This research has certain limitations. It only looked at 12 incubators, which can lead to certain biases. Also, interviews with managers of traditional incubators can be added to allow a direct comparison and not just a comparison with existing literature. Further studies can investigate the details of the success factors and develop best practices for them. For example, how does a good selection procedure of start-ups look like and how can the relationships with research institutions be implemented in the best way.

LindoM@flawlessideas.co.za

Abstract: This systematic literature review examines the intricate interplay between generational differences, the Fourth Industrial Revolution (4IR), and the unanticipated effects of the COVID-19 pandemic on the contemporary world of work. In response to the pandemic, organizations worldwide rapidly reevaluated their work processes, embracing digital technologies and remote work. This unforeseen shift underscored the world's capacity for rapid adaptation to unforeseen challenges. However, the 4IR extends beyond technological advancements, involving non-technological aspects such as evolving business models, workforce well-being, job security, and the changing nature of work. Understanding these dimensions is vital in shaping the modern workforce. Generational differences add another layer of complexity. Each generation, from Baby Boomers to Millennials, brings distinct worldviews and work values. This review explores how different generations perceive and adapt to the evolving nature of work, especially in the context of the 4IR. In addition, the 4IR highlights the critical role of knowledge in driving innovation and competitiveness. Knowledge-sharing practices within organizations have become pivotal in staying ahead in this era of rapid technological change. By addressing both technological and non-technological dimensions of the 4IR and considering generational perspectives, this review offers a comprehensive understanding of how these forces intersect and influence the modern workplace. It provides insights and recommendations to guide organizations, policymakers, and individuals in navigating the complexities of the modern world of work, harnessing 4IR opportunities, and addressing its multifaceted challenges.

Keywords: Generational difference, Fourth Industrial Revolution, COVID-19 Impact, Workplace adaptation, Business models, Knowledge sharing, Digital technology, Workforce preparedness

1. Introduction

The contemporary work landscape is experiencing transformative shifts due to the Fourth Industrial Revolution (4IR) and the global disruption caused by the COVID-19 pandemic. These forces are fundamentally changing organisational processes, workforce dynamics, and the overall approach to business and employment (Schwab, 2017). This paper addresses the critical need to understand these changes, particularly the intersection of generational differences with the technological and non-technological aspects of the 4IR.

The rapid shift to digital technologies and remote work during the pandemic has accelerated the adoption of 4IR technologies, reshaping business models, workforce well-being, and job security (Tang & Wang, 2018). However, the 4IR encompasses more than just technological advancements. It involves significant non-technological dimensions such as evolving business models and changing work nature, necessitating a comprehensive exploration beyond the technological scope (Al-Ayash et al., 2020).

Furthermore, generational differences add another layer of complexity. Each generation, from Baby Boomers to Millennials, brings distinct worldviews and work values. Understanding how these generational dynamics intersect with the 4IR is essential for effective organizational management, leadership, and collaboration. This study aims to fill the research gap by examining these generational perspectives and providing insights into how different age cohorts adapt to and navigate the evolving work environment brought about by the 4IR and the pandemic.

By exploring these dimensions, the paper offers valuable recommendations for organizations, policymakers, and individuals better to manage the multifaceted challenges of the modern workplace and leverage the opportunities presented by the 4IR.

2. Rationale

The rationale for this systematic literature review stems from the need to examine the complex interplay between generational differences, the Fourth Industrial Revolution (4IR), and the unexpected impact of the COVID-19 pandemic on modern work environments. The rapid adoption of digital technology and remote work during the pandemic has reshaped workplace norms, highlighting the urgency of understanding organizational

adaptations and their readiness for the technological upheavals of the 4IR. These shifts have prompted a reassessment of not just technology but also non-technological aspects like business models, workforce well-being, and job security (Schwab, 2017; Tang & Wang, 2018; Martin & Hughes, 2020; Kumar et al., 2021).

Moreover, generational differences have become more pronounced within the workforce, affecting perspectives, attitudes, and behaviors across age groups from Baby Boomers to Millennials (Lyons & Schweitzer, 2017). This generational dynamic intersects significantly with the technological and cultural shifts driven by the 4IR, necessitating a deeper understanding of how these factors converge to influence leadership, management, and collaboration within organizations.

The research problem centers on the knowledge gaps regarding how the COVID-19 pandemic has catalyzed significant changes in economic activities and work processes, reflecting the global adaptability to sudden and severe disruptions (Al-Ayash et al., 2020; Hlatshwayo, 2020; Ebekozien et al., 2022). Additionally, while the 4IR is often viewed through the lens of technological innovation, its broader implications encompassing non-technological dimensions such as the transformation of business models, job security, and the overall nature of work require comprehensive exploration (Aggestam et al., 2017; Schwab, 2017).

This study aims to bridge these gaps by exploring the impacts of the 4IR on business models and investigating how generational differences affect workplace dynamics within this context. It also examines knowledge-sharing practices essential for maintaining competitiveness in a rapidly evolving technological landscape (Hidalgo et al., 2017; DeFelice & Harris, 1998). Ultimately, this research seeks to provide a nuanced understanding of the forces shaping modern workplaces, offering insights and actionable strategies for navigating the complexities of the 4IR, thereby aiding organizations, policymakers, and individuals in effectively responding to these ongoing changes.

3. Research Questions

- How has the COVID-19 pandemic influenced the adoption of digital technology and reevaluation of work processes across various countries, including South Africa, to maintain productivity during lockdowns?
- What non-technological concerns, such as changes in business models, workplace well-being, job security, and the evolving nature of work, arise in the context of the Fourth Industrial Revolution (4IR) alongside technological advancements?
- How does the 4IR impact existing business models, and what adaptations are necessary for organizations to thrive in this era of technological transformation?
- What knowledge-sharing practices are essential in the 4IR era, given the rapid pace of technological innovation, to ensure that organizations and individuals remain competitive and adaptable in this evolving landscape?

4. Methodology

This systematic literature review (SLR) explores how generational differences influence the transition to the Fourth Industrial Revolution (4IR) and examines the potential impact of COVID-19 on readiness for the 4IR. Following a systematic approach as outlined by Massaro et al. (2015), the research commenced by formulating specific questions centered on generational differences, COVID-19, the 4IR, and knowledge transfer. A detailed research protocol was then established, delineating the methodology, article selection criteria, and information extraction procedures.

The article selection phase involved conducting an extensive search through databases such as Scopus, Emerald, and Web of Science, covering publications from 2000 to 2023 and focusing on socio-economic impacts of COVID-19 rather than health aspects, as recommended by Torraco (2005). Initial searches using a combination of key terms with "AND" yielded no results, prompting a refined strategy using "OR" among keywords to enhance relevance and retrieval efficiency.

Screening of articles included reviewing abstracts, introductions, and conclusions to determine their relevance, resulting in 58 of the initial 183 articles being selected for further analysis. A detailed content analysis followed, where a codebook was used to categorize and synthesize information, leading to the identification of patterns and the development of a comprehensive code framework.

This systematic methodology facilitated the creation of a coherent storyline that synthesized findings and insights, thus enriching the discussion on how generational nuances and the unforeseen challenges of COVID-

19 are shaping readiness for the 4IR. The SLR thereby provides valuable perspectives on the dynamics at play in the modern workforce's adaptation to technological and generational shifts.

5. Generational Dynamics in the 4IR era

As the Fourth Industrial Revolution (4IR) unfolds, marked by significant technological shifts like digitization, robotics, and biometric technologies, it intersects profoundly with generational dynamics, reshaping economic and work landscapes (Schwab, 2017; Hermann et al., 2016; Bienhaus & Haddud, 2018). This era introduces not only advancements but also challenges that necessitate a reevaluation of business models and work processes, influenced heavily by the digital revolution and e-commerce (Mourtzis et al., 2016; Shamim et al., 2016).

These technological and economic shifts are paralleled by a transition in generational workforce dynamics. Baby Boomers, known for their loyalty and traditional work values, are gradually making way for Millennials and Gen Z, who bring a different set of values and technological fluency to the workplace (Lyons & Schweitzer, 2017; Watts, 2010). This younger generation is better aligned with the 4IR's demands due to their comfort with digital technologies and remote work, presenting both opportunities and challenges for workplace integration (Kaifi et al., 2012).

Significant generational differences are evident as each cohort brings unique traits and expectations to their roles, impacting workplace behaviors and productivity criteria (Lu & Gursoy, 2016; Smola & Sutton, 2002). The rapid pace of technological change necessitates that employees adapt, requiring changes in skill sets across all generational divides (Schwab, 2017; Wilkesmann & Wilkesmann, 2018).

This evolving scenario underscores the importance of aligning competencies with the technological imperatives of the 4IR—physical, digital, and biometric. Organizations must navigate these generational shifts and technological advancements effectively to harness the full potential of their diverse workforce, optimizing workplace benefits and addressing the unique challenges presented by emerging technologies (Botha, 2018). As such, the interplay between generational dynamics and technological evolution is critical for organizational adaptation and success in the modern economic landscape.e.

6. Baby Boomers Exist in the Workplace

Baby Boomers, entering the workforce during the heyday of mass production, were instrumental in driving efficient manufacturing processes. Their dedication was evident in punctuality, as they were the main contributors to mass production, with time clocks at workstation entrances (Lu & Gursoy, 2016). Success for this generation was synonymous with long hours and unwavering effort, fostering a deep loyalty to employers and the workplace (Macky et al., 2008). Much of their work took place on assembly lines, where speed and adherence to strict specifications were paramount, leaving little room for creativity.

Born around the time of World War II, Baby Boomers witnessed social unrest and the behavior of leaders, motivating them to prioritize family life and economic prosperity (Smola & Sutton, 2002). They facilitated the shift from a focus on military activities to an emphasis on economic endeavors, playing a crucial role in shaping economic prosperity. To adapt to the era's industrial advancements, they established business models compatible with the introduction of steam engines and electrical innovations (Drath & Horch, 2014).

While many Baby Boomers have reached retirement age, they continue to wield significant influence in numerous multinational and local organizations. These organizations often reflect their work values, rooted in loyalty, long hours, punctuality, respect for hierarchies, and adherence to prescribed routines. As younger generations, characterized by different work values, increasingly populate the workplace, generational conflicts may arise. Baby Boomers' values could face additional challenges during the Fourth Industrial Revolution as they approach retirement.

7. Building Bridges with Generation X

Generation X represents the first cohort to encounter and appreciate the significance of application technology capabilities in the workplace aimed at enhancing efficiency (Rani & Samuel, 2016). Similar to Baby Boomers, Generation X places considerable emphasis on the production process, but they also recognize the value of injecting creativity into production through thoughtful planning. The integration of technology during their time primarily targeted the automation of existing business processes, with limited innovation directed towards altering business models. Their work values bear similarities to those of Baby Boomers, but with a slightly greater emphasis on achieving a work-life balance (K. K. Kim, 2016). They acknowledged the importance of social aspects and introduced business models that incorporated this dimension into their

respective industries. Generation X actively introduced social activities within the workplace, even if some perceived them as a potential misuse of organizational resources (Stewart et al., 2017). Some organizations went as far as establishing on-site daycare centers, which didn't necessarily change the culture of long working hours but offered a sense of comfort, knowing that families were within reach in case of emergencies.

In contrast to Baby Boomers, Generation X demonstrates a greater adaptability to changing norms and routines if it leads to working more efficiently and achieving established business objectives (Rani & Samuel, 2016). The era marked by the entry of Generation X into the labor market witnessed significant growth in the automation of office-based business functions. In some sectors, hard labor remained predominant, particularly in areas like mining, manufacturing, and vehicle assembly (Drath & Horch, 2014). Nevertheless, technological advancements varied across sectors, often influenced by the vision of individual organizations. This divergence gave rise to new careers, such as plant operators responsible for operating large machinery, a role that used to require multiple workers but was eventually streamlined to a single operator, leading to workforce reductions.

Globalization posed both challenges and opportunities, particularly in sectors like textiles, where designs could originate in one country and production and shipping take place in another. This era underscored the importance of cost-effectiveness, achieved through automated processes, cost-effective labor, and mass production. Generation X thrived in this business environment, partly due to their work values, which emphasized loyalty and commitment to their employers (Rani & Samuel, 2016). As Generation X transitioned with their unique social inclinations, personal traits, and work values, they paved the way for Generation Y, which brought a different perspective to the workplace, diverging from the values held dear by their predecessors.

8. Navigating the Workplace with Generation Y (Millennials)

Millennials, or Generation Y, have been shaping the workplace since their emergence in the late 20th century (Kaifi et al., 2012; Kosterlitz & Lewis, 2017). As they now occupy everything from entry-level positions to middle management, their influence is pivotal as we navigate the Fourth Industrial Revolution (4IR) (Teng et al., 2019). This generation contrasts sharply with Baby Boomers, displaying a distinct approach to work-life balance, loyalty, and hierarchical respect, and is characterized by a strong preference for a balanced approach to work and life and a pronounced need for individual recognition and appreciation (Hauw & Vos, 2010; Kosterlitz & Lewis, 2017; Sungdoo Kim, 2018).

Raised during the ascent of the Information Age, Millennials were early adopters of technology in education, seeing devices like smartphones and laptops as basic necessities (Liu et al., 2019; Van Tulder et al., 2018). Their comfort with technology extends to the workplace, where they view digital tools as enablers rather than obstacles (Jones & Lee, 2020). This tech-savviness is further demonstrated in their approach to social media and online platforms, which are often preferred over traditional face-to-face interactions (Chua, 2016; Usluel & Mazman, 2009). Millennials have also leveraged these platforms to forge new career paths that capitalize on digital popularity and entrepreneurial spirit without substantial capital investment (Smith et al., 2020).

The 4IR has introduced new work paradigms that resonate well with Millennials, who favor flexible and remote work arrangements over the traditional office-bound models associated with previous generations (Berkery et al., 2020; Jung, 2019). They tend to see job security not in terms of long-term employment with a single company but in adaptable, skills-based employment, often preferring freelance or project-based roles (Lu & Gursoy, 2016; Araujo & Minetti, 2011).

As we move deeper into the 4IR, the potential for technological unemployment grows, with many predicting that AI and robotics will phase out routine jobs. However, Millennials' adaptability and tech proficiency may afford them a competitive edge in an evolving job market that values digital literacy and flexible work arrangements (Botha, 2018; Schwab, 2017; Smith et al., 2020). Their capability to navigate these changes is crucial as businesses and economies strive to harness the full potential of the 4IR, emphasizing the need for continuous learning and adaptability in the modern workforce.

9. Generational Differences in the Face of the Fourth Industrial Revolution and Evolving Work Nature

Adapting to changing environments is crucial for organizational survival. The COVID-19 pandemic accelerated the need for businesses to swiftly adopt new working methods and technology tools to maintain productivity, often without adequate training (Rosenbloom & Markard, 2020). This demand for rapid adaptation is

becoming the new global norm, requiring consideration in future business continuity plans (Singh et al., 2020; Bhuiyan et al., 2023).

Generational differences are another key factor, particularly with the emergence of the Fourth Industrial Revolution (4IR). Older generations may perceive the 4IR as a threat to their job security due to their lower technological proficiency compared to Millennials (Myers & Sadaghiani, 2010). The 4IR's three key drivers demand technological competencies for individuals and companies to thrive, making technology unemployment a significant risk, especially for older generations (Schwab, 2017).

Technology unemployment results from technology replacing labor-intensive jobs, including robotics, automation, artificial intelligence, and biometric systems. Millennials may adapt more readily to complementing technology-driven business processes compared to preceding generations (Sung-jin Kim et al., 2012; Sungdoo Kim, 2018; Wilkesmann & Wilkesmann, 2018). Exceptions exist within each generation, with individuals displaying characteristics associated with other generations, as seen in successful technology-based companies led by Baby Boomers and Millennials (Price Waterhouse Coopers, 2014).

The nature of work is undergoing a profound transformation, characterized by agile business models demanding greater employee adaptability and competence (Agostini & Filippini, 2019; Botha, 2018; Schwab, 2017; Wilkesmann & Wilkesmann, 2018). While technology like robotics is expected to handle routine tasks, creative professions will remain resilient until Artificial Intelligence advances enough to perform creative and intuitive tasks (Agostini & Filippini, 2019). Artificial Intelligence and neural science are already demonstrating capabilities in executing creative tasks based on mathematical algorithms.

10. Transferring Knowledge Across Generations for Future job Success

The impending Fourth Industrial Revolution (4IR) underscores the critical importance of technological competencies for survival and success. However, beyond technological prowess, preserving institutional memory and ensuring business continuity are equally vital for sustained success (Kotlarsky & Oshri, 2005; S. Ryan & O'Connor, 2012; Sharon Ryan et al., 2013). Older generations possess invaluable institutional memory and tacit knowledge, which are indispensable for ensuring business continuity and achieving success (Hau et al., 2013; Nezakati et al., 2015). While Millennials exhibit a natural aptitude for technology, it is essential for gaining and maintaining a competitive edge in the 4IR era (Hau et al., 2013; Kosterlitz & Lewis, 2017). Business triumph in this era is likely to hinge on the organization's ability to facilitate knowledge transfer both within and between different generations. This approach leverages the wealth of tacit knowledge from older generations and the technological competence inherent in Millennials.

Organizations would be wise to comprehensively understand the distinct traits of each generation to harness these traits effectively and restructure their business models to capitalize on them profitably (Kaifi et al., 2012; Rani & Samuel, 2016). Failing to capture and comprehend the characteristics of each generation and subsequently failing to facilitate innovative knowledge transfer represents a missed opportunity for business leaders (Stewart et al., 2017). Among the intriguing attributes of the youngest generation is their non-linear and less structured outlook. They prefer agile methods of operation, resisting confinement to specific spaces and times, and are motivated by clear instructions and deadlines (Claus, 2019). Millennial team members may often question instructions that appear unclear, not out of defiance, but as a form of inquiry seeking clarity, which might be misconstrued as challenging authority.

11. Contribution and Conclusion of the Review

This review significantly enhances our understanding of the contemporary work landscape, the Fourth Industrial Revolution (4IR), and the impact of the COVID-19 pandemic. It highlights several critical areas:

Reassessing Work Processes Amidst COVID-19: This study underscores the transformative influence of the COVID-19 pandemic, showcasing how societies adapted to unforeseen challenges. It provides insights into how organizations rapidly integrated digital technology to maintain productivity, emphasizing the pandemic's impact on global economic activities.

Non-Technological Dimensions of the 4IR: While much focus on the 4IR revolves around technological advancements, this review emphasises the importance of non-technological aspects. These include shifts in business models, employee well-being, job security, and the evolving nature of work. It broadens the understanding of the 4IR by incorporating these critical dimensions.

Insights for Business Model Adaptations: The review explores the impact of the 4IR on business models, offering practical insights for organizations aiming to redefine their strategies and structures in response to technological transformation. This guidance is invaluable for businesses navigating the complexities of the 4IR.

Generational Dynamics Unveiled: By examining how generational disparities influence approaches to the challenges and opportunities of the 4IR, this study provides a deeper understanding of generational dynamics in the workplace. It illuminates the multifaceted interplay of generational perspectives, aiding in effective organisational management.

Navigating the Knowledge Sharing Landscape: Addressing the importance of knowledge sharing in the 4IR era, the review highlights the need for rapid knowledge and skills acquisition in a swiftly evolving technological landscape. It equips organizations and individuals with essential insights for thriving in an environment where knowledge is a vital currency.

Future Research Directions: The review calls for further exploration into how emerging technologies beyond 2022 are shaping work processes and organizational structures. Additionally, investigating the long-term effects of the COVID-19 pandemic on work dynamics and further examining the role of generational differences in adapting to ongoing technological advancements would provide deeper insights.

In conclusion, this review underscores the intricate relationship between generational differences, the 4IR, and the COVID-19 pandemic's impact on the world of work. It calls for comprehensive, adaptive strategies to address these dynamics' multifaceted challenges and opportunities. Doing so provides valuable guidance for individuals and organizations to harness the full potential of the 4IR while addressing non-technological aspects of this transformative era.

[2]Nelson Mandela University, Gqeberha, South Africa

nangamso.mmango@yahoo.com
tapgun@gmail.com

Abstract: As Small and Medium-sized Enterprises (SMEs) increasingly integrate digital technologies into their operations, they face escalating cybersecurity threats that challenge their limited financial and human resources. Historically, cybersecurity was not a primary concern for many SMEs due to their minimal reliance on cyberinfrastructure. However, the growing dependency on digital systems has exposed them to significant risks, necessitating robust cybersecurity measures. This research introduces a cybersecurity resilience framework specifically designed to enhance the cybersecurity posture of SMEs through collaborative efforts. Drawing upon principles of collective intelligence, shared resources, and shared responsibility, the proposed framework promotes a holistic approach that merges advanced technological solutions with collaborative practices among SMEs, industry stakeholders, and governmental entities. By enabling SMEs to pool their cybersecurity resources and capabilities, the framework aims to provide a comprehensive defence against cyber threats that could not be achieved by individual entities alone. The research delves into key collaborative literature to ground the framework in proven strategies and existing successful models of collaboration. It highlights how collective action can be a powerful tool in overcoming the inherent vulnerabilities of SMEs to cyber threats. To validate the effectiveness and applicability of the framework, it went through an expert review process involving cybersecurity professionals and stakeholders in the SME sector. This study not only underscores the necessity for SMEs to adapt to the evolving cybersecurity landscape but also provides a practical blueprint for collective defence. The framework's emphasis on shared responsibility and mutual aid presents a shift from traditional, isolated cybersecurity approaches to a more integrated and cooperative strategy. This has the potential to significantly enhance the resilience of SMEs against cyber threats, safeguarding their operations and contributing to the overall stability of the digital economy. Future research directions include the application of the framework across various industries and global contexts to evaluate its versatility and impact under different regulatory and threat environments.

Keywords: SMEs, Small and medium-sized enterprises, Cybersecurity resilience, Collective intelligence, Collaboration, Information sharing

1. Introduction

In today's interconnected world, the proliferation of digital technologies has significantly transformed the business landscape, offering unprecedented opportunities for innovation, scalability, and market reach (Shahadat *et al.*, 2023). However, this digital integration also comes with heightened vulnerabilities, particularly for Small and Medium-sized Enterprises (SMEs) (Gundu and Mmango, 2024). As these enterprises increasingly depend on digital infrastructures for their operations, they become prime targets for cyber threats that are both sophisticated and relentless. Unlike larger corporations, SMEs often lack the necessary resources (financial, technical, and human) to effectively combat these cyber threats. This disparity not only places them at greater risk of cyber incidents but also potentially jeopardises their financial stability, customer trust, and long-term viability.

Traditional cybersecurity approaches, which primarily focus on individual organisations fortifying their defences, are proving insufficient under the current threat landscape. The dynamic nature of cyber threats requires more than just isolated efforts; it demands a collaborative approach to cybersecurity (Safitra, Lubis and Fakhrurroja, 2023). Recognising this need, this paper proposes a Collaborative Cybersecurity Resilience Framework specifically tailored for SMEs. This framework is designed to leverage the collective intelligence, resources, and capacities of various SMEs, industry partners, and governmental entities.

Drawing from the principles of collective intelligence and shared responsibility, the proposed framework advocates for a holistic approach that integrates technological solutions with collaborative practices. This approach not only aims to enhance the individual cybersecurity postures of SMEs but also seeks to fortify the broader business ecosystem against potential cyber threats. By fostering a culture of information sharing, collaborative threat intelligence, and joint response mechanisms, the framework empowers SMEs to collectively defend against and respond to cyber incidents.

This introduction sets the stage for a detailed exploration of the proposed framework, including its conceptual underpinnings, operational mechanisms, and potential benefits. It also outlines the structure of the paper, which will delve into relevant literature, describe the framework's components, and discuss the findings from an expert review. The ultimate goal of this research is to offer SMEs a viable solution to enhance their cybersecurity resilience and ensure their sustainable growth in the digital age.

2. Related Literature

2.1 Small and Medium-sized Enterprises (SMEs)

SMEs play a pivotal role in driving economic growth, job creation, and social development (Gherghina et al., 2020). With a diverse and vibrant entrepreneurial landscape, SMEs contribute significantly to the country's Gross Domestic Product (GDP) and provide employment opportunities, particularly in sectors such as manufacturing, agriculture, retail, and services. However, SMEs in South Africa face a unique set of challenges that can hinder their growth and sustainability. These challenges include limited access to finance, inadequate infrastructure, regulatory burdens, skills shortages, and market access constraints. Additionally, factors such as political instability, economic uncertainty, and social inequality can further exacerbate the challenges faced by SMEs.

Despite these obstacles, SMEs in South Africa demonstrate resilience, innovation, and entrepreneurial spirit. Many SMEs leverage technology and digital platforms to overcome traditional barriers and access new markets. Moreover, the COVID-19 pandemic has heightened both the vulnerabilities and resilience of SMEs in South Africa. Many SMEs have faced unprecedented challenges due to lockdown measures, supply chain disruptions, and reduced consumer demand. However, the crisis has also spurred innovation and digital adoption among SMEs, accelerating trends towards e-commerce, remote work, and digital transformation.

2.2 Challenges Faced by SMEs in South Africa

Government initiatives like the Small Enterprise Development Agency (SEDA) and the Department of Small Business Development (DSBD) provide crucial support to SMEs in South Africa (Meyburgh, 2022), though many still struggle due to limited access and extensive need. Key challenges include restricted access to finance, exacerbated by high-interest rates and stringent lending criteria (Nanziri and Wamalwa, 2021), and significant infrastructural constraints such as unreliable power and poor internet connectivity that hinder operational efficiency and growth. Additionally, SMEs face a critical shortage of skilled labour, particularly in technology and innovation-driven sectors (Shaikh et al., 2021), compounded by the brain drain phenomenon (Ahlbäck, 2015). Market access is another significant barrier, with SMEs contending with limited marketing budgets, regulatory hurdles, and intense competition from larger corporations (Scheers, 2011). The socio-political environment further complicates the landscape, requiring SMEs to be adaptable and resilient amid political and economic instability (Griffiths, Gundry and Kickul, 2013; Hamiza, Takwi and Rashid, 2020). Cybersecurity also poses a growing challenge as SMEs become more reliant on digital technologies. Many lack adequate cybersecurity measures, making them vulnerable to attacks like phishing and ransomware. Addressing these challenges requires a collective effort from financial institutions, government, and educational bodies to develop tailored solutions and robust cybersecurity frameworks that protect SMEs and ensure their sustainable growth.

2.2.1 Cybersecurity threats

Small and Medium-sized Enterprises (SMEs) in South Africa face a variety of cybersecurity risks, and this study although it has discussed several other challenges faced by SMEs, its main focus is on the cybersecurity threat challenge. One of the most common threats is phishing attacks, where SMEs are targeted with fraudulent emails designed to steal sensitive information (Naqvi et al., 2023). These businesses are also particularly vulnerable to ransomware, a type of malware that locks access to the victim’s data, often forcing them to pay a ransom to regain access (Yuryna Connolly et al., 2020). Data breaches pose another significant risk, especially as SMEs may store critical customer and financial information but typically lack the sophisticated security measures larger corporations might have (Pantelis et al., 2021). Insider threats are also a concern, arising either from negligence or malicious intent, with employees potentially exposing the company to cyber threats by mishandling data or falling for phishing scams (Gundu, Maronga and Boucher, 2019). Additionally, while advanced persistent threats (APTs) are more commonly associated with larger entities, SMEs involved in critical supply chains might also find themselves targets of these prolonged, stealthy cyberattacks. Lastly, the use of outdated and unpatched software can leave SMEs susceptible to a variety of cyber threats, further

exacerbating their vulnerability in a landscape where cyber threats are becoming increasingly sophisticated. Traditional, cybersecurity strategies typically focus on implementing individual defence mechanisms, such as firewalls, antivirus software, and employee training programs. However, these measures often prove inadequate in addressing the dynamic and sophisticated nature of modern cyber threats (Mitrofan, Cruceru and Barbu, 2020). Moreover, SMEs may lack the financial resources and technical expertise required to deploy and maintain robust cybersecurity solutions effectively (Gundu and Mmango, 2024). In light of these challenges, there is a pressing need for a collaborative approach to cybersecurity that leverages collective intelligence and shared responsibility within the SME ecosystem. By pooling resources, knowledge, and expertise, SMEs can enhance their cybersecurity resilience and better defend against cyber threats.

3. Research Methodology

The research aims to establish a robust foundation by integrating the Qualitative Research Approach (QRA) and Design Science Research Methodology (DSRM). Qualitative research was the most suitable for this study as it seeks to uncover underlying meanings and perspectives of collaboration, and cybersecurity issues related to start-up entrepreneurs through literature review. This then highlighted the aspects that will make up the proposed framework for cybersecurity management of start-up entrepreneurs and their collaboration for cybersecurity resilience. Through the thematic analysis technic, this qualitative approach seeks to provide rich descriptions and interpretations of social phenomena, aiding in deriving meaningful conclusions. Design Science Research Methodology (DSRM) offers a systematic framework within Information Systems (IS) research for developing innovative solutions to real-world problems (Dresch, Lacerda and Antunes, 2015). Because DSRM priorities the creation of practical artefacts and solutions, that is the reason it was chosen for this study.

3.1 Design Science Research Methodology

The DSRM process involves problem identification, objective definition, design and development of the artifact, demonstration of its functionality, and rigorous evaluation to assess its performance and impact as dipticted in Figure 1. By communicating the research findings to relevant stakeholders, DSRM ensures the dissemination of outcomes to inform future research and practice. Through the application of DSRM, the research endeavoured to create practical framework aimed at addressing the challenges faced by Small and Medium-sized Enterprises (SMEs) in cybersecurity resilience.

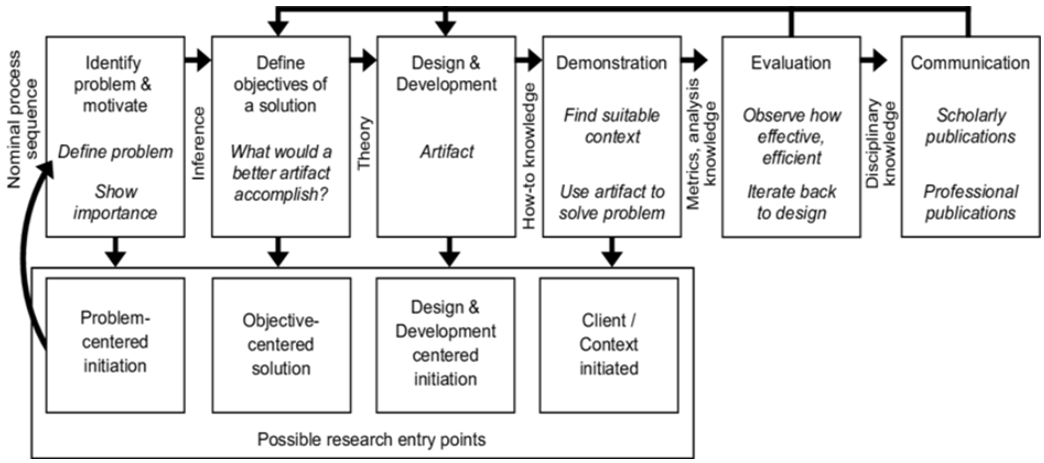

Figure 1: DSRM Process (Dresch, Lacerda and Antunes, 2015)

3.1.1 Problem identification

The identified problem is cyber threats that represent a formidable obstacle to the success of SMEs, presenting a diverse range of risks from cyberattacks to data breaches. Cyberattacks can disrupt essential business processes, leading to costly downtime and productivity losses. Additionally, financial implications such as theft of funds or ransom payments can strain SME budgets and jeopardise financial stability and reputation.

3.1.2 Objectives definition

In addressing the significant threat posed by cyberattacks and data breaches to SMEs, the objectives of this study are to identify and assess potential threats and design a framework, aimed at enhancing cybersecurity resilience among SMEs through a collaborative approach. The framework leverages shared intelligence and resources, improving SMEs' ability to withstand cyberattacks through collective risk assessments, shared threat intelligence, and coordinated incident responses. The last objective involves expert review to refine the framework for practical application.

3.1.3 Design and development

Building on the findings of the literature review, the design and development phase centred on crafting a comprehensive framework aimed at assisting SMEs in enhancing their cybersecurity posture through collaboration. The framework was tailored to give guidance on how they can collaborate to address the specific needs and challenges faced by SMEs, combating their drawbacks in terms of factors such as limited resources, technical expertise, and evolving threat landscapes.

3.1.4 Demonstration

After the development of the first version of the framework, the next critical step was to demonstrate its functionality and effectiveness in addressing the identified problem. This demonstration was provided to the experts who were evaluating the framework.

3.1.5 Evaluation

Experts in cybersecurity and entrepreneurship undertook a rigorous evaluation of the framework, a crucial step in the research or development process. This evaluation aimed to assess the framework's usability and anticipated impact. This thorough evaluation process ensures that the framework effectively enhances cybersecurity measures, mitigating risks and safeguarding against cyber threats while promoting changes in business behaviour towards prioritising cybersecurity.

3.1.6 Communication

This study employs various channels of communication to disseminate research findings, including academic conferences, journal publications, social media platforms, SMEs imbizo (conventions), business summits, business blogs, and other relevant platforms. The aim is to ensure that the insights gained from the study, including the developed framework, reach a diverse range of stakeholders. The study utilises social media platforms to reach a wider audience, including SMEs, policymakers, and practitioners, facilitating broader discussions and knowledge dissemination.

4. Introducing the Proposed Framework

The section outlines the proposed framework aimed at strengthening the cybersecurity defences of SMEs through a collaborative approach. It details the essential components of the framework, including its foundation based on literature.

4.1 Foundation in the Literature

The constructs of the "Collaborative Cybersecurity Resilience Framework for SMEs" framework are deeply rooted in established literature on collaboration as summarised in Table 1. This section outlines how each component of the framework aligns with recognised practices, principles, and research findings from the literature on collaboration. By grounding our approach in a strong theoretical basis, we ensure that the strategies implemented are not only practical but also supported by academic and professional studies.

Table 1: Summary of Literature review

Theme	Short Description	Articles
Define the Need and Scope	**Identify Risks:** Assess the common cybersecurity risks facing start-ups in your network or region. **Determine Scope:** Decide whether the collaboration will focus on specific sectors, technologies, or geographical areas.	(Nguyen *et al.*, 2020; Pedersen *et al.*, 2021; Busch *et al.*, 2024)
Build a Core	**Assemble a Leadership Group**: Gather a small team of committed individuals	(Sun *et al.*, 2020; Tang, Vezzani and

Theme	Short Description	Articles
Team	from different start-ups who are passionate about cybersecurity. **Define Roles**: Assign roles such as project leader, financial advisor, technical expert, and communications officer.	Eriksson, 2020; Devi *et al.*, 2023)
Conduct Preliminary Research	**Understand Best Practices:** Research existing cybersecurity frameworks and best practices. Consider frameworks like NIST or ISO/IEC standards as references. **Survey Potential Participants**: Engage with other start-ups to understand their specific needs and the challenges they face in cybersecurity.	(Andrews-Todd and Forsyth, 2020; Ramezani and Camarinha-Matos, 2020)
Prepare a Clear Value Proposition	**Highlight Benefits:** Emphasize the mutual benefits such as shared knowledge, reduced costs through pooled resources, and enhanced collective security. **Address Specific Needs:** Tailor your message to show how the collaboration addresses specific cybersecurity challenges faced by each startup.	(Afifi, Kalra and Ghazal, 2020; Penuel *et al.*, 2020; Xu, Wang and Wang, 2023)
Use Existing Networks	**Leverage Contacts**: Start with your existing business contacts, industry groups, and professional networks to find interested parties. **Attend Industry Events**: Participate in startup conferences, cybersecurity seminars, and business networking events to meet potential collaborators.	(Ramezani and Camarinha-Matos, 2020; Sun *et al.*, 2020)
Organise an Introductory Meeting or Event	**Host a Webinar or Workshop**: Provide a platform where startups can learn about cybersecurity threats and the importance of collaborative defence strategies. **Facilitate Discussions**: Allow for open discussion so that participants can voice their concerns and interests.	(Soller, Wiebe and Lesgold, 1994; Steiber and Alänge, 2020; Busch *et al.*, 2024)
Follow Up Persistently	**Regular Updates:** Keep potential collaborators informed with updates on progress, developments, and upcoming meetings. **Personal Engagement**: Engage personally with key decision-makers to understand their reservations and work through any objections.	(Hwang and Cha, 2018; Afifi, Kalra and Ghazal, 2020; Nguyen *et al.*, 2020)
Facilitate Easy Onboarding	**Simplify Joining Process**: Make the process of joining the collaboration as simple and straightforward as possible. **Provide Support**: Offer support for new members to integrate into the network smoothly, including technical assistance and access to shared resources.	(Penuel *et al.*, 2020; Sutrisno *et al.*, 2023; Xu, Wang and Wang, 2023)
Develop Shared Tools and Resources	**Identify Resources**: Determine what resources are needed, such as funding, technical tools, and human capital. **Resource Sharing Agreements**: Develop agreements on how resources will be shared and managed.	(Steiber and Alänge, 2020; Tang, Vezzani and Eriksson, 2020; Devi *et al.*, 2023; Sutrisno *et al.*, 2023)
Showcase Immediate and Long-Term Benefits	**Immediate Gains:** Demonstrate quick wins that can be achieved through collaboration, such as immediate access to shared cybersecurity tools or collective bargaining power. **Long-Term Strategy**: Outline the long-term strategic advantages, like ongoing improvement in cybersecurity posture and resilience against future threats.	(Hwang and Cha, 2018; Andrews-Todd and Forsyth, 2020; Al-Omoush, de Lucas and del Val, 2023)
Outreach and Expansion	**Share Successes:** Publicize successful outcomes to attract more participants and support. **Expand Network:** Consider expanding the collaboration as more startups and resources become available.	(Soller, Wiebe and Lesgold, 1994; Pedersen *et al.*, 2021; How and Cheah, 2023)

4.2 Collaborative Cybersecurity Resilience Framework for SMEs

The framework includes actionable strategies and steps for creating a cohesive and proactive collaboration among participating SMEs as illustrated in Figure 2. Each component of the framework is clearly defined and designed for easy adoption and efficient coordination among the interested SMEs.

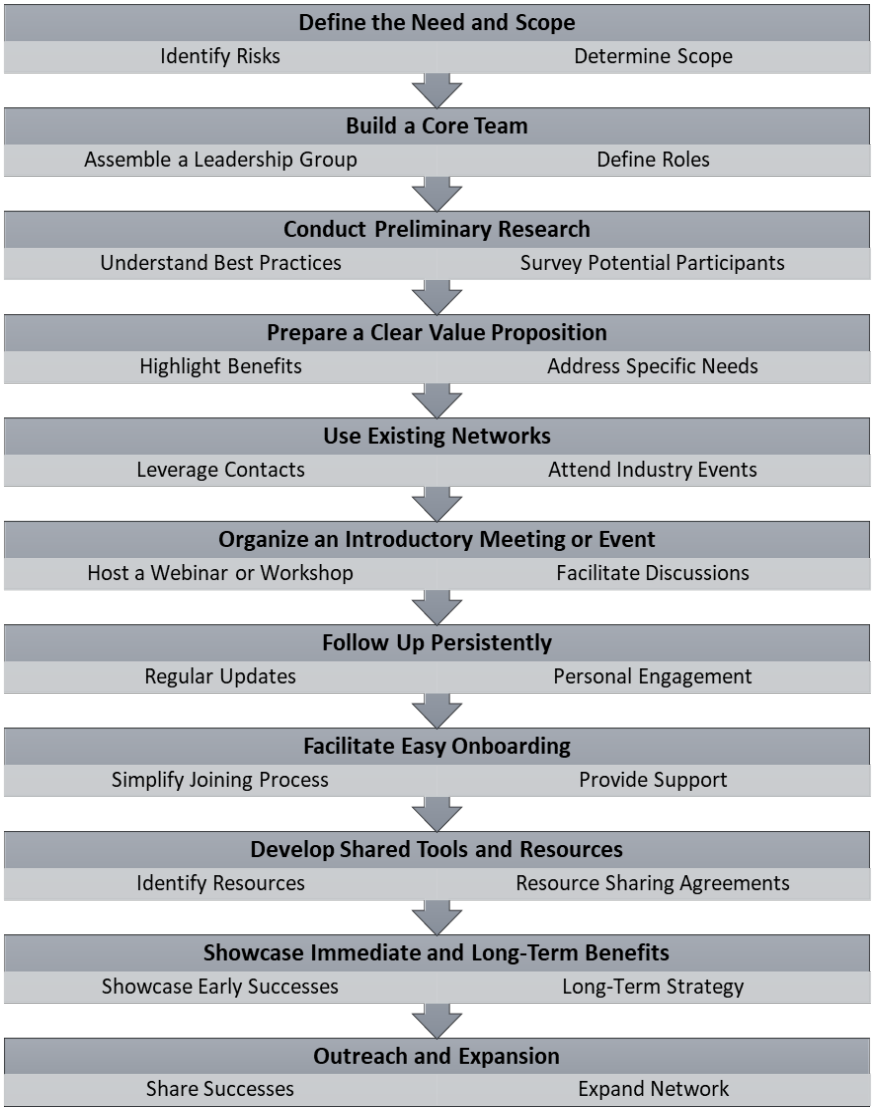

Figure 2: Collaborative Cybersecurity Resilience Framework for SMEs

Implementing the framework provides several significant benefits to SMEs. Through collaborative risk assessments, SMEs gain a comprehensive understanding of potential cybersecurity threats and vulnerabilities. This collective intelligence allows for better-informed decision-making and prioritisation of security efforts, focusing resources on the most critical areas. The shared understanding of risks leads to a more robust defence against cyber threats. The framework leads to Information-sharing platforms that provide a centralized venue for exchanging real-time threat intelligence, best practices, and mitigation strategies. This ensures that all participating SMEs have access to the latest information and can learn from each other's experiences and insights. Such platforms also facilitate rapid dissemination of information about emerging threats and effective defensive measures, keeping all members up-to-date and better prepared.

Engaging in policy advocacy and collaboration with regulatory bodies enables SMEs to contribute to the development of cybersecurity policies that reflect their interests and needs. This active participation helps shape a regulatory environment that supports secure, sustainable growth for SMEs, ensuring that their voices are heard and considered in policy decisions.

5. Discussion

Securing SMEs from cyber threats using collaboration yields a multitude of benefits from safeguarding their operations, finances, and reputation. By ensuring the protection of sensitive customer and business data, SMEs mitigate the risk of data breaches and safeguard against both financial and reputational damage. This is crucial for maintaining the trust of customers and partners, who expect their data to be handled securely. Defending against cyber threats also ensures uninterrupted business operations, minimizing downtime and maintaining productivity levels. This continuity is essential for safeguarding revenue streams and maintaining customer satisfaction, as operational disruptions can lead to significant losses and damage to customer relationships.

Enhanced cybersecurity protects SMEs from financial losses associated with cyberattacks, which can include ransomware payments, legal fees, regulatory fines, and the costs related to data recovery and system restoration. By preserving their financial stability, SMEs can allocate resources more effectively towards growth and development rather than crisis management. A secure operation also preserves an SME's reputation and trustworthiness among customers, partners, and stakeholders. A single data breach can cause irreparable damage to a brand's reputation, making cybersecurity a critical component of reputation management. Demonstrating strong cybersecurity measures can also provide SMEs with a competitive advantage in the marketplace. It instils confidence in customers and partners, distinguishing these businesses from less secure competitors. This advantage is increasingly important as customers become more aware of and concerned about digital security.

Compliance with cybersecurity regulations and standards is another critical benefit, helping SMEs avoid legal liabilities, penalties, and the reputational damage that can result from non-compliance. This fosters trust and credibility within the regulatory landscape, which is becoming more stringent as the digital threat landscape evolves. A secure SME is also better positioned to pursue growth opportunities, expand into new markets, and attract investment. Stakeholders and potential investors recognize a commitment to cybersecurity and effective risk management as key indicators of a company's long-term viability and governance standards. Finally, effective cybersecurity measures provide SME owners and stakeholders with peace of mind, knowing that their business and assets are protected against cyber threats. This allows them to focus more on strategic initiatives and business growth, rather than being preoccupied with the potential for digital disruptions.

5.1 Anticipated Challenges of Implementing the Collaborative Cybersecurity Resilience Framework for Start-Up Entrepreneurs

While the framework presents a promising approach to enhancing cybersecurity resilience among SMEs, several anticipated challenges may arise during its implementation. One significant challenge could be the reluctance of some SMEs to engage in collaborative efforts due to concerns about sharing sensitive information or perceived competition with other businesses. Overcoming this resistance will require fostering a culture of trust and transparency among participants, as well as emphasizing the mutual benefits of collaboration in strengthening cybersecurity defences. Many SMEs operate with limited financial and human resources, making it challenging to allocate resources for cybersecurity initiatives. Implementing the framework's capacity-building initiatives and participating in collaborative activities may require SMEs to invest additional time, money, and personnel, which could strain their already stretched resources.

Compliance with existing legal and regulatory frameworks, such as data protection laws and industry-specific regulations, may pose challenges to information sharing and collaboration among SMEs. Navigating these legal and regulatory complexities while ensuring privacy and confidentiality will require careful consideration and possibly advocacy efforts to address any barriers that hinder collaboration.

SMEs may lack the technical expertise or infrastructure to implement advanced cybersecurity measures or participate effectively in information-sharing platforms. Providing accessible and user-friendly tools and resources, as well as offering training and support, will be essential to overcoming these technical barriers and ensuring broad participation in the framework.

Maintaining long-term engagement and commitment to the framework, as well as adapting it to evolving cyber threats and technological advancements, will be critical for its sustainability. SMEs may face challenges in keeping up with rapid changes in the cybersecurity landscape and may require ongoing support and guidance to remain resilient over time. Addressing these anticipated challenges will require proactive measures, collaboration among stakeholders, and ongoing evaluation and refinement of the framework to ensure its effectiveness and relevance in safeguarding SMEs against cyber threats.

6. Conclusion

SMEs face a unique set of challenges, including limited access to finance, inadequate infrastructure, regulatory burdens, skills shortages, and market access constraints. However, they demonstrate resilience and innovation, leveraging technology and government support initiatives to overcome barriers and drive economic growth. The research highlights the growing vulnerability of Small and Medium-sized Enterprises (SMEs) to cybersecurity threats as they navigate the digital landscape. It emphasises these SMEs do not have adequate knowledge and resources to address these threats. To address this challenge, the study introduces a framework, which advocates for a collaborative approach to bolstering cybersecurity resilience among SMEs. The framework is grounded in principles of collective intelligence and shared accountability, aiming to merge technological solutions with collaborative practices involving SMEs, industry partners, and governmental bodies.

The research methodology in this study integrates the qualitative research approach with Design Science Research Methodology (DSRM), emphasising the development of a practical solution to a real-world problem. The literature review gathered relevant insights from reputable academic databases, employing rigorous selection criteria to ensure the credibility and relevance of sources.

The proposed "Collaborative Cybersecurity Resilience Framework for SMEs" offers a proactive and collaborative approach to cybersecurity, recognising the interconnectedness of SMEs and their shared vulnerabilities to cyber threats. By embracing collective intelligence and shared responsibility, SMEs can enhance their cybersecurity posture and mitigate the risks posed by increasingly sophisticated cyber-attacks.

Future studies could assess the framework's applicability and effectiveness across various geographical regions and industry sectors. This would help to understand how cultural, economic, and regulatory differences impact the implementation and success of collaborative cybersecurity practices.

Acknowledgements

We would like to extend my sincere gratitude to Nelson Mandela University for their invaluable support and funding, which made this research project possible. The financial assistance provided by the university significantly contributed to the successful completion of this study. We would also like to express my deepest appreciation to Matlafatso Financial Accountants and Tax Advisors for their generous financial support. Their contributions were instrumental in advancing this research and achieving the project's objectives.

andrea.rangone@polimi.it

Abstract: We examine and discuss the rise of the Venture Studio phenomenon (also called Startup Studio), which is receiving increasing attention across the globe. Venture Studios promises to mitigate the high failure rates faced by new ventures by engaging earlier in the new venture creation process, contributing from ideation at pre-venture stage. Venture Studios generate business ideas, and then partner with external entrepreneurs to build and validate the new businesses. Despite their increasing prominence, little is known regarding the design choices, activities, and outcomes of Venture Studios, as well as how they differ from other established organisations such as incubators and accelerators. This research aims to fill this gap, by conducting an exploratory case study involving interviews with 14 Venture Studios in Italy. We introduce an I–P–O framework that provides a comprehensive set of design choices and activities that characterise Venture Studios. Findings reveal significant heterogeneity in design choices, indicating no one-size-fits-all approach. Despite this, consistency exists in their processes and entrepreneurial orientation. Second, we question the nature of Venture Studios as Entrepreneurial Support Organisations (ESOs), proposing that they represent a new category with a more active, co-founder-like role. This study also seeks to equip Venture Studio managers with a framework to understand and strategically navigate the diverse approaches within their field. Also, we offer insights to entrepreneurs, investors, and other stakeholders, enabling them to understand the functioning of this novel form of organisation.

Keywords: Venture Studios, Incubators, Accelerators, New Venture Creation, Entrepreneurial Support Organizations

1. Introduction

> *Venture Studios are an "idea factory" searching for product/market fit and a repeatable and scalable business model (Steve Blank)*

Higher failure rates are a common characteristic of new startups, often stemming from various factors such as the quality and viability of the original idea, the competence and cohesion of the team, the ability to secure funding, the sustainability and adaptability of business models, and the timing of market entry (CBInsights, 2021; Eisenmann, 2021). To address these challenges, several types of organisations have emerged, such as incubators, accelerators, science parks, and venture capitalists (Bergman & McMullen, 2022; Clayton, Feldman, & Lowe, 2018). In recent years, however, a new category of organisation has emerged: Venture Studios (Blank, 2022). Defining themselves as "Startup Factories", Venture Studios create multiple ventures simultaneously. The ideation phase can occur either internally or externally; however, all subsequent stages leading up to the establishment of a startup, such as building the MVP and conducting validation, are managed in-house (Blank, 2022). The process of creating a new start-up is designed with the assistance of potential entrepreneurs who are sourced externally and who will be responsible for guiding the company once it is established. The Venture Studio provides prospective entrepreneurs with extensive hands-on support through core team members, infrastructure, and services. In exchange for this support, Venture Studios typically receive an equity stake similar to that of a founder in the ventures they assist in creating (Patel and Chan, 2023).

Perhaps the ontological difference Venture Studios with all the categories of entrepreneurial support organisations (e.g., incubators, accelerators) is that Venture Studios are founders or co-founders of start-ups, and not only supporters. However, this initial difference leads to many other differences, that we will discuss throughout the research, by the mean of a multiple case study on 14 Venture Studios in Italy.

The sparking promise of Venture Studios is double: (i) on the studio perspective, innovating the way new ventures are created, due to the development of great process synergies thanks to the sharing and recycling of resources and knowledge, resulting in better performances in terms of time to capital and rate of returns; (ii) on the prospect entrepreneur/s perspective, the possibility to find in the studios the perfect co-founding team.

2. Origins and Growth of the Phenomenon

Idealab is widely recognised as the pioneer of all Venture Studios. It was founded by Bill Gross in Silicon Valley in 1996. Since then, they have created more than 150 companies that have had over 45 exits, either through IPO

or acquisitions. However, the first real wave of Venture Studios began in 2007, guided by Rocket Internet and Betaworks. Betaworks, founded in New York City by John Borthwick and Andy Weissman, was the originator of unicorns such as Tumblr and Giphy, while German-based Rocket Internet, founded by the 'Samwer brothers', is famous for the establishment of the 'Copycat model', systematically copying successful ventures in other markets (Köhler & Baumann, 2016). With this model, they have been able to launch more than 100 companies worldwide, demonstrating the high success rates potentially achievable through these organisations.

An analysis of the data of the Venture Studio Index, which is accessible on its dedicated website (https://www.venturestudioindex.com/), demonstrates a significant increase in the number of Venture Studios in recent years, highlighting the rapid growth of the phenomenon. This surge (illustrated in Figure 1) may be attributed to the widespread success stories of Venture Studios and the expanding community, which has drawn more attention to the model.

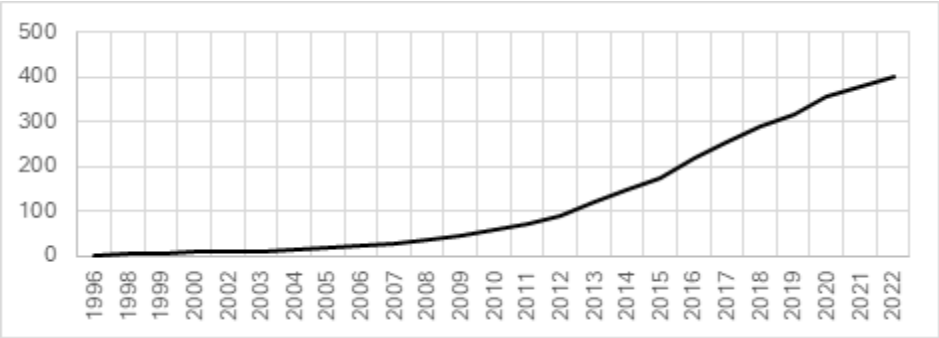

Figure 1: Number of Venture Studio in the Venture Studio Index Dataset

3. An I-P-O analysis of Venture Studios

Limited research exists on the Venture Studios, primarily due to the newness of the phenomenon and limited data availability. We decided to rely on the definition adopted by Rathgeber, Gutmann, & Levasier (2017), that define Venture Studios – that they call 'Company Builder' – as organisations that "*launch new ventures based on a systematic venture creation process. Company builders independently drive the process from idea generation, the hiring of the co-founders to early fundraising. In return, company builders control a substantial part of the new venture's equity, thereby exerting significant influence over the new venture development way beyond the initiation phase".*

Owing to its novelty, there is no unified framework that can describe in a structured way the phenomenon, in terms of what Venture Studios do. In an attempt to frame it, our proposal aims to describe the Venture Studio phenomenon using an Input-Process-Output (I–P–O) analysis (McGrath, 1964). The I-P-O framework was born in psychology to study group activities but has then been used as the basis for other management studies (e.g., Simsek, 2009) due to its ability to differentiate the main antecedents, components, and outcomes of the process under scrutiny. As Venture Studios are often referred to as "Venture Builders" (i.e., a group activity aimed at the generation of new successful ventures), we consider the model very suitable to describe the phenomenon.

The core components of our framework are described in the following.

Input. The design choices that underlie the Venture Studio organisation. We rely on the definition of design choices provided by Cohen, Fehder, Hochberg, & Murray (2019), thus "variation which is likely to be salient both for understanding their impact on and across startups, and their differentiated role in the ecosystem in which they operate" (Cohen et al., 2019"1781).

Process. The main activities that characterise Venture Studios' operations. To this extent, we rely on the Porter Value Chain model (Porter, 1985) as a conceptual toolbox that aligns the studio's view as "a startup factory" – the model allows you to break down the studio's operations into distinct primary and support activities, giving you a clear view of how the product (i.e., the startup) is created and delivered through each stage of the venture building process.

Outcome. The outcomes of the venture studio's operations as a "startup factory" (i.e., in terms of new venture creation and performances).

This paper is divided into three sections. In the first section, the methodology is presented, and the characteristics of the survey sample are summarised. The second section explores the results as related to

achieving a general understanding of the Venture Studios (The resulting I-P-O framework). The third section questions the nature of Venture Studio as Entrepreneurial Support Organisation, such as incubators and accelerators.

4. Methodology

As there is little previous research on Venture Studios, a novel, and relatively unexplored phenomenon, we have chosen an inductive, multiple case study design as our research strategy (Eisenhardt & Graebner, 2007; Yin, 1984). We approached the research design in two steps, combining different sources. First, we studied archival data from various sources, including reports, websites, and third-party interviews in order to get confident with the Venture Studios phenomenon, and we conducted exploratory interviews and conversations with various individuals involved in the industry to understand the main activities performed by studios. Then, we selected a sample of 16 Venture Studios obtained from an original database of Venture Studios based and operating in Italy. This database was set up within a broader research project in 2023, and it has been mapping Italian-Venture Studios by triangulating data from different sources in the entrepreneurial ecosystem – selected according to the definition provided by Rathgeber and colleagues (2017). Thus, we define a venture studio as having the following characteristics: (1) driving the process from business ideation (2) hiring of external co-founders (3) substantial control of the new venture's equity (higher than 10%). Out of the 16 Venture Studio we reached out to, 14 agreed to participate in our study (Table 1).

We thus conducted 14 semi-structured interviews. The interview protocol was drafted according to a semi-structured approach, and remained open to exploring new topics and insights as they arose during the conversations. After analysing the results of these interviews, we coded the interviews and analysed the results. The output of our analysis resulted in 34 codes that were further aggregated following the overarching dimensions of our input-process-output (IPO) framework. Three researchers were involved in the coding process to ensure consistency and reliability. Two researchers coded and clustered independently different elements in the I–P–O framework, and then discussed any discrepancies to reach a consensus on the assignment. The third researcher acted as an arbiter in the process. We also used multiple sources of data, such as third-party interviewees, and archival documents, to triangulate on findings.

Subsequently, we created a questionnaire that we delivered to the 14 studios the questionnaires in order to: (i) collect eventually missing data; (ii) ensure comparability across the different elements of our I–P–O framework; (iii) validate our results.

Table 1: Venture Studios included in our research

Name	Founding Year	Startup created	Interview referent	Questionnaire Confirmation
Studio A	2018	5	CEO and Co-founder	✓
Studio B	2020	3	CEO and Founder	✓
Studio C	2022	1	CEO and Founder	✓
Studio D	2021	3	COO and Co-founder	✓
Studio E	2020	17	CEO and Founder	✓
Studio F	2022	0	CEO and Founder	✓
Studio G	2020	5	CEO and Co-founder	✓
Studio E	2021	4	CEO and Founder	✓
Studio F	2021	3	CEO and Founder	✓
Studio G	2020	3	COO and Co-founder	✓
Studio H	2021	4	CEO and Founder	✓
Studio I	2021	3	CEO and Managing Partner	✓
Studio J	2018	4	CEO and Founder	✓
Studio K	2020	13	CEO and Founder	✓

5. Venture Studio Framework

In this section, the results are described in detail. According to our I-P-O framework, we present the results as follows: given that activities of a Venture Studios include a chain of core activities (i.e., the venture building primary and support activities) that connect antecedents (i.e., design choices) and outcomes (i.e., new venture creation and performances). The final framework is reported in Figure 2.

5.1 Input: Strategic Design Choices

Design choices represent a set of critical decisions regarding the structure of activities. These choices are strategic to the extent to which they are a set of high-commitment choices made that have profound implications on competitive outcomes (Cohen et al., 2019; Pauwels, Clarysse, Wright, & Van Hove, 2016). This first set of choices emerged from the discussion related to the main characteristics of the Venture Studio that were illustrated by the informants while answering to higher order questions such as: *"From whom, and why did the idea of founding your Venture Studio come about? What are your mission and objectives? Do you consider your Venture Studio specialised in a certain sector, business model or technology?"*

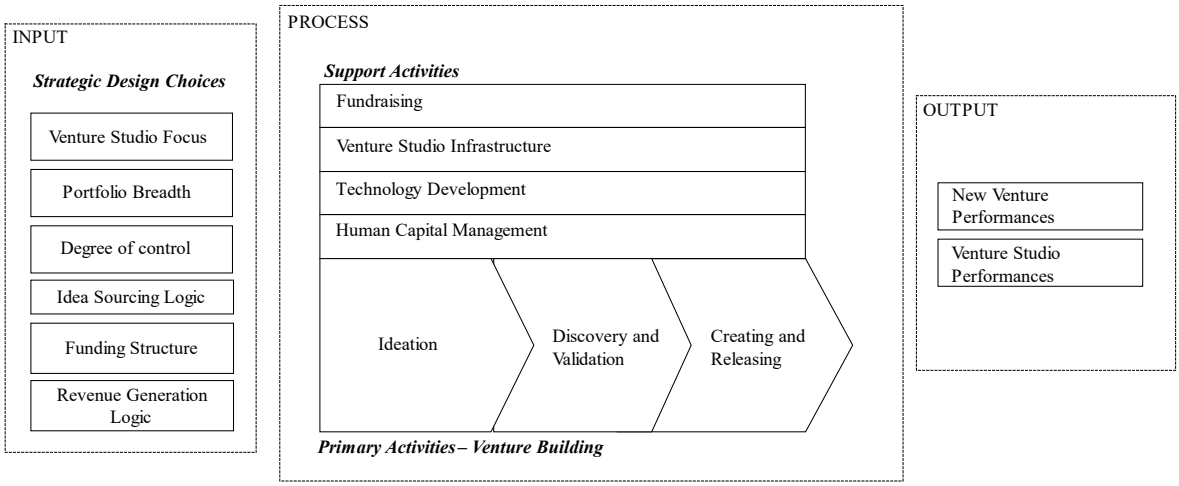

Figure 2: Venture Studio I-P-O framework

Venture Studio focus. Among the most important and characterising choices a Venture Studio could make in its way of doing business is deciding whether to be "generalist" or "specialised" (e.g., focusing on a particular industry, business models, or target customers). First, Industry specialisation allows Venture Studio to exploit past expertise and awareness in that specific sector and ad-hoc networks. Second, Venture Studio could be vertical in building only startups based on a marketplace, or Software as a Service revenue models.. Thirdly, Venture Studio can only focus on a certain type of customer, which may increase the ease of discovery and achievable commonalities in marketing and sales processes and techniques. Specialisation could bring several advantages, such as getting expertise, and economies of scale more easily, repetitively following similar MVP and product developments, or repetitively adopting similar financial models and marketing techniques. Also, generalist Venture Studios highlights the importance to focus on mastering a clear playbook while creating new startups.

Table 2: Venture Studio Specialisation, Degree of Control, Portfolio Breadth

Name	*Industry Focus*	*Business Model Focus*	*Customer Focus*	*Equity Percentage Taken*	*Number of Startups per Year*
Studio A		✓	B2B2C, B2B	30%	2-4
Studio B		✓		15-51%	4
Studio C		✓	B2B	30-40%	2-3
Studio D			B2C	75%	3
Studio E	✓			30%	6-8
Studio F	✓		B2B2C, B2B	50%-85%	2-3

Name	*Industry Focus*	*Business Model Focus*	*Customer Focus*	*Equity Percentage Taken*	*Number of Startups per Year*
Studio G		✓	B2B	45%	4
Studio E				10-15%	no target
Studio F	✓			50-70%	1
Studio G		✓	B2B	37.5%	2
Studio H		✓	B2B	>70%	3
Studio I				15%	1
Studio J			B2B2C, B2B	50-90%	5
Studio K	✓	✓	B2B	51%	no target

Portfolio breadth. Venture Studios could vary on the size of volumes they aim to manage. Most of the Venture Studios in our sample keep volumes between 1 to 8 startups per year but below the chosen threshold of 4 created startups per year. Generic or more experienced Venture Studios would likely manage a higher number of startups, whereas those seeking higher equity control may favor managing fewer startups in parallel. Additionally, Venture Studios that source ideas both internally and externally may have larger pools of potential opportunities to work on.

Degree of control: Among the most important and characterising choices a Venture Studio could make in its way of doing business is deciding when to bring an external co-founder in the process, and which portion of equity to retain. The partition of equity between the Startup Studio and its ventures' co-founders is a pivotal design variable in the hands of such organisations, as it sets the incentives for the development of the new venture. This choice deeply influences the engagement and motivation of the "external" co-founders. As it can be seen from Table 2, the Italian Studios equally split range from 15% to 90%.

Idea selection logic. Venture Studios can source ideas in two ways. Firstly, the firm itself can generate ideas through structured ideation activities, such as brainstorming or research activities. For example, a copycat approach involves sourcing business ideas from successful examples in foreign markets. Alternatively, in an external origination, external entrepreneurs can provide ideas from outside. Venture Studios can also create an opportunity space (e.g., by providing an investment thesis as a starting point to work upon) where ideas emerge from mixed interactions with potential entrepreneurs.

Funding Structure. Venture Studios adopt different funding structures, configuring themselves as either single entity studios (i.e., the Venture Studio entity collects money directly from investors) or dual entity studios (i.e., an external entity handles capital collection). These structures can be open ("evergreen") or closed-ended, similar to a venture capital fund. However, this aspect appears to be evolving rapidly with the development of "best practices," as reported by several informants.

Revenue Generation logic. Although Venture Studios aim to generate revenue from investments in the startups they create, few diversify their models to secure alternative revenue streams for survival. These alternatives include providing consultancy and advisory services to corporations or organising educational events. This diversification may also be necessary because Venture Studios are still relatively new and require time to gain legitimacy through notable exits in their portfolios.

5.2 Process

After analysing the value chain, we identified the studio's core activities in the venture building process, including sourcing ideas and talent, as well as experimentation and validation activities necessary for creating startups. The value chain "disaggregates a firm into its strategically relevant activities" (Porter, 1985), that are sources of competitive advantage. Porter's value chain differentiates between primary activities (i.e., the activities related to the physical creation of the product – the startup – and its sale and transfer to the buyer – the market), and support activities (i.e., that supports primary activities – the venture building process of a startup).

Primary Activities. Primary activities refer to the activities that constitute the venture building process –the development of a startup from the idea conception to its detachment from studio operational influence. These activities are similar for each Venture Studio and differ only to the extent to which some sub-activities are carried

out, and how they are influenced by design choices (e.g., the fact the idea selection is internal or external, or the fact the studio focuses on a certain business model) and support activities.

Often, Venture Studios go through the primary activities through a stage gate (i.e., go/no-go) approach. For example, as explained by a Venture Studio's founder: "*the internal creation of ideas is divided between Lab - Studio - Gallery. The Lab is where the ideas are born: we study the trends, there is already a team of two people working only on that, we have a list of ideas, we prioritise them. (...) in the lab we start the actual activities, i.e. we go to the market first, because we do tests, smoke tests, then once the Entrepreneur in Residence is inside, we also allocate funds, we start to do small developments, there we start in a more concrete way to go and build a business (...) After 6-8 months the start-up must have proven something, and tend to receive capital, public and private. That's the moment when the start-up moves from the Studio to Gallery, it becomes ready for the investors".*

Ideation refers to all the activities related to the identification of opportunities in the market. This can entail some activities such as studying market trends, patent development, SEO activity, data analysis, brainstorming and development of investment thesis. Either, if the idea selection logic is external, the Studios can gather ideas directly from outside, through direct interaction with an external person or organisation, which is bringing them inputs (e.g., by talking with experts or prospect entrepreneurs).

Discovery and validation entail activities aimed at engaging in experimentation activities in order to discover customer problems and validate the solution they want to bring into the market. Sub-activities here refer to interviews with potential customers, developing mock-ups or MVPs. The Prospect entrepreneur can get on board at any point of these activities, depending on the design choices operated by the Venture Studio.

Finally, *Creating and release* refer to those activities focused on setting up the new venture and starting assisting startups in achieving a product market fit by acquiring new customers and identifying appropriate channels for distributing startups' products or services. During this process, the venture team consolidates, and the Venture Studio gradually detaches from the operation support of the venture. Finally, the studio discharges its distinctive burden of execution on the new venture's team, remaining involved only as an advisor and investor. Some employees of the studio may remain part of the new venture's team.

Support activities. Support activities refer to centralised activities at the Venture Studio level, including the development of the Venture Studio itself and support for the business creation process (financial, technological, administrative, legal). *Studio Infrastructure* activities involve managing the day-to-day operations of the Venture Studio team, which include scheduling, resource allocation, and communication. It also entails overseeing budgeting, accounting, and financial reporting for the studio and its startups.

Also, *Fundraising* encompasses all activities related to attracting, developing, and managing financial resources for the Venture Studio, that are needed for the operations of the studio and its startups, according to the choices in terms of funding structure (e.g., single or dual entity). *Technology development* activities involve the maintenance and upgrading of the technological infrastructure necessary for product development and operations. This includes all activities related to creating shared assets for product development, such as the technological stacks used for MVP development. Finally, *Human Resources Management* encompasses all activities related to attracting, developing, and managing talent for both the studio and its startups. It entails the crucial role of selecting the right people for both the Venture Studio and its startups (e.g., the external entrepreneurs that join the Venture Studio).

5.3 Outcomes

First, the new venture creation rate regards the number of new startups built based on innovative ideas and technologies; Second, when asked about the outcome of their businesses, venture studios often equated their success to the ones of the startups they create – for example in terms of fundraising, revenues and profits. Enabling startups to secure funding from venture capitalists, angel investors, and other funding sources (as explained by one informant: "*our startups that come out have to collect on the market, not only the round we help them collect as well, but also in subsequent rounds, that is the key point*"); supporting startups in generating sustainable revenue streams and achieving profitability (as explained by one informant, " *our added value is to give us at least four years to be able to create value with the start-ups and thus have exit gates or at least calls or puts depending on some metric we take into consideration, maybe revenues, customers, market shares, etc.*"); facilitating successful exits through mergers, acquisitions, or initial public offerings (IPOs) that yield significant returns for the studio and its stakeholders. Finally, we discovered that many studios engage in *generating other revenue streams* while waiting for the returns of the startup they create. These alternative revenues are

generated from the provision of the services of the studio 'on-demand' to external customers (e.g., corporates, SMEs, consultancy firms).

6. Discussion

Our study makes significant contributions by examining Venture Studios, a novel organisational category in Entrepreneurial Ecosystems. We introduce an analytic framework that provides a comprehensive set of design choices, processes, and outcomes, that distinguish Venture Studios from other Entrepreneurial Support Organisations such as incubators, and accelerators (Bergman and McMullen, 2022).

Practical contributions

The framework aims to offer Venture Studio managers and stakeholders a tool to comprehend the Venture Studio as a new organisational category (Younger and Fisher, 2020), and to evaluate their positioning and that of their comparables. This contribution will be more significant over time as this organisational category gains popularity. Our study reveals the heterogeneity in design choices that characterise Venture Studios. In doing so, we seek to empower Venture Studios owners by providing a mapping tool to track and navigate their evolution in the Venture Studio landscape. For example, over time, best practices and dominant designs may emerge as the field matures. Also, that same positioning awareness could be interesting for aspiring entrepreneurs and investors who have to decide which Studio they want to work with (Blank, 2022).

Theoretical contributions

We critically explore the extent to which the Venture Studios represent a significant departure from Entrepreneurial Support Organisations such as incubators and accelerators. Bergman and McMullen (2022: 690) provide this definition of an ESO: "*An organisation whose primary purpose is to support individuals and collectives, through (in)direct and im)material assistance, as they seek to initiate and progress through the stages of the entrepreneurial process"*. To be classified as that, an organisation should include the following elements: (i) catalysing entrepreneurial activity and (ii) having as its primary focus providing support to entrepreneurs, and these two aspects should be prioritised in their operations.

Our findings challenge the definition of ESOs. First, venture Studios could be considered 'catalysers' of new venture creation. Indeed, as our findings reveal, they promote entrepreneurship by building new ventures in a parallel and repeatable way. Second, Venture Studio must be either the 'founder' or the 'co-founder', so being considerable as a true entrepreneur. This approach contrasts with the more external support typically offered by traditional ESOs like accelerators and incubators (e.g., Aernoudt, 2004; Cohen and Hochberg, 2014). Therefore, we argue the necessity of considering a spectrum ranging from passive (hands-off) to active (hands-on) support as an additional dimension that can add nuance to the concept of ESO.

7. Conclusions

Venture Studios, especially those managing the whole startup creation process internally, are transforming the concept of entrepreneurship, by shifting it from being an individual endeavor to a process that can be systematically managed by an organisation. This calls for further research on the performance of this model, such as the likelihood of startup success through leveraging shared resources, expertise, and networks within the Venture Studio. Further research could also explore the perspective of external entrepreneurs, examining their motivations and decision-making processes when joining a Venture Studio, including the individual traits of these entrepreneurs. Such studies could reveal important factors that influence entrepreneurs' decisions and their experiences within Venture Studios.

As with any research, our study is subject to limitations. First, our focus was on Venture Studios located in Italy. Given the nuances of different geographical contexts such as the US or other parts of Europe, results may vary due to factors like the maturity of entrepreneurial ecosystems. Second, our study provides a snapshot of Venture Studio inputs, processes, and outputs in a given point in time. A more dynamic, process-oriented approach could offer deeper insights into how Venture Studios rise and evolve. For instance, longitudinal studies tracking the development of Venture Studios over time could illuminate the factors influencing their establishment, growth trajectories, and adaptation strategies in response to changing market conditions. Moreover, comparative analyses between Venture Studios with different specialisations or geographical locations could uncover industry-specific or context-dependent factors shaping their development.

belinda.ndlovu@nust.ac.zw
sibusisiwe.dube@nust.ac.zw
kuda.maguraushe@mut.ac.za

Abstract: Healthcare fraud is a huge concern that affects not only the financial viability of insurance companies but also the well-being of patients who may receive compromised care due to fraudulent acts. Addressing this issue demands novel solutions that can detect and prevent fraudulent conduct in healthcare insurance claims. The project intends to establish an automated fraud detection system using blockchain technology, which has advantages such as security, transparency, and data immutability. By leveraging blockchain's decentralized ledger, the system creates a tamper-proof platform for processing healthcare insurance claims, preventing fraudulent alterations and enhancing trust in the integrity of the claims process. Ethereum's blockchain platform and smart contracts play a critical role in ensuring the secure recording of transactions while preventing retroactive alterations. Moreover, an on-chain database is employed to manage relevant claim data, thereby safeguarding its integrity and ensuring accessibility. The decentralized nature of blockchain technology brings additional advantages by eliminating the need for intermediaries, thereby reducing administrative costs and streamlining the claim processing workflow. The adoption of methodologies such as Personal Extreme Programming (PXP) and Design Science Research Methodology (DSRM) fortifies the project's framework. PXP facilitates continuous improvement through incremental and iterative development, while DSRM ensures a structured approach to problem-solving, yielding reliable results. Through rigorous testing and validation, the automated fraud detection system enhances the efficiency and accuracy of fraud identification in healthcare insurance claims. By combining blockchain technology with methodological frameworks, this project offers a promising solution to combat healthcare fraud, safeguarding insurance systems' integrity and ensuring quality care for patients. Future iterations will focus on expanding the system's capabilities and refining its algorithms to counter the evolving fraudulent tactics prevalent in the healthcare industry.

Keywords: Healthcare fraud, Insurance claims, Blockchain, Automated detection system, Ethereum, Smart contracts

1. Introduction

Healthcare fraud is a pervasive issue that affects the financial stability of insurance companies and the quality of patient care. These fraudulent activities not only result in financial losses but also compromise patient safety, leading to potential harm due to unnecessary or falsified medical procedures (Ismail & Zeadally, 2019). Current fraud detection mechanisms primarily rely on manual audits and rule-based systems, which are often inadequate in identifying sophisticated fraudulent schemes. Traditional methods are plagued by issues such as data quality, scalability, and the ability to adapt to new types of fraud (Amponsah et al., 2022). The integration of advanced technologies like machine learning (ML) and artificial intelligence (AI) has shown promise in enhancing fraud detection capabilities. However, these approaches still face significant challenges, including data privacy concerns, the interpretability of complex models, and the high computational resources required (Kapadiya et al., 2022; Kaafarani et al., 2023). Blockchain technology offers a novel approach to addressing these issues. With its decentralized and immutable nature, blockchain provides a secure, transparent, and tamper-proof platform for processing healthcare insurance claims (Ncube et al., 2022). By leveraging Ethereum's blockchain platform and smart contracts, the proposed system aims to fulfill the following objectives: 1. create a tamper-proof ledger for all claims 2. validate claims in real-time 3. verify the authenticity of claims using blockchain 4. identify fraudulent claims in real-time.

2. Literature Review

This literature review explores the current landscape of healthcare insurance fraud and the potential of blockchain technology in mitigating fraudulent activities. Kapri and Venkatesh (2023) define healthcare insurance as a means of providing financial protection against medical expenses, emphasizing its significance in ensuring the well-being of subscribers. However, fraudulent activities, such as filing false claims, pose a threat to the integrity of insurance systems, as highlighted by Ismail and Zeadally (2019).

2.1 Blockchain Technology in Healthcare

The blockchain network is based on a peer-to-peer network where each participant maintains a replica of the shared ledger, which can only be appended to but not edited ensuring the authenticity and integrity of data (Ncube et al., 2022). Scholars leverage two types of blockchain platforms, Ethereum and Hyperledger, in healthcare insurance fraud detection, which are gaining traction. Kapri & Venkatesh (2023) advocated for Ethereum's scalability and security features in managing insurance processes, highlighting its compliance with healthcare standards and ability to handle thousands of transactions per second while securing user data through its permissioned network.

Ethereum is particularly noted for its ability to address existing system challenges, such as verifying insurance records using EDI (Electronic Data Interchange) Validators and adhering to HIPAA (Health Insurance Portability and Accountability Act) standards (Saldamli, 2020). Mackey et al. (2020) further highlighted Ethereum's support for democratic autonomous organizations, smart contract execution environments, and tokens via the ERC-20 standard, crucial for enhancing data security and ensuring tamper-proof transaction auditing in healthcare fraud detection.

In contrast, Hyperledger is also prominent in healthcare insurance fraud detection. Kaafarani et al. (2023) provide a decision-making framework for selecting blockchain platforms, emphasizing mandatory features like support for smart contracts, a permissioned blockchain, and decentralized networks. They highlight Hyperledger's capabilities in supporting enterprise-grade applications with features such as private networks, data privacy technologies, and multi-language support like Java and Golang.

In summary, the integration of blockchain technology in healthcare insurance aims to enhance data security, compliance, and efficiency in fraud detection processes. Both Ethereum and Hyperledger offer distinct advantages that cater to the specific needs and challenges of the healthcare industry. Ethereum's scalability, robust security features, and support for decentralized applications position it as a strong choice for enhancing fraud detection mechanisms in healthcare insurance compared to Hyperledger's emphasis on enterprise-grade applications and data privacy technologies (Elda Hiererra et al., 2022; Kapri & Venkatesh, 2023).

Flagging Fraudulent Claims in Blockchain

Fraudulent claims are effectively flagged and mitigated through the inherent features of blockchain technology, as discussed by Saldamli (2020). The immutability of blockchain data ensures that once a claim is recorded on the blockchain, it cannot be altered or tampered with. This means that if a healthcare professional submits a bogus claim, it is permanently recorded, making it impossible for the supplier to modify or erase the claim later (Kapadiya et al.,2022).

Furthermore, the use of smart contracts, ledger broadcasting, and network consensus enhances fraud detection and risk reduction (Elda Hiererra et al., 2022). Smart contracts, for instance, can be programmed to automatically verify the authenticity of claims based on predefined criteria, flagging suspicious transactions for further review. Additionally, the consensus mechanism employed in blockchain networks ensures reliability and trust among unknown peers, further strengthening fraud detection efforts.

Predefined rules play a crucial role in flagging fraudulent claims on the blockchain. These rules are typically encoded into smart contracts, which are self-executing contracts with predefined conditions and outcomes. By establishing predefined rules within smart contracts, insurance companies can automate the validation and verification process for claims submission. By leveraging predefined rules within smart contracts, insurance companies can streamline the claims processing workflow, reduce the risk of fraudulent activities, and ensure compliance with regulatory standards. This automation not only improves efficiency but also enhances transparency and trust in the insurance ecosystem (Elda Hiererra et al., 2022; Saldamli 2020).

2.2 Related Works

Artificial Intelligence (AI), Machine Learning (ML), and Data Analytics (DA) have been extensively studied for their roles in healthcare insurance fraud detection (Amponsah et al., 2022a; Kaafarani et al., 2023; Gohil et al., 2022). Kapadiya et al. (2022) emphasized the use of AI in detecting fraud through behavioral profiling and various learning techniques. AI models are praised for their accuracy and efficiency in identifying fraudulent activities. However, they are heavily dependent on high-quality data and are challenged by imbalanced datasets where fraudulent instances are significantly fewer than non-fraudulent ones. Moreover, the integration of AI systems with existing technologies requires specialized knowledge, and ensuring real-time data access remains difficult. Amponsah et al. (2022) discussed ML techniques such as decision trees, support vector machines, and logistic

regression. ML models automate fraud detection effectively and can handle large datasets, enhancing detection capabilities. However, they face significant concerns regarding data quality, scalability, and their reliance on pre-established fraud scenarios, which limits their ability to detect new types of fraud. Additionally, security and privacy issues arise due to the sensitive nature of the data being processed.

Scholars also highlighted the role of advanced data analytics in processing large healthcare datasets to identify anomalies indicative of fraud. DA's strength lies in its ability to manage the volume, variety, velocity, and variability of big data, which are crucial for effective fraud detection. The analytics approach offers comprehensive insights into fraudulent behavior patterns, enhancing detection accuracy. However, managing such complex data presents significant challenges, and the limited evaluation of improvement strategies due to small dataset sizes hampers the effectiveness of these analytics methods. Despite these constraints, integrating ML with DA can provide a more robust understanding of fraud patterns and improve the accuracy of detection systems. Together, AI, ML, and DA offer a multifaceted approach to enhancing fraud detection, each contributing unique strengths while facing specific challenges related to data quality, scalability, and integration (Amponsah et al., 2022a; Kaafarani et al., 2023; Gohil et al., 2022; Herland, 2019).

Blockchain technology, a peer-to-peer network, ensures secure transactions by maintaining a shared ledger with immutability and an append-only nature. This technology preserves data integrity by preventing alterations and simplifying tracking, thereby enhancing transparency and trust. Ncube et al. (2022), Mackey et al. (2020), Kapri & Venkatesh (2023), Saldamli (2020), and Elda Hiererra et al. (2022) advocate for blockchain technology due to its decentralized structure, which eliminates single points of failure and makes it resilient to attacks. Predefined rules in smart contracts can automate validation and verification processes, flag fraudulent claims, reduce fraud risks, and ensure regulatory compliance. These features significantly enhance the efficiency and robustness of fraud detection systems.

In conclusion, while AI, ML, and Data Analytics each offer significant advancements in healthcare insurance fraud detection, they also face substantial challenges related to data quality, scalability, and integration. Blockchain technology addresses many of these issues by ensuring data integrity, security, and transparency through its decentralized nature and the use of smart contracts. Adopting blockchain in the healthcare insurance industry can develop more robust, efficient, and trustworthy fraud detection systems, ultimately enhancing the overall integrity and reliability of the insurance ecosystem.

2.3 Research Gaps

This study identified a critical research gap in healthcare insurance fraud detection. Current technologies, including machine learning (ML), artificial intelligence (AI), and data analytics (DA), rely on high-quality data, but face significant issues related to data quality, ambiguity, and scalability, impacting their ability to detect fraud accurately (Ali, 2019). Amponsah et al. (2022) highlighted that traditional methods, such as manual audits and rule-based systems, are inadequate for detecting sophisticated and complex fraud schemes, necessitating more advanced approaches.

The existing literature (Ncube et al., 2022; Mackey et al., 2020; Kapri & Venkatesh, 2023; Saldamli, 2020; Elda Hiererra et al., 2022) underscores the potential of blockchain technology, but its application in healthcare insurance fraud detection remains underexplored. Developing a comprehensive fraud detection system that incorporates blockchain technology could address the limitations of current methods, offering a more secure, efficient, and trustworthy solution. Further research is essential to fully leverage blockchain's capabilities and create more robust and reliable fraud detection mechanisms.

Blockchain technology offers a promising solution to these challenges by enhancing transparency, accountability, traceability, security, and immutability (Ali, 2019). Its decentralized, tamper-proof ledger ensures data integrity and automates validation processes, reducing human error and ensuring regulatory compliance (Kapri & Venkatesh, 2023). Integrating blockchain can significantly increase the efficiency and effectiveness of fraud detection systems in healthcare insurance.

3. Research Methodology

The methodologies employed Design science as the research methodology and Personal Extreme Programming as the software development approach to create a complete blockchain-based fraud detection system. The software development methodology utilized is known as Personal Extreme Programming (PXP). PXP improves software quality and empowers independent developers by integrating modified XP with Personal Software Process (PSP) methodologies (Iyawa, 2020). PXP prioritizes high-importance skills in each iteration to ensure

customer satisfaction and continuing progress. We divided requirements into functional and non-functional categories using the PXP technique, focusing on claims submission, authentication, verification, analysis, and reporting. Periodic reviews ensure alignment with user demands. Key functional and nonfunctional requirements include**:** The research uses Visual Studio Code as the primary IDE, the Ethereum blockchain platform for smart contract creation, and React for front-end development. For UI prototype, smart contract creation, and local testing, tools such as Hardahat, Remix, and Figma are utilized, in that sequence

4. System Activity Diagram

Activity diagrams are intended to show the activities that make up a system process and the flow of control from one activity to another (Sommerville, 2011). They show how different workflows in the system are constructed, how they start, and the possible decision paths that can be taken from start to finish. Activity diagrams are comprised of activities, states, and transitions between them. Figure 1 below shows the activity diagram for the system

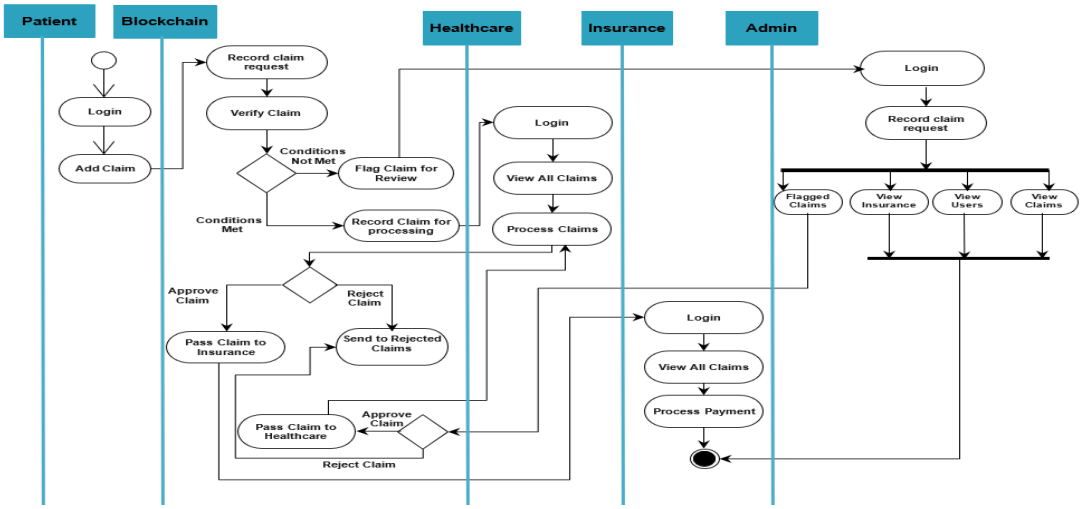

Figure 1: Activity Diagram

The process of initiating a claim begins with a patient submitting a claim request through a web browser, providing details about the medical service received and the cost. This information is then encrypted and sent to a blockchain network for verification and processing. The blockchain verifies the patient's eligibility and the healthcare provider's legitimacy, as well as checks the claim details against per-defined rules encoded in smart contracts. If the verification is successful, the claim is approved, updating the status on the blockchain and potentially initiating a payout to the provider. If the claim does not meet the verification criteria, it may be flagged as potential fraud and passed for further review or rejected. There is also a scenario that allows Admin to view all claims, adding, and listing insurance providers and users.

5. Results and Discussions

The blockchain-based fraud detection system in healthcare insurance demonstrated efficient capabilities through seamless integration of the fronted user interface, backed, and Ethereum blockchain. This system offers transparency, security, and real-time data access, enhancing fraud prevention and detection processes. The results highlight the potential of blockchain based solutions to revolutionize fraud detection in healthcare insurance, providing a reliable platform for mitigating fraudulent activities and ensuring insurance claim integrity. The system consists of interfaces through which patients, healthcare providers, administrators, and insurance professionals interact. These interfaces play a crucial role in facilitating communication, data exchange, and fraud detection within the healthcare insurance ecosystem.

Login

The login screen prompts the user to enter their credentials and gives feedback if the credentials are incorrect. Figure 2 shown below is the visual view of a user logging on to the system.

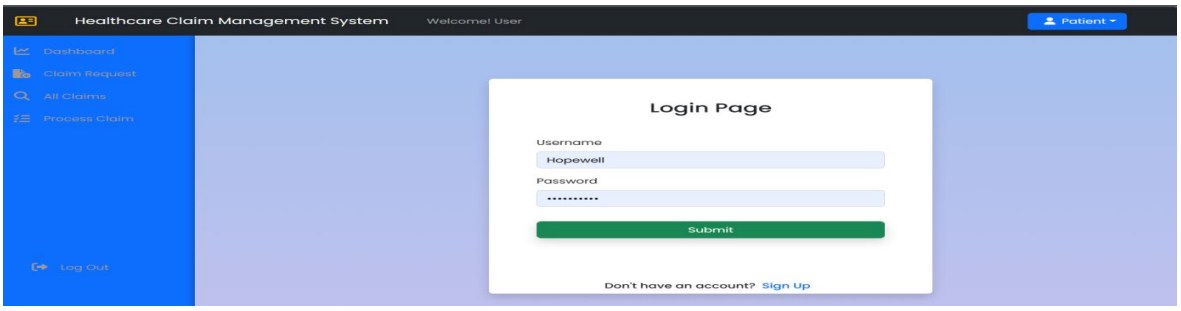

Figure 2: Login Screen

Admin Screen

Administrators utilize an interface to manage user-related tasks, including adding new users such as healthcare providers, patients, and insurance representatives. This interface collects essential personal details and assigns user roles accordingly. Administrators can also add insurance providers to the system. Furthermore, they review and approve user role requests to ensure appropriate role assignments based on user responsibilities. Additionally, administrators have access to tools within the interface to review flagged fraudulent claims, facilitating the investigation and necessary actions such as rejection or further inquiry this is shown in Figure 3.

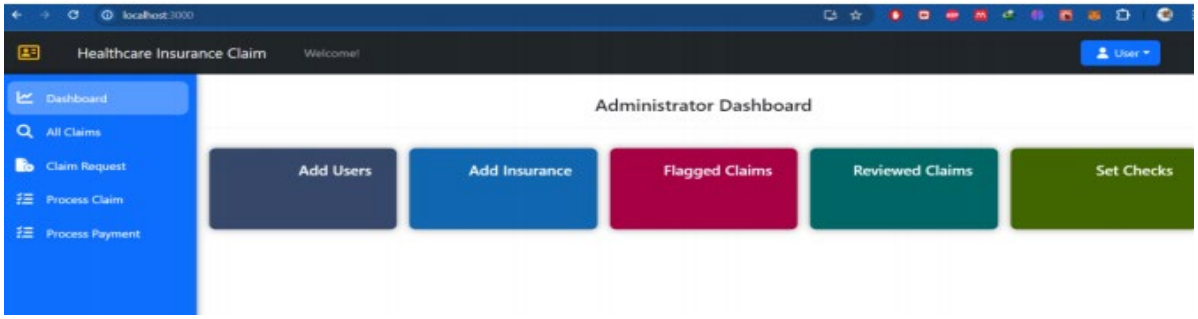

Figure 3: Admin Screen

User Registration Screen

Figure 4 simulates the registration process for a new user in the system by inputting new user information, including name, email, and password, into the registration form. The expected outcome is that upon successful registration, the system creates a new user account and provides confirmation to the user, ensuring a seamless and efficient registration process for new users.

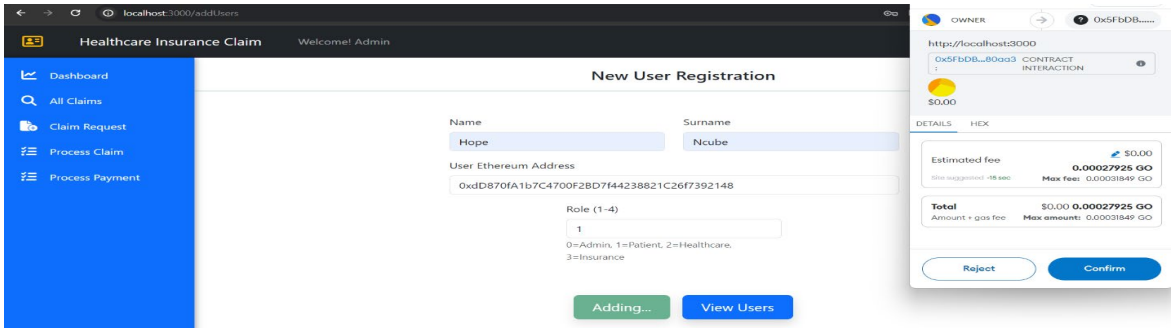

Figure 4: User Registration Screen

Patient Screen

Figure 5 simulates a Patient initiating a claim request for healthcare services received, providing details such as the patient details, healthcare provider information, and treatment received. They can track the status of their submitted claims, including updates on claim processing, approval, or rejection, ensuring transparency and keeping them informed about reimbursement progress.

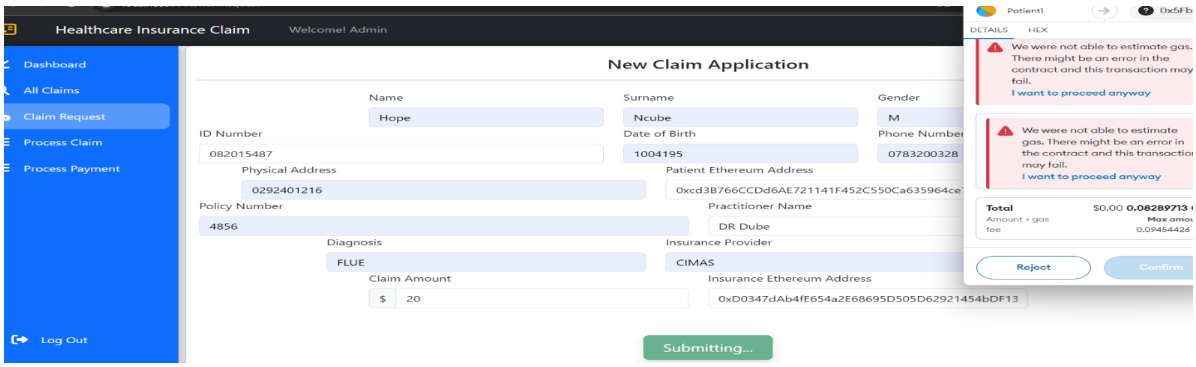

Figure 5: Patient Screen

Healthcare Screen

Healthcare providers review, assess validity, and process claim applications submitted by patients. They access a dashboard displaying all submitted claims, including pending, approved, and rejected claims, enabling them to track claim statuses and take necessary actions accordingly. Figure 6 shows the page for the process of viewing all claims

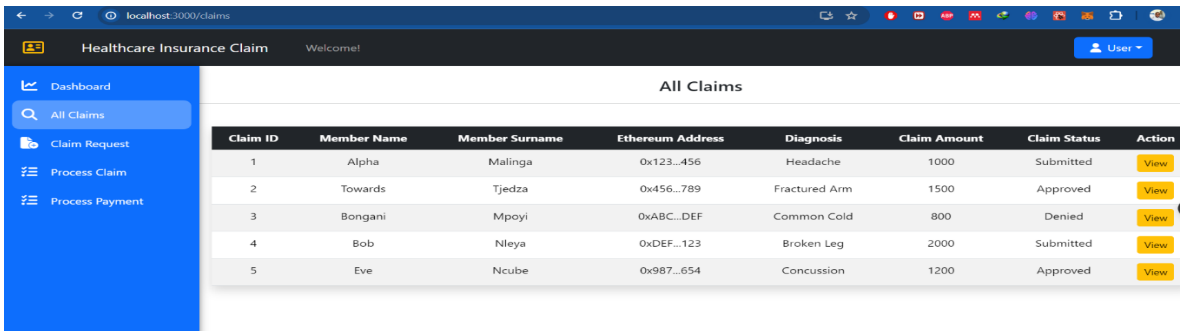

Figure 6: Healthcare Screen

When viewing a single claim, the user interacts with the Claims component, which displays a table of all claims. Each entry has a "View" button. Clicking this button redirects the user to a dedicated page via a dynamic route with the claim's unique ID. The component then fetches and displays the full details of the selected claim in a receipt-like format. This allows users to easily access detailed information about specific claims from the list view. The full Individual claim application made by a user is shown in Figure 7 below.

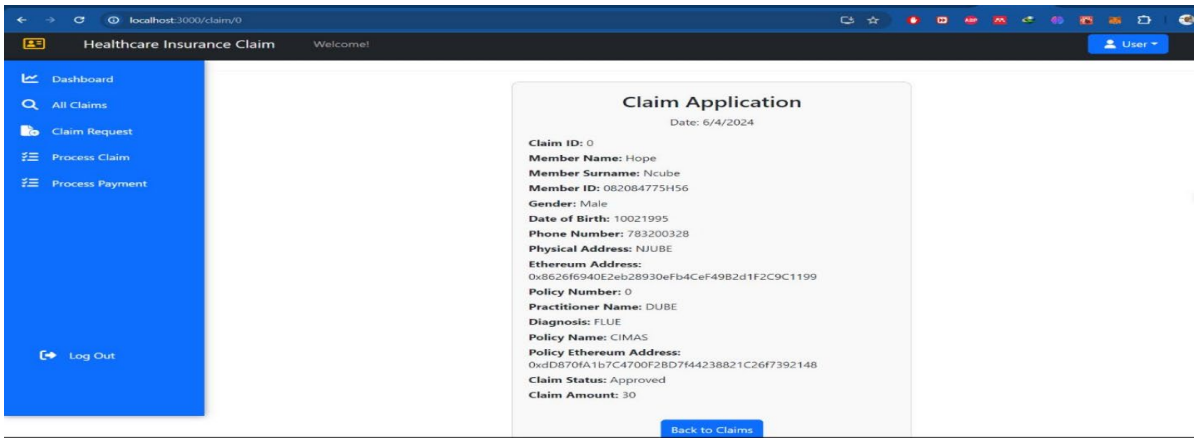

Figure 7: Viewing Full Individual Claim

In the Process Claim interface, the user sees the full details of the claim and is provided with buttons to either approve or deny the claim, along with fields to input any necessary notes or reasons for the decision. This interface is designed to streamline the decision-making process, ensuring that all relevant information is easily accessible, and actions can be taken efficiently. Figure 8 shows the process claim screen

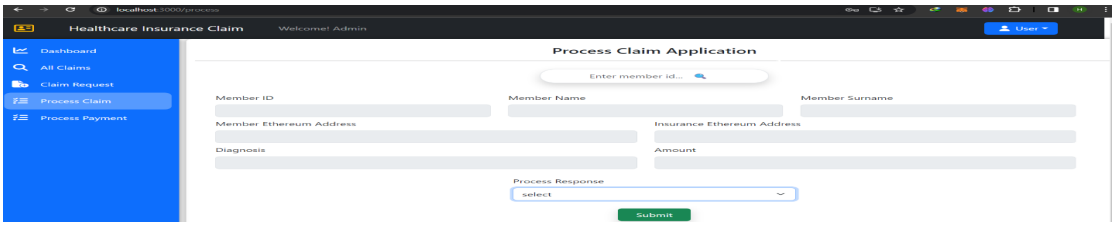

Figure 8: Processing Individual Claim

When a claim with suspicious or irregular details that may indicate fraudulent activity the system detects and flags the claim for further investigation by administrators or designated authorities and displays it alongside other flagged claims this is shown in Figure 9 below

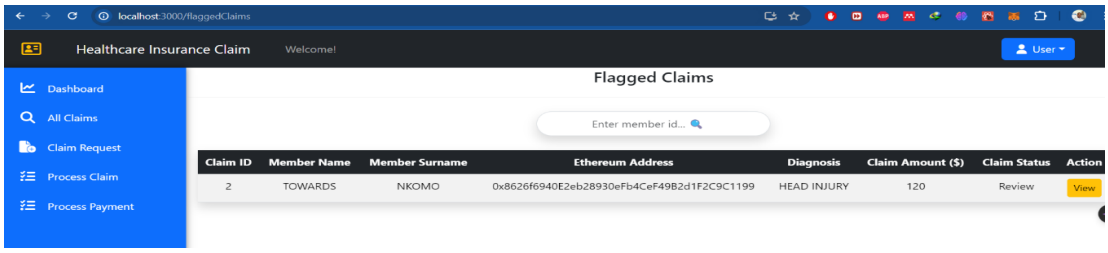

Figure 9: Flagged Claims

Figure 10 below simulated viewing a flagged claim with suspicious or irregular details that may indicate fraudulent activity. The system generates a report of the claim and displays a reason why it was flagged for further investigation by administrators or designated authorities.

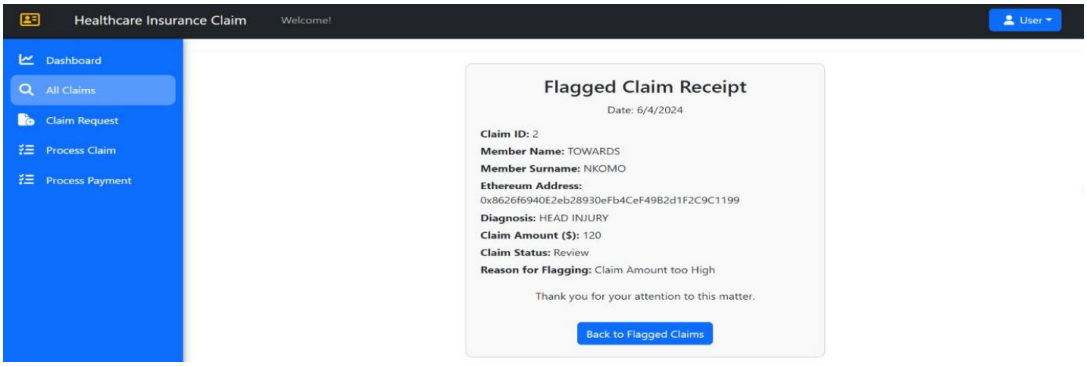

Figure 10: View Flagged Claim Report

Blockchain Claim Application Snippet

Figure 11 simulates the addClaim function which is pivotal in the smart contract, managing the addition of new claims. It requires various parameters detailing the patient, practitioner, diagnosis, insurance policy, and claim amount. These parameters undergo rigorous checks to ensure the validity of the claims.

```
function addClaim(    undefined gas
    User memory patient,
    string memory _practitionerName,
    string memory _diagnosis,
    string memory _policyName,
    address _policyEthAddress,
    uint256 _amount
) public onlyPatient {
    require(insuranceProvider[_policyEthAddress], "Insurance provider not registered");

    // Check if the amount exceeds the max claim amount
    require(_amount <= maxClaimAmount, "Claim amount exceeds the maximum allowed amount");

    // Check the number of claims the patient has made this month
    require(patientClaimCount[patient.ethAddress] < maxClaimsPerMonth, "Patient has exceeded the maximum number of c

    Practitioner memory practitioner = Practitioner(_practitionerName, _diagnosis);
    patient.policyNumber = allPatients[_policyEthAddress].policyNumber; // Assign policy number to patient

    // Create a new claim
    Claim memory newClaim = Claim(patient, practitioner, _policyName, _policyEthAddress, ClaimStatus.Submitted, _amo
```

Figure 11: Blockchain Claim Application Snippet

6. Proposed Improvements

Future improvements for the blockchain based fraud detection system could involve seamless integration with Electronic Health Records (EHR) and the development of a mobile application. By integrating with EHR systems, the fraud detection system can access comprehensive patient data, enabling more accurate fraud detection and

prevention. Additionally, the development of a mobile app can enhance user accessibility and convenience, allowing stakeholders to monitor and interact with the system on the go. Future enhancements may also include advanced machine learning algorithms for predictive fraud detection, real-time monitoring features, and enhanced security measures to safeguard sensitive healthcare data. Furthermore, continuous updates and refinements based on user feedback and emerging technologies can ensure the system remains at the forefront of fraud detection in healthcare insurance.

7. Conclusion

In conclusion, the automated fraud detection system utilizing blockchain technology offers a proactive solution for combating healthcare fraud in insurance claims. By harnessing blockchain's security and transparency, the system enhances the accuracy of fraud detection in healthcare insurance claims. Integration with Ethereum's blockchain platform and smart contracts ensures transaction integrity and reduces the risk of alterations. The decentralized nature of blockchain streamlines claims processing by eliminating intermediaries and reducing administrative costs. The strategy strives to protect the interests of patients in healthcare insurance, while also reducing financial losses through extensive testing and validation. Subsequent editions will focus on improving functionality and optimizing algorithms to combat evolving deceitful methods in the healthcare sector.

Academic Entrepreneurship Overview: New Program Development Using Entrepreneurship Principles

Kent Neupert and Christy Suciu
Boise State University, USA

kneupert@boisestate.edu
csuciu@boisestate.edu

Abstract: This paper examines human dimensions of innovation within the context of complex problem solving and solution generation. We review theories and methodologies used in entrepreneurship, identifying similarities and implications. In an illustrative case study, we describe process used to launch a new academic program in a university. Program faculty used frameworks, perspectives, and analysis that are fundamental to entrepreneurship with the goal of launching an academic program in response to local industry requests. We conclude with a discussion of implications for research and practice.

Keywords: Academic entrepreneurship, Design thinking, Effectuation, Innovation, Entrepreneurship

1. Introduction

Entrepreneurship instructors provide students with an assortment of concepts, frameworks, and analytical methodologies, or a toolbox of sorts, to understand the field of entrepreneurship and, perhaps, start a business. In considering entrepreneurship theories, the perspectives range from deterministic and causal to dynamic and emergent. From a learning perspective, the instructor may want to offer a concise set of materials that describe theoretical aspects of the topic being shared with the audience. However, in offering overviews of theoretical frameworks, there may be some perceived ambiguity or misunderstandings by the audience in reconciling the variety. Instructors may also include stories from life as illustrations of success or failure to convey the nuances of entrepreneurial decisions and actions. The audience may struggle to reconcile theory with practice.

We address these aspects of this conundrum; how to reconcile theoretical differences and how to reconcile theory with practice. This paper reviews foundation theories in entrepreneurship and offers suggestions for distinguishing nuance between the perspectives. Using a case study, we address discuss how theoretical perspectives align with practice. We conclude with thoughts on theory, practice and instruction.

2. Literature Review

Universities are crucibles of innovation that occurs on various levels. Their focus involves open innovation, or innovation that involves the managed inflows and outflows of knowledge across organization boundaries in accord with organization goals, and at various organizational levels (Chesbrough & Bogers, 2014). Within this context, we focus on innovation that addresses problems that are complex, ill-structured, open to various perspectives, and require creativity combined with diverse knowledge in order to develop viable solutions (Beck, et al, 2022). Entrepreneurship literature that puts an emphasis on various frameworks and tools for identifying, and creating and assessing entrepreneurial “opportunities” (e.g., DeTienne and Chandler, 2004) and teaching a design thinking methodology provides a framework to innovate in academic business programs (Glen, Suciu, and Baughn, 2014).

We discuss models of entrepreneurial innovation practices that offer counterpoints to traditional business practices (of extensive planning and forecasting within static markets) for developing and innovating new products, programs, services, or processes. These models involve exploration, experimentation and iteration. Design thinking applies to these processes broadly, incorporating ethnographic methods to understand potential users, ideation to generate new ideas, prototyping to gather user reactions, and visualization throughout the entire iterative process (Lietka & Ogilve, 2011; Brown 2009). This process helps to ensure that ideas for new products, services, programs and processes are anchored in actual needs, even when potential users cannot articulate those needs.

Work in effectuation specifically challenges the logic of planning and extensive goal development in the area of entrepreneurship. Effectuation and the lean startup approach to entrepreneurship reduce the cost and risk of innovation through continuous testing and feedback at early stages of the venture so failures occur at lower levels of investment, and that the firm can move to a plan that works before running out of funds. Each of these innovation models is grounded in deep understanding of the needs of potential customers.

While design thinking provides guidance in developing initial ideas for innovation, the work on business model generation and lean startups helps to address additional issues that arise in the development of the business itself (Mueller & Thoring, 2012). Design thinking is particularly useful in addressing the underlying value proposition component in the business model canvas, developed by Osterwalder and Pigneur (2012), and incorporated in lean models and addresses the customer segments and customer relationships elements of the canvas, but can be extended more broadly. At the same time, the lean methods provide quantitative testing and feedback to assess opportunity in the market. In contrast to descriptive and explanatory sciences, design sciences focus on the process of making choices on what is possible and useful for the creation of possible futures, rather than on what currently prevails (Hevner et al. 2004; Romme 2003).

2.1 Design Thinking Methodology

Design thinking draws from such fields as architecture, urban planning, and product design (Cross, 1982; Lawson, 1979; Kimball, 2011; Rowe, 1987). The problems faced in such fields are often ill-defined and ill-structured, calling for the need to undertake a process of exploration with users in jointly developing an understanding problem formulation, design specifications, and alternatives. The process is highly explorative and iterative, with a strong emphasis on visual representation of concepts and prototypes (Buchanan, 1992; Ferguson, 1997; 1992). Herbert Simon (1969) and Richard Buchanan's (1992) assertion that the difference between science and design is that "design thinking deals primarily with what *does not yet exist*," while science "seeks to explain *what is*." Science discovers, design invents.

Business firms typically collect customer information through focus groups and surveys, and may segment markets based on readily-measurable demographic characteristics. Design thinking, on the other hand, invests in extensive observation and in-depth interviews with users (as well as non-users and extreme users) to develop empathy and insights relating to both expressed and unexpressed needs (Liedtka and Ogilve, 2011; Fraser, 2007, Brown, 2008).

While a traditional business approach attempts to avoid failure and manage risk through extensive and expensive analysis and planning before committing resources to action, design thinking reduces risk by engaging in relatively inexpensive means of gathering information from potential users through interaction based on quick, low-fidelity prototypes (Liedtka and Ogilve, 2011). This is reflected in common design thinking refrains, such as "fail often to succeed sooner" (Kelly, 2001, p. 232) and "fail early to succeed sooner" (Brown, 2009, p. 17). Design thinking provides an opportunity to gather feedback and uncover problems as strategy unfolds, rather than waiting until it is formally locked down and rolled out into the market (Fraser, 2007).

2.2 Business Model Methodology

Business models are being incorporated into innovative projects (Blank and Dorf, 2012; Osterwalder and Pigneur, 2010; and Ries, 2011). The rationale is that many of the business assumptions will probably be incorrect, so the business model itself should be prototyped and developed using design principles. Variations of this idea include Osterwalder and Pigneur's (2010) widely used visual "canvas" that includes nine business building blocks to expedite business model prototyping. Using the business model canvas approach, Blank and Dorf (2012) detail the steps for building a business startup. The model includes assumption testing and emphasizes going "outside the building" for observation and ideas.

In the process of moving from developing a product/service concept to launching business, one faces new sets of issues. Osterwalder and Pigneur's (2010) approach to business model generation addresses nine essential elements used in providing a rationale of how the firm creates, delivers, and captures value. These nine building blocks are: customer segments, value propositions, channels, customer relationships, revenue streams, key resources, key activities, key partnerships, and cost structure. Osterwalder and Pigneur (2010) developed a business model canvas to provide a visual platform and shared language to serve as the basis for understanding, developing, describing, and challenging elements of the proposed business.

Business model generation is customer-centric, research informed understanding of customers' environments, daily routines, concerns and aspirations is used to access and understand unreached segments. Addressing unreached segments is facilitated by extending considerations beyond existing customers. Osterwalder and Pigneur's (2010) approach builds strongly on design thinking principles. Nearly 70 pages of their *Business Model Generation* are devoted specifically to design methods and tools used not only in developing a sound understanding of customer needs, but also in communicating, developing, challenging, and testing the various elements of the business model.

2.3 Lean Start Methodology

Startups involve the creation of new products or services under conditions of extreme uncertainty. Who is the customer and what the product should be is often not yet known. It is critical to design experiments to test and validate early assumptions so that the entrepreneur can learn a sufficient amount about what works before running out of cash (Ries, 2011; Blank & Dorf, 2012; Maurya, 2012). Approaches facilitating this process of learning were drawn from lean principles of manufacturing developed by Toyota, as well that from the "customer development" process developed by Blank (2006). Customer development entails getting out of the building to gain deep, personal firsthand understanding of potential customers' needs (Blank & Dorf, 2012; Maurya, 2012).

Lean approaches replace a fixed business plan with a flexible business model that mitigates risk through early testing to get the product right, and by validating all components of the business plan in building a path to customers. This involves repeated "build-measure-learn" feedback loops in the development and testing of hypotheses relating the product or strategy to all phases of the business model canvas (Reis, 2011, p. 75; Blank & Dorf 2012; Maurya 2012). The lean approach builds on continuous iterations and "pivots", using structured course corrections designed to test a new fundamental hypothesis about the product or strategy (Ries, 2011, p. 149). The process involves the development of prototypes, including a minimally viable product (MVP), for evaluation by, and possible sale to, customers. The experimental nature of this approach is supported by actionable metrics to provide feedback to understand the people behind the numbers (Maurya, 2012). These include split-tests, for example, which offer different versions of products to customers at the same time, and cohort analyses to assess the effect of a design decision over time.

2.4 Effectuation Methodology

Effectuation, articulated by Sarasvathy (2001, 2003), describes processes adopted by entrepreneurs in the area of new business creation, where planning and forecasting is particularly problematic. Simon noted in *Science of the Artificial*, "if there is any way to design without forecasts, we should seize on it" (1996, p. 147). Sarasvathy (2001) found that entrepreneurs succeeded though exploitation of contingencies rather than through well-specified goals and extensive analytic projections.

Entrepreneurs begin with who they are, what they know, and whom they know, and proceed to construct opportunities through experimental and iterative learning. By bringing on board key stakeholders, including customers and strategic partners, the entrepreneur does not need to waste resources on prediction as they continually listen to customers, building an ever-increasing network of customers and partners. The structure of what the venture is, including the market and goals for the firm itself, is flexible and dependent on the particular commitments made by customers and other stakeholders (Sarasvathy, 2001; 2003). This process addresses the constraints that uncertainty places on information processing and the use of planning in entrepreneurship (Grégoire, et al, 2011). Also, effectuation focuses on affordable loss rather than expected returns. As with design thinking, risk is reduced by allowing failures to occur at earlier stages and at lower levels of investment. At the same time, the effectuation process promotes capitalizing on successes that arise, which shape subsequent investments (Sarasvathy, 2003).

Effectuation proposes several other guiding principles (Read, et al, 2011). In a review of the development of effectuation literature, Zhang & Van Burg (2020) identified the following effectuation design principles (Sarasvathy 2001; Wiltbank et al. 2009):

- Principle 1, Bird in hand: Start with your means, who you are, what you know, and whom you know.
- Principle 2, Affordable loss: Decide on the basis of what you can afford to lose instead of expected returns.
- Principle 3, Crazy quilt: Form and obtain pre-commitments from partnerships.
- Principle 4, Lemonade: Leverage both uncertainties and contingencies.
- Principle 5, Pilot-in-the-plane: Rely on human agency to maneuver rather than on exogenous factors, such as technological trajectories.

The above principles are prescribed as heuristics for developing solutions to difficult problems in complex situations under uncertainty. They share the aspiration of exploiting locality and contingency in the evolution of an artifact rather than predicting the best artifact in advance (Sarasvathy 2003). These principles also are not passive deployments and redeployments of resources purely in response to simple signals (cf. Augier and Teece 2009); rather, they are purposeful and intentional actions (Matthews 2009; Zhang & Van Burg, 2020;).

3. Methodology

A qualitative case study was selected for the illustrative purposes of this study. A qualitative approach was deemed appropriate given the purpose of this study is to understand and communicate the how various processes are used in practice. For this project, interviews with the founders, reviews of journal notebooks, and reviews of related program documents were the primary sources of data collection, with in-depth interviews as the primary data collection method. Interviews were carried out over several months to explore the decision-making process and learning outcomes. Journal notebooks were kept by faculty team members throughout and used to provide a record of relevant events. Interviews were conducted both face-to-face.

3.1 Objectives, Including Need and Relevance

The objectives of the paper are to present theoretical perspectives and methodologies to discuss the similarities and differences between them, and to illustrate how these methodologies are implemented by managers. Understanding and distinguishing the basis of the methodologies and similarities is important for researchers and faculty working in the topic area in order support research and training.

3.2 Case study: New Program Development

In this section, we describe the decisions, actions, and learnings experienced by the new program development team charged with launching a hospitality management program.

3.2.1 The program mandate

The impetus for the team's program development effort was a mandate by the university president made in response to a request for a training program by a major employer in one of the state's largest industries. Following a meeting in 2021 with the management team of one of the state's largest ski resorts, the university president said, "We will launch a hospitality program and I want it ready by next year." With that simple statement, the team had their outcome and completion time goals identified.

In 2020, the world was in turmoil as it tried to survive the Covid-19 pandemic. Industries that depended on service employees were substantially short staffed but at the same time the general public's demand for food and entertainment services increased. In Idaho, demand for outdoor recreation in both winter and summer seasons surpassed the capacity available to serve customers. By midyear 2021, tourism had returned to pre-pandemic levels and continued to grow. In 2024, Idaho's $3.7 billion tourism industry employed more than 45,800 people and generated US$475 million in local, state and federal tax revenues (commerce.idaho.gov), making it Idaho's third largest industry behind agriculture and technology. Also, with a large land size and relatively small population, much of the state's tourism and recreation locations are located in rural areas which meant that reaching potential students would be a challenge.

3.2.2 Launching a program

The team likened the launch of the hospitality program to a venture startup. The team was composed of two faculty and one staff member used to working in an academic environment. With backgrounds in entrepreneurship, they used the concepts, frameworks, and processes that they taught in their courses to help guidance their efforts.

The goal of launching a new hospitality program was clear enough but the time frame in which to do it was a constraint. Developing new programs in universities often take several years, not one year. The team's challenge was how to create a new program in a very short amount of time. Also, they had no dedicated funds available to support faculty, staff, course development, or marketing. These conditions were additional resource constraints.

3.2.3 Start with the customer

A first step of the project was identifying the customer. Since ski resorts had initiated the call, they seemed an obvious customer group. But students were also customers as they would be taking the courses in the program.

Before diving into the program development, the team needed to learn more about their intended customer groups. Talking with and understanding user's needs and wants is fundamental for design thinking and the business model canvas approach. Both emphasize the critical importance of first talking with the user to understand their current problems and desired aspects of any future solution or benefit. The goal was to develop a solution that was desirable, feasible and viable.

The team began by talking and engaging with expected customers. As the program request came from a ski resort, the team first met with the resort. In the first discussions, the resort management team brought in their current open jobs list. While the list contained the expected jobs of customer service representatives, chair lift operators, and snow groomers, many of the vacancies were for business roles such as accountants, marketing, supervisors and first line managers. The team learned that during the pandemic, many of the older and more experienced staff had left or retired, while most newly hired staff were younger and less experienced, creating a skill gap in leadership roles. Further conversations revealed it was these opening that were of the biggest concern to the resort. This need for staff with business management skills was reinforced with customer discovery conversations with other ski resorts.

The team turned next to their other customer group, the potential students, identified as people currently employed in the industry or interested in working in the industry. In talking with people were currently working in the industry, the team found that many had started in the industry with summer jobs or as temporary work but stayed because they enjoyed the work, atmosphere, culture, service orientation, and/or camaraderie of the job. They also learned from interviews that many felt additional training or skill development was needed to build a career or be recognized for promotions.

3.2.4 Customer discovery: Pains, gains, and benefits

In the course of interviewing ski resorts and their employees, the team discovered that while the state had 19 ski resorts in operation, only five were large enough to have a sufficient number of interested employees to support program enrollments. With this realization, the team broadened their scope of industry to include resort hotels, urban hotel groups, and restaurant groups. Subsequent conversations with this expanded customer group reinforced many of the earlier customer characteristics, needs, and wants: business management and leadership emphasis, flexible class schedules, online delivery, and career focus. At this point, the team felt they had a good enough understanding of both customer groups to begin working on a solution prototype, or minimum viable product, that they could discuss with users.

3.2.5 Bird in hand principle

To shape their program development efforts, the team followed the effectuation principle, “bird in hand”, to start with what they had available. The team recognized their existing online Bachelors of Business Administration (OBBA) as a platform foundation on which to build. Within five years, the online program had become nationally ranked in the top 25 of online business programs. Primarily a general business management degree program, it could offer areas of emphasis and provided core business management courses. As a “degree completion program,” it was designed to complement two-year associate degree programs. Also, as an online program, it was not geographically constrained by a physical campus, allowing a hospitality focused program to reach students anywhere in the state and beyond, and offering growth potential as the program developed.

The team also recognized that being a business management program, it allowed them to distinguish the program from the many two-year associate degree technical programs which focused on applied job skills such as culinary arts, restaurant, hotel and hospitality operations, and ski lift operations. Focusing on the business management aspect of these industry sectors allowed the team to create a complementary and distinct program that filled a career skill gap for supervisors, first line managers, and those with hospitality management career aspirations. This repositioning of the program and its components was, in essence, an example of the effectuation principle of “transformation”.

3.2.6 Crazy quilt and lemonade principles

Taking this transformation one step further, the team had determined through customer discovery conversations with employers and current employees that many working in hospitality and outdoor recreation industries were unable to stop working in order to attend classes full time. To accommodate this constraint, the team needed to develop an option that allowed a part-time or flexible course schedule. Also requested was a program shorter in duration. Certificate programs could require only six courses completed with less time and cost. Coincidently about this time, the state expanded support of certificate programs for workforce training.

Two related events helped bootstrap the program. First, the state expanded its financial support for certificate programs to include academic programs. Under the Workforce Development program, student participants were eligible for grant award funding up to 80% of program tuition or US$5,000, whichever was less. There were eligibility and residency requirements, but the support would cover most of the certificate tuition cost (idaholaunch.com). Second, the team successfully applied for a program development grant to support the costs

associated with launching a certificate program, receiving program funding support for three years. This was a fortunate transformation and financial bootstrapping achievement.

3.2.7 Program progress

One year later, January 2023, the program offered its first classes with six students enrolled. By January 2024, over 40 students were enrolled. Through customer engagement, the team discovered that the interest in and need for the program was stronger in the urban hotel and restaurant industry segments and pivoted to be responsive to their program input. The team engaged with hospitality and tourism associations, positioning the program as a training partner in enhancing the level of workforce service quality in the local markets, thereby strengthening their venture identity message, which was also supported by social media. Through the team's continued customer engagement, ski resorts began to enroll students in the certificate program, seeing the potential benefits for management development.

3.3 Observations and Discussion

Among the observations derived from the case study research were that the team members were flexible in their search for solutions and ways to progress toward their goal. Faced with a definite purpose, i.e. launch a new program, and a clear timeframe, i.e. in one year, they utilized aspects of all the process models in a flexible mix-and-match manner, applying process options to situations as best fit the situations. They did not perceive themselves bound to a particular approach. Instead, reaching the goal of program launch was the important driver and they utilized whatever methodologies supported progress toward that goal.

In discussing various theories of entrepreneurship innovation methodologies, we may be inclined to present each as distinct and stand alone. However, when discussing implementation, we need to recognize that entrepreneurs often are flexible and not held to strict theoretical boundaries. Instead, they use permeable boundaries between models as a way to match solutions to problems, aligning with Chesbrough and Bogers (2014).

4. Entrepreneurship Thoughts: Theory and Practice

We focused on theories that consider the human aspects of innovation as humans, individually or in groups, perform the innovation (Majchrzak, et.al., 2023). We discussed theories and methodologies regarding creativity and innovation within the context of solving complex ill-structured business problems. In all of these considerations, an important feature stood out: the role, or interpretations and actions, of humans, usually as individuals or organization members, engaging with one or several user groups, to gather and assess wants and needs in order to develop viable solutions (Beck, et al, 2022; Chesbrough & Bogers, 2014; Osterwalder & Pigneur, 2010; Kelley, 2001). How the problem, challenge, or situation was evaluated for potential pains, gains or benefits, and the solution proposed were greatly influenced by the perceptions of the team members and how they interpreted the information gathered from their users or customer groups. This area warrants future research as the findings can be extremely insightful for academics and practitioners.

Another aspect to consider is whether or to what extent do solutions to complex ill-structured problems vary by the individual or group personalities of the problem solvers, especially in whether they take a structured approach to problem solving or a flexible, more open approach. The outcomes could vary on whether teams are strict rule followers or more independent in their thinking and how their perceptions affect the views of other team members involved in solution generation. Future research can examine how the roles of docility and disruption orientation affect problem solving, solution generation, and team dynamics.

This paper described one team's experience in launching a new academic program. Within the perspective advocated by Chesbrough and Bogers (2014) we should consider organizations as having permeable boundaries in regards to information and knowledge flow. Individuals acting within the university may receive knowledge and information from outside the university and use it to shape decisions internally that have external implications. In the team's hospitality program development efforts, their perceptions of opportunities and constraints were very much shaped by their individual perceptions and interpretations of information and how they collectively assessed opportunities, challenges, and their path forward.

5. Conclusion

For university administrators and individual faculty, it is important to utilize the knowledge we share with our students. In this paper, we discussed used processes and methodologies that consider human aspects of innovation that include Design Thinking, Business Models, Lean Start, and Effectuation. In the case study, the

team followed processes and methodology that are the foundations of most design thinking and entrepreneurship courses. However, we may not fully realize the power the offer. Recognizing that these frameworks and methods can apply to a range of problems and solutions can yield effective outcomes if we are ready to see opportunities.

Abstract: The Buy-Now-Pay-Later (BNPL) feature has emerged as a popular payment innovation, offering users convenience and flexibility in their purchasing behavior. However, consumers' adoption of BNPL is often limited due to the trust issue usually associated with electronic payment. Previous studies have highlighted personal traits that affect consumers' trust in adopting BNPL, such as risky indebtedness behaviour or privacy concern. Adopting the Stimulus-Organism-Response framework, this study investigates environmental factors influencing consumers' attitudes and perceptions of privacy risks and trust. The main objective of this study is to identify these factors, which can be valuable to practitioners in promoting consumers' intention to adopt BNPL. The model was tested based on data collected from 430 young Vietnamese consumers. Data analysis is conducted using SmartPLS 4.0. The study's findings, which are significant in consumer behavior, confirm that behavior intention to use BNPL results from attitude, trust, and perceived risk, which were influenced by perceived ease of use and subjective norms. These findings provide actionable insights for practitioners in the field, equipping them with the knowledge to promote BNPL adoption effectively. One notable result of the research is that perceived ease of use has a negative impact on privacy risk. This finding implies that users' primary apprehension in using the E-wallet BNPL feature pertains to the risk of losing their privacy. It strongly recommends that developers create a more user-friendly and transparent BNPL experience to alleviate privacy concerns and enhance user trust, thereby promoting the adoption of BNPL.

Keywords: Buy-Now-Pay-Later, Stimuli-Organism-Response, E-wallet, Vietnam

1. Introduction

In the context of digital payment method advancement and innovative financial services contributing to reshaping financial transactions, the widespread adoption of e-wallets has dramatically influenced consumer payment behaviors. In recent years, the proliferation of the Buy-Now-Pay-Later (BNPL) payment method, especially among youngsters, has become a payment alternative offering users the flexibility to buy products/services and make later payments. It highlights the economic impact of this payment method. With the explosion of e-wallets facilitating transparent transactions, integrating BNPL into these platforms presents a significant opportunity for consumers and businesses. Understanding the factors affecting intention to use this is crucial for companies to utilize the potential opportunities effectively.

While significant contributions of prior research, we identify two gaps. Firstly, existing studies have focused on the intention to use BNPL in the context of credit cards/visas, but they have yet to explore the impact of factors when using this function in e-wallets. Secondly, the previous research has neglected the impact of perceived ease of use on privacy risk and its subsequent effect on intention to use BNPL. This is a salient gap as it has been explored in e-service that ease of use is a potential privacy risk reduction factor (Featherman *et al.,* 2010). Investigating the relationship between perceived ease of use, privacy risks, and BNPL adoptions can assist developers in enhancing their strategies and positively affect the intention to use BNPL on e-wallets.

Our research has two significant contributions. Firstly, it delves into the multifaceted factors that influence individuals' intention to use BNPL integrated on e-wallets, considering the context of the Vietnamese socio-economy specified in the GenZ cohort. Secondly, In this study, we further develop the aspect of "Perceived ease of use" in the context of technology through BNPL payment, exploring the negative impact of this factor on privacy risk. This is a significant contribution as it proves that enhancing the ease of use can reduce privacy risks when using BNPL on an e-wallet.

2. Literature Review and Hypothesis Development

2.1 The S-O-R Framework

The S-O-R (Stimulus-Organism-Response) theoretical framework can help us better understand the aspects that influence consumer acceptance and behavior for Buy Now, Pay Later (BNPL) services. This paradigm systematically investigates the external cues, internal processes, and subsequent responses associated with BNPL adoption.

In the context of BNPL, the "Stimulus" component might refer to different marketing and environmental variables that customers are exposed to. These stimuli may include BNPL providers' promotional efforts and advertising and the availability and visibility of BNPL alternatives during the online purchase process. Furthermore, the perceived ease, flexibility, and financial benefits of BNPL might operate as external triggers to influence customer attention and interest. The "Organism" component describes the internal processes in the consumer's mind in reaction to these inputs. This comprises cognitive processes such as weighing the possible advantages and hazards of utilizing BNPL, analyzing one's financial status, and deciding whether to use BNPL. Affective processes such as emotions, attitudes, and perceptions toward BNPL providers and the perceived trustworthiness of these services can all impact the consumer's internal state. The "Response" component of the S-O-R paradigm refers to the observable behaviors or activities that consumers engage in due to the internal processes activated by stimuli. In the case of BNPL, these answers might include embracing or rejecting BNPL services, utilizing BNPL for purchases regularly, handling BNPL money responsibly, or making word-of-mouth recommendations or criticisms of BNPL.

Understanding the relationships between these components enables BNPL providers and retailers to create effective marketing strategies and environmental cues (S) that positively influence consumers' internal processes (O), resulting in favorable responses (R), such as increased adoption, responsible usage, and positive word-of-mouth. Furthermore, researchers may utilize the S-O-R framework to investigate the variables contributing to BNPL's rising popularity and indicate potential risks or concerns that may influence customer behavior toward these services. The S-O-R theoretical framework is valuable for understanding the intricate interplay of external stimuli, internal processes, and consumer behavior in the context of the growing BNPL business.

2.2 The Intention to use BNPL

Previous studies have found a number of characteristics that influence customer acceptance of BNPL services. One of the critical factors driving BNPL adoption is its ease of use and versatility (Mikael et al., 2022). BNPL enables customers to make purchases without paying the whole amount up front, instead spreading payments over time, frequently in interest-free installments (Bhatia and Golaka, 2022). This flexibility attracts customers who may not have immediate funds accessible or desire to manage their cash flow more efficiently. Financial limitations and restricted access to standard loan options have also contributed significantly to BNPL's intention to use. Many customers, particularly younger generations, experience financial difficulties and struggle with credit card debt or lack a strong credit history (Rau *et al.,* 2021). BNPL services offer a more accessible payment method than traditional credit choices, as they frequently have less severe credit checks and approval processes (Lodewijkx *et al.,* 2023). This makes BNPL an appropriate option for those who may not be eligible for regular credit cards or loans. Effective marketing and promotional tactics by BNPL providers have also contributed significantly to uptake. BNPL firms have created alliances with merchants, used influencer marketing, and provided appealing incentives like discounts or cashback awards (Kearney and Saren, 2021). These techniques have helped to raise knowledge and exposure for BNPL services, making them more desirable and accessible to customers. Furthermore, some customers see BNPL as a form of budgeting that provides greater control over their expenditures. By splitting down payments into smaller installments, BNPL may assist clients in better managing their money and avoiding overspending. The apparent benefit of better planning and spending management has prompted consumer adoption of BNPL.

Consumers' decision to use BNPL services can also be influenced by their trust in the providers and the perceived dangers of these services, such as late fees or credit repercussions (Rau *et al.,* 2021). Consumers may be more willing to use BNPL if they believe the providers are trustworthy and the related risks are controllable or small. Furthermore, the COVID-19 pandemic can increase BNPL adoption as customers confront financial uncertainty and seek other payment choices (Hultman *et al.,* 2022). The pandemic also caused a spike in internet purchasing, where BNPL choices are more clearly displayed, exposing customers to these services. While BNPL provides convenience and flexibility, it also includes significant risks, such as the temptation to overspend, the

accumulation of debt, and the threat of late penalties or bad credit consequences if payments are missed (Lodewijkx *et al.,* 2023). Users must use BNPL services responsibly and understand their terms and conditions to avoid financial troubles. However, the influence of privacy concerns and trust on customer sentiments about BNPL remains uncertain. Because of the frequent hacking and leakage of customers' personal data, privacy issues and trust have continually been raised in the online environment (Roh *et al.,* 2022; Wang *et al.,* 2020).

2.3 Hypothesis Development

2.3.1 The effects of perceived ease of use and subjective norms

Subjective norms are defined as the social pressure or influences people have to go through when deciding to use or not to use a product or a service (Raj *et al.,* 2023). People tend to rely on reviews and opinions from others who are significant to them when they don't understand a system and accordingly gain trust toward that system (Li *et al.,* 2008). Subjective norms can strengthen a potential customer's trust regarding guidance from friends, peers, and superiors and affect their feelings about a product or service (Yang *et al.,* 2017). Considering the circumstances of emerging nations, we anticipate that as the penetration rate of BNPL increases, individuals will progressively accept this technique while continuing to trust the conventional (i.e., cash on delivery). Because societies in these nations have a substantial influence on consumers' adoption of new goods and services (Dholakia and Talukdar, 2004; Kaman, 2008; Parashar et al., 2008; Shukla, 2011; Souiden et al., 2011b), we anticipate that SN will have a direct beneficial impact on customer trust. Users' trust in BNPL services can also be positively influenced by their friends, family, or peers' approval. Hence, we hypothesize:

H1: Subjective norms are positively associated with Trust

Privacy risk is "the possibility that personal information about individuals will be used in ways that are harmful or objectionable to them" (Solove & Schwartz, 2014, p. 36). Social validation within an individual's social circle can affect views of BNPL services since social norms and attitudes determine one's faith in this payment method. Positive reviews and peer recommendations might strengthen trust in BNPL providers, lowering perceived privacy concerns about providing personal and financial information. In short, if an individual's social circle views BNPL as a convenient and trustworthy payment alternative, it may lessen the perceived privacy concerns associated with exchanging personal and financial information with BNPL providers (Rau *et al.,* 2021). Conversely, adverse subjective norms or doubt from one's social group could compound the perceived privacy risk associated with BNPL adoption (Lodewijkx *et al.,* 2023). Therefore, we developed the following hypothesis:

H2: Subjective norms are negatively associated with the perceived privacy risk of BNPL services

Ajzen and Fishbein (1980) found that subjective norms are essential in molding people's attitudes about certain services. Furthermore, empirical studies in consumer behavior, such as those conducted by Kim and Johnson (2016), consistently found a positive relationship between subjective norms and attitudes toward various financial services, implying that perceptions of social approval or disapproval influence attitudes toward BNPL services. As a result, subjective norms have a beneficial influence on attitudes regarding BNPL services because people are more likely to adopt positive views when they sense social acceptability within their social circles. In contrast, unfavorable subjective norms or skepticism from one's social group may contribute to adverse views regarding BNPL adoption (Bhatia & Golaka, 2022). As a result, we estimate that higher levels of subjective norms will lead to more positive sentiments regarding BNPL adoption. Hence, we hypothesize that:

H3: Subjective norms are positively associated with attitude towards BNPL services

Perceived ease of use influences consumer attitudes since it can promote favorable views. A system's perceived ease of use refers to the extent to which a user believes that using it will require no effort. Usage volume and user-system interaction can also indicate ease of use. The criteria below can be used to assess perceived ease of use: simplicity of use, ease of learning, ease of operation, and skill development. Customers will be more favorable to technology if they feel it is straightforward to use, understand, and operate (Sularso, 2012). The perceived ease of use of an application might impact approval or rejection feelings. Customers will accept or exhibit a good attitude toward a newly launched application if they believe it to be user-friendly (Rifa'i, 2019). As a result, we put forth a hypothesis:

H4: Perceived ease of use is positively associated with attitudes

Perceived ease of use (PEOU), a fundamental element in the technological adoption framework, is an individual's belief that utilizing a particular technology requires minimal cognitive effort (Davis, 1989). During pre-purchase assessments, an e-service that seems simple to learn, comprehend, and use should reduce customer uncertainty

and total risk. Although preliminary evidence for this broad risk-reduction impact has been identified in the context of e-services (Featherman *et al.,* 2006), it is still being determined whether PEOU serves to lower estimated levels of privacy risk in particular. An equivalent line of study indicates that a well-explained and easy-to-understand website (i.e., one likely to receive a high PEOU rating) boosts consumer trust in an e-commerce business (Gefen *et al.,* 2003). Because subsequent research has shown that trust and risk (as well as trust and security/reliability concerns) are inversely related (Pavlou, 2003; Pavlou and Gefen, 2004), this line of research suggests that, in addition to increasing consumer trust, PEOU also reduces consumer perceived risk levels, as well as security and reliability concerns. Thus:

H5: Perceived Ease of Use is negatively associated with Privacy Risk

H6: Perceived Ease of Use negatively associated with Trust

2.3.2 The effects of attitude, privacy risks and trust on the intention to adopt BNPL

Ajzen (1980) defines attitude as a person's favorable or unfavorable judgment of specific conduct, which is impacted by ideas about a product or service (Hamid *et al.,* 2023). Attitude can impact intention (Raj *et al.,* 2022; Roh *et al.,* 2022; Singh *et al.,* 2021; Wang *et al.,* 2020) and the motivation behind the customer's decision to attend any activities (Ajzen, 1980). Moreover, a happy attitude appreciates customers' intentions (Wang *et al.,* 2020). When users suppose BNPL is a useful tool for affordable purchasing, it will lead to a favorable attitude and increase their willingness to use it. Therefore we propose:

H7: Consumer attitude is positively associated with intention to use BNPL.

Trust includes customer assurance, dependence, and belief and is an essential element between customers and firms (Roh *et al.,* 2023). Customers tend to trust providers who act in their best interest, fulfill commitment and offer high-quality goods or services (Wang *et al.,* 2020). According to Zhou (2011), initial trust will motivate the intention to use, while it is also mentioned that trusting someone will result in a positive intention toward that person (Aydin and Ozer, 2009). Customers are allowed to see the value of mobile banking and the intention to use it if they have trust in a bank (Gu *et al.,* 2009). Moreover, trust positively impacts attitude, which leads to intention being influenced by reducing the fear of opportunistic behavior (Pavlo, 2003). Hence, we state the hypothesis:

H8: Consumer trust is positively associated with intention to use BNPL.

Privacy risk is the uncertainty that can lead to negative results in using a particular service or product and is associated with the probability of losses from leaking personal information (Zhou, 2012). Moreover, users fear that their personal information might be shared with other third parties without their awareness, which decreases their intention to use the service. According to Gupta et al. (2010), privacy risks may have a negative impact on the intention to continue using the service as consumers are becoming more self-reliant about protecting their personal information from third parties. People tend to stop using a platform and implement proactive information protection methods when doubting a company’s information security. Therefore, we propose the hypothesis:

H9: Privacy risk is negatively associated with intention to use BNPL.

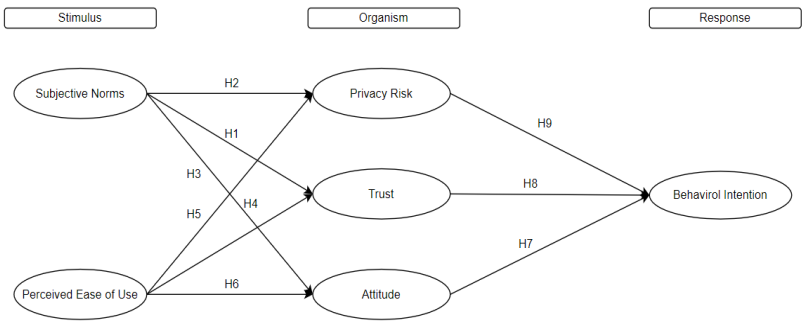

Figure 1: The proposed model

3. Methodology

3.1 Sampling and Data Collection

As the research aims to explain young consumers' behavior, we target undergraduate and postgraduate students in Vietnam. Scales from previous studies were adopted for the research. Three items adopted by Cheng et al. (2006) measured perceived ease of use. The subjective norm was measured by three items from Wu and Chen (2005). Privacy risk was measured by the scale of Aldas-Manzano *et al. (2009) with four items. Trust was measured with four items using the scale developed by Hsu et al.* (2014). Finally, "Attitude" and "Behavior Intention" were measured by adopting the scale of Cheng *et al.* (2006) with 4 and 3 items, respectively. All items were measured using the 5-point Likert scale, with 1 indicating "strongly disagree" and 5 indicating "strongly agree".

Before surveying, our team conducted a pilot test to test the wording and the reliability of the scales. After finalizing the questionnaires, it was made into Google forms and sent out through social media and school websites from 30th January 2024 to 30th February 2024. To make sure that the participants have an understanding of the BNPL feature in e-wallet, a filter question (Do you know about BNPL features in e-wallet apps such as Momo, Shopeepay, etc.) was asked at the beginning of the questionnaires. A BNPL description is also mentioned in the introduction to ensure participants have enough knowledge to complete the questionnaires. Participants who chose " I don't know about BNPL in e-wallet" or the e-wallet app that does not have a BNPL feature were excluded from the survey. Participants who know about BNPL will be asked questions about factors affecting their intention to use BNPL.

There were 435 answers in total, with 5 invalid ones. Table 1 below shows the detailed descriptive statistics of the sample population.

Table 1: Descriptive Statistics

		Frequency	Percent
Gender	Male	233	54.19%
	Female	197	45.81%
Age	Under 20	177	41.16%
	20 - 29	204	47.44%
	30 - 39	39	9.07%
	40 - 49	10	2.33%
	50 - 59	0	0%
	Above 60	0	0%
Education Level	High School or below	0	0%
	College	370	86.05%
	Master or above	60	13.95%

3.2 Analysis

"Partial least squares path modeling" (PLS-PM) technique was used in this study since the collected data was not normally distributed, and it's a suitable method for investigating non-normal data (Hair *et al.,* 2019). SmartPLS 4 was used to conduct the PLS-PM and "Statistical Package for Social Sciences" (SPSS) for descriptive statistical analysis.

The measurement model is evaluated based on reliability and validity. Reliability is assessed through specific measures such as Cronbach's alpha reliability and composite reliability (CR). In contrast, validity (including convergent and discriminant validity) is assessed through the average variance extracted (AVE) and the heterotrait-monotrait (HTMT) ratio.

Table 2: Reliability measures: Cronbach's Alpha, CR, AVE

	Cronbach's Alpha	rho_A	Composite Reliability	AVE
SN	0.702	0.726	0.798	0.579
PEOU	0.863	0.874	0.916	0.785
PR	0.853	0.926	0.903	0.707
A	0.907	0.915	0.935	0.783
T	0.746	0.900	0.802	0.533
BI	0.916	0.917	0.947	0.857

The analysis results from Table 2 show that the square root of the AVE for each concept is greater than the correlation coefficients between latent variables. Therefore, the concepts achieve discriminant validity.

Table 3: Results of the HTMT ratio test for the measurement model

	A	BI	PEOU	PR	SN	T
A						
BI	0.686					
PEOU	0.791	0.761				
PR	0.671	0.640	0.723			
SN	0.391	0.721	0.422	0.335		
T	0.689	0.594	0.646	0.579	0.299	

It also examined the HTMT ratio (Table 3), which shows that all concepts have HTMT ratios below 0.9. This indicates that the concepts achieve discriminant validity.

4. Results and Discussion

4.1 Results

To verify the empirical nature of the theoretical model, we used the bootstrapping technique in SmartPLS for t-statistics tests to clarify the relevance of the path coefficient. Before this, the collinearity statistic was performed to check the model's collinearity problem. The result demonstrates that the VIF value ranges from 1.176 to 2.245, all lower than 3.3. Therefore, it indicates that the multicollinearity phenomenon among the independent variables does not affect the hypothesis testing or cause bias or flip regression coefficients (Kock *et al.,* 2012).

Table 4: Collinearity statistics (inner VIF)

	A	BI	PEOU	PR	SN	T
A		2.245				
BI						
PEOU	1.176			1.176		1.176
PR		1.671				
SN	1.176			1.176		1.176
T		2.081				

The result of the bootstrapping test confirmed that there is a positive relationship between Subjective norms and Attitude (β = 0.145; p = 0.001), between Perceived Ease of Use and Attitude (β = 0.654; p = 0.000), between Attitude and Intention to use (β = 0.267; p = 0.000), between Trust and Intention to use (β = 0.267; p = 0.000). These results show that hypotheses H3, H4, H7, and H8 are all supported. Meanwhile, there is a negative relationship between Subjective norms and Perceived privacy risk (β =-0.110; p = 0.007), between Perceived Ease of Use and Perceived privacy risk (β = -0.608; p = 0.000), between Perceived Ease of Use and Trust (β = -0.608; p = 0.000), between Perceived privacy risk and Intention to use (β = -0.269; p = 0.000). Thus, the result confirmed that H2, H5, H6, H9 is accepted. However, the result rejected H1, meaning that Subjective norms are not positively associated with Trust (β = -0.269; p = 0.000).

Table 5: SEM results and hypothesis testing

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values	Conclusion
A -> BI	0.267	0.269	0.057	4.698	0.000	Accept
PEOU -> A	0.654	0.652	0.041	16.025	0.000	Accept
PEOU -> PR	-0.608	-0.605	0.036	16.963	0.000	Accept
PEOU -> T	0.659	0.656	0.039	16.740	0.000	Accept
PR -> BI	-0.269	-0.267	0.048	5.591	0.000	Accept
SN -> A	0.145	0.147	0.042	3.486	0.001	Accept
SN -> PR	-0.110	-0.115	0.041	2.692	0.007	Accept
SN -> T	0.028	0.035	0.045	0.613	0.540	Reject
T -> BI	0.284	0.285	0.050	5.639	0.000	Accept

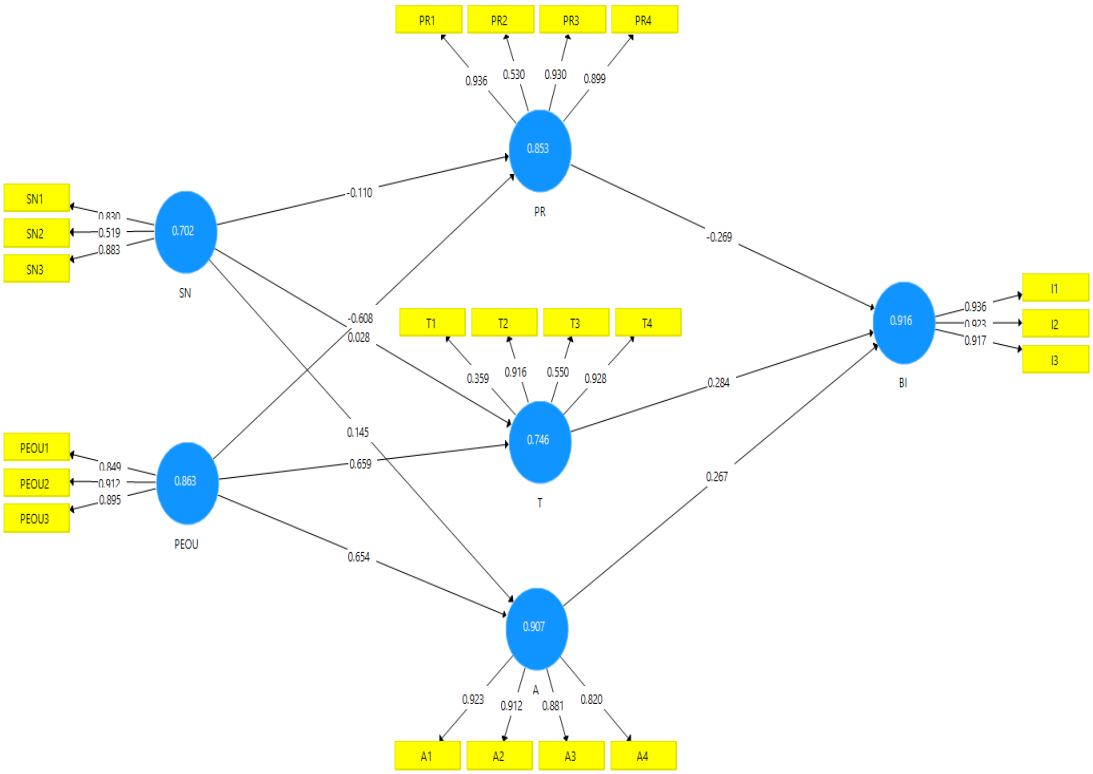

Figure 2: Structural Model

4.2 Discussion

In previous studies, several factors have been proposed to have a significant impact on consumers' intention to use online services, including trust (Wang *et al*., 2020), perceived risk (Penney *et al*., 2021), attitude (Relja *et al*., 2023), and privacy concerns (Raj *et al*., 2023). Therefore, we applied SOR (Stimulus-Organism-Response) as a base model to investigate the influence of attitude, trust, and privacy risk on consumers' behavioral intention in adopting the BNPL feature on e-wallet applications.

This study contributes to the literature by exploring the factors influencing Generation Z's intention to use BNPL integrated within e-wallets. The results indicate a positive impact of perceived ease of use on attitude and trust, suggesting that consumers will be more likely to adopt BNPL when they perceive that using BNPL services is easy, straightforward, and requires minimal effort. This finding is consistent with the conclusion reached by other studies in another context, including online payment (Yang *et al*., 2015), mobile banking (Makanyeza, 2017), and mobile money (Penney *et al*., 2021). Similarly, the positive impact of subjective norms on attitude and trust points to an essential role of social influence in shaping consumer perceptions and their intention towards the BNPL feature. In that case, consumers might believe their friends, family, or peers would approve of their decision to use BNPL services because they trust the provider's credibility (Raj *et al*., 2023).

The results also revealed that perceived ease of use has a negative impact on privacy risk. This means that while consumers find BNPL easy to use, they associate it with higher privacy risks. Alongside the convenience of BNPL, consumers may have concerns about the potential risks of losing their personal and financial information within the digital ecosystem. Exploring the negative impact of perceived ease of use on privacy risk is a significant contribution, demonstrating that enhancing ease of use can reduce privacy risk when using BNPL on e-wallets. Furthermore, this finding indicates that privacy risk hurts the behavioral intention to use the BNPL feature. This emphasizes the importance of privacy issues as a result of hacking and the unauthorized disclosure of consumers' data (Wang *et al*., 2020) and implies that if consumers believe the BNPL feature is associated with privacy risk, their behavioral intention to adopt it is weakened.

5. Conclusion

The study investigates significant factors affecting BNPL adoption within e-wallet applications through the SOR theoretical framework. According to our research, perceived ease of use and subjective norms enhance attitudes

and trust toward BNPL features, while privacy risk discourages the formation of consumers' behavioral using intentions. Therefore, to encourage widespread adoption of BNPL features in e-wallet applications, e-wallet providers should prioritize improving ease of use, leveraging social influence, and mitigating privacy risks.

Abstract: The study examines the entrepreneurship pedagogy and support landscape in secondary schools in Kaduna metropolis. Through the application of qualitative and quantitative methodologies, critical stakeholders including teachers, quality directors, school principals and proprietors were interviewed to determine the state of entrepreneurship education/training in Nigeria, using Kaduna metropolis as case study. Findings reveal poor articulation of national entrepreneurship curriculum, inadequate facilities and resources in the schools visited. Subsequently, some far-reaching suggestions and recommendations were offered to improve entrepreneurship pedagogy in Nigeria in general.

Keywords: Entrepreneurship education, Secondary school, Nigeria, Kaduna, Curriculum

1. Introduction

The impact of entrepreneurial activities and the creation of new businesses on the economic growth of a country and the generation of jobs are recognised worldwide (Sánchez, 2012). Some studies (e.g., Olokundun et al., 2014; Ojo, 2021) have surmised that entrepreneurship competence is relevant for all areas of working and business life, in both new and established activities and enterprises. It is expected that job creation will increase when young people (e.g., secondary school students) are given sound entrepreneurship education and training, for it is today's pupils and students that will create the values and workplaces of the future. It is due to its importance that governments all over the world are paying attention to entrepreneurship education and ensuring its inclusion into schools and colleges curriculum. The key concepts of entrepreneurship can be taught at any time in a person's life, but the values and attitudes that produce a successful entrepreneur are more likely to develop if they are explored and nurtured at a tender age. Teaching children (and young people) about entrepreneurship offers a career path, but more importantly, students learn of the economic and social benefits that entrepreneurs provide to their families, to their communities and their country (Appalachian Regional Commission, 2004).

Nigeria is experiencing a youth bulge (UNDP, 2018) such that the country is regarded as a 'country of the young' with almost half the entire population (46%) currently under the age of 15 (UNICEF, 2019). A sizeable percentage of these young people are especially vulnerable and live in extreme poverty (Ojo, 2019). According to Virk et al. (2024), Nigerian youth face multiple challenges, including poverty, unemployment, and underemployment, limited educational opportunities, and health challenges. The challenges facing Nigeria today is to make education meaningful and more inclusive to this set of young people around the country. Education is widely accepted as one of the most critical means of overcoming the challenges of development, poverty, and inequality. But, from every available study and statistics youth (and general) unemployment is endemic in Nigeria. For example, 55.4% of young people aged 15% to 35% are without work in Nigeria (Al Jazeera, 2019). The number of out of school children and unemployed youth/teenagers in the country is alarming. For instance, there are 727,000 out-of-school children in Kaduna State alone (Alhassan, 2019). The facts on the ground (e.g., high youth unemployment figures, business failures, extreme poverty, etc.) could indicate weak uptake of entrepreneurship among the youth. Subsequently, it could be inferred that the effectiveness of entrepreneurship education in Nigeria's institutions of learning are far from being satisfactory; such that the current quality of education in the country leaves much to be desired.

Studies (e.g., Ajagbe et al., 2016; Ojo, 2021) suggest that the development level of entrepreneurship education and training in many centres of learning in Nigeria may not be mature enough to meet the needs of entrepreneurial practice. Therefore, the perfection of the entrepreneurship education and training system is essential to raise the level of entrepreneurship education and training for the promotion of the entrepreneurial qualities and abilities of students and learners. Invariably, effective entrepreneurship education and training will be particularly useful in a state like Kaduna, which is battling with the challenges of the social menace posed by unemployed youths (Akhaine, 2016). Thus, the key question on focus is: What is the state of entrepreneurship education in Kaduna secondary schools? But the specific question is: Do the current entrepreneurship education

methods and implementation effective in secondary schools in Kaduna? The paper is organised into five sections: (a) conceptual framework - entrepreneurship education, and training (b) contextual interrogation - challenges of entrepreneurship education in Nigeria (c) methodology (d) findings and analysis (e) summary, implications, recommendations, and conclusion.

2. Conceptual Matters - Entrepreneurship Education and Training

Nowadays, entrepreneurship educators view entrepreneurship as a valid concept in all human activities, not just in business (Kirby, 2004). Accordingly, entrepreneurship is defined broadly, including enterprising behaviors, even outside the business context. But the key question remains - can entrepreneurship be taught? According to some authors (e.g., Low, 2001; Woollard et al., 2007), entrepreneurship can indeed be taught and learned though its success depends on internal (individual) and external (contextual) factors (Davidsson, 2003), and should also be related to the development of entrepreneurial behaviour (Fayolle & Gailly, 2013). In this sense, an enterprising person may not necessarily be an entrepreneur and his/her skills and characteristics may be exercised in different contexts (e.g., in a social context as a family or local community) instead of in the market. The academic training aspect of entrepreneurship is important to expose students to new ideas and trends in management and business in the process of obtaining a formal education. In the fast-changing competitive environment, it is no longer enough to know how to perform a specific activity. The ability to create new knowledge is also vital. Entrepreneurship education and training enhance an entrepreneur's absorptive capacity, thereby also influencing his/her capability to acquire and create new knowledge and enabling him/her to better articulate and structure the knowledge-transfer process. The theoretical knowledge in entrepreneurship education/training should emphasise skills like critical thinking, creativity, communication, user orientation, and teamwork as well as using domain-specific and linguistic knowledge. Hitherto, a positive impact of entrepreneurship education on entrepreneurial outcome measures has been reported in many studies. For instance, in a review of literature, Mwasalwiba (2010: 35) found that most studies agreed that "entrepreneurship education has some positive impact on students." Similarly, scholars such as Martin et al. (2012) found a significant relationship between entrepreneurship education and entrepreneurship skills, intentions, and outcomes, although there were potential pitfalls in methodologies in most of the studies (Lorz et al., 2013).

Nevertheless, there are several approaches to teaching entrepreneurship as various researchers proposed assorted methods in delivering entrepreneurial knowledge and skills to students (Fiet, 2000a; Fiet, 2000b). Some of these approaches extended from conventional methods such as textbooks (Fiet, 2002), examinations (McMullan & Cahoon, 1979) to unconventional methods like a business plan (Audet, 2000), life histories of working entrepreneurs (McKenzie, 2004); guest lectures (Klandt & Volkmann, 2006), and field study or visits to business organisations (Cooper et al., 2004). Notwithstanding the differences in curriculum and delivery approaches, the ultimate aim of entrepreneurial programs is to stimulate entrepreneurship awareness among students to increase their interest in entrepreneurship. Taken together, the debate has moved beyond whether entrepreneurship can or should be taught to focus on how to constantly improve entrepreneurship content and delivery to meet the needs of students (e.g., Gendron, 2004).

3. Contextual Interrogation - Challenges of Entrepreneurship Education in Nigeria

Ojo (2021) contends that education in general, and secondary education in particular, seems not to have been properly structured in Nigeria. For instance, the philosophy of self-reliance such as creating a new cultural and productive environment that will provide occupational orientation, technology acquisition, job creation and work discipline is lacking. The failure of secondary education to inculcate these ideas in students has led to wastages in terms of both human and natural resources. This is because youths are not sufficiently equipped with the skills to utilise the natural resources around them (Ojo, 2021). Likewise, Genty et al. (2014) argue that, though there exist several entrepreneurial training institutions in Nigeria, there is no sustainable entrepreneurship system in place. This is because most entrepreneurial training institutions adopt the traditional model of entrepreneurship training. The traditional model of training is either theoretically orientated or geared towards practical skills development. Hence, students and trainees do not acquire creativity and innovation skills and lack risk-taking aptitude. As such, entrepreneurship students and trainees are not proactive in nature and their ability to identify business opportunities is inadequate (Genty et al., 2014). Olokundun et al. (2014) also suggest that the problem of entrepreneurship education in Nigeria seems to be inappropriate structuring. For instance, the philosophy of self-reliance such as creating a new cultural and productive environment that will provide occupational orientation, technology acquisition, job creation and

work discipline seems to be lacking. The failure of entrepreneurship education to inculcate these ideas in students has led to wastage in terms of both human and natural resources.

Moreover, in many institutions and training centres in Nigeria, there seems to be little understanding of what entrepreneurship education and training is or should be. For instance, many academics and trainers equate entrepreneurship with vocational training, and as such, artisans are engaged to teach/coach students/learners vocational trades like carpentry, mechanics, bakery, catering, photography, etc. Likewise, most academics do not perceive themselves as entrepreneurs and they tend to be uni-disciplinary and entrench themselves firmly within their 'academic tribes'. The inadequacy of entrepreneurship education and training in Nigerian schools has been mentioned in the literature. For example, previous studies (e.g., Mohammed, 2015; Olokundun et al., 2014) have found that some schools in Nigeria offer entrepreneurship education that was not effective at motivating students to start their businesses. This is largely because the method of teaching was not practical oriented and lacked real-life experience.

4. Methodology

Both quantitative and qualitative approaches were used in a two-phase mixed methodology in this study. The adoption of a quantitative research design, in which a questionnaire was used as a research instrument, allows data collection that permits anonymity and precludes possible interviewer biases. This research design also allows a respondent sufficient time to consider answers before answering and encourage more respondents to participate in the study (Kumar, 2014). The use of many respondents/participants in a study permits generalisation and data provided by questionnaires are easy to analyse and interpret compared to data obtained from qualitative data (Kumar, 2014). Besides, the anonymity around the application of the questionnaire tends to elicit information that may not be obtained through other methods. Thus, in phase 1 of the fieldwork, a quantitative approach was applied.

On the other hand, the qualitative design was applied in Phase 2 since it aligns largely with the aims and objectives of the study, which principally focussed on examining the dynamic qualities of entrepreneurship education in secondary schools in the Kaduna metropolis. Informants were purposively selected from Kaduna State Ministry of Education's three Zonal Quality Assurance Divisions, namely, Sabon Tasha zone, Rigachukun zone, and Abakpa zone to ensure adequate representation.

Phase 1

The main questionnaire is broken up into two sections. Section 1 focuses on personal questions, which are effectively 'qualifying' questions concerning teaching entrepreneurship. The section also relates to the geographic (location), demographics, the experience, and qualifications of the teachers. Section 2 deals with the actual, 'where', 'what', and 'how' the teachers teach entrepreneurship in the classroom. The section also has questions on the curriculum, teachers' interpretation thereof, and the extent to which teachers deviate from the theoretical curriculum and introduce a 'practical' element. To ensure the validity of the instrument used three experts in the subject area were approached for their comments. They were asked to examine the instrument with regard to its relevance to the study, technicality and clarity of the items in describing issues of entrepreneurship education/training in secondary schools in Nigeria. The researchers amended the instrument in line with their comments. To maximize the reliability of the instrument, the researchers ensured that questions were unambiguously framed to enhance clarity of apprehension and meaning.

Phase 2

The second stage of the methodology is the face-to-face interview sessions with fifty (50) selected respondents from the three categories of interest; zonal education quality directors (2), school principals (14), and entrepreneurship teachers (34). The questions were open-ended to facilitate much deeper interrogation. The qualitative approach largely helps to deeply examine the dynamic qualities of entrepreneurship education in secondary schools in Kaduna. The follow-up interviews were conducted to assess the qualitative data received in the survey.

4.1 Data Collection Process

Participants' responses were collected, collated, and analysed. The researchers referred back to the respondents if reasons are not clear or a reason has emerged that the researchers were unaware of its existence (Saunders et al., 2012). A convenient sample of sixteen (16) schools was selected from the three zonal quality assurance divisions in the Kaduna metropolitan area as described above. Five schools were randomly selected from each zone; however, Queen Amina College (Sabon Tasha zone) was added because it is a girls' boarding secondary

school and one of the best and oldest (established in 1940) secondary schools in Northern Nigeria (Opera News, 2021). Next, eight (8) private secondary schools were selected through referrals, and four (4) secondary schools owned by the military were also added to add depth to the samples. A total of twenty-eight (28) secondary schools were in the sample list.

Questionnaires were administered to teachers of entrepreneurship in all the selected twenty-eight secondary schools. The schools were grouped under three rubrics: Public, private, and military-owned schools. There are sixteen (16) schools from the public category, four (4) from the military-owned schools, and eight (8) from the private category. The schools were selected based on certain considerations, the first is the security consideration. Due to the high level of insecurity in Kaduna in general and around schools in particular (Gabriel, 2021), only schools within the Kaduna metropolis were chosen. The second criterion is the schools must have both junior secondary school (JSS) and senior secondary school (SSS) levels as some schools only have the JSS level. Schools under the public category are clustered into three zonal quality assurance divisions: Rigachukun zone, Sabon Tasha zone, and Abakpa zone.

Our respondents/participants were 84 entrepreneurship teachers, 28 school principals, 3 zonal quality assurance directors, and three private schools' proprietors in the Kaduna metropolis. All the 84 teacher-respondents were given a survey questionnaire to fill, and the researchers carried out 50 face-to-face interviews comprising 34 teachers, 14 principals and 2 zonal quality assurance directors. Each interview lasted between 30 to 45 minutes. The researchers paid due attention to ethical issues. All the respondents/participants gave informed consent approval and were assured of confidentiality and anonymity. For the sake of convenience, a standardised, open-ended questionnaire was used to gather data (Cohen et al., 2011). The questionnaire was given to the informants after approval was received from the Zonal Quality Assurances Divisions and individual School Principals. The teachers filled in the responses and returned to the researchers the same day or at a later day. In this way, they were able to respond to the questions at a time most convenient to them (Greeff, 2011). This data collection method had its advantages and drawbacks. The questions were close-ended and prevented detailed prodding; however, this drawback was ameliorated in phase 2's face-to-face interviews.

Content analysis of the national entrepreneurship subjects' curricula was also conducted to identify the structure and challenges they contain in providing useful guidelines for teaching entrepreneurship in secondary schools. This helped to enhance methodological crystallisation (Strydom & Delport, 2011). Respondents/participants' responses were collected, collated, and analysed. However, it must be mentioned that the quantitative data collected were analysed and converted into meaningful and acceptable information by the use of simple percentages scores.

5. Results and Discussions of Findings

Following the completion of the fieldwork, scores were collated from the questionnaire forms and field notes from interviews with the respondents of the schools visited, into a dataset. Three main themes were distilled from the data, these are dysfunctional entrepreneurship curriculum calibration, the landscape of entrepreneurship education in Kaduna secondary schools, and resources and state of resources in Kaduna secondary schools.

5.1 Dysfunctional Entrepreneurship Curriculum

Findings reveal that the current national curriculum and methods of teaching in many schools in Kaduna metropolis are defective and not fit for purpose. First, there is no uniformity in the structure or organisation of entrepreneurship elements of the various 'entrepreneurship subjects' listed in the national curriculum. For instance, the themes for the subjects are not uniform; while some emphasise classroom pedagogy (e.g., Radio, Television and Electronic), a few others highlight practical actions (e.g., Haircare and Hair Products). In some modules, students' activities include a visit to business premises. Yet, students' activities for some hands-on modules/subjects do not mention visits to existing businesses. For example, practical-oriented modules/subjects such as Plumbing and Pipefitting listed actions such as (a) participate in grouping to show the differences between the organisation of the business units (b) attempt solving problems on record keeping and books of entries in small scale business transactions. There is no mention of visits or invitations of experts as guest lecturers.

Furthermore, the contents of some entrepreneurship modules/subjects do not align with the listed students' activities. For example, there is a disparity between the contents of Entrepreneurship in Salesmanship module mentioned in the curriculum, such as (1) Documents of trade (2) Terms of trade (3) Balance of payment; and students' activities listed for the module, which includes: (1) defines entrepreneurs and entrepreneurship (2)

Lists difference between the two concepts (3) List the problems associated with entrepreneurship (4) Explain how a salesman can be a successful entrepreneur.

Aside from the incongruity of the curriculum, researchers also noticed that entrepreneurship teachers and school managements in many of the schools visited do not align their teachings to the curriculum. Some of the reasons adduced include inadequate finance, especially in carrying out practical aspects of the module/subject (e.g., Agriculture – fishery, catering and craft practice). In addition, a lack of qualified entrepreneurship teachers was mentioned.

5.2 The Landscape of Entrepreneurship Education in Kaduna Secondary Schools

In Nigeria, three distinct groups are involved in the development and promotion of entrepreneurship education programs in secondary schools. These are the governments (Federal and State), Non-governmental agencies (NGOs), and private institutions/organisations (mostly private schools). Secondary entrepreneurship education programs and curriculum, thus, differ both in consistency and form. Some secondary schools in the State may have a state-wide curriculum, while others rely on resources available at a particular school. In the latter case, an experienced or particularly interested teacher/instructor might offer an entrepreneurship course in one school that is not available elsewhere in the State.

Generally, the teaching approach in most of the schools visited relies heavily on classroom lectures (i.e., theorising), only a handful of the schools engaged students in practical aspects of entrepreneurship education. Such practical aspects include applied tutoring, visits to real-life businesses, training excursions, and workshop/studio activities. These events and activities, which will help students to gain practical experience, have basis in learning theories such as action learning (Revans, 2011), problem-based learning (Barrows & Tramblyn, 1980), and experiential learning (Kolb, 1984). Invariably, the introduction of these learning theories in entrepreneurship education (e.g., Scott et al., 2016) has amplified focus on the role of experience in the learning process (Mandel & Noyes, 2016). It was Freire (1996: 68-69) who argued that "learning comprises both an active side and a passive side, where mere action only leads to activism and mere reflection leads to verbalism".

Consequently, students that are largely meant to imbibe the character and attitudinal disposition of entrepreneurs through hands-on entrepreneurial training events end up with only classroom entrepreneurship theorising. Thus, the main goal behind the national entrepreneurship education program appears to be defeated. This main goal aspires to develop students morally, mentally, and physically and to imbue them with the highest ideals of self-sufficiency, and self-efficacy to produce youths who are independent-minded and have the potential to develop an entrepreneurial mind-set to generate jobs for themselves and others.

5.3 Resources and State of Resources in Kaduna Secondary Schools

Resources available for the delivery of quality entrepreneurship education in Kaduna secondary schools as observed and evaluated during the fieldwork are revealed in this section. Resources are classified under two widely used templates – tangible and intangible. The tangible resources include physical structures such as classrooms, teaching facilities (e.g., interactive board, projectors), finance, and entrepreneurship teachers. Intangible resources include such things as teachers' experience (teaching and entrepreneurship), motivation, and capability. These items are discussed below.

5.4 Tangible Resources: Physical Structure and Condition of Schools and Teaching Facilities

The physical conditions of many of the schools, especially the government-owned schools, visited are not in good shape. Some schools' buildings have no roof (or leaking roofs) and students are at the mercy of the weather elements. Facilities such as classrooms, workshops, teaching aids and tools (e.g., interactive boards) are either not available or in deplorable conditions, particularly in many government-owned schools. Insufficient equipment necessary for entrepreneurship education coupled with non-optimisation of the few available ones is noted in many of the schools visited. Inadequate facilities are not limited to government-owned schools but cut across all categories of schools visited. Most schools (i.e., government schools) have over-crowded students and the number of entrepreneurship teachers in most schools (all categories of schools) is not adequate.

5.5 Intangible Resources: Relationship, Experience, and Capability of resource Personnel

There is a general lack of motivation amongst entrepreneurship teachers in government schools compared to teachers in private or military schools. For example, entrepreneurship teachers in government schools are not enthused to go the extra length to inspire or encourage students' entrepreneurial spirit. Most are unwilling to

organise students' visits to local businesses or invite role models to give lectures or engage students in entrepreneurial activities outside the school hours (compared to teachers in some private schools). For instance, none of the government-owned schools took the researchers' offer to give free entrepreneurship lectures to students as a goodwill gesture. Yet, this offer was enthusiastically accepted by all the private schools and most of the military-owned schools visited. In addition, some entrepreneurship teachers in the private schools do organise informal entrepreneurship training and encourage skills acquisition activities for students outside the class hours/period.

A major finding during this research is the realisation of the little or no understanding of the concept of entrepreneurship among almost all the respondents (teachers, administrators, principals, and owners). The general understanding of entrepreneurship among the respondents does not extend beyond business ownership or business start-up. It took the researchers considerable effort to explain the key principles and relatable characteristics of entrepreneurs and entrepreneurship (e.g., innovativeness, hard work, discipline, and entrepreneurial mind-set) that are required to be emphasised in entrepreneurship education/training to the students. It is this mind-set and innovativeness that distinguish entrepreneurs from others (e.g., business owners and managers) and are present in people (e.g., intrapreneurs) who do not own or set up their businesses but exhibit entrepreneurial tendencies that bring value to organisations' activities. Quality entrepreneurship education and skills training can only be achieved, according to Jusoh et al. (2011), through creativity and innovation.

6. Summary, Recommendations and Conclusions

6.1 Summary

This study seeks to understand key issues related to entrepreneurship education in secondary schools in Kaduna metropolis, within the context of entrepreneurial learning, entrepreneurial pedagogy, and entrepreneurial skills acquisition. Towards this end, the study first synthesises the current national curriculum on entrepreneurship and anchors it in the context of entrepreneurship education and training for attaining a quality pedagogical template for students. Studies have shown that secondary schools are an important force influencing innovation systems and entrepreneurship (Fagerberg & Shrolec, 2009). It is assumed that students who are exposed to entrepreneurship education/training at the secondary school level will have basic entrepreneurial knowledge, skills, and attitudes for starting economic, social, or cultural activities for their benefit as well as that of society.

Several issues that render entrepreneurship education and training inadequate in Kaduna State were identified (e.g., weak curriculum, inadequate funding, and inexperienced instructors). It is the case that entrepreneurship education and training ecosystems vary greatly in secondary schools but generally include key building blocks and scaffolds such as the national curriculum on entrepreneurship in Nigerian secondary schools. Given the context of the globalised knowledge economy we live in, it is logical to enrich entrepreneurship education and training field of action for the benefit of all. The attitude we take towards entrepreneurship education and training will have a large impact on economic growth in Nigeria, especially as entrepreneurship promotes individual creativity and economic dynamism. The creation of new enterprises, the commercialisation of new ideas and innovation are essential for the economy. Consequently, education for potential entrepreneurs needs to be robust and coordinated with educational, advice giving, and support programs that help enterprise leadership individuals (e.g., teachers and instructors) or teams understand what it takes to successfully impart knowledge to individuals to be able to manage successful entrepreneurial enterprises. A robust and broader approach will facilitate the efficiency of the investments that individuals, academic institutions, entrepreneurial and small business support organisations and governments make in entrepreneurship education and training events.

7. Recommendations

Flowing from the data and data analysis, this study offers a series of recommendations that can help policymakers leverage the full potential of entrepreneurship education to advance Nigeria's development agenda. Thus, the following abridged recommendations are put forward to enhance entrepreneurship education, particularly in Kaduna State and generally in Nigeria.

- Build a Robust Entrepreneurship Education Ecosystem
- Revamp the National Entrepreneurship Curriculum
- Institute Effective Personal Development Plan Programs
- Create a System of Monitoring and Evaluation

- Facilitate and Encourage Entrepreneurial Activities

8. Conclusions

The Nigerian government has indicated a growing interest in interventions that foster entrepreneurship among the citizenry, making significant investments in entrepreneurship education and training. Positive relationships between entrepreneurial activity and innovation, and between entrepreneurship and job creation have been registered in several research studies. Effective entrepreneurship education offers potential rewards for individuals in both the formal and the informal sectors of the economy as it signifies self-efficacy, potentially more stable income flows, increased profits, and more secure employment. However, the question remains whether entrepreneurship can be taught and, if so, what is the best way to teach it. Several studies have reached mixed conclusions across a variety of outcomes related to entrepreneurship education and training courses. Findings are further complicated by the fact that training and education programs are delivered in diverse socio-cultural and educational contexts.

Nevertheless, the findings of this present study draw on both national and state-specific research, as well as on the experience of teachers/administrators of entrepreneurship education and students of entrepreneurship, using Kaduna as an exemplar. These findings and the others in this study should be very useful in filling some of the critical knowledge gaps that have made it difficult to know what is being taught, how is it taught, and with what general effect. The findings also point to specific gaps in the national entrepreneurship curriculum at the secondary school level. Finally, the study's findings can inform entrepreneurship education policy and program discourse at multiple levels, guide the investment decisions that government institutions and policymakers must make concerning entrepreneurship education at the secondary school level, and more clearly indicate in which direction further research in the entrepreneurship education field is most needed.

Abstract: In this article we briefly present the outlines of a research project on the challenges of managing communication among startups in Portugal. The exploratory study was based on the combination of quantitative and qualitative methodologies and sought to analyze how crucial it is for startups to invest in branding and activate their brands through a planned communication strategy. It is universally recognized that the brand represents the most valuable intangible asset for the organization (Aaker, 1996; Kotler et al, 2012; Huseynli, 2022), currently having all the potential of technology to discover patterns of behavior and communication, but without ever compromising the humanization of the brand, despite the fascination with the digital lifestyle (Kotler et al., 2021). In 2014 a brand management methodology for agile companies emerges, Lean Branding (Busche, 2014) that teaches 21st century entrepreneurs the "way to create, communicate and sell a brand, constantly measuring its performance" (Busche, 2014). This methodology cannot be neglected by startups. The big challenge is precisely the crossing of this business area, which is in affirmation, between the branding, since the literature review has shown that we are facing a little explored theme. Also, understanding how Portuguese entrepreneurs deal with the challenges of brand communication in such a competitive ecosystem, even with more modest budgets, and bringing more knowledge about branding applied to Startups, are the major contributions of this study.

Keywords: Brand management, Brand communication, Startups, Lean branding

1. Introduction

The brand is the most valuable asset for any company, because it represents the business. Company financiers were the first to draw the attention of marketers, strategists and managers to the importance of one of the pillars of brand management; brand equity “brand capital” and “brand value” (Kapferer, 2003), but from a more economic perspective, alerting them to the relevance of a company’s most important intangible asset: the brand.

Markets are dynamic and very volatile, competition is intense and customers are demanding and aware of the decision-making power they have. Given this scenario, it is easy to understand that the path for companies is to focus on branding as a differentiating factor (Aaker, 2011) to achieve longevity in the market.

The brand only exists when it is activated through communication (Kapferer, 1991), which is a “central element in the brand construction and management processes, as it corresponds to the occasion in which it meets its target audiences” (Arriscado et al., 2015, p.3) and, therefore, making brands closer to stakeholders, transforming them into an integral part of consumers' lives, is one of the objectives of brand communication (Aaker, 2010/2011).

The communication strategy must be planned and not according to the needs of the moment, so that the positioning and identity defined by the company reflects the desired image. A brand's identity must be the result of a deliberate and strategically developed effort by organizations and not be the result of chance (Ruão, 2006), which requires systematic, proactive management and an anticipatory perspective (Aaker, 2010; Kapferer , 2003).

For Kotler et al. (2017), in an increasingly digital and interconnected world, customers do not have as much time to devote attention to the brand and are surrounded by alternatives at every step of the way. It is necessary to be present, get their attention and transmit the message they want to hear, companies have seen the need to create stronger bonds with their customers, focusing on the relationship with them, so communication takes on both a strategic and as tactical and operational in this new reality. It becomes crucial to humanize the brand, because the relationship between brands and consumers is horizontal (Kotler et al., 2017).

People no longer just consume products/services, they buy/consume values, image, which means they need to build an emotional relationship with the brand. Consumers in the digital age “make decisions based not only on the characteristics of products, services and prices, but also on what brands say, what they do, who they are and what causes they stand for” (Kotler & Sarkar, 2018, p .20). Regarding communication, Castells (2017) is emphatic with the concept of changing the power relationship in society as he understands that this is defined by values,

in the form of discourse, that motivate social actors (individual, collective, institutional, etc.) to influence the decision of other actors so that they do their will (Castells, 2017). People influence others, transforming cultures and values with the potential of communication networks.

Over the years, companies have grown and evolved in the market. In this sense, technology began to integrate all sectors of companies, using automated systems (Puntoni et al., 2021). Based on this evolution, companies changed their strategies with the aim of investing more in the use of new technologies, applying Artificial Intelligence (AI) (Du, & Xie, 2021). AI has the potential to increase interaction between brand and consumer, in the same way that companies use AI in digital marketing to help consumers learn more about their products and services, and help them navigate through the abundance of offers they have available in a more effective and efficient way, these same AI tools help companies understand consumers and how to approach them with their product and service offerings (Van Esch, P., & Stewart Black, J. , 2021).

This reality paved the way for marketing 5.0 – Technology for Humanity, Kotler et al. (2021) explain how marketers can use technology, in particular artificial intelligence, to satisfy customer needs and make a difference in the world. Marketing 5.0 is data-centric agile marketing, and marketing will continue to be strategic but highly scientific. And it is within this new reality that Startups are born and assert themselves, due to their agility, flexibility and ability to interact with consumers.

2. The Lean Branding Methodology

There are differences between Startups and a conventional company and it is imperative to make the correct distinction, (Blank, 2014). A Startup at the beginning of its activity is necessarily a small or micro company, and needs innovation to not be considered a traditional model company (Sebrae, 2020), however, not all small or micro companies are a Startup. The pace at which traditional small businesses grow is slower.

Startups are not necessarily internet companies, although this modality represents the majority, digital businesses become promising and increasingly attract the attention of large investors (Sebrae, 2020). These arise from ideas from entrepreneurs in a creative and innovative context, aiming to solve a problem (Toledo, 2011). The main characteristics of these businesses are the nature of a temporary organization with the potential for rapid growth, they operate in an environment of extreme uncertainty, in the incessant search for a business model that can become repeatable and scalable. A company established in the market, on the contrary, was designed to execute a business model that could be repeatable and scalable (Blank & Dorf, 2014).

Startups are directly related to the Lean methodology. This methodology is a management philosophy inspired by practices and results that began with Toyota in the 40s. Talking about Lean methodology and Startups takes us to the Lean Startup concept by Eric Ries (2011), who introduced this new concept in the world of Startups.

The Lean Startup methodology, according to Blank (2013), has revealed that it is possible to make the process of creating a company and innovating less risky. For the author, this methodology recommends experimentation instead of detailed planning, the customer's opinion instead of intuition, the interactive path instead of the traditional conception of a finished product from the beginning and presented to the market finished. Although it is only a few years old, concepts such as Minimum Viable Product (MVP) and testing hypotheses acquire meaning in the world of entrepreneurship. The MVP should be a very simple version of the product and include whatever is necessary to convey to the customer as realistic a vision as possible of how the product will work. Only what is necessary to get feedback (Ries, 2011). So, just like building a product, you can also build a brand as the company grows and refine it to find the solution that meets customer preferences. In view of the above, and according to Fresneau (2020), we are faced with a term that is very familiar and increasingly used by entrepreneurs and founders: Minimum Viable Brand (MVB). Being “lean” means understanding that it is not a problem not to have a perfect product upon launch, and this situation is considered the most sensible. The brand will not and should not be perfect when starting the business (Busche, 2014). In this regard, Ries (2012) states in the preface to the book Lean Branding, “just as products are never truly finished, brands must also be committed to adaptation and evolution. Managers must build chameleon brands that adapt to consumers' ever-changing needs and desires, putting hypotheses to the test and using what they learn from repetition and adaptation”, Eric Ries in Lean Branding (Busche, 2014, p.vii)

The Lean Startup methodology presents itself as a recent and very pertinent topic and therefore, it is imperative to study it since the Lean Branding methodology was inspired by this method. Although Lean Startup is focused on product development and business management, its principles can also be applied to brands. The Lean Startup Build-Measure-Learn cycle is completely valid and easy to apply to the Lean Branding methodology. This

is what the authors Busche demonstrated in the book Lean Branding (2014), and Gardner and Cooper, in the book The Lean Brand (2014).

Building a brand in companies that operate in volatile markets, "where barriers to entry are low, competition fierce, people's attention increasingly divided, search more sophisticated and easy access to information, it is quickly realized that building a brand disruptive and dynamic, in a context like the one described, is precisely the path for startups" (Busche, 2014, p. 4). For all of this, the author argues that the time has come when branding must be accessible to Startups.

A lean brand is a brand in which an organization and audience achieve a symbiotic relationship around a common value without creating any brand waste. Brands are currently more relevant and effective if managers, entrepreneurs and professionals in the areas of marketing and communication understand the changes that occur, especially in an increasingly globalized and connected world, and learn from them. "Lean brands have conversations, not monologues" (Busche, 2014, p. 218). For Gardner and Cooper (2014), brand means a relationship, and thousands of Startups, entrepreneurs, managers and entrepreneurs fight to, based on these conversations, build passionate relationships with the public (Gardner & Cooper, 2014). Wheeler (2019), in this regard, wrote that "people fall in love with brands, trust them and believe in their superiority" (Wheeler, 2019, p.2).

In Lean Branding, we talk about brand innovation. An optimized methodology for creating a disruptive brand centered around experimentation, iteration and elimination of brand waste. This methodology provides a scalable structure for continuous cycles of development and improvement of branding through validated learning and the development of real customers (Gardner & Cooper, 2014).

A world of opportunities has opened up for Startups to be in contact with the customer in the same way as a large company. It is necessary to demystify the idea that marketing and branding are only within the reach of companies with large structures. The Lean Branding methodology (Laura Busche, 2014) is proof of this. For all this, we believe it is interesting to study the reality of Portuguese Startups, in their relationship with brands and adoption of Lean branding principles.

3. Building Connections: The Importance of Communication in Brand Consolidation

The function of a brand, nowadays, is not just to identify and differentiate. As highlighted above, the brand currently assumes vital importance for companies, it is universally recognized that the brand represents the most valuable intangible asset for the organization (Aaker, 1996; Kotler et al, 2012; Huseynli, 2022), because it allows managing value that goes beyond your products and services. It is an asset of the organization and, therefore, management should not be restricted to the marketing department, but rather be transversal to the company's structure. The company must provide the brand, first of all, with the content that defines it and gives it identity (reason for being). The brand must have values that allow it to differentiate itself in a market that is increasingly competitive and unstable. When talking about brands, it refers to important associations and memories for consumers, linking an increasingly emotional and symbolic relationship (Aaker, 2010).

The role of branding in the context of business marketing is of paramount importance, as it plays a fundamental role in building an emotional connection with consumers and distinguishing the company from its competitors. As highlighted by Girão, M., & Knupfer, A. M. (2020), a brand truly exists when it is installed in the minds of consumers.

For the brand to "come to life" in the market, it needs to communicate, it is important that the consumer knows it. Kapferer (1991) states that "the brand is a being of discourse. It only exists through communication. Given that the brand states the products or services, it must necessarily take the floor" (Kapferer, 1991, p. 55), so that it can be known and recognized. However, given the high number of messages that reach target audiences, it is increasingly difficult to communicate, get noticed, persuade and influence. More than persuading, now the task is to get noticed. And getting noticed means gaining relevance for what you communicate (Arriscado et al., 2015). And to be relevant in communication, the company must have a pertinent and expressive brand that asserts itself by offering a unique and referential value proposition, differentiated by innovation, capable of distinguishing itself from competitors, gaining customer loyalty and winning the market (Aaker, 2011).

Consistent communication of the brand's values, benefits and differentiators is essential to establish a positive and distinctive image in the minds of consumers compared to the competition, and ensuring a good online experience with the brand will result in a greater chance of interaction with the brand, which will reinforce customer satisfaction (Ho, S. P. S., & Chow, M. Y. C., 2023).

According to Kunch (2018), the complexity of current times, due to globalization, the information technology revolution and the digital era, forces organizations to adopt a new stance and strategically planned communication. Only in this way will they be able to survive in increasingly complex markets and serve increasingly demanding audiences. “Strategic organizational communication plays an important role in the social and organizational context. Faced with the transformations that have been occurring, in the face of the great global uncertainties present in contemporary times, there is no longer space for merely instrumental, technical and tactical communication” (Kunch, 2018, p. 20), because the world we live in is VUCA (Lawrence , 2013), an acronym for volatile, uncertain, complex and ambiguous.

We are based on the line of reasoning of the authors Zerfass et al. (2018), who state that the “term “strategic communication” operates as a replacement for “integrated communication,” which is an umbrella term for all types of goal-oriented communication initiated by organizations to address any kind of stakeholders and audiences” (Zerfass et al, 2018, p.488). For an organization to communicate strategically, it has to work online and offline communication in an integrated way. A holistic approach, which brings together the various areas of communication previously considered in isolation. It is, therefore, about encompassing a set of communication actions designed, structured, planned and integrated to achieve the objectives of an organization and fulfill its mission (Zerfass et al., 2018).

We live in the age of information, communication, technology, big data, computational algorithms, so companies have to follow this evolution to impact internal and external audiences. This is a prominent and valid reality for large companies, small and micro companies, where Startups are naturally inserted.

4. Methodology

With regard to the methodological procedures adopted, we chose to use method triangulation, considering it to be the most appropriate approach to achieving the objectives established for the research. Methodological triangulation involves the collaboration of a team with diverse disciplinary skills, working cooperatively at all stages of the research, integrating different methods and disciplines to bring quantitative and qualitative approaches closer together. In this approach, the methodological specificities of each discipline are not diluted, but rather maintained, allowing an inter or transdisciplinary perspective of research (Minayo, 2014).

As for data collection instruments, in-depth interviews with content analysis and questionnaires with statistical analysis (SPSS) were used. The questionnaire consisted of 21 questions, using a Likert scale from 1 to 6 points. It was applied to a sample of 259 Portuguese entrepreneurs, covering the north, center and south of Portugal, including the islands, and took place over approximately 5 months.

Interviews, one of the most common techniques in scientific work, allow obtaining a large amount of information in an active and informative way. For this exploratory research, 13 interviews were carried out divided into two segments. In segment 1 - Entrepreneurs, we included 6 entrepreneurs from Startups and 2 from Scaleups. We chose to interview Scaleup entrepreneurs to understand whether, during the business transition phase, concerns about branding are the same as in the initial starting up phase. In segment 2 - Specialists - 3 experts in entrepreneurship and 2 in branding participated. The entrepreneurship experts interviewed were: João Borga, former Director of Startup Portugal; Rafael Rocha, professional with 20 years of experience in entrepreneurship and former director of entrepreneurship at ANJE (National Association of Young Entrepreneurs); and Inês Santos Silva, Executive Director of Aliados Consulting. The branding professionals who participated in the study were: Laura Busche, author of the Lean Branding methodology; and Paulo de Lencastre, University Professor and author of several books in the area.

We chose the Delphi method because it is a rich approach that “enables the gathering of a set of opinions from experts and professionals, who work in different areas and who are geographically dispersed, with the goal of understanding and seeking consensus on complex topics, controversial and comprehensive” (Marques & Freitas, 2018, p.411).

5. Results Discussion Analysis

The journey of a Startup is a topic of discussion among entrepreneurship experts in Portugal. While some suggest a life cycle of 1 to 5 years, data from European Startup Monitor indicates that, in general, these companies are less than 10 years old. By combining information from the literature, data from the European Startup Monitor and expert opinions, it is possible to propose a more precise conceptual definition for the term Startup.

We can understand a Startup as a nascent company destined for growth, with a life cycle generally no longer than 10 years and divided into 2 distinct phases. In the first three years, it faces an unstable and challenging period, characterized by a lack of financial and human resources. During this time, conditions of risk and uncertainty are exacerbated as the company relentlessly searches for a replicable and scalable business model. After this initial stage, known as the "Valley of Death", when the Startup reaches the financial break-even point, reality changes, allowing greater autonomy and different priorities. After the fifth year, the company enters a phase of maturity, going through several stages of growth before consolidating itself as an SME or large company. In this process, it relies on professionals, generally led by the founder or a team of up to 30 employees, and works with digital and technological tools, where innovation and disruption are fundamental.

According to the quantitative study, during the first years, brand management may not be a priority for entrepreneurs, who focus on areas such as product/service development, internal management and business model dynamization, due to resource limitations, as shown in table 1.

Table 1: Startup Development Factors

Startup development factors	Average	Standard deviation
Product/Service	5.54	.617
Internal management	5.40	.699
Streamlining the business model	5.10	.818
Brand communication	5.01	.894
Attracting investment	4.34	1.367

Table 1 - Prepared by the authors

However, they recognize the importance of brand management to stand out in a competitive market, where differentiation becomes crucial. To achieve this, it is essential that entrepreneurs invest in creating a strong brand identity and positioning it in the market with a unique value proposition. Lencastre states, "the essence of Startup is differentiation", referring to the intimate connection between entrepreneurship and the idea of standing out from the competition.

Branding essentially encompasses the management of a company's brand strategies. This implies careful planning, structuring and management of the brand Aaker (2010). As Ruão (2006) states, brand identity should not be left to chance, but rather deliberately worked on and managed.

Paulo de Lencastre emphasizes the importance of finding a differentiating concept that resonates with the community. With the advent of the virtual world, new opportunities arise for even small businesses to develop their brands, thanks to innovative methods and tools that do not require large investments. The Lean Branding methodology, for example, aims to demystify the idea that branding is a time-consuming and expensive process. Busche, author of this methodology, in her work provides tools that enable the creation of agile and consistent brands, with a focus on conversion.

Portuguese entrepreneurs recognize the importance of brand management and have a clear understanding of what constitutes a brand. They associate the brand with different dimensions, such as identity, image, logo, company, value system and relationship. However, there is a tendency for some entrepreneurs to associate the brand only with its visual identity. It is crucial to intervene to clarify this concept and emphasize that visual decisions must be aligned with a clear strategy, defined mission and a consistent brand story. Lean Branding focuses on this reality, highlighting the importance of the brand's strategy, history and symbols, and how these elements must be monitored over time to ensure effective communication. This methodology emphasizes agility and the importance of continually measuring performance, especially in a digital market where conversion is crucial. Although Portuguese Startups deal with limited resources and teams with few employees, the collaborative mentality is present, as organizations tend to be more horizontal and less hierarchical. However, they face a series of challenges.

Laura Busche highlights that the biggest challenge when developing a brand is the difficulty in creating a story that goes beyond functional attributes and benefits. It is essential to connect the product with the symbolic and psychological benefits, maintaining a balance to generate a mix of enchantment and rationality in the consumer, leading them to make a conscious and impulse purchase. The Colombian author provides five pieces of advice to Portuguese entrepreneurs: 1) they must develop strategies to highlight their businesses in an agile market,

impacting audiences, especially early adopters, who are more informed and demanding. Many entrepreneurs face difficulties in strategic planning, and it is important to understand that success usually comes after several trials and errors; 2) in saturated markets, they compete with established companies and other emerging startups. The path will be to develop a unique value proposition and communicate it in a clear and convincing way to stand out from the competition; 3) entrepreneurs, especially those at the beginning of their activity, must share lessons learned, knowledge and tools used; 4) it is crucial that Startups invest in internal research for decision-making, reducing dependence on data from secondary sources. Primary investigations, conducted internally, allow for quick and proactive decisions. The formation of an internal department to conduct in-depth interviews, structured questionnaires and other forms of research is recommended; 5) when a brand enters the global market, entrepreneurs compete on a global, not local, level. It is essential to adjust the brand narrative to the global market, adapting it to different social and cultural conditions and customer expectations. Lean brands must be flexible and adaptable, maintaining two-way communication with consumers rather than monologues. The brand has to be "chameleon-like in this sense and adapt. Lean brands have conversations, not monologues" (Busche, 2014, p.7).

In the view of entrepreneurs and experts, the future of branding in the digital era is shaped by the rapid evolution of the business environment, driven by the speed of change and the increasing complexity of the modern world, characterized by the acronym VUCA (Volatility, Uncertainty, Complexity and Ambiguity), as discussed by Lawrence (2013). In this context, companies need to adapt to ongoing transformations, especially in the face of a consumer who plays an increasingly active and creative role in communication.

Changes in brand management suggest that the most agile companies, especially smaller ones, may be best able to transform their brands at the speed required by the constantly changing market. The connectivity provided by digital technology has replaced the traditional model of unilateral communication with a constant dialogue between companies and customers. This has strengthened relations between both parties, placing them side by side in the communication and interaction process. The horizontalization of the communication process brings consumers closer to companies (Kotler et. al, 2017), creating new opportunities for interaction and influence. New consumer profiles emerge, such as "prosumers" and "adprosumers", created by technological developments. The internet allows brands to get closer to these audiences, enabling the co-creation of products and content, which facilitates the dissemination of the brand's image.

With easier access to international markets and more controlled investments, competition increases, but more growth opportunities for companies also emerge. It is essential that companies monitor the performance of their brands and measure results so they can reposition, readjust and redesign communication strategies as necessary. The rapid evolution of the market requires companies to be present in new channels and emerging social networks. This requires professionals with up-to-date skills and qualifications, such as community managers. The branding strategy must be developed quickly, otherwise companies risk losing valuable opportunities.

In the context of Lean Branding, a metaphor used by author Laura Busche (2014) is that of the chameleon and the dinosaur. Companies that maintain cumbersome organizational structures and time-consuming processes are less equipped to succeed, while those that are agile and adaptable are more likely to thrive.

According to Lencastre (an expert in brand semiotics who participated in the study), the future of branding in the digital era will be less centered on brand owners, making room for more open and democratic management. Stakeholders will have a more active role in product design, communication and pricing policy, making brand management more multifaceted and participatory.

Based on the information collected through interviews and questionnaires carried out in this investigation, it was found that entrepreneurs tend to develop a communication strategy for their brands in the most advanced phase of the business, generally after the first three years of operation. In the initial stages, Startups' main concerns revolve around overcoming financial and human resource limitations. This finding confirms that Portuguese Startups approach the communication management of their brands in a planned manner. It has been proven that brand communication plays a crucial role in leveraging business, demonstrating the importance that the topic assumes.

Risky (2015) argues that nowadays it is not enough to have a quality product or a differentiated service, it is essential to publicize and value it through communication. The digital medium emerges as the communication platform par excellence for these businesses, allowing them to win new customers and encourage interaction with the public, which paves the way for co-creation. Startups demonstrate a special affinity with social

networks, as they offer visibility at almost zero cost and make it possible to connect with the world in a matter of seconds, without demanding anything in return, just quality content and maintaining a solid relationship with the clients.

As highlighted by Aaker (2011), the internet provides almost everyone with the opportunity to serve consumers directly and transform the relationship with them into a powerful brand-building tool. This digital environment makes it easier to build a strong presence in the market, strengthening relationships with customers and effectively expanding the brand's reach.

Entrepreneurs, driven by the context of digital natives, adopt a strategic approach from the beginning of their businesses when selecting and planning their presence on digital social networks. These platforms play a fundamental role as the first contact with the market, allowing consumers to assess interest in the products/services offered or in ongoing promotional campaigns. Among the most used networks are Instagram, Facebook, LinkedIn, Twitter and YouTube, with different strategies being used, such as content marketing, storytelling, videos, attractive images, concise messages, contests, stories and collaborative partnerships, for example with influencers including nano influencers. Getting the right message across to your target audience is critical, but it can be difficult with limited resources. Using digital platforms and social networks in a creative and strategic way to reach and engage the target audience effectively, leveraging the power of visual and narrative content, could be the way forward.

Faced with a wide range of digital marketing strategies, contact points, tools and services available, it is observed that Portuguese entrepreneurs tend to adopt the best known, and still little explored, for example, the potential of chatbots. This evolution has completely transformed the way companies manage their businesses, as the fast pace allows managers to monitor brand behavior in real time, thanks to constant feedback from the public.

Based on these reflections, it becomes clear that Startup professionals need to closely monitor emerging trends, identify market requests and develop strategies to discover customer needs, with branding as a primary concern from the beginning of the process.

6. Conclusions

After completing this study, which contributed to both business and academic circles, we highlight the main insights, although there is still a vast area of study on branding applied to Startups to investigate. The insights extracted from this research have a relevant impact on the academic field, namely: presentation of a proposal for a conceptual definition of Startup; a deeper understanding of how Portuguese entrepreneurs involved in the Startup universe define and manage their brands, in addition to understanding the importance they attribute to it; the dissemination of branding trends in the digital era, in which consumers are increasingly connected; the application of the principles of the Lean Branding methodology enables brand management work even with modest budgets, demystifying the idea that this practice is exclusive to large companies.

From this study, some contributions emerge aimed at entrepreneurs, aiming to assist them in brand management in an extremely competitive, volatile and aggressive market: the importance of integrating brand management is recognized from the moment the business idea arises, and not only after overcoming the initial challenges; It is highlighted that the brand has a crucial impact on the Startup's success, going beyond the creation of visual elements; introduction of the concept of Minimum Viable Brand (MVB - Minimum Viable Brand), which, when strategically applied according to the Lean Branding methodology, provides significant benefits to Startups, and finally shares the advice of the author of the Lean Branding methodology on brand management, based in her vast experience as a mentor to several Startups over the years.

CIEQV- Life Quality Research Centre, Santarém, Portugal

Pedro_Duarte_Oliveira@iscte-iul.pt

Abstract: This article explores the relevance of the social economy in addressing contemporary challenges through innovative and sustainable practices, supported by public policies. The research investigates the management models that social and solidarity economy organizations (SSEOs) employ to respond to the challenges of innovation and sustainability. The study includes an in-depth analysis of diverse operational models and accomplishments across various cases, presenting evidence on how the sector adopts innovative and sustainable practices. The article scrutinizes essential characteristics of SSEOs, such as democratic governance, reinvestment of surpluses in social businesses based on innovation and entrepreneurship, and a strong community orientation. These characteristics are examined for their relevance in addressing issues like social inequalities, digital transformation, and climate change. Additionally, the research includes an examination of four diverse cases of SSEOs established in mainland Portugal. It reveals the wide range of activities and significant interactions that these organizations have with various stakeholders in different economic and social contexts, contributing to regional social innovation ecosystems. The empirical study, based on a descriptive case study methodology applied to multiple and heterogeneous cases (in terms of fields of intervention and scale of resources), demonstrates that sustainability has become a driver in the social economy, within a framework of democratic governance and community involvement. Moreover, the research fills a gap in empirical literature by providing strong evidence through real cases of collaborative social innovation, the integration of environmental, social, and governance practices, as well as financial and regulatory support from the state for the resilience of SSEOs. The social value of the research lies in its empirical contribution to demonstrating how social business is a crucial element for communities to address global challenges, promoting economic growth and employment, social justice, including the fight against poverty, and environmental sustainability.

Keywords: Social economy, Sustainability, Digitalization, Social innovation, Social entrepreneurship, Social innovation ecosystem

1. Introduction

The social economy is a vibrant and dynamic sector that is crucial in promoting sustainable development and addressing complex societal challenges. The European Economic and Social Committee (EESC) defines the social economy as "*the set of organisations that do not belong to the public sector, operate democratically with the members having equal rights and duties, and practise a particular regime of ownership and distribution of profits, employing the surpluses to expand the organisation and improve its services to its members and to society*." (EESC, 2012; p.14). Distinguished by its social objectives and democratic governance practices, the social (and solidarity) economy encompasses a diversity of organizations, including cooperatives, mutual societies, associations, and foundations. These organizations operate based on principles of solidarity, the primacy of people over capital, and the reinvestment of surpluses to achieve social goals (Defourny & Nyssens, 2010; Moulaert & Ailenei, 2005). While diverse in its forms and practices, the social economy shares a common goal of meeting social needs and promoting community well-being. It emerges as a key player, through social innovation, social business models, and the inclusive digital transition, to respond to contemporary challenges, such as social inequalities, population aging, technological unemployment, the dehumanization of interpersonal relationships, and environmental crises (World Economic Forum & Schwab Foundation, 2022).

In the current global context, marked by rapid technological and economic changes, the social economy offers innovative and sustainable solutions that reconcile economic development with social justice and environmental protection (Birchall, 2011; European Commission, 2021). According to the Council of the European Union (2023), the social economy has been instrumental in promoting sustainable development practices. Previously, the United Nations (2014) highlighted that the social economy plays a key role in accelerating progress on the Sustainable Development Goals.

This paper will investigate the relevance of the social economy (also including the solidarity economy) in addressing contemporary challenges through innovative and sustainable practices supported by public policies. Thus, the research issue is what governance models social and solidarity economy organizations employ to respond to the challenges of innovation and sustainability. Based on a literature review including scientific articles published very recently in journals indexed to Scopus and Web of Science, as well as documentation

available on e-portals of relevant international organizations, and on original case studies, we present evidence on how such sector contributes to social cohesion, economic development and environmental sustainability.

The structure of the article is as follows. In section 2 a characterization of the social economy is carried out, with emphasis on the distinctive principles of this sector to the private sector. Section 3 explains the distinction between social innovation and social entrepreneurship and their interconnection through the so-called social innovation ecosystem concept. Section 4 presents the case study including the explanation of research methodology, followed by characterization of the analysed cases of social and solidarity economy organizations. Section 5 provides evidence of cases' common practices and challenges regarding models of governance, communication with stakeholders, financial stability measures, social innovation projects, and environmental sustainability projects. Conclusions are presented in Section 6.

2. Characteristics of Social Economy Organizations

As stated by prominent authors (Defourny & Nyssens, 2017 and 2010; Defourny & Develtere, 1999) social and solidarity economy organizations (SSEOs) operate on principles that prioritize community well-being, social justice, and environmental sustainability. The main characteristics that define this sector include the primacy of social objectives; democratic governance; reinvestment of surpluses; autonomy and independence; solidarity and mutuality; and community orientation. By analysing shortly each of these characteristics, through theoretical insights, we will address the statement that SSEOs prioritize the creation of social value over financial profits, addressing issues such as poverty, unemployment, and social exclusion. This feature is key to differentiating the SSE from the business sector.

2.1 Primacy of Social Objectives

The social economy stands out for its emphasis on social objectives, contrasting with traditional economic models which primarily focus on financial profits (Defourny & Nyssens, 2010 and 2017; Utting, 2023; Utting et al., 2015). As mentioned in the Introduction, the main concerns are the reduction of social inequalities, population aging, technological unemployment, the dehumanization of interpersonal relationships, and environmental crises (World Economic Forum & Schwab Foundation, 2022), amongst others.

2.2 Democratic Governance

Democratic governance is a central feature of SSEOs, and they are managed through participatory decision-making processes that guarantee the voice of all members (Yi et al., 2023). Cooperatives, for example, operate on the principle of "one member, one vote," regardless of the amount of capital invested. This democratic framework promotes inclusivity, accountability, and shared ownership, strengthening a sense of community and collective responsibility (Birchall, 2011). Recent studies also highlight the importance of democratic governance for innovation in emerging technologies, such as artificial intelligence, which can be used to optimize internal processes and increase member participation in decision-making (Gonzales, 2023). Junior (2023) explored the importance of democratic governance and stakeholder participation, concluding that inclusive governance structures make SSEOs more resilient and able to respond quickly to crises, promoting sustainable practices effectively.

2.3 Reinvestment of Surpluses

Any surplus generated by SSEOs is reinvested in the organization itself or used to achieve social objectives, rather than being distributed as dividends to shareholders (Defourny & Nyssens, 2010 and 2017; Utting et al., 2015). This reinvestment supports the sustainability and growth of the organization by increasing its ability to deliver social benefits. Borzaga & Becchetti (2010) state that the reinvestment of surpluses is an essential practice that allows social enterprises (part of SSEOs, as shown further) to constantly adapt and innovate, ensuring their continued relevance and impact. The reinvestment of surpluses is vital for the implementation of sustainable practices and the promotion of green initiatives within SSEOs, contributing to the mitigation of the effects of climate change and other threats associated with globalization (Katajamäki, 2023; Giagnocavo, 2023).

2.4 Autonomy and Independence

Although SSEOs often work in partnership with public authorities and private entities, they maintain a high degree of autonomy and independence. This independence is crucial to preserve its social mission and avoid undue external influences. Autonomy allows these organizations to innovate and respond effectively to the needs of their communities (Defourny & Develtere, 1999). Scholz (2016) also highlights the importance of independence for social innovation, especially in contexts where social needs are rapidly changing. Recent research emphasizes that organizational independence facilitates the adoption of emerging technologies, such

as artificial intelligence (AI), which can be used to improve operational efficiency (Gonzales, 2023) and broaden the reach of social initiatives namely in the education sector (Clamp & Tapley, 2023).

2.5 Solidarity and Mutuality

Solidarity and mutuality are core values of the SSEOs. These operate on the principles of mutual support and cooperation, both among its members and with the wider community (Yi et al, 2023). Examples include mutual aid societies and cooperatives that provide support to members in times of need, fostering a culture of reciprocity and collective well-being. Moulaert & Ailenei (2005) emphasize that solidarity is not only a core value but also a practice that strengthens the resilience of communities in the face of economic and social crises. Recent studies suggest that solidarity and mutuality within SSEOs are crucial to addressing global challenges such as the COVID-19 pandemic, helping communities to recover faster and more equitably (Mullings & Otuomagie, 2023).

2.6 Community Orientation

A strong orientation towards community development is another defining feature of the social economy. SSEOs often emerge in response to local needs and priorities, and their activities are rooted in the context of the communities they serve. This local insertion allows SSE to effectively address specific social challenges and contribute to the resilience and vitality of communities (Monzón & Chaves, 2008). Quiroz-Niño and Murga-Menoyo (2017) discuss how the social economy contributes to sustainable development and the strengthening of local communities. These authors highlight that the community orientation of SSEOs is essential for building more cohesive and resilient societies, especially in times of crisis.

The main characteristics of the SSE are as follows: teamwork, cooperation, self-management, inclusion, democracy, the connection of production to a specific geographical area, the creation of conditions for improving quality of life, and the sustainable local development of people and communities.

2.7 Sustainability

Recent literature adds new key themes suggesting promising paths for the evolution and continuous impact of SSEOs, contributing decisively to the change of the economic paradigm based on social innovation, social entrepreneurship, and the digital transition. For instance, Utting et al. (2015) explored how the SSE is emerging as a new economic paradigm that challenges the traditional rules of the market economy under the capitalist economic system. The authors argue that SSEOs are key to promoting social justice and environmental sustainability, especially in contexts of economic crises and climate change. In their view, the integration of these two principles into the operations of such organizations contributes significantly to Sustainable Development Goals. Siddique et al. (2023) found that ethical banks often adopt cooperative organizational structures and participatory governance models that promote principles like democratic control, participation, and collaboration. These features enable ethical banks to develop innovative financial products and services that address emerging societal needs sustainably.

2.8 Digitalization

A remarkable new type of SSEO is the platform cooperative which has emerged side by side with the digitalization of markets and social businesses, especially since the occurrence COVID-19 pandemic. Scholz (2016) examined the role of platform cooperatives in the digital economy. This author argues that these new forms of cooperatives can democratize the digital economy, offering an alternative to the traditional corporate model that dominates the sector. The author highlights that autonomy and democratic governance are essential for the success of platform cooperatives, allowing them to respond flexibly and effectively to the needs of their members.

By econometrically analysing the theoretically positive correlation between technological innovation and economic growth, in the light of neoclassical and endogenous economic growth models, Gonzales (2023) finds evidence in favour of using AI as a proxy for technological innovation. The author's interpretation is that AI helps in production, marketing, and customer acquisition for companies (and organizations, *in latu sensu*), increasing their productivity and consumer reach. In addition, other effects of AI include improved quality of services, increased accuracy and efficiency in work, and increased customer satisfaction.

3. Social Innovation and Social Entrepreneurship

Social innovation and social entrepreneurship are two distinct yet interconnected concepts that aim to address complex social problems and promote sustainable development. Social innovation involves creating new ideas,

products, services, or models that are effective in improving living conditions and promoting social well-being (Coronel-Pango et al., 2023; Adro & Fernandes, 2021). Social entrepreneurship, on the other hand, utilizes entrepreneurial methods to solve social problems by combining a social mission with business strategies (Sottini et al., 2024).

3.1 Similarities and Differences

Both social innovation and social entrepreneurship recognize the importance of stakeholder collaboration and participation in achieving meaningful and sustainable results (Coronel-Pango et al., 2023; Adro & Fernandes, 2021; Crupi et al., 2023). However, social innovation is a broader concept that encompasses various activities and actors, while social entrepreneurship is more specific, focusing on applying business strategies to solve social problems (Sottini et al., 2024; Adro & Fernandes, 2021). Another significant difference lies in the approach to finance and sustainability. Social innovation initiatives can be funded through various sources, such as grants, government funding, crowdfunding, and social investment, with their sustainability often depending on their ability to generate continuous social impact (Global Innovation Fund, 2024). Social entrepreneurs, on the other hand, seek financially sustainable business models that generate revenue to reinvest in their social mission and expand their impact (Sottini et al., 2024).

Social innovation and entrepreneurship emerge as central themes in sustainable development and solving complex social problems. These concepts often intertwine, providing new approaches to social and economic challenges, and promoting social cohesion and community development. In recent years, the intersection between these fields has gained prominence in academic literature and regional development policies (European Parliament, 2021). This reflects a growing awareness of the need for integrated strategies that promote economic growth and respond effectively to social needs (Sottini et al., 2024). These strategies involve co-creation aiming to invest in evidence-based, accessible, affordable, and scalable new solutions (NESTA, 2015).

3.2 Social Innovation Ecosystem

Collaboration between different sectors – public, private, and SSEOs – is essential for the success of initiatives mentioned in the previous section, fostering a robust and resilient social innovation ecosystem (Abdi et al., 2024). This is characterized by the participation of diverse actors, including non-profit organizations, social enterprises, governments, and local communities aiming at innovation in different dimensions, such as environmental sustainability, social inclusion, and economic justice (OECD, 2021).

Another important aspect is the role of public policies and funding in supporting social innovation. Financing programs, tax incentives, and public-private partnerships are some of the strategies used to foster the development of financially sustainable business models, using revenues generated by their activities to reinvest in the social mission and expand their impact (Sottini et al., 2024). The successful implementation of these policies can significantly accelerate the uptake and impact of social innovation and social entrepreneurship, fertilizing and densifying regional social innovation ecosystems and thus contributing to building fairer and more equitable societies.

4. Case Study

4.1 Research Methodology

The present research used a descriptive case study methodology (Yin, 2018; Stake, 1995) to explore and describe in depth the characteristics and contexts of specific SSEOs. This methodology involves detailed collection and analysis of data from multiple sources, providing a holistic view of the phenomena under analysis.

Semi-structured interviews were carried out between April and May 2024 having been selected as interviewed people playing strategic roles within the organizations investigated, accumulating extensive experience at the top and mid-levels of management. Besides the interviews, the data collection process also involved consultation of available reports and accounts, and direct observation, including visits to the respective infrastructures. This approach ensured rich and contextualized data collection, which is essential for in-depth analysis of heterogeneous cases of SSEOs.

4.2 Sample Data Collection

This section presents collected data on a small sample of prominent Social and Solidarity Economy Organizations (SSEOs) dedicated to various social causes and located across different regions of Portugal. The coverage spans the entire country, from the northern to the southern regions, as well as from coastal areas to the interior.

Organization 1 is a non-governmental and private institution of social solidarity located in the NUTS3 region of Metropolitan Area of Lisboa, with approximately 60 years of existence. With about 160 employees, its mission is to support and care for children and young people in vulnerable situations, promoting a family environment that fosters their development and autonomy. Its values include solidarity, respect, and dignity. The organization operates through self-sufficient communities known as "villages," where children are cared for by dedicated ladies. It maintains close relationships with donors, volunteers, and the local community. The funding sources include state subsidies (33%), donations from individuals and companies (53%), and property and financial revenues (14%), with a total revenue of approximately €6,147,000 and a net profit of around €572,000. The challenges faced include efficient communication, maintaining operational quality and credibility, and ensuring continuous funding. In terms of social impact, the organization supported over 400 children and young people in 2023, and its awareness campaigns reached more than 10,000 people. However, it does not have any environmental sustainability projects.

Organization 2 is a non-profit social solidarity association located in the NUTS3 region of Baixo Alentejo, with approximately 25 years of existence. It has about 70 employees and aims to intervene in therapy with at-risk adolescents, promoting their social reintegration. Its values include empathy, change, and trust. The organization operates therapeutic centers offering psychology, occupational therapy, and social support services, in collaboration with schools, health services, and community organizations. Its funding sources include the Portuguese Ministry of Health, user contributions, and Social Security support. The challenges include overcoming the social stigma associated with addictions, securing public funding, and ensuring service continuity with limited resources. In terms of social impact, the organization served over 300 at-risk adolescents in 2023, with a 70% success rate in school reintegration and improved mental health indicators. It does not have any environmental sustainability projects.

Organization 3 is a civic non-profit association, a private institution of social solidarity, and a non-governmental development organization (NGDO) located in the NUTS3 region of Metropolitan Area of Lisbon, with approximately 20 years of existence. With about 40 employees, the organization promotes human dignity and social innovation, focusing on education and sustainable community development. It operates programs spanning education, social inclusion, and sustainable development. Its funding sources include European funds, local authorities, foundations, and private donations, with a total income of approximately €3,168,000 and a net profit of around €475,000. The challenges include ensuring long-term financial sustainability and balancing employee workload. In terms of social impact, the organization implemented over 20 community projects in 2023, impacting around 5,000 people. It promotes sustainability through the *Ubuntu in the Neighborhood* Project.

Organization 4 is a private institution of social solidarity located in the NUTS3 region of Ave, with approximately 45 years of existence. With about 90 employees, its mission is to promote social inclusion through art and culture. Its values include creativity, community participation, and cultural innovation. The organization operates programs including theatrical performances, workshops, and educational activities, in collaboration with schools, senior universities, cultural organizations, municipalities, and the local community. Its funding sources include public funds, private sponsorships, ticket sales, and partnerships. The challenges include securing continuous funding, managing limited human resources, and adapting programs to community needs. In terms of social impact, the organization had a positive impact on the development of educational, social, and artistic skills for all ages and developed various community programs, including elderly care and temporary reception centers. It promotes sustainable practices through the Eco-Schools project.

5. Results

The research reveals several common practices and challenges among the analysed Social and Solidarity Economy Organizations (SSEOs): active participation of members and partners in governance is a core practice, fostering transparency and accountability. Organizations demonstrate a strong alignment between their day-to-day activities and founding values, with empathy, change, trust, courage, commitment, and responsibility guiding internal practices and policies.

Clear and regular communication with stakeholders using traditional and digital channels is essential to maintain trust and support. Organizations monitor public opinion and provide whistleblowing channels and complaints books to promote customer, employee, and supplier satisfaction.

Diversification of funding sources is a common concern to ensure financial stability and continuity of missions, reducing over-dependence on public subsidies. Organizations seek financing through sales, service provision,

and state support for social innovation and entrepreneurship projects. The centrality of values and mission in governance is evident, with organizations facing challenges such as social stigma, public disinvestment, and the need to maintain service quality with limited resources. Organizational resilience is strengthened through collaborative innovation practices. The analysed organizations have a significant social impact, benefiting thousands of individuals and communities through effective management practices, democratic governance, autonomy, and innovative approaches to address contemporary social challenges.

As a summary result the research fills a gap in empirical literature by showing strong evidence through real cases of collaborative social innovation, the integration of environmental, social, and governance practices, as well as financial and regulatory support from the state for the resilience of SSEOs. The social value of the research lies in the empirical contribution of social business as a crucial element for communities to address global challenges, promoting economic growth and employment, social justice, including the fight against poverty, and environmental sustainability.

6. Conclusions

The research shows that democratic governance, diverse funding, and effective communication are essential for the effectiveness and sustainability of the Social Economy. Public policies are crucial in supporting and promoting social economy activities, directly influencing the sector's sustainability and impact. SSEOs rely heavily on government subsidies and programs to run and expand their operations, which are essential for their maintenance and growth.

The resilience of the social economy sector is strengthened by financial and regulatory support from the government, as seen during the COVID-19 pandemic. Public policies also promote social innovation, enabling impactful projects on social inclusion and community development. Intersectoral collaboration facilitated by public policies is essential for the success of the social economy sector, as these policies promote partnerships and support networks, allowing the sector to innovate, grow, and adapt to contemporary challenges.

The combination of innovative and sustainable practices supported by public policies is key to addressing global challenges such as social inequalities, digital transformation, and climate change, promoting economic growth, social justice, and environmental sustainability.

Abstract: Successful start-ups are those capable of evoking customer loyalty. To achieve this, a well-crafted brand with a clear brand message that resonates with the target audience is needed. The pandemic, and its aftermath, has led to heightened scrutiny of brands by audiences, with consumers spending more time and money online. Purchase decisions and brand loyalty are increasingly influenced by what brands stand for, with a preference for those that believably prioritise people over profits. Nearly two-thirds of UK consumers expect brands to address societal issues. This trend is particularly pronounced among Generation Z, the fastest-growing demographic in the UK and other advanced economies in terms of spending power. This age cohort differs in several respects from preceding generations, showing a distinct hunger for social causes relating to equity, diversity and inclusion (EDI). This paper presents findings from an investigation into Generation Z's perception of EDI as part of entrepreneurial market communications. Our research aims to explore the target audience's awareness and attitude toward the inclusion of EDI elements in start-up brands and to ideate tangible recommendations for entrepreneurs in terms of embracing EDI as part of their brand's activities. Guided by Design Thinking, a total of 35 semi-structured interviews were conducted with young adults in Greater London, UK. Through inductive Thematic Analysis, four key themes emerged: (i) There is currently limited visibility and awareness of start-ups with EDI branding; (ii) there is a desire for authenticity alongside distrust of brands delivering on this; (iii) there is an expectation of intersectional diversity; and (iv) there is a limited risk of 'cancel culture' for start-ups. Based on these insights, four tangible recommendations were formulated for crafting socially conscious start-up brands: (i) embrace intersectional diversity internally and externally; (ii) cultivate a community to co-create EDI initiatives; (iii) utilising/collaborate with existing EDI associations; and (iv) prioritise EDI efforts in branded communications.

Keywords: Equity, Diversity and inclusion (EDI), Branding, Start-up, Entrepreneurial marketing, Design thinking

1. Introduction

The rise of start-ups and their impact on the global economy is well established, but so is their high failure rate. According to Chaudhri, Pridmore and Mauck (2022), the latter is largely due to many start-ups not focusing enough on building a strong brand. It might sound obvious, almost too basic even, but in order to build a business that survives in the market, a start-up needs customers. This, however, poses a real challenge for many entrepreneurs. Research by CB Insight (2021) indicates that not understanding customer wants and needs, and thus not connecting with consumers, is one of the most common reasons that lead to start-ups failing. Knowing the market, and one's target audience, is key to building a successful business.

A long-standing mantra in the business world is the Pareto principle, according to which 80% of sales are generated by 20% of customers (Lavinsky, 2014). Successful start-ups are, therefore, those that can evoke customer loyalty. To achieve this, a well-crafted brand with a clear brand message that resonates with the target audience is needed. According to Lam and colleagues (2010), establishing a robust and healthy brand is essential for achieving a sustainable competitive advantage.

The pandemic, and its aftermath, has led to heightened scrutiny of brands by target audiences, with consumers spending additional time and money online. Purchase decisions, and decisions to stay with a company, are increasingly influenced by what brands stand for, favouring those that put people before profits (Edelman Trust, 2020). Almost two-thirds of UK customers expect brands to focus on values that address societal 'we' issues (Edelman Trust, 2021). This is particularly true among Generation Z, those born loosely between 1995 and 2010; Generation Z is currently the fastest growing demographic in the UK and other advanced economies in terms of spending power (Brodzik et al., 2022). This age group differs in several respects from preceding generations, with a distinct hunger for social causes relating to equity, diversity and inclusion (EDI). No previous generation has 'championed diversity and inclusion quite like Gen Z' (Germano, 2020, para 2).

Because of this valuable audience's focus, it is essential that start-ups targeting this consumer group embrace authentic models for EDI, and incorporate these into their entrepreneurial market communications in order to relate to their audiences (Naylor, Lamberton and West, 2012). Realising any form of authenticity in branding

requires the full involvement of stakeholders, whose perception and expectations need to be matched and/or adjusted (Stengel, 2017). According to Jahns (2023), there is a need for more culture-centric approaches, emphasising genuine connections, active participation and (co-brand) partnerships, as well as a meaningful brand purpose. This sense of purpose is tied to brand identity, which can be expressed in various forms such as a name, logo, symbol, packaging design, or certain performances and actions (Belch and Belch, 2009).

Generation Z is often associated with 'woke consumerism' and 'cancel culture'—the former labelling an increasing intolerance of transgressions, particularly in relation to social justice, and the latter referring to the public boycott of brands and people, often fuelled by social media movements. Both have been considered growing threats to existing and emerging brands (Amed et al., 2019; Forbes, 2020). Aligned values between consumers and brands can help overcome these risks and are a key reason why people are drawn to certain brands (Lim, 2019). Aligned values undeniably contribute to 'brand love', the degree of emotional and passionate affection that a satisfied consumer has toward a particular brand. In contrast, brands that do not align with the consumer's mindset and expectations are running the risk of losing them (Forrester, 2022). This appears particularly relevant in the context of EDI, as inclusive policies (e.g., LGBTQ+ or ethnic equity) might help increase the appeal of a brand amongst a variety of audiences and might even help grow a brand's market share (Cunningham and Melton, 2014; Brodzik et al., 2022).

Consumers ascribe a central role to businesses in transforming societies and pursuing social causes. In a recent survey, over two-thirds of UK consumers voiced that 'brands are expected to solve both societal and personal problems' (Edelman Trust, 2020, p.12). For Generation Z, this number is even as high as nine in ten consumers (Amed et al., 2019). Entrepreneurs therefore ought to craft a socially conscious start-up brand that positively resonates with generational concerns, such as those revolving around EDI, which, in turn, should inform their business decisions. Emerging brands need to pay close attention to changes within consumption behaviour. As consumers seek to build their identity through brands and products, not providing adequate means to 'forge feelings of social solidarity' (Arnould and Thompson, 2005, p.873) may lead consumers into the welcoming arms of competitor brands that are more in line with current social attitudes. An authentic approach beyond tokenism is needed to avoid being perceived as and/or criticised for 'piggybacking' off current social movements, such as Black Lives Matter, or chasing the 'pink pound'—a reference to the disposable income of LGBTQ+ consumers (Dhal, 2020).

A recent study on consumers' perceptions of LGBTQ+ brand activism by Tressoldi, Espartel and Rohden (2023), based on eleven in-depth interviews based in Brazil, revealed that outwardly supporting diversity can help brands win over consumers if the activism is perceived positively in terms of the brand's representativeness and social impact. However, inauthentic activism perceived as inconsistent and insincere can significantly harm a brand's image and bottom line, potentially leading to consumer backlash and boycotts. Similarly, a study on co-brand partnerships supporting minority entrepreneurs in the US by Smiths, James, and Griffiths (2023) highlighted that a mismatch between brands and what consumers perceived these brands stand for could result in consumer backlash.

These studies highlight the importance of a considered implementation of social activism when constructing a start-up's brand. However, as Shi and Miles (2020) point out, evidence-based knowledge regarding start-up brand identity construction—as part of entrepreneurial marketing—is still in its infancy and requires more insights before a robust theory can be developed. In other words, there is still a lack of clear guidance to date on how entrepreneurs can effectively build their brand identity. This is where our research comes in.

This paper presents results from an investigation into Generation Z's perception of EDI as part of entrepreneurial branding in the UK. The objectives of this research project are twofold:

- To explore the target audience's awareness of and attitude towards the inclusion of EDI elements in a start-up's brand; and
- to ideate tangible recommendations for entrepreneurs in terms of embracing EDI as part of their brand's activities.

By addressing real-world challenges for brands, this research is applied and practice-oriented, making it particularly valuable in the discourse on brand management, as noted by Baumgarth and colleagues (2020). Additionally, it contributes valuable new data points for the on-going conceptualisation of a theoretical framework on brand identity construction (Shi and Miles, 2020).

2. Study Design: Design Thinking

This project is framed by Design Thinking (figure 1), a research approach that focuses on understanding and addressing complex problems through a human-centred and iterative process (Meinel and Leifer, 2012). Design Thinking lends itself to the investigation and development of branding, due to its emphasis on continuous user feedback which facilitates co-creation. Customer co-creation has been shown to positively impact brand value (Merz, He and Vargo, 2009; France et al., 2020), experiencing increasing popularity amongst brand managers due to the progressive empowerment of stakeholders in digital environments that require changes to the ways in which brands are created and managed (Siano, Vollero and Bertolini, 2020). The results presented in this paper reflect the Design Thinking process up to, and including, prototyping; thus, covering all stages dedicated to *understanding* and *exploring* the topic at hand. According to recent literature, this is a suitable point for sharing research outcomes with broader audiences to further enhance the feedback loop (Micheli et al., 2019).

Figure 1: The Design Thinking process

In addition to a literature review, *N* = 35 semi-structured interviews were conducted with Generation Z consumers based in Greater London, England, as part of the *empathise* stage. A combination of convenience and snowball sampling was employed to recruit suitable participants. The initial convenience sampling was conducted among the student population at the University of West London, with the sole selection criterion being that they were born between 1995 and 2010 and currently lived within Greater London. In the subsequent snowball sampling procedure, the selection criterion of location was added—that is, recommended participants needed to live in a different borough within Greater London. This approach aimed to diversify the socio-cultural and socio-economic makeup of the sample. Each interview lasted between 46 and 71 minutes, and took place in person between November 2022 and February 2023. Participants were aged between 18 and 25 years, and included 20 women, 14 men and one non-binary interviewee from diverse socio-demographic backgrounds.

Stimulus material for the consumer interviews derived from two start-ups that have tailored their brand values and messages around aspects of EDI. The two start-ups, both from the fashion sector, were part of the London School of Film, Media and Design's Creative Entrepreneurship Suite throughout 2020 and 2021. Both crafted their branding around a founder's story, emphasising the aspect of LGBTQ+ and black ownership of their fashion brands, as well as the aspect of giving back to their respective communities. Data collection was concluded once a desired level of understanding and saturation was reached (Fugard and Potts, 2015; Saunders et al., 2018). All interviews were subsequently transcribed and analysed using inductive Thematic Analysis (Kiger and Varpio, 2020) in order to define key consumer problems (Design Thinking: *define* stage). Data analysis was facilitated by

NVivo, which documented and structured key themes. To ensure anonymity, each participant was assigned a number from one to thirty-five (the corresponding participant number, e.g., P1, P2, P3, etc., is indicated after each quotation). Finally, tangible recommendations were *ideated* and *prototyped* for creative start-ups to better embrace EDI as part of their entrepreneurial branding.

3. Empathising: Consumer Insight

The analysis of the consumer interviews resulted in a total of four key themes: theme one addresses a lack of visibility and awareness of start-ups with EDI branding amongst participants; theme two lays out the consumer group's desire for authenticity, paired with distrust of brands delivering on this; theme three looks at the importance of intersectional diversity; and, finally, theme four provides insight on the limited danger of cancel culture for start-ups.

Theme one: (in)visibility

A key theme identified addresses a *lack of visibility and awareness* of start-ups embracing EDI in the UK market amongst participants. This was both the case for black owned start-ups, as well as for those embracing LGBTQ+ as part of their branding. Participants raised concern about a lack of easily accessible information and transparent messaging that would help them identify relevant start-ups. *'Where to begin, where do I start to find these brands?' (P14) 'It's hard to find UK based black owned fashion brands.' (P5)* Suggestions to overcome this included *'bold' (P7)* and more *'transparent' (P1)* brand communication on behalf of the start-up that *'should hit me with what it stands for right when I encounter the brand for the first time' (P20)*.

Theme two: authenticity

Closely connected to this is the second theme of *authenticity and distrust*. Participants expressed a desire to see start-ups adopt an authentic approach to EDI—that is, something rooted in more than just promotional efforts, but that permeates the brand's values and actions. *'Everyone can say they support equality, but that doesn't mean they actually do it.' (P15) 'Actions speak louder than just random promises.' (P18)* It appears that the target audience puts brands under considerable scrutiny and reflects on whether activities might be opportunistic in nature. *'During the BLM [Black Lives Matter] protests, many fashion brands pandered to the trend of supporting diversity. This felt rather fake.' (P29) 'Are you really here for us, or just yourself?' (P2)*

Just like with the previous theme, transparency and clarity appear to be key to overcoming distrust and to back up any authentic approach to EDI. *'As a brand, you've got to make it clear what you're about.' (P11)* Suggestions from participants for start-ups included presenting tangible *'proof' (P9)* as part of their communications, such as, featuring easy-to-find testimonials or examples for any EDI claims on their website and social media. In addition, start-ups should ensure that, if they commence their genuine EDI efforts, these do not coincide with bigger movements or heritage months. *'Just avoid pride month, at least at the beginning.' (P4) 'If all you do is just happening during a themed month, be it black history or pride month, or because there are protests going on, you can just stop doing it right away. No one will believe that you are genuine.' (P13)* Several participants also indicated that their trust in an authentic approach would improve if independent third parties featured and/or backed the brand and their activities.

Theme three: intersectionality

Theme three revolves around the importance of *intersectionality* when it comes to EDI as part of a start-up's branding. Participants showed a distinct awareness that *'just ticking one box' (P13)* with regard to equity, diversity and inclusion was not enough. *'Really, the changes we're talking about making should be the bare minimum anyway.' (P16)* The plurality and intersections of diversity characteristics ought to be kept in mind when crafting brand values and messages, as not meeting the target audience's expectations might negatively impact brand trust. *'It would make me question whether they know what they are doing if they say they are all about diversity and inclusion but then only care about one group. I wouldn't buy from someone who seems clueless.' (P24) 'I'd buy more often from a brand if I could trust that they honestly stand for diverse-diversity, yeah.' (P21)*

Theme four: cancel culture

The final theme challenges the idea of a growing threat of *cancel culture* from this consumer group. Most participants stated that they would not publicly boycott a brand based on controversial EDI business practises, due to the personal efforts associated and the potential danger of ending up helping the brand. *'I don't feed into cancel culture, because it's too exhausting carrying all that fire and anger for brands who use our rage for*

publicity.' (P6) This appears to hold particularly true for start-ups, which appear to enjoy an additional level of goodwill in case of a misstep. *'If it is a small business that just started, I'd give them another chance if they mess up once.' (P19) 'As long as they are honest about it and learn their lesson, I'd not cancel a start-up.' (P4)* Nevertheless, bad EDI practice might still negatively impact brand love, with participants being less attracted to brands with questionable EDI practices. *'I would probably care less about the brand, but if I needed something specific, I'd probably still buy from there.' (P33) 'I might lose some interest in it [the brand], yes. Completely cancel it? No, I wouldn't.' (P21)*

4. Defining the Existing Issues

The apparent lack of public awareness amongst participants regarding start-ups embracing EDI does not come as a surprise. The first half of 2023 saw almost half a million new companies registered every hour in the UK, with an unprecedented number of new brands entering the already saturated fashion market since the start of the pandemic (Chen, 2021; Young, 2022; Miles, 2024). The confusion and lack of direction among participants is an understandable consequence. It is difficult for consumers to keep track of all market players and would require an undue amount of time and consumer effort to research every new start-up brand. A lack of transparent guidance regarding brands embracing EDI more holistically—that is, beyond promotional efforts—impedes easy navigation of the market.

The importance of authenticity in terms of EDI, expressed by participants in this study, is in line with what previous researchers have found to be a crucial component for the success of emerging brands (Jahns, 2019; Mirzaei, Wilkie and Siuki, 2022). Generation Z, more than any previous generation, requires authenticity and truthfulness from brands to be encouraged in their consumption (Francis and Hoefel, 2018). Brand authenticity contributes to the development of brand trust (Portal, Abratt and Bendixen, 2019).

Consequently, actions driven by tokenism can damage this crucial trust, which appears to impact the perception of brands overall and consumers' decision making more specifically, thus supporting what, *inter alia*, Tressoldi, Espartel and Rohden (2023), Smith, James and Griffiths (2023) and Cunningham and Melton (2014) have highlighted for Brazil and the US. In this context, it is also unsurprising to see a heightened expectation for brands to embrace the plurality and intersection of EDI characteristics. As Generation Z have grown up digitally immersed, they have had opportunities to engage regularly with diverse people online, resulting in more than half of Generation Z believing that it is natural to belong to various social groups or communities at any given point in time (Francis and Hoefel, 2018). The expectation of intersectionality as part of branding is thus simply a reflection of this generation's own lived experience and reality.

Although the apparent low willingness of participants to publicly boycott brands that infringe on consumer expectations regarding good EDI practice does not echo the warnings expressed by some authors for other countries (i.a., Amed et al., 2019; Forbes, 2020; Tressoldi, Espartel and Rohden, 2023), the findings are in line with recent research by Forrester (2022, para 2), which states that 'cancel culture impacts personal brands more than company brands'. Whilst on the surface, this appears to be positive news for start-ups, further research is needed as to how this might affect businesses where the lines between personal brand and company brand are blurred; this is often the case in entrepreneurial market communications, with start-ups crafting their brands around origin and founder's stories.

Also, although most participants would not cancel a brand for a lack of EDI, they indicate a decreased engagement with and attraction to these brands. This might result in a strategic disadvantage; research has shown that customers must 'feel' a brand and know what is happening with it to develop love for the brand and to become advocates or influencers for it (Stengel, 2017; Coelho, Bairrada and Peres, 2019).

5. Ideating and Prototyping Recommendations for Start-Ups

Based on the findings within this study, four tangible recommendations for start-ups targeting Generation Z and wanting to embrace EDI were derived:

Recommendation one: Embrace intersectional diversity internally and externally

A focus on one single diversity characteristic should be avoided when crafting a brand. Rather, a brand that embraces the plurality of EDI characteristics is appreciated. On this basis, crafting effective brand storytelling that encompasses the range of diversity within an organisation (be that the founder, team, etc.) would likely demonstrate a good understanding of the matter. Furthermore, demonstrating this externally through

partnerships, such as with contractors, manufacturers, marketing agencies, etc. would highlight practical action on EDI commitments.

Recommendation two: Build and foster a community

Engaging with the target audience beyond selling products/services and attempting to forge genuine communication will give brands greater authenticity in relation to the brand's values and identity. This rapport with the target audience should be utilised to co-create EDI strategies, aiding in transparency from a brand's position. This can strengthen consumer trust and brand love, as well as loyalty, as there is a more meaningful reason to return to the brand.

Recommendation three: Sign up to existing associations working in EDI

Aligning with an organisation that already offers education, training and/or resources may make it easier to form EDI policies based on research and social awareness that already exists. There is also value in being a part of an organisation that has a proven track record in EDI, such as *My Runway Group* (https://www.myrunwaygroup.com/) and/or *Consortium* (https://www.consortium.lgbt/), as well as being recognisable with the target audience. This recognition can be utilised to demonstrate a brand's values, but should not be conducted in isolation to avoid the appearance of opportunism and/or tokenism. Start-ups should only sign up and join organisations that truly align with their own values and mission to ensure an authentic approach to EDI.

Recommendation four: Put EDI efforts front and centre of branded communications

Bold and clear messaging can increase transparency as to what the start-up embraces in terms of EDI, which is appreciated by the target audience. Making it easier for interested audiences to find the information is key. For example, on the brand's website, messages on EDI should be featured in several places—and optimised for search engines—as well as featured in the profile section of social media accounts.

However, brands can take it one step further by producing material that is interesting to the target audience. Creating content that is engaging branded material can also be a vital educational tool. The presence of informative, compelling content means that there is greater chance consumers will engage with a brand; sharing through socials, offline word of mouth, etc. are all ways that consumers become active participants in demonstrating social proof of a brand's strategy.

6. Concluding Remarks

Generation Z has a distinct hunger for brands that authentically embrace social causes relating to EDI. They want to see brands reflect their lived experience and reality in order to identify and connect with these brands. Start-ups that cater to Generation Z might therefore want to consider EDI as a core part of their entrepreneurial branding.

This paper derived four tangible recommendations worth considering when crafting or redesigning their branding, but most importantly, start-ups should think about EDI as part of the customer experience rather than a tick-box exercise. Activities and actions that feel organic and complement the customer journey will likely resonate well with the target audience. The aim should always be to build a community of loyal customers by staying authentic to the brand's identity.

EDI elements as part of entrepreneurial market communications appear to have the potential for gains in terms of, *inter alia*, brand love and brand loyalty. Our research also showed that start-ups that might have been hesitant to broach this topic in the past may not need to be too worried about negative impact. Consumer goodwill appears to lower the risk of business damage caused by missteps. Co-creation with the target audience, and transparent communications, might further mitigate the risk.

Contribution and outlook

This study delved into a critical aspect of contemporary branding—the incorporation of EDI elements to resonate with Generation Z consumers. Our research methodology, guided by Design Thinking, emphasises a human-centred and iterative approach—putting the stakeholders front and centre in the creation of socially conscious start-up branding, thus aligning to calls for stakeholder involvement (*i.a.*, Stengel, 2017; Jahns, 2023). Our exploration of how brands can move beyond tokenism to embrace the plurality and intersectionality of EDI characteristics is crucial for long-term brand sustainability and consumer engagement, and delivers much needed additional insights for the on-going journey towards more robust theories for entrepreneurial branding

(Shi and Miles, 2020). We want to emphasise, however, that there is still a lot that needs to be done. The authors of this paper agree with Chaudhri, Pridmore and Mauck (2022) that entrepreneurial brand building is not a one-size-fits-all process and lacks a linear pathway. Although our prototyped framework does not guarantee success, it suggests a new approach for using strategic communication to develop a socially conscious start-up brand that integrates equity, diversity, and inclusion (EDI) into its branding efforts.

What are the next steps for this project? For the final stages of the Design Thinking process, collaborations with creative start-ups across Greater London are pursued. Guided by the recommendations put forward in this paper, both strategy and creative assets tailored to the participating start-up brands will be developed and tested (A/B testing) with existing Generation Z customers. Results from the testing phase are expected to be available by early 2025, with the final implementation expected to take place later that year.

Inspiring Entrepreneurship by Spreading New Technologies and Innovative Methods that Popularise Science and Art

Dan Ophir
Dept. of Computer Science, Ariel University, Israel

dano@ariel.ac.il

Abstract: In recent years a new term related to *GPT (Generative Pre-trained Transformer)* has become very popular among professional society members who develop and use computing applications. This trend has inspired entrepreneurship in education in the following aspects: *Academic* – in the Computer Science and Management Departments *Non-academic* - studies for high school pupils and for adults who wish to enrich their education. The purpose of these studies is to popularise science, technology, and art using innovative methods to make these subjects attractive. Academic *entrepreneurship* requires students to be innovative, namely, to create a project using their acquired professional skills. The work, called the *final project*, is a part of the students' academic requirements at universities. As a promoter of these projects, I have been giving the students proposals, suggestions, and inspiration for the subjects of their projects. The article mentions and describes a *database* with hundreds of recommendations for subjects for projects as well as projects completed by students who previously finished their *final project.* This project's database is used as a model for the current students. The *database* includes the project's hierarchical classification along with subsections, according to their theme, *innovation level, and* completeness, indicating their practical or theoretical properties. The following projects are a sample demonstrating the variety of the final projects, for example: "*Analysing the voiceless languages*"*, "Double buffer economic boiler",* and *"Creating the most consensual coalition".* The second aspect of the entrepreneurship being developed is a series of lectures "*The Popularisation of the Science and the Art"*. This collection of lectures includes an innovative method for preparing and presenting the lectures, connecting attractively the way in which science and art are popularised together for an audience in a wide spectrum of society. The *Power-Point* presentations contain built-in programs, demonstrating dynamic and user-friendly theoretical issues that are accessible using artistic, visual, and acoustic effects, such as known clips, classical and modern paintings, sculptures, music, and other artistic creations. Some of the subjects in this series of lectures are as follows: "*Cryptology*", "*Illusions*", "*Architecture and Mathematics*", and "*Polarisation index in the society*". The main difference between the two above *entrepreneurships* is that in the first case, the main innovation lies in finding the subject of each final project, whereas in the second case, the innovation relies on its *implementation*, namely, its multi-media and multi-disciplinary presentation.

Keywords: GPT (generative pre-trained transformer), Entrepreneurship, Final project, Database, Science and art popularisation, Implementation

1. Introduction

Encouraging the *entrepreneurship* presented in the article is performed at two levels: (1) the academic level, where students mentor and (2) popularising science and art. Both ways inspire *entrepreneurship* in different populations. Entrepreneurship is technologically a relatively new domain mainly based on computer science and the business sector. There is rich related literature in this area, for example, Wilkinson A. (July 2024) and Dung L. T. and Dung T. T. (2024).

The purpose of this article is, on the one hand, to popularise and integrate the following three domains: science, technology, and art into a wider population and on the other hand, to get computer science students closer to these three domains. The wider population represents the passive side of this concept, whereas students must be active, and as an entrepreneur, to be inventive, to be well informed about what is new, and to improve prospects for humanity.

The article consists of two main parts related to its purposes. Each part describes the different modules according to the type of its user: the consumer, for whom it is dedicated, the students in the academic case, or the wide audience in the non-academic case. In the first case the emphasis is on novelty and usefulness, whereas in the second case the emphasis is on presenting examples of the audio-visual merging of art, science, and technology.

A detailed description of these two ways is given next.

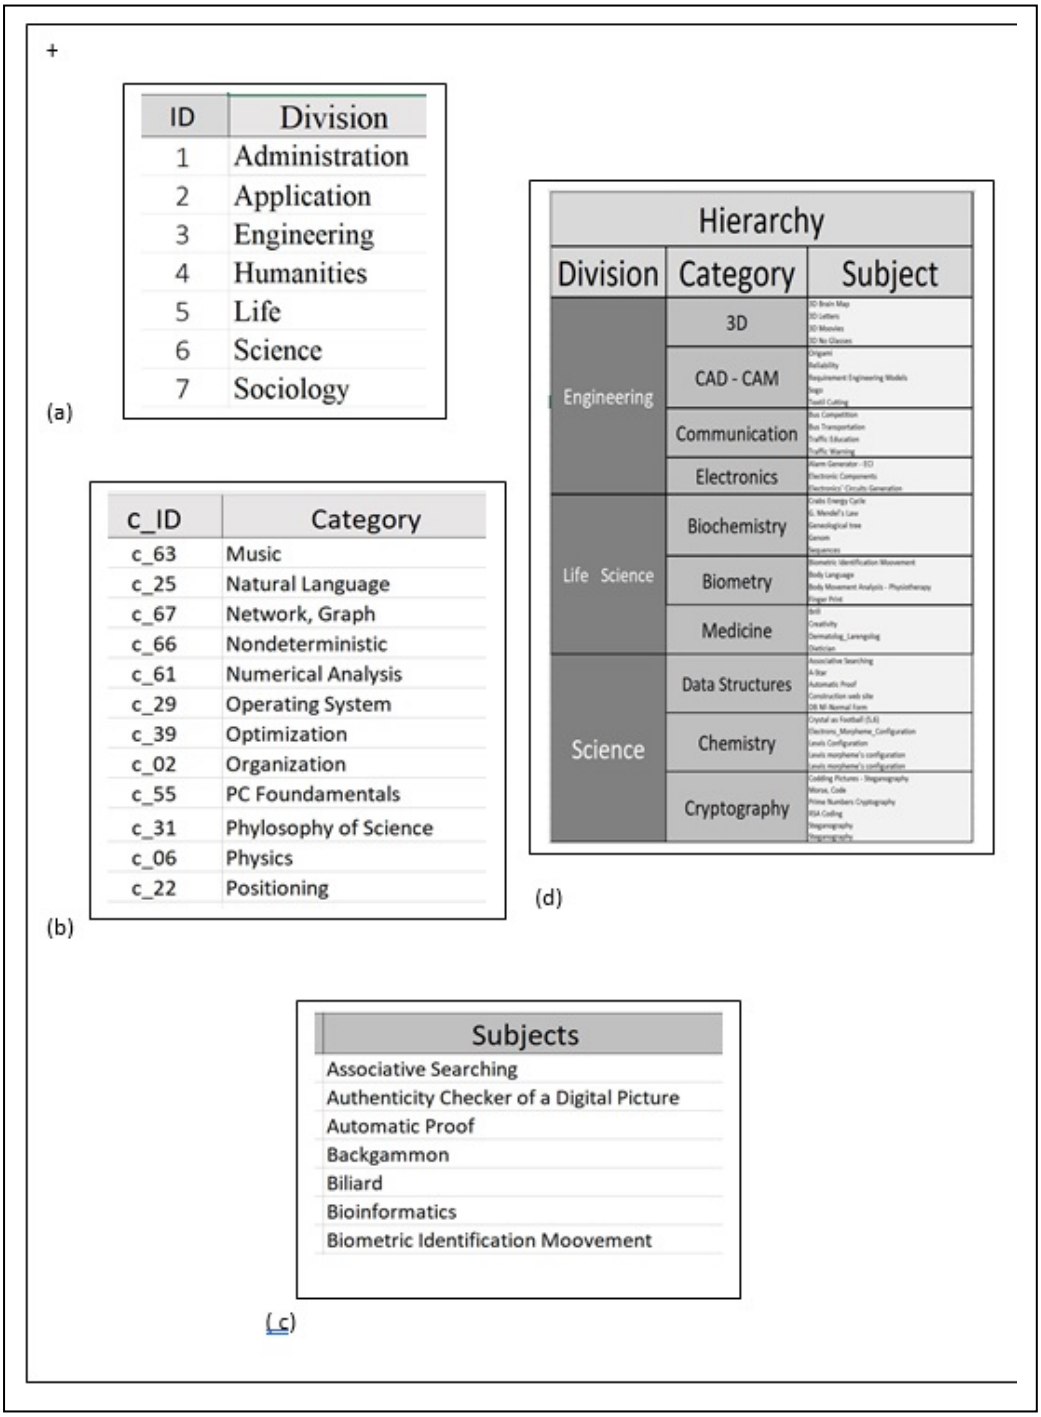

Table 1: Classification of project subjects in the data base by divisions and categories

a. The divisions used in this classification

Klein bottle 3D Model

Submitted by Nikolai Tiukov
Supervisor: Dr. Dan Ofir

Introduction

The Klein bottle is an amazing example of a two-dimensional manifold which is not orientable. It is a closed surface and has no border and an enclosed interior nor exterior (Figure 1).

Figure 1
3D Klein bottle model

Klein bottle was described by German mathematician Felix Klein in 1882. Klein bottle model can be physically realized only in four dimensions, since it must pass through itself without the presence of a hole.

Klein bottle in Creative arts

Figure 2
3D Klein Bottle Opener

Figure 3
the Infinite Galaxy Puzzle

Designer for 3D printing Bathsheba Grossman (Somerville, USA) has created the 3D Klein Bottle Opener in stainless steel and bronze (Figure 2). Jessica Rosenkrantz and Jesse Louis-Rosenberg (Somerville, USA) from a generative design studio Nervous System designed the Infinite Galaxy Puzzle (Figure 3). The puzzle doesn't have fixed borders, pieces from one edge could be flipped and attached to the opposite side. The image is continuous from one side of the surface to the other.

Klein bottle in science

In ferromagnetism in statistical mechanics, Lu WT and Wu FY have used it with a Möbius strip for the partition function of the Ising model. Another example of using is in the Ethernet network. Fuliang Lu in his paper have shown application of Klein bottle boundary condition to computed the numbers of spanning trees. Theoretical physicist Hong-Hao Tu with colleagues have shown that (1 + 1)-dimensional nonchiral rational conformal field theory exhibits a universal entropy on a Klein bottle and they have devised a Klein twist procedure to extract such universal entropy, which found excellent agreement with CFT predictions for quantum XY and Ising chains.

The goal

The project aim is to program an easy and user-friendly interface for visualization of Klein bottle 3D model.

Methods

The software was implemented in Python on web page www.pythonanywhere.com . 3D model was scalable according to the user input entered into the dialog box. Numpy-stl package was used to create files for 3D printing.

Software solution

The workflow consist of following steps:

1. Enter in your browser web site http://klein3d.pythonanywhere.com
2. Choose the model of Klein bottle (Program settings allows the user a choice of three models)
3. Choose a size of the Klein bottle model (Available in sizes from 5 to 15 cm)
4. Download the .STL file for 3D printing

Are you ready to print a Klein bottle in 3D?

Figure 4 - Print screen of web page: http://klein3d.pythonanywhere.com

Figure 1: An example of a poster prepared by a student, Nikolai Turkov, as one of the requirements of the Final Project, a Klein Bottle. The Klein Bottle is a topological special figure in which the inner and the outer parts are encountered in an astonishing manner. The aim of the project was to construct such a bottle using solid modeling and a 3D Line Printer

There is a time limit for working on the final project. However, this limit does not prevent it from being completed in a reasonable time. The research limitation related to the popularisation of science, technology. and art lies in the difficulty of matching a suitable audience to the type and level of the subject.

2. Academic Level

At this level, mentoring the students in their final project is described. One of the obligations of students in scientific and technological orientations in academic institutions is completing final projects. The students who

completed final projects with me were required to present an original problem, without a known solution, and to solve it by writing code for the algorithm in order to solve the problem. The steps for submitting a dissertation follow:

2.1 Choosing a Topic

The procedure for choosing topics for the final project consists of the following three stages:

- *An Interview*: A short interview with the student about himself: the courses he took, his hobbies, his interests, etc.
- *Suggestions* - My topic suggestions from a selection of open topics and final projects that match the student's background, which may inspire similar topics. The relevant topics offered are organised hierarchically by divisions (see Table 1 (a)), categories (Table 1(b)), and subjects (Table 1(c)) (see a hierarchical classification in a partial data base collection - Table 1 (d)).
- *Decision and Project Proposal* – The third stage is to reach a decision regarding selecting a project. The decision can be immediate, on the spot, or soon afterwards in writing. After the decision, the student writes a detailed project proposal that includes the following sections:
- *Project name*
- *Its purpose*
- *The finished product - its target audience and the way it is used*
- *The development method - tools for its development.*
- *Prerequisites - the background required by the developer.*

Figure 2: Gallery of Zoom participants

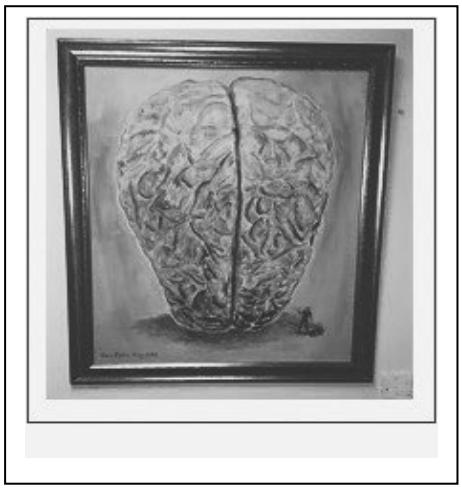

Figure 3: The chosen Logo: "Brain vs. Fear" (Ophir D, (2003) "Brain's Fear")

2.2 Guiding a Project and its Implementation

Meetings are held at times when the student reports on the progress of his work in writing and orally and receives feedback from his supervisor. Repeated feedback includes encouragement for action, advice on dealing with difficulties that appear along the way, and referral to the relevant reference materials and professional literature.

2.2.1 Final project results

Final project results are presented to various forums until the final weighted grade is generated. The final products are as follows:

- Poster - One of the milestones in developing the project is Poster Day. On this day, all students doing final projects in the department present their projects as a poster (see Figure 1) in a concise, visual way to the public: students, lecturers, and faculty members. A team of judges consisting of three moderators give a score on the poster, accompanied by notes.
- Thesis - a student summarises his thesis according to a predetermined format and submits it to his supervisor and the supervisor responsible for managing the students' final projects.
- Project Presentation - the student prepares to present his project and is tested on the project while presenting his project to a panel of judges.

2.2.2 By-products

Some of my projects were used by the instructors as inspiration and as a starting point for an idea presented in articles and presentations at international scientific conferences such as Mesika L. & Ophir D. (2012), Ophir D. & Pomerantz I. (2012), and others. A small part was submitted as a patent at the National Patent Institute.

3. Non-Academic Level

The social media network development tools, such as Facebook and ZOOM, which enable individuals to appeal to a wide audience around the world, motivated the *entrepreneurship* to develop the methodology of popularising science and art. Figure 2 illustrates the ZOOM meeting participants' gallery.

3.1 Modules of the popularisation pattern

3.1.1 Brand

Logo

The logo of the template will run in various media; it should be relevant to the popularisation of science, and attract attention, i.e., catch the eye of a potential user. The logo should have several characteristics to attract attention, be easy to remember, and be relevant to the topic it represents.

The logo we chose meets these requirements (Figure 3). It depicts a huge brain and a small person next to it, which gives the impression of some kind of intimidation: man fears the brain. There is symbolism here; the mind represents reason, knowledge, and science; man, on the one hand, is afraid and on the other, he is curious. A series of popularisation lectures is introduced here, with the aim of combining them.

The anomaly of the logo is expressed in the disproportion in size between the size of the brain and the size of the person; the logo is easy to remember because it represents only two objects: the brain and the person.

Website

A website is used to automatically prepare a list of participants with their preferences, which allows the lecturer to upgrade his contacts with potential participants (see Ophir D. (2021)

There are two types of interactivities:

- Real-time interactivity: During the lecture, the lecturer asks the viewers questions and receives immediate answers, for example, in a lecture on illusions the lecturer gives a test to a reality tester.
- Long-term interactivity: Viewers initiate their contact with the lecturer by asking questions or making comments at the end of the lecture or at a time convenient via email or through a website. This allows the lecturer to interact with the viewers, who send him relevant lecture materials.

3.1.2 Open a Facebook profile

Constructing a Facebook profile requires ensuring a wide exposure. One of the tools that fulfill this requirement is opening the Facebook profile with something suitable so that other users will discover your background.

3.1.3 The lecture outlines

Title

The title of a popularised lecture should be intriguing and should capture the viewer's attention. For that purpose, the title should be exceptional; for example, the title may imply ambiguity, as in the title "*The Illusion of Art or the Art of Illusion*" (see Sekel Al (2006)). The title can allude to elements whose connection is as distant as in the title: "*Architecture, Art, and Mathematics*". At first glance, these concepts are distant, and the viewer may be interested in the connection between the three factors. The title "*Logic, how does it deal with paradoxes?*" (see Baronett S. (2018)) is another type of headline that can entice a potential viewer. Another way to capture potential viewers' attention is to mention useful aspects of the lecture: "*Game Theory and* Their *Contribution in Everyday Decision-Making Process*" (see Neumann J. Von and Morgenstern O., (2020)).

A title that contains a question mark is often a good title because it indicates the lecturer's appreciation of the viewer. Here the lecturer thinks that the viewer will know how to deal with the question at the end of the lecture. A title that hints, e.g., gives tips on easy financial gains, appeals to the audience, as in the headline: "*Understanding Bitchain, and its Impact on Optimal Digital Currency Investments*."

Mystery and secrecy disguised within the headline can add interest to the lecture, as in the headline: "*What are covert encryptions and what damage can they cause*?" Here we encounter another factor that attracts attention in the title, namely, the element of intimidation: if you do not go to the lecture, you will not know how to deal with external threats. Finally, we will present counter examples of a boring title that does not pretend to attract attention, for example, in titles such as "*Game theory*", "Encryption and Identification" (see Burette S. and Paine S., (2001)), "*Bitcoin*", and "*Computer Games*".

Lecture's Abstract

The abstract accompanies the invitation to the lecture. The role of the abstract is to briefly tell the target audience about the content of the lecture. On the one hand, the abstract should attract potential viewers, and on the other hand, it is advisable to leave the factor of surprise to the lecture itself, for example, by presenting a connection between two different areas. As an example, we have shown an association between encryption and genetics (see Piercer B. A., (2016)). The summary also explains how the current lecture fits into the series of lectures as part of the popularisation of science. Thus, it is possible to advertise the entire series.

Opening and closing remarks

The opening contains the following components: (1) thanking the organisers of the lecture series for their contribution to the initiative, the organisation, and for inviting the lecturer to give a lecture; (2) a description of the factors that led the lecturer to develop a series of lectures, and an overview of which lectures have already been given as part of the series; (3) a reference to the audience's responses to lectures given so far; and (4) conclusions to the above

After the opening remarks, it is recommended that the opening slide, which explains the motivation for the lecture, will appear. The slide will contain a direct description of events that were effectively dealt with thanks to the means described in the lecture. For example, the first slide showed World War II videos on the music of Richard Wagner (Cabalgata de las Valkyries) (see Wagner R., (1851)) and explained the crucial function of the enigma cipher in this event. It began with fireworks against the backdrop of Rossini's impressive music of William Tel's opening "Gallop" (see Rossini (1829)).

Concluding remarks to the viewers: thanking them for listening, directing them to a slide containing the contact details of the lecturer, in case there are any questions and comments, along with follow-up lectures in the series; referring viewers to a penultimate slide containing the lecture's punch line, expressed with familiar musical accompaniment, conveying the message of the lecture in a pleasant and relaxed atmosphere, for example, Frank Sinatra's famous song "I do it my way" at the end of the lecture entitled: "Poland-Israel stories

In the context of culture, science, and what connects them""

3.1.4 Table of contents

The table of contents is built hierarchically, as a tree with several levels of detail. Each node in the tree is a link to relevant material in the lecture.

If we look, for example, at a genealogical tree of the lecture topics: "*Time, Space, and Art*" (see Figure 6, Dainton B. F., (2010)), we see a branching tree with five levels of detail. An arbitrary route in the tree was chosen: [World > Space > Cosmos > Space-I].

The following features will help popularise science, preferably through visualisation and sound effects. There is extensive use of videos, animation, graphical interfaces, supported by programming languages integrated into the middle of the presentation. Several examples presented below are contained in presentation lectures popularising science and art given so far in the lecture methodology described here.

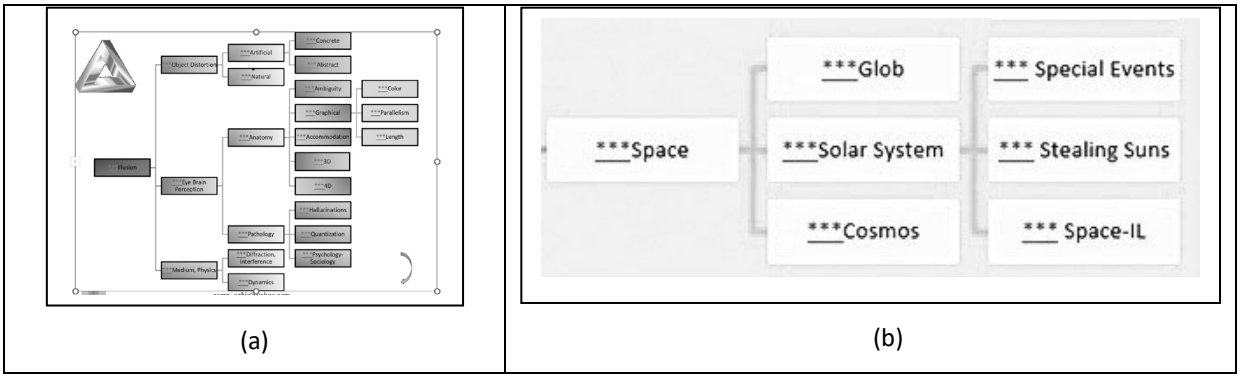

Figure 4: Tree of Contents (a) The whole tree in a miniature size; (b) A partial tree contents

Figure 5: Charlie Chaplin in "*The Gold Rush*" demonstrates hallucinations as a type of illusion in the lecture: "*The Art of Illusions or the Illusions of Art*"

Videos

In a lecture entitled: "*The Art of Illusions or the Illusions of Art*", Charlie Chaplin's video "*The Gold Rush*" was presented, in which the protagonists suffer from exhaustion, accompanied by hallucinations, a kind of illusion. A soundtrack of Chopin's "*Nocturne*" accompanies the video. The video is supposed to evoke in the veteran viewers' feelings of nostalgia, an indulgence in the past - a period in which the film was shown in cinemas (Figure 5, Chaplin C., (1925)).

Sometimes the videos are critical to understand a dynamic phenomenon, as in the case of a description of a folding bridge in a lecture: "*Architecture, Art, and Mathematics*". It is impossible to accurately describe the details of the bridge's folding.

Audio Features

Audio was brought up in a lecture on encryption in the context of the mutual identification of two listeners talking to two telephone line hunters and attempting to identify each other.

Animations

Animations were used in the lecture: "*Space, Time, and Art*" (Figure 6), in a humorous description of the Time Traveler Paradox (see Campbell, J.W. (1935)) the Theory of Special Relativity.

Simulation

Simulations were presented in the lecture: "*Game Theory and Their Contribution in the Decision-Making Process*". The simulation shows the decision tree and the control panel from one node to another node in

another branch, depending on the decision made. Another example of simulation is simulating the Roulette game in the casino in the lecture "*The Art* of *Illusion or the Illusion of the Art*".

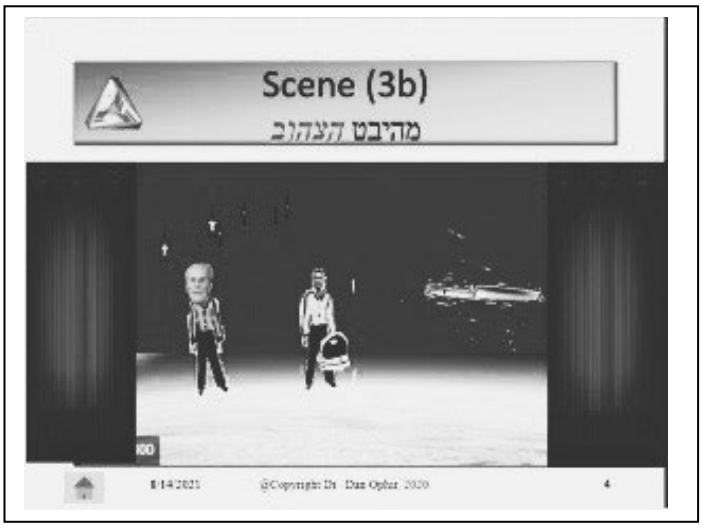

Figure 6: Twins' space encounter, according to the *Twins Paradox* of the *Relativistic Theory*

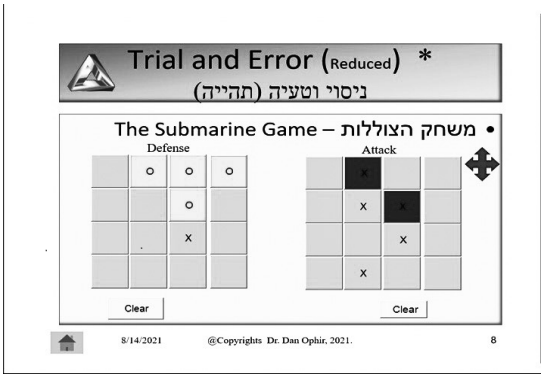

Figure 7: The *Submarine Computerized Game*, embedded in the slide presentation. The left and the right big squares represent the battle fields seen from both opponents' points of view, respectively

Computing-Programming

Computer programming is incorporated in a presentation in the lecture entitled "*Computer Games, Do They Improve Our Thinking Capability*?" The graphical interface to the software in the presentation allows the user to play the submarine game and to experience it in real time (Figure 7).

The above demonstrates how in an entertaining, humorous, interactive, and pleasant way, with the help of built-in musical accompaniment, adapted in rhythm and sound to the nature of the content, something can be presented on the slide, consciously and sometimes subconsciously, allowing popular information to be conveyed to the listener's satisfaction.

3.1.5 Subjects

Exact Sciences

- Bioinformatics - The field of genetics, the structure of the gene, is composed of four nucleotides - amino acids, in a lecture on encryption
- Mathematics - Concept series, Fibonacci series, the concept of the limit, the golden ratio, in the lecture: "*Architecture, Art and Mathematics*"
- 4Biology - Blood Types - ABO, mentioned by Prof. Leopold Hirschfeld, of Jewish-Polish descent, who helped discover our blood types - in a lecture: "*My Story in the background of Polish Israeli Cultural and Scientific Relations*".

The Humanity and Social Sciences

- Communication - The concept of fake news, disinformation (in "*Cryptography and Identification*")
- Psychology - The concept of a reality test – a reality test, verbal and performance intelligence, CBT (Cognitive Behavioral Therapy) (in "*Illusion of Art and Art of Illusion*")
- History - The crucial event of May 26-27, 1941, Atlantic Ocean, west of Brest, the Allied victory over the Nazis, turning points in World War II battles (in "*Cryptography and Identification*")
- Literature - Shaul Tchernichovsky, one of Israel's national poets, wrote in his poem: "A man is not, but a pattern of the landscape of his homeland." This quotation was mentioned in the lecture "*Childhood in the background of Polish Israeli cultural and scientific relations*".

Art

- Painting - Pictures of Francisco Goya, Van Gogh, Escher, Vasarely, Einhorn, and Dali Salvador (in "*Illusion of Art and Art of Illusion*").
- 4Sculpture - The Rapaport sculpture of the Warsaw - Ghetto Uprising (in "*Childhood, Poland-Israel Culture, and Science*").
- 4Music - Gallop in the William Tell Overture, by Rossini; Giovacchini Antonio (in "*Illusion of Art and Art of Illusion*").
- Cinema - "Obscene Proposal" - Robert Radford, "Gold Rush" - Charlie Chaplin (in "*Illusion of Art and Art of Illusion*"). In *Cryptology* – the history of *Enigma* was described using the background of "*Ride of the Valkyries*" (see Wagner R., (1851)).

Technology

- Image Processing - The meaning of the pixel and the RGB primary colors were explained in lectures: encryption, and in a lecture on graphics, respectively.
- Optical Instrumentation - *Sextant* - an instrument for measuring spatial angles; the *Hubble-Space-Telescope,* a telescope built for space exploration; the Helmet-Mounted Display (HMD) – another optical tool. The instruments were included in the lecture: "*Time, Space and Art*".

4. Conclusions

In science, technology, and art two-level entrepreneurship methods were described above. Both were intended to cover a wide spectrum of the audience's interests considering the subjects and their levels. Their purpose was both educational and practical: to make life easier and more pleasant. The mentor/lecturer's advantages were mainly regarding satisfaction in contributing to society, along with some profit.

Regarding the first type of usage, in the academic world there is a term called "lecturer evaluation", in which the students evaluate the lecturers' performance, and in the final project for which I have received the highest possible grade, which is an indication of this kind of activity. Additional academic recognition of these projects is reflected in the high number of citations and viewings of the papers, which were motivated by the *students' final projects*. The publication of those articles, which appear in the references, is evidence of their originality and their academic value, (for example, Mesika L. & D. Ophir D. (2012) and Ophir D. & Pomerantz (2012)).

In the non-academic case, its popularity may be indicated by the *satisfaction index* of the series of the lectures, measured by the number of superlatives, relative to the number of participants in the lectures. These superlatives are included in the feedback received and by the repeated participation of the same individuals in the next lectures in the series.

It appears that the academic and the non-academic parts in this paper have been largely approved. It turned out that the final projects of the students in the computer science and in the management industry departments contribute to their successful employment in industry; for example, one student advanced to the position of vice-director in the Google-Israel development wing.

The series of lectures popularizing science, technology, and art were received with great appreciation, mainly in two public sectors: workers' committees and retired workers. Their satisfaction was expressed in their feedback and very positive questionnaire results. This kind of activity is a kind of entrepreneurship and novelty.

Abstract: Digital technologies are becoming increasingly complex and integrated, leading to significant transformations in society and the economy. The article aims to explore and summarize the new opportunities and potential risks of the widespread use of artificial intelligence (AI) in all aspects of life, to define the new skills and necessary knowledge of digital entrepreneurs and to highlight the need for transformation in modern education. Recognizing that the relationship between technology and business is two-way and becoming stronger, revealing that well-prepared employees are a guarantee of success and prosperity of companies in various fields, we try to focus on the main groups of qualities, skills and basic knowledge of students in the age of artificial intelligence. The development of the Internet, expansion of connectivity through social networks, the advent of AI, 3D printing, and immersive technologies like Augmented Reality, and Virtual Reality, require new knowledge and skills, leading to new challenges in education. Qualified personnel in this modern world must have solid professional training and systemic thinking (knowledge, skills, accumulated information), developed cognitive abilities, and personal skills based on collecting and analyzing large amounts of diverse information from heterogeneous sources. Questions arise: how can multiple information sources be combined effectively, and how can the fusion of multiple sources provide additional information to support decision-making processes? Combining information obtained from the real world makes the results heterogeneous and more informative. It follows the need to develop machine learning methods to extract relevant information from increasingly complex data sets. The goal is to improve the accuracy of the applied classification algorithms by combining predictions from multiple models, as well as obtaining a more stable final classification evaluation, effective handling of noisy data, adaptation to changing conditions, and improving stability when solving problems. On the other hand, how to ensure that the enormous potential of artificial intelligence, virtual reality, connection with the physical world, machine learning, and pervasive networks of people and machines will be fully used to improve the quality of life and contribute to the building of stable societies. Changes must be subordinated to policy and investments for reliable artificial intelligence and based on an ethical and human-centered approach. All of these should be established as a fundamental principle of training in Higher education which imposes the need for transformation in modern education.

Keywords: Artificial intelligence, Machine learning, Data fusion, e-Learning, Entrepreneurship

1. Industry Development and Labor Market Change

The new reality in which we live and work is closely related to Artificial Intelligence and Industry 4.0. This necessitates the acquisition of new knowledge and skills by the modern entrepreneur to guarantee the success and prosperity of the company, which is the matter of the main research question in the paper. The first part of the article discusses the basic concepts such as AI, Industry 4.0, machine learning and its application for data mining. The second part presents the challenges facing modern education and the need for new approaches and changes. In the third part, contemporary requirements for an interdisciplinary approach and the need for transformation of modern education, combining theory and practice, are explained.

Comprehensive digitalization of activities in the economy, organizational systems, trade, and services and the penetration of Artificial Intelligence (AI) in all areas has led to the development of industry and a radical change in the labor market. Industry 4.0 is emerging. In Germany, the term "Industry 4.0" first appeared during the Hanover exhibition in 2011. Professors from the Massachusetts Institute of Technology (MIT) Erik Brynjolfsson and Andrew McAfee use the term "second machine age" in their book of the same name, published in 2014 (Brynjolfsson and McAfee, 2014).

According to Schwab (2017), "The fourth industrial revolution is a stage in the development of society, characterized by the rapid development and progress of digital technologies and their massive penetration into all spheres of life." It is based on intelligent and interconnected machines and systems. New concepts appear Internet of Things (IoT), Internet of events, Internet of people (social networks - Facebook, Twitter, LinkedIn, etc.), and Internet of location (mobile phones, smartphones, tablets, etc.). Such networks are created

to restructure economic and societal processes in such a way as to exclude the need for human involvement in a large part of actions and operations.

Digital technologies are becoming increasingly complex and integrated, and as such they are causing significant transformations in society and the economy. Artificial intelligence is at the heart of this transformation because the scientific breakthroughs associated with it form fields whose functioning depends to a large extent on the representation of knowledge and the imitation of human reasoning abilities. Artificial Intelligence and Data Science are evolving: Machine Learning; Natural language procedures; Image recognition; Computer intelligence; Intelligent robotics etc. A rapid development of technologies directly related to Artificial intelligence follows, such as: Web; IoT; Cloud technologies; Computing - supercomputers, GPUs, etc.

According to the study (Chege and Wang, 2020), technological innovation has a significant positive impact on job creation in small businesses and serves as a major engine for economic growth. The effective application of information technology in these enterprises significantly improves their competitiveness and provides them with access to global markets. According to the authors (Ciarli et al, 2021) digitalization is not just replacing jobs, but is related to the transformation of activities and their reorganization. For example, in agriculture, technology-driven digital transformation is bringing change far beyond simply training farmers to operate farm machinery. Instead, farm owners will have to shift to making high-level strategic decisions about software and equipment upgrades, requiring both financial expertise and technical skills.

In the book “Digital Entrepreneurship Impact on Business and Society” (Soltanifar et al, 2021) focuses on digital entrepreneurship and the main factors that influence digital business. The main digital technologies that are considered are related to Cloud Computing, VR/AR, IoT, AI, and Distributed Ledger Technologies. According to the authors, good knowledge of digital technologies is a prerequisite for generating good ideas at the right time and place. Therefore, the digital entrepreneurial personality must maintain the following competencies:

- Creativity, organizational skills, and sense of market opportunities;
- Knowledge of the technical requirements and competition of the surrounding environment;
- Courage to apply creativity to their own business.

Alongside the positive impact that digitalization has, people's dependence on it is also increasing and the likelihood of cyber attacks and security breaches is growing.

Social networks open doors and minimize barriers to connection and communication, but they also give rise to new forms of social anxiety. Digitization facilitates payments and commerce but also stimulates new types of fraud. Technologies that speed up and expand information processing can also drastically cut jobs. The increasing complexity and interdependence of technologies are accompanied by a significant increase in risk factors. This requires studying and deciding on monitoring, controlling, and assessing risk in the context of multi-criteria decision-making, with emphasis on fuzzy logic models, algorithms, and applications (Popchev and Orozova, 2021). In the book "Industries of the Future", Ross (2017) summarizes the main features and dangers: the forces that "unleash unprecedented progress" in lifestyles and wealth accumulation also have the potential to allow identity theft or invasion of personal living space.

With the adoption of digitalization in various spheres, a change is needed in the way of perceiving the world, work, training, and the opportunities that are revealed. People with entrepreneurial skills are constantly looking for new possibilities and ways to achieve their goals. Knowledge of new technologies and ways to apply them will unlock powerful creative energy, help create and offer new services to the market, and offer innovative approaches to solving new and existing problems.

2. The Challenges to Training and the Need for new Approaches

Considering the wide application of artificial intelligence (AI) in various sectors, it becomes extremely important to study its potential impact on the business models (BM) of entrepreneurs (Pfau and Rimpp, 2021). Trained personnel in this modern world must have stable professional training and system thinking (knowledge, skills, accumulated information), developed cognitive qualities, and personal skills such as:

- ability to analyze multiple project perspectives;
- apply a set of appropriate criteria for a realistic assessment of projects in terms of development and implementation time, price, risk, and security;
- to work successfully in a team on real projects with a clear final goal;

- competence in artificial intelligence (AI), big data, and information and communication technologies, to have interdisciplinary thinking, etc.

AI is not a new concept and it has long been present in various spheres of our daily life. Some of these applications are well-known to users, while others often go unnoticed. Examples include shopping recommendation systems, facial recognition technologies, and voice assistants (Intel Corporation, 2020).

Technology continuously monitors and measures various aspects of the learning environment, producing large amounts of data. The sources cover a wide field, including fixed and mobile sensor networks, human-provided data, domain knowledge, and more. The effectiveness of AI methods depends largely on the quality of the data it is trained on. In an educational context, this means providing accurate, representative, and diverse data for training algorithms. Next comes the need to develop methods for collecting, preparing, and managing such data, as well as developing machine learning algorithms to extract relevant information from increasingly complex data sets.

The questions arise: how to efficiently combine several data sources and how to combine the results of the work of different classification algorithms. Data fusion aims to improve classification accuracy by combining the predictions of multiple models, on the other hand obtaining a more stable final classification, dealing with noisy data, and adapting to different changing scenarios and conditions.

According to (Pereira et al, 2024)'s comparative study of automatic data fusion methods, they are divided into early and late fusion categories. Early fusion is divided into sensor data fusion and feature data fusion. Early sensor-level fusion methods can be applied: Bayesian Inference, Kalman Filter, Fuzzy Logic, Artificial Neural Networks, Dempster–Shafer, etc. Early Fusion from Features methods can be Principal Component Analysis (PCA), Singular Value Decomposition (SVD), Multidimensional Scaling (MDS)), and Deep Learning. Late fusion is divided into Late Fusion from Scores and Late Fusion from Decisions.

For example, an artificial intelligence and machine learning method of the type Early feature fusion (Pereira et al, 2024) performs the combination of features extracted from different levels of a neural network at an early stage of the model architecture. This integration allows the unification of both low- and high-level functions, allowing the simultaneous capture of detailed and abstract information. By fusing features at the beginning of the network, classifiers and regression models can generate more comprehensive descriptions of the input data.

This representation has the potential to improve the performance of various tasks, including image classification, object detection, and semantic segmentation. AI models can be improved using early feature fusion, thus advancing several data analytics applications. Figure 1 (Pereira et al, 2024) shows a block diagram of the stated method. Data sources are processed to extract the characteristic features that describe them. The most informative of them are selected. The selected features are used for regression and/or classification. The results can be applied to decision-making.

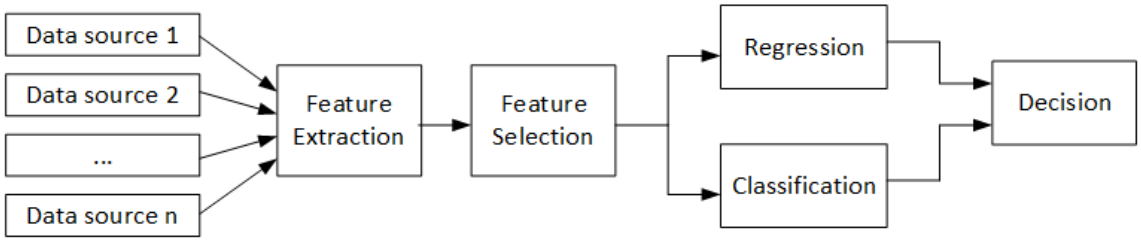

Figure 1: The early feature fusion method

3. Contemporary Requirements for an Interdisciplinary Approach

Current demands on education require an interdisciplinary approach, drawing resources, knowledge, and expertise from both the field of learning and specialists in learning theory, AI, big data, and psychology. Artificial intelligence resources can be methods, algorithms, programs, and positive experience in applying AI in many fields; development of AI-based learning management systems (LMS), intelligent training systems (ITS), etc., general-purpose AI-based intelligent systems (such as recommending systems, recognition and search systems). Cloud computing serves as a medium for AI and as part of our everyday life could be successfully implemented in business and would lead to competitive advantages (Delinov et al, 2022).

Augmented reality (AR) and virtual reality (VR) devices can be used to create interactive online ecosystems for specific training programs, offering participants virtual challenges and tests necessary to successfully complete the training. These platforms can be adapted to any industry, with virtual customers or patients being served by AI bot avatars, resulting in an immersive and engaging learning experience.

Cognitive sciences also provide methods for the development of higher cognitive functions such as critical thinking, problem-solving, innovation, decision-making, etc. On the other hand, the classical basic philosophical theories of learning: behaviorism, cognitivism, constructivism, connectivism of learning, can be a main source of ideas. They are the basis of already established private learning theories such as active learning, problem-based learning, project-based learning, etc.

There are many specific theories of learning, each focusing on particular characteristics or procedures. These theories can be useful in forming certain guidelines or limitations in the development of digital learning. The pedagogical framework TPACK (Mishra and Koehler, 2006) helps educators realize the power of technology and ways to properly integrate it into learning by combining their knowledge and pedagogical principles. According to the model, the knowledge, skills, and experience of the educator are essential to use the technological potential to achieve educational goals.

The successful implementation of young people in the modern world also requires business competence, entrepreneurial spirit, and leadership qualities. A transformation of higher education is needed. The requirement for modernity and the responsibilities towards the educational system requires that in the curricula of bachelor's and master's programs, depending on the professional direction and specialty, training in the following areas, as well as the connections between them, must be included: Artificial intelligence, Big data and their processing (DataScience), Digital Transformation, Industry Development / Entrepreneurship and Cloud computing.

Research in (Kruger, 2021) and their proposed conceptual model connect business functionalities and the necessary competencies that will allow entrepreneurs to cope with the challenges posed by Industry 4.0 and the change in the way enterprises are managed and business in its essence. The main competencies are related to Innovation, Creativity, Integrated business and technology skills, Leadership and communication, Networking, and sales.

The use of modern technologies such as virtual reality (VR), artificial intelligence (AI), augmented reality (AR), and robotics includes different teaching methods, allowing entrepreneurship education to be included in the curricula not only in business schools but also in science and technology students. This can serve as a starting point for changing and updating curricula and programs to meet the requirements of entrepreneurs.

Taking into account the various limitations (financial, available material base, certification requirements, etc.), the learning process can be planned by: appropriate differentiation of the learned content using the means of electronic learning; conducting interdisciplinary research and project work; personalized learning opportunities, collaborative learning in changing roles; international exchange (Erasmus+ program), etc. Personalized learning is a complex and highly uncertain system that can be realized by using Big Data and technologies based on artificial intelligence.

Students must come to the understanding on their own that obtaining knowledge is a complex process of research, gathering and processing data and information, asking questions and answers, forming and testing hypotheses, making a decision, and summarizing. AI tools have the potential to greatly enhance teaching, but they should not replace it. Overreliance on these tools can lead to a loss of human contact and individual attention which are essential components of effective education. The role of transmitters of support, guidance, and motivation is indispensable and a key component of successful education.

4. Conclusion

The article summarizes the new opportunities and potential risks of the widespread use of artificial intelligence in all aspects of life, defines the basic skills and necessary knowledge of digital entrepreneurs and emphasizes the need for transformation in modern education. In the opinion of the authors, the training should focus to a much greater extent on the study of problems from the real world, acquiring knowledge and skills for their use; conducting scientific research together with the students, and activities related to the formation of skills for independent learning, practice-oriented learning and maximum preparation for work in real conditions, as well as nurturing an entrepreneurial spirit during the studies at the university. The implementation of these tasks requires various resources and, above all, knowledge, experience, and prioritized new research and

development agreed upon at different levels, subordinated to the problem of adaptation to the current hyper-connected world. Changes should be subject to policy and investments for reliable artificial intelligence (Policy, 2019) and based on an ethical approach (Ethics, 2019), which should be established as a basic principle of training in the Higher School.

The transformation of higher education in the era of artificial intelligence requires innovative solutions, as well as actions related to the need to overcome contradictions and difficulties of an objective and subjective nature. Constructive cooperation between the Ministry of Education and Science, business, and the Higher Schools of the country is necessary.

Design Thinking for Frugal Innovation: Unleashing Sustainable Business Models in Emerging Markets

Jayshree Patnaik[1] and Pradeep Kumar Tarei[2]
[1]Indian Institute of Technology Hyderabad, Kandi, India
[2]Indian Institute of Management Jammu, Jagti, India

jpatnaik@em.iith.ac.in
pradeep.tarei@gmail.com

Abstract: Frugal innovation is a hotbed for low-cost innovative solutions that addresses the needs of underprivileged customers in emerging markets. Many of such frugal innovations are designed and developed by organizations that work at grassroots, and develop solutions in response to the interest of disadvantaged communities. With a central tenet of transforming an existing or undesirable state into a desired state, Design plays a significant role in meeting the unmet needs of such disadvantaged communities. Lately, Design Thinking is increasingly gaining traction as a human-centered approach to innovation that focuses on creative, innovative and iterative development. The foundation of Design Thinking lies in a strong desire to understand more about the people for whom the products and services are developed. When combined with the principles of sustainable business models, design thinking can lead to frugal innovations that not only meet the needs of underprivileged customers but also engender long-term social, economic, and environmental implications. However, studies focusing on the interplay of design thinking and sustainable business models, to unravel the outcome of frugal innovation are scanty. The current study fills this knowledge gap by uncovering how design thinking and sustainable business models can jointly help in improving the outcomes of frugal innovation practices in emerging markets. The research methodology comprises qualitative data collection through a multi-case study strategy using a grounded theory approach. The findings result in a conceptual framework that can be utilized to assess the performance metrics of organizations practicing frugal innovation in an emerging market context. The framework suggests that the outcome of frugal innovation can be measured using various indicators such as affordability, accessibility, energy efficiency, empowerment, and a human-centric approach. By focusing on human-centered solutions and maximizing the potential of frugal innovation, the study's contribution can potentially offer insights for organizations aiming to create a sustainable impact.

Keywords: Frugal innovation, Design thinking, Sustainable business model, Emerging market

1. Introduction

The burgeoning need to solve local problems of emerging markets has become an absolute necessity among organizations. Frugal Innovation (FI) has lately become the linchpin by which firms and organizations create new processes, production systems, and products for unmet local needs (Wozniak & Wereda, 2023). The most recent study on the evolution of FI has demonstrated its critical role in combating the COVID-19 pandemic reviving academic interest in the field (De Marchi et al, 2022). Frugal innovation is characterized by an environment that has resource scarcity, institutional voids, and affordability constraints (Ebolor et al, 2022). This paradigm shifts in end-users' needs and the imperative of addressing sustainable development goals are making organizations change their business model and technological innovations (Hossain, 2020). To successfully respond to this transition, innovators and designers need to steer from a conventional decision-making attitude to a human-centric design strategy for developing affordable and appropriate solutions that establish sustainability. Even though the association between frugal innovation and sustainability has been conceptualized in the literature, there is limited discussion on how such innovative solutions are being designed, developed, and disseminated limiting the potential of frugal innovation.

Design has always been a stimulator for innovation both in the product and service domains (Liedtka, 2018). Over the last few years, design thinking has become a buzzword among businesses and researchers, and it has cemented its position as a study where organizations can gain a competitive advantage from a designer's way of thinking and executing. Design Thinking has been conceived as a potential way of obtaining solutions to complex business problems and managing innovation to newer forms of life (Frisk & Bannister, 2022). Design Thinking acts as a facilitator for businesses and organizations to frame their intention by clearly articulating business models and enhancing the understanding of end users (Sekoboto & Mazanai, 2022). Design Thinking has been employed more and more as a tactic to aid in the development of sustainable business models, a phenomenon that has attracted attention on a global scale (Kurek et al, 2023).

Another critical component that influences the outcome of innovation activity is a sustainable business model (SBM) (Jaksic, 2016). Many times, frugal solutions are developed by organizations from ideation to dissemination without proper consideration of the business model. The sustainable business model is a rising topic of interest

in the management discourse to address the needs of underserved users (Comin et al, 2020). Hossain et al. (2021) mention that a frugal innovation is an appropriate means to serve low-income users, and, developing a sustainable business model around frugal innovation can help in attaining sustainable development. Sustainable business models help organizations in maintaining a competitive advantage by delivering, capturing and creating new value (Dal Mas et al, 2020). As an innovative endeavor, design thinking puts forth the idea of developing goods and services based on human needs, with diverse teams in finding pertinent solutions for complicated issues to develop creative solutions towards sustainability (Carella et al, 2022). Even though design thinking is acknowledged to be a key driver of competitiveness on a global scale, there are still developing nations where design as an instrument of innovation serves a negligible role in terms of contributing to the community. Table 1 outlines the recent discourse around these three concepts and taps on the gap for strengthening research.

Table 1: Comparing recent works on Design Thinking, Business Model Innovation, Frugal Innovation

Author	Focus	Design Thinking (DT)	Sustainable Business Model (SMB)	Frugal Innovation (FI)	Combined Studies (DT+SBM+FI)	Context/Technique
Sekoboto and Mazanai (2022)	Applying DT for circular business model innovation	Yes	Yes	No	No	Case Studies in South- African Small and Medium-sized Enterprises

Current Study	Synergistic role of DT, BMI in developing frugal innovations	Yes	Yes	Yes	Yes	Case Study on diverse organizations

Currently, there is scarce literature on frugal innovation that pivots on the interplay of design thinking and sustainable business models in conjunction. Exploring the concepts together will generate new avenues for discerning how to create, capture, and deliver value for the end users in emerging markets. Frugal Innovation in conjunction with Design Thinking can be used to develop new goods, services, and business models, in addition to changing processes or products (Ebolor et al, 2022). Any decisions made by organizations concerning role of innovation in business models will have a direct impact on performance. Thus, the study aims to investigate how frugal innovations are produced with novel business models that contribute to sustainable development. In response to the aforementioned questions, the study addresses two research questions (RQ):

RQ1: *How does the integration of principles of design thinking enhance the development of frugal innovations that align with sustainable business models?*

RQ2: *What metrics can be used to assess the performance of frugal innovations that have been developed using design thinking a sustainable business models practices?*

With the exploratory analysis of three organizations from an Indian context, the study illustrates how the generation of appropriate solutions is possible when product ideation and developmental and operational concerns are taken into account. Furthermore, the study also positions that a frugal solution should not be only technologically appropriate, but also be backed by sound business models in a given environment. The novelty of the studies lies in utilizing the concept of design thinking and sustainable business models for the development, dissemination, and evaluation of frugal innovation products. The remaining part of the article is

as follows: the next section discusses the methodology. The findings and discussions are presented in section three. Section four ends with the conclusion and proposed contributions.

2. Methodology

The study follows an exploratory approach and implements a multi-case-based strategy. The major intention of using a case-based approach is to investigate the qualitative information through an inductive process. A multi-case study was chosen to intensify the depth of observations; importantly, this enabled the researcher to revisit the primary research questions. According to Yin (2009), the vigor of a case study lies in dealing with multiple, significant sources for research questions allowing a multifaceted analysis. Mignenan (2022) stated that there are three kinds of organizations that are engaged in the approach of frugal innovation: multinational organizations, local organizations, and small-medium scale organizations. The study focused on choosing small-scale organizations that have attracted significant market traction despite the constraints in the development process. An exhaustive search of organizations was made to select the right cases through online databases and public resources. We selected three organizations from a large basket of organizations. The reason for selecting these organizations is because of the reflection of design thinking and frugal innovation in their functioning. The selected organizations fundamentally differ from each other, but they share a certain dimension of similarity. They have been operating in an environment characterized by resources and institutional voids, to address societal, economic, and environmental concerns. The major business idea of all these organizations centers on local development and sustainable operation in rural regions of India.

The first case selected is “X”, a for-profit social enterprise (*name changed to maintain anonymity*) alleviating poverty by giving people access to clean energy, building an ecosystem for sustainable energy innovations, bridging gaps through holistic solutions, and scaling solutions via replication. The inclusive approach followed by X has generated employment for many rural entrepreneurs. The second case selected for the study is “Y”, a development initiative mission that improves the rural economy by conducting science & technology intervention in the traditional practice of rural farm and non-farm production. The third case selected is “Z” an organization actively operating in energy, health, drinking water, skill development, and education. The vision of “Z” is to bring change by involving vulnerable communities from developing countries to design technologies for improving their economic and social well-being.

The data collection involved both primary interviews and secondary responses in the form of field notes, brochures, reports, and website articles. The data collection was done on the frugal innovation, design thinking aspects, and business model of these organizations from their origin to the present time. The data comprises face-to-face semi-structured interviews, field observations, and secondary documents as shown in Table 2. A semi-structured interview was made with six management and technology personnel from these three organizations. The interview was audio-recorded taking permission from the respondents at their organization’s premises. The field observations allowed us to note down their conduct and laid the ground for a contextual understanding of the concepts. Furthermore, the interviewed personnel demonstrated the entire mechanism of frugal innovations and business functioning.

The study follows an inductive approach which is concerned with finding the most probable description of what has happened from the respondents’ context for developing themes (Varma & Dutta, 2022). The data analysis is led by following the ideals of Grounded Theory (Gioia et al, 2013). NVivo12 software, which is frequently used for complex, heterogeneous, and qualitative datasets, was used to analyze the qualitative data (Patnaik & Bhowmick, 2020). The first stage of the analysis concerns with creating the data structure which starts with the data coding procedure. We examined the relationships between the transcripts and organized them into 1st-order codes based on our framed research questions. We further checked the idea that the first-order code might assist us in understanding the respondents' perspective. The data generated from the 1st-order codes were theoretically-focused and abstract.

The first stage further involved repeated cycling between theory and data. Once we reached a manageable number of codes, we handled the data by continually adding and removing codes that were emerging from the structure. We deduced that the saturation of the first-order codes has been reached when no meaningful insights emerged. Using axial coding (Strauss & Corbin, 1998), we looked for connections between and within the structure of 1st-order codes at the second level of analysis. In line with the underlying data structure, this leads to the creation of the 2nd-order codes. As we iterated over the 1st-order codes, we looked for any concepts that would help to clarify the respondents' narration. Second-order codes were created during this iterative process, and they eventually came together to form eight aggregate themes. The degree of importance of each of the themes discovered was once more reviewed throughout each instance in the last level of analysis.

Consequently, the development of data structures fulfills two purposes. First, it offers an apparent summary of the analysis performed on the original data. Second, it offers a foundation for illustrating an in-depth narrative of the study in its entirety. The data structure is shown in Table 3, which shows how the movement from raw data to the aggregate theme was achieved visually.

Table 2: Overview of selected organizations

Case	X	Y	Z
Nature	For-profit	Academic	Non-governmental
Year of establishment	1995	2008	1972
Location	Bangalore	Guwahati	Rajasthan
Product	Solar-energy related products	Agriculture, Energy, Assistive, Animal Husbandry, Textile, and Handicrafts	Solar-energy, Water, Education
No of Employees	100	30	50
Interview (semi-structured) participants	Head consultant, Project design associate	Senior faculty, Project lead	Co-founder, Field engineer
Time (in mins) taken for interviewing each of the respondent	90-120		120

Table 3: Thematic Analysis

First Order Codes	Second-order Codes	Aggregate Dimension
I. Communities trying to work hard to improve their lives and reduce dependency II. We focus to design technologies in response to unmet local needs III. There exists an immense opportunity to utilize rural resources for boosting their livelihood IV. We have to familiarize with community lifestyle to help them talk comfortably about their problems	• *Understand Field Requirements* • *Identifying Opportunities at grassroots* • *Recognizing appropriate solutions* • *Fostering Trust*	*Empathy*
I. Discerning exact needs of community to define the problem statement and identify the gap in the market and community II. Validating community indigenous knowledge and mobilizing scientific ideas to design appropriate solutions	• *Aiming for Productivity* • *User Segmentation* • *Bridging demand and supply*	*Define*
I. Making exhaustive discussions among different stakeholders to identify the best solution II. Involving communities in the development process for bridging the knowledge gap and ensuring improved technical advancement	• *Collaboration with stakeholders* • *Generating Ideas* • *Resource Mobilization*	*Ideate*
I. Ensuring our innovation are efficient than traditional techniques and flexible as high-end technologies II. Checking the compatibility of technologies with the users and local manufacturing facilities for the utility	• *Experimentation* • *Training Partners* • *Networking*	*Prototype*
I. Conducting workshops and engaging communities to evaluate the utility of the technological innovation II. Carrying out demonstration and training with different NGOs for a wide-scale technology adoption	• *Feedback* • *Field Trials* • *Knowledge Diffusion*	*Testing*

First Order Codes	Second-order Codes	Aggregate Dimension
I. Technologies developed are affordable, require less maintenance, user-friendly, efficient and maintain optimal performance II. Technologies have potential for transforming well-being by making proper interventions	• *Delivering customized end-to-end solutions* • *Effective-delivery mechanism*	*Value Deliver*
I. Sensitizing communities regarding opportunities associated with innovation through different workshops I. Increasing technology accessibility and availability to different geographic regions by forming local networks	• *Entrepreneurial Opportunities* • *Developing the appropriate technological solutions*	*Value Create*
I. Increased revenue generation for community members by selling technologies in local markets II. Technologies have potential for transforming well-being by making proper interventions	• *Market Creation* • *Profit accrued on sales*	*Value Capture*

3. Findings and Discussions

The section shares the findings of the empirical analysis concerning the key elements of design thinking (empathy, defining, ideating, prototyping, testing) and sustainable business models (value delivery, value creation, value capture). The obtained themes represent the diverse opportunities, unexploited needs, and constraints overcome by these organizations in their day-to-day activities for creating frugal innovation and delivering value in the livelihood of the end-users.

Empathy and Defining user insights are considered important aspects of design thinking (Micheli et al, 2019). Immersing into the lives of the end users and letting go of the biases serve as the first step in the innovation process (Liedtka, 2018). Our empirical findings support this statement. The significant aspect of empathy lies in how these organizations undertake efforts to understand their end users for whom they are developing and designing innovative solutions. These organizations tap into empathy by identifying the pain points, and behavioral, and physiological patterns of their users, and feeling their perspective. The case of "Z" demonstrated that women from low-income sections can also be innovators and designers. Thus, from the perspective of design thinking, "Z" recognized and empathized with these women and their social conditions. They trained them as innovators who were able to develop low-cost solar products using minimum resources that were appropriate to their socio-economic context. The Define stage in the organizations is undertaken by converting the observations in the empathy stage into meaningful and actionable problem statements. These organizations attempted to give a precise structure to the identified pain points among the end users in the defined stage. Comprehending the users' perspectives, and inferring their undiscovered needs will give clarity to the problem statement. The organization "Y" identified the field requirements of the rural people, interacted with them, understood their perspective, and identified the opportunities associated with upgrading the existing technological innovation.

The ideation stage in organizations is marked by the generation of ideas for translating the defined problem statement. These organizations employ different brainstorming techniques to create ideas for solving the identified problem. For example, "X" conducts brainstorming sessions with the women to generate feasible ideas for designing solutions, thus giving them equal decision-making responsibility. Furthermore, "X" implements verbal expressions and mental imaging for visualizing and creating interesting ideas.

The prototype stage in the organizations is characterized by a rudimentary model of the identified problem statement (Samadhiya & Agrawal, 2022). These organizations create a low-fidelity prototype for seeking answers and try to evaluate if the solution is capable of addressing the intended problem. Testing is the last phase of design thinking in organizations where the prototype is tested in a real-life setting by the actual end users. The practice of prototyping and testing are significantly reflected in the "Y" design activity. Once, "Y" prepares a low-fidelity prototype, it is taken to the field where the local community uses it, if there is any discrepancy in the operation, then the community gives feedback, and the technology is again modified in the lab until the design in the technology is made appropriate. Once the final design is ready for use, it is transferred to the communities with the help of support partners like NGOs, and local action groups. Blank & Dorf (2020) posit that testing solutions from conception to problem resolution verifies their viability from a commercial perspective and their appeal to end-users.

According to Baumeister et al (2015), a sustainable business model considers the interest of the various beneficiary that also includes the community and its ecosystem, and our findings support this concept. Various groups were associated with different stages in the innovation process of these organizations including funding agencies, professional designers, and intermediary organizations that further mobilized the economic, social, and environmental values for the frugal innovation. The major value creation of these organizations is appropriate, affordable, customizable, and good enough solutions that fit local needs. These organizations respond to the unmet local needs at the grassroots and the lack of access to such technological solutions that will improve their living standards and transform their well-being. For example, the organization "Y" creates and shapes an ecosystem where innovation and entrepreneurship can flourish at the grassroots and where the rural end-users can eliminate dependency on external agencies. The new frugal solutions developed eliminated the drudgery and manual labor of the people and resulted in increased productivity.

A major aspect of value delivery in all three organizations is they rely on local resources, and networking opportunities to create delivery at the grassroots thereby bridging the institutional gaps and resource constraints. Utilizing the available resources makes these firms address any financial, or operational issues that may inhibit the development process. "X" operations are a hub and spoke model that ensures the availability of services across different locations by providing financing options. The hub represents the established energy centers in rural areas where the spoke denotes hiring agents, training the local who further acts as a prime linkage to the end-users. Furthermore, it continues to maintain a long-term association with its partners, which facilitates generating a superior quality of product offerings, door-step financing, managing inventory, conducting flexible prototyping, and leveraging capabilities. The three organizations cater to the different constraints in their functional environment with their models of value capture.

Emerging markets often do not have typical institutional support. For example, the organization "Y" does not give direct loans but closely works with financial organizations to provide credit to their customers. It rents products to local customers, where the product or service is often free for the first year, and then an optimal fee is charged for that service. The members visit each service rented to the user once in three months to ensure performance. It helps in curbing dependency on non-renewable resources and mentors' rural people to become entrepreneurs. The "Y" business model constitutes a set of innovative nexuses that seek to diffuse sustainable technologies to the people at the grassroots in an economically viable way.

Thus, the findings from the analysis stress affordability, accessibility, energy-efficient, empowerment, and human-centric solutions as the outcome of frugal innovations when design thinking and sustainable business models are incorporated into the development process. The empirical framework shown below in Figure 1 represents the association between design thinking and business models for fostering frugal innovations. These entire dynamic aids the organization in increasing performance, and sustainability and bringing a positive change in the lives of the community.

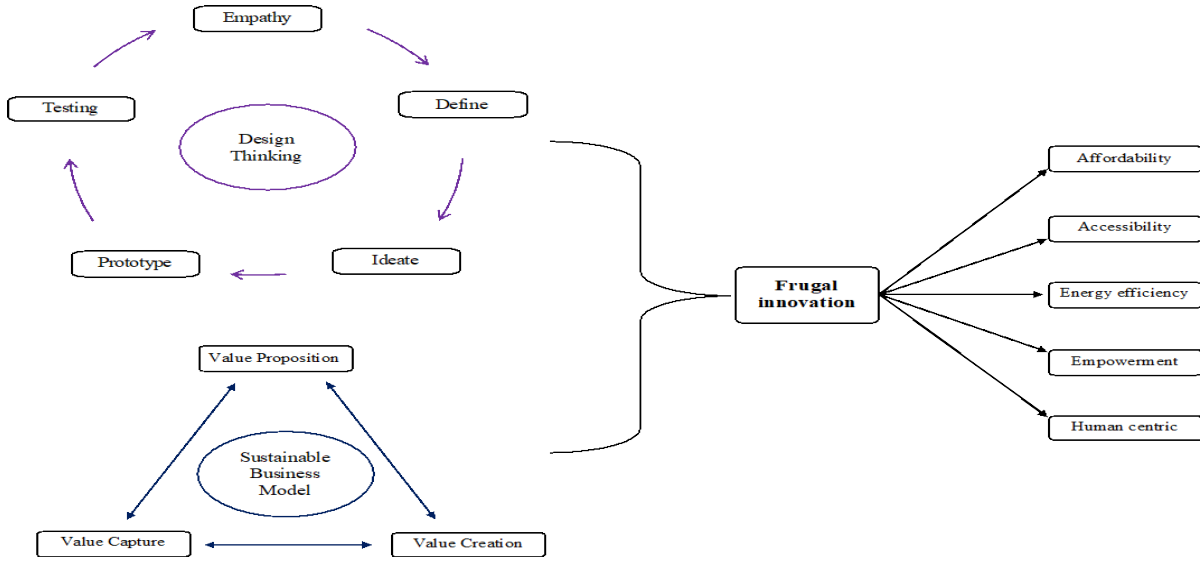

Figure 1: The Analytical Framework

4. Conclusion

The objective of this study was to uncover the desirability, feasibility and, viability of frugal innovation from the lens of design thinking and sustainable business model. The study explored organizations engaged at the grassroots developing human-centered solutions and building a novel sustainable business model. The findings provided a simplified dynamic of frugal innovation, demonstrating a wide range of contextual activities like empathy, define, ideate, prototype, testing, value creation, value capture, and value delivery. Even the research on design thinking, frugal innovation, and sustainable business models have received attention over the years, exploring this concept together for entailing development in the emerging market is still in its infancy. There is a perceptible gap in the existing practice of frugal innovation using design thinking to study the genesis of such innovations. The pairing of 'design' and 'thinking' in design thinking will provide the arena to implement design tools for problem-solving that are not only related to functionality but also to the form of business planning. The theoretical implications of this study lie in uncovering the stages of design thinking for identifying the problems at the grassroots and demonstrating the scope of value delivery and value capture. The study also demonstrated how tenets of design thinking can be applied to small-scale and low-cost innovations.

Organizations engaged at the grassroots have exhaustive knowledge about the rural end-users in emerging markets, when the need arises, they create human-centered solutions making an affordable value proposition for them. This frugal innovation designed through the lens of design thinking is solving problems at the local level which conventional companies have failed to solve. Thus, managers and practitioners need to rethink their strategies for gauging the effects of frugal innovation. Furthermore, this study will make managers, policymakers comprehend the opportunities and impediments linked with the management of frugal innovation. The empirical findings from the study lay the ground for advanced research on the nexus between design thinking and frugal innovation. This study comes with its own set of limitations and outlines pathways for future studies. The study considers three diverse cases of frugal innovation from an Indian context; thus, the findings cannot be generalized to all organizations. New studies can include a larger number of cases from a different geographical context and validate these findings, thereby, generating more insights into the frugal innovation mechanism. The concept of Design thinking and sustainable business model for mobilizing frugal innovation at the grassroots is a new addition to the academic discourse, thus there has been a limited understanding in the context. Future research can delve into how frugal innovation emerges from the ideation to the prototype stage would be interesting to explore.

The Efficient Applicability Limits of Social Entrepreneurship

Ruslan Pavlov
Independent researcher, Ashgabat, Turkmenistan

pavlovru@mail.ru

Abstract: The efficiency of social entrepreneurship depends on the ability of social enterprises to be sustainable. So, this paper implies deriving the efficient applicability limits of social entrepreneurship in terms of their sustainability. The more sustainable a social enterprise is, the wider its efficient applicability limits are. So, it's a novel approach towards studying the efficiency of social enterprises and the limits of their efficient applicability. The case study approach is used to estimate these limits, and three social enterprises are taken for this analysis, namely, APOPO, Benetech and Conserve. The insights of this paper suggest that the burden on social enterprises should be dosed, because their viability depends, in most part, on implementing the respective social policy. Under the excessive burden on social enterprises they could be destroyed, whereas under the insufficient burden some of their capacities could be idle, and that would suggest that they are inefficient. Eight factors of increasing the efficient applicability limits of social entrepreneurship (namely the state support of social enterprises, the aid provided for social enterprises by the private sponsors, the support for social enterprises provided by the international organizations, the support for social enterprises provided by the external sources of loan and emission financing, creation of special economic zones in different innovation centres, in which social enterprises are formed, using social enterprises as sub-contractors of the private business in the process of social outsourcing, the position of public opinion towards social entrepreneurship, the strategy of designing and marketing the products of social enterprises) were derived. The measures of the state support, enlarging the efficient applicability limits of social enterprises are provided. Also, the creation of special economic zones in the innovation centres, in which social enterprises are formed, is proposed, as well as the mechanism of subsidizing social enterprises by the state and creating some special conditions for the microfinance and social stock markets as the main external sources of financing social enterprises are suggested.

Keywords: Efficient applicability, Social enterprise, Innovation

1. Introduction

In recent decades, there has been growing interest towards the topic of social entrepreneurship in the scientist community. It is connected primarily with the fact that it presents a new, innovative way of solving social problems under the environment of decreasing public expenditures by the state, and so it is rather an efficient tool of substitution of the state in different social sectors. For a long time the problem of efficient applicability of social entrepreneurship wasn't considered in economic studies, because within the ideological aspect the neoliberal approach towards studying social entrepreneurship predominated. And this neoliberal aspect doesn't allow to consider social entrepreneurship in its inseparable link with the public policy, but the neoliberal economists consider it separately from the state and social system, they consider it as mere ordinary private business maximizing its profit. For example, in such manner it is considered by A.A. Moskovskaya and her colleagues from the Higher School of Economics of Russia (Moskovskaya, 2011). Though in order to use this tool adequately one should determine the limits of efficient applicability of this phenomenon, since under the excessive burden on social enterprises, the risk of degradation of this phenomenon emerges, and in the case of insufficient burden its incomplete development takes place. In most part, the efficiency of social enterprises depends on their ability to be financially sustainable, so their limits of efficient applicability should be determined on the base of their data on their sustainability. The more sustainable a social enterprise is, the wider limits of efficient applicability it has.

In terms of the efficient applicability limits of social entrepreneurship, one can derive two aspects of this phenomenon: sectoral and territorial. The sectoral aspect implies using this phenomenon in respective sectors, which could be in line with the mission of social enterprises. The territorial aspect implies deriving the regions, in which social entrepreneurship is developed to the greatest extent, and that implies deriving the position of local authorities concerning social enterprises, their awareness about the large potential of social entrepreneurs and their readiness to stimulate the development of social enterprises.

2. The Sectoral Aspect of the Efficient Applicability Limits of Social Entrepreneurship

Within a context of sectoral attachment in Russia the most part of social enterprises works in the sectors of education, healthcare and social services. Such sectors as culture, sports, leisure and entertainment are at the third place, according to their popularity. Further processing industries, other services, trade and maintenance take place following the industries staying at the third place (see Table 1). Such industries as mining, household activities, public administration, military security and social care are the least popular industries within the area of social entrepreneurship (Soloviova, 2023). Meanwhile, one should mention that during the period of 2020-

2022 the amount of social enterprises increased in almost all the sectors of economic activities. The processing industries and storage and transportation, excluding the insurance, financial activities and electricity supply due to the low base effect, demonstrate the most significant rates of increase (about three-fold increase). Social entrepreneurship is less active in its development in agriculture and forestry (111%), as well as in the activities of hotels and public catering (149%) and the real estate operations (182%) (Soloviova, 2023). These facts can be explained by the approval that social enterprises have a certain social mission that is focused on executing a special social impact, and this impact can be realized best of all in such sectors as education, healthcare and culture. All the rest sectors are less important in terms of producing the social impact. As a whole, the sectoral structure of social entrepreneurship within the Unified register of the subjects of small and medium-sized entrepreneurship corresponds with that of social entrepreneurship, according to the statistical data of competition "Social entrepreneur", which is held by the Our Future Foundation (OFF, 2020). The sectoral structure of social entrepreneurship is such surprising that one should ask questions: "Why should one use social entrepreneurship, in most part, in education, healthcare and public services? And why shouldn't it be used in mining and oil and gas industry?" The answer to these questions underlies the assumption that using social entrepreneurship in oil and gas industry wouldn't be worthwhile, since its main task is not the profit maximization and rent-seeking, but solving certain social problems on the base of innovative approach. It is the maximum presence of social entrepreneurship in these sectors that determines the limits of its efficient applicability.

Table 1: Distribution of social enterprises of the Russian Federation by types of economic activity, 2020-2022

The section of economic activity classification	2020	2021	2022
Education	662	1864	2013
The activity in the field of healthcare and social services	873	1824	1908
The activity in the field of culture, sports, organization of leisure and entertainment	442	1168	1280
Manufacturing industries	237	577	606
Providing other types of services	158	446	474
Wholesaling and retailing; maintenance of vehicles and motorbikes	152	380	412

3. The Territorial Aspect of the Efficient Applicability Limits of Social Entrepreneurship

The territorial aspect implies deriving the regions, in which social entrepreneurship is developed to the greatest extent, and that implies deriving the position of local authorities concerning social enterprises, their awareness about the large potential of social entrepreneurs and their readiness to stimulate the development of social

enterprises. So, for instance, in Russia in such subjects as Moscow, the Moscow region, the Khanty-Mansiysk Autonomous Area, the Republic of Bashkortostan, the Nizhny Novgorod Region and the Primorye Territory the positions of local authorities towards social enterprises is active in the sense that they rather actively support social entrepreneurship initiatives at the local level, providing subsidies for them and other kinds of the state support, without which the development of social entrepreneurship wouldn't attain such great results (see Table 1). So, for instance in the Republic of Bashkortostan in 2021 within the national project "Small and medium-sized entrepreneurship and the support of individual entrepreneurial initiative" 147 social entrepreneurs of the Republic got the measures of state support, which amounted to 70 million rubles, the amount of grants was from 100 to 500 thousand rubles (RBC Ufa, 2022). Later this programme was prolonged as it was in high demand. Speaking about other measures, one can't help but mention that the municipalities provide the financial support for the entrepreneurs to reimburse the costs incurred by them. It is the competition procedure, and social entrepreneurs have the priority in it. The Bashkir microloan company provides loans at preferential rates, and the category of social entrepreneurs is allocated into the special category, and the annual interest rate of this company is about 3.5% for social enterprises. The Republic of Bashkortostan and the Regional Leasing Company, that hasn't allocated the category of social entrepreneurs into the special category before, agreed that social entrepreneurs would have preferential rates. In terms of the size in Russia the microenterprises predominate over other enterprises (Soloviova, 2023), and first of all it is connected with the fact that it is easier for the organizations that have small sizes to meet such criteria as the necessary share of employees belonging to the category of socially vulnerable people and the necessary share of expenditures connected with their wages. The significant decrease of amount of social enterprises (so, for instance, in the Tambov region in 2022 it was 0, as compared with 2021 when it was 7 in the region (see Table 2)) can be explained by the fact that these enterprises decided not to confirm their status because they didn't benefit from inclusion into the register before.

Table 2: Region leaders and region outsiders according to the amount of social enterprises in the regions of Russia in 2020-2022

As a whole, the territorial aspect shows that the efficient applicability limits of social enterprises are wider in the regions, where the local authorities actively support social entrepreneurs, and they are narrower in the regions, where social entrepreneurs don't find any benefits from inclusion into the respective register. It is the support of local authorities at different levels that is the main factor of increasing the limits of efficient applicability of social entrepreneurship in the respective regions within the territorial aspect of this problem.

4. Three Cases of Determining the Efficient Applicability Limits of Social Enterprises

In order to determine the efficient applicability limits of social enterprises, it is sufficient to present just three examples characterizing the level of their financial sustainability, and, hence, characterizing the level of their

efficient applicability. Here three cases of social enterprises in terms of their efficient applicability limits are presented, allowing for the fact that in each of them a special factor of increasing the efficient applicability limits of social enterprises is presented. So, for instance, in the first of them the significant impact of the aid provided by the external private sponsors is emphasized, in the second one the significant influence provided by the governmental sources of financing is noted and in the third one a special role of creating the structure division on the development of design and marketing strategy of social enterprise is highlighted.

The first example is connected with the social enterprise "Benetech", which can be named as the most progressive social enterprise in the USA. This enterprise was initially named "Arkenstone" and it was engaged in manufacturing a special reading machine for the blind people. Later the company sold this business to a commercial distributor and focused on producing the software such as, for instance, Bookshare, Human Rignts, Route 66 and Benetech labs. Its total amount of financial sources consisted of 33% of its external sources and of 67% of its own income in 2008 (see Figure 1). Later, in 2017 its total income from software sales was 10.078.925 dollars (see Table 3), which is approximately 13-fold greater than the total sum of the donations, that were made to it. So, the limits of efficient applicability of this social enterprise are rather wide reflecting the high level of its financial sustainability. But at the same time this enterprise had a large share of the financial support provided by private sponsors, namely grants and contributions from the private sources of financing. It was at the level of 32% of the total amount of financial sources of Benetech's projects in 2008 (see Figure 1).

Source: Fruchterman (2008)

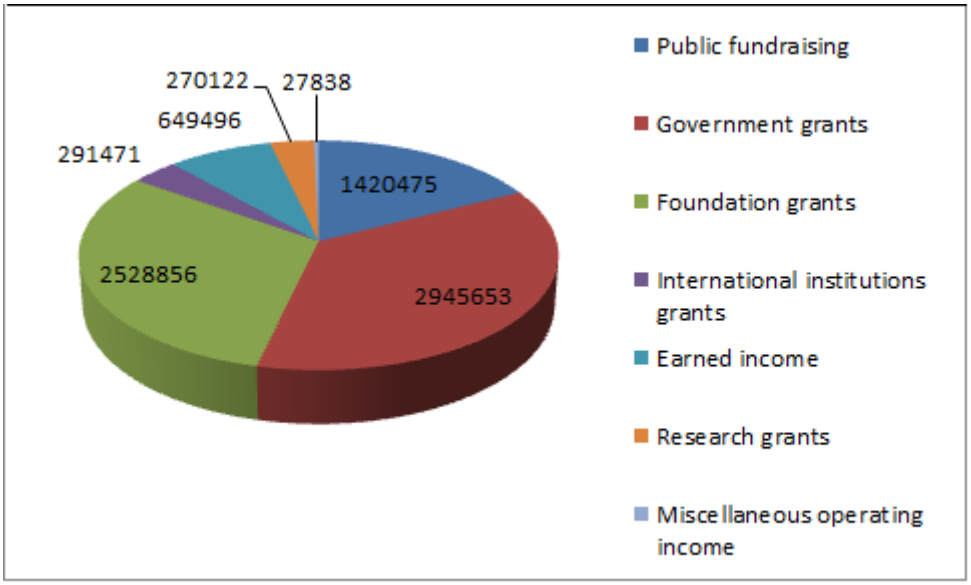

Figure 1: Financial sources of Benetech in 2008

Table 3: Financial support and income of Benetech in 2017

Financial support or income	Value (US dollars)
Donations	793.147
Services/products provided	412.078
Payment for engineering and consulting services	5
Income from software sales:	
Bookshare	9.439.665
Human rights	569.102
Route 66	99
Benetech labs	70.059
Interest income	6.413
Rental income	22.392
Total financial support and income	11.312.960

Source: Benetech (2018)

The second example is connected with the social enterprise “APOPO” from Mozambique. This enterprise is engaged in landmine and tuberculosis detection, and is a very successive social enterprise, but it always needs some financial support from the external sources. During the period of twenty-one years since its foundation APOPO has developed into a mature organization. 2018 was marked by great progress – not only expanding its existing landmine detection program in Cambodia and securing independent registration in Angola but also enabling it to reach even more tuberculosis patients in Africa with the incredible expansion from 73 partner hospitals in two countries at the beginning of the year to 142 hospitals in three countries at the end of the year. The structure of financial sources of this company is rather diverse. In 2022 more than 90% in this structure consisted of external sources, and the share of the government grants was the largest and comprised 2945653 US dollars, and only 0.5% were of its own income (APOPO, 2022) (see Figure 2). As the definition of this phenomenon says, “a social enterprise is an organization that applies commercial strategies to maximize improvements in financial, social and environmental well-being” (Wikipedia, 2013). It can be structured as a charity or non-governmental organization and can require some external sources of financing during the periods of its formation. According to the authors of the website Social Change Central (2024), there are four stages of a social enterprise, namely the incubation stage, the birth stage, the nurturing stage and the maturity stage. At the nurturing stage the social entrepreneur is searching for grant opportunities and reaching out within different networks to get barriers moved. At this stage a social enterprise is not self-sustainable. So, the limits of efficient applicability of this enterprise at this stage can be high, but only due to the massive government support, by means of the government grants. This enterprise can reach some degree of sustainability only at the maturity stage. As the authors of the aforementioned website say, addressing to the social entrepreneur running this enterprise at the fourth stage: “Your impact is where you wanted it to be, your finances are stable, and you have a solid and well-functioning team” (Social Change Central, 2024).

Source: APOPO (2022)

Figure 2: The structure of financial sources of APOPO in 2022 (in US dollars)

The third example is connected with Conserve India. It was established in 1998 as an NGO, and it emerged as a social entrepreneurship company in 2004. Conserve has developed a proprietary handmade process for transforming everyday plastics like bags, chips packets, and biscuit wrappers into "Handmade Recycled Plastic," a novel fabric that may be used as a form of vegan leather, for fashion accessories, home furnishings, and even to make low-cost housing tiles. It also works to create valuable apparel from plastic waste. “We started collecting plastic waste that has no resale value and so nobody else was collecting it, from the Yamuna River and other diversified waste streams which otherwise would have ended up in the ocean or landfills. Landfills are disease's breeding grounds, and they are wreaking havoc on the unorganized sector of the ragpicker population who live right next to landfills” says Ms Kanika Ahuja, Director of Conserve India (AIM2Flourish, 2022). Kanika Ahuja's parents started Conserve India as a non-profit organization, and Kanika has worked for Conserve since she was a child. She was involved in several of Conserve India’s initiatives to clean up plastic garbage from slums, land fields, and water bodies, which posed a severe threat to the environment and society. Kanika quit her lucrative

corporate job and joined Conserve India full-time in 2016. She launched a for-profit brand LIFAFFA for marketing and selling Conserve products made of upcycled plastic with a global reach. LIFAFFA, the marketing arm of Conserve India is responsible for designing and marketing the products. LIFAFFA sells its products through online platforms. The quality and aesthetics of the products helped the company to attain a fiscal year revenue of 100,000 USD in 2021 amidst the Covid-19 pandemic. The company was profitable and had faster growth, with a Compound Annual Growth Rate of 30% before the pandemic. So, the limits of efficient applicability of this social enterprise are rather wide due to the strategy of designing and marketing the products.

5. The Main Financial Sources of Social Enterprises

So, we can derive five main kinds of financial sources of social enterprises: conventional financing, social investment, government contracts, crowdfunding and internal resources. Consider the estimates of their real availability for social enterprises on the example of the USA (presented below in Table 4).

Table 4: Comparison of different financial options for social enterprises

Financial Options	Timeliness	Amount	Stability	Mission	Distance
Conventional Financing	OK	Good	OK	Poor	Good
Social Investment	Poor	OK	Good	Good	OK-Varies
Government Contracts	Poor	OK	Poor	Good	OK
Crowdfunding	Good	Poor	OK	Good	n/a
Internal Resources	Good	OK	Good	n/a	Good

SCALE: Poor = smaller / worse, OK = medium, Good = higher / best

Source: Tulchin, Yi-Han Lin (2012)

Factors defined:

Timeliness: level of effort needed to obtain the cash

Amount: Funding levels likely from that source

Stability: Availability of capital over time

Mission: How motivated the option is by an enterprise's purpose

Distance: How far the option is to the U.S.

So, we can conclude that in terms of the level of effort needed to obtain the cash, that is of the ability of receiving it in time, the conventional financing is the most available way, and social investment and government contracts are less available in that case. But in terms of funding levels social investment and government contracts are rather available, though that is not the case for crowdfunding.

Social enterprises are rather vulnerable in terms of their presence at the market, because they experience a large deficit of financial sources. At the same time it is hard to overestimate the benefit that they provide for the society as a whole, because in terms of social usefulness and social value that they provide they can cover the amounts that are invested in them by the external sponsors. In this sense they are really very effective enterprises, so the financial aid which is provided for them by the external sources is justified.

6. The Main Factors of Increasing the Efficient Applicability Limits of Social Entrepreneurship

After doing this analysis we can derive 8 main factors of increasing the efficient applicability limits of social entrepreneurship:

1. *The state support of social enterprises*: Beside the example of successful social entrepreneurship state support in Bashkortostan, one should also highlight the special programme of supporting social entrepreneurs in the USA during B. Obama presidentship named "Pay for success", according to

which, a certain sum was returned to the investor in the case if the target of the project he invested in was fulfilled, the sum he invested in was returned to him and he would get a certain premium, if the target of the project was overfulfilled, but he wouldn't get anything, if the target of the project wasn't fulfilled (Vanroekel and Greenblatt, 2013). In the process of financing this project the finances of taxpayers were involved, and that meant that this project was financed at the expense of the state budget.

2. *The aid provided for social enterprises by the private sponsors*: At the initial stage of social enterprise formation the aid provided by the private sponsors, such as the Our Future Foundation for Regional Social Programs providing interest-free loans for social entrepreneurs, plays an important part in this process.
3. *The support for social enterprises provided by the international organizations:* At different stages of formation and development of social enterprises the international organizations, such as, for instance, UNESCO, Global Development Group and Hawk Rock Foundation, play a special role in these processes.
4. *The support for social enterprises provided by the external sources of loan and emission financing:* Such institutions as micro-financing organizations and social stock exchange play a crucial role in the development of social enterprises in those countries, where they emerge. So, they need to be derived in a separate section.
5. *Creation of special economic zones in different innovation centres, in which social enterprises are formed:* The special economic zones should be formed in such centres as “Skolkovo” (in Russia) with special preferential tax rates for individuals and organizations that invest in social enterprises.
6. *Using social enterprises as sub-contractors of the private business in the process of social outsourcing:* Social outsourcing is the process of transferring the enterprises of social infrastructure to the management of the private sector companies. This process was named “Race to the bottom” in the economic literature, because the private sector companies pursued, first of all, their own interests, not the interests of these enterprises, and saved on everything (In the Public Interest, 2014). As a result, these enterprises were moved to the regions, where the real estate was cheaper than that at the initial place, but where the crime rate was higher than there. This resulted in numerous facts of rapes of the children’s home wards, and the staff was underpaid, so only low-skilled employees could be hired. Social enterprises couldn’t compete on equal terms with a big business in this process, because they had limited financial resources at their disposal, and so they had to be content with the role of sub-contractors, being in service of the big business and performing those functions which were left by the big business for these enterprises (Williams and Richardson, 2012). But even being in this role, they were faithful to their responsibilities and didn’t save on their costs if it threatened to turn into a real catastrophe. On the contrary, due to their main mission that was focused on solving social problems on the base of innovative approach, they solved these problems quite successfully and without any damage for those projects, which were provided for them under the sub-contractual management, which is the most important thing there. So, the role of sub-contractors in service of the big business is one of the variants of increasing the efficient applicability limits of social entrepreneurship until the level of qualitative management of the social infrastructure entities which were transferred to social enterprises on the base of sub-contracts.
7. *The position of public opinion towards social entrepreneurship:* One should take into consideration the position of public opinion towards this topic. To what extent does the public opinion perceive the feasibility of social entrepreneurship? The results of public opinion polls comply with the picture of social entrepreneurship development in different regions. Respectively, in those regions where the level of social entrepreneurship development is relatively low, less people can say that they are familiar with this concept. So, for instance, according to the study of the researcher group ZIRKON (2008), in the Central, the Northwestern, the Siberian and the Far East Federal Districts 7-10% of the respondents answered confidently that they knew what this concept meant. As compared with them, in the Southern, the Volga and the Urals Federal Districts the quantity of the people knowing something about this phenomenon constituted only 4-5% of the respondents.
8. *The strategy of designing and marketing the products of social enterprises:* As we can see from the experience of LIFAFFA, a good strategy for designing and marketing the products can help social enterprises to develop. So, the case of Conserve India can be a good example on this topic.

7. In Conclusion

So, we can summarize our conclusions concerning the definition of the main factors of increasing the efficient applicability limits of social entrepreneurship. First, a very important role of the state support of social enterprises in this process at different levels is noted. Second, a special role of private sponsors in this process is derived. Third, an important role of international organizations in the process of promotion and support of social entrepreneurship is emphasized. Fourth, a huge role provided by such intermediaries as microfinance institutions and social stock market in this process is noted. Fifth, the conclusion stating that in order to increase the efficient applicability limits of social entrepreneurship, one should create the special economic zones in the innovation centres is derived. Sixth, the efficient applicability limits can increase under involving these enterprises into the process of performing the roles of sub-contractors in service of the big business in the process of social outsourcing. Seventh, in order to emerge in new regions, social enterprises should be supported by the public opinion in these regions. And finally the last conclusion is the necessity to create within a social enterprise the special division on the development of designing and marketing strategy for this enterprise.

The actual efficient applicability limits of social entrepreneurship in terms of its sectoral and territorial specifics are outlined in this paper. In terms of the sectoral specifics, the most significant presence of social entrepreneurship in such sectors as education, healthcare and culture is noted and the least significant presence of it in such sector as mining is noticed, and that can be explained by the special mission of social entrepreneurship focused on maximization of the social value produced by it, and not on rent seeking and profit maximization. In terms of the territorial specifics the conclusion that the most significant part of social enterprises contained in the specified regions is due to the active governmental policy at these regions is substantiated. Also the main factors increasing the possible efficient applicability limits of social entrepreneurship in terms of the special policy on forming the respective institutions of supporting social entrepreneurship at different stages of its evolution are provided.

Robert K. Merton and Innovation-Related Topics: Three Theoretical Ideas

Tor Helge Pedersen
Inland University College of Applied Sciences, Lillehammer, Norway

Tor.Helge.Pedersen@inn.no

Abstract: As in other disciplines, such as organization science, sociology, and economics, there are good reasons for scholars in innovation and entrepreneurship research to revisit the classics within and outside their own research fields. Robert K. Merton (1910–2003) is not usually explicitly connected to innovation research, but to fields such as the sociology of science and knowledge. However, his scholarly productions include texts relevant to innovation and entrepreneurship. In 1935, he published on invention and innovation in American industry, and in 1938, he put forward the idea of innovation as deviant behavior or nonconformist adaptive behavior (Merton 1938a). In 1945, he began writing about the concept of serendipity, which he later discussed several times. This paper discusses how theoretical insights from Merton may inspire entrepreneurship, creativity, and innovation research. The discussion is framed around Merton's innovation-related ideas and their relevance today, based on 20–25 Merton publications from 1934 to 2004 drawn from his larger scholarly production. The paper extracts three main examples of Merton's theoretical ideas and insights. The first is his interest in simultaneous independent discoveries (Merton 1961a; 1961b), which has later been seen as a zeitgeist perspective on (scientific) creativity. The second is his view of innovation as deviant behavior and an adaptive response (Merton 1938), which is relevant to, among others, discussion of the dark side of innovation. The third is his interest in the idea of serendipity in scientific discovery (Merton 1945; 1948a), which is relevant today in relation to entrepreneurial opportunity and accidental innovation.

Keywords: Robert K. Merton, Accidental innovation, Invention, Discovery, Scientific creativity, Deviant behavior

1. Introduction

Robert K. Merton, the founder of the field of sociology of science, contributed to several fields, and the literature on his contributions is extensive. As in other disciplines, such as organization science, sociology, and economics (e.g., Becker, Knudsen, and March 2006; Adler 2009; Swedberg 2009), exploring classics within or outside the innovation field may be useful. Good reasons exist for exploring Merton's scholarly production in relation to entrepreneurship and innovation research. As will be shown, he made several contributions that can be connected to innovation-related topics. To the examples above (e.g., serendipity, deviant behavior, invention), several can be added, such as the role of sociological factors in the rise of science and inventions (Merton 1935b; 1938b), which he addressed in his doctoral dissertation, which "dealt, in part with the sources of innovation in science and technology" (Zuckerman 2010, p. 260). His publications are not much explored within such a frame of innovation-related topics. However, in the contemporary literature on different innovation-related topics, at least three have a possible connection back to Merton: serendipity in entrepreneurship and innovation (Austin, Davin, and Sullivan 2012; Dew 2009; Murayama, Nirei, and Shimizu 2015; Garud, Gehman, and Giuliani 2018; Busch 2022; Busch and Barkema 2022; Busch and Grimes 2023; Fultz and Hmieleski, 2021), zeitgeist in relation to the selection of new ideas (Simonton 2004; Czarniawska 2009), and discussions on the dark side of innovation (e.g., Coad et al. 2021; Biggi and Guiliani 2021). Motivated by these observations, this paper explores and discusses some of Merton's innovation-related ideas by asking: What are his innovation-related ideas about—and to what relevance today?

Methodologically, the theoretical discussion is based on 20–25 Merton publications selected from his large scholarly production. His scholarly production between 1934 and 2004 comprised 20 books, more than 150 articles, and numerous introductions and prefaces. One book was written in 1958 and published posthumously in 2004 (Merton and Barber 2004). The search process comprised of exploring and reading his publications, especially those that are connected to his sociology of deviance and sociology of science. In addition, secondary literature was explored to check for alternative interpretations and to be sure that important and early publications were included in the theoretical discussion. The selection process was about selecting ideas to focus on and of selecting early Merton-publications on these theoretical ideas. In some cases (e.g., serendipity), Merton developed his thinking on that idea. Therefore, several later publications were included in the discussion. In other cases, Merton revised, elaborated on, and revisited earlier publications (e.g., Merton 1938a). Since some publications are later reformulations (e.g., his ideas regarding deviance), the publication list is reduced during the process. The references to contemporary literature that illustrate the relevance of his ideas are also kept to a minimum. The number of publications, in other words, could be seen as a limitation of this discussion—but they are examples.

Further, the paper is based on the argument that science and sociology of science are relevant for understanding creativity and innovation and that analogical reasoning between these two domains is relevant (Simon 1985). Discoveries can be seen as a type of innovation or scientific innovation per se (Mulkay 1972). Interestingly, though mentioned in the context of the antecedent conditions of innovations, Merton (1961a) cited Bacon, who said, "All innovations, social or scientific, 'are the births of time'" (Merton 1961a, p. 473), which also illustrates this view. Discoveries can be seen as equivalent to inventions and new theoretical formulations (Merton 1967). A scientific law can thus be compared to a new business idea, organizational idea, or piece of technical equipment. Though there are other views on the innovation process (e.g., Schumpeter 1939), several emphasize a connection between scientific discoveries, basic research, inventions, and innovation (e.g., Dosi 1988, p. 1136), for example, that science was the origin of synthetic chemistry, the transistor, and bioengineering. Others use the term science-based innovation (Garud et al. 2018, p. 125), which implies the science–innovation connection. Finally, there are subfields concerned with the commercialization of academic research, technology transfer, and academic spin-offs.

The paper is organized as follows: The next section briefly surveys Merton's ideas that are relevant to this theoretical discussion. Then, the three selected ideas are presented and discussed. Finally, the paper concludes and suggests future studies.

2. Merton on Invention, Innovation, and Scientific Discoveries

Merton (1935a), in one of his first articles, investigated the causes of variation in the rate of industrial invention, for example, the sociocultural factors influencing the rate of invention within specific industrial fields: "It is with … the rate of invention within specific fields of industry and the rate of adoption of inventions – that this paper is most directly concerned" (Merton 1935a, p. 455). He referred to Schumpeter (1926) when he discussed the individuals in control of a given industry and attitudes to introducing innovations/inventions (1935a, p. 468). Merton (1935a) used patent data to study the rise and fall of innovation by industry.

In 1938, Merton published both his doctoral thesis (Merton 1938b), originally dated 1935 (Merton, 1935b), and an article entitled "Social structure and anomie" (Merton 1938a). In the latter, he used the term "innovation as deviant behavior." His doctoral thesis was on science as a social institution. In this study of the rise of science in 17th-century England and how ascetic Protestantism (unanticipated) contributed to the rise of scientific thought, he set out to analyze the scientific revolution of the 17th century. He dismissed the Carlylean heroic explanation that this arose from "the simultaneous appearance of geniuses" (Merton 1938b, p. 364) and wrote that the "more plausible explanation is to be found in the combination of sociological circumstances" (p. 364). In his analysis of science and military technology, he used words such as entrepreneur, innovation, intellectual genius, scientific genius, and century of genius. He found that need is important as a source of invention only if it appears in a "cultural context … which places a high value upon innovation, which has a tradition of successful invention and which customarily meets such needs through technological invention rather than through other expedients" (1938b, p. 517). He concluded that the growth of science was not due to the chance concentration of a handful of geniuses, but that "the cultural soil of seventeenth century England was peculiarly fertile for the growth and spread of science" (1938b, p. 597).

Merton's interest in the concept of serendipity came out of his exploration since 1934 of how and why intentional social actions often had unintended consequences (Shulman 2004). In 1936, Merton (1936) published an article in which he discussed unanticipated and unintended consequences, a topic he followed up in 1940 in relation to bureaucratic structures (Merton 1940) and in several other publications (Merton 1998). This led him back to study science as a social institution and to an interest in the role of the unanticipated in scientific discovery (Shulman 2004). Serendipity became related to this problem (Merton and Barber 2004, p. 141). In 1945, Merton described the serendipitous component of research as "the discovery, by chance or sagacity, of valid results which were not sought for" (Merton 1945, p. 469n). He noted that fruitful empirical research may also originate new hypotheses, and three years later, he wrote that under certain conditions, a research finding gives rise to social theory. He said that the "serendipity pattern refers to the fairly common experience of observing *an unanticipated, anomalous and strategic* datum which becomes the occasion for developing a new theory or for extending an existing theory" (1948a, p. 506, italics in original). Each element of the pattern is explained by Merton (1948a), and he wrote that "Serendipity is here connected to unanticipated consequences" (p. 506). Merton and Barber wrote a book on serendipity in 1958 that was published posthumously (Merton and Barber 2004). It was a study of the travels and adventures of the serendipity concept since Horace Walpole first used it in a letter in 1754, spread through time and domains, such as science, over the following 200 years. With the pursuit of serendipity came the book *On the Shoulders*

of Giants (Merton 1965/1993), which traced the use and reception of an aphorism across fields and centuries. Serendipity is an aphorism that is about discovery, invention, and accumulation of knowledge (Merton 1965/1993). Both books represent studies of sociological semantics (Zuckerman 2010).

Merton was interested in discoveries, inventions, and theoretical ideas. In 1967, Merton (1967) discussed the early and later formulation of ideas, continuities, and discontinuities in theoretical ideas, which he compared somewhat to multiples (discoveries) in physical and biological sciences (p. 20). He also used a vocabulary to designate varying degrees of resemblance between early and later formulations of scientific ideas and findings. He was interested in multiple discoveries in science by scientists working independently of one another (Merton 1961a, 1961b; 1963), as well as the role of genius in science (1961a; 1961b), which will be discussed in Section Three. This interest also included priority disputes among scientists (Merton 1957) (i.e., disagreements among scientists involved in multiple discoveries over who deserved priority). For example, Isaac Newton raised charges of plagiarism against Leibniz regarding who should get credit for inventing calculus. Furthermore, the theory of natural selection was developed practically identically by Alfred Russel Wallace and by Charles Darwin (Ogburn and Thomas 1922, p. 83), a dispute that "stabilized at that point, with due credit to both" (Merton 1957, p. 653). Later, Merton (1968) proposed a Matthew effect in science (i.e., that the more eminent scientist in a collaboration [paper or project] or cases of independent multiple discoveries tends to get most credit).

Merton had many more ideas and concepts than included here. These include the theorem of functional alternatives (equivalents or substitutes): "just as the same item may have multiple functions, so may the same function be diversely fulfilled by alternative items" (Merton 1949c, p. 34, italics in the original). He later noted that "it has often been suggested that the functional equivalent of a patent office be established in science to adjudicate rival claims to priority" (Merton 1957, p. 654), which he also raised in discussing scientific genius (1961a; 1961b). Finally, in discussing the innovative organization, Merton (1965) pointed to the importance of context. In the same publication, he defined the "*act* of innovation" as a "socially valued departure from past practice or thought" (p. 50).

3. Three Relevant Theoretical Ideas

This section discusses three theoretical ideas extracted from Merton's work in relation to this paper's topic.

From multiple discoveries to a zeitgeist perspective

The writer and politician Victor Hugo, who lived parts of his life in Paris, is often attributed with a quote that underlines the power of ideas when they resonate with the zeitgeist. One variant of this quote is that nothing is so powerful as an idea whose time has come. The term and the meaning of zeitgeist can be traced to Goethe in 1827 (Boring 1955), and Campbell (1960) used the term "simultaneous independent invention" early on (p. 386n). Illustrating this phenomenon in relation to theoretical thought, Penrose (1959) noted indirectly that "after having laboriously worked out for myself what I took to be an important and 'original' idea, I have often had the disconcerting experience of subsequently finding the same idea better expressed by some other writer" (p. 2n). She pointed implicitly at a common problem of multiple discovery—several people can come up with the same discovery or formulation independently, which is something noted by others (e.g., Kroeber 1917): "[a] phenomenon that many inventions have been made two or more times by different inventors, each working without knowledge of the other's research" (Ogburn and Thomas 1922, p. 83). Famous examples of multiples are Newton/Leibniz, Darwin/Wallace, the discovery of the law of genetic inheritance by Gregor Mendel, Hugo de Vries, Carl Correns, and Erich von Tschermak (Simonton 2004), and the inventions of the airplane and the telephone (Ogburn and Thomas 1922).

Merton (1961a) further developed the cultural view of discovery from Ogburn and Thomas (1922) in particular and referred to their compilation of some 150 cases of independent discovery and invention, where "they concluded that the innovations [!] became virtually inevitable as certain kinds of knowledge accumulated in the cultural heritage" (Merton 1961a, p. 475). Merton used the word multiple for the "multiple and independent appearance of the same scientific discovery" (1961a, p. 475) when he (Merton and Barber, in Merton 1961s) studied 264 such multiples. He (1961a, p. 477) argued that "all scientific discoveries are in principle multiples, including those that on the surface appear to be singletons" and "such occurrences suggest that discoveries become virtually inevitable when prerequisite kinds of knowledge and tools accumulate in man's cultural store" (Merton 1961a; 1961b; 1963, p. 237).

Merton also discussed the conception of scientific genius (Merton 1961a; 1961b), which he first addressed in his doctoral dissertation (1938b). He observed that those of "great scientific genius will have been repeatedly

involved in multiples … because the genius will have made many discoveries altogether" (Merton 1961a, p. 484). Indeed, the "men of scientific genius are precisely those … whose work in the end would be eventually rediscovered. These rediscoveries would be made, not by a single scientist, but an entire corps of scientists" (p. 484). The single scientific genius thus becomes, according to Merton, "the functional equivalent of a considerable array of other scientists of varying degrees of talent" (1961a, p. 484; 1963, p. 249). Merton thus had a functional interpretation of genius and constrained/defined the genius sociologically rather than psychologically. He argued in another publication that discoveries have been duplicated by less prominent scientists and thus that the "genius is superfluous to a sociological concept of scientific progress" (1961b, p. 306). Further, he wrote that "discoveries and inventions become virtually inevitable (1) as prerequisite kinds of knowledge accumulate in man's cultural store; (2) as the attention of a sufficient number of investigators is focused on a problem – by emerging social needs, or by developments internal to the particular science, or by both" (1961b, p. 306; see also 1963, p. 237).

The argument on multiples was later called "the *zeitgeist* theory of creativity" (Simonton 1979, p. 1603, italics in the original), the zeitgeist perspective on scientific creativity, and a social deterministic interpretation of multiple discoveries (Simonton 2004), in which the individual creator is reduced to being a mere agent of zeitgeist, precluding both the role of chance and genius (Simonton 2004, pp. 10–11). The individual creator is downplayed: "it is the sociocultural system as a whole, embodied as the spirit of the times, which is ultimately responsible for any given technoscientific advance" (Simonton 1979, p. 1603). Conversely, if the perspective has some relevance to the demanding task of scientific discovery, then it could also be relevant for technological solutions, organizational ideas, and business ideas in a time of high availability of prior knowledge and AI-based tools. Attempts to do something new or original may in retrospect just be following an idea whose time has come because the zeitgeist may be more effective than any leader or interest group who attempts to select ideas (Czarniawska and Joerges 1996), similar to cultural heritage (accumulated knowledge) and social developments that may direct "the attention of investigators to particular problems" (Ogburn and Thomas 1922; Merton 1961a, p. 475). The term zeitgeist has therefore been discussed in relation to such a selection of ideas, so-called master ideas, organizational fashion (Czarniawska and Joerges 1996, pp. 36–37), and institutional entrepreneurship and the emergence of institutions (Czarniawska 2009, pp. 427, 438). Certain similarities can also be observed in relation to organizational-level technological innovation. Cohen and Levinthal (1990) talked about accumulated prior knowledge and noted that the accumulation of knowledge enhances organizations' ability to convert this knowledge into further innovations.

Innovation as deviant behavior

The second extracted idea is innovation seen as deviant behavior. Merton (1938a) outlined a typology of deviant behavior that included four modes of adaptation—innovation, ritualism, retreatism, and rebellion—as alternatives to the fifth category of conformity. He perceived innovation as a mode of adaptation—a response or type of behavior (a nonconformist innovative type of behavior) to strains/tensions within social structures. For example, innovation is more likely when the dominant cultural goal is accepted but the avenues for employing legitimate means are blocked, thus exerting pressure or strain toward deviant behavior (p. 678). Merton discussed innovation in relation to business crime and crime (1938a; 1949a), but he did not see it exclusively through the lens of negative deviance. He later stressed that he saw innovation as a "neutral term" (1955, p. 45). Merton can be connected to both innovation with negative connotations (i.e., a negative form of deviance) and innovation with positive connotations or a positive form of deviance (e.g., Mainemelis 2010). For example, Vaughan (1982) argued that that the idea of deviant behavior can be used in relation to unlawful organizational behavior (pp. 1378-1379) and Mainemelis (2010) showed that creative deviance may be important in developing successful ideas.

A contemporary example is research on the dark side of innovation, in which keywords constitute perverse effects, the noxious consequences of innovation (Biggi and Guiliani 2021), and negative and unintended consequences (Coad et al. 2021). While Merton mostly paid attention to behavior (e.g., response, mode of adaptation, and innovative act), this new research is more impact-oriented, even though Merton also indicated that it is not easy to decide whether the outcome is legal, illegal, good, or bad (Merton 1949a). Biggi and Giuliani (2021) referred to Merton (1936) regarding the view that innovations might have unintended direct effects and negative side effects on society and the environment. They identified five strands of scholarly research on the noxious impacts of innovation. One strand was concerned with the dark side of technology acceptance (p. 26), the work-related consequences of telework, and social media. Merton can enrich this discourse through a greater focus on behavior or response than on outcome. Merton's theory focuses on the emergence of patterns of deviant behavior. Finally, Merton can also be an important

contribution to studies of the effect side or outcomes of innovation (unintended consequences). In relation to the topic of dark side of innovation, a couple of contemporary examples can be found in digital platform companies (e.g., Facebook and Uber). Several of these companies have introduced new employment arrangements where much of their workforce is defined as independent contractors rather than employees. The result is new working conditions, and not in favor of the employees-contractors. Another example is Facebook's innovative business model, based on data as resource, which is an element in this company's success. On the other hand, data on user activities may also be used in inappropriate ways. One recent example is Meta's controversial plans to use their users' public posts and images on Facebook and Instagram to train AI tools belonging to the parent company Meta.

Serendipity in science, entrepreneurship, and innovation

As noted in the introduction, recent literature has discussed serendipity in entrepreneurship and innovation (e.g., accidental innovation). For example, Swedberg (2021) referred to Merton's version of serendipity as an alternative approach when he advocated Schumpeter (1934/2021) in relation to creative behavior: "Merton's idea that scientists sometimes stumble on a discovery by mistake (serendipity)" (Swedberg 2021, p. xii). Although Merton was not the first to discover this phenomenon and word (see Merton and Barber 2004), as mentioned, it was a recurring topic during his scholarly production (1945; 1948a; 1965/1993, 1998; 2004), and he devoted a whole book to it (Merton and Barber 2004). Merton's version was that scientists sometimes make discoveries as a result of chance combined with wisdom—what he called serendipity or the serendipity pattern (Merton 1945, p. 469n; 1948a, pp. 506-7), and it was about unanticipated consequences: "Serendipity, which refers to the search for one thing that turns up another, is obviously related to the problem of unanticipated consequences, and was intimately connected with the discovery's absorbing interest" (Merton and Barber 2004, p. 141). Two cited and famous examples of serendipity are Columbus's discovery of America and Fleming's discovery of penicillin in 1928 (Dew 2009), and early mentions of serendipity included Cannon (1940). When Campbell (1960) included the idea of serendipity in his evolutionary model of creative thought, he referred, among others, to Merton. As seen earlier, several later studies referred to serendipity (e.g., Austin et al. 2012; Busch 2022). In relation to scientific creativity, Simonton (2004) favored a chance viewpoint, which includes the phenomenon of serendipity (Simonton 1979, p. 1604). When Dew (2009) wrote about serendipity in entrepreneurship, he referred to Merton and Barber (2004) and said that the "vast majority of research on serendipity involves scientific discoveries" (p. 736). He defined it as "search leading to unintended discovery" (Dew 2009, p. 753), or "some combination of search (directed effort), contingency (favorable accidents), and prior knowledge (sagacity)" (pp. 736). Dew (2009) argued that serendipity plays an important role in entrepreneurship and is a quite prevalent feature of entrepreneurship (e.g., the discovery of opportunities) and that entrepreneurs and entrepreneurship scholars intuitively "conceptualize entrepreneurial opportunity in terms of serendipity" (pp. 735–736). In the contemporary literature on innovation and entrepreneurship, examples are mentioned in relation to new market (Denrell, Fang & Winter 2003; Dew 2009), contexts of high uncertainty such emerging markets (Busch & Grimes 2023), tackling environmental challenges (Busch & Barkema 2019; Busch & Grimes 2023) as well as coming up with list of examples of serendipity in invention and discoveries (Roberts 1989; Austin et al. 2012).

4. Conclusion

As described, Merton was not the first to define all three extracted ideas, but he further developed them. The three extracted ideas are about the role of the spirit of the times (the zeitgeist), deviant behavior (the dark side and unintended consequences), and accidental innovation. These insights could be of interest for scholars interested in the emergence of new ideas, the bright and dark sides of innovation (avoiding pro-innovation bias), and entrepreneurial opportunities (entrepreneurship and opportunity recognition). This relevance can further be seen in Simonton's (2004) presentation of four perspectives or viewpoints on scientific creativity (logic, genius, zeitgeist and chance). He saw Merton as an important representative of the so-called zeitgeist perspective. In fact, Merton early on also discussed genius viewpoints (1938b; 1961a; 1961b) and even chance viewpoints (1945; 1948a; 1965/1993; 1998; 2004). Many of the cited contemporary studies have benefited from Merton, for example, from Merton and Barber (2004). Future studies could explore Merton as a classic source to understand accidental innovation, how the accumulated knowledge store (zeitgeist) may affect new solutions in an age of information availability and AI, and the bright/dark side of innovation in different contexts.

Abstract: The importance of research and development is reflected in the fact that one of the main priorities of the EU's development policies is increasing spending on research and development in EU member states (EC, 2010). Enterprises do not always have enough internal financial resources to launch their own innovation projects, and therefore they turn to external resource providers (Wang et al., 2016). The paper is aimed at examining the impact of corporate expenditures on R&D from the point of view of their funding sources and analysing the occurrence of the substitution effect of public support for R&D in EU 27 countries. These countries also have the highest level of public financing of research and development, that is, they use the public support of business innovations to the highest extent. The analysis showed that in the EU 27, the substitution effect of public support for research and development is not significant, or rather the complementarity of both types of expenditure prevails at the national level, as public funding of corporate research and development seems to have a positive effect on private research and development and investments. Our analysis is based on available secondary data for 27 EU member states. for a twenty-year observation period (2000-2020). The results have been achieved by using a methodology that includes cluster analysis, panel regression and correlation analysis. We bring new empirical evidence on the relationships between public support and business research and development expenditures. The research results showed the main sources of funding for corporate research and development. It concerns the business enterprises, government and abroad. The cluster analysis determined three clusters, divided according to the structure of the financing of R&D enterprises in EU countries. The results of the cluster analysis were partially in line with the current results of the European Innovation Review. Our findings provide policy implications for the public support policy.

Keywords: R&D funding, Public support policy, Substitution effect, Public, Panel regression and correlation analysis

1. Introduction

According to several previous studies, innovation is considered an important determinant of economic growth (Akcali, and Sismanoglu, 2015, Blanco et al., 2015, Falk, 2007), as well as the competitiveness of companies (Abdal et al, 2016). Although research and development ("R&D") and innovation are not the same thing, research and development is a key component of innovation. Innovation and research and development are becoming a significant part of the policies of countries and transnational unions such as the European Union. This is shown by the EU's "Europe 2020" strategy, which calls on member states to invest 3% of their GDP in research and development (EC, 2020). However, it is important not only to look at R&D spending as one aggregate indicator but also to consider the contributions of different innovation actors to R&D funding. Since it is known that companies are the main innovation actors that create the largest number of innovations in the national innovation system, the contribution is aimed at financing corporate research and development. The problem for companies is the lack of resources for starting their innovative activities. Their effort is to obtain financial resources in various forms. In this direction, public support for innovation from government sources to businesses is significant, which does not always bring the desired effects and can crowd out private investments. In addition to examining the impact of corporate spending on research and development in the EU 27 countries from the perspective of their funding sources, our research deals with this unwanted effect of public support.

2. Literature Review

R&D spending is known as a driver of innovation and productivity (Diaconu, 2019) from the perspective of government as well as businesses. Foreign studies have documented that there is a significant correlation between business R&D spending and national competitiveness, economic growth, government spending, employment growth, etc. (Olakojo, King, 2023; Diaconu, 2013; Coad, Rao, 2010; Nekrep, Strašek, Boršič, 2018). According to foreign studies, we can say that BERD has a huge potential for the country from both the macroeconomic and microeconomic levels.

According to the OECD survey (2019), many companies do not engage in innovation activities, even though discussions about the importance of innovation in the economy and the importance of business investments in research and development have a positive impact on its competitiveness. However, there are real barriers that limit business investment in research and development. These are, for example, factors preventing companies from investing in (Spielkamp and Rammer, 2009) and financial restrictions that prevent companies from investing in innovations (D' Este et al., 2012). Companies do not always have enough internal financial resources to launch their own innovation projects and therefore they turn to external resource providers (Wang et al., 2016). The practice also points to the absence of financial resources for the introduction of innovations as a barrier to support investment in innovations in enterprises (EK, 2014). A firm's access to financial resources varies depending on the size of the firm as well as its specialization (OECD, 2004). Foreign sources for financing innovative and research and development activities can be obtained from various economic entities. Companies most often obtain these resources from other companies (e.g. banks).

OECD (2015) lists five main innovation actors that can finance corporate R&D. These are business enterprises, government, universities, private non-profit organizations, and institutions from abroad. These entities help to finance private innovation projects and overcome obstacles to innovation. In addition to private investment (EIB, 2019), the most important source of financing for innovative businesses is the public sector through the government. No less important is the help of universities and private non-profit organizations, their support is mainly non-financial, mainly in the form of cooperation and joint research (Perkmann, Walsh, 2007; Abidin et al., 2014; Rybnicek, Königsgruber, 2018).

Falk (2006) brought significant results, which showed the compatibility of BERD and GERD based on the use of the GMM model. The study yielded the findings that R&D expenditures conducted by universities are significantly positively related to business sector R&D expenditures, suggesting that public sector R&D and private sector R&D are complementary. Direct R&D subsidies and the share of high-tech exports are significantly positively related to the R&D intensity of the business sector.

The main reason for the involvement of the public sector (and other innovation actors) in the financing of business research and development is the fact that otherwise, the market would invest in innovation activities less than is socially acceptable. Intellectual property rights and state-funded R&D subsidies should therefore stimulate innovation (Leibowicz, 2018). The effects of public support on private R&D investments can have a positive or negative impact (the so-called substitution effect) on private R&D investments. Despite the many advantages of public support for innovation, according to the economic literature, there are also limitations, which we call state failures (Guellec and Pottelsberghe, 2000).

From the perspective of several foreign studies, it can be argued that it is the variable "higher education" that represents a statistically significant variable in the BERD assessment (Aruzhan et al., 2016; Falk, 2006). Government R&D funding represents a less efficient source of funding than BERD, but the synergy of BERD and GERD has a positive impact in terms of patents in the country (Aruzhan et al., 2016).

Shelton and Leydesdorff (2011), through multivariate linear regression models, showed the synergy of GERD and BERD resulted in long-term and sustainable benefits in publications. Research focusing on the impact of scientific productivity on business efficiency has yielded findings that scientific productivity is positively associated with business efficiency (Van Looy, et al., 2011).

These failures are closely related to the issue of complementarity, where we can encounter several types of negative effects: displacement, substitution, leakage, and dead weight (McPherson, McDonald, 2010). Many authors deal with the substitution and displacement effect of subsidies. Guo, Guo, and Jiang (2016) argue that research on the effects of government R&D support programs is inconclusive. It has been proven that businesses that have been given government subsidies achieve higher productivity and profitability. It was also found that these enterprises grow faster, have better access to external financing, invest more funds in research and development and show a higher social return. On one hand, many studies found an additionality between public support and private R&D investment (Ali-Yrkkö, 2005; Sadraoui, Zina, 2009; Afcha, López, 2013; Liu, Li, Li, 2016; Carboni, 2017) According to their results R&D subsidies stimulate private R&D investments in enterprises.

On the other hand, many studies suggest that public R&D support programs do not stimulate business performance. Moreover, several studies have even found that government R&D subsidies crowd out private R&D (Hussinger, 2008, Görg. 2008, Zúñiga-Vicente et al., 2014). Firms awarded with public support could

reduce their own investment into R&D beyond the level that would have been performed without this support (Zúñiga-Vicente et al., 2014).

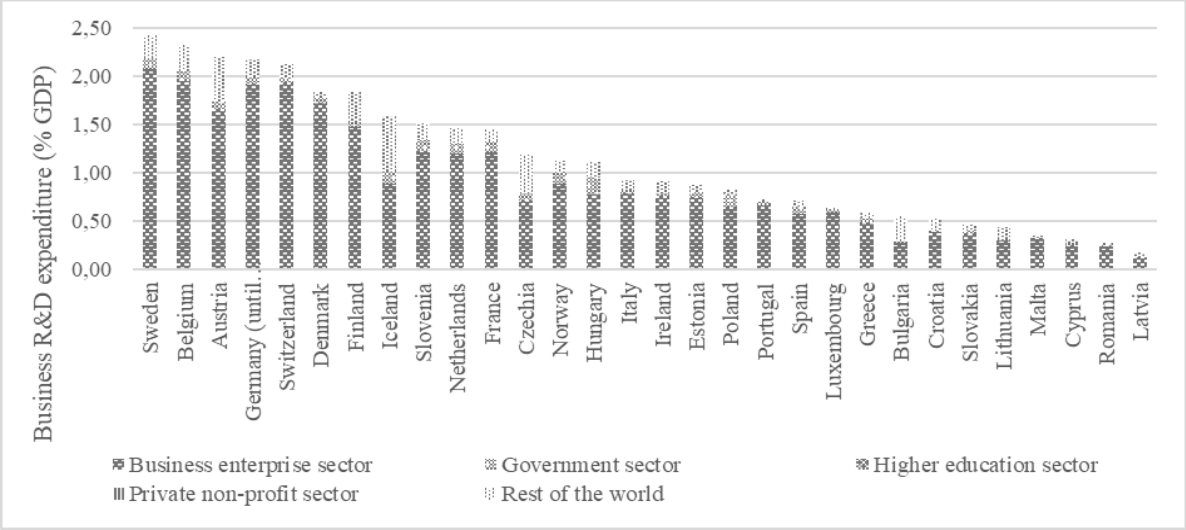
The occurrence of the substitution or effect of subsidies therefore varies depending on the region and industry in which the company operates (Capron, Van Pottelsberghe de la Potterie, 1997; Jin, Shang, Xu, 2018). Therefore, it is appropriate to examine the regional dimensions of their operation, for example in a specific EU member state.

3. Material and Methods

The contribution is aimed at examining the potential effect of corporate expenditures on R&D from the point of view of their funding sources and analysing the occurrence of the substitution effect of public support for R&D in EU 27 countries. The objective contains two research questions:

RQ1: Do private companies use enough of their own resources to finance corporate R&D in EU 27 and thus contribute to the structure of corporate spending on R&D?

RQ2: How does public support for corporate R&D increase corporate investment in R&D? Is there no substitution effect?



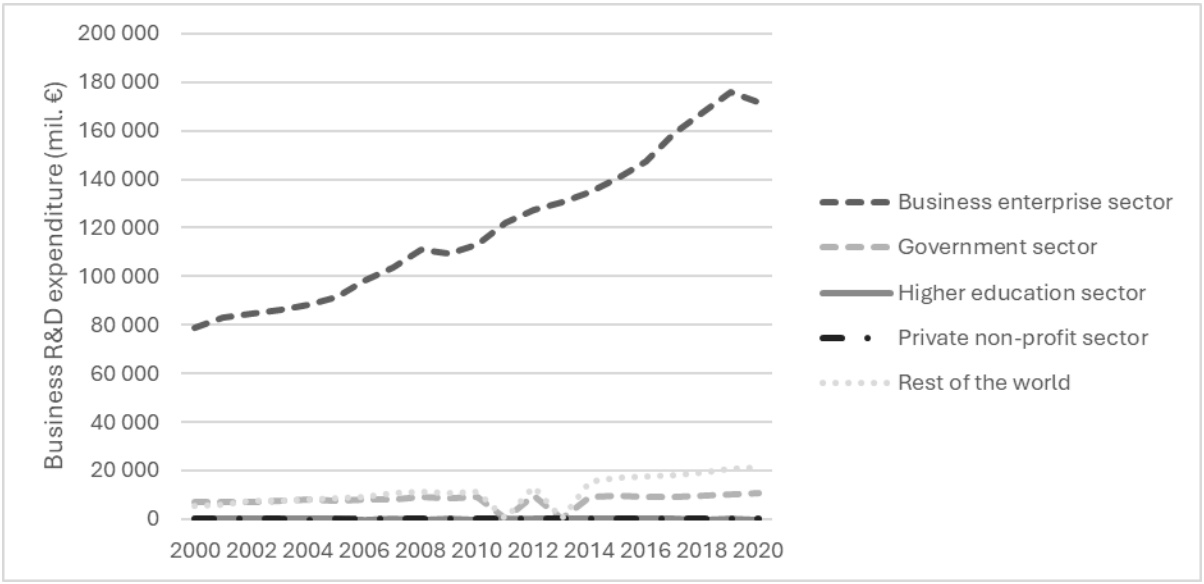
As part of the analysis, secondary data are used from the Eurostat, OECD databases within the "Innovation Indicators" section. The key indicator (GERD - Gross Domestic Expenditure on R&D) examined in the paper expenditure on research and development of the EU member states according to the source of funding. Eurostat distinguishes five possible financial sources that can be used to finance research and development: sources of business enterprises, governments, universities, private non-profit organizations and sources from abroad (e.g. FDI), development aid, remittance flows). As for aid from EU sources, up to 70% of the volume of interventions is significantly redistributed through the EU budget in the form of shared financing through government sources. The redistribution of the sources is further decided by the government of the member state (EC, 2021). Since business enterprises are generally identified as the key innovation actors involved in most R&D activities in the country, we focus on the financial resources used to finance business R&D (BERD - Business Enterprise R&D Expenditure). We used cluster analysis, panel regression and correlation analysis based on secondary data analysis.

From the point of view of the preferences of the importance of public support, in this research we focus on updating the structure of research and development financing in the long-term perspective of the created clusters, consisting of countries with a comparable structure of their financing, as well as on the possible extent of occurrence of the substitution effect, mainly between public support and corporate innovations (Pisár, et.al., 2020). From the available data we obtained, we performed a cluster analysis that illustrates clusters of countries with a comparable corporate R&D funding structure. A hierarchical agglomerative algorithm was also used in combination with Ward's method. The given method was used due to the fact that this procedure was applied to a sample of updated secondary data for the monitored twenty-year period (2000-2020), as it appeared to be the most suitable due to the contour coefficient achieved.

To determine the degree of substitution effect due to the negative impact of public support, we will perform a regression and correlation analysis on panel data, specifically on a sample of all 27 EU member states for the years 2000-2020. The regression is also based on a combination of least squares and cross-sectional fixed effects model. The logarithms of the data will be used in the regression analysis to achieve a normal distribution of the data. To test the causality of the selected variables of this analysis, we will use the granger causality hypothesis.

4. Results and Discussion

Public support from EU resources and increasing the growth of member states' expenditure on research and development is one of the main priorities of the EU 27. As part of the group of innovative actors, we will examine the scope of companies' expenditures on research and development, since a large part of these expenditures takes place in enterprises.



Source: Own research, Eurostat Database.

Figure 1: Business R&D funding in the EU member states in 2019 (% of GDP)

Other innovative actors thus participate in the financing of corporate research and development (Figure 1). The graph shows the difference in investments in research and development between EU countries. In countries such as Sweden, Germany or Belgium, companies spend more than 2% of national GDP on research and development, but elsewhere this value is lower than 0.5% (e.g. Cyprus, Latvia or Romania). In almost all surveyed countries, firms mostly use private financial resources, which means that they mostly use their own profit or resources from other private enterprises (e.g. commercial banks).

Abroad sources (especially FDI) constitute the second important source of financing for business innovations. However, the amount of funds from abroad is different in individual EU countries. Abroad resources used to finance business R&D appear to be mostly used in countries with open economies. There are different results on the level of public financing in the monitored countries. In countries such as Hungary, Slovenia, Sweden, public support using subsidy resources from the EU budget represents a significant part of their R&D expenditures. On the contrary, in other countries their use is small (e.g. Latvia, Lithuania or Romania).

Source: Own research, Eurostat Database.

Figure 2: Development of business R&D funding of innovation actors between 2000 - 2020 (as aggregate value of the EU, mil. EUR)

Graph 2 shows the financing of corporate R&D from the sources of other innovative actors, namely universities and private non-profit organizations. It is interesting that in all EU member countries the values are almost

negligible. It proves that the share of institutions in their financing is not that significant, which is also supported by the economic theory. We also examined the evolution of corporate R&D funding in the EU over a longer period, the contributions of different innovation instigators to corporate R&D expenditure as the aggregate value of all EU Member States are also examined. The results of the analysis, based on the development over time, confirmed that from 2020 the company's own resources are participating in the financing of R&D expenses for a long time. This is a level of 67% of the total corporate expenditure on R&D with a growing tendency over time.

In the monitored period, the share of foreign acquisitions in public financing represented 6-7% of the total R&D expenditures of companies in EU countries. The increase in the share of external resources (from the public sector or from abroad) in absolute numbers was caused by the drawing of subsidy resources from the EU budget and the growth of public expenditure on FDI. As a result of the growth of corporate resources, the share of external resources in corporate R&D records the same level. Using the available data for a twenty-year period (2000-2020), we performed a cluster analysis. We have grouped individual clusters with a comparable corporate R&D funding structure (Table 1).

Table 1: Structure of R&D funding of EU 27 countries in 2019 (statistical variables per country cluster)

Member country cluster	Business enterprises	Government	Abroad
Cluster 1 (FR, HU, NL, PL, SI)	1,01 (0,248)	0,122 (0,031)	0,136 (0,040)
Cluster 2 (BG, CR, CY, DK, EE, GR, IE, IT, LV, LT, LU, MT, PT, RO, SK, ES)	0,54 (0,377)	0,0275 (0,019)	0,075 (0,062)
Cluster 3 (AT, BE, CZ, FI, DE, SE)	1,633 (0,458)	0,08 (0,018)	0,312 (0,093)

Source: Own research, Eurostat Database.

Note: the table shows the specific values of the statistical variables. These are mean values and standard deviation values in parentheses (.)

The resulting Silhouette coefficient (value 0.59) confirmed the appropriateness of choosing a cluster algorithm by classifying EU member countries into three clusters. The results of processing the average values of the corporate R&D financing structure brought several conclusions. In the cluster of 3 EU member countries (namely Austria, Belgium, the Czech Republic, Finland, Germany and Sweden), the highest private support for corporate R&D, including the use of foreign resources, can be noted precisely as a result of FDI support. They are also dominant with the highest innovative performance. We assume that these resources (both corporate and foreign) are one of the success factors of these countries in the areas of innovation and R&D support. Through cluster analysis, we achieved results that were partially comparable to the European Innovation Scoreboard (2021), which confirms the fact that corporate financing of research and development is a factor in the country's innovation performance. The conclusions of the analysis showed that corporate R&D is financed mainly from private sources and funds from abroad, primarily from FDI and also shared financing from EU budget sources. These are countries with a medium level of innovation performance, included in cluster 1 (France, Hungary, the Netherlands, Poland and Slovenia).

Table 2: Correlation matrix of R&D expenditure funded by actors in EU members in 2000-2020

	Business enterprises sector	Government sector	Higher education sector
Business enterprise sector	1	0.9879	0.7146
Government sector	0.9879	1	0.7129
Higher education sector	0.7146	0.7129	1

Source: Own research, EViews based on data from Eurostat.

Based on the existence of a relationship between corporate and public financing of corporate R&D, we examine the possible impact of the substitution effect of public financing of R&D in EU countries. According to

the data in Table 2, correlation and regression analysis were performed between these relationships. We also examine the impact of higher education financing on corporate R&D, since the higher education sector also takes the form of public universities. We included possible time lags in the effect of government and university funding sectors on corporate R&D investment in the regression analysis. As part of the analysis, we do not take into account the potential effects of government support on corporate R&D, as companies do not yet use this form of support.

Table 3: Granger causality analysis of innovation actors in EU member states based on 2000-2020 2 time lags (model research results)

Null Hypothesis:	Observations	F-Statistic	Probability
GOV does not Granger Cause ENT	500	4.77426	0.0088
ENT does not Granger Cause GOV		4.19205	0.0157
UNI does not Granger Cause ENT	500	20.1425	4.E-09
ENT does not Granger Cause UNI		7.25737	0.0008

Source: Own research, EViews based on Eurostat data and published methodology by the authors Pisar, et. al. (2020).

The analysis further showed a positive correlation between the investigated variables (Table 3). The relationship between government and education funds shows a positive correlation, and there is also a very high positive correlation between corporate and government spending. Granger causality was further used to determine whether selected variables were suitable for regression analysis, as correlation does not necessarily imply causation. The conclusion of the Granger causality tests confirmed the rejection of the hypothesis that government funding and university funding does not cause Granger funding of businesses, as it is clear that this test runs both ways, i.e. from government funding and university funding (at the 1% significance level) to business funding in both cases.

Table 4: The impact of selected innovative actors on private investments in the EU in the years 2000-2020 with different time lags (results of regression analysis)

*Note: T-statistics are shown in parentheses (.). Respective significance levels according to p-values are indicated as: */**/*** examined at 10%/5%/1% significance levels.*

Using the Akaike information criterion, we examined the model in detail without a time lag, with a time lag of one year, and with a time lag of two years (Table 4). We are based on the authors' published methodology (Pisár, et. al., 2020), which defined the use of the Akaike criteria in the evaluation of the influence of selected innovative actors on private investments in the EU over an earlier time period.

According to the results of this criterion, we selected a model without a time delay. A regression model examined the effect of public and university funding of corporate research on corporate investment in

corporate R&D without time lag. Based on the results of the model, changes in funding from public sources and universities explain 97.61% of changes in R&D funding of private enterprises. The regression line of the influence of public and university funding on business funding is as follows:

$$\hat{y} = -0.05314 + 0.85528gov + 0.06058uni \quad (1)$$

where gov represents the government funding coefficient and uni represents the university funding coefficient. The P-values of the T-statistics of university and government funding are statistically significant in the model. Therefore, we can interpret the impact of both public funding and university funding on corporate investment in research and development. We can conclude that in this case there is no substitution effect of public R&D support, which occurs when companies replace their investments in R&D with public support. It can therefore be said that in EU member countries, public support for R&D, especially through the use of shared financing from the EU budget, has a positive effect on private R&D investments.

Our research brings some new empirical evidence to the discussion on the relationship between public support and business R&D expenditures. Contrary to for example Görg (2008) and Zúñiga-Vicente et al., (2014) we found no evidence of the crowding-out effect. Our conclusions are consistent with the results of many authors investigating the occurrence of the substitution effect and the impact of public support on private investment in research and development, which confirm the positive effect of public support on private investment in research and development (David, Hall, Toole, 1999; Ali-Yrkkö , 2005, Choi, Lee, 2017) and are partially consistent with other studies (Aristei, Sterlacchini, Venturini, 2015). We therefore see public support for corporate research and development as an important part of financing innovation and research and development in the EU.

5. Policy Implications

The results obtained provide several conclusions and policy implications. We consider business spending on R&D to be one of the key elements of the country's innovation performance, which is also reflected in the EU's Europe 2020 strategy. It emphasizes the growth of spending on R&D as one of the strategy's main goals. Although the structure of corporate R&D expenditure financing is different in individual EU countries, public R&D support is an important part of corporate R&D funding, especially when it comes to shared funding from EU sources.

Since our results confirm the positive impact of public R&D support on private R&D investment in cluster 1 countries (namely France, Hungary, the Netherlands, Poland, and Slovenia), we propose to intensify their public R&D support. This will leverage the level of private R&D investment in these countries, with the potential to increase the innovation performance of the countries under study. One of the main contributions of our paper is an international comparison of the structure of corporate R&D funding, which provides interesting policy implications at the EU level. While many studies are concerned with investigating the effects of public support for R&D and innovation, they are not focused on the structure of corporate R&D funding, although our research is not unlimited. We did not consider in our analysis other factors that can influence private R&D investments, as we focused only on its financing. Based on the results of the analysis of the positive impact of public financing on GDP growth using regression models (Granger causality), it can be recommended to narrow the analysis of the substitution effect only to a certain group of EU countries. This would provide more concrete results that would lead to recommendations useful for public policy makers.

6. Conclusion

Published studies point to innovation as a key element in the growth and competitiveness of companies. Despite these positives, some companies do not engage in innovative activities precisely because of the lack of financial resources that are necessary to support innovative projects. Therefore, other actors also participate in the financing of entrepreneurial R&D activities.

The results showed that corporate research and development is mostly financed by private sources, followed by foreign funds and public sources. We have created three clusters of EU member countries with a similar structure of corporate funding of research and development. The results of this part of the cluster analysis were identical to the results of the European Innovation Scoreboard, which indicates the importance of the financing of corporate research and development as one of the factors of the country's innovation performance. We confirmed the assumption that the substitution effect of public support for research and development does not occur in EU member states, since public funding of corporate R&D seems to have a positive effect on private investment in R&D.

Abstract: The objective of this work is to identify the major lessons learned from the Cyprus's tourism Small & Medium Enterprises (SMEs), following the recent Covid-19 pandemic. Further, the purpose was to reach out to SMEs owners, managers, and entrepreneurs in order to identify specific issues during and after Covid-19 pandemic, such as management practices in terms of acquiring professional assistance, applying online sales, their opinion about the measures applied by the Republic of Cyprus, and the European Union, as well their knowledge about the Recovery and Resilience Plan (RRP). A quantitative research method and a probability sampling methods have been applied. The research has reached out to SMEs with the valuable assistance of the Cyprus Chamber of Commerce and Industry (CCCI). Lack of access to financial support and professional assistance, and poor knowledge of the RRP, calling for a more effective communication approach by the national authorities has been identified. Tourism's SMEs sustainable development is highly influenced by acquiring the relevant assistance, calling for all stakeholders to apply the appropriate practices and measure in order to enhance Tourism's SMEs sustainable development.

Keywords: Republic of Cyprus, Tourism, SMEs, Innovation, Sustainability, Covid-19, RRP

1. Introduction

The Covid-19 emergence has led to a massive impact on global economy, creating concerns over its sustainability and ability for innovation (Song and Zhou, 2020) and a sharp fall of global economy (Mou, 2020). For the Cyprus economy, the impact of Covid-19 has been massive as the country has experienced its worst economic performance since the banking and financial meltdown in 2013 (IMF, 2021). Several controversial policies by the national authorities have created problems for the country's SMEs, with the tourism industry to experience major problems considering that it is the largest industry in the country Kakoullis et al. (2021). Consecutive lockdowns imposed by national authorities led to negative impacts on several industries and businesses, especially those with limited ability to overcome challenges (Verschuur, Koks and Hall, 2021; Rahman et al, 2021). The pandemic's impact on tourism has also led to social problems, such as life-quality in several countries, especially those dependent on tourism (UNWTO, 2021). Despite positive signs the problems remain as the recovery pace is slow, causing concerns in terms of arrivals and revenue. Such fluctuations are clearly revealing tourism industry's sensitivity and how sudden crises can lead to a greater level of uncertainty (UNWTO, 2022). The pandemic has triggered the development of policies by national governments to support businesses that have been affected by lockdowns. However, focus has been paid on specific areas such as employment, innovation, regulative aid, inclusive emergency packages, governance, promoting demand, sustainable development planning, and strategic marketing (Kreiner and Ram, 2020). Therefore, the objective of this research is to identify the challenges related to the Cyprus' SMEs related to the above issues.

The current articles followed the analysis of extensive literature review from credible resources in order to provide the appropriate scientific background (Snyder, 2019). Following the Quantitative research methodology, the research has applied a statistical analysis using IBM.SPSS Statistics 25 for Windows. A set of conclusions, recommendations, and limitations have been applied in order to ensure a comprehensive approach, and enable future research.

2. Literature Review

2.1 The Role of SMEs in the Cyprus and European Union Economy

Defining SMEs has been a challenge as this is influenced by several factors, such as the size of the country's economy and industry (Cacciolatti and Lee, 2015). The European Commission (2022) realizes this challenge, as a major driver for SMEs in obtaining financial support though targeted programs designed by the Union, as they constitute the backbone of its entire economy, providing opportunities for innovation and entrepreneurship. The European Commission (2022) outlines the relevant parameters on which SMEs are defined, with these enterprises to be divided into three subcategories; namely medium-sized, small and micro.

SMEs play a key-role in the development of European Union (EU) economy as they contribute €4.357 trillion, creating opportunities for innovation and entrepreneurship. EU SMEs are highly affected by several factors such as the need for innovation that will enable them to overcome competition and take advantage of the opportunities provided. Innovation for SMEs is influenced by several key-drivers such as Research & Development (R&D), networking, and access to edge Information Technology (IT) (Hervás-Oliver et al, 2021). SMEs have played a significant role during economic crisis, creating opportunities for entrepreneurship and innovation, especially in countries that have experienced economic decline (Južnik Rotar, Kontošić Pamić and Bojnec, 2019). The Cyprus' economy is highly benefited by the SMEs' operations, as the latter contribute 75.5% of the country's GDP, employing 82.6% of the country's workforce (European Commission, 2023). The country's SMEs are highly affected by innovation investments, hence, the collaboration between both the public and private institutions is considered as of a vital importance (Masouras et al., 2021).

2.2 Access to Financial Support

Gaining access to financial support is essential for sustainable development and innovation for SMEs, especially for those businesses operating within a responsible environment, enabling them to attract external investments (Durst and Wolfgang, 2021). A major problem confronted by SMEs refers to the high percentage of Non-Performing Loans (NPL). Considering SMEs' impact on national economies, failure to obtain financial support will potentially holdback innovation (Shihadeh, Gamage and Hannoon, 2019). Poor political decisions constitute a major obstacle in obtaining financial support by SMEs, hence, requiring more practical measures (Ghosh, 2022). Recent problems related to inflation and high interest rates have caused concerns over the EU's SMEs to obtain valuable access to financial support and overcome their cashflow challenges (Boccaletti et al., 2024). Poor policies developed by the EU have become a major concern in relation to the Union's SME, hence, negatively impacting their competitiveness (Batrancea et al., 2022).

SMEs in advanced tourism economies such as Spain face serious problems in obtaining access to financial support. This is mainly due to lack of providing financial statements revealing their profitability and ability to pay back their loans. This requires from the tourism' SMEs to operate in a more professional manner, especially following financial crises, therefore, create opportunities to become more resilient and innovative (Moya-Martínez and Del Pozo-Rubio, 2021). Similar are the problems in the emerging tourism country of Vietnam, in which tourism SMEs are facing obstacles in accessing financial support. These obstacles have intensified during the pandemic, forcing tourism SMEs, to search not only for formal, but sadly, informal financing (Van Song et al, 2022).

H_1: The majority of tourism SMEs in the ROC is facing difficulties in obtaining financial support from banking institutions.

2.3 Inflation and Tourism

Inflation in Tourism is influenced by several external factors such as pandemics, economic crises, wars, armed conflicts, and other hazards, that lead to a major negative impact on the industry's businesses, especially those that do not possess the relevant knowhow and financial capability to overcome problems. The European Central Bank (ECB) (Lis and Nordeman, 2021) provide some important insight and suggest that consecutive lockdowns and other related measures by national governments have led to a massive impact on tourism-related services with inflation to have deteriorated in the industry.

Inflation in tourism and other related services has hit the lower-income classes, with this being visible in several regions across the world, with the SMEs suffering from such consequences due to lack of cashflow and access to funding (Gössling and Schweiggart, 2022). Overcoming these challenges requires from all businesses to ensure innovation, product, and service diversification. This approach can enable them to ease the inflation problems and increase their resilience (Rogerson, 2021). The negative inflation consequences have also hit West African Economic and Monetary Union (WAEMU). This calls for policy-makers to implement measures that will overcome the pandemic's spillovers (Coulibaly, 2021).

H_2: The majority of tourism SMEs in the ROC is concerned about the Inflation consequences.

2.4 Government Assistance

The problems of limited access to financial support from SMEs start from poor governmental schemes, especially during difficult times, with the problems to be identified in operations such as supply chain and HR,

(OECD, 2021). The role of Public and Private Partnerships (PPP) can potentially mitigate the negative impact of the absence of governmental support (Corredera-Catalán, di Pietro and Trujillo-Ponce, 2021). The benefits of PPP and government assistance in the tourism SMEs has been clearly visible during the recent pandemic (Turkson et all., 2021; Kousi, Mitsi and Simos, 2021). For SMEs in developing countries, such as Cyprus, governmental support constitutes a major mediator for establishing a competitive advantage and improvement of operational performance and productivity (Jayeola et al., 2022).

2.5 Republic of Cyprus (ROC) and the Recovery and Resilience Plan (RRP)

The problems developed in EU economy have forced the Union to take a comprehensive approach towards resolving the extensive negative consequences, with the Recovery & Resilience Facility to be an important tool. The European Commission (EC, 2022) clarifies that *"As part of a wide-ranging response, the aim of the Recovery and Resilience Facility is to mitigate the economic and social impact of the coronavirus pandemic and make European economies and societies more sustainable, resilient and better prepared for the challenges and opportunities of the green and digital transitions."*

For the fragile Cyprus economy that has in recent years experienced serious problems such as the 2013 banking system meltdown (Clerides, 2014) which was, sadly, enhanced by banking mismanagement and governmental failures to control the upcoming domino effect leading the country to high risk (Brown et al, 2018), the RRP is considered to be a life-saving tool with the government paying attention to its effective implementation and it is based on five major pillars (public health, green economy, competitiveness, digitalization, and HR).

The Cyprus RRP refers extensively to the tourism sector, focuses on its positive impact, however it points out the negative dimensions and states that *"Cyprus's travel and tourism sector is currently reliant on international visitors and specifically the tourism receipts from two countries which account for two-thirds of total visitors. The lack of diversification in the number of countries that travel to Cyprus could expose the country to a demand shock due to economic, social and political developments"* (RRP, p. 20).

H_3: The majority of tourism SMEs in the ROC has limited knowledge about the country's RRP.

H_4: The majority of tourism SMEs in the ROC has not acquired professional assistance to restructure their businesses.

H_5: SMEs that have acquired professional assistance are more likely to develop their online sales compared to those that have not acquired professional assistance.

3. Methodology

The researchers provided a Questionnaire of 21 questions, with a pilot Questionnaire (20) to have been provided, with minor changes to have been made, mainly in terms of wording. The Questionnaire was based on previous research and adjusted to the needs of the current work. This research applied Quantitative research method through the support of the Cyprus Chamber of Commerce and Industry (CCCI) and a non-probability sampling method has been applied. The sample covered the entire ROC territory, with attention to be paid on the four major tourist regions, namely Pafos, Larnaca, Limassol, and Famagusta). The targeted research audience is the SMEs owners within the country's tourism industry. 258 questionnaires were distributed with 207 answers; a total 80.23% response rate. All data collected were analysed using IBM.SPSS Statistics 25 for Windows in order to enable greater analysis (Saleh, 2023).

4. Statistical Analysis

Data were analysed using IBM.SPSS Statistics 25 for Windows. For the purposes of this study, a sample of 207 participants were selected. Follow Table 1 presents the frequency and percentage distribution for the participants demographic characteristics. Regarding gender at the sample of the 207 participants (business owners and/or managers, and/or entrepreneurs), 149 (72%) were male and 58 (28%) were female, revealing that most business owners within the ROC are males, complying with the official statistics. Regarding age groups, 60 (29%) were between 34-41 years old, 51 (24,6%) were between 42-49, 44 (21,3%) were between 26-33, 42 (20,3%) were above 50 and 10 (4,8%) were between 18-25. Regarding the district of operation of the sample, 65 participants (31,4%) were in Pafos, 47 participants (22,7%) in Limassol, 41 participants (19,8%) in Larnaca, 38 participants (18,4%) in Famagusta and 16 participants (7,7%) in Nicosia. Further, regarding the area of operations (Question 4) of the sample of the 207 participants, 145 (70%) were in urban areas and 62 (30%)

in rural areas. The distribution is in alignment with the population distribution within the ROC, consequently, there is a comprehensive overview of geographical participation.

When the participants were asked about the degree of SMEs' difficulty to obtain financial support from a banking institution 55,6% find it very difficult/difficult, 22,2% find it neutral, and 20,7% find it easy/very easy. As a result, 115 participants (55,6%) confronted serious problems in relation to getting access to financial support to overcome existing problems and possibly finance new operations therefore, Hypothesis 1 is accepted.

Regarding the degree of someone's belief that the current inflation will affect Cyprus' Tourism development 61.5% expressed the concern that the current inflation shall very highly/highly influence the Cyprus tourism development a4,8% expressed the opinion that inflation shall not affect the tourism operations. This reveals SMEs' concerns over the sector's future and their ability to overcome possible problems, thus raising the need for further national support, therefore, Hypothesis 2 is accepted.

Regarding the degree of someone's awareness of the Cyprus RRP 68% replied negatively and only 19% replied negatively, therefore, Hypothesis 3 is accepted. This creates serious concerns over SMEs' ability to inform themselves about such important issues that would to a great degree ease the problem of getting access to financial support.

When the participants were asked whether someone during and/or after Covid period has acquired professional assistance to restructure their business, 72,5%) responded negatively while 27,5% responded positively. These answers can be combined with Question 21 which is related to whether SMEs have developed their online sales in which 58,5% responded positively while 40,6%) responded negatively. Despite the two results not being fully compatible, it is an obvious fact that SMEs have taken advantage of the opportunity to expand their sales network by developing their own skills through social media and other online means. Therefore, Hypotheses 4 and 5 are accepted.

In addition, when the participants were asked according to the degree of someone's belief that the Cyprus Deputy Ministry of Tourism responds to the challenges of SMEs in the Tourism sector, 100 participants (48,3%) rated the second lowest and only 21 (10,1%) rated the second highest scale. Importantly, none of the participants has answered that have a full positive opinion over the Ministry's support. The overall participants' perception is that there is poor assistance, hence, creating serious concerns over the governmental support which requires substantial improvement.

Table 1: Frequency and percentage distribution for the demographic variables of the Participant characteristics

Demographic Variable	Category	N	Percentage
Gender	Female	58	28.0%
	Male	149	72.0%
	Total	207	100.0%
Age	18-25	10	4.8%
	26-33	44	21.3%
	34-41	60	29.0%
	42-49	51	24.6%
	50+	42	20.3%
	Total	207	100.0%
District of Operations	Nicosia	16	7.7%
	Limassol	47	22.7%

	2	10	4.8%
	3	69	33.3%
	4	73	35.3%
	5	54	26.1%
	Total	206	99.5%
	Missing Values	1	0.5%
	Total	207	100.0%
Access to Financial Support from Banking	Very Easy	3	1.4%
	Easy	40	19.3%

Demographic Variable	Category	N	Percentage
Institution	Neutral	46	22.2%
	Difficult	53	25.6%
	Very Difficult	62	30.0%
	Total	204	98.6%
	Missing Values	3	1.4%
	Total	207	100.0%

Further, Table 2 reveals that there is a statistically significant relationship and frequency between whether someone has acquired professional assistance to restructure his/her business and whether they develop their online sales (p<0,001). More specifically, those who develop their online sales were more likely to acquire assistance (36,4%) compared to those who did not develop their online sales (15,5%).

Table 2: Comparison of Acquiring Professional Assistance and On-line Sales

Chi-Square Tests						
	Value	df	Asymptotic Significance (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)	Point Probability
Pearson Chi-Square	11,608[a]	2	,003	,002

N of Valid Cases	207					

a. 2 cells (33,3%) have expected count less than 5. The minimum expected count is 55.

b. The standardized statistic is 2,924.

5. Discussion

The EU SBA Act (2011) identifies the obstacles confronted by SMEs to obtain access to the relevant financial/funding support. Further, the Act raises the importance for SMEs to gain such support, calling for the national governments to enable this through the development of specific programs, e-government, and e-procurement. Therefore, the research results are in full alignment with the EU preliminary identifications.

Spanish tourism has confronted serious problems during the pandemic, such access to financial support and poor innovation (Corredera-Catalán et al, 2021). Yao and Liu (2023) identify that China's SMEs, especially those operating within the vulnerable tourism sector have been incredibly affected in terms of obtaining financial support. Arcuri and Pisani (2023) identified the negative effects of Covid-19 on Italy's SMEs, with access to funding opportunities to have been hurt dramatically. The authors have identified that SMEs that have implemented more sustainable policies, including those related to green economy, realized improved financial results and increased their opportunities in obtaining access to financing leading to innovation. Such findings are in consistency with previous research in Italy in regards to the financial performance and access to financial support by Italian SMEs, that have hurt the country's overall macroeconomic goals (Di Bartolomeo, D'Imperio and Felici, F. 2022). The European Economic and Social Committee (2022) adds to the previous findings related to Italy's SMEs during the pandemic and suggests that companies that have strategically focused on digital transformation and/or transition experience increased opportunities to enjoy a sustainable economic growth in the turbulent post-pandemic era.

Brexit has led to a massive impact on UK's SMEs as uncertainty had prevailed. This was enhanced by limited governmental support creating further problems over the country's sustainable development (Sindakis and Aggarwal, 2022). For the country's SMEs, Brexit concerns were increased due to continuous lockdowns and inability to obtain financial support, especially at the pandemic's initial stages. Such problems were only eased

as a result of the government's support through the British Business Bank which provided £5 billion, assisting SMEs to overcome problems (Assefa, 2023).

6. Conclusions

The objective of the current research was to identify the lessons learned by the Cyprus' tourism SMEs, following the recent pandemic. This quantitative research of 207 questionnaires focuses on delivering the appropriate assistance to both internal and external stakeholder and contribute to the existing literature. The pandemic outbreak has led to serious impacts on the operations of the country's SMEs, with the access to financial support to remain a serious concern. This is added to the recent financial problems confronted in the country as a result of the banking and financial crisis which led the country's economy into a deep recession. SMEs' owners are seriously concerned over the acquired support by the national authorities, especially the Deputy Ministry of Tourism. The role of the government of the Republic of Cyprus has been evaluated as a negative one, as the pandemic has brought tourism industry before a new reality which the government did not handle in the best possible way. The pandemic was an opportunity for SMEs to acquire professional support by a substantial percentage (47,3%), and improve their online sales (84,5%). SMEs are also facing serious problems in obtaining access to financial support, an issue that is holding them back from developing their operations and becoming more competitive and innovative. Tourism industry entrepreneurs can use these results in order to identify threats and opportunities for future investments.

7. Recommendations

Tourism SMEs are considered as the backbone of the island's national economy, especially since the country has gone through consecutive economic and health crises that have created high level of uncertainty. Such uncertainty must be eased in order to enable tourism SMEs to overcome problems and become a source of innovation. The official authorities must take strategic decisions in order to ensure that these challenges shall be eased, hence, providing them the ability to become key-players in the sector's sustainable development. The RRP constitutes a powerful tool in the hands of the national authorities that need to ensure that this will be transferred towards the country's SMEs, with the tourism sector to be considered as a top priority within the specific plan. Lack of full use of the RRP will only increase the problems and create further concerns over the industry's sustainable development. Considering the repeated recommendations provided by EU's SBA Fact Sheets, focus on RRP's success should constitute a necessity rather than an option for the country's national authorities. The Deputy Ministry of Tourism's role, as the official body that possesses the legitimate power to provide support as well as to implement strategies that will substantially enhance the sector's SMEs performance and sustainable development, is of a crucial importance. Findings are indeed worrying, calling for the Deputy Ministry to take actions towards not only in regard to policy making, but most importantly, toward increasing its communication with SMEs. SMEs should focus more on acquiring information to ensure that they will have improved opportunities for financing and innovation. Information about national and EU funding opportunities, such as RRP can easily be obtained, hence, SMEs should work closer with the both the authorities and Chambers to eliminate the problem.

Limitations

The current research faces specific limitations that are mainly concerned with the sample size and confidence level, the Questionnaire formulation, the data collection method. Lack of previous academic research on the topic also in the ROC create limitations, therefore, further research can contribute towards the results' credibility.

Disclaimer

The authors have not received any financial support by any public, private, and/or any other organisation for the development of this research. The opinions and conclusions of the current research represent the authors' approach which is based on all relevant ethical research values. Appendix: Questionnaire

Question 1: Gender
Male
Female
Question 2: Age
18-25
26-33
34-41
42-49
50+
Question 3: District of Operations
Nicosia
Limassol
Pafos
Larnaca
Famagusta
Question 4: Area of Operations
Urban
Rural
Question 5: Type of Business
Pub/Bar

Restaurant
Traditional Tavern
Souvenir Shop
Watersports
Car hire/Rent
Retail
Apartments for Rent
Other
Question 6: How many people work in your business?
1-5
6-10
11-15
16-20
21+
Question 7: How many years has your business been operating?
1-5
6-10
11+
Question 8: What is your opinion about the Cyprus Government's measures in relation to the Tourism Industry during the Covid-19 period?
Strongly Positive
Positive
Neutral
Negative
Strongly Negative
Question 9: What is your opinion about the European Union's measures in relation to the Tourism Industry during the Covid-19 period?
Strongly Positive
Positive
Neutral
Negative
Strongly Negative
Question 10: Has your business faced financial problems during the Covid-19 period?
Yes
No
I prefer not to say
Question 11: If you have answered Yes in Question 10, to which level these problems were (1 being the lowest level and 5 being the highest level)?
1
2
3
4
5
Question 12: During the Covid-19 period the Revenue of my business has:
Increased over 20%
Increased between 11-20%

Increased between 1-10%
No Change
Decreased between 1-10%
Decreased between 11-20%
Decreased over 20%
Question 13: Have you received financial support from the Government?
Yes
No
I prefer not to say
Question 14: If you have answered Yes in Question 13, to which level this financial support has supported your business (1 being the lowest level and 5 being the highest level)?
1
2
3
4
5
Question 15: If I need financial support from a banking institution, I find it:
Very difficult
Difficult
Neutral
Easy
Very easy
Question 16: During the Covid-19 period, did you lay off any of your employees, and if Yes, how many employees did you lay off?
1-3
4-6
7-10
11+
I did not lay off any employees
Question 17: From 1 to 5 (1 being the lowest level and 5 being the highest level), to which level are you aware of the Cyprus Recovery and Resilience Plan (RRP)?
1
2
3
4
5
Question 18: From 1 to 5 (1 being the lowest level and 5 being the highest level), to which level do you believe that the Cyprus Deputy Ministry of Tourism responds to the challenges of SMEs in the Tourism sector?
1
2
3
4
5
Question 19: From 1 to 5 (1 being the lowest level and 5 being the highest level), to which level do you believe that the current Inflation will affect Cyprus' Tourism development?
1

2 3 4 5
Question 20: During and/or after the Covid-19 period I have acquired professional assistance in order to restructure my business: Yes No I prefer not to say
Question 21: During and/or after the Covid-19 period I have developed my online sales: 1 2 3 4 5

Innovative Learning Practices as a Driver of Students´ Performance

Abstract: Higher education institutions have faced the imperative of adapting pedagogical approaches to meet the demands of the twenty-first century and the changing needs of their students. This study investigates how active learning methodologies impact undergraduate students' academic performance in two different academic fields: engineering education and the social sciences. The study was conducted in a Portuguese higher education institution, the Polytechnic University of Coimbra, using a sample of 97 undergraduate students. Results reveal that active learning approaches particularly problem-based learning (PBL) enhance student engagement, learning experiences, and competencies. Moreover, the research indicates significant differences in the effectiveness of these approaches between engineering and the social sciences, with engineering students demonstrating a more pronounced improvement in their academic performance. These findings highlight the importance of integrating innovative active learning practices into higher education environments to better prepare students for the challenges of modern societies.

Keywords*:* Active learning practices, Problem-based learning (PBL), Higher education, Students 'performance

1. Introduction

Implementing active learning methodologies in the classroom's contexts is seen as central to the success of the educational process. These innovative educational practices are expected to boost student's engagement with the learning process. The future graduate needs to acquire not only technical skills but also transversal and human-centered skills and attitudes, such as adaptability, flexibility, interdisciplinary collaboration, teamwork, creativity, communication, critical thinking, and complex problem-solving, to be prepared for the demands of the twenty-first-century labour market (Leal-Rodríguez and Alborat-Morant, 2019).

Bonwell and Eison (1991), in their seminal work Active Learning: Creating Excitement in the Classroom, define active learning as "instructional activities involving students in doing things and thinking about what they are doing." This is a broad concept that includes a wide range of teaching and learning strategies in which students are required to engage actively in the learning process. Active learning stands thus in contrast to traditional learning approaches in which students are passive receivers of knowledge from an expert. Methods that promote active learning focus on developing students' skills and values rather than transmitting knowledge and require that students process content themselves to learn. The learners are engaged in discussions, teamwork, real-world problem-solving, decision-making, and cooperative hands-on projects to develop higher-order thinking skills such as convergent thinking, creative thinking, and analytical thinking, which are crucial for students to succeed in today's world (McGuinness, 2021; O'Loughlin, 1992; Carr et al., 2015; Petress, 2008). The role of the teacher in active learning classrooms is substantially different from the traditional methods. Instead of functioning as a transmitter of knowledge or an expert with answers, the teacher assumes the role of a facilitator of learning processes, guiding students on their journeys of self-discovery by offering advice but also allowing the students to work out their strategies and making their own mistakes (McGuinness, 2021). In this way, the teacher provides support and tools for the students to do their own research into the topic they need to learn about or the problem they need to solve.

There is evidence in the literature that active learning methodologies improve students' learning outcomes and performance (see, for example, Sukackė et al., 2022; Mabley et al., 2020; Li et al., 2019; Freeman et al., 2014; Trullàs et al., 2022). Focusing on engineering education, Sukackė et al. (2022), conducting a systematic literature review on the implementation of three active learning methods (problem-based learning, project-based learning, and challenge-based learning), point out that "implementing active learning methods in engineering education is becoming the new norm and is seen as a prerequisite to prepare future engineers not only for their professional lives but also to tackle global issues''. Leal-Rodríguez and Alborat-Morant (2019), in turn, from an empirical study involving a sample of 80 students belonging to a Bachelor´s Degree in Business Administration at a Spanish Business School, show that promoting innovative experimental learning practices constitutes an effective approach to improving students' competences and academic performance. In the same view, Deeley

(2010) points out the benefits of experience-based learning, demonstrating that, overall, this learning approach has the potential to lead to students' intellectual and emotional enhancement. Chapman et al. (2016) also demonstrate that innovative learning methods have a positive impact on the class and improve students' performance. Moreover, Trullàs et al. (2022) conclude that problem-based learning is an effective approach to medical education based on a scoping review of available international evidence concerning the effectiveness and usefulness of PBL methodology in undergraduate medical teaching programs. The results demonstrate that through PBL students not only acquire knowledge but also skills that are required in the medical profession.

The positive effect of active learning methodologies on students' performance has already been demonstrated in studies such as Zancul et al. (2017), Fernandes et al. (2014), and Alves et al. (2016). However, despite the huge potential of innovative learning practices for fostering and enhancing learning, their implementation in classroom contexts has been limited. Indeed, several studies highlight that implementing active learning approaches is a challenging and complex process that requires a paradigm shift and involves great effort and time from all HEI stakeholders, namely leaders, teachers, students, and staff (Membrillo-Hernández et al., 2019; Zancul et al., 2017; Namasivayam et al., 2017).

Against this background, this paper aims to contribute to this literature stream by providing new empirical evidence on the role of innovative active learning methods based on collaborative problem-based learning (PBL) on students´ engagement, learning experience, and competencies. This study was carried out within the context of a Portuguese higher education institution, the Polytechnic University of Coimbra, using a sample of students from two different scientific areas, engineering, and social sciences.

The remainder of the paper is structured as follows: Section 2 describes the methodology used in this study. Section 3 presents and discusses the empirical results. The last section draws the main conclusions.

2. Methodology

The study involved a sample of 97 undergraduate students from the Polytechnic University of Coimbra, from two different scientific areas: 32 engineering students (bachelor's degree in sustainable cities management) and 65 social sciences students (bachelor's degree in media studies).

The research instrument used in the present study to collect the data from our group of respondents was an online questionnaire. For measuring the responses, a 7-point Likert scale was used. A Likert-type scale is a psychometric scale commonly used in survey research, namely in the social sciences. It is used when there is an order in responses and distances between categories are not quantitative. When responding to a Likert questionnaire item, respondents specify their level of agreement or disagreement on a symmetric agree-disagree scale for a sequence of statements. The range of the Likert scale captures the intensity of the respondent's attitudes towards a particular question (Aktas Altunay and Ezgi Yilmaz, 2023).

In our active learning experiment, the students are asked to carry out a problem-based learning (PBL) process in which they learn about a subject by working in groups to find a solution for a real-world problem. This approach is applied throughout the entire academic semester as the primary learning and teaching method. Following Eddy and Dan (2016), the PBL process comprises seven stages, as described in Figure 1.

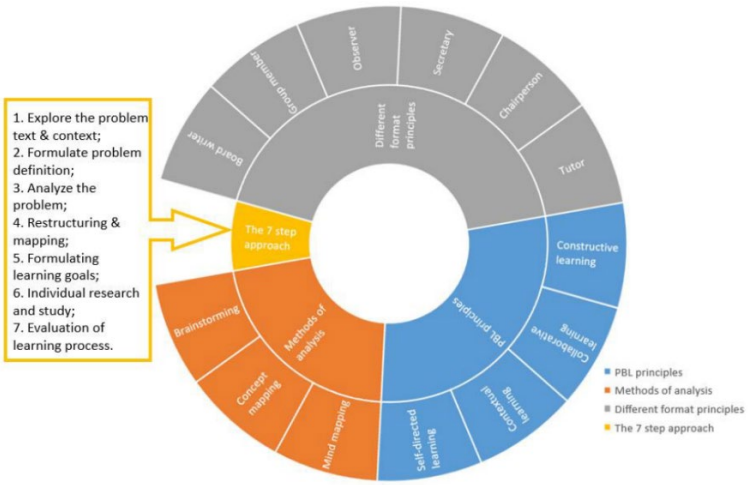

Figure 1: Problem-based learning process (adapted from Eddy and Dan, 2016)

It should be noted that throughout the different phases of the learning process, students, organised in small teams (from four to six members), make use of a variety of techniques and tools, such as brainstorming, researching relevant sources of information, mind mapping, or future scenario planning, to engage in the learning process, achieve the learning objectives, and come up with innovative and effective problem solutions.

As discussed above, in classroom-based PBL, the teacher's role is to be a facilitator who supports students through their learning process and whose main mission is to guide and engage the students, monitor the stages, provide advice and material suggestions, and inspire discussions when student teams are working together (Masek, 2016).

3. Results

The first evidence of the PBL´s implementation as an active learning methodology concerns the students' satisfaction level with participation in this pilot program, as illustrated in Figure 2. Most of the students (86%) are satisfied with the implementation of the PBL methodology. Although represent a residual part of the sample, 3% of the students have a negative, or very negative judgment about their participation. After analysing both education areas separately, engineering students are the most satisfied with their participation. Moreover, no negative opinion has been registered, and 75% of students have chosen "agree" or "strongly agree" to evaluate their perception. It should be noted that considering only the highest grade on the Likert scale, three times more answers (34% against 9%) have been expressed among engineering students.

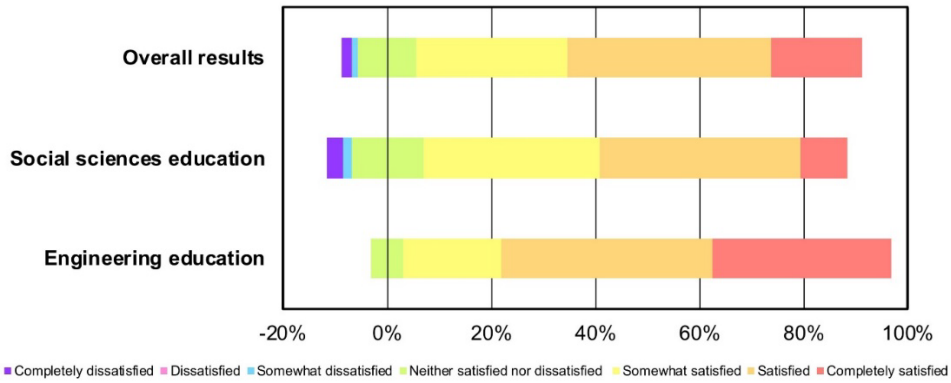

Figure 2: Students' degree of satisfaction

To better understand the satisfaction level expressed by the students, the remaining questions of the survey addressed different essential aspects, namely, questions aiming to understand students' motivation and engagement. This assessment is achieved through two questions related to class dynamics and productivity, whose results are illustrated in Figure 3 and Figure 4, respectively. Starting by analysing the joint results of both groups of students, 85% of students agreed that this pedagogical approach improved both class dynamics (Figure 3) and class productivity (Figure 4). These two parameters are an indirect way to evaluate students' motivation to attend and actively participate in classes. Indeed, according to annual reports presented by bachelor pedagogical coordinators, the main reason for academic failure is related to student absenteeism. Identical conclusions have already been identified in other studies conducted in Portugal (Teixeira, 2013), and it is worth mentioning that this problem has already been pointed out in the seventies of the last century (Mohamed et al., 1974). This latest study shows that, already in the 1970s, students' attitudes were identified as the main determining factor in the level of absenteeism. Thus, if students recognise that their time in the classroom is properly used, i.e., classes are productive, and that the learning process is student-centered, i.e., classes are dynamic, students feel intrinsically motivated to attend all classes, using to good advantage of all the benefits that being present in the classroom brings. Finally, it is worth mentioning that only 4% of the students answered that the PBL methodology didn't contribute to improved class performance.

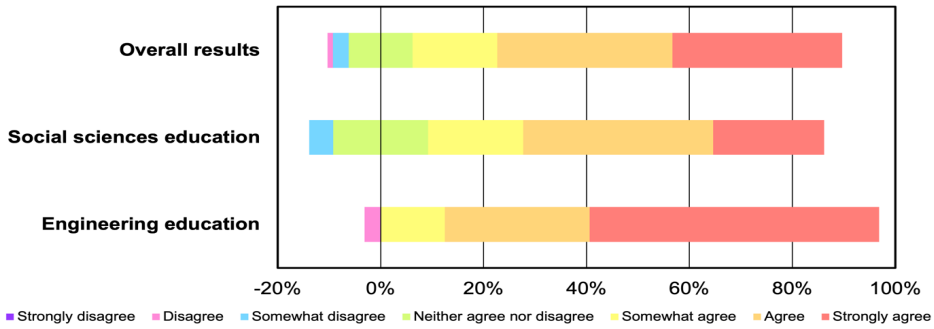

Figure 3: Students' perceptions on the improvement of class dynamics

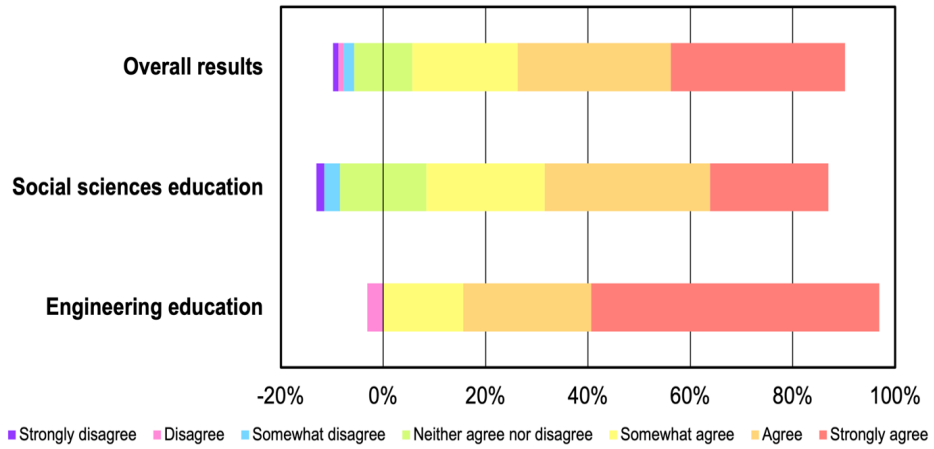

Figure 4: Students' perceptions on the increase of class productivity

When comparing the perceptions of social sciences and engineering students, it is also clear that the implementation of PBL as an active learning methodology is far more appreciated by engineering students. Not only 97% of the students have a positive perception of this student-centered approach (20% more than students from social sciences education), but the answer "strongly agree" represents more than 50% of the opinion, which contrasts with only 22% of social sciences education respondents. Another interesting observation is that engineering students didn't show neutral opinions when asked if class dynamics (Figure 3) and class productivity (Figure 4) had improved. These findings may derive from the fact that the implementation of active learning methodologies represents a very different paradigm when compared to lecturing and exercise-solving classes, which continue to be the common pedagogical approaches.

As concluded by Neves et al. (2021), educators need to be competent in technical and professional issues, but they also need to develop their pedagogical skills to be able to develop innovative teaching strategies and methodologies. Indeed, the outcomes from the present innovative learning approach experiment show that students are satisfied with this pilot program.

Intrinsically related to students´ motivation is their level of academic performance and their willingness to see this active learning methodology implemented in other subjects. These two fundamental pieces of evidence are depicted in Figure 5 and Figure 6, respectively. Based on students' positive perceptions of class dynamics and productivity, it is expected that their perception of the influence of the PBL approach on their final grade (Figure 5) would be positive, which is confirmed by the empirical outcomes. Overall, 85% of students consider that their experience allowed them to achieve better academic results. Although the numbers are not expressive, 3% of students answered that PBL methodology didn't influence their final grade, and 12% had no opinion. This conclusion is in line with other studies carried out in several educational areas, such as natural sciences (Aidoo et al., 2016), health sciences (Qin et al., 2016), and humanities and social sciences (Kozanitis and Nenciovici, 2022). Comparing social sciences and engineering students' perceptions, the previously identified pattern remains. For 56% of engineering students, PBL methodology strongly contributes to a higher final grade, compared to only 15% of social sciences students (Figure 5). Some students seem to have no well-defined position (6%), but no students have negative perceptions. In contrast, 5% of social sciences students don't recognise the added value of this pedagogical approach for their final grade.

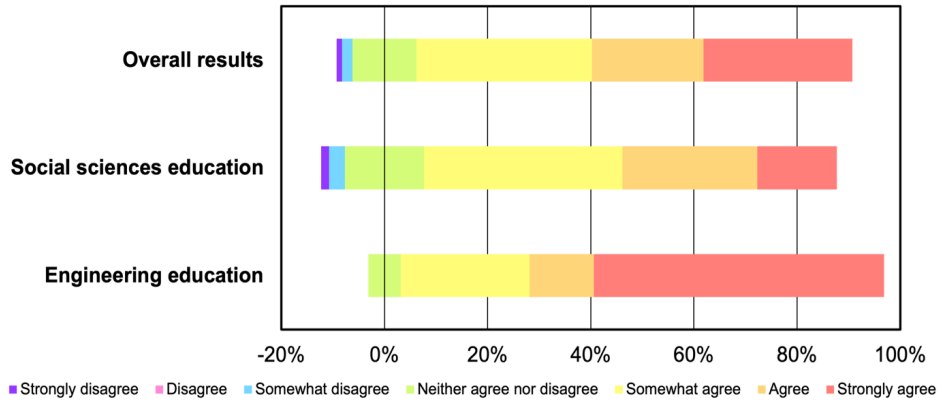

Figure 5: Students' perceptions on the increase of final grade

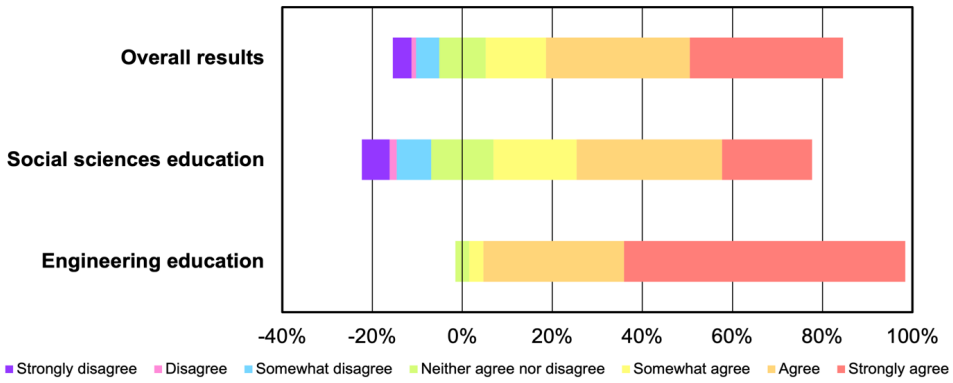

Figure 6: Willingness to the implementation of the PBL methodology in other subjects

Considering the previous positive effects of both classes' environment and final grades, the results illustrated in Figure 6 are expected, i.e., most students (79%) would like to see active learning methodologies implemented in other subjects. Once more, engineering students tend to be more willing to see this type of approach replicated in other subjects. In the first analysis, one may think that results may be related to the different completion rates of full-time bachelor's students in each field of study. However, according to the OECD (2022), in Portugal, the completion rates in the fields of education and STEM (science, technology, engineering, and mathematics) by the end of the theoretical duration of the curricula are almost identical, at 61.5% and 62%, respectively.

The last group of questions proposed in the online survey aimed to assess the impact of PBL on students' social skills, thinking competencies, and self-learning abilities. Eight different skills were assessed, among them the so-called 21st-century skills (World Economic Forum, 2016): critical thinking (problem-solving), creativity, communication, and teamwork (collaboration), digital competencies, and data analysis. Leadership and entrepreneurship are also part of the character qualities that students need to acquire or develop during their academic path to success in today's world.

Analysing the overall results, which are illustrated in Figure 7, it can be stated that more than 75% of all the inquired students consider that their skills or competencies have been positively impacted by the PBL learning process. The 21st-century skills of critical thinking (problem-solving), creativity, communication, and data analysis are, undoubtedly, the areas in which the outcomes are more noticeable (86% of the students' perceptions are positive). In contrast, students' perceptions of the impact of the PBL approach on entrepreneurship, leadership, and digital competencies present the worst results, highlighting 10% of the negative answers. The number of students without a formed opinion is equally considerable.

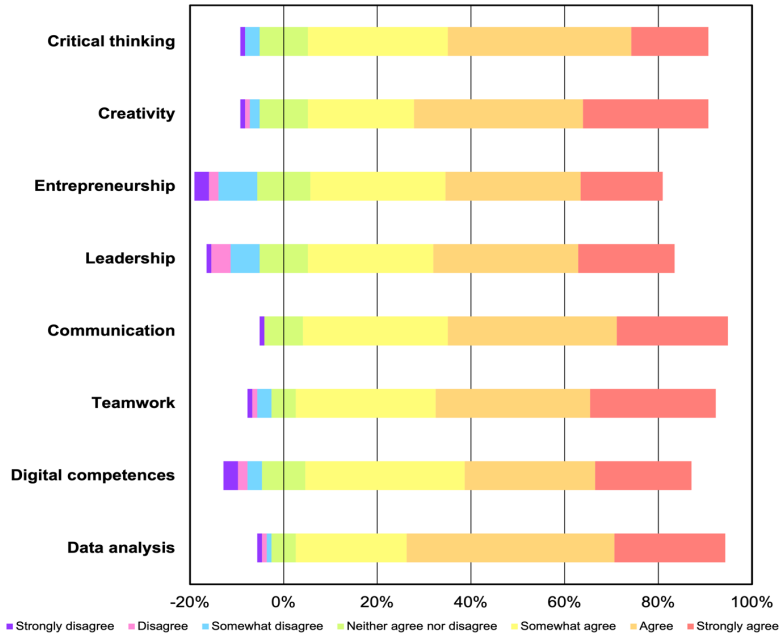

Figure 7: Students' perception on the improvement of transversal skills: overall results

Although further investigation is required, these results may arise from the pedagogical approach itself. Indeed, and in contrast with other student-centered methodologies, such as co-creation and project-based learning, PBL practices do not presuppose direct contact with third-party organisations or companies. This lack of competitive atmosphere or the non-existence of a well-defined goal does not stimulate the entrepreneurial profile of students, as they may not be able to understand the applicability of the proposed challenges.

Regarding digital literacy, results show that the implementation of the PBL methodology does not directly affect this competence. Although students are invited to use digital tools that are unfamiliar to many of them, there is no obligation to use them. Students can achieve all the goals by using common digital resources that they already dominate. Finally, problem-based learning implies that students work in groups of four to six members. Therefore, teamwork is naturally developed, but only a small number of students take on a team leadership role.

The discrepancy between the two fields of education identified in the previous analysis remains valid when examining students' perceptions of the impact of PBL methodology on their skills. Social sciences students (Figure 8) tend to have a less positive perception than engineering students (Figure 9).

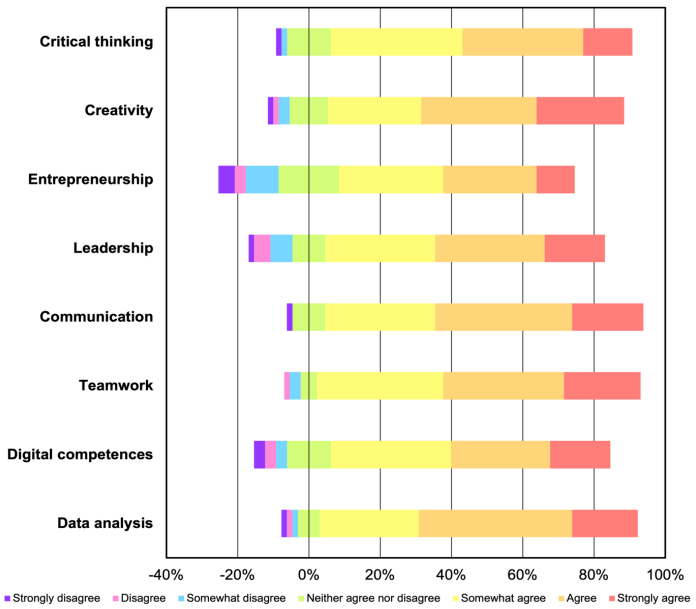

Figure 8: Students' perceptions on the improvement of transversal skills: social sciences education

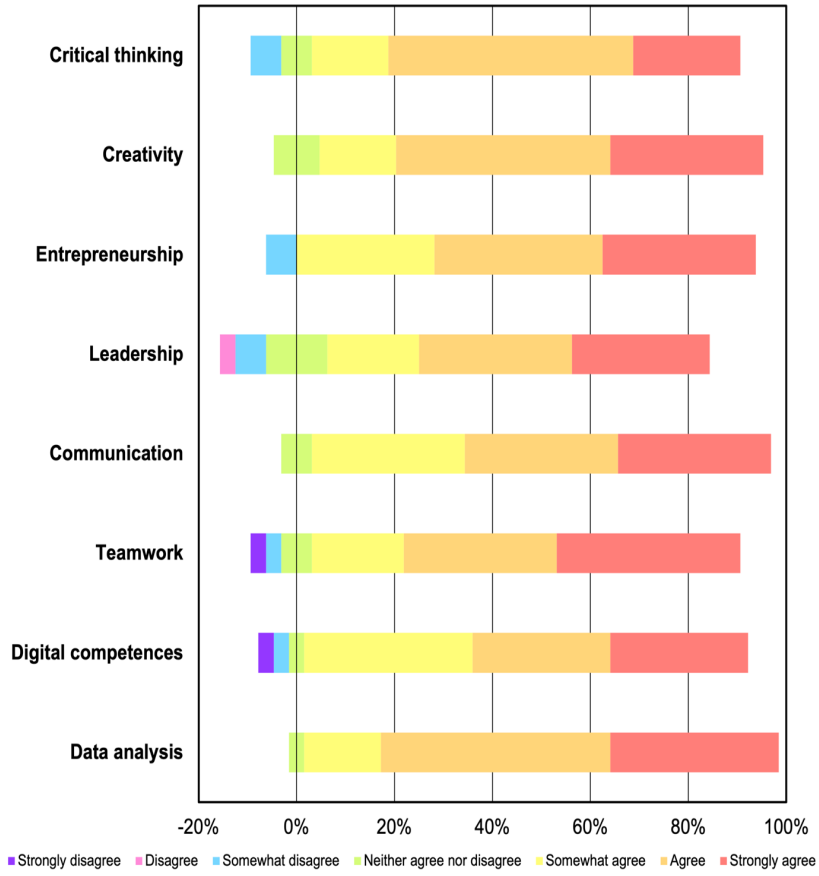

Figure 9: Students' perceptions on the improvement of transversal skills: engineering education

4. Conclusions

There is an evident and pressing need for a change in the prevalent approaches and methodologies employed in higher education. An alternative to conventional learning paradigms is the shift to student-centred education through active learning approaches. Numerous studies have demonstrated the effectiveness of these strategies in increasing students' motivation and performance. The results of this study corroborate and enrich these conclusions. The high degree of students' satisfaction and their desire to use innovative teaching and learning practices in other disciplines should be noted. Regarding classroom dynamics and productivity, two factors that will boost student motivation during the learning process, most students agree that using the PBL technique improves these aspects. These metrics offer insight into how students develop a stronger connection with the curriculum, which leads to more active and diligent engagement and improved integration with teachers and the school community. The active methodology has helped teachers make their lessons more fruitful and efficient. Moreover, when the PBL technique is implemented, it is evident that students are becoming more conscious of their actions and taking more responsibility. Memorization-focused learning has given way to the practical application of knowledge-based learning. When comparing engineering education to social science education, the results reveal notable variations in PBL strategies' efficacy, with engineering students demonstrating a more pronounced improvement in their academic performance. Concerning competency progress, most students reported that they had developed more transversal skills, particularly in the areas of communication, creativity, critical thinking (problem-solving), and data analysis.

These findings foster a redefinition of the pedagogical role traditionally assigned to educators and the exploration of more innovative learning practices. From the perspective of students, it is evident that the integration of active learning methodologies is perceived as conducive to achieving more favourable academic and professional outcomes. Empirical evidence regarding students' satisfaction indicates a positive influence on motivation and engagement within both classroom settings and the broader learning context.

Abstract: According to the French Agency for Ecological Transition, ADEME, the textile sector is projected to contribute to 26% of global greenhouse gas emissions by 2050, highlighting the significance of sustainable fashion. The current market, influenced by increasingly conscientious consumers seeking transparency regarding product origins and production conditions, alongside stricter regulations, compels fashion companies to diminish their environmental footprint by embracing progressively sustainable and eco-friendly practices. With the ability to purchase garments online from anywhere in the world, the necessity of providing clear and accurate information to customers and the supply chain about product features through a document in a smart format has become essential. Consequently, digitization has become imperative in the fashion industry, with the digital passport serving as a pivotal milestone in advancing towards an eco-friendly and more digitalized sector. However, small, and medium-sized enterprises (SMEs) face an uncertain landscape where standards and technologies may not always be mature or readily accessible. Furthermore, limited internal expertise and scarce financial resources often pose challenges in independently developing new technological solutions. One proposed solution is to adopt open innovation approaches. This qualitative research study employs a single case study approach, presenting insights from a small enterprise in the fashion industry specializing in label printing. Utilizing primary data sources such as multiple interviews with managers and secondary sources like detailed briefings of company meetings with technological partners and machinery suppliers, the study aims to shed light on the initial phase of an open innovation approach by SMEs amidst the challenges of twin transition. It highlights that the shift from internal RD& to open innovation is not a direct one, but an iterative one. Scholars will gain a deeper understanding of open innovation mechanisms within SMEs, while practitioners will gain insights into building innovation networks to navigate twin transition challenges.

Keywords: SMEs, Twin transition, Open Innovation, Case study

1. Introduction

In an era of globalized online shopping, the transparency and traceability of garments have become increasingly vital. The introduction of the "*digital passport*" for garments marks a revolutionary step in the fashion industry's journey toward sustainability and digitization. This digital document, accessible through QR codes, NFC, or blockchain technology, encapsulates the entire lifecycle of a garment—from the sourcing of raw materials to its final disposal. It provides comprehensive details such as the origins, manufacturing processes, environmental impacts, and recyclability of the product (*Forbes – 01-16-24*) The digital passport is not just an informational tool; it is a strategic response to the urgent need for an eco-friendly transformation within the fashion industry. Initiated by visionary leaders like Federico Marchetti and supported by an innovative collaboration under the Fashion Task Force, this initiative leverages technology to enhance consumer engagement and foster responsible production practices. By equipping consumers with detailed knowledge about their clothing's environmental and social footprint, the digital passport empowers them to make informed purchasing decisions (*Il Sole 24 Ore*).

When a company, particularly a small-to-medium enterprise (SME), faces a situation of uncertainty, it may begin to collaborate with customers and suppliers (Nieto and Santamaria, 2010). Choosing an open innovation approach represents both an opportunity for SMEs to keep pace with the challenges posed by the market (Van de Vrande, 2009), but also a criticality due to their limited formalization and smaller networks (Spithoven, Vanhaverbeke, and Roijakkers, 2012).

This paper, starting from the challenges posed by the twin transition and the opportunities offered by open innovation, aims to understand through which mechanisms small-to-medium enterprises transition from a closed to an open innovation approach. This is a phenomenon still scarcely explored in the literature, which merits the attention of both scholars and practitioners. To do this, a case study related to the fashion industry is presented, where the anticipated introduction of a digital passport for clothing presents many uncertainties for smaller firms. The paper provides a) a brief literature review on open innovation in SMEs b) a detailed

presentation of the methodology used c) the presentation of findings and their theoretical discussion. The paper concludes by providing directions for future research lines.

2. Literature Review

2.1 Open Innovation: SMEs vs Large Enterprise

In the realm of open innovation (OI), the comparative strengths and weaknesses of small and medium-sized enterprises (SMEs) versus large firms are nuanced and complex. Large firms enjoy resource advantages, and SMEs leverage behavioral strengths such as entrepreneurship and flexibility, which foster quicker decision-making and innovativeness (Narula, 2004). SMEs also adeptly align employee incentives with innovative efforts, enhancing their responsiveness to market opportunities (Holmstrom, 1989; Zenger, 1994). However, SMEs face significant challenges, primarily in accessing critical resources and capabilities for innovation (Hewitt-Dundas, 2006). Large firms, with their scale and scope advantages, are better positioned for innovations that demand specialized teams or sophisticated equipment, allowing them to amortize the fixed costs of innovation across higher sales volumes (Cohen and Klepper, 1996). In contrast, SMEs often struggle with technological resource acquisition, recruitment of skilled staff, and continuous employee training (Bougrain and Haudeville, 2002). The implementation of OI strategies also varies with the size of the enterprise. Large firms typically focus on R&D collaborations during the technology exploration phase, whereas SMEs emphasize the commercialization phase (Lee, 2010; Narula, 2002). SMEs can benefit from limited internal resources by engaging in vertical collaborations with suppliers and clients to innovate effectively (Nieto and Santamaria, 2010). As SMEs mature, they often adopt more formal structures to manage their innovation processes, gradually mirroring the structured and professionalized innovation approaches of larger firms (Vareska van de Vrande et al., 2009). Nevertheless, SMEs inherently face greater risks in engaging with OI due to their limited formalization and smaller networks (Spithoven, Vanhaverbeke, and Roijakkers, 2012). Larger firms generally make more extensive use of OI practices to introduce new products or services, benefiting from cost and time efficiencies sourced from external knowledge (Chesbrough, 006). Conversely, SMEs are adept at responding to market needs through organizational flexibility and less bureaucracy, though they are constrained by resource limitations (Cassiman and Veugelers, 2006). Interestingly, while SMEs may introduce fewer new products or services compared to large firms, their reliance on OI results in a significant portion of their turnover being derived from such innovations, effectively equalizing the impact of OI practices on both SMEs and large firms (Spithoven, Vanhaverbeke, and Roijakkers, 2012). This indicates that while large companies have superior absorptive capacity, the tangible impacts of OI practices on market introduction and turnover generation from innovations are comparable across firm size (ibidem)

2.2 Open Innovation in SMEs

Van de Vrande (2009) highlights that SMEs adopt OI to keep up with market developments, swiftly develop products, incorporate new technologies, and enhance their innovation processes and brand reputation. Additionally, Venturini and Verbano (2012) emphasize that SMEs seek external partners to compensate for internal skill shortages, integrate diverse competencies, stimulate creativity, and share risks and costs associated with new technological developments. However, the implementation of OI is not without challenges. Igartua, Garrigós, and Hervas-Oliver (2010) discuss barriers such as limited time and financial resources, and managerial issues. Muzzi and Albertini (2015), among others, point out that the limited size of SMEs often results in challenges like constrained cognitive capacities and lack of experience in collaboration, which are barriers to effective OI. Ahn (2017) and others further categorize these obstacles according to the types of OI—whether it involves acquiring knowledge (inbound OI), co-creation (coupled OI), or transferring knowledge (outbound OI). MEs face both internal and external barriers in adopting OI. Internally, common challenges include a lack of time, financial resources, expertise, and a culture resistant to openness (Grimaldi, Greco, and Cricelli, 2021; Lam, 2013). These internal barriers are also reflected in attitudes like the ‘not invented here’ or ‘not sold here’ syndromes, which can stifle innovation efforts (Chesbrough and Crowther, 2006).

Externally, SMEs struggle with finding appropriate partners, dealing with demand uncertainty, navigating legal ambiguities around intellectual property, and overcoming administrative burdens (Dziurski and Sopińska, 2020). The challenge of finding partners is compounded by issues like lack of social and cognitive proximity, which can hinder effective communication and collaboration (Albats, 2020). Granstrand (1997) noted the growing need for firms to possess multiple technological competencies due to the increased knowledge content in products and cross-fertilization of technology areas. Rajneesh Narula (2002) observed that firms are increasingly adopting non-internal technology development strategies such as strategic alliances and outsourcing, benefiting firms of all sizes. According to Cassiman (1999), Hagedoorn (2000), Bayona (2001), and Caloghirou (2003), technological

collaboration serves as a strategic mechanism to enhance technological capabilities, access new markets, secure public funding, and complete the innovation process. María Jesús Nieto and Lluís Santamaria (2006) stated, "Technological collaboration may be a good way to improve innovativeness of SMEs strengthening and complementing their lack of resources and capabilities." Narula (2002) highlighted that both large and small firms engage in R&D collaboration to shorten innovation time and access complementary technologies, but large firms are better positioned to form partnerships. Narula (2001) differentiated firms' decisions on internal versus external R&D based on the centrality of technological competence to their activities, with strategic competencies likely developed in-house and less critical ones through partnerships or outsourcing. SMEs weigh the use of non-internal means more cautiously due to their vulnerability and concerns over losing technological assets Narula (2001). Innovation partnerships stimulate SMEs' innovation capabilities, helping them overcome growth barriers due to limited resources and boosting their competitiveness (van Dijk, 1997). Nieto and Santamaria (2006) also suggested that technological collaboration can significantly enhance SMEs' innovation capacities, allowing them to bridge the gap with larger firms. Jill L. Sawers, Marthinus W. Pretorius, and Leon A.G. Oerlemans (2008) highlighted the potential hazards of collaboration for small firms, particularly the asymmetric nature of partnerships which often benefits larger firms more. They noted the importance of safeguarding strategic capabilities through formal and informal mechanisms to prevent unintentional knowledge flows to larger partners. They identified three main safeguarding mechanisms: market, bureaucratic, and informal social mechanisms, with trust playing a critical role in the success of partnerships.

As emerged from the literature review, scholars have long studied open innovation. The literature, however, appears to be still fragmented. Many studies focus on the antecedents and the outcome of OI in SMEs, however, the mechanisms that govern the change toward an open innovation approach are still quite unexplored in SMEs. This topic is becoming more relevant since European SMEs, particularly those working in the fashion industry, will be facing a huge challenge in adapting to the twin transition.

3. Methodology

The present study has been conceived as a descriptive single case study Yin (2014). The case study methodology is particularly fitting when research inquiries are open-ended and aim to dissect intricate phenomena (Yin, 2014), such SMEs shift towards open innovation. This research project has the main objective of understanding the complex dynamics that govern the change from a closed approach to innovation to an open approach to innovation. The unit of analysis is the single SME, taken as an object of analysis in the month through which open innovation has been pursued. The fashion industry has been set as the setting of the case for the challenges offered by the introduction of the "digital passport". Data has been collected from 8 interviews with managers of the firm (see Table 1); only decision-makers have been involved in the interviews. All the interviewees were interviewed in multiple rounds and semi-structured interviews were used. The first interview was used to understand the situation ex-ante, while a further round was used to deep dive into the relationships with the different external partners and the action that the company undertook to tackle the twin transition (i.e. digital passport). Interviews have been complemented with the verbatim transcript of 7 meetings with external partners and summary reports of other informal meetings. Data collected refers to a period of 12 months. Other materials have been collected to triangulate data (such as documents for a public call). The names of the companies involved in the meeting have been anonymized. This study will present an explorative analysis.

Table 1: List of meetings recorded and transcribed verbatim

REPORT MEETING		
DATE	**COMPANY**	**ATTENDEES FROM ITALIAN LABEL FACTORY**
24/07/2023	Blue	Sales manager and tech leader
24/07/2023	Black	Sales manager
13/10/2023	Red	Sales manager and tech leader
28/11/2023	Green	CEO
07/11/2023	Yellow	CEO
16/11/2023	Purple	CEO, sales manager, tech leader
21/11/2023	White	Sales manager

Table 2: Company description

COMPANY	DESCRIPTION
Blue	involved in making machinery for effective label weaving
Black	is part of the Arancione Group and is involved in the development of RFID technology implemented in the world of weaving and woven labels
Red	makes machinery for the packaging stage of woven labels (cutting, folding, and bagging)
Green	assembles weaving machinery by buying the various components (loom body, pavilion, etc...) from different suppliers which he then operates through the implementation of his own software
Yellow	offers a consultancy service in which its technical knowledge and contacts are made available to create a kind of partnership during which the client is assisted and supported in the process of conceiving, developing, and introducing an invention that is then filed with a joint patent
Purple	produces machinery for automatic labelling of different types of products, offering its expertise in electronics, logic, and software within a partnership with another company that instead supplies the mechanical and component parts
White	deals only with the trade and distribution of RFID microchips (even in small quantities)
Arancione	is a group within which several companies, operating in the textile supply chain, are included to offer all the products needed by garment makers and brands to carry out the final stage of garment making and customization
Azzurro	is engaged in microchip manufacturing by investing in research and development in the field of RFID technology
Rosa	oversees packaging and trading the finished garments that will then be sold directly to the end consumer

4. Case description

"*Italian Label Factory*" (anonymized name) is an Italian SME active in the textile sector of fashion and apparel, established in 1961, which has contributed to the disastrous environmental impact. Its core business is the production of woven ribbons and labels for garment packaging and customization.

On the customer side, *Italian Label Factory* is very active and involved in terms of innovation and collaboration, having a kind of internal R&D department made up directly of its own sales team. This team offers insights based on past work and leverages its skills and knowledge, working closely with customers to support them in the development of new products that better meet their needs (and potentially those of others as well). By combining multiple roles simultaneously (R&D and sales), the company avoids having a dedicated internal R&D department, saving resources, and increasing flexibility. On the supplier side, Italian Label Factory is less involved in terms of R&D, lacking the necessary skills to have a specific internal department but relying on its trusted and longstanding suppliers who propose new technologies and/or improvements that enhance the performance of existing machinery using feedback received from various customers. Although resources are saved by not allocating them to an R&D department, lacking any internal innovative competence poses the risk of becoming dependent on suppliers who can decide whom to provide their technologies/innovations to (including competitors).

The green transition to reduce the environmental impact caused by the textile sector is no longer postponable, and Italian Label Factory has always been very sensitive to these issues. Already in 2019, it implemented the use of recycled yarn proposed by the most avant-garde suppliers, but today, to be sustainable, it is necessary to have visibility and control over one's own production chain by tracking one's garments even after the sale, optimizing their disposal and recycling process. The digital passport encapsulates a multitude of opportunities by optimizing logistic processes and reducing the environmental impact of each garment. Being in 2024, the only risk is that of mistiming by moving too early in offering customers a more expensive product whose benefits they do not fully understand yet. Moving too late, they would lose the advantages linked to being the first to find a solution, risking having to comply with already registered patents.

5. Findings

To better understand the mechanism that led Italian Label Factory to open innovation, we read the data collected using a micro perspective and segmenting the transition from internal *R&D only* to open innovation in several phases:

Phase 0 – Uncertainty and open-innovation dilemma. Italian Label Factory finds itself in a context of high uncertainty where there are still no precise laws regarding the restrictions that will come into force from 2030 and the parameters to comply with them. To improve the global sustainability of the textile sector, it was thought to develop a solution that could reconcile RFID technology with classic woven labels into a single product and, through the traceability of garments, optimize the management of logistics and their disposal/recycling. From the beginning, it was necessary to determine whether it was better to develop a solution internally using one's own skills and contacts to fully enjoy the potential advantages or whether to collaborate through partnerships with suppliers and customers, with whom the potential advantages of developing a winning solution would also have to be shared.

Phase 1. The first approach to open innovation. Through discussions with Italian Label Factory's current machinery suppliers (Blue), it was investigated how they could support their project and how they were addressing the introduction of the digital garment passport.

> *"From the very first phone contacts with Blu, it was clear that it was not going to be as easy as we initially imagined" (Owner of Italian Label Factory).*

Having sensed the opportunity from the beginning, Italian Label Factory thought it could not develop a winning solution on its own: it contacted the main and historical supplier of weaving machinery, Blue, to commission a loom capable of weaving the label and simultaneously inserting RFID technology. Blue had abandoned the research and development of RFID technology implemented in classic weaving, ceding the dedicated division (Black) to the Orange group. Speaking with Black, they had patented with Orange a particular self-adhesive RFID to be applied to the back of the woven label as an interim solution.

Phase 2 – Back to a closed innovation approach. Managers from Italian Label Factory perceived feeling was that somehow, they wanted to disincentivize Italian Label Factory from working with them and adopt this kind of solution. The perceived hostility, however, convinced the company that they were moving in the right direction and that the self-adhesive solution is indeed currently feasible to meet the need for traceability of garments.

> *"We come back disappointed but at the same time we interpreted this hostility in wanting to share this new technology as a kind of increased awareness in the fact that we are moving in the right direction"(Sales manager of Italian Label Factory).*

Therefore, Italian Label Factory tries to invest internally with a closed innovation to develop a similar solution to offer to its customers.

Phase 3 – Towards an open innovation approach. The absence of an internal R&D department (supplier side) and any competence to develop a loom capable of reconciling the weaving of labels with RFID technology and knowledge in the field of RFID to develop an interim solution like the self-adhesive one, however, pushed Italian Label Factory to rely on Yellow, a consulting firm for innovations in traceability and logistics, which offers its technical knowledge and contacts to find the best manufacturers in the world to supply, accompanying and supporting the process of conceiving, developing, and introducing a new innovation to then file a joint patent.

Phase 4 – Building an innovation network. The contacts suggested by Yellow were abandoned and it was decided to share the project with more actors where each provides their skills, knowledge, technologies, and machinery to develop and offer this product to the final customer. The company understood that such a challenge should be addressed in a multi-partner open innovation network.

Phase 5 – Open-innovation: co-development of a solution. In the following months of meetings and ecological transition, Italian Label Factory has collaborated more by broadening its base of suppliers by turning for the first time to the direct competitors of Blue.

> *"I recalled that when I met with Green this summer during ITMA 2023, they mentioned something about the digital passport and the opportunity it represented for all players in the textile supply chain. Considering recent developments, I felt it was my duty to contact them and arrange a meeting as soon as possible" (Owner of Italian Label Factory).*

Green is a very innovative reality sensitive to the theme of the introduction of the digital passport having understood the potential, the limits of the self-adhesive solution, and the inability to develop a loom capable of weaving the yarn with the aluminum fiber antenna simultaneously. The collaboration was successful. The solution devised in collaboration with Green consists of weaving a tubular label with a small cut on the back that creates a sort of pocket inside which the RFID chip will then be mechanically inserted. This slit is then closed by sewing the label on the garment so that the chip does not come out separating from the garment during its useful life.

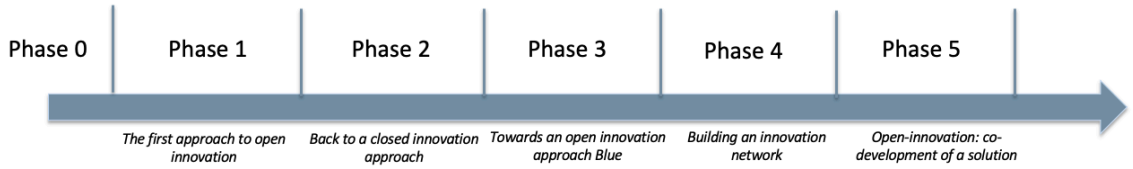

Figure 1: Project timeline

6. Discussions

This work, although exploratory in nature, sheds light on the mechanisms that lead an SME to adopt an open approach.

Nowadays textile companies are working in the same context that is described in the literature by Milliken (1987) when it comes to the concept of environmental uncertainty. These SMEs are experiencing a high level of environmental uncertainty due to the lack of critical information regarding the content of the regulations that will govern the use and introduction of the digital garment passport in 2030. Consequently, it's not possible to predict future events by regulatory forces ("*state uncertainty*"), and we as not able to understand what impact this innovation will have on companies ("*effect uncertainty*"), and which solution will be the most appropriate to adopt ("*response uncertainty*") between that of self-adhesive RFID and that with the tubular tag containing RFID (or another one not yet thought of). Therefore, companies in the textile supply chain remain in a stalemate where they are unable to make decisions since they do not yet know the standards to which they will have to adhere.

To reduce this uncertainty, as also explained by Schoemaker and Day (2009), Italian Label Factory keeps in constant contact with the actors in its supply chain leveraging extended networks to gather more information and scan weak signals about potential opportunities coming from the market and decides to change its approach by "*adopting multiple perspectives to get a better peripheral view".*

Italian Label Factory has changed its approach and, as explained earlier by Chesbrough (2003), has shifted from seeking a solution through close innovation in which it relied solely on its own internal R&D and its own strengths and resources, to an open innovation approach by relying on external information and resources by opening up to collaborations with other players in the supply chain with whom knowledge, ideas and technologies are shared so as to make up for the scarce resources in the innovation phase that distinguish SMEs from large companies.

Through this type of approach, as explained by Dahl and Moreau (2002), SMEs can compete in the market by finding better solutions than those sought by large companies through their R&D departments since they are the result of the vision and mix of skills and knowledge of several actors at once. This is the case of Italian Label Factory and the actors who participated in the partnership, who were able to develop a solution (tubular label with RFID inside the pocket) that was far better than that of the big industry giants (self-adhesive application of RFID on the back of the woven label) and able to meet the requirements of the introduction of the digital garment passport.

One of the most important contributions of this work in the academic literature is the explanation of open innovation in SMEs as a trial-and-error approach between closed and open innovation approaches. Moreover, it shows that this process is first guided by a more passive approach (*exploitation of the known partner*) and then by a more active approach (*scouting of a new partner).* We show that the transition from internal R&D to open innovation is not a linear process, but an iterative process that makes the company shift multiple times from closeness to openness and vice versa. Leveraging pre-existing knowledge ties and tackling hostility and

discouragement, searching for a partner appear to be the antecedents that led an SME to shift several times from internal R&D to open innovation.

From a practitioner's point of view, this paper offers interesting insight that managers could follow. It shows how building on existing ties could lead to hostility or discouragement in pursuing an open innovation approach and trying to stick to internal R&D. If the company locks in with this approach it will be not able to tackle new challenges. Moreover, it highlights how open innovation between companies that face similar challenges can lead to the development of new products, more effective than the ones offered by the market.

7. Conclusion, Limitations, and Further Research Avenues

This research paper achieves a dual objective. On one hand, by situating itself within the literature on open innovation, it confirms some of the evidence from both qualitative and quantitative studies concerning open innovation in small and medium enterprises (SMEs). On the other hand, it enriches the literature by exploring the mechanisms that enable a small firm to transition from a closed to an open innovation approach. Moreover, it utilizes the perspective of open innovation to understand how SMEs handle the twin transition, an emerging trend of great significance for both practitioners and scholars.

However, this study is not without limitations. Although the use of a single-case study is beneficial for understanding new phenomena, such as the twin transition in SMEs, future research could aim to broaden the sample of cases by a) extending the analysis to the fashion industry, considering other types of productive activities that will be impacted by the introduction of the “digital passport,” and b) expanding the analysis with a cross-industry perspective. It should be noted, however, that this case clearly represents the complexities and the climate of uncertainty that many small enterprises are currently facing. The data was collected over a 12-month period of the project conducted by Italian Label Factory. Although this time frame is sufficient to study the phenomenon in question—specifically the transition from a closed to an open approach—it would be interesting to conduct a longitudinal analysis that follows the company up to 2030 and the official introduction of the digital passport.

Business Model Innovation Toward Sustainability: A Case Study in Outdoor Fitness Equipment

Francesca Rossignoli
University of Verona, Italy

francesca.rossignoli@univr.it

Abstract: A novel competitive landscape requires managers to innovate business models. Drawing on a theoretical framework that classifies Business Model Innovations (BMI), the paper contributes to the literature studying business model innovation toward sustainability in outdoor fitness equipment (OFE). The OFE is an empirical setting worth investigating because emerging trends disrupt the fitness industry. The Pandemic has shifted how these firms deliver their services. The concept of wellness has evolved from "being in shape" to "achieving a well-being state," which includes mental, spiritual, and physical health. Differently from the pre-pandemic period, consumers' focus is on feeling better rather than looking better physically. Relying on a case study approach and using multiple semi-structured interviews, the paper offers empirical evidence of BMI in the OFE. The company innovated its business model (BM), embracing novelty and differentiation and moving from rethinking customer segmentation. Further, the case shows how BMI widens value creation toward a sustainable path, generating social and environmental value. The value chain and the company's ability to partner with its suppliers are pivotal. While the challenges generated by changes in customers' habits trigger the BMI, the suppliers' know-how and alignment with the company's value proposition drove the innovation toward a SBM. The paper contributes to the literature on BMI and SBM. The evidence allows future research to explore how partnerships among companies operating along the same value chain emerge for the sake of the BMI toward sustainability. Practical and managerial implications are offered.

Keywords: Business model innovation, Sustainable business model, Outdoor fitness equipment, OFE

1. Introduction

The fitness market was significantly impacted by the Covid-19 outbreak. Notably, the Pandemic has drastically changed how these firms do business. For instance, before the pandemic, gyms and clubs were at the top of the exercise industry hierarchy. In 2020, the consulting firm Deloitte reported that "clubs in Europe lost 15.4 percent of their members, or more than 10 million people, even when closures were relatively brief". Although they experienced a sharp decrease due to COVID-19 restrictions, the future expectations seem positive since "the gym and health clubs market share is expected to increase by USD 101.18 billion from 2020 to 2025". Moreover, as reported by the European Health & Fitness Market Report 2022 developed by Deloitte and Europe Active, the European fitness market is rapidly growing. In addition, the COVID-19 restrictions and lockdowns have forced many customers to adopt alternative workout methods, such as home workouts with zero equipment or with few home devices like the ones offered by Peloton or Mirror. Several studies showed a drastic change in consumer behaviour, confirming the increase of consumers' awareness about the positive impacts of fitness and wellness activities (Chow, 2013). Since a growing number of people prioritize their well-being, they are more engaged in physical exercise today than before. In fact, after the advent of the Pandemic, they have proved to be more inclined to improve their quality of life by adopting a healthier lifestyle. As the Mindbody 2022 Fitness report discussed, "just as 2020 created new paths to connection and wellness, 2021 reinforced the need to make those paths sustainable". The concept of wellness has evolved from being in shape to achieving a well-being state, which includes mental, spiritual, and physical health. Differently from the pre-pandemic period, the consumers focus on feeling better rather than looking better physically. Notably, the main reasons consumers focus more on wellness are to improve their health status, live a long and healthy life, and, finally, be healthy to enjoy life. Consequently, many trends have occurred in the last couple of years. According to the American College of Sports Medicine (ACSM), many new fitness trends have emerged after Covid-19. In 2021, the "Worldwide Survey of Fitness Trends", annually conducted by the ACSM's Health & Fitness Journal, established the following main emerging trends: online training, wearable technologies, bodyweight training, outdoor activities, high-intensity interval training (HIIT), virtual training, exercise is medicine, strength training with free weights and fitness programs for older adults. Because of the impossibility of working in physical gyms and clubs, people relied on other workout methods, like online live, on-demand exercise classes, and health-wellness coaching. Consequently, there has been a proliferation of fitness Apps that offer live and on record virtual classes. Further, the demand for fitness has expanded toward a new target customer: older adults. More precisely, one of the most interesting target ages is the Silver Age, which ranges from Baby Boomers (people born in the United States and Western Europe between 1946 and 1964) to Over 70. It is common knowledge that the population-aging phenomenon is increasing worldwide.

Consequently, the market size is drastically growing because of demographic reasons; further, people in the Silver Age are characterized by a higher expenditure capacity than the younger age groups. As the London Business School estimated in 2021, the expenditure capacity of over 50-year-old people in the United States accounts for USD 7.1 trillion per year. However, in 2032 the expectation of the same spending capacity for the same target age is estimated at USD 13.5 trillion per year. Therefore, the Healthy Longevity market represents a very good investment opportunity for businesses in the fitness sector. Finally, given new emerging trends and customer targets, businesses must understand how to include them in their business strategy.

Emerging trends are disrupting the fitness industry. In this regard, the novel competitive landscape requires managers to redesign business models. To compete, fitness firms must rethink, reinvent, and reorganize the ways in which they create, deliver, and capture value through their business models. In this competitive landscape it is essential for companies to innovate business model. Prior literature show that business model innovation (BMI) is a key leverage for companies to gain and sustain their competitive advantage (Bashir and Verma, 2017). Although BMI has been analyzed from many perspectives (Wirtz et al. 2016), there is still uncertainty about the BMI components. The discussion around BM innovation, even respect to BM imitation, remains an open research area (Montemari et al., 2024). Among the multiple conceptual framework provided by prior literature, this research relies on the Triple Layered Business Model Canvas (Joyce and Paquin, 2016) to provide empirical evidence about how a business model is innovated toward sustainability in the aftermath of the Pandemic emergency.

Relying on a case study approach and using multiple semi-structured interviews, the paper offers empirical evidence about the changes implemented by a company operating in the OFE to innovate its business model toward sustainability. Empirical evidence shows how BMI widens value creation toward a sustainable path, generating social and environmental value. The paper provides theoretical conceptualizations of BMI that can be extended to different industries for future research. Practical and managerial implications are offered.

2. Literature Review and Research Questions

Research has shown that business model innovation (BMI) is a key leverage for companies to gain and sustain their competitive advantage (Bashir and Verma, 2017). BMI aims to create new pathways of value creation that are sufficiently radical to change the existing competitive landscape (Barnes et al., 2024).

BMI has been analyzed from many perspectives (Wirtz et al. 2016), including types of innovation (Taran, Boer, and Lindgren 2015), BM innovation processes (Holtström 2021; Taran, Boer, and Nielsen 2022), and enablers and barriers to BM innovation (Mateu and March-Chorda 2016). The BMI literature is recent, rapidly growing, and untheorized (Foss and Saebi, 2017; Montemari et al., 2024). The concept and the theoretical rationalization of BMI components still need more elaboration (Shakeel et al., 2020). This research is positioned in the BMI literature that classifies BMI, relying on the conceptual antecedents of BM (Foss and Saebi, 2017). BMI is clarified as a drastic transformation of existing BM (Adams et al., 2016). With respect to BM, BMI introduces the additional conceptual dimension of innovation thus raising additional theoretical and empirical questions to those already posed in the BM literature. Prior literature highlights that innovation might involve different levels of newness: new to the world, new to the industry, and new to the company (Garcia and Calantone, 2002; Montemari et al., 2024). This research explores the newness at the company level and aims to provide empirical evidence to answer the following research question:

RQ1. What changes are innovating the BM of a company operating in outdoor fitness equipment?

Sustainability is an ethical choice and a response to a specific market demand from customers requiring sustainability practices (Mannien et al., 2024; Kurek et al., 2023). Recently, the increasing focus on BM is due to sustainability issues (Rossignoli and Lionzo, 2018). Sustainable development occurs through new business ideas and BM innovations (Bocken et al., 2014; Hart and Milstein, 2003; Schaltegger et al., 2012; Stubbs and Cocklin, 2008) with the aim of combining sustainable value and value innovation while keeping the spirit of the business model (Shakeel et al., 2020). The business model for sustainability 'incorporates sustainability as an integral part of the company's value proposition and value creation logic' (Abdelkafi & Täuscher, 2016, p. 75). The literature offers different classifications of the available kinds of sustainable business models (Lüdeke-Freund et al., 2018). However, the research agenda remains wide, leaving room for further investigations (Najmaei and Sadeghinejad, 2023). Within sustainable business model literature, studies identifying sustainable value-creation elements is still fragmented (Mannien et al., 2024). The triple-bottom-line approach is a well-acknowledged framework the literature is referring to when studying sustainable business models (Dhir et al., 2023). Joyce and Paquin (2016) conceptualize sustainable business models (SBMs) according to the

Triple Layered Business Model Canvas (TLBMC), which illustrates an implementation of the Business Model Canvas (BMC) towards a sustainability perspective. The most widely used Osterwalder and Pigneur (2010) canvas adopts an economic approach, but it lacks a sustainability perspective. In this respect, the TLBMC helps to visualize how business model innovation can be developed toward a sustainable perspective. TLBMC enlarges the original BMC by adding two layers: environmental and social. The environmental layer is based on a lifecycle perspective, and the social layer is based on a stakeholder perspective. The TLBMC provides a holistic view of how the firm can generate value for itself and its stakeholders. Furthermore, it details the shift toward a circular model, which offers enormous opportunities, including cost saving through waste reduction, better supply chain management, lower sensitivity to resource price volatility, and longer, better customer relationships. Drawing on the TLBMC, I empirically explore how the pressure toward sustainability shapes the BMI, attempting to answer the following research question:

RQ2: What are the changes toward sustainability in BM of a company operating in outdoor fitness equipment?

3. Methodology

This paper is based on a case study design (Yin, 2009). Prior studies acknowledge lack of rigorous, theoretically guided and empirically based approaches in research on BM (Zott, Amit and Massa, 2011). I use an inductive methodology to enable the development of theory about BMI (Yin, 2009).

My evidence is drawn from the study of a company operating in the OFE industry: MyE. The name of the company is fictitious for the sake of anonymity. Three major sources of data were used. First, available sources such as the company websites, updated catalogs, annual report and correlated articles. Second, qualitative data was gathered during the “Move City Sport 2022” event, which was held in Bergamo in October 2022. Lastly, I collected information from multiple semi-structured interviews with MyE’s founder and the top managers. I coded and analysed the interviews, focusing on the components of Triple Layered Business Model Canvas (Joyce and Paquin, 2016). Second, a within-case analysis was developed to elucidate the drivers that led to BMI (Yin, 2009). Iterating between theory and the case analysis clarified the theoretical argumentation (Eisenhardt, 1989).

4. Findings

To address RQ1, it is helpful to understand the decision-making process followed by MyE's top management to innovate its business model (BM).

To address the proliferation of several new fitness trends that emerged with COVID-19, the company had to meet novel consumer needs and behaviors in the OFE. Even before the Pandemic, the market demand for OFE started focusing on realizing “wellness projects” rather than selecting a mix of single products. MyE’s top management formed a system containing “their mindsets related to the key business ideas, and their unique view of the business” (MyE’s CEO interview). As a result, in 2020, MyE started designing international projects to create “public wellness projects”. To achieve this, the company sought to enlarge its target customer end-user by embracing an inclusive approach. The choice to embrace inclusiveness was carried out with the awareness that the business strategy needs to be dynamic to follow the external environments. Unlike the competitors, MyE decided not to move indoor fitness equipment to outdoor spaces but instead to create a new environment of equipment that is essentially different from indoor tools. For example, the brand decided not to produce cardio equipment since the aim is to lead people to do cardio by exploiting outdoor areas. Consequently, the workout type was born to be instinctive and based on body weight rather than on moving outside indoor gym weights. In response to changes in the firm’s external environment, the CEO expanded its product lines and provided a 360-degree outdoor fitness experience.

Furthermore, MyE brought a new value proposition that prompt people to pursue an outdoor fitness lifestyle. In doing so, it developed the first artistic and design concept for outdoor fitness worldwide and introduced the concept of functional sculptures. According to it, the fitness products integrate into the outdoor context with a strong artistic sense that combines art, design, and fitness. The idea's implementation was made possible thanks to the industrial know-how of the main industrial partner, who has 30 years of urban design experience and MyE’s top management know-how, which gave the knowledge derived from 20 years of experience in the fitness industry.

The new customers’ needs were addressed in two ways: i) revisiting the customer segmentation, adding new categories of target customers, and ii) revising the products to combine functionality with beauty in both public and private spaces. MyE's business model employs radical innovation in the industry, including novelty

and differentiation. The innovation of the business model follows the "focused BMI" typology (Foss and Saebi, 2017). Innovation is "focused" for two main reasons. First, the new BM is a novelty to the OFE industry because it is one-of-a-kind in the overall OFE competitive landscape. Second, the innovation is "modular" because it changes only one component rather than the whole BM architecture. Specifically, MyE decided to serve new customer targets, extending its product to the public segment. MyE's focuses on extending the new outdoor fitness experience in the following segments: corporate, academic, hospitality, residential, mall, convention center, cruise, and private.

Consequently, introducing a novel target customer set has drastically changed how MyE does business. Furthermore, creating product lines dedicated to athletes and non-athletes has required much investment. The development of products required significant expenses in terms of R&D. The realization of those products was made possible thanks to a highly skilled workforce, design skills, and accurate designs. Moreover, the product development was done by external consultants who have contributed to the project. Additionally, all those products cannot be easily imitated thanks to the legal protection of patents.

To address RQ2, it must be pointed out that MyE sells luxury fitness equipment. Like other luxury brands, it aims to reshape its BM sustainably. A few decades ago, "luxury" was defined as a status symbol since it related to exclusivity. However, the approach has now changed toward a new value-creation perspective. Luxury embraces environmental and social issues to promote the community's well-being. Accordingly, MyE BM turned to sustainability generating superior customer value and contributing to the sustainable development of society.

The company decided to operate "to reduce adverse external effects and create new positive external effects for the environment and society" (MyE's CEO interview). MyE's products are considered durable and long-lasting and projected to be environmentally friendly.

Starting in 2020, MyE lays its foundation on three main values: inclusivity, which allows everyone to do outdoor workouts; aesthetics, which enhances the outdoor areas with art and design; and, finally, Italian craftsmanship, which translates into great technical work.

In the triple bottom line approach Joyce and Paquin (2016) used to conceptualize the sustainable business model, the environmental layer describes how the organization generates more environmental benefits than environmental impacts. The fitness-wellness industry is characterized by many emissions, especially from raw materials processing and transportation. MyE's set the goal to reduce carbon emissions in all value chain stages. MyE operates using an eco-friendly manufacturing process. Since 80% of total carbon emissions derive from raw materials, MyE has carefully evaluated the selection of its raw materials to be environmentally friendly. The selected materials are considered a fundamental component of its product lines, which can be defined as green or sustainable because of their long lifespan, but, most of all, because of the absence of plastic components. All products are eco-friendly since they are 100% plastic-free.

Further, they can be distinguished into two typologies, ranging from "born green" to "made green" materials. The former regards materials derived from nature, such as wood or marble. The latter is formed by materials that have been given a second life by mixing recycled materials. For instance, components are mostly made of recycled pieces. In so doing, MyE employs a recycling process for almost all its finishing. This specific manufacturing practice allows to reduce material waste significantly. Furthermore, the leading industrial partner has "always demonstrated a strong focus on corporate social responsibility through constant research in new technologies and materials and by making conscious design choices".

The company uses energy from 100% sustainable sources for the manufacturing process. Since 2009, it has engaged renewable energies using a technologically advanced processes plant. MyE started to create renewable energy, which allows it to cover most of its energy needs. The company provides clean energy thanks to its photovoltaic system, which has over 7500 solar panels installed on its plants' rooftops. The adoption of solar energy is translated into reducing more than 850 tons of CO_2 per year in the environment. In short, the company lowered its material waste and carbon footprint.

From a social perspective, all OFE firms deliver social sustainability because their core business is creating social value and promoting consumer health and well-being. The OFE can positively affect society by improving physical activity and public spaces (Chow et al., 2021). Outdoor fitness training benefits people's physical condition by improving blood pressure, physical fitness, and quality of life (Chow, 2013). In the public context (B2G), OFE creates a space where people can socialize while meeting their fitness goals. Meanwhile, in the private context (B2B and B2C), they can enhance the public health status of individuals. Although most OFE

firms mainly operate in the B2G market segment, MyE delivers social value in many customer segments. Indeed, it seeks to create social value by offering fitness solutions for a multi-target end-user. More specifically, the brand's functional and innovative fitness solutions are conceived to guide people to pursue a healthy lifestyle. Additionally, the business strategy aims to create an outdoor wellness community. Specifically, its mission focuses on improving "interactions between people and creating the right conditions for socializing, working, playing sports and having fun" (MyE's CEO interview).

MyE has always complied with national health and security laws for the sake of its workforce. Workplace accident prevention procedures are in place to ensure the safety and well-being of the employees. Recently, MyE has embraced a health policy, setting the standards for protecting and ensuring employees' and operations' well-being. The policy covers all the employees, and accountability lies with the Board of Directors.

MyE states it offers equal opportunities regardless of ethnic background, race, religion, age, gender, disability, sexual orientation, outlook, or social status. However, the male component of MyE's workers is much larger than the female one. This is due to the difference in the job assignments, which is driven by maximizing individual personal skills.

MyE has fostered charity groups. For instance, the community of people who train in Miami has felt obliged to give something back to the city by organizing solidarity activities every month around one of MyE's most iconic facilities. Furthermore, the company has recently addressed social inclusiveness in its projects. Given the goal of creating healthier communities, the brand offers parks to outdoor wellness experiences, allowing every kind of user to enjoy public spaces free of charge. Finally, it also creates value for the city itself. For instance, a study in Los Angeles outlines that "parks in Los Angeles installed with OFE attracted new visitors and stimulated increased physical activity". Thus, the company contributes to the requalification of urban areas by creating a place where people can work out and connect.

5. Conclusions

The theoretical rationalization of BMI components is still undefined (Shakeel et al., 2020) and attracts academic research and professional interest. With respect to BM, BMI introduces the additional conceptual dimension of innovation, thus raising additional theoretical and empirical questions to those already posed in the BM literature. This research moves from the BMI literature that classifies BMI relying on the conceptual antecedents of BM (Foss and Saebi, 2017) and relies on the Triple Layered Business Model Canvas (Joyce and Paquin, 2016) to provide empirical evidence about how a business model is innovated toward sustainability in the aftermath of the Pandemic emergency.

Relying on a case study approach and using multiple semi-structured interviews, the paper offers empirical evidence about the changes implemented by a company operating in the OFE to innovate its business model toward sustainability.

Empirical evidence shows that the innovation of the business model was triggered by the changes in the customers' needs and habits. The BMI took place in two directions: novelty and differentiation. Novelty refers to the new customer targets, as the company revolves towards additional customers, such as corporate, academic, hospitality, residential, mall, convention center, cruise, and private. Differentiation refers to the product's renewal to combine functionality and beauty.

The pressure toward sustainability resulted from changes in the customers' needs, which triggered a turn in the value proposition. It evolved from selling fitness equipment to providing equipment to achieve a well-being state that includes mental, spiritual, and physical health. The case shows how BMI widens value creation toward a sustainable path, generating social and environmental value.

The study has the potential for many contributions. First, the study contributes to the theoretical conceptualizations of BMI, showing that innovation may be triggered from only one BM component, generating a cascade of effects in the whole BM architecture. Furthermore, the study contributes to the literature investigating SMB, revealing that the value chain pressures and the company's ability to partner with its suppliers are pivotal in pursuing SBM. While the challenges generated by customer habits and needs changes triggered the company to rethink its offer, the suppliers' know-how and alignment with its value proposition drove the innovation. The product renewal was possible thanks to the partnership between the company and its suppliers, who share a common value proposition besides the contractual agreements.

Second, the paper contributes to the studies investigating OFE's benefits, showing that besides the physical well-being of many users (Chow et al., 2020; Chow, 2013), OFE constitutes a profitable business in the fitness

industry. The increasing demand for OFE feeds the evolution of extant businesses and generates incoming wealth for suppliers along the value chain.

The generalizability of the study is granted by the robust adherence to the case study (Yin, 2009) methods widely used in qualitative studies. However, the study is not exempt from limitations as it relies on a single case study. Further research might extend the evidence by comparing multiple studies in the same industry.

Practical and managerial implications are offered. The case shows that innovating a BM strongly depends on the top management's choices. Leaders' attitudes toward changes and firm flexibility represent favourable conditions for BM innovation. In this case, the CEO's attitude toward open innovation was pivotal in driving the decision-making inside and outside the company involving the supplier in a quasi-network partnership.

Future research shall explore further how these relationships emerge and evolve for the sake of the BMI.

The Role of the Inclusive Leader in Driving Innovation: An Example of a Teal Organisation

Agnieszka Rzepka
Department of Economics and Economic Management, Management Faculty, Lublin University of Technology, Poland

a.rzepka@pollub.pl

Abstract: The role of the leader is to create change and indicate the direction in which the organisation should go. Leader is the one who inspires, creates the organisational culture and builds emotional relationships that result in a much more effective company. His or her activity also influences the level of innovation in the company - the more inspired a co-worker perceives a leader and the greater his or her capabilities and freedom of action, the greater the chance of creating newer or even revolutionary solutions. The author's research has shown that the role of a leader in an innovative organisation cannot consist only in creating and promoting a vision, and then inspiring others to make it a reality. It can be concluded that the period of feisty and charismatic visionary leaders is slowly passing into oblivion, and their place is being taken by leaders who are able to discover and unleash the creative potential of the entire team in their talented colleagues. Amidst the evolving landscape of businesses, there is a growing focus on identifying key traits of leadership essential for effective organizational change. It is advocated that every organization should draw on these traits to innovate its employee resources. The presented results show the results of four years of research within the framework of the project entitled Teal Organisations: developing self-management and entrepreneurial culture in the age of Economy 4.0. The research shows how the understanding of innovation, the role of leadership has changed over several years and what research gaps are emerging. The research targeted micro and small enterprises in the family business sector. Insights from the third stage conducted in 2023 shed light on the qualities and competencies of leaders. The study's findings highlight that leadership fosters better team outcomes through enhanced decision-making and collaboration. Our research shows, that leaders are required to acquire, develop and refine the skills of facilitating the work of a team to effectively and continuously generate innovation. The leader must master several skills, i.e. knowing the tools of creative team work, allowing the free flow of information, the ability to integrate ideas in order to create a new, better idea, so that the valuable ones do not get diluted and are qualified for further innovative work through well-considered decisions.

Keywords: Leader, Innovation, Teal organisation

1. Introduction

1.1 Leader (Inclusive)

Leadership, as defined in literature, encompasses distinct features and competencies crucial for effective functioning within a specific environment (Pasieczny, 1981; Chmiel, 2003). Key traits outlined by authors such as Kirkpatrick, Locke, Zaccaro, Kemp, and Bader include determination, motivation, responsibility, self-confidence, cognitive abilities, extroversion, emotional and social intelligence, openness, self-control, problem-solving skills, and compliance. What is more, leaders play a pivotal role in change initiatives thanks to their ability to influence employee reactions and provide clarity, connection, and accountability (Kurtessis et al., 2017; Van Buren, Greenwood, & Sheehan, 2011). Establishing respect-based relationships where employees' needs are acknowledged and met (Travaglione et al., 2017) fosters managerial support, facilitating communication and strategic decision implementation (Dasgupta, 2015).

Inclusive leadership fosters collaboration and innovation by inviting employee participation in goal-setting and decision-making processes (Bilińska-Reformat, 2011). It creates an environment where individuals from diverse roles contribute to identifying sources of innovation and engage in trust-based, joint decision-making (Garita, Martinez, 2016).

1.2 Innovation

The issue of innovation has been present in the literature for a long time, but in recent years it has been increasingly considered in the context of the dynamic changes that are occurring in the organization's environment and the need to adapt to them. Despite the fact that since the time of Schumpeter, considered the founder of the concept of innovation and viewing it as the creation of new combinations of existing resources (Schumpeter, 1934), many new definitions have appeared (e.g. OECD/Eurostat, 2009; Mulgary & Albury, 2003; NAO, 2009; Damanpour & Schneider, 2009; Kogabayev & Maziliauskas, 2017), what is invariably emphasized is that their essential component is creativity (e.g., Seaden & Manseau, 2001; Cropley et al, 2011; Meutia et al., 2018). Currently, in its most basic form, innovation is defined as any change that results in a benefit. In practice, innovation is associated with a series of activities aimed at creating entirely new or significantly improved

products, processes, or systems. It is often assumed that innovation occurs when a particular solution has never been used before, at least in the context of a particular company. What is important when it comes to innovation is that, in recent years, a variety of conceptual frameworks have emerged to offer a better understanding of the factors that contribute to and promote innovation (Hosseini & Azizi, 2020).

Roy & Mohapatra (2023) see creativity as one of the components of the triad (along with culture and innovation) recognizing that rootedness and cultural grouping moderate the relationship between creativity and innovation. Ek Styv´en et al. (2022) conclude that the opportunity to be creative and innovative at work is an important driver for employees to stay with their current employer, similarly, Rzepka & Sabat (2022) find that creative behavior leads to innovation.

2. Methodology

The research used in this article is part of another research project under the name of "Teal organisations in Economy 4.0". The project involves conducting research in Poland and in selected countries of the world (USA, Georgia, Slovakia, Brazil, England, Romania, Czech Republic, Ukraine, Spain). The research is conducted in stages and includes a pilot study, core research and repeat research. The research has been and will be conducted using the principles and standards developed by the OECD - DAL (Development Assistance Committee - Networking on development evaluation). The research included a preliminary phase and three subsequent stages. It involved 622 respondents and employed CAWI and CAPI methods in accordance with OECD-DAL recommendations. Random sampling targeted Polish enterprise employees. Statistical analyses utilized the Cronbach alpha test, ANOVA method, and F test (Fisher-Snedecor) with SPSS STATISTICA software. The choice of countries is based on the availability of studies and is random.

The aim of the analysis was to record and specify those characteristic features of the surveyed companies that differentiate the level of subsequent indicators. For this purpose, a one-factor variance analysis was used as a method to verify the hypotheses. The null hypothesis with equal average values for the general population was verified by the F-test (Fisher-Snedecor). The application of this test was possible because the calculated indices could be considered as continuous variables with distributions close to normality (at the materiality level $\alpha = 0.05$) based on the results of the calculations performed with the Kolomogorov-Smirnov test. A Alpha Cronbach test was carried out to verify the reliability of the questions concerning the surveyed companies. The above tests made it possible to determine the variables for which there are statistically significant correlations.

Table 1: Scope of business activity

		Pilot	I stage	II stage	III stage
Predominant mode of the company's operation (%)	Commerce	19.7	10.3	16.6	13.4
	Production	17.6	13.9	28.0	21.8
	Services	62.7	75.8	55.4	64.8
Scope of the company's activity (%)	Local	19.3	22.1	9.4	19.2
	Regional	8.2	12.4	27.3	26.3
	National	30.0	23.0	22.0	23.0
	International	42.5	42.4	41.3	31.5
Number of employees (%)	0-9	13.7	9.1	3.3	5.1
	10-49	24.0	18.8	55.1	37.6
	50-249	15.5	28.2	16.6	21.6
	250 - 999	18.5	20.9	16.6	14.9
	1000 - more	28.3	23.0	8.4	20.8

Source: Own research

The research hypothesis posits that an inclusive leader, characterized by humility and vision, effectively unites and motivates employees. Humility lends credibility to their actions, while vision is crucial for long-term organizational success. The study focused on top-level employees from family businesses, with the majority

employing up to 50 individuals (68.3%) and operating nationally (42.5%). During the study period, 11.4% represented IT companies, and 39.6% were from the hotel industry.

3. Variables Adopted for Research

Table 2: Basic descriptive statistics of the characteristics selected for research

		Mean	Me	Mo	N_{Mo}	Min	Max	Standard deviation	IN_{With}
Although leadership skills help in this position, well-developed interpersonal skills are essential to properly carrying out group tasks	Y	4.27	4	4	112	2	5	0.75	17%
Knowledge	X_1	4.30	4	5	118	1	5	0.79	18%
Vision	X_2	4.26	4	4	115	1	5	0.78	18%
Humility	X_3	4.26	4	5	117	1	5	0.83	19%
Courage	X_4	4.27	4	4	112	1	5	0.77	18%
Honesty	X_5	4.44	5	5	141	1	5	0.74	16%

Source: Own research. Me – median, Mo – modal, dominant.

The respondents rated honesty (4.44) and knowledge (4.30) highest, while vision and humility scored the lowest (4.26). The Spearman rank correlation table reveals the relationships between the variables. The strongest correlations with the variable Y are found with courage (0.62) and humility (0.58), followed closely by knowledge (0.57).

Table 3: Spearman rank correlation matrix

	Y	Knowledge	Vision	Humility	Courage	Honesty
Y	1	0,57	0,54	0,58	0,62	0,47
Knowledge	0.57	1	0.62	0.60	0.61	0.64
Vision	0.54	0.62	1	0.56	0.63	0.56
Humility	0.58	0.60	0.56	1	0.61	0.58
Courage	0.62	0.61	0.63	0.61	1	0.52
Honesty	0.47	0.64	0.56	0.58	0.52	1

Source: Own research

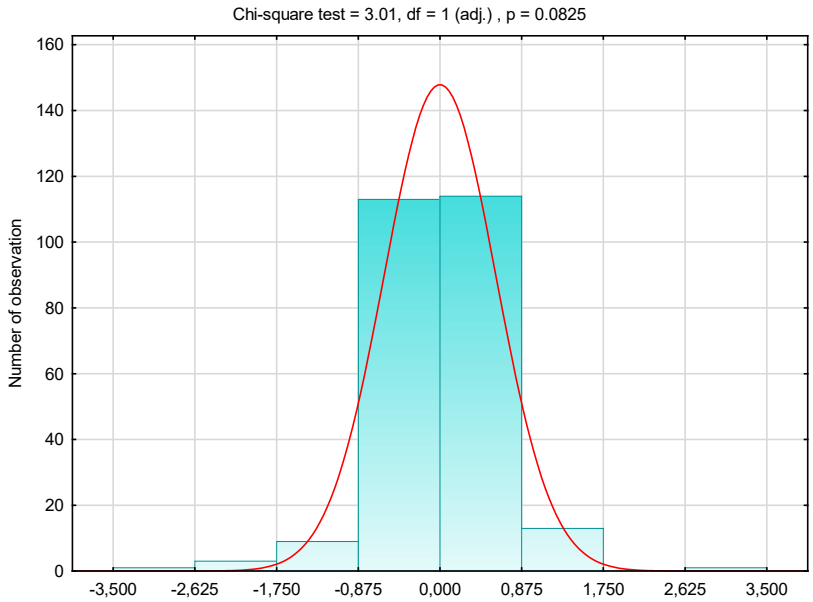
Based on the selected set of potential explanatory variables, three models were constructed. The first is basic for all respondents, while the other two are for men and women separately.

4. General Model

The results of the regression analysis for the base model are presented in Table 4. The research reveals that two statistically significant variables entered the model: courage and humility. The model demonstrates a 36% fit to the data. The multiple correlation coefficient R is 60%, with a standard error of estimation of 0.60.

Table 4: Estimation results for the base model

	b*	Std. error with b*	b	Std. error with b	t(251)	p
Intercept			1.582	0.230	6.886	0.000
Courage	0.407	0.063	0.398	0.062	6.425	0.000
Humility	0.259	0.063	0.232	0.057	4.085	0.000



Source: Own research

The model can be expressed as:

$$Y = 1.582 + 0.398X_4 + 0.232X_3$$
$$(0{,}230) \qquad (0{,}062) \qquad (0{,}057)$$

If the courage rating increases by 1 point, the leadership ability rating increases by 0.898 points. For every 1-point increase in humility score, the leadership ability score increases by 0.232 points.

The normality of residuals, a fundamental condition for a properly constructed model, was assessed. The analysis reveals that p>α with p=0.0825, indicating no grounds to reject the null hypothesis of a normal distribution of residuals. Therefore, the model is constructed correctly. Figure 1 illustrates the examination of the normal distribution fit.

Source: Own research

Figure 1: Normal distribution fit – residuals of the base model

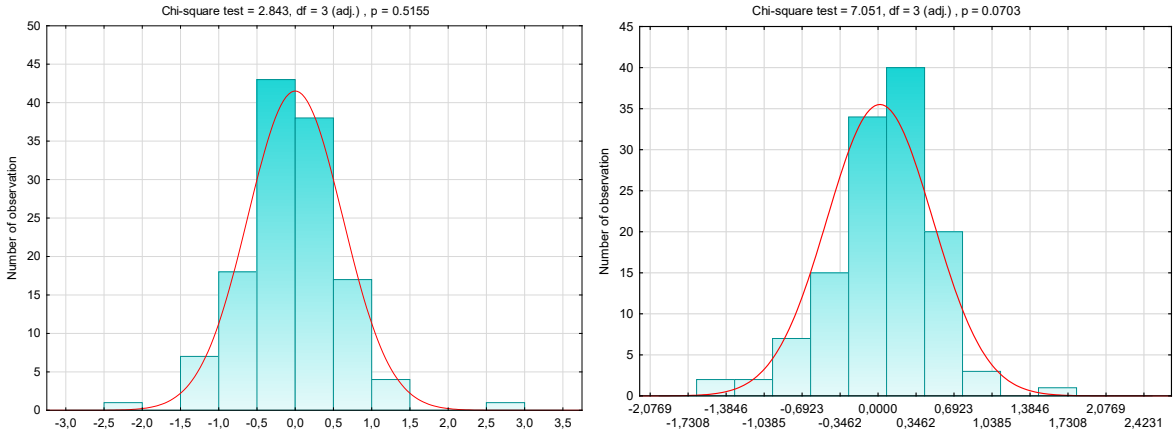


Table 5: Estimation results for the model for men and women

Men						
	b*	**Std. error**	**b**	**Std. error**	**t(126)**	**p**
		z b*		z b		
Intercept			1.921	0.299	6.421	0.000
Courage	0.322	0.095	0.290	0.086	3.389	0.001
Humility	0.308	0.095	0.261	0.080	3.244	0.002
Women						
	b*	**Std. error**	**b**	**Std. error**	**t(122)**	**p**
		z b*		z b		
Intercept			0.445	0.345	1.290	0.200
Courage	0.427	0.071	0.472	0.078	6.034	0.000
Knowledge	0.414	0.071	0.416	0.071	5.850	0.000

Source: Own research

Summarizing the regression results, leadership skills support men in their roles, yet strong interpersonal skills are essential for effective group performance (R=0.569, R^2=0.324, Corr.R2=0.313; F(2,126)=30.211, p<.00000, SE=0.625, v2=1). Similarly, for women, leadership skills aid in their roles, but developed interpersonal skills are

crucial for group tasks (R=0.718, R^2=0.516, Corr.R2=0.508; F(2,122)=65.025, p<0.0000, SE=0.519, v2=2). Figure 2 depicts the distribution fit for both groups.

Source: Own research

Figure 2: Normal distribution fit – model residuals for men and women

5. Findings

As mentioned before, leadership involves influencing individuals to achieve goals. While 44.2% somewhat agreed and 34.7% strongly agreed that "a good leader should foster independent thinking and accountability among subordinates," only 2.1% disagreed, with 18% undecided. Notably, 78.1% agreed that "in relations with subordinates, a leader should act as a mentor, providing guidance and advice without taking over." Additionally, over 70% (39.2% and 38.1%, respectively) agreed that "a leader should have the knowledge to manage teams, projects, and processes effectively."

The findings show strong support for key leadership traits: "vision" and "humility". Over 70% of respondents (38.9% and 37.9%, respectively) endorse vision's ability to inspire action, while over 76% advocate for humility's importance in admitting mistakes. Effective leaders value, support, and empower their employees, motivating them to work hard and supporting them in times of need. They possess all the necessary qualities to effectively manage a team. An inclusive leader possesses specialized skills, including knowledge, acquired qualifications, innovative abilities, creativity, and analytical thinking (Rzepka et al., 2023). Interpersonal skills are paramount for team cohesion; even with strong managerial qualifications, ineffective communication can hinder success. Effective guidance from a manager is vital for achieving team goals. Minimal standard deviations across responses in Table 1 (ranging from 4.05 through 4.09 to 4.11) indicate a high level of consensus.

Research also highlights that a leader's effectiveness hinges on learnable skills that can be continuously honed, irrespective of inherent traits. Leaders should excel in social competencies for effective team leadership, including communication, active listening, feedback provision, goal motivation, positive self-presentation, problem-solving, and assertive behavior. An effective, inclusive leader is visionary, entrepreneurial, and adaptable to change.

6. Discussion

The results of the conducted analyses confirm the formulated research hypothesis: an inclusive leader embodies humility and possesses a long-term vision. These qualities enable the leader to foster connections among employees and foster partnerships between them, particularly crucial in the context of diversity management within family businesses.

As demonstrated, an inclusive leader should embody humility and vision. However, inclusivity in leadership is not solely defined by specific personality traits; it also encompasses the characteristics of the task situation and behaviors that can be acquired through knowledge and observation of role models (Jawad and Ozbilgin, 2015). Nevertheless, not everyone possesses the inherent traits to become a leader. Individuals with attributes such as intelligence, courage, decisiveness, eloquence, and personal refinement are predisposed to assuming leadership roles within an organization. The personality traits, leadership style, experience, and organizational knowledge of leaders all have an impact on their effectiveness.

Team members may not know their roles and responsibilities and struggle to work together effectively without a leader. Rzepka's study has confirmed that the majority of respondents (90 percent) see a leader's organizational skills as the most desirable, as they help organize a team's work. Employees frequently experience confusion, according to Ind and Watt (2004), when there is no leader to provide direction. In such cases, projects can quickly fall behind schedule, and the quality of the work may suffer. It is safe to say that there is a consensus that leaders are responsible for setting goals, providing direction, and ensuring everyone works towards a common purpose (Levis & Mills, 2018). Good team leaders must also be able to listen to feedback from their team members (and provide it) openly and constructively (Weston-Smyth, 2023).

In today's world, a leader or manager is no longer seen as someone who simply issues orders from the top of a hierarchical structure. Instead, effective management involves working collaboratively with the team, often in a supportive role. This approach has been shown to be essential for positive performance, productivity, and motivation (Khan & Mashikhi, 2017). Research has found that activities to improve teamwork, such as team-building exercises, positively impact team effectiveness and success (Aga et al., 2016). Team leaders often play a critical role in guiding their teams to success, relying on intuition to accomplish an effective leadership style that is not just about hard facts but also about using one's instincts (Gopalakrishnan, 2007). A team leader sets the tone for the team, provides direction, and helps team members work together effectively. In 2021, a study examined the impact of having a leader on team performance. The study involved an escape-room challenge (as the group dynamics observed in such places are believed to be comparable to workplace dynamics (Depledge, 2019) in which several teams participated. Randomly selected teams were asked to choose a leader before starting the task, while others were not given this option. The study results showed that the teams with designated leaders performed significantly better. Specifically, 63 percent of these teams completed the challenge within an hour, compared to only 44 percent of teams without designated leaders (Coggan, 2022).

7. Conclusion

In the era of change management, "inclusiveness" emerges as a pivotal competency for contemporary, innovative leaders. Indeed, innovation stands as a cornerstone in the context of family businesses, impacting various outcomes and consequently, long-term competitiveness within their markets (Block et al., 2023; Casado-Belmonte et al., 2021; Dekker et al., 2013; Duran et al., 2016).

The idea of the Teal organization is used in practice to varying degrees depending on the circumstances. However, the more independent the employees are, the more creative they usually are. The manager of such a self-managing team assumes the role of coach and mentor for the employees. He inspires and motivates his team and supports them in achieving their goals.

The key attributes of inclusive leaders, including awareness, curiosity, commitment, cooperation, courage, and cultural intelligence, serve as primary drivers for organizational development success. Therefore, further research in this area should concentrate on delineating the influence of inclusive leadership on employee development. Additionally, fostering inclusivity facilitates the formation of employee teams, underscoring the importance of investigating the leader's role in catalyzing relationships among employees as another avenue for future research.

Ecological Innovations in Hotel Companies: A Case Study of Poland

Krzysztof Sala
University of the National Education Commission, Institute of Law, Economics and Administration, Krakow, Poland

krzysztof.sala@up.krakow.pl

Abstract: Entrepreneurship is one of the key pillars of the modern market economy. The most important attributes of entrepreneurship include innovation. According to many economists, most of the economic growth of developed countries should now be linked to the application and implementation of innovation. Among many types of innovations, ecological innovations (eco-innovations) deserve special attention. Ecological innovations contribute to the reduction of operating costs, increase in competitive advantage and facilitate entry into new markets. At the same time, they have a positive impact on the natural environment. The examples of eco-innovations are also increasingly often found in hotel companies. The aim of the publication is to discuss the current examples of the most significant ecological innovations in hotel enterprises. The article considers the significant impact of ecological innovations on the activities of this type of enterprises. In order to achieve the objectives of the publication, the Polish hotel market was taken into account. The article presents the following research thesis: Environmental innovations are an increasingly important element influencing the operation of hotel enterprises in Poland. However, there is still little awareness of them among guests. The article was written on the basis of books studies, monographs, magazines and netographic information. Methodology of research carried out for the needs of the work. To identify and analyze ecological innovations in hotels in Poland, as well as for the purposes of achieving the goals of the work, two methods of collecting primary research material were used. The first one is based on the analysis of existing data, including the analysis of guest opinions on the booking portal and literary criticism. The second one consisted of a diagnostic survey in which a non-standardized interview was used as a research technique on a deliberately selected group of hotel owners and managers from all over Poland, who have decided to introduce ecological innovations on the premises of their facilities. Interviews were conducted in January-February 2024. The interview did not take into account objects that temporarily suspended their activity. The results of the research positively verify theses.

Keywords: Economy, Hotel, Client, Creativity, Environmental protection, Entrepreneurship

1. Introduction

Entrepreneurship is one of the key pillars of the modern market economy. The most important attributes of entrepreneurship include innovation. According to many economists, most of the economic growth of developed countries should now be linked to the application and implementation of innovation. Among many types of innovations, ecological innovations (eco-innovations) deserve special attention. Ecological innovations contribute to the reduction of operating costs, increase in competitive advantage and facilitate entry into new markets. At the same time, they have a positive impact on the natural environment. The examples of eco-innovations are also increasingly often found in hotel companies.

The aim of the publication is to discuss current examples of the most significant ecological innovations in hotel enterprises. The article considers the significant impact of ecological innovations on the activities of this type of enterprises. This article focused on the Polish hotel market to meet the objectives of the publication.

The article presents the following research thesis: Environmental innovations are an increasingly important element influencing the operation of hotel enterprises in Poland. However, there is still little awareness of them among guests. The article was written on the basis of books studies, monographs, magazines and netographic information.

Methodology of research carried out for the needs of the work. To identify and analyze ecological innovations in hotels in Poland, as well as for the purposes of achieving the goals of the work, two methods of collecting primary research material were used. The first one is based on the analysis of existing data, including the analysis of guest opinions on the booking portal and literary criticism. The second one consisted of a diagnostic survey in which a non-standardized interview was used as a research technique on a deliberately selected group of hotel owners and managers from all over Poland, who have decided to introduce ecological innovations on the premises of their facilities. Interviews were conducted in January-February 2024. The interview did not take into account objects that temporarily suspended their activity. The results of the research positively verify theses.

2. The Concept of Innovation and Ecological Innovation

Many academics have contributed to the topic of innovation. Austrian economist J. Schumpeter believed that companies must be innovative in order to remain competitive on the market (Schumpeter, 1947). Another

authority in this area, P. Drucker, believed that a non-innovation company inevitably would grow old and deteriorate. (Drucker 2003).

Inovativeness can be understood as the introduction to the market of a new or significantly improved product, good or service or the implementation in the enterprise of a new or significantly improved process. Innovations are the result of technological development, new combinations of existing technologies and the use of modern knowledge desired by the company (Wozniak, 2006). For the purposes of research and comparative analysis, it is recommended to use the classification of innovations proposed by OECD specialists, contained in the so-called Oslo Manual. The Oslo Manual distinguishes innovation (OECD, 2008):

- product,
- process,
- organizational,
- marketing.

In addition to the types of innovation mentioned by the Oslo Manual, the concept of ecological innovation (eco-innovation) is increasingly found in literature. Ecological innovation can be defined as "innovations, which consist of new or changed processes, practices, systems and products that use environmental resources, at the same time, they contribute to its protection" (Jarża, 2013). According to the classic definition, eco-innovation is a "new product that provides value for the customer and for business, while significantly reducing the negative impact on the environment'' (James, 2001). According to another definition, eco-innovation should be understood as "intentional conduct characterized by entrepreneurship, including the stage of product design and integrated management of it during its life cycle, which contributes to the pro-ecological modernisation of industrial-age societies by taking environmental concerns into account when developing products and related processes. Eco-innovation leads to integrated solutions to reduce resource and energy inputs while improving product and service quality. Technological innovation is one of the ways of eco-innovation" (Carley, Spapens ,2000). For some authors, innovation means "any new forms of action aimed at significant and visible progress towards the goal of sustainable development, by reducing environmental impact or achieving greater efficiency and responsibility in the use of resources, including energy" (Prystrom, 2013). In turn, according to the authors of another definition, eco-innovations consist of new or modified processes, techniques, practices, systems and products that eliminate or reduce harmful effects on the environment (Kemp, Andersen, Butter, 2004).

In Poland, eco-innovation was defined comprehensively only in 2009 by the Central Statistical Office (GUS). This definition defines eco-innovations as "innovations that bring environmental benefits, as a new or significantly improved product (article or service), process, marketing or organizational method, or, which bring environmental benefits compared to alternatives" (GUS, 2010).

At the European level, defining the concept of eco-innovation has also been addressed by, inter alia, the European Commission (EC), the Organisation for Economic Co-operation and Development (OECD) and Eurostat. The European Commission defines eco-innovation as "a form of innovation, the purpose of which is to make significant and demonstrable progress towards achieving the sustainable development goals by reducing environmental impact or achieving a more efficient and responsible use of natural resources including energy" (https://commission.europa.eu/research-and-innovation_pl)

The theories of eco-innovation can and even should be considered in a narrow and broad perspective. The broad approach to eco-innovation concerns, on the one hand, solutions from the company's activities and institutional and social solutions; on the other hand, it is a prerequisite for sustainable development, increased social welfare and improved quality of life. The aim of eco-innovation, in a broad perspective, is to provide a sustainable competitive advantage for the enterprise in economic terms without harming the quality of the natural environment or in economic terms with minimal damage to this environment with full responsibility to society. They are narrowed down and are not integrated into the entire activity of the enterprise (Przychodzień, 2015).

The primary objective of eco-innovation should therefore be considered as environmental benefits, i.e., reduction of the negative impact of economic activity on the natural environment by reducing energy intensity, reduction in the use of natural resources or the emission of harmful substances (Ottman, Stafford, Hartman, 2006). Therefore, eco-innovation is such an innovation that seeks, on the one hand, to reduce the burden on the environment; and on the other, to achieve a certain environmental performance. Ecological innovations implement a policy of reducing pressure on the environment, using pro-ecological solutions. An eco-innovative solution is one that is innovative in relation to the most modern solution. Therefore, the paper assumes that eco-innovations include the production and application of new products, services, processes, and, systems and

procedures to meet human needs and ensure a better quality of life while minimising the consumption of natural resources and the emission of pollutants into the environment per unit of product or service over the entire life cycle compared to with alternative solutions (Kemp, Pearson, 2007).

Ecological innovation depends on many different factors and should be considered in a multi-faceted dimentions. The main factor contributing to their development are legal regulations, while other factors related to market conditions as well as technological capabilities of companies also play an important role. In addition, savings achieved through the implementation of environmental innovations are important factors. Eco-innovations are also strongly correlated with product and process innovations, and their implementation is influenced by the functioning environmental management systems, as well as their level and quality.

3. Ecological Innovation in Global Hospitality

Due to its size, the hotel industry is one of the most environmentally friendly sectors of tourism. On average, per 1 hotel room, between 160 kg and 200 kg of carbon dioxide are produced per year. However, the water consumption is from 170 to 400 liters per guest per 1 day for a 5-star hotel. Hotels generate an average of 1 kg of waste per 1 guest per 1 hotel day (Fatoki, 2019). Considering these facts, pro-environmental behaviour should be regarded as necessary to be implemented at various levels of the facility's operation (Firlej, Spychalska, 2015).

Pro-ecological measures in the global hotel industry, especially in the context of contemporary environmental issues, are not only a necessity, but an important tool for increasing the competitiveness of a facility and its offer in an increasingly competitive market. Analysing a variety of sources, both academic articles and promotional material from a number of hotels, it is possible to identify many interesting and often original initiatives or ideas. (Bugdol, Puciato, Boris, 2019).

Noteworthy is the fact that progress in eco-innovation is largely a natural consequence of fungible trends in the global economy, including the escalating popularity of ecotourism. In addition to the changes in the means by which tourists travel, their mindset has also evolved. UNWTO research indicates that 87% of tourists in the world want to travel sustainably. Additionally, 33% revealed that ecotourism consists in rational selection of the place of their stay, including primarily the right hotel (https://www.national-geographic.pl/traveler/artykul/7-najbardziej-ekologicznych-hoteli-na-ziemi-mamy-zdjecia).

As in the case of other areas of the economy, here too, the supply side responds to changes from the demand side, modifying its activities in the field of ecological innovation. Individual activities that are part of ecological innovation have been used in the hotel industry for years. The most important of them can be:

- Perlators mounted in taps (water saving up to several dozen percent),
- Minibars with high energy class without freon release,
- LED lighting that uses 75% less energy and emits the same amount of heat,,
- Energy-efficient household and rtv equipment throughout the facility,
- Encouraging not to change towels or bed linen without the express wishes of the guests.

In addition to these activities, which in their own way fit into ecological innovation, many more sublime examples of activities around the world can be also found. Nowadays, more and more hotels are built in accordance with the principles of ecology or apply very advanced ecological innovations (Baker, Davis, Weaver 2014).

For the purposes of this article, it is worth giving a few examples. The advanced eco-innovation Brooklyn Bridge Hotel in the USA is LEED Gold certified and is equipped with state-of-the-art, energy-saving heating and cooling systems, LED lighting control thermostats, and, HVAC systems with energy recovery and advanced monitoring. Approximately 25% of the hotel's roof is occupied by green areas with garden beds overgrown with trees and shrubs that work diligently to produce oxygen, absorb carbon dioxide from the atmosphere and reduce the urban heat island effect. The hotel is distinguished by having a water recovery system that collects rainwater and practically uses it to irrigate the park. Additionally, the facility actively conducts educational campaigns for the implementation of pro-ecological activities, such as public transport, promotion of plant diet, the principles of good recycling, and restrictions on the use of plastic in everyday life and environmental education of others (https://www.1hotels.com/brooklyn-bridge/sustainability).

Another example is the Butiquehotel Stadthalle in Vienna. The facility offers its guests a rest on the lavender roof and tasting of organic honey produced on the site. The hotel promotes ecological transport by rewarding the guests arriving at the hotel by train or bicycle with a discount of 10% on renting a room. By not placing minibars in rooms, the hotel saves 21,024 kg of CO2 per room. The object segregates 100% garbage. Photovoltaic

panels used in the hotel allow to produce own, clean electricity throughout the year. Solar panels provide the hotel with hot water. Eco-friendly shower heads, LED lighting and standby devices greatly reduce water and energy consumption. (https://www.hotelstadthalle.at/en/boutiquehotel/green-heart-vienna.html).

Another example is the Hotel Soneva Fushi, located on Kunfunadhoo Island Baa Atoll in the Maldives. The hotel uses renewable energy sources such as solar energy and has its own ecological gardens that supply restaurants with fresh products. The resort has its own glass factory, where recycled glass is processed into handmade items, and even a recycling center where guests can learn how to manage their own waste. The hotel has established its own Soneva Foundation, which supports the development of the projects that have a positive impact on the environment, society and the economy. Wherever possible, the Soneva Foundation applies the principles of impact investing in an effort to recoup its investments by financing carbon dioxide emissions, which in turn will be used in the projects, to help extend the reach and benefits for more families. (https://soneva.com/foundation/). Examples of other hotels that are most advanced in implementing eco-innovation are shown in Table 1.

Table 1: Examples of hotels that most advanced implement ecological innovations in 2024

Hotel name	Location	Characteristics
Hi Hotel Eco Spa & Beach ****	Nice, France	Using recycled paper, organic paints, safe cleaners and organic food
Campi ya Kanzi ****	Mtito Andei, Kenya	Using solar panels, solar boilers, promoting eco-tourism with respect for the Maasai culture
Hoshinoya Karuizawa ****	Karuizawa, Japan	Own hydroelectric power plant operating for the needs of the hotel, the use of renewable energy
Crosby Street Hotel *****	New York, USA	Eco-friendly building materials brick, stone, glass. The vegetable garden providing ingredients for the menu of the local restaurant
Magdas Hotel ****	Vienna, Austria	Using recycled furniture, offering beer from local breweries
Ritz Cartlon *****	Charlotte, USA	Using a green roof with garden and hives. Production of own herbs and honey used in the hotel kitchen. Hotel staff wearing clothes made from recycled plastic bottles

https://sznyt.pl/2019/08/12/8-ekologicznych-hoteli-ktore-wskazuja-kierunek-rozwoju-turystyki/.

4. Ecological Innovation in Hotels in Poland

Polish hospitality industry strives to keep up with global trends in innovation, including ecological innovation. However, the use of eco-innovation is not yet common among Polish hotels. This is evidenced by the limited amount of compact and netographic data describing ecological innovations in the domestic hotel industry. The analysis of the domestic hotel industry in terms of ecological innovation allows to identify approximately 20 facilities (for a total number of over 2,600 hotels), which are described in the media and widely considered by experts to be ecological. Only half of this group clearly informs on their websites about the eco-innovations used, and only three such facilities have ecological certificates. The same group consists of the properties entirely constructed in accordance with ecological principles. Only two facilities have the word eco in their name. Analysing the opinions of the guests of these hotels posted on the booking portal since the beginning of 2024, the environmental novelties and innovations used were not subject to wider feedback.

The most common cases are these in which individual eco-innovation solutions are used on a different scale in hotels of different categorisation and character (historic hotels, chain hotels). (Sala, 2021).

One of the most outstanding ecological facilities in Poland is the Arlamow Hotel. Extensive information on this can be found on the hotel's website itself. The hotel prides itself on its comprehensive approach to environmental measures, notable among which are its own CHP plant with trigeneration technology, the use of

a food waste composting machine that transforms food waste by heat into pre-compost used in the CHP plant to generate energy, available water dispensers helping to save around 3,000 plastic bottles per year, the replacement of disposable paper towels in the toilets with reusable cotton towels in rolls. In addition, the hotel conducts educational activities of an ecological nature addressed to guests. As part of it, tree planting, cleaning of the land, ecological games for children take place, and as part of the Holistic Mice package, the promotion of a healthy and active lifestyle takes place (https://www.arlamow.pl/hotel-ekologiczny).

Located in Kolobrzeg, the Aquarius Hotel Spa & Wellness makes high use of ecological innovations, branding itself on its website as eco-friendly. The design of the individual elements facilitated ecological operations right from the building phase. The facility uses glass, returnable water bottles and biodegradable beverage tubes. The hotel consistently replaces paper flyers with electronic informants on hotel television. In addition, the facility encourages drinking tap water and actively participates in ecological campaigns, including recycling campaigns (https://www.aquariusspa.pl/pl/hotel-spa-nad-morzem/hotel-przyjazny-srodowisku/).

The Eco Tatry Hotel already in its name suggests ecological solutions, which is confirmed on the site of the facility and its slow life philosophy. The hotel is based on 4 pillars: Nature, Ecology, Silence, Health. The hotel stands out from the others with its own eco-initiatives, the use of solar collectors, environmentally friendly heating, the implementgation of recycling. The property also prides itself on using natural materials for the construction of the cottages (https://www.ecotatry-hotel.pl/hotel-koscielisko-o-nas/).

Opened in 2017, Radisson Blu Resort in Swinoujscie is the first 5-star hotel in Poland designed and built from scratch in accordance with the guidelines of the ecological LEED certificate. During the LEED certification process, all the elements of sustainable construction are taken into account, such as: location and type of land intended for investment, energy and water consumption, quality of the internal environment, type of materials used, and, innovativeness. One of the many solutions used in this hotel is the use of rainwater to power parts of the toilet (https://enjoyyourstay.pl/hotele-ekologiczne/). The examples of other hotels in Poland that show eco-innovation are presented in Table 2.

Table 2: Examples of ecological innovators among hotels in Poland in 2024

Hotel name	Location	Characteristics
Hotel St Bruno ****	Giżycko	Elimination of the use of typical plastic products. Encouraging the use of tap water instead of bottled water for guests to drink. Use for heating the building of heat pumps, reducing water consumption and the use of LED lighting. Application of the zero waste principle
Uroczysko 7 Stawów ****	Gola Dzierżoniowska	Own heat pumps and biological treatment plant. A grey water system that eliminates drinking water for activities that do not require it. Growing our own herbs and vegetables, used in the dishes of the local restaurant
Herbarium Hotel & Spa ****	Chomiąża Szlachecka	Own heat pumps, the use of natural herbs in gastronomy, limiting the use of paper in the area of marketing, the use of QR codes, offering ionized water in glass bottles
Hotel Dębowy Biowellness & SPA ***	Bielawa	The use of organic products - honey from local apiary, herbs, wines, milk, chocolate, as well as coffee grounds. Use of fruits, vegetables and herbs from the hotel garden and products purchased from local suppliers
Klekotki Spa & Resort ***	Klekotki, Skowrony	Use of own sewage treatment plant, hydroelectric power plant, solar collectors, heat pumps and water treatment plants. Used organic laundry detergents, serving food-based products from

Hotel name	Location	Characteristics
		local suppliers and the nearby organic vegetable and herb garden
Hotel Bast ***	Inowrocław	Using glass packaging and withdrawing from plastic. Using own vegetables for hotel gastronomy. Having own wildlife rehabilitation center
Trystian Hotel & Spa ****	Kąty Rybackie	Air conditioning based on chilled water unit, the use of water foaming caps in taps and shower heads and high-quality dishwashers. Use of intelligent electricity management
Bukowy Park Hotel Medical Spa ****	Polanica Zdrój	Roof gardens, which reduce the need for heating energy, and are also used to install solar collectors, from which renewable energy is used to heat water. The use of intelligent energy management systems, including, inter alia, a heat recovery system from mechanical ventilation or energy-saving bulbs

Source: Own elaboration.

The most popular ecological innovations used in hotels in Poland include:

- Solutions for saving electricity, water and heating,
- Promoting organic food based on the production of own, ecological products,
- Removing plastic items from the hotel space.

In the context of the above theoretical considerations, as well as the case study analysis of various hotel facilities from the world and Poland, an examination of the approach to green operations on the Polish hotel market was thought to be appropriate. In March 2024, in-depth interviews were conducted with a deliberately selected group of hotel owners and managers, which are recognized in the media as hotels implementing ecological innovations.

E. Blazejczak, marketing and public relations manager of Herbarium Hotel & Spa believes that "*the ecological innovations used in the hotel today are its important asset and significant added value. Modern energy solutions in particular can bring significant savings in an era of rising inflation. However, ecological innovations themselves are not yet the main reason for choosing a hotel as a destination, and guests learn about them during their stay. The task of the hotel is therefore to educate guests about the valorization of ecological innovations. There are also no guest reviews for eco-innovations on the booking portal after the stay''*. J. Szczyglowska, the owner of the Bast Hotel, is of the opinion "*that ecological innovations are an element of building a competitive advantage of the hotel and a way to reduce the costs of its operation. The guests themselves are consumers and are not guided by the environmental rationale of the facility when choosing it. They become acquainted with it during their stay. They also do not comment on this fact on the booking portal.''* And in turn. K. Michalowska, the manager at Klekotki Spa & Resort is of the opinion that "*the applied ecological innovations in her hotel are an important criterion for choosing a hotel for some guests. However, guests rarely comment on eco-innovations after their stay."* The manager of the guests' experience of the St. Bruno K. Świderski Hotel argues that "*some types of eco-innovation, such as electric vehicle charging stations, are particularly important in the hotel's operations, especially for businessmen. In general, however, guests rarely show interest in pro-ecological attitudes. Encouraging to reduce the use of towels or paper raises resistance. Paper straws are considered impractical."* A. Polomska from Trystian Hotel & Spa believes that "*eco-innovations are a showcase of a given hotel, proving its progressiveness. However, hotel guests are not yet ecologically aware. The process of changing the awareness will gradually progress. Hotel guests benefit from ecological novelties available on site and familiarise themselves with them. This is especially true for older people. The youngest guests, in turn, are already much more aware of the valorization of ecological solutions."* K. Sochaj, the director of the Hotel Debowy Biowellness & SPA , "*appreciates the importance of eco-innovation in a modern hotel, whose aim is to increase the well-being of guests."* At the same time, however, he believes that hotel guests do not pay attention to ecological innovation. *"We should also not exaggerate the introduction of too radical pro-ecological solutions in hotels, eliminating (as it already happens in Austria) televisions from rooms and access to wi-fi. Hotel guests are*

still used to the services of smart tv." J. Wilczynska, the manager of Bukowy Park Hotel Medical Spa, claims that "*environmental innovation contributes both to the benefits of reducing costs, as well as has a positive impact on marketing and visitor interest."* The guests of her hotel pay more and more attention to the ecological aspects of the hotel, without commenting on them on the booking portals. According to E. Nadolska, general manager of the Uroczysko Siedmiu Stawów Hotel, "*ecological innovation is playing a growing role in the hotel industry in Poland. Guests more and more often pay attention to eco-innovations used in the places of their stays. This hotel tries to educate its guests by placing information in rooms about its environmental policy, including in particular the practice of cleaning rooms every third day. The hotel intends to continue to introduce new ecological innovations in order to meet market trends. The introduction of photovoltaic panels is planned. Among the already functioning ecological innovations, guests pay the most attention to chargering stations for electric cars. Shaping the approach of guests to ecological issues facilitates the use of the booking portal, which selects objects in terms of sustainable travel or access to charging stations for electric vehicles''*.

5. Conclusion

Ecological innovations are an increasingly important element affecting the functioning of hotel enterprises in Poland, although they are not yet widely used. Not all owners or managers are convinced of its valorization for their hotels. The number of eco-friendly inowators among the total number of domestic hotels is still small. A characteristic element is the fact that ecological innovation in Poland is not the domain of only luxury chain hotels, but also independent facilities. Ecological innovation in Polish hotels has its own specificity. The use of ecological innovations in the field of heating (heat pumps, photovoltaic panels, solar collectors, modern air conditioning), lighting (LED technology) dominates, water management (water saving and purification equipment) or thermal insulation (green roofs). Such solutions can bring significant savings in operating costs of facilities and the level of prices of stays, which affects the profitability of the operation. Many hotels in Poland equate ecological innovation with promoting the principles of healthy eating based on the production and promotion of their own vegetables, fruits, herbs and honeys. Moreover, such activities contribute to the increase in profits of individual facilities from the sale of these products. A smaller number of hotels publish information about their pro-ecological activity on the websites. Only in isolated cases do hotels use the term eco in the parts of their names. These facts prove that ecological innovation is not yet of colossal importance in the field of marketing. Additionally, it is important to realise that hotel guests are not sufficiently aware of the benefits of eco-innovations, which translates into their pro-environmental behaviour and post-stay opinions. Relatively few guests attach importance to the environmental performance of a facility when making a booking. Nor do all customers see the point of using it. Thus, hotels can act as educators in this regard for their guests, especially the older generation.

Considering the changing economic conditions, the seeking modernity, the emergence of new hotels and the ongoing evolution in ecological attitudes, it seems appropriate to undertake further research into ecological innovations in the national and global hotel industry.

Abstract: Currently, worldwide there is an accelerated digital transformation, which will continue in time with the same trend, becoming an everyday part of human life. The appearance of covid-19 has had a strong impact on several aspects of life, especially in the way of acquiring products and/or services, which, due to the fear of receiving money from a person infected with the virus, led people to look for other options to carry out their economic transactions without physical contact, such as the use of electronic wallets. However, many entrepreneurs still do not use this type of technology in their businesses. The purpose of this research is to determine the impact of the use of electronic wallets in the commercial transactions of SMEs. To this end, we worked with entrepreneurs in the town of Otuzco in the La Libertad Region of Peru. It was observed that they only carried out transactions using the cash collection and payment method and did not use technological tools such as electronic wallets. This is applied research with a quasi-experimental design, cross-sectional and quantitative approach, with a sample of 88 SMEs divided into a control group (23 SMEs) and an experimental group (65 SMEs). The survey was used as a data collection technique, and a program was developed to promote the use of electronic wallets in the entrepreneurs of the city of Otuzco, obtaining as a result a positive impact on the commercial transactions of these SMEs. The results show that 96% of the merchants were reluctant to use electronic wallets for fear of being affected by computer crimes. After the training, 98% of the merchants monitored recognized the importance of their use in their regular commercial transactions. In conclusion, it was found that training on the use of electronic wallets and continuous monitoring have a positive impact on the level of commercial transactions, boosting the competitiveness of businesses by increasing sales, streamlining operations, and reducing financial costs. The research is of interest because it shows the importance of disseminating programs in the use of technological tools such as digital wallets in small businesses to achieve a positive impact on the improvement of their economic activities.

Keywords: Technology, SMEs, Commerce, Development, Digital applications

1. Introduction

Currently, worldwide there is an accelerated digital transformation, which will continue in time with the same trend, becoming an everyday part of human life, in addition, the emergence of covid-19, strongly affected various aspects of life, especially in the way of acquiring products and / or services, The fear of receiving money from a person infected with the virus led people to look for other options to carry out their economic transactions without physical contact, such as the use of electronic wallets, which are the world's favorite because of their simplicity and minimal cost (Hoang and Nguyen, 2022).

According to McKinsey (2020), this global virus pushed people to learn to use the electronic means of payment that were already available, being adopted quickly in countries that had the necessary digital channels, but complicated for those where the equipment was insufficient, so that the migration to digital would take longer. That is why there are small groups that have not yet managed to adapt and are unaware of the use and benefits of digital tools for their businesses, meaning this is a barrier to globalized economic growth.

Worldpay (2020) points out that the way in which people carry out economic transactions daily has a lot to do with their culture, habits and the level of technology available to them; therefore, in places where people lack all of the above, there will continue to be a negative tendency to always use cash as a means of payment.

While it is true that there are internal factors such as the culture and habits of each individual that affect the way of making economic transactions, other highly external factors also have a significant impact, so Aparna et al. (2015) emphasize that merchants are somehow prevented from efficiently taking advantage of electronic payment tools, due to the lack of internet in some rural areas, in addition to the lack of technical knowledge of its correct use.

Muhtasim (2022) mentions that another factor that makes merchants distrustful of using digital wallets is the issue of privacy and cybercrime, which have a negative impact on the decision to adopt these electronic tools, since due to this fear they prefer to use cash for their transactions in their stores. This situation is detrimental to businesses because it does not allow them to increase sales and this affects profits (Ajimon and Prajod, 2021).

In Peru, due to state initiatives, there is a regulatory standard that encourages the growth of electronic payment methods, as Abad et al. (2016) report that Peru has a legal framework that encourages access to electronic payments, which is essential for the expansion and growth of mobile payments today. According to El Comercio (2022), in response to the pandemic, 61% of Peruvians abandoned the use of cash, and 79% of Peruvians are open to the possibility of trying new digital payment options.

However, there are many entrepreneurs who do not use or are unaware of the use of digital wallets, in the case of Peru more than 60% of the total population is unaware and does not take advantage of the benefits, nor trust in these electronic tools, so to promote their proper use, it is necessary to promote internet connection in remote areas and especially provide programs that educate on financial issues, giving them greater confidence for the implementation of electronic wallets in their businesses (Gubbins, 2023).

Such is the specific case of SMEs in the district of Otuzco, La Libertad. Most of these small entrepreneurs are unaware of the benefits they would get with the use of electronic wallets in their businesses, although it is true that they have a smartphone and internet connection, they are still wary of the security of using these digital tools for their daily transactions, affecting their level of sales to the general public, since millennials represent a large part of their clientele and they normally use and prefer to use digital payments to make their purchases. For this reason, it is of utmost importance to train them on the efficient use of digital wallets to efficiently take advantage of the benefits of technology. As explained, this article aims to determine the impact of the use of e-wallets in the commercial transactions of SMEs.

2. Literature Review

According to Páez (2020) digital wallets also called digital purses are mobile or web applications that have the functionality to store and send money for transactions at any time of the day. They are used to perform online economic transactions using a cell phone, computer, tablet or any electronic device with internet connection (Le et al., 2019).

Through mobile payment, money is transferred to a person through a mobile device which enhances the functionality of smartphones because they become virtual debit cards. It is currently the most popular mobile banking service, especially in newly developing regions where the rate of transactions through these e-wallets has increased (Taufan and Yuwono, 2019).

Due to the simplicity of their use, e-wallets have managed to consolidate their position as the world's favorite for making payments and collections, since they only need to top up the balance through the delivery of cash at a recharge point or ATM, contributing to financial inclusion (Aunurrochim and Bin, 2021, Cotrina and Pumarrumi, 2020). Customers see this option as very versatile as they can use them through mobile applications downloaded on their cell phones (Wang et al. 2016).

For some time now, technological innovations on electronic wallets have been trying to improve the coexistence of businesses so that transactions flow with greater continuity and strengthen commercial operations (Bellido and Bartolo, 2023). An important aspect is the short transit time of money and low distribution charges provide a guarantee of a higher level of sales, boosting business growth (Wei et al., 2023).

Several researchers approach the topic of digital wallets from different contexts and realities. The use of these tools is becoming widespread and is spreading faster and faster because their use increases the level of transactions, as they become easier, faster and more efficient to conduct business on a daily basis (Putri and Sumitra 2020), however, a certain part of the population has problems adapting to these new technologies (Manrai et al., 2021).

In order to identify elements that influence their adoption, Ramos (2022) proposes several alternative solutions for the use of these tools, taking into account that security and risk mechanisms influence the decision to adopt or not digital wallets, and that the correct use of these tools in businesses could be promoted.

The use of these wallets promotes financial inclusion, and it can be determined that the new electronic platforms have had a positive impact on businesses (Llamocca and Huaylla, 2020; Cotrina and Pumarrumi, 2020), which is why it is important to promote their use and publicize the minimal costs and benefits they offer. Taking into account that it helps to reduce costs and implies greater speed in commercial exchanges (Márquez, 2016). In addition, it avoids carrying cash, thus reducing assaults, promotes competitiveness and becomes a differentiator from traditional businesses (Encalada et al., 2020).

On the customer side, factors such as ease of use, credibility and security are established, which make digital wallets a preferred option for consumers (Soervanto and Sumantri, 2020). The key factors driving the adoption of these wallets were also analyzed by Ilieva et al. (2023), identifying ease of use, social influence, compatibility with lifestyle and perceived trust. Sharma (2022) determines a positive relationship between customer intentions and the factors of ease of use, trust and experience through the use of e-wallets. Despite the ease of use and greater security compared to the use of credit and debit cards, as well as the absence of transaction costs, there are gaps that represent a challenge for their sustainability over time (Bagla and Sancheti, 2018; Kapoor, 2020, Chawla and Joshi, 2019).

Determining factors with respect to generating greater trust in the use of e-wallets were analyzed by Kinis and Tanova (2022) who determined that the behavioral intention to use e-wallets increases if a reimbursement condition is shown in case of fraud.

There is still a significant gap for e-wallets to be used to their full extent. Alam et al. (2021) conducted a SWOT analysis where they point out important strengths such as easy access, security, adequate management of products and services, as well as speed. However, they identify some weaknesses such as lack of infrastructure and exploitation by the mobile telephony market.

Studies reveal that users, regardless of age, prefer to use digital wallets for their simplicity. They use them for online shopping, transportation, restaurants, purchase of necessities, avoiding carrying money or going to ATMs to withdraw cash (Mavale et al., 2020). However, financial security, cybercrime and level of trust influence the use of digital wallets (Muhtasim et al., 2022).

No quasi-experimental studies on training programs on the use of e-wallets were found to be able to measure the effect they have on the economic transactions of merchants who increase the use of these technological tools.

3. Methodology

The research has a quantitative approach because it focuses on the collection of numerical data. It is applied. The design is quasi-experimental because it reveals the impact of manipulating one or more independent variables on the dependent variable. The objective of the research is to determine the impact of the use of electronic wallets on SME business transactions.

The hypothesis of the research is that the implementation of an e-wallet training program does have a positive impact on SME business transactions.

The population of this research is represented by 88 SMEs in the province of Otuzco; this number was identified personally, observing and counting them at the time of applying the surveys. SMEs from all economic sectors in the city of Otuzco were included, without distinguishing any socio-demographic aspect. The sample is considered a census sample; this type of sampling is used when the sample represents 100% of the population and when the number of individuals is manageable.

A survey was applied to obtain information on various aspects related to the knowledge and use of the electronic purse for their businesses. To measure the reliability of the instrument (questionnaire) with dichotomous measures, the Kuder Richarson coefficient was used, yielding a result of 0.898, which means that the reliability is adequate.

kr20 = (k/(k -1))(1-(Σ pq)/σ^2) = (8/(8 -1))(1-(1.11)/〖5.16〗^2) = 0.898

4. Results

The characteristics of the 88 businesses that do not yet use electronic wallets during their economic transactions are disclosed.

Table 1: Socioeconomic characteristics of SMEs

Age	18 to 35 years old	10%
	36 to 53 years old	57%
	Over 53 years old	33%
Gender	Male	88%
	Female	13%

Academic level	primary	8%
	secondary	74%
	technical studies	18%
Item	Commerce	97%
	Services	3%
Monthly sales	0 - <1000	8%
	>1000 - <5000	76%
	>5000 - <10000	13%
	>10000	3%

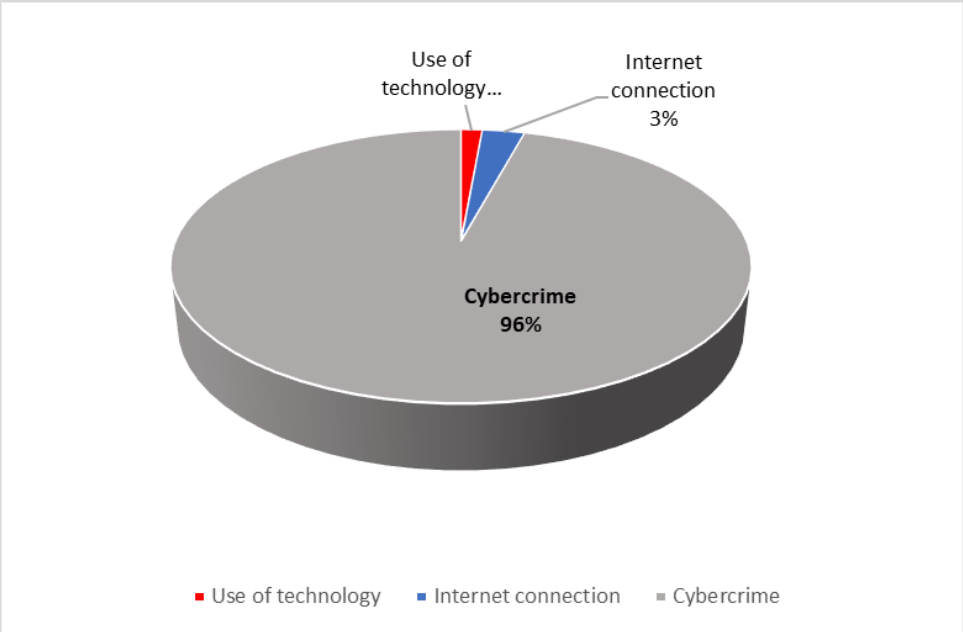

Figure 1: Factors impeding the use of digital wallets

The factor that predominates widely in comparison with the others is the fear of cybercrime, since traders believe that if they ever lose their cell phone, they run the risk of unscrupulous people using their money and emptying their accounts leaving them bankrupt; secondly, internet connection represents a minimum percentage, some businesses do not have a stable internet connection, and finally, the technological issue is a factor that affects to a lesser extent since the vast majority of businesses have a cell phone.

Table 2: Development of the Training Program on the use of Digital Wallets

Objective	To encourage merchants to use and take advantage of the benefits offered by electronic wallets.
Place	Auditorium of the Provincial Municipality of Otuzco, in front of the main square.
Date	July 21, 2023

Agenda:

Introduction and Welcome	5 minutes
Definition and Importance of Electronic Wallets	20 minutes
Advantages, benefits, and precautionary measures	25 minutes
Examples, practical demonstration	40 minutes
Questions from the audience	30 minutes

After the training on the use of electronic wallets and the accompaniment for a period of approximately 2 weeks, the survey was applied to measure the impact on commercial transactions in SME merchants.

The following shows the evolution of the responses of the questionnaire applied to the 88 merchants, comparing the impact on the responses of the 65 people who attended the training and allowed continuous follow-up, with the 23 people who did not attend, therefore, this research divides the sample into two groups, the control group, made up of those SMEs that were surveyed pre and post training, but without having participated in the training; and the experimental group, made up of the SMEs surveyed pre and post the scheduled training.

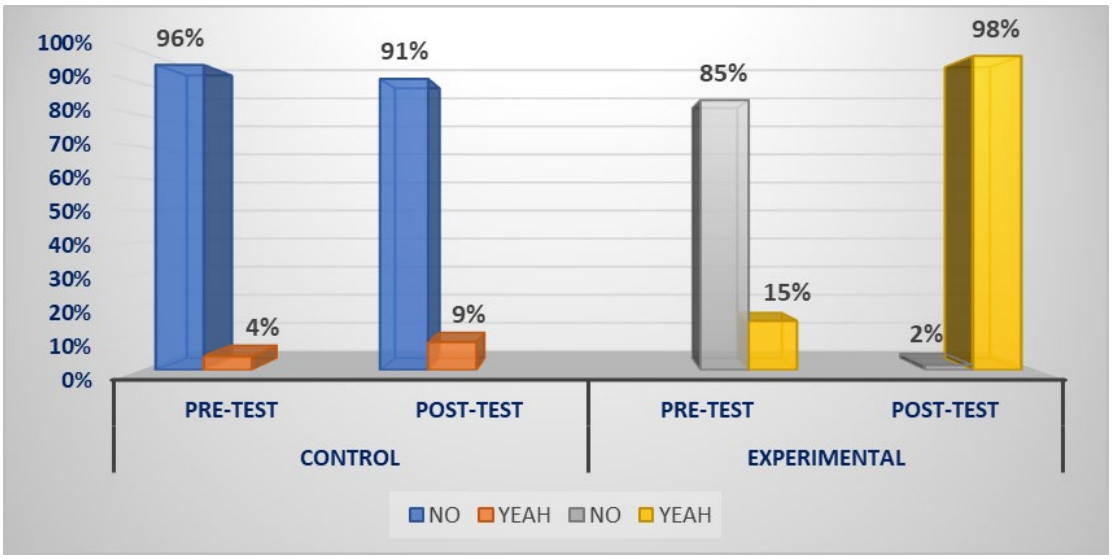

Figure 2: Importance of the use of electronic wallets for business operations

The control group shows little acceptance of the importance of the use of electronic wallets in their businesses. The results in the experimental group show a significant impact, because after the training 98% of the respondents value the importance of the use of these wallets as an important impulse in their business operations.

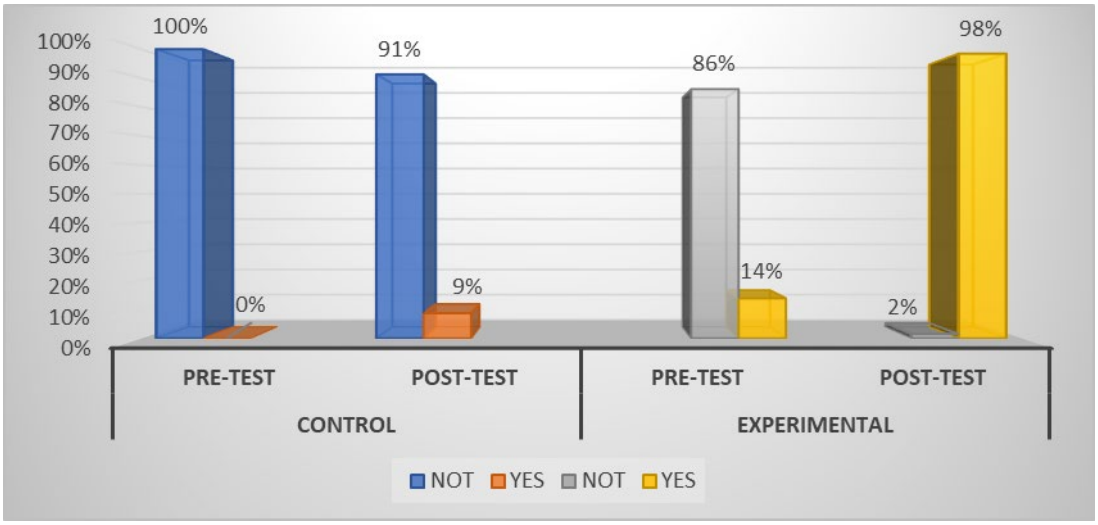

Figure 3: Electronic wallets facilitate cash change management

The control group is still reluctant to use electronic wallets, some respondents changed their minds in the post-test, due to comments from friends or relatives. The results in the experimental group show a significant impact, since after the training 98% of the respondents testified that they found it much easier to make change when making sales, improving the flow of customer service.

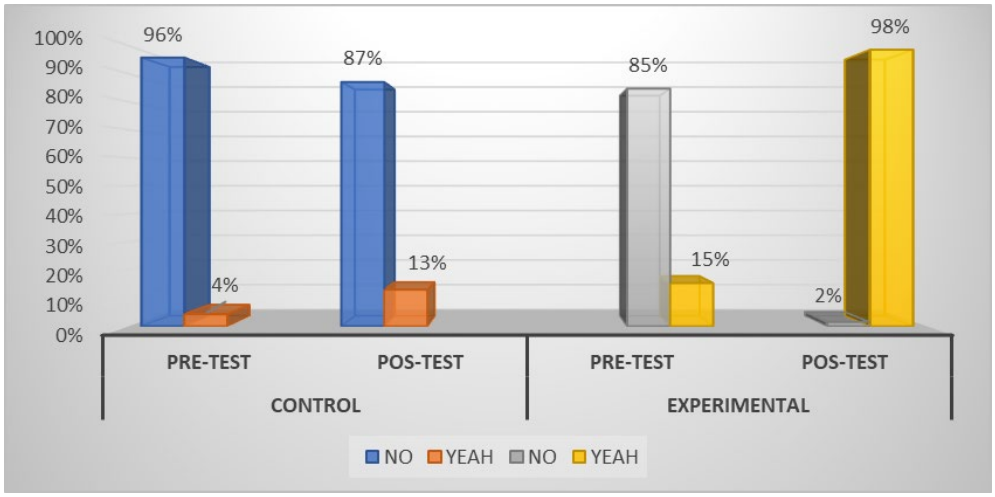

Figure 4: Use of electronic wallets facilitates payment to suppliers

The same trend in the consultation regarding payments to suppliers, which is often presented as a difficulty since they come from different remote areas of the city and with this mechanism it is much more feasible to comply with payments on time and thus make purchases more easily.

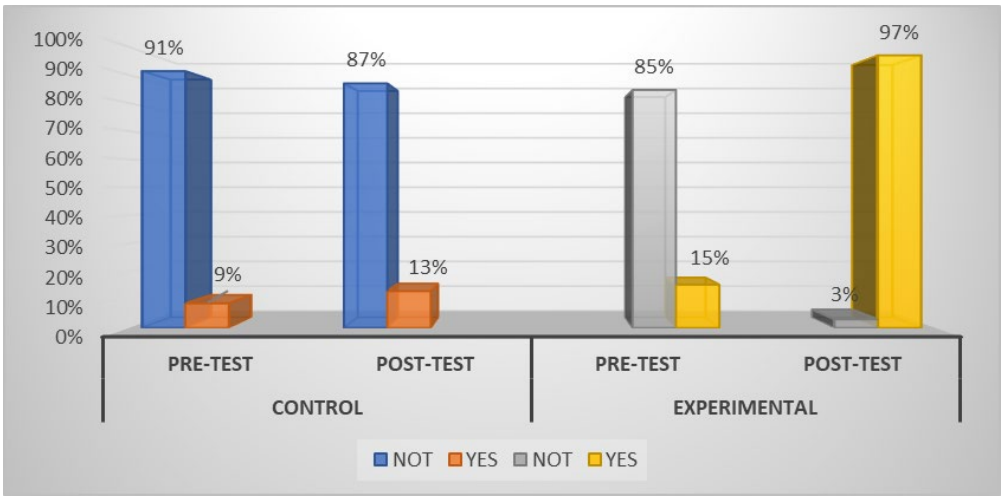

Figure 5: Use of electronic wallets facilitates service payments

The control group, made up of those merchants who did not attend the training, did not present relevant changes in the pre- and post-test, while in the experimental group, approximately all the merchants have changed their way of thinking, this being the result of the dissemination of the benefits that electronic wallets bring to businesses, such as, Improving sales by capturing the largest number of customers, since the use of these electronic tools avoids several day-to-day sales problems, such as not having a single payment for the returns, traveling to another location to pay suppliers, or making deposits to pay for various services necessary for the operation of the business where commissions are charged, etc.

Table 3: Normality test

	Group	Kolmogorov-Smirnov[a]			Shapiro-Wilk		
		Statistical	gl	Sig.	Statistical	gl	Sig.
Measurement Pre-Test	Control	.402	23	.000	.562	23	.000
	Experimental	.350	65	.000	.712	65	.000
Measurement Post-Test	Control	.422	23	.000	.641	23	.000
	Experimental	.527	65	.000	.134	65	.000

It is identified that the significant probability of the pre-test and post-test measurement is less than 0.05, therefore, it is concluded that the data do not tend to a normal distribution.

Based on this, non-parametric tests were performed for related samples, so the Wilcoxon test was applied in two parts, the first for the control group:

Table 4: Incidence between the pre-test and post-test of the Control group

Test Statistic[s]	
	Post-Test Measurement Pre-Test Measurement
Z	-1.342[b]
Asymptotic sig. (bilateral)	.180

It is observed that the asymptotic significance is greater than 0.05; therefore, it is concluded that the results of the questionnaire applied to the control group in the pre-test and post-test moments did not produce relevant changes; in summary, the merchants in this group continue with the fear and uncertainty that prevents them from using electronic wallets.

On the other hand, different results were obtained in the experimental group, as shown in the following table:

Table 5: Incidence between the pre-test and post-test of the Control group

Test Statistics	
	Post-Test Measurement Pre-Test Measurement
Z	-6.771[b]
Asymptotic sig. (bilateral)	.000

In this case the asymptotic significance is much lower than 0.05, that is to say that in this group there is a very noticeable incidence between before and after the programmed training, in other words, the merchants who attended and accepted the continuous follow-up, already use at least one electronic wallet for their respective businesses, thus achieving greater efficiency in their commercial transactions, allowing them to increase their sales gradually, since generally, tourists use electronic tools for their purchases.

5. Discussion

According to the results obtained, the hypothesis is validated, since the implementation of a training program on the use of electronic wallets does have a positive impact on the commercial transactions of SMEs. After the training and continuous follow-up, it was noted that the level of commercial transactions gradually increased, since more clients are being attracted every day.

The results show that the sales income regularly received by the businesses is relatively low, and that women represent most of the salespeople who do not know how to use an electronic wallet according to the survey, due to their low level of education. Likewise, the age of the merchants is not a differentiating criterion in the level of knowledge of electronic wallets, since according to results the ages of the respondents vary between 18 and 53 years old. This is in line with the research of Manrai et al. (2021), which found that semi-rural women present problems in adopting new technologies related to finance, since if they do not have facilities and training available, they will not be able to learn to use digital payments. It is also aligned with Mavale et al. (2020), who mention that regardless of the age of the users, their behavior and preferences are the same due to their simplicity of use.

It is observed that, after some time of their use, the level of commercial transactions gradually improved according to the result obtained by applying the Wilcoxon test, since thanks to the various benefits such as their simplicity of use, the zero commissions charged by these electronic tools for their use, the speed of the transactions as they are immediate, avoiding loss of time, they allow merchants to adapt quickly. It is identified with the study by Wie et al. (2023), where they mention that thanks to the short transit time of money and the minimum distribution costs, it helps to ensure that a higher percentage of customers are captured. In the same

line, Márquez (2016) says that, as there is greater confidence in the use of digital payments, being faster and safer, it allows to reach a greater number of customers, achieving customer loyalty. It is also supported by the research of Putri and Sumitra (2020), where they found that the use of electronic wallets has a positive impact on sales, because of which sales become easier, faster and more efficient.

This allows them to grow economically and develop in line with the emergence of new technologies in the world.

6. Conclusions and Recommendations

It was determined that the use of electronic wallets has a positive impact on the commercial transactions of SMEs, considering that sales revenues gradually increased as it allowed merchants to capture a greater number of customers for all the benefits that their use brings, therefore, it is absolutely necessary that all large and small businesses learn to use at least one electronic wallet with the help of training and monitoring, so that in this way they continue to capture more local and international clientele.

It was found that the level of knowledge about the use of electronic wallets by SMEs in the city of Otuzco is almost nil, since, although it is true that more than half of those surveyed have heard of these tools at some point, almost all of them are unaware of their use and benefits. Therefore, it is concluded that there are businesses that do not use electronic wallets in their operations due to lack of knowledge.

It was identified that there are several factors that affect the adoption of electronic wallets, but the main one is the fear of cybercrime and distrust in the use of these tools; therefore, it is concluded that as long as they are not made aware of their correct use, they will continue with this fear, being unable to use them.

The impact of the training on the use of electronic wallets for SMEs in Otuzco is positive, since after the merchants who attended the training (experimental group) put into practice what they learned in their businesses, they noticed that the use of these tools helps to increase their sales, to make it easier to manage money for collections and payments, which allows them to enhance their economic activities, so it is considered essential to train entrepreneurs on these technological issues that help the sustainable development of their businesses.

From Potential to Action: Strategies for Supporting Female Founders in the Pre-Start-Up Phase

Thérèse Schmutz, Dario Meyer, Daniel Merz and Rolf Meyer
University of Applied Sciences and Arts, Northwestern Switzerland

therese.schmutz@fhnw.ch
dario.meyer@fhnw.ch
daniel.merz21@gmail.com
rolf.meyer@fhnw.ch

Abstract: In today's global economy, the role of start-ups is recognized as crucial for a country's competitiveness. Creating a supportive entrepreneurial ecosystem is therefore essential to enable founders to realize their potential optimally. Notably, there is a significant gender disparity in start-ups, suggesting a vast untapped entrepreneurial potential among women. This research aims to enhance the utilization of female start-up potential by providing actionable recommendations, based on an empirical analysis of the pre-start-up process of (potential) female founders. Through a qualitative research methodology, this study investigates the factors influencing women's journey towards entrepreneurship, considering diverse biographies and life situations. Interviews with ten women showed the complexity of the pre-start-up phase and the necessity for a broad support system. The study identifies several key areas for action to foster female entrepreneurship. Firstly, increasing awareness and visibility of self-employment as a viable career path for women is crucial, requiring more female role models and media representation to challenge traditional gender roles and stereotypes. This could cultivate a natural inclination towards entrepreneurship and sectors with high start-up activity. Moreover, lessening the disproportionate burden of family responsibilities on women is essential, suggesting enhancements in childcare facilities and encouraging shared domestic duties. The research further suggests the implementation of support programs to reduce barriers and provide a realistic view of entrepreneurship, alongside the potential benefits of mentorship in both pre- and post-start-up phases. Women's risk-averse, cautious approach in the pre-start-up process often leads to hesitance in developing innovative projects. Encouraging a focus on market needs and early engagement with potential customers, alongside proactive network building, seeking co-founders, or outsourcing, can address knowledge gaps and reduce uncertainties, making self-employment a more attractive option. This study emphasizes the importance of a collaborative effort among various stakeholders in the entrepreneurial ecosystem to unlock the entrepreneurial potential among women.

Keywords: Female entrepreneurship, Gender disparity, Pre-start-up process, Entrepreneurship ecosystem, Start-up support, Entrepreneurial tendency

1. Introduction

Entrepreneurs play a pivotal role in creating new jobs, driving structural change, and fostering economic drivers for innovation and technological progress, especially in growth and technology sectors (Danko, 2018). Despite the recognised potential of female entrepreneurship, women consistently account for only one third of entrepreneurial activity in Switzerland (Baldegger et al., 2020). And the share of entrepreneurs in the overall female working-age population has remained stable at 6-7% for the past 30 years, while the share of men is significantly higher (Bundesamt für Statistik, 2020). This suggests a significant untapped potential among women, where targeted investments and initiatives could lead to substantial economic benefits (Allen et al., 2008). Furthermore, there are also societal reasons to address the gender gap in self-employment, given the legal anchorage of gender equality in Swiss law since 1981 (Bundesamt für Statistik, 2013). Nevertheless, women continue to face greater constraints on their career development opportunities, as evidenced by their under-representation in managerial positions and lower rates of self-employment (Leicht & Welter, 2004).

The gender gap in entrepreneurship is particularly pronounced in Switzerland, indicating a need for further exploration and intervention (Elam et al., 2019). This study aims to bridge the gender gap in entrepreneurship by exploring how Switzerland can better leverage female entrepreneurial potential. It seeks to offer actionable recommendations based on an empirical investigation of the pre-founding process among women. The research will explore various paths to self-employment, identify obstacles women face before starting a company, and analyse these challenges in a contextual framework. The main research question is: *How can the entrepreneurial potential of women in the pre-startup phase in Switzerland be unlocked?* Based on this, the following sub-questions were included:

- What triggers the *inclination* towards entrepreneurship among women?
- Which *goals and motives* do women pursue in becoming self-employed?
- What *obstacles* do women encounter in the pre-startup process?

- What is the impact of different (gender-specific) life situations and environments?
- Under what *conditions* do women become entrepreneurs?
- What potential for action and *support* are there in the pre-start-up process?

This research does not aim to explain why fewer women than men embark on entrepreneurship. It focuses on the female pre-founding process to better understand and harness women's entrepreneurial potential.

The research is structured int seven sections. The literature review explores the determinants of the lower rate of female founders. The methodology starts with the developed theoretical framework and introduces the qualitative approach chosen. In the results section the research questions are answered and discussed. The last two sections close the paper with recommendations and directions for future research.

2. Literature Review

Entrepreneurship has historically been seen as male-dominated (Brush, 2008, S. 611), while the field of female entrepreneurship, which has only developed in recent decades, still requires considerable research. Previous studies have mainly focused on descriptive, quantitative comparisons based on statistical indicators. For this reason, the need for qualitative research approaches that consider personal circumstances, social and professional conditions as well as individual intentions for success and motives for starting a business is increasingly being emphasized (Ettl, 2010; Henry & Foss, 2016; Paoloni & Serafini, 2018).

Many studies examine the "outcome" of start-up activities and often highlight differences between male and female founders. Even if this study does not aim to make a direct comparison on a gender basis, such studies offer valuable insights. Shinnar et al. (2018) found that gender influences the relationship between entrepreneurial intentions and actions, and that lower social expectations and environmental support contribute to women being less likely to start businesses despite their intentions. When self-employed, women are often solo entrepreneurs, employ fewer staff than men and concentrate on smaller businesses, which is partly attributed to the demands of childcare and leads to higher levels of part-time self-employment (Bergmann et al., 2014; Leicht et al., 2004). Despite similar survival rates of businesses founded by women, these businesses tend to have lower turnover, lower growth and fewer investments than those founded by men (Brush, 2008; Du Rietz & Henrektson, 2000).

There are several determinants of the lower female start-up activity. One is the entrepreneurial tendency and the motivation. All studies show a higher propensity and motivation among men than women (e.g. Sieger et al. 2019; Engels, 2020). Another factor is the recognition and development of business opportunities. The literature shows that men more often identify these opportunities and that they are more innovative (Gonzalez-Alvarez & Solis-Rodriguez, 2011; Baldegger et al., 2020). This is reflected in the number of women in scalable and highly innovative start-ups, where only 12.8% of founders are women (Schatt, 2024). Also, the background of a person plays a role. One the one hand, university graduates found more often than people without university degree. By now women have more university degrees then men (Bundesamt für Statistik, 2016). Therefore, this should not play a significant role going forward. However, men are over-represented in technical subjects at university, which is where many of the innovative start-ups come from. The second pillar when looking at the background is management and leadership experience. Founders have in average a high level of experience. As women are still under-represented in management roles, they have less opportunities to gain skills that are also valuable for self-employment (Bergmann et al., 2014; OECD, 2016).

Also, a determinant is the personality traits and the self-perception. It is consistently shown that women rate their abilities significantly lower than men. (SECO, 2008; OECD, 2016; Baldegger et al., 2020). In Switzerland, around 20 per cent more women than men consider their entrepreneurial skills to be insufficient for self-employment (Baldegger et al., 2020). Regarding the female start-up rate, this is aggravated by the fact that women have a slightly higher fear of failure (SECO, 2008; OECD, 2016). A main thrust that is also reflected in the statements of the qualitative study by Tchouvakhina (2004), in which women are generally described as more anxious and insecure.

As the main burden of household and family work is still borne by women, it can be assumed that self-employment among women is significantly more influenced by family circumstances than among men. Family-related factors - limited to the pure probability of starting a business - can have both an inhibiting and a promoting effect. On the one hand, a considerable proportion of self-employed women strive to achieve a better work-life balance through greater flexibility in terms of location and time. On the other hand, family obligations represent an obstacle to starting a business, especially in resource-intensive business models (Lauxen-Ulbrich et

al., 2004). Female founders without kids work in average six hours more than mothers, while there is no difference among male founders with and without kids (Hirschfeld et al., 2019).

3. Theoretical Framework

This study takes the gender gap in business start-ups as an opportunity to analyse the pre-start-up process in more detail from a female perspective. Based on two equally large gender groups of working age, there is a disparity of around one third at the end of the pre-start-up process. Accordingly, this period needs to be analysed more closely to promote female start-up activity.

The pre-foundation process is to be understood as part of the foundation process, which is itself part of the overall company life cycle and ends with the formal founding act (Welter & Bergmann, 2002). As only a fraction realises their intentions, the start-up process is presented as a funnel. The large number of influencing factors and the high level of complexity within the pre-start-up process make it more difficult to identify the main start-up obstacles that can result in the start-up project being cancelled. Therefore, a theoretical framework was developed specifically for this study, which is shown in Figure 1. The pre-foundation phase was modelled as a serial, multi-stage process. The aim of the theoretical framework is to theoretically illustrate various stages in the pre-foundation-process that can be differentiated from one another to better categorise the various influencing factors and their interdependencies. It should be noted that the developed pre-startup process is a theoretical, ideal-type model, which is unlikely to be linear or continuous in practice.

Pre-start-up-process as theoretical framework

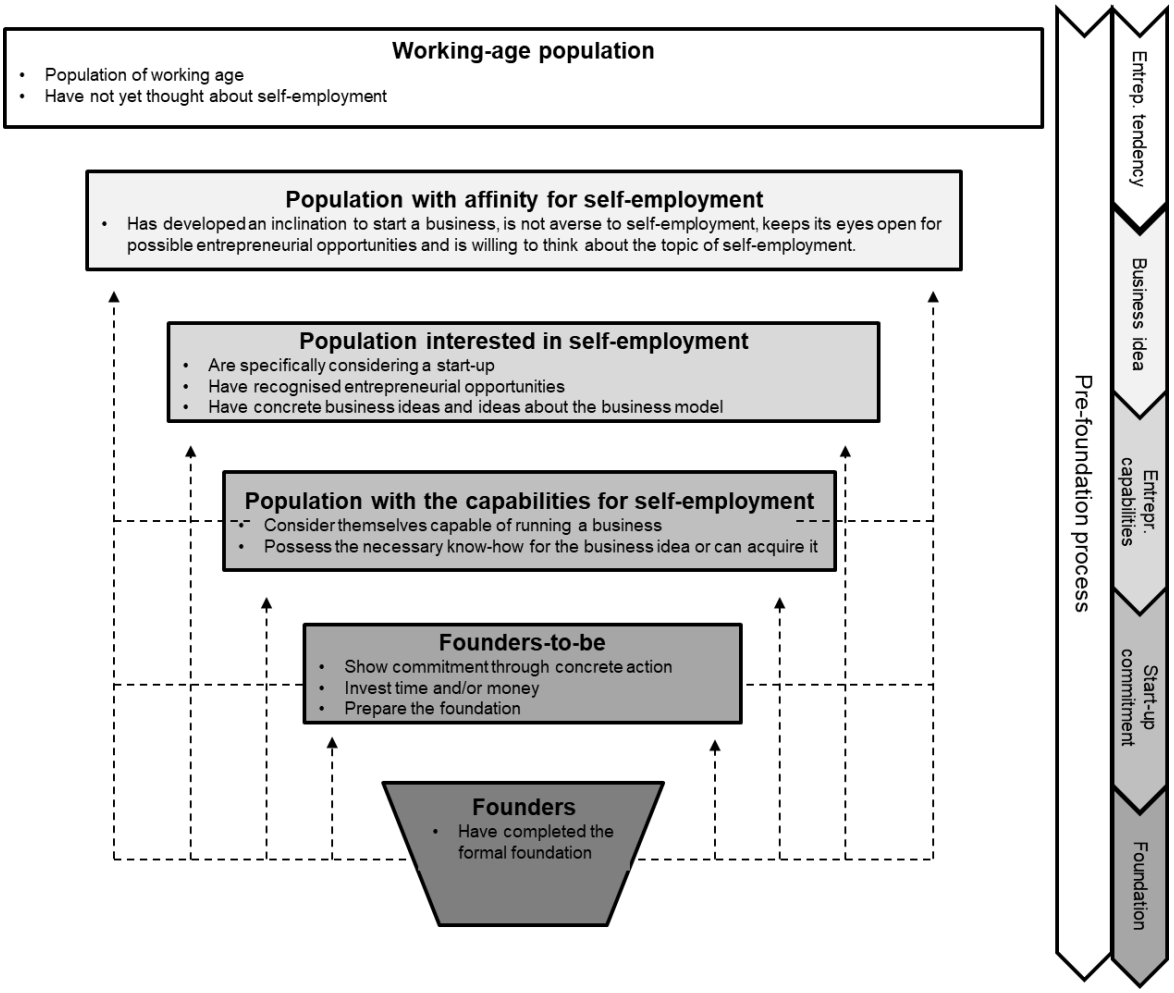

Figure 1: Pre-start-up process (own figure)

4. Methodology

This study adopts a qualitative methodology to investigate the pre-founding process from a female perspective, which enables an in-depth exploration beyond mere statistical differences, focusing on personal, biographical, and contextual factors.

Research Design. A qualitative framework is chosen to closely examine the difficulties of the pre-founding process, prioritizing a contextual and case-specific analysis. This method is well-suited for addressing the multifaceted and under-researched aspects of female entrepreneurship, allowing for a detailed understanding of individual experiences and societal influences.

Sampling and Field Access. The study targets women of working age in the German-speaking part of Switzerland who are at the different stages of the pre-founding process. The selection process aimed for diversity among participants, including founders, aspiring founders, and those who discontinued their projects, while considering socio-demographic characteristics.

Data Collection. Data was collected through ten interviews, employing a semi-structured interview guide that allows flexibility for participants to express their views while ensuring focused exploration of the research themes. This method facilitates a comprehensive understanding of the pre-founding process from multiple perspectives, emphasizing openness and reflexivity in the interview process.

Data Analysis. Interviews were transcribed and analysed using Atlas.ti9 software. This involved a categorization, starting with main categories derived from the theoretical framework and refining through sub-categories emerged from the data. The analysis aimed to maintain a balance between a detailed examination of individual cases and the identification of broader patterns and themes.

5. Results and Discussion

Based on the results from the interviews the research questions were answered.

What triggers the inclination towards entrepreneurship among women?

Among the women surveyed, the inclination to start their own business was triggered in various ways. Two of the women stated that they had a lifelong affinity for self-employment and always considered it as a normal career option. In one case, the inclination to start a business was triggered by an innovative professional environment. One woman made a personal and professional assessment when her children reached school age. The remaining six women stated that their inclination to set up their own business was only triggered when they identified the idea of setting up their own business.

From the other statements made in the interviews, two other factors could be identified, which may have additionally influenced the inclination to start a business. On the one hand, seven of the women interviewed have a self-employed father. Although a large proportion of the women denied a parental effect on the propensity to start a business, a look at the literature suggests an influence, although unconscious. On the other hand, seven of the women also report that they were dissatisfied with their previous professional situation and in some cases relate this directly to the interest in starting a business. Although the motives mentioned were almost exclusively pull motives, there is an obvious connection between dissatisfaction with the job and the emergence of an inclination to start a business. The findings from the interviews show that it is difficult in many cases - even for the women surveyed themselves - to make a clear statement as to whether and since when they have had an inclination to start their own business. Influencing factors such as parental role models and dissatisfaction with the professional work situation can trigger a latent and unnoticed entrepreneurial interest without this being perceived as a clear entrepreneurial inclination by the women themselves. A clear distinction between push and pull start-ups, as is sometimes made in the literature, does not apply to the majority of the samples analysed. Rather, entrepreneurial interest seems to stem from a combination of factors, with job dissatisfaction playing a central role.

The participants themselves see the main reasons for the lower propensity to start a business among women in the societal role models for women, the lack of entrepreneurial role models, and in the media, where successful women are portrayed as deviant from the norm and associated with masculine attributes.

Which goals and motives do women pursue in becoming self-employed?

When asked about the motives for self-employment, almost all women cite motives that can be subsumed under the terms self-determination and self-realisation. These include specific statements such as being their own

boss, being able to make their own decisions, being independent, having freedom and realising their own ideas. In many cases, these are goals and wishes that remained unfulfilled at the previous job.

For three women, social considerations also played a role in their start-up plans, while none of the women mentioned financial motives or a high income. Some of the women also see certain advantages in self-employment in terms of flexible working methods in connection with childcare. Others hope for a greater variety of topics and a faster realisation of ideas. All of the seven women with self-employed parents decided against taking over their parents' company or never even considered it.

How were the entrepreneurial opportunities identified?

The identification of entrepreneurial opportunities was also very case-specific. In principle, two different development patterns can be recognised as to how the business ideas were identified. These range from unexpected revelations and increased awareness to the active and targeted search for entrepreneurial opportunities.

An existing entrepreneurial tendency, which can itself be caused by various factors as described, is primarily responsible for whether entrepreneurial opportunities are sought or pursued at all. The intensity, duration and scope of the search influence how, where and for how long the search is conducted and therefore have a positive effect on the probability of finding an opportunity. The intensity of the search is determined by the degree of job dissatisfaction and the lack of career alternatives. The duration of the search depends on when the entrepreneurial inclination was triggered.

However, individual statements from the interviewees also show that start-up ideas can also be found quite unexpectedly, without prior searching. The start-up idea can be brought to the attention of potential female founders both by chance and by third parties from the network. Whether and for how long the start-up idea is pursued depends on the one hand on the career alternatives and on the other hand on further obstacles and impediments in the further course of the pre-start-up process.

What obstacles do women encounter in the pre-startup process?

A majority of the participants are very self-critical of their abilities and that this represents a certain uncertainty in the pre-start-up process, especially with regard to future sales. The women identify sales as an important success factor for self-employment but are unsure whether they will be able to confidently market their services. Self-confidence, in-depth knowledge, and positive feedback appear to be very important to gain the necessary security and self-confidence.

In this context, other women point out that they were able to reduce and overcome their uncertainties through early customer surveys, extensive market and competitor analyses or by contacting potential business partners. Positive feedback from specialists or doing well in competitions was also described as a motivational boost in the pre-start-up process.

A large workload, doubts about setting boundaries, and the financial risks were often seen as barriers in the pre-start-up phase. Predominantly, these inhibiting factors are personality traits. Skill and knowledge gaps, particularly in administration, law, or accounting, are also cited as barriers, but as ones that can be overcome. Starting a business as a team is seen as beneficial, as the complementing skills can be crucial for covering knowledge gaps. All surveyed women favoured founding in a team than solo, with many viewing a co-founder as vital for success. Additionally, solo founders often use freelancers to fill knowledge gaps, manage order fluctuations, and offload undesirable tasks, which allows them to concentrate on core competencies.

Several women consider the transition phase from employment to self-employment to be a critical phase. Some women do not want to take any financial risks and prepare their start-up on the side, which exposes them to a lack of time. Others consider it more important to have enough time during the preparation phase and quit their job, which exposes them to a financial risk. Having a professional alternative, their family situation, the possibility of reducing their workload, a supportive environment and financial savings or their partner's income are relevant decision criteria for bridging the transition period.

What is the impact of different (gender-specific) life situations and environments?

The compatibility of work and family was often mentioned as an important influencing factor in relation to self-employment. Reports on this topic were very ambivalent. Some see self-employment as an opportunity to better harmonise work and family life through a flexible form of work. Others see the described uncertainties during the preparation and early phase as an inhibiting factor, which can intensify in combination with children in need

of care. This seems to be particularly the case with resource-intensive start-up projects. For this reason, individual female respondents tried to start a business before starting a family or only started after their children reached school age. It can therefore be assumed that a high workload in the family can have an inhibiting effect on resource-intensive start-up plans, especially if these occur at the same time.

Particularly in connection with children, but also otherwise, the importance of support from the partner or family environment was highlighted, which can take on childcare and household tasks and also provide mental and financial support. The importance of networks, which serve as a source of information for the women and can help them solve problems, was also mentioned.

Under what conditions do women become entrepreneurs?

There is no universally valid formula that sets out the conditions; however, various influencing factors and conditions can be recognised from the interviews. The professional alternatives in existing employment are to a certain extent in competition with self-employment. The decisive factor seems to be which form of employment is better suited to both professional and private goals and motives. Accordingly, this decision is based on an individualised weighing up of interests, which can cause the start-up project to be abandoned at all stages of the pre-start-up process.

If the decision is made in favour of self-employment, it is very important to have a functioning business model and to know who the paying customers are. In addition, there must be confidence that the challenges ahead can be mastered with one's own skills. If this is not the case, it must be possible to compensate for deficits and gaps in knowledge either through potential co-founders or by outsourcing work. It must be possible to either bridge the income gap or solve the problem of the double time burden and to reconcile the start-up project with any family requirements in terms of time and finances. The support of the partner and family also appears to be an important prerequisite for the start-up project to be realised.

What potential for action and support are there in the pre-start-up process?

Most respondents were positive about the existing services, although some potential for improvement was pointed out. Attention was drawn to the lack of role models, which could encourage women to set up their own business and support in the pre-start-up process. Also, the underrepresentation of self-employed and successful women in media coverage and the fact that, in the event of coverage, they are often connoted as deviating from the female norm and with male attributes.

The attended support programmes and courses were mostly rated positively. However, many women would like further support, for example in the form of a mentor as independent advisor in the pre- and post-start-up phase. In some cases, it was pointed out that the focus of counselling in the private sector is on selling the service, which led to doubts about the objectivity of the advice. An open and honest discussion about entrepreneurship is desired that does not unrealistically glorify it and allows talks about the downsides. Reports on failed start-up projects are also seen as useful to learn from mistakes and gain a realistic insight into self-employment.

Many women see potential in the search for suitable co-founders. The majority looked for co-founders in their known professional, school or private environment. However, it was also pointed out that knowing the co-founder was not a mandatory requirement. Various women therefore see potential in digital search options for co-founders.

5.1 Adapted Theoretical Framework

Based on the literature and the findings from the empirical data, the theoretical framework presented in section 3 was supplemented with the influencing factors for each stage of the pre-foundation process, shown in figure 2. Influencing factors with a plus sign have a positive effect on progress in the pre-start-up process, while factors with a minus sign have an inhibiting effect. The professional alternative was assigned to the start-up idea stage, as its influence is greatest at this stage. However, as shown, this factor has an impact on the entire pre-start-up process, where the two forms of employment are constantly weighed up against each other.

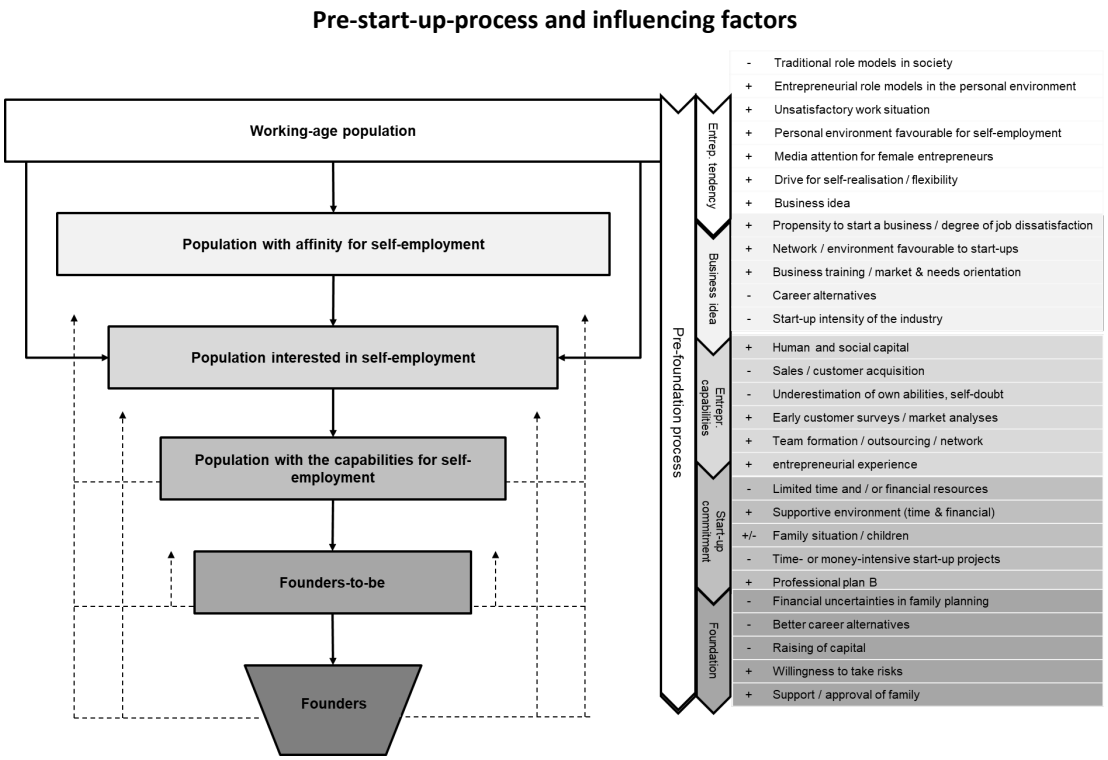

Figure 2: Pre-start-up process and its influencing factors (own figure)

6. Recommendations

Based on these findings, the following opportunities were identified to better support female founders-to-be. The measures and strategies for raising the proportion of female founders targeted at the pre-founding phase are addressed towards potential founders, entrepreneurs, educational institutions, start-up support institutions, governmental bodies as well as society.

For potential female founders

- Establish and maintain professional contacts early on. Think ahead about topics relevant to your founding project and how to acquire necessary knowledge, e.g. through leveraging women's networks.
- Confident decision-making: Acknowledge that men may market their services more confidently than women. Consider this when making decisions and do not restrict your own potential.
- While seeking entrepreneurial opportunities, do not focus solely on your qualifications and experiences. Pay attention to unmet market needs from the perspective of potential customers and consider how you can fulfil these needs.
- Reflect on your business model early in the process. Identify your paying customers and engage with them and partners as soon as possible.
- View missing knowledge or skills not as overwhelming barriers. Explore partnering with co-founders, tapping into your network, or outsourcing certain tasks, for example to freelancers.
- Insist on active involvement from your partner in household and childcare responsibilities. Strive to create conditions that allow both partners to thrive professionally and personally.
- Think about starting a business with your partner. Mutual support, understanding, and the combination of professional and personal synergies have been highlighted as beneficial.
- Be confident in your abilities. View any unsuccessful venture not as a failure but as a valuable experience that will aid your professional and personal growth.

For Female Entrepreneurs

- Share your journey as a female entrepreneur, highlighting your successes and experiences. Support other women in the pre-founding phase by sharing the advantages and challenges of entrepreneurship transparently and how you overcame these challenges.

- Serve as role model as an inspiration for future generations, especially girls and young women. Discuss why you chose self-employment and highlight aspects of your entrepreneurial journey that differentiate from male stereotypes.

For Educational Institutions, Start-up Support Initiatives, and Governmental Bodies

- Offer training and support programs with a practical focus to build entrepreneurial skills and reduce uncertainties regarding self-employment.
- Actively create opportunities for female role models in education, including professorships, teaching materials, case studies, and guest lectures.
- Use current or former entrepreneurs to serve as mentors to guide female founders through process.
- Promote team founding for women and develop (virtual) platforms for finding co-founders. Enhance physical and virtual spaces for entrepreneurs and innovative companies to meet and benefit from mutual support and synergy.
- Implement measures to attract more women to fields and studies traditionally dominated by men, thereby increasing female entrepreneurial activity.
- Introduce more awards and competitions specifically designed to support innovative and resource-intensive ventures by women, offering not only financial support but also networking opportunities and feedback from experts.
- Incorporate the concept of self-employment into compulsory education to normalize it as a career option from an early age. This could help foster intrinsic entrepreneurial inclinations among all children, not just those with entrepreneurial family backgrounds.
- Include entrepreneurial competencies, negotiation, sales, and strategic thinking in the curriculum to promote entrepreneurship and ensure the acquisition of skills traditionally associated with male entrepreneurs.

For Society and Policy

- Expand part-time and flexible working models in leadership positions to enable women to acquire entrepreneurial skills while managing family commitments.
- Ensure balanced media coverage of entrepreneurship that portrays successful women entrepreneurs without reinforcing stereotypes.
- Address traditional gender roles and stereotypes by creating opportunities for female role models in male-dominated professions and promoting equal sharing of employment and family responsibilities.
- Consider subsidies for childcare or tax policies favouring dual earners to support women's professional careers.
- Encourage men to contribute to family responsibilities, enabling women to pursue their professional aspirations. Advocate for gender-neutral parental leave policies to facilitate equal sharing of professional and familial duties.

7. Conclusion

This research focused on the under-researched pre-start-up process of women in Switzerland and aimed to develop recommendations for action to better utilise the start-up potential of women. The literature highlights the need to consider various influencing factors not in isolation, but as part of an integrated whole in order to understand their complex interactions. Therefore, a qualitative research approach was chosen that makes it possible to analyse the pre-start-up process. A theoretical framework was developed that divides the pre-foundation process into different phases and helps to systematically structure the influencing factors. Despite certain limitations, this framework has proven useful for systematically collecting and analysing the data. The research identifies a variety of influencing factors and barriers affecting women in the different stages of starting a business.

Future research could focus on women that have abandoned their entrepreneurial ventures. The primary data collection highlighted the challenge of these women. Exploring the reasons behind these decisions could offer valuable insights for supporting potential female entrepreneurs. Also, the number of interviews was rather small. A broader, quantitative study based on the recognized factors could deepen the understanding.

There are several limitations to this study. Firstly, as mentioned above, the number of interviews was limited. Secondly, most of the founders had an academic degree, which may lead to different findings than for women without a degree. Thirdly, participation was voluntary. The study may therefore be subject to selection bias, as

only people who were willing to talk about their experiences were included. Finally, the study has a narrow geographical and therefore cultural focus. This does not allow for generalization in other contexts.

Towards Health 4.0: Blockchain-Based Electronic Health Record for Care Coordination

Abstract: Inter-organizational data sharing in healthcare is fraught with challenges, including diverse healthcare terminologies, incompatible data structures, and issues with data consistency and security. Establishing a unified patient record across a data-sharing network is problematic, and centralized data stores and authority providers are prime targets for cyberattacks. This study proposes a blockchain-based patient data-sharing strategy that relies on network consensus rather than a single, centralized source of trust. The consensus is based on evidence of both structural and semantic interoperability. The primary objective is to develop secure and controlled data-sharing mechanisms that enhance care coordination. The research utilized Kanban as the software development methodology to manage the project effectively. The study found that blockchain-based electronic health record (EHR) systems significantly enhance care coordination by enabling seamless data transfer and fostering trust and collaboration among healthcare providers. Key findings include improved data consistency, enhanced security, and increased interoperability across diverse healthcare systems. These results suggest that blockchain technology can play a crucial role in transforming healthcare delivery and improving patient outcomes in the context of Health 4.0. This work contributes to the ongoing discussion on leveraging blockchain technology to revolutionize healthcare systems, offering a robust framework for secure and efficient data sharing that can lead to better healthcare delivery and patient care outcomes.

Keywords: Blockchain, Distributed ledger, Permissioned, Electronic health record, Health 4.0, Care coordination

1. Introduction

The integration of digital technologies into healthcare systems, often referred to as Health 4.0 (Radanliev et al, 2020), has the potential to revolutionize patient care, clinical outcomes, and operational efficiencies. Among the emerging technologies, blockchain stands out as a promising solution for transforming electronic health record (EHR) systems and enhancing care coordination Blockchain technology presents a viable way around the drawbacks of the existing EHR systems. Blockchain is a decentralized distributed ledger system that uses multiple computers to keep track of transactions in a way that prevents tampering and makes the data recorded unchangeable (Ncube et al, 2022). Blockchain technology can protect private medical data from breaches and illegal changes by generating a tamper-proof and secure ledger. By giving people authority over their health information, this promotes trust. Additionally, by bridging the gap between incompatible EHR systems and enabling seamless data transmission between providers, blockchain can enhance care coordination. Ultimately, blockchain can transform EHRs into a more secure, patient-centered, and efficient health information management system (Careline and Godhavari, 2022). The majority of medical data is stored in silos, each having a unique storage architecture and descriptive interpretation (Gupta et al, 2020). Due to this reality, it is challenging to create an interoperable electronic health record exchange or archives or even to easily and securely transmit clinical data to patients, providers, and other stakeholders. Within the same health system, various providers may keep separate sets of patient demographic data. There are redundant tests. There is little prescription data, which raises the possibility of adverse drug reactions. Doctors cannot make treatment suggestions in light of historical circumstances. Data from multiple sources must be manually compiled by population health and case managers to create an accurate picture of a patient's overall health. Since modern technology has advanced so quickly, health institutions have realized how important it is to use and share data. This emphasizes how crucial data privacy is. With the use of blockchain technology, each participant is guaranteed to have a copy of the digital ledger, which is updated instantly as transactions take place. The absence of a centralized server makes hacking all but impossible. The ledger is an unchangeable source of truth since, in theory, a recorded transaction cannot be undone (Careline and Godhavari, 2022). In light of these problems, this research paper proposes a blockchain-based electronic health record (EHR) system aimed at improving care coordination by providing secure and interoperable platforms for sharing patient information among healthcare providers. The objectives of this study are to develop a controlled private data management system using a distributed ledger for capturing patient medical records securely and efficiently. The objectives

of the proposed system are to capture patient medical records, to book appointments for patients, and to view and manage those appointments.

2. Literature Review

Health 4.0 has immense potential to enhance clinical results, patient care, and operational effectiveness. Blockchain is one of the cutting-edge technologies that could completely transform care coordination and electronic health records (EHRs). To improve care coordination, this literature review examines the opportunities and problems associated with deploying blockchain-based EHR systems.

2.1 Challenges of Traditional Electronic Health Records

While there are many benefits to using Electronic Health Records (EHR) in healthcare, there are also specific challenges that must be resolved such as interoperability, data security and privacy, and data quality and integrity. The smooth transfer of health information between various systems is still hampered by interoperability problems (Afza et al, 2021); (Gupta et al, 2020). The communication between various EHR systems is hampered by the lack of defined formats and protocols, which might compromise patient care by causing patient data to become fragmented (Afza et al, 2021). (Afza et al, 2021) raised concerns over the protection of sensitive patient data held in electronic health record (EHR) systems due to persistent security and privacy issues. The reliability of EHR systems is further impacted by the problem of preserving data correctness and integrity. There may be anomalies, errors, and discrepancies in the data.

2.2 Blockchain Technology in Healthcare

Blockchain technology has emerged as a promising solution to addressing the challenges of traditional EHR systems (Afza et al, 2021). Blockchain offers a secured and decentralized system for managing health data, ensuring transparency, integrity, and accessibility while preserving patient privacy. This paper proposed an electronic health record-based which used a distributed ledger to store and manage medical records, records access logs, and access permissions.

2.3 Blockchain-Based Electronic Health Records for Care Coordination

Blockchain technology has demonstrated the potential to address the issues with conventional EHR systems. Blockchain provides a safe, decentralized framework for managing health-related information and protecting patient privacy while guaranteeing accessibility, integrity, and openness. Multiple studies have examined the possible uses of blockchain in the medical field. In their comprehensive assessment of blockchain technology in healthcare, (Durneva et al, 2020)(Jhamba et al., 2024) emphasized how it might improve patient-centered care, interoperability, and data security. Likewise, systematic reviews by and (Hunt et al, 2022) have shown how blockchain technology may be used to secure health data and advance health informatics. Blockchain-based EHR system implementation can significantly enhance care coordination by giving medical professionals access to a safe and reliable environment for exchanging patient data. Through the utilization of blockchain technology, healthcare institutions can ensure the integrity, security, and accessibility of patient data, thereby enhancing care quality and patient outcomes. (Gupta et al, 2020) proposed an interoperable healthcare system using blockchain technology, emphasizing its potential to improve data sharing and care coordination among healthcare providers. Similarly, (Molde et al, 2020) explored the use of blockchain for EHRs, highlighting its ability to enhance data security, integrity, and patient privacy.

While blockchain technology offers significant potential for transforming EHR systems and care coordination, several

challenges and opportunities need to be addressed. (Kiania et al, 2023) conducted a comprehensive investigation of blockchain technology in healthcare, identifying challenges such as scalability, interoperability, and regulatory compliance. However, they also highlighted the opportunities for leveraging blockchain technology to enhance data security, integrity, and patient engagement. (Taherdoost, 2023) carried out a comprehensive examination regarding blockchain technology in healthcare, identifying emerging trends, challenges, and future directions. They emphasized the need for further research and innovation to address the scalability, interoperability, and regulatory challenges associated with blockchain-based EHR systems.

2.4 Existing Blockchain Implementations in EHR

In this section, we discuss various blockchain-based EHR systems, their features, and their weaknesses.

2.4.1 Medrec

Medrec is an EHR developed by researchers at the Massachusetts Institute of Technology (MIT) for managing Electronic Health Records (EHR). It was designed to address the challenges of data fragmentation, security, and interoperability in healthcare systems (Kiania et al, 2023). Using blockchain technology, MedRec, specifically Ethereum, creates a decentralized and encrypted collection and sharing system for patient health records. Since Medrec is built using Ethereum as the underlying blockchain it takes all the challenges of Ethereum which are the cost of processing transactions and scalability

2.4.2 Medibloc

MediBloc is a public blockchain platform that has been used to develop an EHR system called MediBloc. MediBloc uses a consortium blockchain architecture and offers features such as data sharing, security, and privacy (Hort et al, 2021). The challenges of Medibloc are scalability and performance. As the number of participants and volume of data on the MediBloc platform increase, scalability, and performance become critical factors. Blockchain systems may face challenges in handling a large number of transactions and maintaining high throughput. Ensuring that the platform can scale effectively to accommodate growing user bases and data volumes is essential for its success (Hort et al, 2021).

2.4.3 GemOS

GemOS is a blockchain-based operating system designed for healthcare. It allows healthcare providers to securely access and share patient health-related data while ensuring patient privacy and data integrity. GemOS, like other blockchain-based systems, faces scalability challenges (Zhang et al, 2016). As the number of transactions increases, the blockchain becomes slower and more cumbersome to manage.

2.4.4 Patientory

Patientory is an EHR platform utilizing a distributed ledger that allows patients to manage their health records securely and access them from anywhere. It also permits safe patient information access for medical professionals and communication with patients in real time. Patientory and similar platforms face privacy concerns due to the visibility of all transactions on the blockchain. Protecting patients' sensitive health information becomes challenging (Xia et al, 2017).

2.4.5 Medicalchain

Medicalchain is a platform that allows patients to store and manage their medical data securely using blockchain technology. It provides patients with full control over who can access their health records and allows for easy sharing of data with healthcare providers. Medicalchain faces scalability challenges (Zhang et al, 2016). As the number of transactions increases, the blockchain becomes slower and more cumbersome to manage. In response to the scalability and privacy challenges identified in existing blockchain-based electronic health record (EHR) systems, this paper proposes a novel solution aimed at addressing these issues and enhancing care coordination in healthcare settings. Building upon the limitations of current blockchain systems, the proposed system presents an innovative approach to securely manage patient data while ensuring scalability, data privacy, and user control. Our solution leverages a private blockchain network to address privacy concerns, ensuring that sensitive health data is securely

stored and accessed only by authorized parties. By using a private blockchain, we can guarantee the confidentiality and integrity of patient information while maintaining transparency and auditability. In addition, our system utilizes multiple chains on the same network and a Proof of Authority (PoA) consensus mechanism to address scalability challenges. By distributing the information across multiple chains and using a more efficient consensus mechanism, we can significantly improve the speed and scalability of the blockchain network, ensuring that it can handle a large number of transactions efficiently.

3. Methodology

This section outlines the process and strategies utilized to achieve the project's goal of creating an electronic health record system using blockchain technology.

3.1 Research Methodology

Document analysis was the research methodology used in this study. It is a methodical way of going over and assessing different types of documents, both digital and physical formats. Document analysis is a qualitative

research method that entails carefully reviewing and interpreting data to derive understanding, extract meaning, and produce empirical knowledge (Corbin et al, 2008).

3.2 Software Development Methodology

For this research project, we adopted the Kanban methodology as our software development framework. Kanban is a visual and iterative software development approach that emphasizes continuous delivery and workflow optimization. It is based on the principles of visualizing work, limiting work in progress, focusing on flow, and continuous improvement (Anderson, 2010)

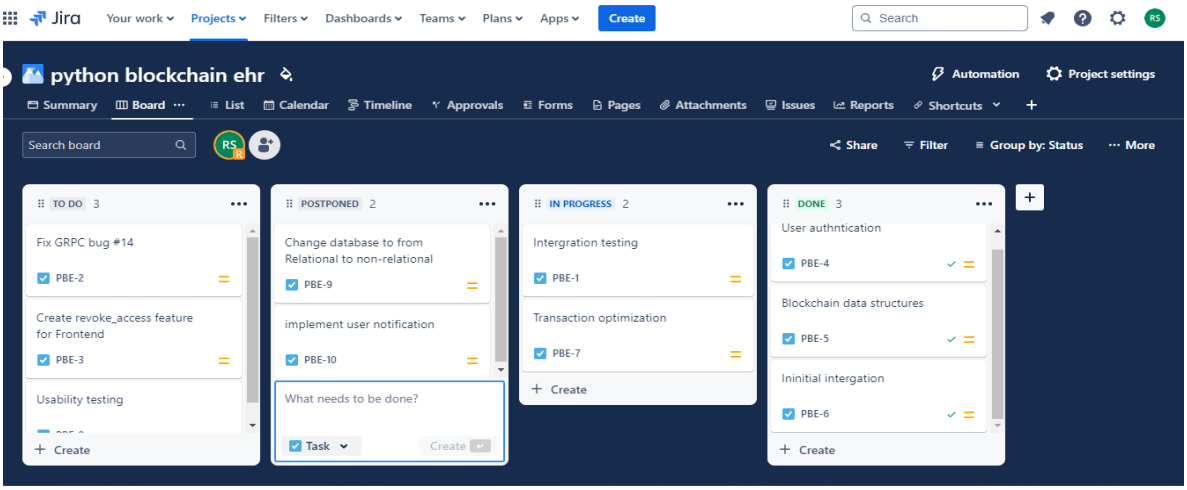

Figure 1: Kanban Board

In applying the Kanban methodology to our project, we utilized a Kanban board in Figure 1 to visualize our software development workflow. The board consisted of distinct columns denoting the waiting list, work in progress, completed, and testing phases of the development process. Tasks were represented as cards on the Kanban board, and team members were responsible for moving cards across the board as work progressed through different stages. Work-in-progress (WIP) limits were imposed on every step of the process to avoid excessive workload on team members and keep up a continuous workflow. Regular retrospectives were conducted to review the team's performance and identify areas for improvement. Using the Kanban methodology provided several benefits to our project. It improved visibility and transparency into the development process, enabling team members to monitor progress with ease of tasks and identify any bottlenecks or inefficiencies. The visual nature of the Kanban board also facilitated better workflow management and task prioritization, ensuring that the most important tasks were completed first. Overall, the Kanban methodology contributed to increased productivity and efficiency through continuous improvement.

Java was used to create the Android client of the blockchain electronic health record system, while Python was used to develop the distributed ledger and the RPC service that communicates with the Android client. Java is a widely used programming language known for its portability across platforms (Horstmann and Cornell, 2013). Python is a recommended language for blockchain development because of its recognition for readability and simplicity (Lutz, 2013).

3.3 Proposed Blockchain-Based EHR

Our proposed blockchain-based Electronic Health Record (EHR) system is intended to address the challenges of existing EHR systems while also using the benefits of blockchain technology to improve care coordination and patient outcomes. Key features include secure and private storage of patient medical records on a distributed ledger; scalable architecture utilizing a private blockchain network and a Proof of Authority (PoA) consensus mechanism; user-friendly interfaces for both healthcare providers and patients; and advanced security measures such as role-based access control and encryption.

3.3.1 System architecture

As part of the development process, a System Architecture Design is necessary to ensure a well-structured and organized system. Figure 2 shows the private and permissioned blockchain-based electronic health record system architecture, which uses a Proof of Authority (PoA) consensus mechanism.

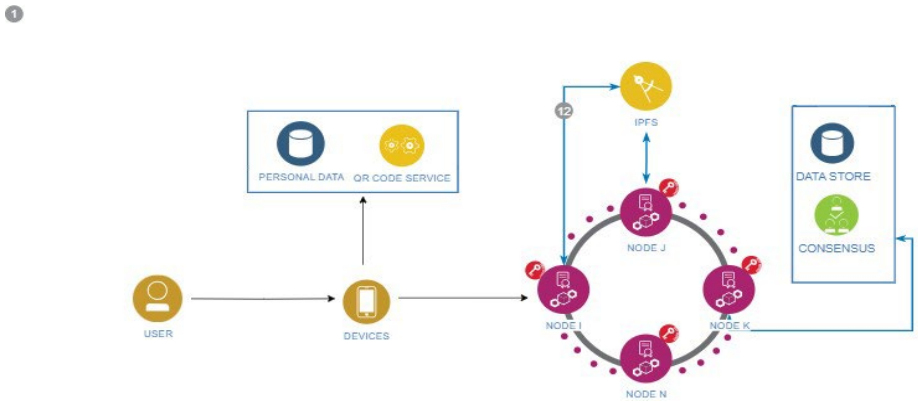

Figure 2: System architecture

The blockchain is private, ensuring that data is exclusively accessed by authorized entities within the network. This confidentiality is fortified by robust encryption mechanisms, notably RSA-SHA256, which provides data integrity and security. This encryption standard, widely recognized for its strength, safeguards sensitive health-related information. The system boasts a direct communication channel between the blockchain and mobile clients, facilitated by remote procedure calls (RPC). Personally Identifiable Information (PII) remains securely stored on mobile devices and off-chain databases, enhancing privacy and confidentiality. Patient-controlled access permissions further empower individuals, granting them control over their health data.

3.3.2 Functionality

Figure 2 depicts a blockchain-based system architecture for managing personal and health-related data, emphasizing security and distributed consensus. The user interacts with the system through devices that interface with a central data service. A key feature is the QR code service, which allows one person to scan a QR code on the owner's device, granting access to the owner's records. This service ensures secure and convenient access control. The Android application on the user device communicates with a decentralized network of nodes (Node I, Node J, Node K, Node N) that collectively maintain the blockchain. Each node participates in consensus algorithms to validate transactions, ensuring data integrity and consistency across the network. The system leverages the InterPlanetary File System (IPFS) for efficient, distributed data storage, connecting to the blockchain network. The InterPlanetary File System (IPFS) is a peer-to-peer hypermedia protocol designed to make the web faster, safer, and more open (Benet, 2014) Validated data is then securely stored in a dedicated data store, safeguarded by consensus mechanisms. This architecture ensures robust security, decentralized control, and high availability of personal and health data, providing a reliable framework for blockchain applications. Patients get to share their medical information with their care providers therefore, facilitating care coordination. Medical history is permanently recorded in the data store allowing for continued care even after switching care providers or hospital centers.

4. Results

This study investigates the development and deployment of a blockchain-based Electronic Health Record (EHR) system as a potential cornerstone for achieving Health 4.0 in healthcare delivery. We present the findings of our research, focusing on the system's performance, functionalities, and its capacity to address limitations inherent to traditional EHR systems. This section delves into the achieved milestones, optimizations implemented, and insights gleaned, emphasizing the transformative potential of blockchain technology within the domain of healthcare informatics.

4.1 Transaction Structure Snippet

Figure 3 shows the structure of the transaction that will be stored on the blocks of the blockchain. Each transaction type is stored on a separate chain, for example, permissions and records are stored on different chains on the same or different nodes enabling faster access to information by maintaining smaller spate chains. This makes the network faster in writing and reading transactions from the distributed ledger.

```python
@dataclass
class Transaction:
    """
    transaction_type : represents the node-type
    Not all transactions are stored on all nodes
    access logs - Node Type 1, access permissions - Node Type 2
    medical records - Node Type 3
    """
    transaction_type: str
    data: str
    metadata: str
    hash: str

    def __post_init__(self):
        self.hash = create_hash_default(self.data)

    def _from_dict(self, data: dict):
        self.type = data['type']
        self.data = data['data']
        self.metadata = data['metadata']
        self.hash = create_hash_default(self.data)
```

Figure 3: Code snipper showing transaction structure

4.2 HashChain Structure

Figure 4 shows that HashChain which will be stored in memory. The actual blockchain data can reach very large sizes which cannot be stored in memory. Storing references of the actual data in memory allows for faster searching and faster data access. The HashChain is also used to verify chains from different nodes to assess if they agree with each other without necessarily copying the whole blockchain and its data.

```python
@dataclass
class HashChain:
    chain: set()

    def add_block(self, block: HashBlock):
        self.chain.add(block)

    def find_block(self, block: str):
        return self.chain.count(block)

    def get_subset(self, o_chain) -> bool:
        return set(o_chain.chain).issubset(set(self.chain))

    def __le__(self, other):
        if isinstance(other, self.__class__):
            return len(self.chain) <= len(other.chain)

    def __lt__(self, other):
        if isinstance(other, self.__class__):
            return len(self.chain) < len(other.chain)
```

Figure 4: Showing Hashchain structure

4.3 User Interface

The electronic health record system has a user interface for doctors and patients. The doctor gets to update and view the patient`s records and the patient gets to view their records and give or revoke doctors` access to their records. The doctor and the patient share the same login screen where they enter their account details to access the electronic health record application on their mobile phone or tablet.

4.3.1 The doctor home screen

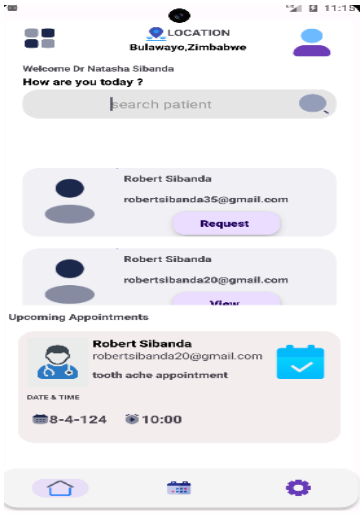

Figure 5: Doctor home screen

The home screen for the doctor is shown in Figure 5 where he/she searches for patients and gets to view or edit their records if he is permissioned. The doctor can also view his/her messages and notifications on the home screen. The doctors use the home screen to search for patients. The doctor can also submit a request for accessing patient records. The doctor can also accept or deny appointments from the home interface. All the upcoming appointments will be displayed at the bottom of the interface.

4.3.2 The patient home screen

Figure 6: Patient Home screen

Figure 6 shows the patient home screen where patients can view their doctors, and grant doctors access to their electronic records. The patient by checking or unchecking the View and Update button on a doctor`s card can add or remove permissions to a doctor to either view or update their medical records. Appointments will be shown at the bottom of the screen.

4.3.3 Health information screen

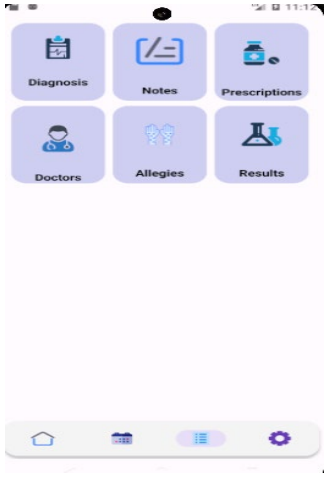

Figure 7: Health information screen

The health information screen in Figure 7 is used to view and update information on the selected patient. The doctor can add prescriptions, notes, alleges, laboratory results interpretations, and diagnoses. This screen can also be used to set an appointment for a patient.

The doctor has less functionality on their health information screen since they cannot add and update their records. They can be able to view their doctors, prescriptions, laboratory results, alleges, diagnoses, and notes from their doctors. Patients can give doctors permission to view and update their records by having them scan a QR code on their device. Doctors that have received permissions through scanning are given temporary permissions and those permissions can be revoked by the patient at any time. The Settings screen is also used to manage privacy and security settings such as changing passwords and enabling password protection of electronic health records.

5. Discussion

The results of this study demonstrate that our blockchain-based EHR system successfully addresses the scalability and privacy challenges faced by existing systems. By utilizing a private blockchain architecture and implementing advanced consensus mechanisms, we were able to achieve higher scalability and lower latency, while also ensuring data privacy and security. These findings have significant implications for the future of healthcare informatics and pave the way for the widespread adoption of blockchain technology in healthcare settings.

5.1 Performance Optimization Results

Several optimizations were made to improve the scalability and efficiency of the system. By implementing load balancing between nodes and utilizing the PoA consensus mechanism, we were able to significantly improve system performance. These optimizations resulted in higher transaction throughput and lower latency, enhancing the overall scalability of the system. Our proposed system addresses this scalability challenge by implementing shading and an off-chain storage mechanism. In our system, patient data stored on the blockchain includes only basic patient information along with an IPFS hash. This off-chain scaling solution reduces the volume of patient medical records stored directly on the blockchain.

5.2 Proposed Blockchain EHR System Latency

By storing less data directly on the blockchain, our system improves transaction speed as shown in Figure 8, the proposed system can process twice as many transactions per second as other blockchain EHR systems. Additionally, by utilizing IPFS, which stores data in a decentralized manner using a peer-to-peer network, we ensure that our system's security is not compromised while addressing the scalability problem.

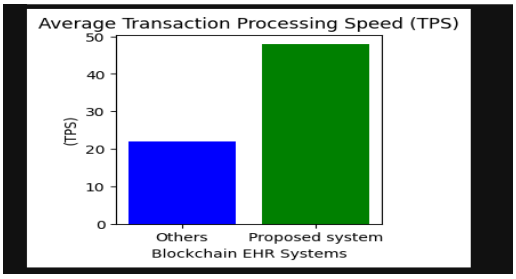

Figure 8: Proposed Blockchain EHR system latency

5.3 Challenges

Many Challenges were during the development of the blockchain-based EHR, among these was the imperative to implement robust security measures while concurrently ensuring scalability and speed. Balancing these requirements posed a significant hurdle, as stringent security protocols often impose computational overheads that can potentially hinder system performance. Additionally, maintaining data integrity and privacy amidst the system's expansion presented ongoing challenges. Scalability was crucial to accommodate the increasing volume of transactions and data, requiring careful architectural considerations to prevent bottlenecks and ensure seamless operation.

6. Conclusion

In conclusion, implementing an Electronic Health Record (EHR) system using a distributed ledger is a big step toward realizing Health 4.0 and improving care coordination in the healthcare sector. We have dealt with several of the issues associated with standard EHR systems, including data security, interoperability, and data integrity, by utilizing blockchain technology. We can raise patient outcomes, lower costs, and improve treatment quality by offering a decentralized, transparent, and secure platform for exchanging and storing health information. The delivery and management of healthcare will continue to be revolutionized in the future by more research and the use of blockchain-based EHR systems, which will ultimately result in a system that is more effective, efficient, and patient-centred.

7. Future Work

Future improvements for the blockchain-based Electronic Health Record (EHR) system outlined in this paper include enhancing the User Experience (UX) and User Interface (UI) design to improve adoption rates among

healthcare professionals and patients. Additionally, integrating the system with innovations such as AI (artificial intelligence) and the Internet of Things (IoT) have the potential to increase its usefulness. Continuously optimizing scalability and performance, establishing interoperability standards, and strengthening data privacy and security measures are essential steps. Real-world implementation and validation studies across diverse healthcare settings, along with cost-effectiveness and sustainability assessments, will provide valuable insights for broader adoption and long-term success. By addressing these improvements, the blockchain-based EHR system can evolve into a more robust, user-friendly, and widely adopted solution for enhancing care coordination and improving patient outcomes in the era of Health 4.0.

Empowering Future Entrepreneurs: Developing an Online Entrepreneurial Mentoring Program Across Diverse EU Regions

Katrin Singer-Coudoux, Henry Nicolai Buxmann and Markus Will
Fraunhofer Institute for Production Systems and Design Technology, Berlin, Germany

katrin.singer@ipk.fraunhofer.de
henry.nicolai.buxmann@ipk.fraunhofer.de
markus.will@fraunhofer.ipk.fraunhofer.de

Abstract: The 2023 European Innovation Scoreboard reveals that there is an innovation asymmetry between different EU regions which is leading to an innovation gap. In particular southern and eastern EU countries showcase a lower level of innovation compared to their northern and western counterparts. Addressing this disparity, the ENTRPRENEDU project, funded by the European Union, pioneers a unique approach tailored for emerging and moderate innovation regions. This paper presents the development process of the curriculum for the ENTRPRENEDU online mentoring program, detailing the demand analysis, curriculum development, and implementation phases. This paper contributes to the discourse on entrepreneurial online education and mentoring program development by showcasing a tailored approach to curriculum design. The findings offer practical insights for educators, policymakers, and practitioners seeking to nurture entrepreneurship and innovation in diverse regional contexts.

Keywords: Innovation, Entrepreneurship, Hackathon, Mentoring, Curriculum, Demand analysis

1. Introduction

The European innovation landscape is currently at a critical juncture, marked by increasing global competition (Abels and Bieling, 2023). The European Union (2023) states in the European Innovation Scoreboard (EIS) that despite notable progress, there remains a pressing need to bridge the innovation gap between European countries and regions. In particular southern and eastern European countries perform lower innovation activities compared to their western and northern counterparts. The EIS offers a comparative evaluation of the research and innovation performance among EU member states, as well as other European countries and regional neighbours. It clusters countries based on their innovation activities into four performance groups which are namely: Innovation Leaders, Strong Innovators, Moderate Innovators and Emerging Innovators. Countries that fall into the last two categories have an innovation score that is lower than the European Union average score. Hereby, Croatia, Slovakia, Poland, Latvia, Bulgaria and Romania are Emerging Innovators while Estonia, Slovenia, Czechia, Italy, Spain, Malta, Portugal, Lithuania, Greece and Hungary are Moderate Innovators.

The urgency to close the innovation gap extends to the development of educational programs and support mechanisms aimed at fostering the ambitions of young individuals and bolstering start-up growth. However, challenges such as knowledge disparities, available human resources, financial constraints, and the accurate use of information technologies are present in this dynamic environment (European Union, 2023). In this context, innovators, educational institutions, and entrepreneurs emerge as pivotal drivers of technological progress, economic prosperity and job creation (Blackwell, Cobb and Weinberg, 2002; Fritsch and Wyrwich, 2017). To fully leverage this potential, educational institutions should forge close partnerships with the industry, equipping students with the entrepreneurial skills necessary to navigate the rapidly evolving innovation landscape.

The ENTREPRENEDU project (Enhancing Entrepreneurial Ecosystems for Education), involving a consortium of eight European partners including Fondazione E. Amaldi, Fraunhofer IPK, EBAN, Corallia, Cleantech Bulgaria, F6S Network Limited, Luiss University, and the University of Thessaly, aims to enhance entrepreneurial ecosystems in education. This initiative focuses on reducing the innovation and educational gaps across Europe. It features hackathons in Italy, Greece, and Bulgaria, where individuals aged 18 to 40 and new start-ups generate about 90 business ideas related to deep tech and sustainability. The top four teams from each hackathon join the ENTREPRENEDU online mentoring program.

2. Development of Online Mentoring Programs for Early-Stage Entrepreneurs

Mentoring programs for entrepreneurs provide a structured framework in which novice entrepreneurs, or mentees, receive guidance from seasoned business practitioners, known as mentors. These programs are pivotal in developing vital entrepreneurial skills and advancing business growth. Assenova (2020) showed that mentoring for early-stage entrepreneurs lead to an increase in revenue, profit and employment growth for underprivileged entrepreneurs. Further, research by Cope and Watts (2000) underscores the significance of

these programs in offering personalized support that is critically aligned with the mentees' specific business development stages. Such individualized support not only addresses the immediate needs of the entrepreneurs but also profoundly impacts their self-efficacy, enhancing their belief in their capabilities to succeed (St-Jean et al., 2018). Furthermore, mentoring influences the culture within start-ups, promoting adherence to foundational principles and cultivating an environment conducive to constructive problem-solving (Brodie et al., 2017).

Despite the benefits, the shift towards online mentoring programs introduces new challenges, particularly in establishing the depth of connection that face-to-face interactions facilitate. Online platforms, while providing wide-reaching access, lack the non-verbal communication cues such as body language and eye contact, which are essential in building trust and rapport between mentors and mentees (Lall et al., 2022). The asynchronous nature of many online interactions also impedes the flow of real-time feedback, which is important for the timely guidance and adjustment in the learning process (Hooley et al., 2016; Walsh, 2016).

In contrast, Kakouris (2017) introduces a transformative pedagogical approach in Greek entrepreneurship education through the TeleCC online platform. This constructivist model emphasizes cognitive development through interactive and reflective learning experiences. By fostering critical thinking and meta-learning, it represents a substantial shift from traditional mentoring to a dynamic, participant-driven educational practice, potentially enriching lifelong and inclusive learning in entrepreneurship. Kakouris (2009) further emphasizes the importance of specialized online platforms to support experiential entrepreneurial learning effectively in European higher education. These platforms are crucial for facilitating action learning and supporting working groups beyond traditional classroom settings.

The global spread of COVID-19 has further accelerated the transition to online education, as highlighted by Liguori and Winkler (2020). The pandemic has forced a swift and substantial shift to online delivery across educational institutions worldwide, necessitating a rethink of how entrepreneurship is taught. This situation underscores the urgency to enhance online learning capacities and develop more effective methods for imparting entrepreneurial competencies and mindsets online, adapting to new realities and market conditions as they evolve.

Addressing these challenges necessitates a hybrid approach that combines the strengths of both asynchronous and synchronous learning methods. Asynchronous learning allows participants the flexibility to engage with the material at their own pace, which can make the mentoring more accessible and inclusive, accommodating various learning styles and personal schedules (Chang et al., 2014). On the contrary, synchronous learning, through real-time interactions such as video conferences, mimics the immediacy and engagement of traditional classroom settings. This method enhances the engagement and allows for dynamic discussions and immediate feedback, which are vital for an effective learning experience (Mullen, 2021). By incorporating both asynchronous and synchronous learning formats into the curriculum, participants can benefit from a blended approach that combines the advantages of self-paced learning with real-time engagement. This hybrid model can offer a comprehensive learning experience, cater to different learning preferences, and maximize the effectiveness of the mentoring program (Dada et al., 2019).

Moreover, the structure of mentoring programs should embrace progressive learning, which involves designing a curriculum that gradually transitions from basic to more complex entrepreneurial concepts and practices. This approach allows participants to build on their knowledge base and skills systematically, ensuring a solid foundation of understanding before advancing to more challenging topics (DuBois et al., 2011).

To effectively support mentees through these progressive stages of learning, mentoring support should be adaptable and responsive to the changing needs of the participants as they advance through the program. This support includes tailored guidance and feedback that align with the mentees' evolving levels of expertise and challenges (Rigg and O'Dwyer, 2012; Russell, 2007). Additionally, fostering autonomy and self-efficacy is crucial in these programs. As mentees progress, they should be encouraged to gradually take on more responsibility in decision-making and problem-solving, thus empowering them to take ownership of their learning journey and business development (Sarri, 2011; Seet et al., 2018). Incorporating opportunities for reflection and self-assessment at each stage of the program can further aid mentees in consolidating their learning, identifying areas for improvement, and setting realistic goals for future development (Garcia-Molsosa et al., 2021).

Finally, conducting a demand analysis for entrepreneurial mentoring is critical in understanding the specific needs and psychological resources of entrepreneurs, such as self-efficacy and optimism. Such an analysis can guide the development of mentoring programs that effectively address these needs, enhancing entrepreneurial intentions and outcomes (Ayodele et al., 2022; Baluku et al., 2020; Nabi et al., 2021).

3. Development of an Online Mentoring Program in the ENTREPRENEDU Project

In the following, the methodology for developing the ENTREPRENEDU online mentoring program is presented.

3.1 Methodology for Demand Analysis

The first step to develop the curriculum for the ENTREPRENEDU online mentoring program was the execution of a demand analysis. Employing a qualitative research design for the demand analysis, semi-structured interviews were conducted to delve into the nuanced needs and experiences of the participating teams. These hour-long sessions followed a pre-defined guideline and aimed to determine the specific entrepreneurial needs of the participating teams. For the analysis of interview data, a thematic approach was utilized revealing clusters of predominant needs among the teams, serving as the cornerstone for deriving six overarching mentoring topics.

The data collection took place on 30th June 2023. The process comprised online interviews with representatives from each of the four selected teams that constitute the first cohort of the program. Each interview session lasted one hour, aiming to capture an understanding of the participant's experiences and needs. The interviews were conducted and protocolled by two Fraunhofer researchers and one research assistant to ensure consistency in data collection and interpretation. Prior to data collection, an interview guide was prepared to establish a clear direction and framework for the interview. The guideline was structured around eight key dimensions, namely: (1) Business Objectives and Goals, (2) Resources and Support, (3) Product or Service Evaluation, (4) Target Group, (5) Challenges and Problems, (6) Trends and Innovation relevant for business idea, (7), Knowledge, Know-How and Attitude, (8) Learning Objectives.

All interviews were conducted with respect to ethical considerations, including voluntary participation, confidentiality, and privacy of the participants. The data gathered from the interviews were analysed using thematic analysis. This method was employed as it provides a flexible and useful research tool for identifying, analysing, and interpreting patterns of meaning ('themes') within qualitative data. Based on the protocols of the interviews, we carried out a process known as 'open coding'. This is the first step in qualitative data analysis, and it involves identifying and defining themes that emerged from the interviews. In this process, we read through the protocols and labelled segments of the text that encapsulated key thoughts or concepts. After coding the protocols, the codes were examined for patterns and sorted into broader categories. This stage of 'axial coding' involved the clustering of related codes to identify the main themes. These themes were then compared across all teams to identify shared or unique demands. The themes derived from this analysis process served as a basis for the derivation of the mentoring topics, thereby ensuring that the curriculum is tailored to meet the specific needs and learning objectives of the teams.

Based on the results from the demand analysis presented above, the modules described in Table 1 have been derived. The mentoring partners were responsible for the creation and execution of one of the six mentoring modules. Fraunhofer IPK was responsible for coordination of the creation and execution of the mentoring program.

Table 1: Mentoring Modules

Module	Description	Mentoring Partner
Business Model Development	Enables participants to understand the importance of a well-defined business model, equipping them with necessary tools and knowledge for its development.	Fraunhofer IPK
Crafting a Unique and Competitive Value Proposition	Teaches participants how to define, develop, and communicate compelling value propositions for market differentiation and competitive advantage.	Luiss University
Idea Pitch: from Tech Feasibility to Product Development	Guides participants in connecting technological feasibility with product development and creating persuasive technology pitches.	Fondazione. E. Amaldi
Investment Pitch and Quantifying Funding Needs	Equips participants with skills to create effective investment pitches and accurately determine financial needs.	EBAN

Module	Description	Mentoring Partner
Entrepreneurial Business Planning	Provides participants with a comprehensive understanding of business planning, including market analysis, operational planning, and financial forecasting.	Corallia
Access to Finance and Related Funding	Offers knowledge on navigating the financial landscape and developing skills to present compelling business cases to participants.	Cleantech Bulgaria

3.2 The Mentoring Program Development

The results derived from the demand analysis were tailored to address the identified needs and laid the foundation for the program's curriculum development. The results indicated that the teams and start-ups possess varying skill levels and experiences. Hence, a blended learning approach entailing asynchronous and synchronous elements that increase in their complexity was chosen for the curriculum development. This allows the participants to benefit from both approaches and focus on the content of their respective skill levels. Further, the online setting enables participants to join the program from their respective geographical regions. Figure 1 provides a comprehensive overview of the mentoring program's three distinctive phases, detailing their respective mentoring units, content structure and learning depth.

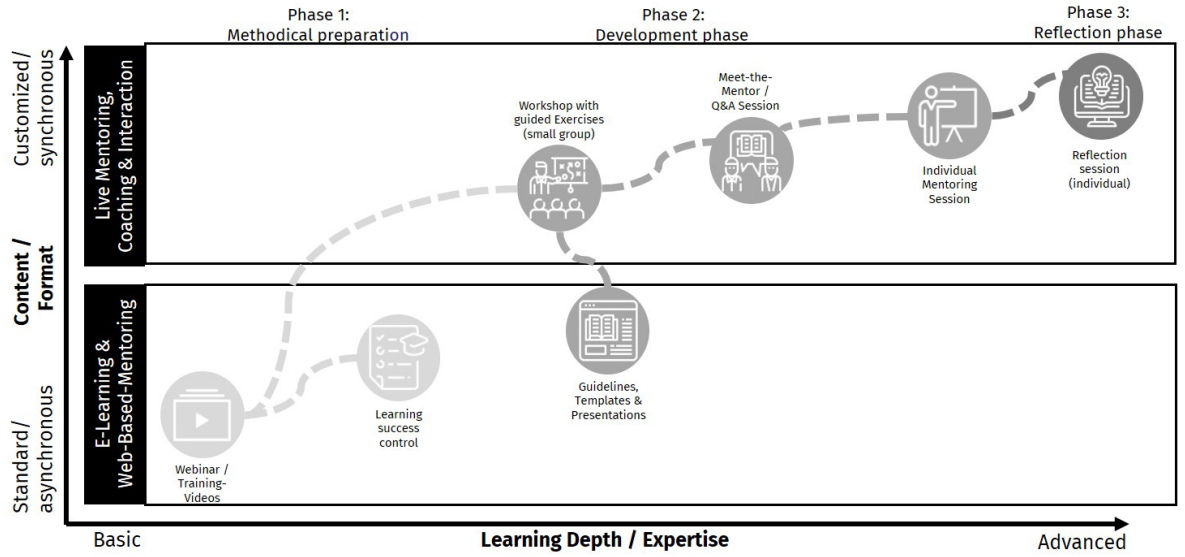

Figure 1: Mentoring program structure

The methodical preparation constitutes phase one where the content is standardized, aiming to transfer basic knowledge via online-based formats such as webinars and training videos. This content is identical for all participants of the first cohort and includes a one-hour learning success control which can be conducted using a quiz format. Here for each mentoring module three training videos have been facilitated by the mentoring partners. Each video has a length of approximately one hour and the complexity of the video content increases in unison with their numeration.

The second phase is focused on development and entails more advanced learning experiences that are customized to the participants' needs. This phase takes place in a live mentoring setting that entails interaction between the mentor and the participants. Therefore, workshops, Question & Answer (Q&A) sessions and individual mentoring are all viable formats for this phase. Each mentoring partner offers a two-hour workshop for all participants of a cohort. Thereby templates and tools such as Concept and Miro boards are utilized, and the participants have the opportunity to exchange feedback with their peers. Following the workshop, a 1-hour Question & Answer session is provided by each mentoring partner, in which participants can discuss the previously learned content. Further, each mentoring partner offers 2 hours of individual mentoring to each participant in which their needs and specific circumstance are prioritized.

Lastly, the reflection phase focuses on introspection and feedback. Each mentoring partner offers a one-hour reflection session. Here the participants come together with the mentor for one last time to evaluate their

progress, development and achievements of their goals. Further, future actions and goals that the participants should aim for are discussed.

Combining the durations of all three phases, the mentoring program will provide a total of ten hours of valuable mentorship to each participant. This extended support seeks to maximize the potential of the participating teams and contribute to their long-term success. Considering the participation of six mentoring organizations, each start-up within the first cohort is set to benefit from a total of 60 hours of mentoring.

4. Results: Application of the Mentoring Program

A comprehensive curriculum has been developed for all six mentoring modules. It begins with a clear outline of the goals and objectives for each module of the mentoring program. Moreover, based on the need's analysis and the expertise of each mentoring partner, the core subjects that the program aims to impart to the mentees have been defined. Each module has been designed to directly support the achievement of the program's objectives. For each module, the curriculum specifies the expected learning outcomes, which helps to clarify the contents of each mentoring module. Moreover, the content & resources, which include the materials, resources, and activities that will be used to deliver each module, as well as the different applied mentoring methods, were outlined in the curriculum. Additionally, the curriculum detailed the sequence in which the topics would be covered and the timeline for the entire mentoring program. It also defined how progress would be assessed and how feedback would be provided. In the following chapter, the curriculum is exemplified through Module 1: Business Model Development.

4.1 Exemplary Mentoring Module for Business Model Development

The module was strategically designed to equip participants with a comprehensive understanding of the elements of a robust business model. The module, facilitated by experts from Fraunhofer IPK, aims to provide the foundational tools and strategic insights necessary for the effective development and implementation of business models that are congruent with the entrepreneurial versions and market requirements of start-up teams.

The module commenced with the methodical preparation phase which comprised three learning videos aiming to establish a strong knowledge base for the participants, equipping them with the necessary theoretical concepts and tools needed to develop a robust business model.

The initial video serves as an introduction to the fundamental understanding of business model development. It is explained that it is not just about understanding one's product or service, but also about understanding the ecosystem in which the future business operates. The challenges faced by budding entrepreneurs and the importance of feedback and mentorship in defining a robust business model are highlighted. By the end of the video, viewers are said to be equipped with the knowledge to start, redefine, or pivot their current or future business model to better align with their business goals.

Progressing to a more advanced stage, the second video introduced participants to the business model canvas (BMC), aiming to offer an advanced understanding of its elements and application as a tool. It covers the definition and history of the BMC, introduces various adaptations, discusses its elements in detail, and provides examples of BMC applications.

In the third video, an overview is given of an approach to continuously adapt, develop, and change a business model according to external and internal drivers. For this purpose, a framework for strategic business development is introduced and filled with practical tools and techniques to analyse internal and external factors affecting the business model, as well as to derive relevant actions to systematically develop the business model in order to grow and survive as a successful company on the market.

Following the videos, a multiple-choice quiz was implemented to test the mentees understanding of mentoring videos to then focus in the following mentoring process on areas where the performance in the quiz was lacking. The quiz includes both theoretical and practical questions related to the content presented in the 3 videos of the module.

In the development phase participants actively refined and enhanced their business model under mentor guidance. A pivotal component of this phase is an interactive workshop designed to facilitate the application of learned concepts through the use of the business model canvas. During this workshop, participants are guided through a series of structured exercises that aid in the visualization and refinement of their business models. In this session, a whiteboard tool was used to let the mentees fill out their own business model canvas. Each team

had their individual virtual room in which the mentors provided support. Later on, the teams presented their status of the BMC and received feedback from the mentors and their peers.

Additionally, a meet-the-mentor Q&A session provided the teams with an opportunity to clarify questions and receive direct feedback on their business model development. This session offered strategic insights and practical advice, helping teams improve and tailor their business models to market demands.

Furthermore, individual mentoring sessions were conducted to provide bespoke guidance tailored to the unique needs of each team. These sessions focus on strategic aspects of business model refinement such as resource allocation, partnership development, and customer engagement. Mentors work closely with the teams to fine-tune each element of the business model, ensuring its alignment with strategic business objectives and market opportunities. In the individual session the business model canvas of the start-ups was reviewed and completed. The sessions began with a thorough review of the start-up's current BMC. Mentors and mentees collaboratively examined each component of the canvas, from the value proposition to customer segments, channels, revenue streams, and key activities. Further, the focus was placed on providing and discussing fitting business model partners that the start-up can apply to their BMC. Where gaps were identified, mentors provided targeted advice on how to address them, ensuring that by the end of the session, each start-up had a completed BMC that was both realistic and ambitious. A significant portion of these sessions was dedicated to exploring and selecting fitting business model patterns that start-ups could integrate into their BMC. This exploration was guided by the mentor's expertise in identifying patterns that have proven successful across various industries and how they could be tailored to the teams' specific context. Discussions revolved around a range of innovative business model patterns.

The module culminates in the reflection phase, which centres on reflection and strategic forward planning. A structured reflection session allowed the participants to assess their progress, recognize achievements and identify areas for future development.

4.2 Implementation and Validation of the Online Mentoring Program

To facilitate the mentoring program the online platform of the consortium partner F6S Network Limited was utilized. Here participants registered their teams on the platform to access the dedicated mentoring pages for each module. Each page featured private groups for sharing training videos, quizzes, and materials, and allowed mentors to post announcements and communicate with mentees. Further, the module descriptions and quizzes, to assess the mentees understanding of the mentoring modules, were also hosted on the F6S platform. The first four teams registered during the Italian hackathon formed cohort one. The mentors conducted workshops, Q&A sessions, individual mentoring and reflection sessions using their preferred online meeting tools.

The first initiation of the mentoring program took place from the middle of November 2023 to the beginning of March 2024. After the completion of the mentoring program the participants provided the consortium with feedback during a qualitative interview. The interview took place in guided online video calls and was facilitated by two researchers from Fraunhofer IPK. The methodology was structured around a semi-structured feedback guideline, exploring seven sections which are namely: (1) Reflection on the Mentoring Journey, (2) Overcoming Obstacles and Developing Skills, (3) Progress and Future Goals, (4) Learning from the Community, (5) Overall Satisfaction with the Mentoring Program and Modules, (6) Technical and Organisational Feedback and (7) Closing thoughts

The respondents reported significant development in their business ideas and models, attributing the program's effectiveness to steering their concepts towards feasibility and concrete planning. Mentors played a crucial role in this transformation, challenging assumptions and refining visions. Challenges faced by teams included scalability concerns and integrating learned modules effectively, but the program provided focused support to overcome these hurdles and cultivate essential skills. Through mentoring, teams clarified and strengthened value propositions and identified areas for business model improvement. Participants expressed appreciation for the program's assistance in establishing actionable goals and metrics for success, although an even stronger linkage between the different mentoring modules was desired. The overall, satisfaction with the program and modules was high, with constructive feedback provided for improvement in integration and scheduling. Derived from the feedback various enhancement actions were determined to improve the quality of the mentoring program for the second cohort. These include for example increasing the time between sessions without extending the program's duration to facilitate better absorption and reflection of the content. This approach would allow participants to apply their learnings more effectively during the intervals. Furthermore, it was

decided to facilitate the live mentoring session on one specific web application to streamline the process of scheduling and executing these sessions.

5. Conclusion

In conclusion, the ENTREPRENEDU project has demonstrated a proactive approach in addressing the innovation and educational gaps prevalent in the European Union, with a specific focus on emerging and moderate innovation regions. This initiative has successfully implemented a blended learning curriculum that combines traditional methods with asynchronous materials, enhancing its attractiveness and accessibility for diverse teams. This approach not only supports the scalability of the program across different regional contexts but also ensures it is replicable, allowing for broad adoption in various educational settings. These elements together make the ENTRPRENEDU mentoring program a valuable model for both academic research and practical application.

This research enhances the literature on online education and entrepreneurial training by demonstrating the effective use of blended learning strategies in emerging and moderate innovation regions. It highlights the effectiveness of asynchronous learning tools and structured mentoring on entrepreneurial skill development. For practitioners, the project offers a tested framework to foster innovation and skill growth. The participant feedback emphasizes the program's positive effects on business development and skill enhancement, while also suggesting areas for refinement such as better integration and scheduling. Overall, the ENTREPRENEDU online mentoring program exemplifies a concerted effort to foster entrepreneurial ecosystems, cultivate innovation, and bridge educational disparities, thus contributing to the long-term prosperity of the European Union.

Abstract: The notion of the circular economy has garnered noteworthy interest as a viable substitute for the conventional linear economic framework. This paper investigates the emergence of circular economy business models in Cambodia, focusing on the drivers that are shaping this transition, the barriers that businesses encounter, and the potential impacts of circular economy initiatives on the Cambodian economy and society. By examining the Cambodian context, this study seeks to shed light on the opportunities and barriers associated with the adoption of circular economy practices in a least developed country setting. Even though Cambodia has made strides toward development, Gaudemar (2016) noted that it is improbable for the country to "graduate" from its Least Developed Country (LDC) classification until 2025 or later. Furthermore, the findings of this research can contribute to the gap in the literature related to policy interventions and strategic decision-making aimed at promoting sustainable economic development and environmental stewardship in Cambodia.

Keywords: Circular economy, Drivers, Challenges, Impact

1. Introduction

The traditional linear economic model, characterized by the take-make-dispose approach as pointed out by Jorgensen and Pedersen (2017), has led to resource depletion, environmental degradation, and social inequalities, particularly in developing countries such as Cambodia. In response to these challenges, the concept of the circular economy has emerged as a promising framework for achieving sustainable development by promoting the regenerative and efficient use of resources. As Cambodia continues to experience rapid economic growth and industrialization, there is a mounting requirement to transition towards more sustainable and resource-efficient business models. Industries, academics, and legislators recognize the circular economy as a promising strategy for collaboratively enhancing value chain sustainability and competitiveness because of its capacity to disentangle economic growth from resource consumption and waste production (Bressanelli, 2022). A production and consumption paradigm known as the "circular economy" emphasizes “sharing, leasing, reusing, repairing, refurbishing, and recycling current materials and products for as long as feasible” (European Parliament News, 2023). Through this approach, the “goods' life cycle is extended and waste is minimized to the bare least. Recycling ensures that resources from products that are nearing the end of their useful lives are kept within the economy” whenever possible. These could be regularly used in a prolific way, creating even additional value. This “deviates from the traditional, sequential economic take-make-consume-throw-away process” allowing the idea to hinge on a profusion of inexpensive, effortlessly available resources and an “energy paradigm (European Parliament News, 2023).

2. Circularity vs Sustainability

Primitive man survived with whatever resources were accessible and may possibly be utilized as, or converted into, lodging, provisions, foods, or equipment. Stahel (2020) identified that as “circular economy based on scarcity, as expressed in an old New England maxim: *use it up, wear it out, make it do or do without”*. The author opined that circularity was a requirement for most as only the affluent and influential resided in relative contentment and that this condition can still be found in less developed populations. The circular economy's reuse and repair strategies, however, have persisted throughout this time, silently and unnoticeably, across society. According to Stahel (2016), reducing the use of inputs for industrial production gave rise to the Circular Economy (CE) concept in the 1970s, however it turns out that circular economy may be applied to any resource. With the start of the 1973 oil price shock, the circular economy began to gain traction in the early 1970s. In 1976, Stahel and Ready delivered a study to the European Communities Commission in Brussels that examined an “economy in loops” and “its effects on society”. The "axiom of the smallest loop" was named after this

research, which demonstrated the “economic superiority of reusing objects over recycling materials”, (Awan et al., 2020).

According to Andrews (2015), the integration of circular economy into sustainability is a component of the holistic picture that circular economy delivers. This creates a parallel between the two concepts, with sustainability serving as the foundation and circular economy as the actual application. It is vital to take note that circular economy has been around long before sustainable businesses began stemming from Sustainable Development Goals (SDG). The Brundtland Commission explored sustainable development as a solution to environmental issues in their report in 1987. The concept of sustainable development received major international recognition for the first time at the 1972 United Nations Conference on the Human Environment in Stockholm, Sweden (United Nations, 2024). The idea that growth and the environment, which were once seen to be two different concerns, could be managed in a way that would benefit both was embraced by the international community, even though the phrase was not used specifically. Following the 1992 United Nations Conference on Environment and Development in Rio de Janeiro, the focus shifted to sustainable development. In 2015, the UN established the Sustainable Development Goals (SDGs), which emphasize interconnectedness and balance environmental, social, and economic sustainability. The SDGs are to "end poverty, protect the environment, and ensure peace and prosperity by 2030" (Hajian and Jangchi Kashani, 2021).

3. The History of Circular Economy and the Onset of Circular Economy Business Models

The history of circular economy is depicted by Tuladhar et al., (2022) as shown in Figure 1.

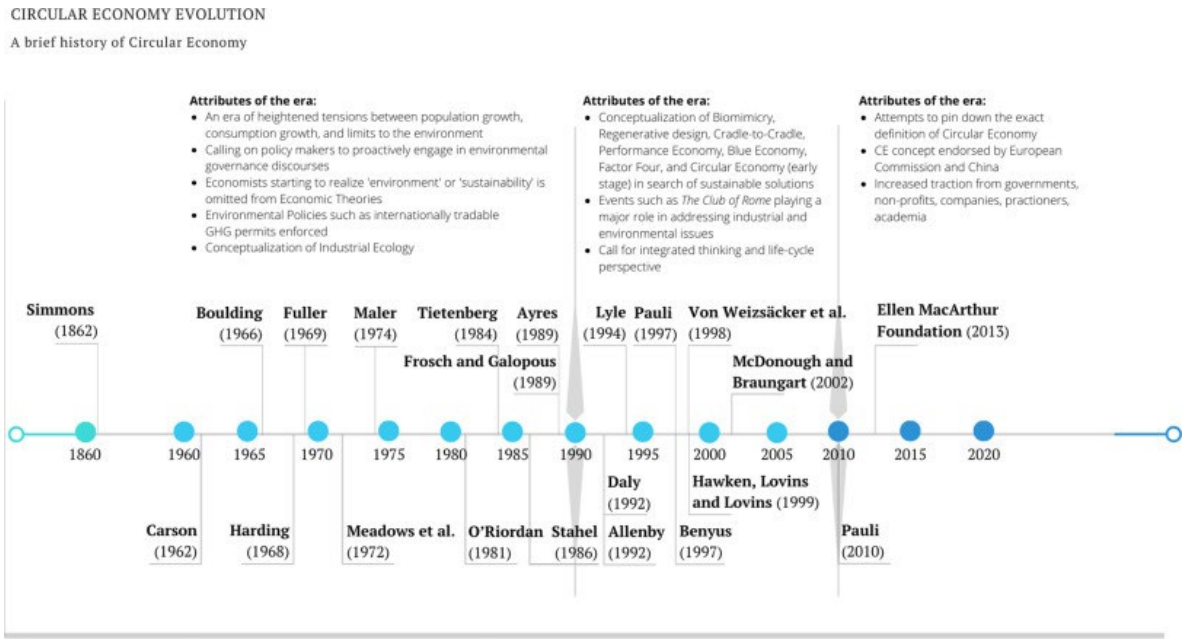

Figure 1: History of Circular Economy. Source: Circular Economy Evolution, (Tuladhar et al., 2022)

While environmental literature began to flourish in the 1960s, the first indications of circular economy may be found in the 1860s, when Simmonds proposed the necessity of symbiotic practices, those that benefit the environment and the economy equally in 1862, as mentioned in Thuladhar et al., (2022). The evolution of circular economy story over time is shown in the part that follows. Since 1860s till 1989, there were increasing tensions between population growth and increasing limits to the environment which resulted in policy makers to engage proactively in environmental governance discourses (Tuladhar et al., 2022). During this period, economists comprehended the omission of 1) environment and 2) sustainability from Economic Theories which subsequently resulted in the introduction of internationally tradable GHG permits and the conceptualization of Industrial Ecology by Frosch in1992.

In the next two decades, the world saw the conceptualization of 1) Biomimicry, 2) Regeneration Design, 3) Cradle to Cradle, 4) Performance Economy, 5) Blue Economy and 6) Factor Four, summarized in Table 1.

Table 1: Conceptualization of Environmental Governance

Theorist	Concept	Description
Benyus (1997)	Biomimicry	Drawing comparisons between companies and the natural ecosystem and offering "ten lessons" for an environmentally conscious business, society, or economy to learn from nature in order to find solutions to issues or just to breathe new life into existing goods and procedures
Lyle (1994)	Regeneration Design	Prioritizing the selection of materials, designing products for ease of disassembly, and applying systems thinking are essential to maximizing environmental efficiency prior to, during, and post-product usage.
McDonough and Braungart (1998)	Cradle-to-Cradle	Complies completely with nature, no harmful elements are produced, therefore laws are not necessary.
Stahel, 1986 theory mentioned as a solid building block of the CE by Sillanpää and Ncibi (2019)	Performance Economy	A method that "builds spiral-loops that minimizes the flow of matter and energy, and environmental degradation without impeding economic growth or the advancement of social and technical sciences"
Gunter Pauli (2010)	Blue Economy	Creative approaches that result in zero waste and claim that the formation of industry clusters, where the trash from one is used as an input for another, is the solution
von Weizacker (1997)	Factor Four	Provided examples of how our economies' resource productivity may rise fourfold, allowing us to live twice as well with half as much resources.

Source: History and evolution of the circular economy and circular economy business models (Tuladhar et al., 2022)

Subsequent decade witnessed the efforts to pin down the exact definition of Circular Economy (Kirchherr et al., 2017) which was endorsed by the European Commission and China resulting in increased traction for governments, non-profits, corporations, practioners and academia (Tuladhar et al., 2022).

4. Drivers

4.1 Government Initiatives

Cambodia, which is home to about 16 million people, lacks industrial diversification in terms of electronics and enhanced production and is mostly dependent on the garment sector. According to The World Bank (2023), Cambodia's GDP is expected to expand by 3.0%; yet, prominent ecological challenges and societal disparity are still present (BTI, 2022). USAID (2022) reported that deforestation, pollution, and environment corrosion are among the environmental problems that Cambodia faces. Between 2001 and the present, 2.6 million hectares of forest cover have been lost due to severe deforestation throughout the previous 20 years with logging and agricultural growth being the primary causes of deforestation (Pauly et al., 2022). Pheakdey et al. (2022) highlighted the significant issue of waste management, as landfilling and burial at disposal sites pose environmental dangers such as greenhouse gas emissions. Due to its reliance on resource extraction and export-oriented industries such as the textile industry, Cambodia's economy produces a lot of pollution and waste, primarily “Municipal Solid Waste” but also industrial, construction, and demolition waste (UNDP, 2022).

Given the situation, the circular economy holds great promise for addressing resource depletion, environmental degradation, and waste generation for a wide range of stakeholders, including businesses, governments, and society at large (Crome et al., 2023). An increase in the consumption of materials and energy has resulted from Cambodia's expanding population and economy. Like in other nations, this has led to new difficulties in managing waste, energy, the environment, and natural resources sustainably. The Circular Economy Strategy and Action Plan, in the words of H.E. Say Samal, Minister of the Environment and Chair of the National Council for Sustainable Development, "aim to create a win-win solution to the present challenges". The Strategy aims to close the loop of the entire value chain and preserve the value of resources for as long as feasible, as opposed to just extracting, using, and discarding them (UNDP, 2021).

"The circular economy has the ability to provide new economic values, a variety of job opportunities, and beneficial social and environmental change. It may direct the course of sustainable development for nations of all income levels, including Cambodia” said UNDP Cambodia Resident Representative Nick Beresford while the Swedish ambassador to Cambodia, H.E. Björn Häggmark, underlined further that in order to advance the idea of

a circular economy, the government must take the initiative, and all other stakeholders namely households, people, and others must also actively participate (UNDP, 2021).

Acknowledging the crucial role played by the business sector in expediting the shift towards a circular economy, a private sector platform was developed alongside the new plan to facilitate the exchange of information regarding feasible policies and initiatives. One of the most important first steps in developing a circular economy is the sharing of best business practices. According to H.E. Mikami Masahiro, Japan's Extraordinary and Plenipotentiary Ambassador to the Kingdom of Cambodia, "this knowledge will enable other industry players to use and replicate best circular economy measures and accelerate the industry-wide transitions", (UNDP, 2021).

Another initiative is the Circular Strategy on Environment 2023 – 2028 focusing on framework for Policy, Administration and Extension for a Clean, Green and Sustainable Cambodia as depicted in Figure 2. The Royal Government of Cambodia (RGC), through the 7th Legislature of the National Assembly, produced the Circular Strategy on Environment 2023-2028 in compliance with the Pentagon Strategy, Phase 1 - 2023-2028 (MOE, 2023). This strategy outlines the RGC's commitment to its mission in the environment to satisfy the economic needs in order to achieve sustainable development goals. Under this initiative, priority programs must be implemented in light of climate change as environmental and natural resource management, particularly in the areas of “land, water, minerals, and forestry”, continues to develop while simultaneously address the new issues brought on by climate change.

Figure 2: Circular Strategy on Environment 2023 – 2028. Source: Ministry of Environment, Royal Government of Cambodia

The two relevant programs that drive circularity under this initiative are presented in Table 2.

Table 2: Strategy and Programs Summary

Strategy 1 (Clean) Angle 1: Controlling Pollution **Priority 1: Improving the implementation and monitoring of solid waste, liquid, and hazardous waste management systems**
Create sub-decrees regarding the management of single-use plastics and plastic waste, the management of hazardous wastes, paint lead levels, electrical and electronic equipment types, reports on pollution releases and transfers into the environment, and other pertinent legal instruments;
Encourage the application of the 4R Principle (Refuse, Reduce, Reuse, and Recycle) in order to encourage a circular economy and solid waste management, especially with regard to plastic trash;
Promote the conversion of plants and agricultural products into packaging materials as an alternative to plastic;
Distribute legal documents to the public, especially the owners of pollution sources, about the management of solid, liquid, plastic, and hazardous wastes; bolster the application of laws pertaining to the handling of plastic, liquid, solid, and hazardous wastes; bolster the knowledge of Ministry and Provincial Department of Environment representatives regarding the handling of hazardous, liquid, and solid wastes;
Strengthen the ability of officials from the Ministry of Environment, Municipal or Provincial Department of Environment on the management and disposal of solid, liquid, plastic, and hazardous wastes;
Coordinate, cooperate, and mobilize support to encourage environmentally friendly schools, pagodas, and other religious institutions, legal entities, and individuals who have participated in the environmentally friendly activities.

Strategy 1 (Clean) Angle 1: Controlling Pollution **Priority 3: Promoting the implementation of waste management policy linked to the implementation of decentralization and deconcentrating policy and Safe Village, Commune-Sangkat policy** Examine and compile information regarding the kinds and intensities of risks and consequences associated with hazardous materials, hazardous waste, radioactive waste, and medical waste that are dumped into the environment; Publish information about the dangers and consequences associated with hazardous materials, hazardous wastes, radioactive wastes, and medical wastes;
Encourage the Department of Environment and Sub-National Administration to get training, information, and teaching on solid waste management techniques; collaborate to track and assess the 2020–2030 urban solid waste management policy's implementation;

4.2 Corporate Social Responsibilities (CSR)

Another key driver to circularity is the corporate social responsibility (CSR) that drive companies to embrace circular business models. Companies, Business Associations and Chambers of Commerce often synergize to educate small and medium businesses on circularity and sustainability measures. The Global Circular Fashion Forum's (GCFF) for example, initiated the "Circular Fashion Partnership Cambodia," that intends to assist countries that produce textiles in hastening and increasing the recycling of post-industrial textiles waste. Through this partnership, another event titled the "Textile Waste Opportunities for Circular Textiles, Garments, and Footwear in Cambodia" an initiative by GFA and GIZ, aims to establish circular systems in Cambodia. The initiative will support a pilot project focusing on sorting and recycling textile waste, diverting it from landfills and incineration. The event attracted representatives from manufacturers, brands, recyclers, and government officials (Khmer Times, 2023).

Similarly, the glass bottle return initiative, launched by HEINEKEN Cambodia, is a strong endorsement of the brewer's “Brew A Better Cambodia” aim, which lays out specific, bold goals to increase circularity and decarbonize the whole value chain by 2040, as well as its production by 2030. Since packaging plays a significant role in the brewer's whole value chain footprint, expediting returnable packaging is essential to fulfilling these long-term obligations. Since the food and beverage and hospitality sectors account for the majority of the market for glass bottle sales for brewers, collaborating with them is also a deliberate move (Anon, 2023).

In the same way, the first 4P's store abroad opened in Phnom Penh, Cambodia, in July 2021. In response to Cambodia's waste dilemma, the pizza restaurant adopted the daring idea of zero-waste. By following the 5Rs—reduce, reuse, repurpose, and recycle—they started the movement from the ground up and turned the food scraps from the restaurant into a brand-new zero-waste pizza. They created meaningful pieces of art out of the broken plates and used leftover lime peels to make tea that produces no trash. All garbage, from inside and outdoors, is moved to the recycling room for segregation and recycling (Pizza 4P’s, n.d.). During a panel discussion that took place in April 2024, the Sustainability Specialist of the company shared that food shells are powdered and mixed to animal feed as they are great source of calcium and further reiterated that much of their 5Rs are integrated into the company’s operations and are integral part of their business. The company firmly believes that they can confidently advance towards a waste-free future if they analyzed every action carefully and with resolve.

Likewise, a joint venture between the Siam City Cement Company (SCCC) of Thailand and the Chip Mong Group of Cambodia, called Chip Mong Insee Cement Corporation established the business unit Chip Mong Ecocycle in 2019 to offer sustainable industrial waste management solutions through cement kiln co processing for the first time in Cambodia. Through partnerships and collaborations to provide new technology for sustainable industrial waste management through circularity, Chip Mong Ecocycle is leading the charge for transformation in Cambodian industrial waste management (H&M Foundation, 2021). Although circular business models in Cambodia have proven to be a success, the number of such businesses are still relatively small in comparison to the majority of traditional business models both formal and informal in the country.

5. Barriers

The two main sectors of the waste economy in Cambodia are the solid waste management sector and the notional recyclable waste management industry. In some nations, state-owned or major corporations either entirely or partially "manage" the recycling trash systems. By contrast, Cambodia's garbage system is an authentic “grassroots recycling economy” that operates independently of the state until 2019 and adheres to its own laws and paths. Throughout the world, the so-called "informal" (recyclable) waste economies have been

progressively organized and commercialized during the last 20 years (Eitel, 2022). Meanwhile, waste reclaimers are still able to continue collecting recyclables in neighboring nations like Thailand and Vietnam, but the government provides financial and technical support to the industry in addition to capacity-building programs and incentives (Sasaki et al. 2014, Chua 2016, Jellinek 1993, Nguyen 2019 as cited in Eitel, 2022). Thus, Phnom Penh's recycling economy is unique, but its distinctiveness is threatened by heated political debates over formalizing the industry.

Given that Cambodia was engulfed in a genocide until the late 1970s, understanding circularity in the nation requires awareness of the surrounding context and the ability to connect to the intricacy of the culture and recent history of the nation. Despite the rapid growth and government initiatives, Cambodia lax enforcement and societal readiness are the immediate barriers to transformation from traditional business models to circularity.

According to Ghosh (2019), the adoption of circular economy has been restricted to industrialized countries with improved waste management techniques, technological advantages, wider access to resources, and requisite skills while emerging economies continue to lag in adopting circular practices due to the enormous complexity of this approach (Diaz, 2017). A recent study indicated that just 8.6–9.1% of the world's economies were circular in 2019–2020, underscoring the stark delay in the adoption of circular practices (Kirchherr and van Santen, 2019). Other barriers explored in multiple studies based on industries and size of enterprise are summarized in Table 3.

Table 3: Barriers to Circular Economy

Industry	**Barriers**	**Researcher**
Agriculture	Absence of knowledge and awareness, as well as lack of government assistance	Kumar et al. (2021)
Coffee	Localized perspective, absence of uniformity, and consistency of governmental directives	van Keulen and Kirchherr (2021)
Textile Market	Low consumer demand	Huang et al. (2021)
Global Textile	High production and sales costs for circular goods	Hartley et al. (2022)
Electronics and Electrical Equipment	1) Producer reluctance & cultural issues 2) Weak waste regulation, a lack of transparency throughout the production chain, and a lack of CE standards	1) Cole et al. (2019) 2) Rizos and Bryhn (2022)
Automotive	1) Absence of knowledge and experience with CE, 2) Ineffective environmental legislation, ownership difficulties, and a lack of government assistance	1) Agyemang et al. (2019) 2) Kayikci et al. (2021)
Furniture	Insufficient funds and unpredictability in the economy	Silvius et al. (2021)
Scale of Enterprise	**Barriers**	**Researcher**
	Insufficient expertise and significant expenses associated with adhering to rules and regulations	García-Quevedo et al. (2020); Mishra et al. (2022)
	Poor profitability, a lack of cooperation and awareness among stakeholders, and management's reluctance to change	Mangla et al. (2018)
	Inability to distinguish between profit-sharing and responsibility models, as well as ownership concerns	Tura et al. (2019)

Micro, Small and Medium Scale Industries	Lack of harmonization of the laws, lack of government enforcement and collaboration, and lack of uniformity	Stumpf et al. (2021
	Insufficient customer awareness and businesses' reluctance	Kirchherr et al. (2018)
	Age factor: older people reluctant to use products made of recycled materials as opposed to younger people	Neves and Marques (2022)
	Technical and economic impediments are connected to regulatory restrictions.	Bening et al. (2021)

Source: Circular economy adoption barriers in built environment- a case of emerging economy (Mhatre et al.,2023)

The barriers and the low percentage of circularity adaptation globally are indicative why it is even more challenging to foster circular business models in least developed economy such as Cambodia. As ideal as it seems, this requires enormous effort in terms of regulatory and socio-economic aspects. Chen et al. (2020) inferred that promoting environment-oriented development such as circular economy can be financially taxing for local governments, as it requires significant financial outlay and slows GDP growth. The author further indicated that transitioning from economy-oriented development to circular economy requires sacrificing economic growth, affecting early-stage local economic growth.

6. Impact

Despite the barriers, countries around the world including Cambodia have not ruled out the impact the circular economy has on environmental preservation. The positive impact of circular business models has proven to be effective in the garment industry. Under the International Finance Corporations' Cambodia Improvement Program, eleven suppliers that "operate cut-and-sew and garment-washing" businesses put resource efficiency measures in place in 2019 and 2020. These efforts reduced electricity and water use by 18% and 29%, respectively. This action supports the nation's climate goals while also increasing productivity. Producers implemented resource-efficiency initiatives over 22 months, reducing energy usage by 29%, water usage by 44%, and greenhouse gas emissions by 25%, with 60% of recommendations implemented, considering the epidemic (IFC Org, 2022). Similarly, the UNDP published the 'Handbook for Implementing Circular Economy Practices in Hotels and Restaurants' that offers Cambodian hotels and restaurants helpful advice on how to change their operations to become more sustainable (UNDP Org, 2021). Initiative such as this is crucial for Cambodia as the Minister of Tourism predicted that there would be about 28 million tourists by 2030, a fourfold increase from 2020 (IPS Commercial, 2020).

7. Conclusion

As Cambodia transitions towards a circular economy, the 'private sector will play a central role in achieving this change' (UNPD Org, 2021). Similarly, regional and world organizations support will expedite the transition through infrastructure provision and capacity building. The Economic Research Institute for ASEAN and East Asia (ERIA) Capacity Building Program and Policy Design Department organized a two-day training on Circular Economy Introduction for Cambodian officials, realizing the importance of strong and rigorous policymaking. In order to ensure the successful implementation of circular economy priorities and agenda under the ASEAN Framework on Circular Economy, the workshop's objectives were to assist Cambodian policymakers in mainstreaming circularity in routine work processes, comprehending circular economy concepts, identifying potential economic activities or sectors, establishing enablers, and putting in place suitable monitoring and evaluation mechanisms

In conclusion, the circular economy is neither a panacea for prosperity, sustainability, or employment. Businesses and governments need to make sure that these initiatives are taking us in the right direction and not toward a circular future that is even less sustainable by carefully assessing the expected and actual impact of these measures. Making the changes necessary to use the planet's resources sustainably can be accomplished through circularity. However, chasing circularity as a goal unto itself deceives us and might even have unfavorable effects. We need targets to make sure we stay inside the safe operating space and don't go beyond

the planet's capacity to maintain society, as well as metrics to help us stay focused on the impacts we seek. To maximize the benefits of circularity and assist society in realizing its advantages, industries and governments alike must adopt it carefully and thoughtfully. From a resource stance, recycling is only valuable if the resources required for "recovery and recycling are less than those needed for extraction and disposal", (Moss, 2019). There have even been suggestions that, if not executed with caution, the circular economy could lead to the depletion of resources. Maybe society shouldn't aim for zero waste in the end and should instead determine the ideal reprocessing rate for each material and understand the complete impact of circularity on businesses, countries, and even individuals' sustainability efforts. This requires further study and impact-based metrics to accurately measure the impact of circular activities on resources and the environment.

Innovation and Entrepreneurship in Southeast Asia: The Role of Geographical Indications

Robert Brian Smith[1], Nucharee Nuchkoom Smith[2]and Mark Perry[1]

mperry21@une.edu.au

Abstract: The Southeast Asian economies have been highly proactive in developing Geographical Indicators (GIs) within their jurisdictions. For instance, Thailand developed its "One Tambon One Product" (OTOP) project to support community co-operatives in *tambons* (sub-districts) and villages throughout Thailand. The aim was to increase village incomes and preserve local wisdom. This followed Japan's One Village One Product (OVOP) program. This was followed by its "One Province, One GI" to encourage each of its 76 provinces and Bangkok to develop at least one GI product. The aim was to increase village incomes and preserve local wisdom. Subsequently, the Lao People's Democratic Republic (PDR) established its One District One Product (ODOP) program. In addition, local communities throughout most of the eleven Southeast Asian Nations, often with the support of external development agencies, have protected their products using GIs or Trademark legislation. The number of domestic GIs registered within the eleven Southeast Asian nations as of April 2024 was Cambodia with seven, Indonesia with 127, Lao PDR with six, Malaysia with 79, Thailand with 194, and Vietnam with 94. These cover both agricultural and non-agricultural products, with the majority in each jurisdiction being the agricultural sector. This paper outlines the legislative framework of GI protection of products from the above jurisdictions and how the legislation has provided a framework for local entrepreneurs and communities to develop and protect local products, thus improving the quality of life of those local communities, whether as producers or providers of labour. Cambodia and Lao PDR have also followed a different path to registering GIs as they are parties to the World Intellectual Property Organisation's Geneva Act, which provides a one-stop shop for registering GIs. Products protected by the relevant legislation include agricultural products, products derived from agricultural products, cooked food, handicrafts, and woven cloth, including associated designs and pottery methods and designs. Three examples are provided in detail: Kampot Pepper – Producers return to ancestral lands after 40 years of civil war and unrest; Bolaven Coffee – International development agencies support small landholders to form a co-operative to support the development of their community; and Mak Mao Berry Juice – One man's 30-year passion to commercialise a local product.

Keywords: Community development, Geographical indications,Iinnovation, Legislation, Traditional knowledge

1. Introduction

This paper focuses on implementing and promoting Geographical Indications (GIs) in Southeast Asia. Initially, it provides a strategic overview of the approach of the ten nations to adopting and promoting GIs. This is followed by an analysis of the types of products registered in each jurisdiction. As will be seen this also includes handicrafts. Three examples of successful commercialisation of GI products are provided.

One of the key innovation initiatives of the ten-member Association of Southeast Nations (ASEAN) has been the promotion of GIs to foster community development. For instance, Thailand's "One Tambon One Product" (OTOP) project, launched in 2001, to support community co-operatives in *tambons* (sub-districts) and villages throughout Thailand. The aim was to increase village incomes and preserve local wisdom. The inspiration was Japan's One Village One Product (OVOP) program (Food and Agriculture Organization, 2023). Subsequently, the Lao PDR established its One District One Product (ODOP) program (Khaosan Pathet Lao, 2014). Thailand followed up its OTOP program with its "One Province, One Geographical Indication" program to encourage each of its 76 provinces and Bangkok to develop at least one GI product (Department of Intellectual Property, 2013). With the registration of the "Ekkarat Drum" or "Klong Ekkarat" of An Thong province, on 22 June 2021, its goal was achieved (Nishimura & Asahi, 2021).

According to the World Trade Organisation (WTO), of which all ten members of ASEAN are members, geographical indications are "indications which identify a good as originating in the territory of a Member, or a region or locality in that territory, where a given quality, reputation or other characteristics of the good is essentially attributable to its geographical origin" (*TRIPS Agreement (as amended)*, art 22(1)). Member states are required to provide legal means for interested parties to prevent use of a designation or presentation of a good that "misleads the public as to the geographical origin of the good" (art 22(2)(a)).

The World Intellectual Property Organization (WIPO) has identified three primary modalities for the protection of GIs (World Intellectual Property Organization, 2024):

- *sui generis* systems which are established [by a country] to "apply specifically and exclusively to GIs";
- "collective marks and certification marks";
- "modalities focusing on business practices (such as laws relating to the repression of unfair competition or consumer protection)".

Most ASEAN economies use the *sui generis* system approach for registering domestic and foreign GIs. This may entail GI-specific legislation or specific requirements within broader intellectual property (IP) protection legislation. In addition, Cambodia and Lao PDR are parties to the *Geneva Act of the Lisbon Agreement on Appellations of Origin and Geographical Indications,* which allows for registration of GIs in its International Register, which allows for registration in the territory of the other parties to the *Geneva Act* provided it complies with the requirements of the foreign party (art 6). Countries not party to the Geneva Act must register their products in each of the desired foreign jurisdictions per the foreign jurisdiction's requirements.

Currently, Cambodia, Indonesia, Lao PDR, Malaysia, Thailand, Singapore and Vietnam offer protection under a *sui generis* law on GIs, with the law applicable to both agricultural and non-agricultural in all jurisdictions other than Singapore (ASEAN, 2020, p. 2). Singapore specifies the categories of goods it protects in its GI legislation. Brunei Darussalam, Myanmar and the Philippines protect GIs as "collective marks and/or certification marks under their trademark system" (ASEAN, 2020, p. 2). The Geographical Indication Legislation of the ASEAN member states is listed in Table 1.

Table 1: Geographical indication legislation of the ASEAN Member States

Country	Legislation
Brunei Darussalam	Trade Marks Act (rev ed 2000)
Cambodia	Law on Geographical Indications, 2014
Indonesia	Law on Trademarks and Geographical Indications
Lao PDR	Law on Intellectual Property (Amended), 2017
Malaysia	Geographical Indications Act 2002
Myanmar	Trademarks Law 2019
Philippines	Intellectual Property Code
Singapore	Geographical Indications Act
Thailand	Protection of Geographical Indications Act (2003)
	Ministerial Regulation of Geographical Indications (2003)
Vietnam	Law on Intellectual Property 2005

Registration of a Geographical Indication requires the applicant to provide comprehensive information concerning the product. An example is Koerintji Cinnamon from Indonesia, which had been exported and traded internationally by the Dutch since 1895 (ARISE+ Indonesia, 2022). It is claimed that 85% of cinnamon in the global market is from Indonesia, with the most premium quality being Koerintji Cinnamon, which the communities have produced for generations with traditional knowledge on cultivating the product resulting in its unique qualities and taste (ARISE+ Indonesia, 2022). As an example, a summary of the details of its registration is provided in Table 2.

Table 2: Summary of registration details of Koerintji Cinnamon

Property	Description
Product	Koerintji Cinnamon is produced from the variety of *Cinnamomum burmannii* grown and cultivated by the local Kerinci community in the southern part of Sumatra, Indonesia.
Certificate Number	ID G 000 000 043

Property	Description
Geographical Coverage & Origin	Kabupaten Kerinci is located on a plateau area surrounded by hills and is connected to the Bukit Barisan mountain range. Koerintji Cinnamon trees grow on hills across 12 districts (named in the registration).
Official GI Lodger & Community	"The Masyarakat Perlindungan Indikasi Geografis Kayumanis Koerintji Jambi (MPIG-K2J) is the official GI lodger of Koerintji Cinnamon and represents farmers' groups and local co-operatives, consisting of artisans, collectors, individual farmers, members of co-operatives and traders" (ARISE+ Indonesia, 2022).
Unique Physical Specifications – Dried Hard Barks	Quality grades are classified as follows: • KM (thickness >5mm, age: 30 years and above) • KF (thickness 3-5mm, 20-30 years) • KS (thickness 2-3mm, 10-20 years) • KA (thickness 1-2mm, 6 years) • The more mature the tree, the higher the price.
Unique Physical Specifications – Cinnamon Sticks	Sticks or quills are obtained from 8-10-year-old bark of Koerintji Cinnamon. The bark is sun-dried for up to 4 days and then air-dried at room temperature of 26^0C. After the drying process is completed, bark is cut into specific lengths and/or ground into coarse or fine powder. Koerintji Cinnamon sticks or quills have a thickness between 1mm and 3mm and of 8-10 years of age, grouped into two grades: • **VAA** has a double roll at each end and a diameter of 6-10 mm • **VA** has a single roll at each end and a diameter of 10-15 mm
Protected Name & Reputation	Koerintji Cinnamon / Kayumanis Koerintji
Correct Labelling	"The protected name of "Koerintji Cinnamon" can only be strictly used for the authentic and pure composition of 100% Koerintji Cinnamon – cinnamon sourced, grown and produced exclusively in the geographical coverage and origin defined in the GI Book of Specification. Mixed cinnamon cannot be sold using this name. However, the name of Koerintji Cinnamon may appear on the ingredient list as part of recipes or mixtures whereby the percentage/content of Koerintji Cinnamon must be clearly stated on the labelling" (ARISE+ Indonesia, 2022).
Traceability & Origin	Product packaging containing the composition of authentic 100% Koerintji Cinnamon must, by law, include in the labelling: • Official Indonesian GI logo • Registered GI product logo • Correct GI name: Koerintji Cinnamon / Kayumanis Koerintji • GI Code of Origin: Product traceability or lot code with prior approval from MPIG-K2J

The Geneva-based Organization for an International Geographical Indications Network (oriGIn) (2024) has identified what it considers to be the "benefits for producers and consumers":

- Protection of geographical names shows that GIs "can create wealth and add value in developing countries";
- GIs generally are based on minimum innovation, and developing countries have a rich history of traditional knowledge; they are well-placed to transfer such knowledge into marketable products with possible international market reach;
- Poor countries have a competitive labour advantage, particularly in agriculture and handicrafts;
- There can be spillover benefits to the economy;
- A GI can only be produced in its designated area, which provides its specific characteristics, restricting the ability of big corporations to exploit the GI holders;
- A GI provides "collective" rather than "individual" rights, meaning both the community and small producers can benefit;
- A collective approach generates economies of scale for small producers and
- "GIs are a light monopoly" in that it is a monopoly over a geographical name and not an exclusive right over a product.

2. Geographical Indications within Southeast Asia

2.1 Domestic GI Registrations

Unfortunately, details of the number of GIs in each jurisdiction depend on when the GI data is posted online. For instance, the ASEAN GI database is only updated periodically. To ensure that the data are as complete as

possible, the data source with the most domestic registrations for a particular country was used, as shown in Table 3 below. Data for registration of foreign products has been excluded.

As will be seen, 509 domestic GIs have been registered. As Brunei Darussalam and Singapore are very small nations, it is unsurprising that there are no registered domestic GIs. On the other hand, Singapore has registered a significant number of foreign GIs. Whilst Myanmar has the requisite legislation, the current political situation, which, to all intents and purposes, amounts to civil war, precludes any meaningful development.

Fresh fruit and vegetables are by far the most popular GIs. Even within one country, a generic fruit type, such as mangoes, may be granted a number of registrations as each particular geographical area produces a fruit with different identifiable characteristics. This means that the registration process must be rigorous, and the local growers' committee must be diligent in certifying the products in its area.

Thailand has the highest number of rice and sago registrations, with Indonesia having the highest number of coffee registrations by far. Surprisingly, Indonesia, once called the “Spice Islands”, is only just ahead of Vietnam for the number of spice and salt registrations.

It is important to note that GI registrations are not restricted to agricultural products, as they also include a significant number of fabric and handicraft registrations. Such products have particular traditional regional designs and use traditional processes.

Table 3: Domestic Geographical Indications registered in the ASEAN Members States

Member	Total Domestic GIs	Fruit & Vegetables	Rice & Sago	Coffee	Tea	Wine & Spirits	Juice & Honey	Spices & Salt	Cacao	Seafood	Processed Food & Meat	Palm & Rice Sugar	Fabrics	Handicrafts	Gems & Pearls	Tobacco	Miscellaneous
Brunei Darussalam	-	-															
Cambodia[1]	7	1					1	2		1	1	1					
Indonesia[2]	127	17	8	49	1		1	15	1	3	1	3	15	6	1	3	3

2.2 Examples of GI Products

This section details three GI products to show the different motivations behind the development of an industry and the registration of a GI.

2.2.1 Kampot Pepper – producers return to ancestral lands after 40 years of civil war and unrest

Cambodia recorded Kampot Pepper as the first GI registered via the Geneva Act of the Lisbon System of the World Intellectual Property Organization (WIPO, 2021). Pepper production in Cambodia commenced as early as

the 13th Century. Following the conflict in Indonesia between the Sultan of Aceh and the Dutch Army in 1873-1874, some production moved to Kampot (Kampot Pepper Promotion Association (KPPA), 2024). With the French colonialists arriving at the end of the 19th Century, production increased to 8,000 tonnes yearly. Then it stabilised at around 3,000 tonnes per year. It was considered to be of exceptional quality, particularly by the Chefs of France (KPPA, 2024).

From 1975, with the arrival of the Khmer Rouge and the subsequent civil war, production ceased, and the poles of pepper essentially disappeared. At the end of the 20th Century, families returned to their ancestral lands and commenced pepper production (KPPA, 2024). Kampot Pepper is grown exclusively in the provinces of Kampot and Kep and was registered domestically in 2010. The pepper's growing requirements and physical and organoleptic characteristics are detailed in ARISE+ (2019, pp. 39-45). Figure 1 shows the poles of Kampot pepper.

Figure 1: Poles of pepper plants at E Che Ngov Heng Food Production Company in Ta Ang Village, Kampot City

The Department of Intellectual Property considered that the impact of registration was significant (WIPO, 2021). The average farm-gate price rose from USD 7.50/kg in the year before domestic registration to USD 22.70/kg ten years after registration. For 2019, 2020 and 2021, the production of the members of the KPPA has been around 100 tonnes per annum (KPPA, 2024).

A study highlighting the role of contract farming and the role of the Kampot Pepper Agricultural Co-operative and the Kampot Pepper Promotion Association is described in detail in Thorng & Chao (2016).

2.2.2 Bolaven Coffee – International development agencies support small landholders to form a co-operative to support the development of their community

The Bolaven Plateau is a fertile rolling upland in southern Laos (Encyclopaedia Britannica, 2011). It is a significant basaltic lava intrusion at an average elevation of 1,000 metres. It is in the path of the June-to-November southwest monsoon, resulting in an average rainfall of 4,000 mm. The conditions are favourable to the production of high-quality coffee beans. Figure 2 shows a small coffee roasting oven on one of the plantations.

Figure 2: Coffee roasting oven at village on Bolaven Plateau west of Paksong

There is a mix of smallholders and commercial operations. The major co-operative consists of 1,855 smallholder families whose plantations had an average size of 3 hectares (Bolaven Plateau Coffee Producers Co-operative, 2016). The co-operative (CPC) is involved with all stages of the supply chain, from planting to the marketing of Bolaven Coffee. The objectives of the co-operative are to represent the coffee producers at both domestic and international levels for all coffee-related activities, provide technical assistance, and support all aspects of marketing and promotion (CPC 2024).

CPC is also very active on Facebook, with regular posts in Lao and English (Bolaven Plateau Coffee Producers Co-operative, 2024b).

2.2.3 Mak Mao Berry Juice – One man's 30-year passion to commercialise a local product

Mr Khanop Wannawong is of tribal heritage and lives in the Phu Phan hills of Sakon Nakhon Province in northeastern Thailand. He has spent over 30 years developing the cultivation of Mak Mao berries. His garden has around 31 different cultivars of Mak Mao berry trees with a Sakon Nakhon variant that has earned a GI mark (Mishra, 2023).

Figure 3: Dry pressing Mak Mao berries to produce Mak Mao juice

Sakon Nakhon is an undulating and wavy plain around 172 m above sea level. The Phu Pan ridge in the south and west of the province forms the great basin landscape. The province has three seasons: summer, rainy, and winter. Summer is very hot, and the annual average rainfall across the province is around 1,700 mm. With the climate and the nourishing soil, the wild berry Mak Mao Berry grows (from Sakon Nakhon Mak Mao Club banner at Wannawong orchard).

The Geographical Indication is defined by the Thai Department of Intellectual Property (Thai IP) as follows:

"Sakon Nakhon Mak Mao Berry Juice is a sweet and sour with a bitter taste of astringent juice. It is produced from large-size Mak Mao Luang fruit by passing it through a [cold] pressing process to separate the Mak Mao juice from the pulp. Ready-to-drink Mak Ma Berry Juice and Concentrated Mak Mao Berry Juice are produced by selecting only fresh and perfect fruit. Its manufacturing place is Sakon Nakhon province" (from the Thai IP banner at Wannawong orchard).

The number of producers has always been small; now, only four produce GI-certified Mak Mao Juice. Wine is also produced but does not have a GI mark.

Production is very labour-intensive, so the quantity of juice produced is relatively small.

Many studies have been undertaken on the benefits of drinking Mak Mao juice (e.g. Jorjong, Butkhup, & Samappito, 2015).

2.3 The Power of GI Products in Regional Development

Obtaining GI registration is just the beginning. For instance, the Department of Intellectual Property of Thailand has identified the following benefits from registration of a community product as a GI:

- Protection – the name of the product becomes the exclusive right of the registering community;
- Confidence building – consumers have enhanced confidence in the source and quality of the product;
- Move to the international level – the Department supports the applicant to register internationally;
- Added value – the GI registration serves as a marketing tool, and the selling price should increase;
- Maintenance – the standard of the product and the associated local wisdom is preserved;
- Support – the GI supports sustainable community tourism; and
- Strength – the GI helps unite the local inhabitants and develop the community (Department of Intellectual Property, 2016).

In September 2021, the Thai Deputy Commerce Minister identified three prominent roles of the Department of Intellectual Policy going forward:

- Promotion and protection of GIs, including advice on identifying GIs and consulting the registration process in Thailand and abroad;
- Promote and support the development of product quality control systems; and
- Support the development of images and package design for GI products and improve sales channels (Department of Intellectual Property, 2021, p. 3)

As a result, one of Thailand's major supermarket groups undertook the promotion of GI products in its supermarkets and encouraged its local sourcing teams to source GI products in the regions (Department of Intellectual Property, 2021, p. 8).

Similar support has been provided in other ASEAN jurisdictions by organisations such as Agence Française de Développement (2024), ARISE+ Indonesia (2024) Centre de Coopération Internationale en Recherche Agronomique pour le Développement (CIRAD), FAO, the European Union (FAO, 2020), and Groupe de Recherches et d'Echanges Technologiques (GRET, 2024).

Wongburanavart (2023, p. 68) concluded that Thailand's conventional IP regimes, especially GIs and plant variety rights, are compatible with protecting traditional knowledge as they "can grant indigenous and Local communities the right to control the use and ensure that the benefits are returned to the local community". Nonetheless, there are still some limitations and loopholes that also lead to misappropriations of traditional knowledge, and therefore, the development of a specific *sui generis* system to protect traditional knowledge should be considered.

3. Discussion

Geographical Indications have been seen as an effective community development tool in most ASEAN economies. A feature that differentiates the ASEAN and European approaches is the ability to register non-food items such as handicrafts and fabrics. The main criterion is that the product has properties that are unique to an identified geographical area, however defined. The registration of a GI protects a community's traditional knowledge as the GI is registered in the name of the community and not in the name of any individual.

The three examples discussed above were chosen to show three different approaches to the development of GI registration.

Kampot pepper had been a sought-after product for decades prior to the murderous Pol Pot regime taking control. The Kampot and Kep Provinces on the Gulf of Thailand remained Khmer Rouge strongholds long after the fall of the regime in most of the country. When the civil unrest ended, the traditional owners returned to redevelop the industry. Certainly, they needed assistance in the process. This enabled them to re-enter the international market and obtain local GI registration, followed by becoming the first GI registered under the Geneva Act of World Intellectual Property's Lisbon System (WIPO, 2021) to which the European Union is a party (WIPO, 2023). In 2023 Cambodia exported 103 tonnes of Kampot pepper, with "some 85 percent of the pepper shipped to Europe and the remaining 15 percent sold to other countries, including the US, Canada, China, Japan, and South Korea" (Chea Vanyuth, 2024).

In Laos, the development of the Bolaven Coffee industry was to improve the quality of life of local communities by facilitating sustainable agriculture. While the example focused on the Bolaven Plateau Coffee Producers Co-operative, this was not the only modality. Private producers were also buying up and developing extensive coffee plantations. The Food and Agriculture Organization supported the Lao government in setting up the legal framework for its GI system (Food and Agricultural Organization, 2021). In addition, Paksong Tea, Komaen Tea, Houaphanh Silk, and Luang Prabang Silk were selected for the initial set of GI registrations. In addition, Bolaven Coffee was added to the list. "Interprofessional Associations (IPAs) were formed with value chain actors for managing these products and books of specifications were developed for each GI product, detailing their unique characteristics, inputs, geographical scope and production methods" (Food and Agricultural Organization, 2021). The Bolaven Plateau Coffee Producers Co-operative, a key organisation in developing the local communities, is supported by the Lao Government, Asian Development Bank, and Agence Française de Développement. Fair Trade is a crucial partner (CPC 2024a).

In the third case the initiative remained with individual innovation and entrepreneurship of local individuals. Nevertheless, they required assistance with development and marketing activities. Marketing is supported by the involvement of local supermarkets.

Southeast Asian governments are committed to the concept of GIs to develop rural communities. Some are more able than others to commit to developing GIs and their ongoing support in the local communities. Others are dependent on external sources. In either case, the impact on the livelihoods of local communities can be very significant. Governments must also identify which GI products should be registered internationally to protect traditional knowledge and highlight their nation's products.

4. Recommendations and Conclusions

GIs can be an effective tool in promoting community development. It must be grounded in a robust intellectual property protection regime. Preferably this should be standalone sui generis GI legislation or specific GI requirements within omnibus intellectual property protection legislation. Trademark protection legislation does not have the same protections as specific GI legislation. The legislation should not be developed solely to protect wine but rather allow for the protection of farm produce, food and handicrafts, and any other products that can be defined by their "terroir" (unique habitat).

The first step is to obtain a "sponsor" such as the government, an international development agency or an active local promoter. This will enable identifying and promoting a GI in a systematic and sustainable model.

For agricultural products, the process should start with gathering information from key stakeholders using household surveys, focus group discussions, key informant surveys, and market and literature surveys to gather together all available traditional and scientific knowledge (Joshi & Gauchin, 2020, p.36), A field and laboratory evaluations should follow this to identify the potential genetic GI resources and their geographical boundaries.

The Re-Emergence of Food Security in the Western World: Short Supply Chains in Portuguese Territorial Contexts

Cristina Sousa, Sofia Vale and Maria de Fátima Ferreiro
Iscte, Instituto Universitário de Lisboa, Portugal

cristina.sousa@ iscte-iul.pt
sofia.vale@iscte-iul.pt
fatima.ferreiro@ iscte-iul.pt

Abstract: In the context of growing concerns surrounding food security and sustainability, this paper examines the emergence of short food supply chains (SFSCs) as alternative food systems. Focusing on box schemes in Portugal, the study investigates the socioeconomic factors influencing the presence of SFSC actors, utilizing a quantitative approach. Drawing on data from 420 producers offering food boxes and secondary data on municipality-level variables, the analysis reveals nuanced relationships between factors such as average income, urbanization, education levels, gender composition, and the proliferation of SFSCs. Notably, the study uncovers differential patterns in the determinants of SFSC presence between metropolitan and non-metropolitan areas, highlighting the significance of territorial contexts. The findings contribute empirical insights to the evolving literature on SFSCs, informing strategies for fostering resilient and equitable food systems in diverse geographic settings.

Keywords: Food security, Sustainability, Innovation, Short supply chains

1. Introduction

The first decades of the XXI century assisted to a re-emergence of the concern with food safety in the Western world. This "back to basics" movement is due to systemic crises, starting with the financial and economic crisis of 2008, the pandemic crisis, and, more recently, the war in Ukraine, which has had a tremendous impact on food (e.g. grain) supply chains. The re-emergence is accompanied by conceptual, political, and entrepreneurial innovations that envisage a transition of food systems towards sustainability.

The food sector corresponds to "activities, infrastructures, and people involved in feeding the world population (e.g. agricultural production, processing, distribution, consumption and disposal of goods)" (Bock et al., 2022, p.6). The current system is characterized by the concentration of power, the simplification, homogenization, and impoverishment of landscapes, the degradation of diets and cultures, but also the importance of family farming. The combination of these multidimensional effects and the geopolitical instability of the XXI century justifies the need to reflect on the role and the approaches to a central sector of our societies.

The paper builds on the evolution of the concept of food security and relates this evolution to the emergence of short food supply chains (SFSCs) as alternative food systems. SFSCs offer alternative solutions to food production and consumption that are more in line with the principles of food security and sustainable development (El Bilali et al, 2019; Stein & Santini, 2022). The proximity of producers and consumers is one of the benefits of SFSC. At this regard, and from the customers perspective, the decrease of intermediaries diminishes the asymmetry of information (De Frazio, 2016). Other benefits mentioned by literature include the dynamization of local economies through job creation, skills development, job satisfaction and the adoption of more sustainable practices by increasing the agricultural biodiversity (Mundler&Laughrea, 2016; De Frazio, 2016).

FSCs have become increasingly popular in Europe (Gori & Castellini, 2023). The literature already provides some insights into the importance of the socioeconomic characteristics of the territory for the popularity of these alternative food systems. However, existing studies tend to be qualitative case studies on specific regions or producers.

This paper aims to contribute to the nascent literature on the determinants of the growth of one type of SFSC – box schemes. It combines information on local farmers with socioeconomic characteristics of their local markets, identified by the municipalities in which they are located. The farmers were identified through their participation in a government online platform that connects small local producers with their potential markets, giving them the scale they need to survive (Jia et al., 2023). The analysis considers some socio-demographic characteristics of the territories that may influence the number of producers offering food boxes, and distinguishes the metropolitan areas of Lisbon and Porto from the rest of the territory.

The remaining of the paper is organized as follows. Section 2 presents the state of the art on this topic. Section 3 describes the method and the data used in the analysis. Section 4 presents and discusses the paper's results. The last section concludes.

2. Literature Review

In the last two decades, the issue of food security and, in this context, short food supply chains (SFSC), has received increasing attention (e.g., Raftowicz et al, 2024; Gori & Castellini, 2023; Chiffoleau & Dourian, 2020¸ Ruszkai et al, 2021). In addition to the concerns and public policies envisaging environmental and ecological purposes, this increase is explained by the crises that took place during the 21st century. This is the case of the 2008 crisis with the rise in the cereals' prices, the pandemic crisis and, more recently, the wars and the current geopolitical instability with huge implications for food security, namely the instability and dismantling of global food supply chains, with particular emphasis on cereals.

The renewed interest of Western countries in food security and food sovereignty has launched a debate on the difference between those concepts. In 1996, the World Food Summit presented the most widely accepted definition of food security: "At the individual, household, national, regional and global levels [food security is achieved] when all people, at all times, have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life". The 2021 World Food Summit consolidated this concept. In 2002, the World Food Summit presented a new definition of food sovereignty as "the true right to food and to produce food, which means that all people have the right to safe, nutritious, and culturally appropriate food and to food-producing resources and the ability to sustain themselves and their societies. Food sovereignty means the primacy of people's and community's rights to food and food production, over trade concerns' (LVC, 2002). The rights-based approach of food sovereignty is more clearly visible, and the rights no longer primarily accrue to nations, but to peoples and communities" (van Hemert, 2023, pp. 3-4).

SFSCs emerged as an alternative contributing to more economic, social, and environmentally sustainable food systems. SFSCs are presented in the literature as alternative food networks (AFN), that is, a system that "differ from the 'conventional' or is usually defined by what it is not, instead of what it is" (Michel-Villarreal et al., 2019, p. 3). In fact, the existing literature gives some insights into the role of SFSCs in food systems transition and resilience, namely concerning their up-scaling. Polita and Madureira (2021) address the transition to SFSC taking place in a Portuguese region by employing a multi-level perspective. Sousa and Ferreiro (2023) analyze the role of social innovation in sustainable food transition, focusing on box schemes. Salavisa et al. (2021) address the transition of the agro-food system in Lisbon Metropolitan Area.

According to the definition of the EU Regulation No. 1305/2013 [3], a short supply chain is a supply chain involving a limited number of economic operators, committed to cooperation, local economic development, and close geographical and social relationships between producers, processors, and consumers. Other AFNs include farmers markets, community supported agriculture (CSA), on-farm direct sales, canteen or restaurant procurement schemes, digital platforms proposing well-identified farmers' products (Chiffoleau & Dourian, 2020), and box schemes, which is the type of SFSC considered in this paper for the Portuguese case. According to Gori & Castellini the most studied AFN is farmers' market, followed by CSA, and cooperative and community garden (Gori & Castellini, 2023). Box schemes are not so addressed in the literature. Moreover, the existing empirical studies tend to resort to multiple case studies method, to address countries in the Global North, particularly in Europe with Italy and the United Kingdom scoring highest, and to focus on the "motivation of actors; collaborative governance; sustainability; social relations and trust; boundary negotiation and resilience" (Gori & Castellini, 2023, p.2).

Research provides insights on the facilitating and blocking factors of SFSC implementation, especially in Europe (Hyland et al, 2023; Enthoven et al, 2023; Aouinait et al, 2022; Popp et al., 2018). Scholars stress the importance of the role of the consumer (engagement, motivation, and participation) (Enthoven et al, 2023; Hyland et al., 2023), specifically the aspects related to the accessibility and quality of products, their variability, the support to local economy, the expense, and trust (Hyland et al., 2023; Aouinait et al, 2022). Socioeconomic factors, such as age, gender, education, and income, in consumer's propensity to adhere to FSSC are relevant in consumer's motivation towards SFSC. Escobar-Lopez et al. (2021, pp. 12) mention that "several works have reported that women have more pro-environment attitudes and take a more active part in this type of initiatives"; and "some works have established a link between the higher educational level and the possibility of choosing alternative foods due to the information available". Popp et al. (2019: p.31) show that, in the case of new EU member states, the "relatively low propensity to pay for local products on the part of the

population (…) further decreases possibilities for short supply chain development". Relatedly, Sitaker et al (2020) found that communities with higher income have more food basket offer. The relevance of contextual and territorial factors, namely the role of LEADER action groups as promoters of SFSC in Europe, is also addressed by Ruszkai et al. (2021).

SFSC is built on relational and spatial proximity, as well as trust (Thorsøe & Kjeldsen, 2016).) and rooted in specific territorial contexts (Grando et al, 2017). Thus, unique characteristics of the territory can also affect the presence of SFSC in addition to socioeconomic factors. Urban areas in particular tend to attract a diverse range of consumers with varying income levels and preferences, which may represent a larger potential market but necessitate the use of specialty retail chains as market channels for small farmers. In this sense, the European Parliament distinguishes between neo-traditional SFSC, which is cantered on cooperative networks of producers, consumers, and institutions and is typically found in urban areas, and traditional SFSC, which is based on farms (Augère-Granier, 2016).

The paper is in line with this research approach by considering socioeconomic variables of territorial contexts of the Portuguese SFSC in the model of box schemes. In the Portuguese case these contextual factors are very critical in the emergence, development and sustainability of SFSC (Polita & Madureira, 2021; Salavisa et al, 2021). The paper contributes to the scarce literature on box schemes by providing an exploratory quantitative study of the regional socioeconomic factors that may influence the demand for food boxes (local markets) and therefore may contribute to explain the number of producers offering food boxes in each region.

3. Data and Method

The empirical analysis focuses on food baskets delivered by farmers, a type of SFSC. According to the Portuguese law, a sustainable supply chain comprises producers and consumers who are far apart by up to 50 kilometres. The sample comprises 420 producers offering food boxes. They were identified from an online platform developed and updated by the Portuguese Ministry of Agriculture in partnership with other organizations[1]. The goal of this platform is to promote and disseminate SFSC by bringing closer together producers and consumers and fostering both the consumption of local products and the use of proximity markets. On this platform, producers advertise their products and baskets, and consumers can search by type of product and place their orders for delivery. As stated by Jia et al. (2023), challenges to SFSC include information asymmetry, lack of infrastructure and market dynamics. Thus, the online platform operates as a key determinant of these businesses' success, building the necessary bridges between its main actors – farmers and consumers.

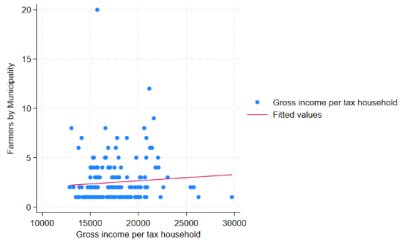
The search was narrowed down to fruit, vegetables, legumes and mushrooms, the most common types of products in the boxes. The analysis focuses on characterizing the local markets in which these SFSC are built, using the municipality as the unit of analysis and distinguishing the metropolitan areas of Lisbon and Porto from the rest of Portugal. As a result, the analysis intertwines three actors: the farmers who were kicked off the platform; the platform itself, which was created as a public policy to link farmers and consumers; and the consumers themselves, who are embodied by the municipality's general socioeconomic traits.

Portugal is located in southern Europe and consists of a continental part and two autonomous archipelagos: the Azores and Madeira. It is composed of 308 municipalities. Farmers are scattered throughout the country, although their presence is greatest in the northern continental part. The boxes are very diverse, ranging from one to thirteen categories of products, some of which are processed, such as olive oil, olive paste or jam.

To characterize the local markets, secondary data was collected, from Portuguese National Statistics and Ministry of Agriculture, on the following variables: gross income per tax aggregate, the number of cities, the total population, the share of women in the population, the total average age, and education levels, all by municipality. The descriptive statistics are displayed in Table 1.

[1] These organizations include the National Rural Network, the "Minha Terra" Federation, Local Action Groups and Municipalities. The Portal is called "Alimente quem o Alimenta" which stands for "Feed those who feed you".

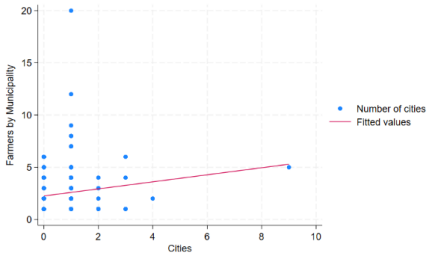
Table 1: Descriptive statistics by municipality



Variable	Mean	Std.dev.	Min	Max
Producers by municipality	2.497041	2.368253	1	20
Gross income per tax aggregate	17472.31	2659.18	12848	29727
Cities	0.727811	0.99247	0	9
Share of the population with secondary education	38.31757	8.12793	22.98	66.35
Share of women in total population	51.82154	0.7704134	49.37222	54.13592

Source: Author's calculations using data from Portuguese National Statistics and Ministry of Agriculture

A descriptive analysis is performed using Stata software to identify patterns of association between the number of farmers per municipality and the variables listed in Table 1.



4. Results

There is a positive association between the number of producers and average income per tax aggregate by municipality as shown in Figure 1. However, Table 2 shows that the correlation between these two variables is not statistically significant. A similar but statistically significant relationship is observed with the average number of cities (Figure 2 and Table 2). Although not represented for the sake of space, a positive correlation was also found between the population and the number of villages. These data suggest that the scale (market size) at which these farmers operate is relevant to them, in line with the findings of Sitaker et al. (2020), possibly by facilitating their matching with consumers whose preferences are aligned with the products they supply, thus enabling them to take advantage of market opportunities.

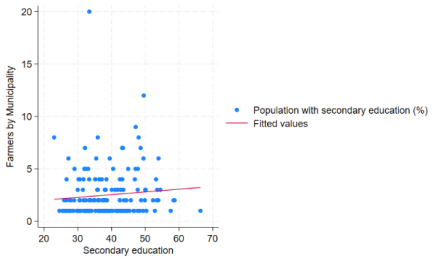

Figure 1: Number of farmers concerning gross income per tax aggregate

Source: Authors' own elaboration

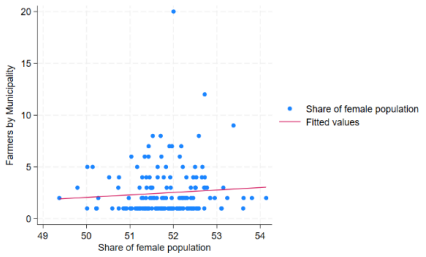

Figure 2: Number of farmers concerning the number of cities

The composition of the population also seems to be related to the presence of a greater number of farmers committed with SFSC as advanced by the literature. Figure 3, which depicts the relationship between the number of farmers and the proportion of the population with secondary education, indicates a positive association between these variables, whereas Figure 4 shows that a greater presence of women has a positive effect on the number of farmers in the municipality, both results in line with previous findings from Escobar-Lopez (2021). However, none of these associations is statistically significant (see Table 2).

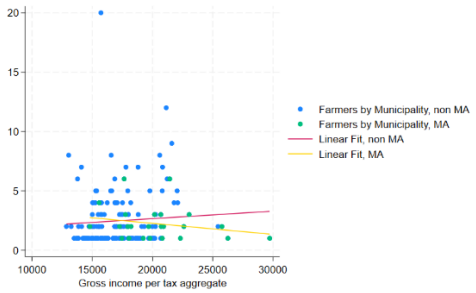

Figure 4: Number of farmers concerning the share of women in the total population

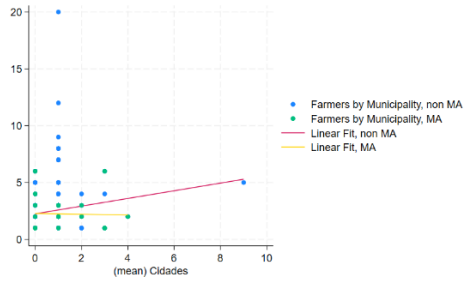
Table 2: Correlation matrix

	Farmers	Income	Cities	Education	Women
Farmers	1.0000				
Income	0.0709 (0.3595)	1.0000			
Cities	0.1415* (0.0665)	0.2041*** (0.0078)	1.0000		
Education	0.0895 (0.2473)	0.8877*** (0.0000)	0.2701*** (0.0004)	1.0000	
Women	0.0770 (0.3194)	0.3442*** (0.0000)	0.0485 (0.5310)	0.3655*** (0.0000)	1.0000
Notes: p-values between parentheses; * indicates p-value <0.01; *** * indicates p-value <0.1					



The statistical significance found in the correlation between farmers and population, as well as between these and the number of cities, might suggest that the urban concentration of population can act as a facilitator for these producers, making it easier for them to reach a larger number of consumers without having to use intermediaries, ensuring the profitability of their business.

To test if the degree of urbanization of the territory affects the presence of local producers and box suppliers, the number of farmers was regressed against gross income per tax aggregate for municipalities in the Lisbon and Porto metropolitan areas, as well as municipalities that are not in these metropolitan areas. The regressions shown in Figure 5 exhibit asymmetrical behavior for the two types of areas. While there is a positive correlation between the number of farmers and the average gross income per tax aggregate in less urbanized areas, this relationship turns negative in metropolitan areas. Figure 6 exhibits the same type of non-linearity for cities.

Source: Authors' own elaboration

Figure 5: Number of farmers concerning gross income per tax aggregate, distinguishing the metropolitan areas of Lisbon and Porto from the rest of the country

Source: Authors' own elaboration

Figure 6: Number of farmers concerning the number of cities, distinguishing the metropolitan areas of Lisbon and Porto from the rest of the country

These varying correlations by type of territory could be caused by a higher concentration of farmers in less affluent metropolitan municipalities since these typically have a higher proportion of available land. Owing to the existence of associated socioeconomic traits, these areas also have populations that are less educated and that appear to have smaller proportions of women.

Overall, the findings indicate that the characteristics that facilitate or impede the existence of these unique actors in Portuguese municipalities vary in their territorial expression and, specifically, alter in response to the level of urbanization. The correlations' reversal in sign raises the possibility that variables other than those found in conventional socioeconomic theories could influence farmers' willingness to sell their produce through SFSC. Specifically, the urban setting may help overcome obstacles noted in the literature, such as peers' inefficiency and lack of teamwork and producers' poor marketing and communication skills (Aouinaït et al, 2022).

5. Conclusion

This paper has examined the resurgence of food security and sustainability concerns in the wake of systemic crises, such as financial downturns, pandemics, and geopolitical instability. In this context, SFSCs have emerged as innovative alternatives to conventional food systems, aligning with principles of food security and sustainable development, by establishing direct relationships between producers and consumers.

Through a quantitative exploratory analysis focusing on box schemes in Portugal, the study sheds light on the socioeconomic factors influencing the growth of SFSCs, particularly to the number of producers offering food boxes. The findings reveal a nuanced relationship between various socioeconomic variables and the presence of SFSC actors, with factors such as average income, urbanization, education levels, and gender composition playing a significant role. In particular, the study uncovers distinct patterns in the determinants of SFSC presence between metropolitan and non-metropolitan areas.

As limitations, it should be noted that this study is an exploratory analysis and focuses solely on a group of farmers who produce and sell a specific type of agricultural product; thus, the results should be interpreted with caution because they may be sector-specific.

These findings suggest the importance of considering territorial contexts in understanding the dynamics of alternative food systems and have several implications for public policy. Firstly, policymakers should prioritize support for the development and expansion of SFSCs, which could include information campaigns aimed at different population profiles. Secondly, policymakers should recognize the nuanced relationship between socioeconomic factors and the presence of SFSCs, particularly the differences between metropolitan and non-metropolitan areas. Interventions and policies envisaging the promotion of SFSCs should be tailored to the specific contexts of different regions, considering factors such as income levels, urbanization, education, and gender composition.

The Efficiency of Intellectual Capital Formation at the Scientific Institutions of Engineering and Computer Sciences

Inese Spica, Rozite Katrina Ponne, Paula Jegere and Iveta Liniņa
Scientific Institution Business Competence Centre, Riga, Latvia

inese.spica@gmail.com
rozite.spica@gmail.com
jegerepaula@inbox.lv
iveta.linina@turiba.lv

Abstract: The research of the formation of intellectual capital (IC) of engineering and computer sciences (E&CSs) at scientific institutions (SIs) in Latvia in the present situation is highly topical. The object of the research is the formation of IC of E&CSs at SIs while the subject of the research is the comparative analysis of the efficiency of the involvement of academic staff and students in the formation of IC of E&CSs at SIs of Latvia. The objective of the research is to study the involvement of academic staff and students in the formation of IC of E&CSs at SIs in Latvia in the period from 2013 to 2018. The following tasks were determined to reach the objective: to study the formation of IC of E&CSs at SIs; to identify the concept of the efficiency of the involvement of academic staff and students in the formation of IC of E&CSs; to calculate main indicators thereof, and, to carry out the comparative analysis of indicators characterising the efficiency of the involvement of academic staff and students in the formation of IC of E&CSs at SIs in Latvia. Research methods used in the paper are content analysis, economic analysis, and economic experiment.

Keywords: Intellectual capital, Scientific institutions, Efficiency, Engineering science, Computer sciences

1. Introduction

Every six years, the Ministry of Education and Science of the Republic of Latvia (MoES) organises the International Evaluation of Scientific Institutions' Activity (IESIA) of SIs registered in Latvia. The last IESIA refers to the period from 2013 to 2018. In order to establish the dynamics of efficiency indicators of academic staff involved in the formation of IC in E&CSs at SIs of Latvia (MoES, 2021), the authors used the output data of findings across the set of evaluation of SIs of E&CSs per period from 2013 to 2018 offered by "Technopolis-group" (TG).

The comparative analysis will reveal whether the score of E&CSs at SIs of Latvia in the IESIA of TG coincides with the place of SIs of Latvia in the ratings of IC indicators, and whether the overall score of SIs of Latvia also reflects the efficiency of the involvement of the academic staff of SIs of Latvia in the IC formation.

Hypothesis: The overall score of SIs shows the efficiency of the IC formation at SIs of Latvia.

2. Theoretical Background

Spica et al (2017a) state that IC is an economic category, the spiritual value created by the human potential, and it can be accumulated and converted into the value of other capitals. By investigating certain information about the management of education, we can increase the capacity and significance of the country's total economic capital movement. Rondeau et al (2022) remind that peer reviewed publications remain a traditional form of academic productivity. Spica et al (2017a; 2017b) have worked out four indicators of the efficiency of the formation of IC in the higher education establishment (HEE): (1)The efficiency of the involvement of academic staff in the formation of IC per year in percentages (AIK); (2)The efficiency of the involvement of academic staff with a Doctorate degree in the formation of IC per year in percentages (DIK); (3)The efficiency of the involvement of students in the formation of IC per year in percentages (SIK); (4)Mutual efficiency of the involvement members of the academic staff with Doctorate degrees and the academic staff without Doctorate degrees in the formation of IC per year in times, (DE).

3. Methodology

In order to calculate the AIK, DIK, SIK, and DE of the HEE Spica et al (2017a; 2017b) have worked out four formulas: (1) AIK = (ZPS : AS) x 100; (2) DIK = (ZPS : DS) x 100; (3) SIK = (ZPS : SS) x 100; (4) DE = DIK : AIK. Where: ZPS represents the number of scientific publications of the HEE per year; AS represents the number of academic staff in full-time jobs per year; DS represents the number of academic staff with Doctorate degrees holding in full-time jobs per year; SS represents the number of students per year.

The authors modified the above mentioned formulas for the purposes of the study. Namely, they calculate IC efficiency indicators for total numbers of full time equivalent (FTE) academic and research personnel (KIK), for FTE academic personnel (AIK), for FTE academic and research personnel (PIK) and for PhDs completed at SIs (SIK). In addition, all the said IC efficiency indicators were calculated for different forms of IC such as total number of self-reported outputs of IC (KS), articles in peer reviewed scientific edited journals and conference proceedings included in WoS or SCOPUS (WS), articles in peer reviewed edited journals, and conference proceedings not included in WoS or SCOPUS (RS), monographs (MS), and Latvian patent (LPS), and European patent and International patents (EPS). The authors calculated mutual efficiency indicators (PE) regarding involvement of the FTE academic and research personnel (PS) and the FTE academic personnel (AS) in the formation of IC in times.

In the present research, the authors used the following data from the IESIA: output data on the number of FTE academic personnel (AS), the number of FTE academic and research personnel (PS), the total number of FTE academic and research personel (KS), the number of PhDs completed (SS), the number of articles in peer reviewed scientific edited journals and conference proceedings included in WoS or SCOPUS (WS), the number of articles in peer reviewed scientific edited journals and conference proceedings not included in WoS or SCOPUS (RS), the number of monographs (MS), the number of Latvian patents (LPS), and the number of European and International patents (EPS), and total number of self-reported outputs (KS) in period from 2013 to 2018 per SI of E&CSs in Latvia. Authors revised the above WS, RS, MS, LPS, EPS and KS for the year.

The number of scientific publications and patents are the main results of the IC formation at SIs of E&CSs. TG analysed 16 SIs of E&CSs of Latvia, 2 were private SIs and 14 were public SIs. During the period analysed in the IESIA, there were such SIs in Latvia: Institute of Physical Energetics (IPE); ISMA Computer Technology Laboratory (ISMA/CTL); Research Institute of Latvian Maritime Academy (LMA); Rezekne Academy of Technology Institute of Engineering (RAT/IE); Riga Technical University (RTU) Faculty of Civil Engineering (CE); Transport and Telecommunication Institute (TTI); RTU Fa-culty of Electronics and Telecommunications (FET); Ventspils University of Applied Sciences Engineering and Technology Research Platform (VU/ETRP); RTU Faculty of Materials Science and Applied Chemistry (FMSAC); RTU Faculty of Mechanical Engineering, Transport and Aeronautics (FMETA); RTU Faculty of Power and Electrical Engineering (FPEE); Institute of Electronics and Computer Science (EDI); Latvian University of Life Sciences and Technologies Engineering and Technologies Unit (LULST/ETU); Liepaja University Engineering and Technologies Unit (LU/ETU); RTU Faculty of Computer Science and Information Technology (FCSIT); University of Latvia Institute of Mathematics and Computer Science (UL/IMCS).

In this study, one scientific publication or one patent are accepted as one unit of IC. Further, using the modified formulas 1; 2; 3; 4, were calculated: AIK, PIK, KIK, SIK, PE. Then, according to the results obtained through the author's calculations, a corresponding rating place was assigned to each SI of Latvia per year and each of the above indicators AIK, PIK, KIK, SIK.

Each place in the rating was then assessed with an appropriate score, where the lowest score is 1 point, while the highest score is 5 points. Thus, the SI, which took first to third place in - AIK, PIK, KIK and SIK received 5 points in the ranking, took fourth to sixth place - received 4 points, seventh to ninth place - received 3 points, tenth to twelfth place - received 2 points, and thirteenth to sixteenth place - received 1 point.

The above mentioned assessment system allows to compare the quantitative efficiency indicators of SIs of E&CSs in Latvia calculated by the authors to IESIA overall assessment criterion - quality of the SI research performance. The re-levant TG was the score of research performance of each SI using a scale where score 5 means an outstanding level of research, score 4 means a very good level of research, score 3 means a good level of research, score 2 means an adequate level of research, and score 1 means a poor level of research (MoES, 2021).

The follow-up authors compared the results of their own estimates of SIs quantitative indicators to the qualitative indicators of the relevant TG, and calculated the difference between the indicators and the changes. For this purpose, the authors calculated the average score of indicators for each SI recording the efficiency of the IC formation and compared these scores to scores of the research quality of each SI and overall score developed by the TG Panel.

4. Results

According to the authors' estimates, from the IESIA data show that the total number of self-reported outputs of SIs of E&CSs in Latvia is taken in the largest proportion by the WS - 61,80%, which is followed by the RS - 32,65%, the LPS - 3,94%, the MS - 0,96%, the EPS - 0,65%.

To calculate the efficiency of the involvement of academic and research staff in the WS formation, the authors used formulas:

AIK = (WS : AS) x 100 (1)

PIK = (WS : PS) x 100 (2)

KIK = (WS : KS) x 100 (3)

SIK = (WS : SS) x 100 (4)

PE = PIK : AIK (5)

These indicators of SIs and their place in the rating of SIs of E&CSs in Latvia as well as its scores are summarized in Table 1. The table of the SIs indicators, ratings, and score was drawn up by authors. The summarized indicators show that in general, in Table 1, the figure rests in the range from 1584% to 12% in respect of the SIs in Latvia.

The authors compared the SIK indicators of all students of HEE in Latvia to SIK indicators of PhDs students of SIs of E&CSs in Latvia, and found that SIK indicators of the PhDs students were considerably higher. It follows from the study by Spica et all (2018) that the highest SIK indicators were held by Daugavpils University (1,45% in 2013) and the University of Latvia (1,82% in 2014). Meanwhile, between 2013 and 2018, the highest annual SIK indicator for PhDs students of SIs of E&CSs in Latvia was held by the VU/ETRP and represented 654%.

When analying the results obtained by SIs in the IC formation in the field of E&CSs, the same methodology was used as in the fields of social sciences, and, humanities and art sciences. Thus, the quantitative results of SIs in these fields can be compared. One of the main criteria for the quantitative evaluation of SIs is the efficiency of the involvement of the SIs staff in the formation of WoS and SCOPUS publications.

The comparison of the results of the three fields of science leads to conclusion that the highest score of the KIK indicator in the field of social sciences is 278% (Spica et al, 2022) while the highest score of the KIK indicator in field of E&CSs is 449%, and, the highest score of the KIK indicator in field of humanities and art sciences is 53% (Spica et al, 2023). In addition, it should be noted that the highest score of the KIK indicator in the field of humanities and art sciences is almost 9 times lower than the highest score in the field of E&CSs, and, the highest KIK indicator in field of social sciences is almost 2 times lower.

In Table 2 authors calculate efficiency of the involvement of academic and research staff in the RS formation, the authors used formulas:

AIK = (RS : AS) x 100 (6)

PIK = (RS : PS) x 100 (7)

KIK = (RS : KS) x 100 (8)

SIK = (RS : SS) x 100 (9)

PE = PIK : AIK

In Table 2, in respect of SIs of E&CSs in Latvia, the figure rests in the range from 14% to 829%. The highest indicator is the AIK in the TTI, but the lowest indicators is the KIK in the LMA. The AIK indicators were not collected for the 4 SIs of E&CSs.

In Table 3 authors calculate efficiency of the involvement of academic and research staff in the formation of MS, the authors used formulas:

AIK = (MS : AS) x 100 (11)

PIK = (MS : PS) x 100 (12)

KIK = (MS : KS) x 100 (13)

SIK = (MS : SS) x 100 (14)

PE = PIK : AIK (15)

In Table 3 the figure rests in the range from 0% to 142% in respect of the SIs of E&CSs in Latvia. The highest indicator are AIK and PIK in the ISMA/CTL but the lowest indicators are AIK and KIK in the LMA.

In Table 4 authors calculate efficiency of the involvement of academic personnel and research personnel in the formation of LPS, the authors used formulas:

AIK = (LPS : AS) x 100 (16)

PIK = (LPS : PS) x 100 (17)

KIK = (LPS : KS) x 100 (18)

SIK = (LPS : SS) x 100 (19)

PE = PIK : AIK (20)

UL/IMCS	0	0	0	0	11	2	0	10	2	1,0	0	1	8	3	1,7
Average	4			3			2				0,6	3			

In Table 5 authors calculate efficiency of the involvement of academic personnel and research personel in the formation of EPS, the authors used formulas:

AIK = (EPS : AS) x 100 (21)

PIK = (EPS : PS) x 100 (22)

KIK = (EPS : KS) x 100 (23)

SIK = (EPS : SS) x 100 (24)

PE = PIK : AIK (25)

In Table 5 the figure rests in the range from 0% to 38% in respect of the SIs of E&CSs in Latvia; the highest SIK is held by the EDI while the lowest KIK belongs to the RTU/FPEE and RTU/FCSIT.

In the all tables, the awerage indicators PE are the same, and the average SIK indicators are the highest, while the average KIK indicators; the average AIK indicators are the highest, while the average PIK indicators.

The highest average rate of the PE indicators is 1,8 (Spica et al, 2022) in social sciences, the second highest average rate of the PE indicators is 1,7 (Spica et al, 2023) in humanities and art sciences, and, the lowest average rate of the PE indicators is 0,6 in E&CSs. In addition, it should be noted that the highest average rate of the PE in the field of social sciences is three times higher than the average rate in the field of E&CSs.

UL/IMCS	3	3	2,0	1,0	1,0	2,4	0,6	0,6

5. Conclusions

The study of the authors did not result in confirmation of their hypothesis. When comparing the qualitative ratings of TG group to the quantitative assessments perfomed by the authors, it can be concluded that they differ from minus 3,5 points to plus 3,5 points in total.

The study shows that the TAAP, TAAPS, TAKO, and TAKOS of SIs of E&CSs in Latvia were higher than the results compiled by the relevant TG Panel except for the EDI, where all scores were too lower, and, exept for the LMA, where QTG, OTG, TAAP, TAAPS scores coincided.

The authors is encouraged to supplement the methodology for international evaluation of scientific institutions with four efficiency indicators AIK, PIK, KIK, SIK of the involvement of academic staff and students in the formation of IC per year in percentage, and, PE in times, in order to improve the quality of the evaluation of SIs.

Abstract: The formation of intellectual capital (IC) of medical and health sciences at scientific institutions (SIs) is highly topical for all people on the world. The object of the research is formation of IC of medical and health sciences at SIs while the subject of the research is the comparative analyses of the efficiency of the involvement of academic staff and PhD students in the formation of IC of medical and health sciences at SIs of Latvia. The objective of the research is to study the involvement of academic staff and PhD students in the formation of IC of medical and health sciences at SIs in Latvia in the period from 2013 to 2018. The following tasks were determined to reach the objective: to study the formation of IC of medical and health sciences at SIs; to identify the concept of the efficiency of the involvement of academic staff and PhD students in the formation of IC of medical and health sciences; to calculate main indicators thereof, and, to carry out the comparative analysis of indicators characterising the efficiency of the involvement of academic staff and PhD students in the formation of IC of medical and health sciences at SIs in Latvia. Research me-thods used in the paper are content analysis, economic analysis, and economic experiment.

Keywords: Efficiency indicators, Intellectual capital, Scientific institutions, Medical and health sciences

1. Introduction

Every six years, the Ministry of Education and Science of the Republic of Latvia (MoES) organises an international evaluation of SIs registered in Latvia. The previous International Evaluation of Scientific Institutions' Activity (IESIA) in Latvia covered the period from 2006 to 2011. The last IESIA refers to the period from 2013 to 2018. In order to establish the dynamics of efficiency indicators of academic staff involved in the formation of IC in medical and health sciences at SIs of Latvia (MoES, 2021), the authors were used secondary output data of findings across the set of evaluation of SIs of medical and health sciences per period from 2013 to 2018 offered by “Technopolis-group” (TG).

Consequently, it provides an opportunity for the authors to calculate the IC indicators in medical and health sciences at SIs of Latvia and to compare their dynamics during the period from 2013 to 2018. The authors analyzed secondary data from the above period because newer data was not available.

Data of the comparative analysis will help to develop support programs to increase the efficiency of involvement of the academic staff in the IC formation. In addition, the comparative analysis will reveal whether the score of medical and health sciences at SIs of Latvia in the IESIA of TG coincides with the place of SIs of Latvia in the ratings of IC indicators, and whether the overall score of SIs of Latvia also reflects the efficiency of the involvement of the academic staff of SIs of Latvia in the IC formation.

Hypothesis: The overall score of SIs shows the efficiency of the IC formation at SIs of Latvia.

2. Theoretical Background

Spica et al (2017a) state that IC is an economic category, the spiritual value created by the human potential, and it can be accumulated and converted into the value of other capitals. By investigating certain information about the management of education, we can increase the capacity and significance of the country's total economic capital movement. Rondeau et al (2022) remind that peer reviewed publications remain a traditional form of academic productivity. Spica et al (2017a; 2017b) have worked out four indicators of the efficiency of the formation of IC in the higher education establishment (HEE): (1)The efficiency of the involvement of academic staff in the formation of IC per year in percentages (AIK); (2)The efficiency of the involvement of academic staff with a Doctorate degree in the formation of IC per year in percentages (DIK); (3)The efficiency of the involvement of students in the formation of IC per year in percentages (SIK); (4)Mutual efficiency of the involvement members of the academic staff with Doctorate degrees and the academic staff without Doctorate degrees in the formation of IC per year in times, (DE).

3. Methodology

In order to calculate the AIK, DIK, SIK, and DE of the HEE Spica et al (2017a; 2017b) have worked out four formulas: (1) AIK = (ZPS : AS) x 100; (2) DIK = (ZPS : DS) x 100; (3) SIK = (ZPS : SS) x 100; (4) DE = DIK : AIK. Where: ZPS represents the number of scientific publications of the HEE per year; AS represents the number of academic staff in full-time jobs per year; DS represents the number of academic staff with Doctorate degrees holding in full-time jobs per year; SS represents the number of students per year.

The authors modified the above mentioned formulas for the purposes of the study. Namely, they calculate IC efficiency indicators for total numbers of full time equivalent (FTE) academic and research personnel (KIK), for FTE academic personnel (AIK), for FTE academic and research personnel (PIK) and for PhDs completed at SIs (SIK). In addition, all the said IC efficiency indicators were calculated for different forms of IC such as total number of self-reported outputs of IC (KS), articles in peer reviewed scientific edited journals and conference proceedings included in WoS or SCOPUS (WS), articles in peer reviewed edited journals, and conference proceedings not included in WoS or SCOPUS (RS), monographs (MS), and Latvian patent (LPS), and European patent and International patents (EPS). The authors calculated mutual efficiency indicators (PE) regarding involvement of the FTE academic and research personnel (PS) and the FTE academic personnel (AS) in the formation of IC in times.

In the present research, the authors used the following data from the IESIA: output data on the number of FTE academic personnel (AS), the number of FTE academic and research personnel (PS), the total number of FTE academic and research personel (KS), the number of PhDs completed (SS), the number of articles in peer reviewed scientific edited journals and conference proceedings included in WoS or SCOPUS (WS), the number of articles in peer reviewed scientific edited journals and conference proceedings not included in WoS or SCOPUS (RS), the number of monographs (MS), the number of Latvian patents (LPS), and the number of European and International patents (EPS), and total number of self-reported outputs (KS) in period from 2013 to 2018 per SI of medical and health sciences in Latvia. Authors revised the above WS, RS, MS, LPS, EPS and KS for the year.

The number of scientific publications and patents are the main results of the IC formation at SIs of medical and health sciences. TG analysed 8 public SIs of medical and health sciences of Latvia.

During the period analysed in the IESIA, there were 8 such SIs in Latvia: Latvian Biomedical Research and Study Centre (LBRSC); Limited liability company “Riga East University Hospital” (REUH); Pauls Stradins Clinical University Hospital Research Institute (PSCUHRI); Latvian Institute of Organic Synthesis (LIOS); Latvian Academy of Sport Education (LASE); Riga Stradins University Platform of Medicine (RSU/MP); Riga Stradins University Public Health Platform (RSU/PHP); University of Latvia Medicine and Health Science Cluster (UL/MHSC).

In this study, one scientific publication or one patent are accepted as one unit of IC. Further, using the modified formulas 1; 2; 3; and 4, were calculated: KIK, AIK, PIK, SIK, PE. Then, according to the results obtained through the author's calculations, a corresponding rating place was assigned to each SI of Latvia per year and each of the above indicators KIK, AIK, PIK and SIK.

Each place in the rating was then assessed with an appropriate score, where the lowest score is 1 point, while the highest score is 5 points. Thus, the SI, which took first place in - KIK, AIK, PIK and SIK received 5 points in the ranking, took second place - received 4 points, took third place - received 3 points, took fourth place - received 2 points, and took fifth to eighth place - received 1 point.

The above mentioned assessment system allows to compare the quantitative efficiency indicators of SIs of medical and health science in Latvia calculated by the authors to IESIA overall assessment criterion - quality of the SI research performance. The relevant TG Panel was the score of research performance of each SI using a scale where score 5 means an outstanding level of research, score 4 means a very good level of research, score 3 means a good level of research, score 2 means an adequate level of research, and score 1 means a poor level of research (MoES, 2021).

The score assigned to the overall assessment by the relevant TG Panel was based on the assessment of five sub elements A to E, where element A characterises the quality of the research, element B - the impact on the development of the specific field of science, element C - the economic and social impact of the research, element D - the research environment and infrastructure of the institution, element E - the institution development potential. The Panel was provided with scores against each sub-element and the overall score and was also provided with narrative descriptions of their scores, the overall score and the sub-elements (MoES, 2021).

The follow-up authors compared the results of their own estimates of SIs quantitative indicators to the qualitative indicators of the relevant TG Panel, and calculated the difference between the indicators and the changes. For this purpose, the authors calculated the average score of indicators for each SI recording the efficiency of the IC formation and compared these scores to scores of the research quality of each SI and overall score developed by the TG Panel.

4. Results

It follows from the IESIA that in Latvia, 5 SIs of medical and health sciences have corresponding fields of science in basic medicine, 4 SIs corresponding fields of science in health biotehnology, clinical medicine, health sciences, 3 SIs corresponding fields of science in other medical sciences. In turn, such corresponding fields of sciences as biological sciences; educational sciences; sports sciences are operated by 1 SI in each field of science.

According to the authors' estimates, from the IESIA data show that the total number of self-reported outputs of SIs of medical and health science in Latvia is taken in the largest proportion by the WS - 68,14%, which is followed by the RS - 24,57%, the MS - 2,66%, the LPS - 3,34%, the EPS - 1,29%.

To calculate the efficiency of the involvement of academic and research staff in the WS formation, the authors used formulas that were developed and applied already before and are modified now:

AIK = (WS : AS) x 100 (1)

PIK = (WS : PS) x 100 (2)

KIK = (WS : KS) x 100 (3)

SIK = (WS : SS) x 100 (4)

PE = PIK : AIK (5)

Table 1: The efficiency of the involvement of academic and research staff in the WS formation at SIs of medical and health sciences in Latvia per year in period from 2013 to 2018

SI	AIK (%)	AIK rating	AIK score	PIK (%)	PIK rating	PIK score	KIK (%)	KIK rating	KIK score	Average of AIK & PIK score	PE in times	SIK (%)	SIK rating	SIK score	Average of AIK & PIK & SIK score

Average	456			160			118				0,4	209			

These indicators of SIs and their place in the rating of SIs of medical and health sciences in Latvia as well as its scores are summarized in Table 1. The table of the SIs indicators, ratings, and score was drawn up by authors. The summarized indicators show that in general, in Table 1, the figure rests in the range from 20256% to 17% in

respect of the SIs in Latvia. The highest indicators are PIK and KIK in the REUH, while the lowest indicators is KIK in the LASE. Comparing the figures collected in Table 1, the authors conclude that the AIK indicator rests in the range from 21% to 519%. The lowest SIK indicators of 75% is for the LASE, the highest SIK indicator of 494% is for the REUH. The PS of the SIs of medical and health sciences are 0,6 times to 3,8 times efficient in the WS formation.

In Table 1, the authors created the rating and score of the SIs of medical and health sciences in Latvia based on the AIK, PIK, KIK, SIK indicators of the efficiency of the academic research personnel and PhDs involvement in the WS formation. According to the AIK indicator, the first place, and highest score is taken by the RSU/PHP; according to the PIK, KIK and SIK indicators, the first place, and highest score are taken by the REUH.

The authors compared the SIK indicators of all students of HEE in Latvia to SIK indicators of PhDs students of SIs of medical and health sciences in Latvia, and found that SIK indicators of the PhDs students were considerably higher. It follows from the study by Spica et all (2018) that the highest SIK indicators were held by Daugavpils University (1,45% in 2013) and the University of Latvia (1,82% in 2014). Meanwhile, between 2013 and 2018, the highest annual SIK indicator for PhDs students of SIs of medical and health sciences in Latvia was held by the REUH and represented 494%.

When analysing the results obtained by SIs in the IC formation in the field of medical and health sciences, the same methodology was used as in the fields of social sciences, and, humanities and art sciences. Thus, the quantitative results of SIs in these fields can be compared. One of the main criteria for the quantitative evaluation of SIs is the efficiency of the involvement of the SIs staff in the formation of WoS and SCOPUS publications.

The comparison of the results of the three fields of science leads to conclusion that the highest score of the KIK indicator in the field of social sciences is 278% (Spica et al, 2022) while the highest score of the KIK indicator in field of medical and health sciences is 20256%, and, the highest score of the KIK indicator in field of humanities and art sciences is 53% (Spica et al, 2023). In addition, it should be noted that the highest score of the KIK indicator in the field of humanities and art sciences is 382 times lower than the highest score in the field of medical and health science, and, the highest KIK indicator in field of social sciences is 73 times lower.

A similar trend is observed when comparing the efficiency of the involvement PhD degree holders in the formation of WoS and SCOPUS publications in the three above-referred fields of science. Here, the highest rate of the SIK indicator in social sciences is 667% (Spica et al, 2022) while in medical and health sciences the highest rate is 494%, and, the highest rate of the SIK indicator in humanities and art science is 450% (Spica et al, 2023). In turn, the lowest rate of the SIK indicator in the field of medical and health sciences is 75%; the lowest rate of the SIK indicator in the field of social sciences is 58% (Spica et al, 2022); the lowest rate of the SIK indicator in the field of humanities and art science is 13% (Spica et al, 2023). This means that the lowest rate in the field of medical and health sciences, however, is almost 6 times higher than the lowest rate in the field of humanities and art science, and, almost 1 times higher than the lowest rate in the field of social sciences.

In Table 2 authors calculate efficiency of the involvement of academic and research staff in the RS formation, the authors used formulas 6; 7; 8; 9; 10:

$$AIK = (RS : AS) \times 100 \quad (6)$$

$$PIK = (RS : PS) \times 100 \quad (7)$$

$$KIK = (RS : KS) \times 100 \quad (8)$$

$$SIK = (RS : SS) \times 100 \quad (9)$$

$$PE = PIK : AIK$$

In Table 2, in respect of SIs of medical and health science in Latvia, the figure rests in the range from 3% to 7992%. The highest indicator are the PIK and KIK in the REUH, but the lowest indicators are the PIK and KIK in the LBRSC and LIOS.

The AIK indicators were collected only for the 4 SIs of medical and health sciences, and the authors conclude that the highest AIK indicator of 165% is held by the RSU/MP while the lowest AIK indicator of 39% belongs to the LASE; the highest SIK indicator of 195% is held by the REUH, while the lowest SIK indicator of 12% belongs to LIOS.

Average	18			6			5				0,4	8			

In Table 3 authors calculate efficiency of the involvement of academic and research staff in the formation of MS, the authors used formulas 11; 12; 13; 14; 15:

AIK = (MS : AS) x 100 (11)

PIK = (MS : PS) x 100 (12)

KIK = (MS : KS) x 100 (13)

SIK = (MS : SS) x 100 (14)

PE = PIK : AIK (15)

In Table 3 the figure rests in the range from 0% to 641% in respect of the SIs in Latvia. The highest indicator are PIK and KIK in the REUH, but the lowest indicators are PIK and KIK in the LBRSC.

In Table 4 authors calculate efficiency of the involvement of academic personnel and research personnel in the formation of LPS, the authors used formulas 16; 17; 18; 19; 20:

AIK = (LPS : AS) x 100 (16)

PIK = (LPS : PS) x 100 (17)

KIK = (LPS : KS) x 100 (18)

SIK = (LPS : SS) x 100 (19)

PE = PIK : AIK (20)

Table 4: The efficiency of the involvement of academic and research staff in the LPS formation at SIs of medical and health sciences in Latvia per year in period from 2013 to 2018

SI	AIK (%)	AIK rating	AIK score	PIK (%)	PIK rating	PIK score	KIK (%)	KIK rating	KIK score	Average of AIK & PIK score	PE in times	SIK (%)	SIK rating	SIK score	Average of AIK & PIK & SIK score

Average	22			8			6				0,4	10			

In Table 4 the figure rests in the range from 1% to 256% in respect of the SIs in Latvia. Comparing the figures collected in Table 4, the authors conclude that the highest PIK and KIK score is held by the REUH, while the lowest AIK and KIK score belongs to the LASE, the lowest SIK score go to the RSU/PHP.

In Table 5 authors calculate efficiency of the involvement of academic personnel and research personel in the formation of EPS, the authors used formulas 21; 22; 23; 24; 25:

AIK = (EPS : AS) x 100 (21)

PIK = (EPS : PS) x 100 (22)

KIK = (EPS : KS) x 100 (23)

SIK = (EPS : SS) x 100 (24)

PE = PIK : AIK (25)

UL/MHSC	3	3	2,0	1,0	1,0	2,0	1,0	1,0

Of the 8 Latvian SIs in the field of medical and health sciences, only the 4 SIs have the EPS. In Table 5 the figure rests in the range from 0% to 22% in respect of the SIs in Latvia; the highest SIK score is held by the LIOS while the lowest AIK, PIK, and KIK score belongs to the UL/MHSC.

In the all tables, the average indicators PE are the same, and the average SIK indicators are the highest, while the average KIK indicators; the average AIK indicators are the highest, while the average PIK indicators.

The comparison of the results of the three fields of science leads to conclusion that the highest average rate of the PE indicators is 1,8 (Spica et al, 2022) in social sciences, the second highest average rate of the PE indicators is 1,7 (Spica et al, 2023) in humanities and art sciences, and, the lowest average rate of the PE indicators is 0,4 in medical and health sciences. In addition, it should be noted that the highest average rate of the PE in the field of social sciences is almost five times higher than the lowest average rate in the field of medical and health sciences.

5. Conclusions

The study of the authors did not result in confirmation of their hypothesis. When comparing the qualitative ratings of TG group to the quantitative assessments performed by the authors, it can be concluded that they differ from minus 2,0 points to plus 4,5 points in total. The hypothesis is accepted *pro tem* for other branches of SIs of Latvia.

The study shows that the AIK, KIK, PIK, and SIK of SIs of medical and health sciences in Latvia were lower than the results compiled by the relevant TG Panel except one SIs of these sciences, and, except for the PSCUHRI, where QTG, OTG, TAKO scores coincided.

The authors is encouraged to supplement the methodology for international evaluation of scientific institutions with efficiency indicators in order to improve the quality of the evaluation.

The scientific novelty of the research: 1)comparative analysis of indicators characterising the efficiency of the involvement of academic staff and PhD students in the formation of IC of medical and health sciences at SIs in Latvia; 2)modified the formulas of efficiency of the involvement of academic staff and PhD students in the formation IC of medical and health sciences; 3)system of efficiency indicators of IC formation at SIs.

Abstract: The success of women entrepreneurs is almost uniformly judged by financial criteria. As a result, the so-called underperformance hypothesis is put forward. However, this hypothesis may be ill-founded, and it may serve to reproduce and reinforce myths about women and entrepreneurship. It is important to understand what success means for women entrepreneurs operating in a given socio-economic context before we label them as underperformers. Moreover, although the importance of the contextual approach is recognized, some contexts are under-researched and less visible. Results from North America and Western Europe cannot be replicated in other contexts, especially in developing countries or patriarchal societies. For different contexts, we need new evidence. And this new evidence can make us realize that some concepts need to be revised to capture the collective vision of entrepreneurs. Instead of one paradigm, we should recognize the existence of a diversity of forms, motives, and understanding of success in entrepreneurship, as well as the contexts in which it occurs, to ensure holistic knowledge on entrepreneurship. To respond to these challenges, the research is conducted on a sample of 300 female entrepreneurs in the Republic of Serbia who operate in manufacturing. The respondents were asked to state what business success means to them and then to subjectively assess how successful they are according to the same criteria. In this way, the research results reveal how successful women entrepreneurs are, but measured in a way that reflects their perceptions of success. Results show that the importance that a certain criterion has for female entrepreneurs as an indicator of success is positively related to their success measured by that criterion. Not imposing on women entrepreneurs the usual measures of business success, the paper responds to calls to de-masculinize women's entrepreneurship research by introducing gender-specific variables and widening the set of measures of success. In doing so, it is placed in specific and under-researched contexts of a developing country and manufacturing industry. In this way, the paper further contributes to the enrichment of the entrepreneurship knowledge base.

Keywords: Female entrepreneurship, Manufacturing, Developing countries

1. Introduction

The majority of studies on women's entrepreneurship exclusively use some financial measure as an indicator of business success. Despite the wide consensus that women value qualitative aspects of business performance, the success of women entrepreneurs is almost uniformly judged upon financial criteria (Sullivan and Meek, 2012). As a result, the so-called underperformance hypothesis is put forward, suggesting that women entrepreneurs perform worse compared to their male counterparts (Deng, Liang and Wang, 2020). And since entrepreneurship contributes to economic growth, this underperformance of female entrepreneurs becomes a problem (Ahl, 2006). In investigating the causes of this *problem,* studies mainly point out some *flaws* or *deficits* of women entrepreneurs (Henry et al, 2021). Hence, women entrepreneurs underperform because they are less entrepreneurially oriented, they are less motivated to grow, they do not have adequate education or experience, they are cautious, they apply inadequate or feminine management practices, they lack networking skills and similar. Consequently, women are perceived as the *others*, secondary, complementary to men, or, in the best case, as an unused resource.

The field of entrepreneurship is highly masculinized. Because women are not men, they are seen as *others* who differ and who have to become more similar to men who are the norm, the standard (Lockeyer, Hoyte and Dewitt, 2018). And the status of the *other* implies some weakness, a worse position from which women need to be saved. The assumption is that those who are *less,* want to become better by imitating those who are *more*. But, instead of ironing out the differences no matter what, perhaps women should be appreciated as they are, and a new frame of reference should be built. Instead as *the others,* we should start perceiving female entrepreneurs as *the ones.*

Researchers focus on investigating the reasons for female entrepreneurs' underperformance, rather than questioning the standards of success themselves (Dean et al, 2019). The underperformance hypothesis is a reflection of the tendency for women to be evaluated in relation to masculine business norms and conventional measures of economic performance, which are considered to be the hallmark of entrepreneurial success (Watson, Stuetzer and Zolin, 2017; Du Rietz and Henrikson, 2000). Therefore, women are less successful because

of the way we define and judge their success (Lockeyer, Hoyte and Dewitt, 2018). The focus on economic growth in women's entrepreneurship research hides the heterogeneity and complexity of women's experiences (Dean et al, 2019). It is a narrow window through which we observe and evaluate performance (Lockeyer, Hoyte and Dewitt, 2018). So, why don't we open the window wide to see the entire landscape of entrepreneurship? To do that, we need to redefine the way we understand women entrepreneurs' performance (Irene, 2018; Lockeyer, Hoyte and Dewitt, 2018).

In addition to probably concealing the real truth, the underperformance hypothesis serves as a mechanism that maintains the gender hierarchy in favour of men (Dean et al, 2019). The preconceived notion is that when you think of a successful entrepreneur, you think of a man (Aidis, 2018). This can lower the entrepreneurial self-confidence of women (McAdam, 2023), it can discourage them from entering entrepreneurship (Watson, 2020), and it affects the decision-making of those who dispose and allocate resources (Aidis, 2018; Voitkane et al, 2018). Because of its important implications, we need to be sure whether this underperformance hypothesis is just a result of a methodological narrowness, or whether it faithfully reflects the reality.

Because of the management practice-industry interactions, women's entrepreneurship scholars call for industry-specific research orientation (Carter, Williams and Reynolds, 1997). As a result, most of the studies on women's entrepreneurship are conducted in the service and retail sectors (Henry, Foss and Ahl, 2016). In some way, this is justified by the fact that both as employees and as entrepreneurs, women are overrepresented in the services industries (Aidis, 2016; Henry, Foss and Ahl, 2016; Terjesen, 2016; Braches and Elliot, 2017; Brixiova, Kangoye and Said, 2020; Gawel and Mroczek-Dabrowska, 2021), and this is one of the most common observations of entrepreneurship scholars (Sullivan and Meek, 2012; Mitchelmore and Rowley, 2013). All of the above results in studies of women's entrepreneurial activity in manufacturing being rare.

Moreover, although the importance of the contextual approach to entrepreneurship is recognized, certain social, economic and cultural contexts are under-researched and less visible. Research on the subject is generally performed in developed countries, with North American, the UK, and Australian studies dominating the field (Henry, Foss and Ahl, 2016; Cabrera and Mauricio, 2017). Nevertheless, the results from developed countries cannot be merely replicated in other contexts, such as developing countries or patriarchal societies. For different contexts, we need new evidence. And this new evidence can make us realize that some concepts need to be revised to capture the collective vision of entrepreneurs. Instead of one paradigm, we should recognize the existence of a diversity of forms, motives, and understanding of success in entrepreneurship, as well as the contexts in which it occurs, to ensure holistic knowledge of entrepreneurship (Baker and Welter, 2017). The present study is one step on that journey. It aims at expanding the understanding of business success and its achievement by female entrepreneurs in under-researched contexts such as manufacturing and a developing country. To deliver this, the paper has the usual structure of a quantitative study. After the introductory considerations of the background, significance, and goal of the study, relevant literature is analysed and hypotheses are set. Methodological aspects of the study, including the sample, data collection, variables, and methods are presented in the third section of the paper, after which the research results are presented and discussed. The paper ends with certain concluding remarks.

2. Literature Review and Hypotheses Development

As a research field, entrepreneurship is criticized for not being methodologically diverse (Neergaard and Ulhøi, 2007). Studies on women's entrepreneurship often use gender-biased measures and other male constructions which are then just imposed on women through questionnaires (Henry, Foss and Ahl, 2016). Normative standards are set for what a successful business should look like. Common standards of success, such as profit or growth, are just attributed to women, without questioning (Lerner and Almor, 2002; McAdam, 2023). And in relation to them, women are found to be underperformers (Cabrera and Mauricio, 2017; Henry et al, 2021). Nevertheless, when controlling for structural factors, there is no difference in the performance of women and men entrepreneurs (Ahl, 2006; Marlow and McAdam, 2013; Watson, Stuetzer and Zolin, 2017; Sappleton, 2018). Moreover, there are arguments suggesting that women entrepreneurs are not underperformers, but rather restrained performers (Marlow and McAdam, 2013). Underperformance suggests that women have failed to realize their entrepreneurial potential and that they need to be *fixed* to meet the standards set by men (Henry, Foss and Ahl, 2016; Foss, Henry and Mikalsen, 2019; Marlow, 2023; McAdam, 2023). Constrained performance suggests that firms (regardless of gender) realize the potential that their environment allows them.

Ignoring the fact that women entrepreneurs' performance is restrained is not the only problem with the underperformance hypothesis. Neglecting the multifaceted nature of business success is another one. Dean et al. (2019) argue that the underperformance hypothesis springs not from empirical evidence, but from the

dominance of neoclassical growth discourse and official statistics and politics. Hence, this hypothesis may be ill-founded and it may serve to reproduce and reinforce myths about women and entrepreneurship (Marlow and McAdam, 2013). It is important to understand what success means for women entrepreneurs operating in a given socio-economic context, before we label them as underperformers (Hailemariam and Kroon, 2018). Not only that it subordinates women by default, but mainstream research practice also fails to register potential differences in women's approach to business (Morris et al, 2006).

Business success cannot (always) be simply equated with financial outcomes (Hailemariam and Kroon, 2008). Solely relying on one type of business performance indicators does not provide a complete insight into women's entrepreneurship and their performance (Cabrera and Mauricio, 2017). It is found that women do value financial business results, but that they attach high importance to qualitative outcomes as well (Sullivan and Meek, 2012). In other words, women expect a broader scope of entrepreneurship's benefits (Morris et al, 2006; Jennings and Brush, 2013). Female entrepreneurs themselves are a heterogeneous group, they differ by many criteria (Hailemariam and Kroon, 2008). Basically, the motivation and goals of entering entrepreneurship combined with a specific social-economic-cultural context determine how a woman will define business success. The way women define their success depends on the gender socialization they went through, their motives, background, and value priorities (Hailemariam and Kroon, 2008).

All of these diversities should be recognized, appreciated, and conceptualized in such a way as to capture the actual, rather than the assumed reality (Henry et al, 2021). This will sometimes require us to critically re-examine certain basic assumptions on which we build knowledge on entrepreneurship (Marlow and McAdam, 2013; Narendran, 2018). Adopting Baron's and Henry's (2011) framework, the present study focuses on the postlaunch phase of the entrepreneurial process. The main dependent variable of this phase is the performance and success of an entrepreneurial venture. The business success of an entrepreneur is a multidimensional construct that cannot be fully captured only by financial and economic indicators (Hailemariam and Kroon, 2008). Therefore, along with quantitative, entrepreneurial success should also be captured in qualitative terms (Carbera and Mauricio, 2017). Quantitative indicators of success are those referring to the economic, and financial business results, while the qualitative dimension includes outcomes such as independence, autonomy, flexibility, recognition, personal development, and the like. This study answers the calls to include qualitative indicators when researching the performance of entrepreneurs in general, and of female entrepreneurs, in particular (Baron and Henry, 2011; Zolin, Watson and Stuetzer, 2013).

Various theories, including the Expectancy Theory (Vroom, 1964), the Entrepreneurial Event Model (Shapero and Sokol, 1982), and the Theory of Planned Behaviour (Ajzen, 1991) offer explanations for individuals' engaging in certain actions. What all these theoretical frameworks recognize is the importance of personal attitudes and values for an action or a behaviour. Along with other antecedents, for a specific engagement, it is important how much an individual values the outcomes or the rewards that the focal engagement or behaviour will result in. The higher the perceived value, attractiveness, or desirability of a certain outcome, the stronger the intention will be to engage in behaviour that results in a specific outcome. And according to the Goal-setting Theory, goals (or intentions) have a directive function, they direct attention and effort to activities that are important to the goal and distract attention from those activities that are not important to the goal (Locke and Latham, 2002).

So, in line with the previous, the rationale of this paper is as follows. The way women entrepreneurs perceive business success (which is their goal), affects their behaviour, or commitment to achieving that goal. And the level of commitment is related to the level of success in achieving the goal. In other words, the more a specific output is a measure of business success for female entrepreneurs, the more successful they will be in achieving it. Within the presented framework, we hypothesize that:

Hypothesis 1: Female entrepreneurs look at business success from different angles, measuring and achieving it throughout a broad scope of success outcomes.

Hypothesis 2: Female entrepreneurs' business success achievement is associated with their perception of business success.

3. Methodology

3.1 Data and Sample

The target population consists of Serbian business entities in manufacturing, whose founders and legal representatives are women. A stratified simple random sample is selected from the database of the Serbian Business Registers Agency. The stratification is obtained by crossing the legal form, size class and territory of the

business entity. In line with Serbian Statistical Office practice, four size classes (less than 10 employees, 10-49, 50-249, 250 and more employees), three legal forms (limited liability company, entrepreneurs, other), and four regions (Belgrade, Šumadija and Western Serbia, Southern and Eastern Serbia, and Vojvodina) are used for stratification. A total of 42 strata are defined.

A questionnaire with a combination of open and closed questions is used to collect data. Field research is conducted during January and February 2024. Public opinion polling agency conducted a telephone survey of female entrepreneurs, following the questionnaire provided by the authors of this study. A total of 300 filled questionnaires are obtained.

3.2 Variables

3.2.1 Business success

This variable is considered twice, as a perception and as an achievement. First, it is measured how female entrepreneurs perceive business success. They were asked what it meant for them to achieve business success. They were offered a set of success outcomes (indicators). For each, they had to express the level of agreement or disagreement with the statement that the given indicator is a measure of business success (1-completely disagree, 5-completely agree). Then, they were asked to rate the extent to which they were successful in achieving each of the indicated indicators of success (1-very unsuccessful, 5-very successful). Both questions used the same indicators. Similar to Irene (2018) or Hailemariam and Kroon (2018), we use the following business success indicators: income and profit increase; employment increase; personal wealth; personal achievement and development; reputation in the community; customer satisfaction and loyalty; satisfaction and relations with employees, suppliers, customers; family-business balance; and contribution and creating value for the community.

3.2.2 Control variables

Because it is shown that they can affect female entrepreneurs' perception and achievement of success (Morris et al, 2006; Elam and Terjesen, 2010; Sullivan and Meek, 2012; Marlow and McAdam, 2013; Watson, Stuetzer and Zolin, 2017; Hailemariam and Kroon, 2018; McAdam, 2023), working hours (full time: yes/no), work from home (yes/no) and age (up to 49, more than 50 years) are included as control variables.

3.3 Methods

For evaluating the first hypothesis, descriptive statistics is used. To examine whether there is a dependence between the importance of a certain indicator of success for female entrepreneurs and their success measured by that indicator, the Chi-Square test of independence is applied. As the distribution of answers for each of the mentioned variables significantly deviates from the normal distribution, independence testing is based on the non-parametric test. Though usually applied when examining the dependence between two categorical variables, the Chi-Square test is also used when ordinal variables are not normally distributed. We use Spearman's correlation coefficient to assess the direction of correlation between variables. SPSS v. 29 is used as technical support.

4. Results and Discussion

Except for one outcome related to the realization of personal wealth, all other indicators of business success have an average score higher than 4, and half of the indicators have an average score higher than 4.5 (Table 1). Moreover, the median is not less than 4 for any indicator, while half of the business success indicators have a median of 5. This means that female entrepreneurs strongly agree that business success has many forms, so it cannot be limited to achieving financial outcomes. Our results suggest that women understand success as a multidimensional variable that needs to be measured and expressed in different terms. Overall, the results confirm that women entrepreneurs value a broad scope of business success outcomes (Sullivan and Meek, 2012), which validates our first hypothesis.

There is a statistically significant relationship between how women perceive business success and how successful they are (Table 2). The more female entrepreneurs understand success through the prism of a certain indicator, the more successful they are, measured by the same indicator. This holds for all the indicators of success evaluated in this study. In most cases, this relationship is not affected by female entrepreneurs' age, or whether they work full-time or from their home. Therefore, the second hypothesis is confirmed as well.

Table 1: Women entrepreneurs' perceptions of business success

What it means to achieve success in business (1-totally disagree; 5-totally agree)	Mean	St. deviation	Median
Income and profit increase	4.29	0.868	4.5
Employment increase	4.24	0.929	4.0
Personal wealth	3.51	1.220	4.0
Personal achievement and development	4.53	0.729	5.0
Reputation in the community	4.00	1.069	4.0
Customer satisfaction and loyalty	4.73	0.553	5.0
Satisfaction and relations with employees, suppliers, customers	4.71	0.559	5.0
Family-business balance	4.62	0.640	5.0
Contribution and value for the community	4.50	0.743	5.0

In some cases, female entrepreneurs' working hours influence the association between their perceptions and achievement of success. The results indicate that the relationship between the perception of success as an increase in income, profit, employment, and personal wealth, on the one hand, and the achievement of such success, on the other, exists only when female entrepreneurs work full-time. Similarly, there seems to be no relationship between the achieved and the success perceived as reputation in the community, in the group of female entrepreneurs who do not work full-time. This indicates a moderating effect of working hours. Also, it seems that for the association between understanding and achieving (primarily) financial outcomes of business success, the working time of female entrepreneurs is more important than working from home. While shorter working hours can disrupt this connection, the association is not affected by whether female entrepreneur works from home or not.

The connection between the perception and achievement of business success exists in each of the two female entrepreneurs' age groups, in all cases, except when success is perceived and achieved as an increase in employment. In this case, the greater importance of employment growth as a measure of success is associated to a higher level of achieving this aspect of business success, but only in the group of older female entrepreneurs (50+).

By showing that female entrepreneurs appreciate a wide set of success outputs and that there is a connection between the way they perceive and the level at which they achieve success in terms of the same output, our findings support the argument that the set of measures of entrepreneurial business success should be expanded (Henry, Foss and Ahl, 2016; Watson, 2020; McAdam, 2023), because women entrepreneurs perceive success in many different ways (Sullivan and Meek, 2012; Cabrera and Mauricio, 2017; Hailemariam and Kroon, 2018; Lockeyer, Hoyte and Dewitt, 2018; Henry et al, 2021). Moreover, the results suggest that the hypothesis of their underperformance should be critically re-examined (Ahl, 2006; Marlow and McAdam, 2013; Dean et al, 2019; Treanor, 2022). So, when we find that female entrepreneurs achieve lower incomes or profits, or that they have fewer employees, it may be because they do not perceive success in those terms and, therefore, do not strive to achieve these outcomes. We should take this possibility into account when designing our research and interpreting research results.

Table 2: Relationship between women entrepreneurs' perception and achievement of business success

	All entrepreneurs		Full working time		Work from home		Age	
	n=300		Yes (n=263)	No (n=37)	Yes (n=139)	No (n=161)	49 (n=144)	50+(n=156)

5. Conclusion

By investigating women entrepreneurs in under-researched contexts such as manufacturing and a developing country, this study reveals that business success is a multifaceted phenomenon for women entrepreneurs. Moreover, results show that there is an association between how women entrepreneurs perceive success and the level of their success. The greater the importance of a certain indicator for measuring business success, the more successful female entrepreneurs will be, measured by that indicator. Therefore, the study argues that we should first be aware of how women entrepreneurs understand success. Then, we should relate women entrepreneurs' understanding of success to their achievements. In this way, we may find out that they actually achieve what they consider a success. That does not make them underperformers. On the contrary, if we dislocate ourselves from the imposed and prevailing understanding of business success, we may find that female entrepreneurs are as successful as their male counterparts. Therefore, we have to be very careful in labelling women entrepreneurs as underperformers, thus making them subordinated and discouraging other women from entering entrepreneurship.

In arguing this, we are not downplaying the importance of the barriers faced by female entrepreneurs in achieving (financial) success. Hence, we are not questioning the argument that the performance of female entrepreneurs is restrained. Moreover, the study does not address the question of why female entrepreneurs have certain perceptions of success. Although aware of this, we are not dealing with the social imperatives, assigned roles, and other elements of a social and cultural background that shape female entrepreneurs' perceptions of business success. Instead, the study points out the necessity to expand the set of measures of entrepreneurial success, and to demasculinize the field, both in the methodological and in the discursive sense. When this is done, the myth of underperformance will prove to be just that, a myth. A hypothesis that is not sufficiently or adequately supported by evidence.

Abstract: According to the United Nations, the world generates about 61.3 million tons of electronic waste yearly, increasing at a significant rate of 3-5% per year, with nearly $10 billion of precious metals wasted in e-waste. In contrast, global recycling rates fall to approximately 17%. Improper e-waste dismantling leads to severe health hazards, environmental issues, and resource conservation. Therefore, handling e-waste correctly is the top priority that needs to be addressed, and recycling is the safest and most effective method. This study adopts the SOR model to examine the effect of social media marketing on consumers' intention to participate in e-waste recycling programs. The study utilized data from 345 Vietnamese consumers, as the nation is recognized for the rapid increase in discarded electronic products. SmartPLS 4.0 was used to analyze the collected data. The findings highlight the use of social media marketing in influencing consumers' recycling intention and reveal a sequential mediation in which social media marketing impacts consumers' e-waste recycling intention through the link of consumers' attitudes and perceived behavioral control. This study contributes to existing knowledge by highlighting social media marketing as a critical tool for promoting consumers' recycling practices. The sequential mediation found in the study suggests a practical marketing strategy for policymakers and businesses to encourage consumers to maintain their e-waste intention to participate.

Keywords: E-waste recycling, SOR, Social media marketing, Vietnam

1. Introduction

Global electrical and electronic waste is alarmingly growing, as Forti (2020) predicted, to reach 74 million tons by 2030, doubling the amount from 2014. Electronic waste worldwide can be processed through formal or informal recycling systems. Formal e-waste recycling, which requires cutting-edge equipment to recover salvageable materials properly, is costly. Developing countries use informal recycling procedures to collect resources from e-waste, exposing workers to the harmful contents of e-waste. This improper e-waste processing begets significant disruptions to community health, environmental issues, and resource preservation. Therefore, the expanding global efforts in e-waste recycling aim to strictly manage the sources of e-waste to minimize negative impacts on environments and communities. Hence, consumers' involvement in e-waste recycling plays a crucial role in sustainable development.

Social media is becoming popular with most people, and it is an effective means for organizations and governments to convey messages about sustainable development. However, the impact of marketing messages for e-waste recycling practices on consumers' habit of recycling has been inadequately examined. We adopt the Stimuli-Organism-Response framework to investigate the effects of social media marketing on pro-environmental behavior in the context of e-waste recycling. We propose that social media marketing influences consumers' habits through its impact on shaping their attitudes and perceptions of behavioral control. The study also adds insights into the practices in Vietnam, a developing country with increasing e-waste. Based on our results, the government and businesses could develop initiatives that motivate e-waste recycling more effectively and encourage consumers to engage more actively in e-waste programs.

2. Theoretical Background

Stimulus-Organism-Response (SOR) theory was a psychological behavior theory developed by Mehrabian and Russell in 1974, focused on exploiting the influence of stimulus factors on an individual's behaviors. The stimulus factor in this model refers to external variables, Organisms represent consumers' emotions and perceptions, and Response refers to their reactions after receiving stimulus and self-awareness. This model describes the closed connection between Stimulus-Organism-Response; when stimulus factors influence the individual's attitude and perception, they will have a response-like behavior (Mehrabian and Russell, 1974; Jacoby, 2002; Shen and Khalifa, 2012). In the context of sustainability, especially in the e-waste context, social

media marketing is still unexplored as a stimulus factor to promote the recycling intention of consumers. Moreover, researchers have found conflicting effects of social media marketing on consumers' behavior (Karimi et al., 2021; Nekmahmud et al., 2022; Trivedi et al., 2018; Ying & Wang, 2019), which suggests a potential for a mediation effect. Adopting this SOR framework, this study considers the attitude and perceived behavioral control for e-recycling practices as the mediators that transfer the impact of social media marketing on consumers' intention to participate in e-waste recycling.

3. Hypotheses Development

3.1 Social Media Marketing

Social media marketing (SMM) is a business's marketing campaign to disseminate content to consumers and is considered a practical option for advertisers in the digital economy (Lee et al., 2018). It has been shown to positively influence consumers' behavior to engage in pro-environmental behavior (Hynes and Wilson, 2016; Minton et al., 2021). This effect is due to the information and entertainment that advertisements communicate to consumers and the two-way communication between the advertisers and consumers (Dao et al., 2015). The information regarding e-waste programs included in social media marketing highlights the environmental value of recycling practices. Therefore, it is proposed that the following:

H1(+): Social media marketing has a positive impact on consumers' intention to participate in e-waste recycling programs

Minton et al. (2012) showed that advertising on social media promotes consumers' green behavior for recycling, green transportation, organic food, recycling, charity, and anti-materialism by emphasizing their motives for involvement in green practices. As attitude is an association between an object and an evaluation of the object (Fazio, 1995), customers likely form positive perceptions toward recycling when interacting with green advertisements on social media platforms. Therefore, it is offered that:

H2(+): Social media marketing has a positive impact on attitudes toward e-recycling

Perceived behavioral control is the individual's assessment of the difficulty or ease of performing a behavior (Ajzen, 1985). This construct is based on the individual's confidence in performing a practice. The more resources and opportunities an individual has to perform an activity, the more favorable the environment, the fewer constraints to adopt the behavior, and the greater the perceived control of behavior. Sustainable advertising often provides information on green issues to promote supportive behavior (Liu et al., 2022). Social media allows two-way communication between the organization and consumers so they can seek information and clarify concerns over the practices for recycling (Rosenthal and Linder, 2021). Consumers can gain more confidence in the practice with sufficient information on what to do and how to recycle. Therefore, it is suggested that:

H3(+): Social media marketing positively impacts perceived behavioral control.

3.2 The Effects of Attitude and Perceived Behavior Control

E-waste products refer to all electrical and electronic equipment the owner discards with no intention to reuse. Examples of e-waste are tablets, monitors, mobiles, computers, notebooks, refrigerators, washing machines, digital cameras, power cords, banks, desktops, memory cards, laptops, and speakers. E-waste recycling includes routine cleaning, storing, sorting, moving, separating, disassembling, upgrading, returning, incinerating, disposing, reusing, giving or donating, or selling the wasted product (Aboelmaged, 2021). In the e-waste literature, attitude and perceived behavioral control affect the intention to participate in e-waste recycling (Thukral et al., 2022). Therefore, it is offered:

H4(+): Consumers'attitude toward e-waste recycling is positively associated with their intention to participate in e-waste recycling

H5(+): Consumers'perceived behavioral control toward e-waste recycling is positively associated with their intention to participate in e-waste recycling

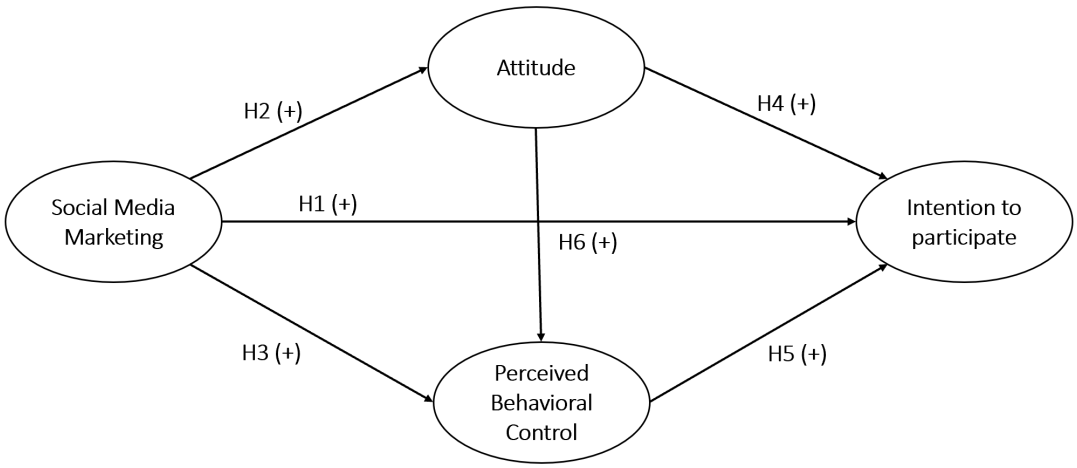

Figure 1: Conceptual model

Minton et al. (2012) showed that contemporary consumers have now passed the point where they are committed to green practices for rewards and become more actively involved in sustainable actions. This intrinsic motivation for sustainability is linked with a positive attitude toward recycling and can motivate consumers to seek information on processing recyclable wastes (Rosenthal & Linder, 2021). More information on practical solutions can help consumers gain confidence in their practices. Therefore, it is proposed that:

H6(+): consumers' attitude toward e-waste recycling is positively associated with their Perceived Behavioral Control of e-recycling

4. Methodology

4.1 Data Collection and Sampling

The study used a convenient sampling technique to collect data. We surveyed 345 consumers from December 21, 2023 to January 6, 2024. Respondents live in Ho Chi Minh City, where e-waste issues are becoming more serious, and the consumers' awareness of these issues has not been high. A Google Forms was distributed to young consumers active on social media platforms.

Table 1 Shows the sample demographic, the proportion of females to males is one to one (51.1% and 48.9% respectively). This gender structure is similar to the gender ratio in Ho Chi Minh City (48.7% for males and 51.3% for females). Most of the responses are from university students between 19 and 25, with monthly income below 10,000,000 VND (approximately equivalent to US$400) and the frequency of their exposure to sustainability content on social media.

4.2 Measurement of Constructs

The study used a total of four constructs, including Social Media Marketing (7 Indicators) adapted from Nekmahmud et al. (2022), the other three constructs of attitude toward e-waste recycling (6 Indicators), Scales to measure Perceived Behavioral Control (7 Indicators) and intention to participate in e-waste recycling programs (5 Indicators) were adopted from Sari et al., (2021). All constructs were measured by a Five-point Likert scale, ranging from 1 for "Strongly disagree" to 5 for "Strongly agree".

Table 1: Demographic Statistics

Variable	Category	Frequency	Percentage
Gender	Male	146	42.3
	Female	199	57.7
Age Group	15-18	74	21.4
	19-25	271	78.6
Education	Secondary School	15	4.3
	High School	17	4.9
	College	6	1.7
	University	301	87.2
	Master's degree or higher	6	1.7
Monthly Income (VND)	< 10,000,000	312	90.4
	10,000,000 - 20,000,000	24	7.0
	20,000,001 - 30,000,000	4	1.2
	30,000,001 - 40,000,000	3	.9
	> 40,000,000	2	.6
Frequency	Never	6	1.7
	Rarely	40	11.6
	Sometimes	161	46.7
	Usually	106	30.7
	Every day	32	9.3

4.3 Analysis Methods

SPSS 25 software was used to clean the collected data and show the sample descriptions. After that, we used SmartPLS 4.0 software to analyze measurement and structural models. The partial least squares structural equation modeling (PLS-SEM) method was used to evaluate the structural model. Data was first analyzed to assess the inner model for the validity and reliability of the constructs. Subsequently, the model was assessed using criteria of R2, f2, and coefficients of relationships in the model.

5. Data Analysis and Results

5.1 Measurement Model

Cronbach's alpha and composite reliability were used to assess datasets' reliability and internal consistency. All variables have Cronbach's Alpha coefficient values and Composite Reliability values exceeding 0.7 and lower than 0.9, demonstrating that the latent variables have qualified internal consistency and reliability (Hair et al., 2014). Item removal was made to ensure the convergent validity of the constructs. The final measurement model satisfies all thresholds for Cronbach's Alpha, Composite Reliability, and AVE, as shown in Table 2. Discriminant validity of the constructs is shown in Table 3 and Table 4.

5.2 Structural Equation Model

Figure 2 shows the variation of endogenous variables. The model can explain 58.4% of the variance of intention to participate, 23.1% of the variance of attitude, and 34.5% of perceived behavioral control.

Social media marketing positively influences intention to participate with a small effect size (β=0.137; p=0.010, f^2=0.034). Therefore, hypothesis H1 is accepted. Social media marketing also has a positive impact on attitude (β=0.484; p <0.001, f2=0.3) and on Perceived Behavioral Control (β=0.227; p <0.001, f2=0.06). It can be seen that social media marketing has a more substantial effect on Attitude ($f2$ = 0.30) compared to the relationship with Perceived Behavioral Control ($f2$ = 0.061). These results support both hypotheses H2 and H3. Results show that both attitude and perceived behavior control have influence on E-waste Recycling intention to participate with a large effect size (β=0.418; p < 0.001, $f2$ = 0.153), while Attitude has a positive effect on the intention with a medium effect size (β=0.358; p < 0.001, $f2$ = 0.214) (see Figure 2).

The impact of Attitude on Perceived Behavioral Control is also significantly positive with a medium effect size (β=0.443; p < 0.001, $f2$ = 0.231), confirming H6.

Table 2: Factor loading, the Cronbach's alpha, CR, and AVE values

Variables	Indicators	Loading Factor	Cronbach's Alpha	Composite Reliability	AVE
Attitude	AT1	0.718	0.837	0.881	0.552
	AT2	0.743			
	AT3	0.741			
	AT4	0.788			
	AT5	0.754			
	AT6	0.710			
Perceived Behavioral Control	PBC2	0.654	0.763	0.841	0.516
	PBC4	0.697			
	PBC5	0.800			
	PBC6	0.779			
	PBC7	0.648			
Social Media Marketing	SMM1	0.690	0.899	0.921	0.625
	SMM2	0.704			
	SMM3	0.803			
	SMM4	0.834			
	SMM5	0.842			
	SMM6	0.817			
	SMM7	0.830			
E-waste recycling intention to participate	IP1	0.808	0.850	0.893	0.625
	IP2	0.759			
	IP3	0.787			
	IP4	0.775			
	IP5	0.823			

Table 3: Fornell-Larcker Criterion

	AT	IP	PBC	SMM
AT	0.743			
IP	0.344	0.799		
PBC	0.575	0.478	0.718	
SMM	0.484	0.268	0.459	0.791

Note: SMM stands for social Media Marketing, AT stands for attitude, PBC stands for perceived behavioral control, and IP stands for intention to participate in e-waste recycling. The square root of AVE for discriminant validity is placed along the diagonal; off the diagonal are the correlations among constructs.

Table 4: Heterotrait-Monotrait ratio (HTMT)

Variables	Item Indicators	Correlations			
		AT	IP	PBC	SMM
AT	6				
IP	5	0.440			
PBC	5	0.711	0.642		
SMM	7	0.549	0.329	0.551	

Note: SMM – Social Media Marketing, AT – attitude; PBC – perceived behavioral control; IP - E-waste recycling intention to participate.

Table 5: Specific indirect effects (mediation analysis)

Path	β	SD	T statistics	P value
SMM – PBC - IP	0.107	0.033	3.268	0.001
SMM – AT – PBC – IP	0.100	0.020	5.088	0.000
SMM – AT – IP	0.149	0.032	4.668	0.000
SMM – AT – PBC	0.213	0.043	4.960	0.000
AT – PBC – IP	0.209	0.033	6.279	0.000

Note: SMM – Social Media Marketing, AT – attitude; PBC – perceived behavioral control; IP - E-waste recycling intention to participate.

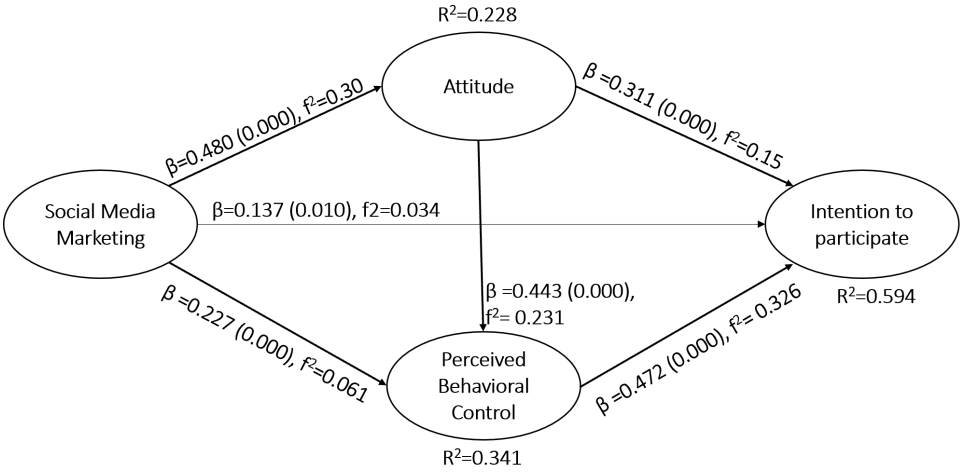

Figure 2: Testing results

6. Discussions

Adopting the Stimuli-Organism-Response theory, this study investigated the effect of social media marketing on consumers' intention to participate in an e-waste recycling program. While social media marketing has been found to influence consumers' sustainability behavior (Nekmahmud et al., 2022; Ying and Wang., 2019), its effect on e-waste recycling has not been adequately explored.

The findings of this study emphasized the use of social media marketing in promoting appropriate recycling practices for consumers. While only 20% of e-waste produced was recognized, collected, and recycled in 2018, the findings of this study point out an essential factor that promotes proper e-waste recycling practices. The result shows that social media marketing influences consumers' intentions through its effect on attitudes toward e-waste recycling. This is consistent with previous research that has confirmed this effect in various green contexts, such as food waste (Teoh et al., 2021), and green cosmetics (Pop et al., 2020). The findings of the study also corroborate with previous studies that point out that social media marketing affects pro-environmental behavior (Karimi et al., 2021) through perceived behavior control. An important of this study is to show that attitude positively impacts perceived behavioral control, revealing a sequential mediation effect transfering the effect of social media marketing on consumers' intention to participate in e-waste recycling programs.

This study focused solely on individuals aged 19 to 25 in HCMC. While this sample size was statistically significant, potential limitations exist in the generalizability of the findings to other demographics or areas. Future studies could broaden the location and age range to understand consumers' habits better. Moreover, our research only examined one external factor influencing internal factors that shape consumers' e-waste recycling habits. Future research should incorporate more factors to offer a more comprehensive understanding of the determinants of consumers' e-waste recycling behaviors.

7. Conclusion

The study investigates the effect of social media marketing on consumers' intention to participate in e-waste recycling programs. Adopting the SOR theory, the study reveals that social media marketing impacts consumers' participation intention through a series of mediation effects: attitude toward recycling, perceived behavioral control of recycling activities, or the linkage between attitude and perceived behavioral control. These findings emphasize the use of information in social media marketing to highlight the values of recycling activities and make consumers perceive their recycling practices as feasible and convenient. This insight assists policymakers and businesses in developing and promoting social marketing campaigns related to sustainability and the environment, thereby fostering the formation of e-waste recycling intention among consumers.

Abstract: This paper seeks to study factors influencing the early stages of entrepreneurship within the context of coronavirus pandemic, specifically within an emerging country. We utilize from a unique dataset collected by Global Entrepreneurship Monitor which is the sole global research repository compiling data on entrepreneurial activities and individual entrepreneurial attributes across 50 countries worldwide. In particular, this study focuses on the GEM survey data pertaining to Turkey during the period coinciding with the COVID-19 pandemic in the year 2021. The analysis is done by binary logistic regression with dependent variable being total entrepreneurship activity. Findings indicate that opportunity-driven respondents, with high-status aspirations, possessing necessary skills and acknowledging the challenges of their entrepreneurial environment, are the ones who show a higher probability of engaging in entrepreneurial activities. While these variables have been scrutinized in existing literature, our contribution lies in examining their effects within an emerging market, a relatively understudied context, particularly in the aftermath of a global pandemic. Results suggest that the individuals reporting a substantial increase in income during the pandemic, and perceiving a harder business environment to start a new venture show elevated probabilities of becoming an entrepreneur. These two are the pandemic-related variables demonstrating statistical significance, which highlights the fact that this period created its entrepreneurs, who exploit high resilience and dynamic capacity to adapt to crisis times. They experienced a significant increase in their income, capitalized on their comparative advantage in entrepreneurial skills within an environment where starting a business is not easy and took advantage of the opportunities seeking for high status using their adaptive capacity. These findings are consistent with Theories of Resilience and Dynamic Capabilities. Finally, younger respondents are more inclined to engage in entrepreneurial activity, which is consistent with the existing literature. In light of these findings, policymakers are encouraged to invest in educational programs for potential entrepreneurs to enhance their self-efficacy, given that the necessary skills for business initiation emerge as a pivotal factor for engaging in entrepreneurial activities. Moreover, creating platforms for successful entrepreneurs to share their experiences could amplify the perceived prestige associated with entrepreneurship, which may attract potential entrepreneurs.

Keywords: Covid-19, GEM data, Total early entrepreneurial activity, Resilience theory, Dynamic capabilities

1. Introduction

Entrepreneurship, both as a process and at the individual level, involves multiple phases: from the initial gestation phase to the established phase or the discontinuation phase. An entrepreneur can be someone who is just starting a business and striving to survive in the market, or someone who has owned an established business for many years. According to Reynolds et al (2005), early stage entrepreneurs are those who are actively engaged in starting or managing a business that they own wholly or partly, and which is less than three and a half years old. Established entrepreneurs, on the other hand, are those who own and manage a business that has been paying wages or salaries for more than three and a half years (Bosma and Harding, 2007). Early-stage entrepreneurship reflects the dynamic entrepreneurial potential of a country, indicating the percentage of the population that is willing and able to embark on entrepreneurial ventures (Özdemir and Karadeniz, 2011).

Covid-19 is a crisis that can be considered as deeper than the 2008-2012 financial crisis (Liñán and Jaén, 2022). The Turkish entrepreneurial environment, like those in other countries, has been significantly impacted by the COVID-19 pandemic. Significant drops as a result of losing current clients and finding it difficult to get new ones in Turkish manufacturing output were seen in several important industries, such as clothes, textiles, and automobiles, with some companies closing. The unpredictability of the epidemic has also increased investor caution, which has an impact on start-up investment. Some venture capitalists (VCs) have moved their focus to industries like health, online education, and hygiene goods, while others have focused on sustaining existing portfolio businesses. Demand and supply have both suffered from lower consumer demand for specific products and supply chain disruptions brought on by operational halts and quarantines.

Positive advancements have occurred despite these obstacles, especially with regard to the transition to online business models. Several companies that had not previously sold products online swiftly made the transition by

creating mobile applications, providing touchless delivery option, and encouraging contactless payments. With government measures supporting TV-based distance learning, educational institutions quickly made the switch to online platforms. Through cooperative initiatives within the entrepreneurial ecosystem, new firms tackling pandemic-related problems have emerged, and creative solutions have been developed. Health-related start-ups producing critical supplies like testing kits and ventilators have received substantial governmental support, highlighting the resilience and adaptability of Turkish entrepreneurs during this crisis.

This paper examines the factors affecting total early entrepreneurial activity in an emerging economy, Turkey, in the post-covid-19 period. Further, by comparing the effect of same variables in the pre- and post-pandemic period, the paper presents the difference between these two periods, underlying the divergence of the relationships between certain variables in the post-pandemic period. We use Global Entrepreneurship Monitor data for the periods 2018 and 2021 and aim to determine the factors affecting early entrepreneurial activity in Turkey. Our contribution to the literature is threefold; 1) studying early-stage entrepreneurial activity in an emerging economy, 2) examining the effects of covid-related variables to this activity, 3) explaining early entrepreneurial activity basing our arguments on entrepreneurs' resilience and dynamic capabilities. To the best of our knowledge, no empirical studies have directly examined the impact of the COVID-19 pandemic on early-stage entrepreneurship activity in an emerging economy with an explanation based on resilience and dynamic capabilities of entrepreneurs. Our paper aims to address this gap in the literature.

2. Theoretical Framework

2.1 Resilience and Dynamic Capabilities Theories

The COVID-19 pandemic profoundly impacted global economies, presenting businesses with unprecedented challenges. Resilience theory (RT) provides a framework for understanding how entrepreneurs identified and capitalized on new opportunities amidst uncertainty and rapidly changing market conditions. Key elements like adaptive capacity, diversity, and learning enabled entrepreneurs to identify and pursue new opportunities. Those who quickly adjusted strategies, diversified revenue streams, and learned from setbacks were more likely to succeed. Understanding and applying these principles is crucial for businesses to navigate future disruptions and thrive in a post-pandemic economy. This theory emphasizes absorbing shocks, adapting to new circumstances, and transforming systems to flourish in a changed environment. Adaptive capacity, the ability to reorganize structures, strategies, and behaviors in response to external changes while preserving core functions (Walker et al, 2004), proved critical. Entrepreneurs with strong adaptive capacity pivoted their business models to meet evolving market demands, such as transitioning to remote services or online delivery during lockdowns. Kuckertz et al (2020) highlight that startups with a digital-first approach swiftly adopted virtual communication tools and focused on online services like e-learning, telehealth, and fitness classes. Entrepreneurs with strong business skills and industry-specific knowledge rapidly pivoted their models, leveraging digital marketing, logistics, and customer engagement. Resilient, adaptable, and resourceful entrepreneurs garnered significant respect for navigating the pandemic's challenges.

Dynamic capabilities (DC) are defined as a firm's ability to integrate, build, and reconfigure internal and external competencies to address rapidly changing environments, enabling new and innovative competitive advantages (Teece et al, 1997). Emerging from strategic management literature, DCs explain how current resources can be exploited to adapt to change (Ambrosini and Bowman, 2009). In volatile and uncertain environments, DCs are crucial for integrating resources and recognizing new opportunities, generating economic value by replacing old structures with new ones (Schumpeter, 1994). Entrepreneurs' responses depend on their ability to adapt resources (Teece, 2012). Focusing on capabilities enhances understanding of firm recovery (Sullivan-Taylor and Branicki, 2011). Managerial perceptions of environmental change are crucial in utilizing DCs, leading to different capabilities deployment in similar uncertain environments (Aragon-Correa and Sharma, 2003). Post-pandemic, entrepreneurs who deploy necessary DCs can adapt to new business environments. DCs explain how entrepreneurs identify and pursue new opportunities during crises like the COVID-19 pandemic, helping businesses survive (Eisenhardt and Martin, 2000). This concept serves as a useful tool for understanding factors affecting early entrepreneurial activities.

2.2 Hypotheses

Opportunity recognition is central to entrepreneurial activity, as highlighted in the literature (Bird, 1988; Eckhardt and Shane, 2003; Shane and Venkataraman, 2000). Entrepreneurs motivated by profits, innovation, and growth are termed "opportunity-driven" (Schade & Schuhmacher, 2023). These opportunities often arise from changes in policies, socio-economic structures, technologies, or the environment (George et al, 2016; De

Massis et al, 2018). Covid-19, while challenging, also presents entrepreneurial opportunities that require acknowledgment and action. However, negative emotions in crisis conditions can hinder opportunity recognition (Chhatwani et al, 2022). Post-Covid-19, resilient individuals can leverage their entrepreneurial mindset to find opportunities (Zahra, 2020). Dynamic capabilities theory also emphasizes the importance of adapting and identifying opportunities in volatile environments (Battisti & Deakins, 2017). Combining resilience and dynamic capabilities theories suggests that recognizing opportunities quickly and effectively, especially during crises, offers a comparative advantage in entrepreneurship. Therefore, we hypothesize that;

H_1: *Opportunity recognition in the post-covid-19 period positively affects being involved in TEA activities.*

Self-efficacy also significantly affects entrepreneurial intentions, actions, and behaviors (Byod and Vozikis, 1994; Chen, Greene, & Crick, 1998). Self-confidence mediates entrepreneurial intentions and is higher among entrepreneurs (Zhao, Seibert, & Hills, 2005; Tyszka et al, 2011). Early-stage entrepreneurs often exhibit overconfidence in their abilities (Koellinger, Minniti, & Schade, 2007). Higher self-efficacy also increases the likelihood of new firm creation by the unemployed (Laguna, 2013; Verheul, Uhlaner, and Thurik, 2003). During crises like the Covid-19 pandemic, entrepreneurial resilience is crucial for success, and self-efficacy strengthens this resilience (Hedner, Abouzeedan, & Klofsten, 2011; Sharma and Rautela, 2022). Self-efficacy remains a predictor of entrepreneurial intentions under uncertainty (Bergenholtz, Klyver, and Vuculescu, 2023) and in extreme conditions like war (Bullough, Renko, & Myatt, 2014). Increased self-efficacy enhances dynamic capabilities, crucial for adapting to the changing entrepreneurial environment (Kevill, Trehan, & Easterby-Smith, 2017). Thus, we hypothesize based on resilience and dynamic capabilities theories in relation to entrepreneurial self-efficacy;

H_2: *Higher entrepreneurial self-efficacy in the post-covid-19 period positively affects being involved in TEA activities.*

Income inequality significantly impacts entrepreneurial dynamics, activity, and motivation (Halvarsson et al, 2018; Packard and Bylund, 2018; Bruton et al, 2021). Covid-19 caused significant income losses and increased uncertainty, reducing available funds for potential entrepreneurs (Almeida et al, 2021). Low-income and low-educated individuals faced the highest income and job losses globally (Bradley et al, 2020). New venture rates dropped dramatically, akin to the 40% decline during the Great Recession. However, unlike the Great Recession, where high-income households were most affected due to real estate issues, the Covid-19 crisis hit low- and medium-income potential entrepreneurs harder due to financing difficulties (Albert et al, 2023). The 2020 GEM survey included questions about income losses due to the pandemic to understand this impact. Thus, we hypothesize;

H_3: *Higher income in the post-Covid-19 period positively affects being involved in TEA activities.*

The entrepreneurial environment, including regional factors, institutional factors, and regulations, significantly affects new venture entry rates (Armington and Acs, 2002). During crises, starting a new business depends on individual factors like self-efficacy and resilience (Doern et al, 2019) and contextual factors like the crisis's depth and nature (Hofer, 1980). The pandemic exemplified a severe crisis, with businesses facing unprecedented limitations. Rescue packages had marginal effects on startups, especially in emerging economies needing urgent public health support (Salamzadeh and Dana, 2021). This situation worsened for countries like Brazil, India, Iran, Russia, Mexico, and Turkey due to less systematic markets and higher investment risks (Kawamorita et al, 2020; Salamzadeh and Dana, 2021; Ojha and Shubha, 2020).Despite adverse conditions, the pandemic created new opportunities for potential entrepreneurs, leading to either faster failure or success depending on resilience and dynamic capabilities (Zahra, 2020). A favorable business environment with fair markets, reduced startup costs (Lim et al, 2010), and effective institutions (Liu and Li, 2022) stimulates entrepreneurship. Thus, we hypothesize;

H_4: *Having a favorable perception on easiness to start a business in ones' country in the pre-covid-19 period positively affects being involved in TEA activities.*

H_5: *Having a favorable perception on easiness to start a business in ones' country in the post-Covid-19 period positively affects being involved in TEA activities.*

Additionally, we remain the highly studied status variable that measures the high status attributed to successful entrepreneurs, and add age as control variable.

H_6: *High level of status and respect attributed to successful entrepreneurs in one's country positively affects being involved in TEA activities.*

H_7: *Age negatively affects being involved in TEA activities.*

3. Data, Methodology, and Findings

We used data from Global Entrepreneurship Monitor which is originated in 1999 as a collaborative research initiative providing information regarding entrepreneurship and entrepreneurial environment in 120 countries from all over the world. We used the adult population survey data for years 2018 and 2021, which covers individual responses of 2424 and 2404 participants, respectively from Turkey. We specifically select these two years, which corresponds to the before- and after-covid period, to be able to capture the effects of pandemic on the entrepreneurial activities, in particular, early entrepreneurial activities in an emerging economy. Demographic indicators for both years are quite similar to each other. When we evaluate the basic demographic variables for 2021 in comparison with 2018; gender breakdown is almost the same, with 51% male and 49% female, for two years. Concerning age breakdown, respondents of 2021 are more clustered in 35-64 years compared to that of 2018. Hence, for the first two categories covering ages 18-34, respondents of 2018 are higher in number compared to that of 2021. Still, for both years, almost 52% of the participants fall in the 25-44 interval of age, signaling a similar distribution. Comparing the occupation answers, in 2021 we have less homemaker, unemployed, and student while have more full employed (including self- employed) and retired/disabled compared to 2018. Yet, the general breakdown is quite similar. In terms of education, first and second stage tertiary educated respondents are higher, in 2021 compared to 2018. Considering income, we divide the sample into three for both years as lowest 33% tile, middle 33% tile and upper 33% tile. In 2021, participants falling into the upper 33% tile (lower 33%) is higher (lower) than 2018 while the middle 33% tile is quite similar.

We employ a Binary Logistic Regression taking the most well-known variable of the GEM database named TEA as the dependent variable. It is a yes/no (1/0) question about whether the respondent is currently engaging in an early stage entrepreneurial activity (nascent or a new entrepreneur) or not. An early stage entrepreneurial activity corresponds to initiating a “new” business (paying salaries for at least 3 months but no more than 42 months) or actively managing enterprises that are less than 42 months old. The independent variables include entrepreneurial attitude and perceptions such as perceived capabilities, perceived opportunity, perceived high status due to entrepreneurial success, perceived easiness of starting a business. In addition, we have two variables measuring the effect of corona on individual income and on the perception about easiness of starting a new business. Opportunity perception (opport) is a yes/no (1/0) question concerning whether the respondent see good opportunities for starting a business in the next 6 months. Perceived capabilities (suskill) is a self-perception of the respondent about his/her skills and knowledge concerning starting a business, measured as 1/0 (yes/no). First pandemic variable, change in income during corona (crincome) is a 5 point scale question asking whether the coronavirus pandemic led the respondents’ household income to strongly decrease (1), or strongly increase (5). Perceived easiness of starting a business (easystart) variable is a yes/no question and indicates whether the respondent perceive that starting a new business in his/her country is easy (1) or not (0). Other corona variable measures respondents’ perception of easiness to start a business in corona times (crstart) with a 5 point scale question asking whether it is significantly easier (1) or significantly harder (5) to start a business in the respondents’ country compared to pre-covid-19 period. Perception of high status (nbstatus) indicates that if the respondent has the perception that in their country, those successful at starting a new business have a high level of status and respect (1) or not (0). Finally, we have age in 7 categories.

Figure 1 plots the responses for the effect of covid-19 pandemic on income with respect to income groups in Turkey. It is evident that pandemic comes as a negative income shock for every income group in general. Yet, we have a small group that faces an increase in their income due to pandemic. It is worth noting that a majority of those who experienced an income increase due to pandemic are from the highest income segment of the respondents. Thus, we can conclude that there is a small group of people, mostly coming from high income segment, having a positive income shock due to covid-19. This is significant as they are the ones who have a comparative advantage in terms of financial sources which may affect entrepreneurial intention and activity.

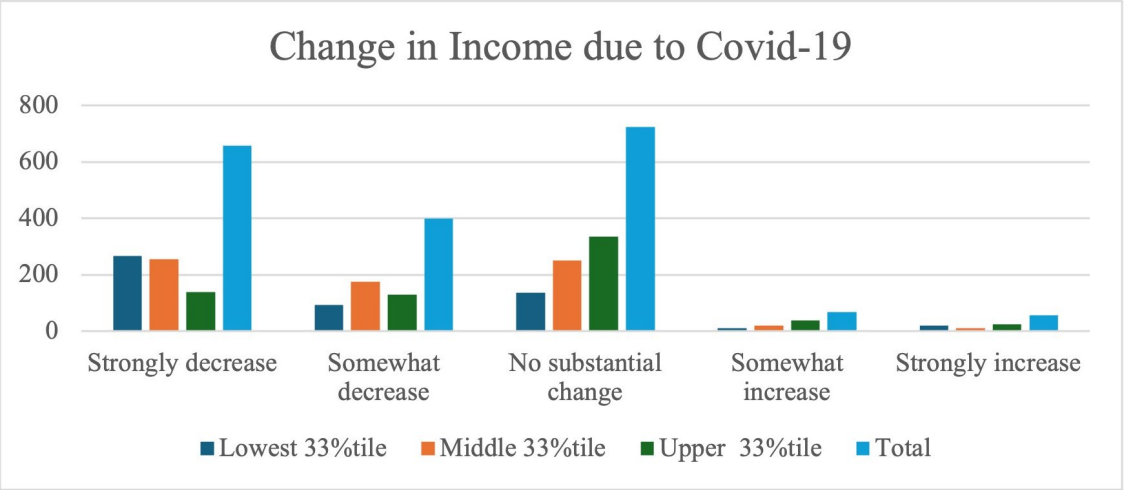

Figure 1: The effect of Covid-19 on income with respect to 3 income classes

In order to test and compare our hypotheses on core variables in the pre- and post-pandemic period, we consider 2018 and 2021 year GEM data for Turkey. We run a Binary logistic Regression taking TEA as the dependent variable and hypothesized variables; opportunity recognition (opport), self-efficacy indicating perceived skills on start-up activities (suskill), income in the post-covid-19 period (crincome), perception on easiness to start a business in the pre- and post-covid-19 period (easystart and crstart), high status attributed to successful entrepreneurs (nbstatus), and age as the independent variables for both years. Hence, following is the model we test:

$TEA=\alpha+\beta_1*opport+\beta_2*suskill+\beta_3*crincome+\beta_4*easystart+\beta_5*crstart+\beta_6*nbstatus+\beta_7*age+\varepsilon$

Although we had two sample of 2424 and 2404 respondents for 2018 and 2021 initially, our sample sizes decreased to 1574 and 17, respectively, due to missing data. Results are presented in Table I. We have good model fit, indicated by significant Chi-square values of 153.653($p<0.001$) and 33.886 ($p<0.001$) respectively. And the classification tables suggest our models predict involving in entrepreneurial activity correctly 82.8% and 69% of the time for 2018 and 2021, which are quite high accuracy rates (considering our modest sample size for the period 2021).

Results suggest that the factors influencing entrepreneurial activity changed significantly from the pre- to the post-Covid-19 period. Before the pandemic, only self-efficacy, income, and age significantly affect entrepreneurial activity. Opportunity recognition, favorable environment for start-ups, and high status associated with successful entrepreneurs are all lack explanatory power of entrepreneurial activity in the pre-Covid-19 period. However, all these three variables prove significance in the post-pandemic period.

Let us delve into the findings concerning the post-pandemic period. Literature suggests that opportunities arise from environmental shifts that create imbalances individuals can exploit (Holcombe 2003). During crises, recognizing these opportunities is expected to increase early entrepreneurial activity (Shane and Venkataraman 2000) consistent with our findings. A prevalence of necessity-driven entrepreneurs, driven by the need to meet basic needs, is expected in an emerging economy like Turkey (Estrin et al, 2019). However, our model shows that opportunity recognition positively impacts early entrepreneurial activity. Individual self-efficacy is closely linked to entrepreneurial activity and success (Krueger et al, 2000; Shane et al, 2003), which our results support. Higher income positively affects entrepreneurial intentions and early activity by reducing financial constraints confirming literature (Evans & Jovanovic, 1989). Hence, individuals who can adapt to changing entrepreneurial environment using their dynamic capabilities and adaptive capacity indicated by higher income and accumulated knowledge and skills are more probable to engage in new venture creation. Additionally, higher status perception associated with successful entrepreneurs positively influences entrepreneurial activity, particularly in individualistic economies where status provides greater utility (Liñán, Santos, and Fernández, 2011). Our findings align with this perspective.

On the contrary, perception of a favorable start-up environment in the country proves significance but with a negative sign. In a similar vein, pandemic variable, measuring the perception of easiness of starting a new venture compared to pre-pandemic period, proves significance with a positive sign, meaning perception of increased difficulty in starting a new business has positive effect on entrepreneurial activities. Combining these two variables, our findings suggest that individuals who think that it is not easy to start a new venture in their country and gets even more difficult in the post-pandemic period are the ones who show higher probabilities to engage in early entrepreneurial activities. These findings does not support our hypotheses and they also contradict with the vast literature suggesting a favorable business environment would have fostering effects on entrepreneurial activities (Amorós, Bosma and Levie, 2013; Kaufmann, Kraay and Mastruzzi, 2006; Klapper, Laeven and Rajan, 2006). However, these results are supported by Djankov et al (2002) which demonstrates that startup activity is generally higher when the regulatory requirements for entry are more stringent, meaning when the easiness to start a business is lower. This can also be explained by Theories of Resilience and Dynamic Capabilities as individuals with high resilient and dynamic capacity can consider such hard times as an opportunity where they can use their comparative advantage over low-income and low-skilled entrepreneurs to become successful. This may be the case for Turkey where individuals perceiving a difficult start-up environment are more probable to engage in early entrepreneurial activity. Hence, in highly challenging times of post pandemic period, opportunity-driven individuals who enjoy high resilient capacity and dynamic capabilities, supported by high self-efficacy and elevated income during this period are more probable to engage in entrepreneurial activity.

4. Discussion and Conclusion

This paper studies the factors affecting total entrepreneurial activity in an emerging economy in the post-covid-19 period. Results show that opportunity recognition, individual self-efficacy, higher income in the post-covid-19 period, and perception of higher status attributed to successful entrepreneurs positively affect the probability of engaging in total early entrepreneurial activities in the post-pandemic period. Thus, although existing literature would anticipate of Turkey as dominated by necessity-driven entrepreneurs, our results suggest that opportunity driven individuals are more probable to engage in entrepreneurial activities in the post-covid-19 period.

On the other hand, individuals who perceive a difficult entry environment for start-ups are more probable to engage in early entrepreneurial activity. Combining these results, we can infer that pandemic act as a contextual factor creating its own type of potential entrepreneurs. They recognize new opportunities and rely on their increased income in the post-pandemic period and high self-efficacy in exploiting these new opportunities in an environment where starting a new business is harder compared to pre-pandemic period. Theory of Resilience and Dynamic Capabilities can shed a light on why they are eager to exploit opportunities in challenging times. These new type of potential entrepreneurs rely on their dynamic capabilities and high resilience which enable

them to adapt to changing environments. Their high skills, knowledge, and increased income during crisis times feed their adaptive capacity and hence they show higher probabilities of engaging in new venture creation.

In light of these findings, policymakers are encouraged to invest in educational programs for potential entrepreneurs to enhance their self-efficacy, given that the necessary skills for business initiation emerge as a pivotal factor for engaging in entrepreneurial activities. It may even overcome the effect of fear of failure in a post-crisis period, in this case a global pandemic. Moreover, creating platforms for successful entrepreneurs to share their experiences could amplify the perceived prestige associated with entrepreneurship, which may attract potential entrepreneurs. Finally, increasing availability of financial funds to potential entrepreneurs can support them in their start-up activities. In the past twenty years, the significance of venture capital and similar financing methods (such as angel financing) in promoting the growth of new firms has significantly increased, both in the United States and globally, encompassing developed and emerging economies (Chemmanur and Fulghieri, 2014).

There are certain limitations to this study. First of all, this study takes only one emerging economy as sample of interest. Further studies can add other emerging countries, and can come to more generalizable conclusions, or make comparisons among them. In addition, since we could attain only 1 year data in the post-pandemic period, we could run our analysis considering only 1 year of data. Future studies can add time variation in the data and can make conclusions about the effect of recovering on total early entrepreneurial activity. Finally, due to missing data in specifically the pandemic-related question, our ending sample size is quite modest in this study. Increasing sample size would entail to more generalizable conclusions.

Innovation Success in the European Union: Aggregate Demand Analysis

Bernard Vaníček and Tomáš Fišera
University of Pardubice, Czech Republic

bernard.vanicek@upce.cz
tomas.fisera@upce.cz

Abstract: In the current period of uncertainty in the European Union, innovation is becoming a key factor for maintaining not only economic stability but also competitiveness in the globalised environment. Following the financial crisis that hit Europe, aggregate demand indicators slowly started to stabilise, mostly reaching their peak in 2019. However, in the following year, due to the pandemic crisis, these indicators fell again, posing a new challenge for researchers around the world. This study examines the relationship between macroeconomic indicators of aggregate demand and innovation performance in 25 EU countries. Using data for the period 2013-2021 as input for the regression analysis, the research identifies firm investment and exports as important innovation support factors and highlights their key role. On the other hand, the research shows that household consumption and imports are barriers to innovation. Somewhat surprisingly, government spending on goods and services does not have a significant impact on innovation success, underlining the need to rethink government investment policies. This finding highlights the need for a more thorough analysis of the effectiveness of state investment in innovation and possible adjustments to state policies to maximise the promotion of innovation activities in the state. The study also highlights the importance of comprehensive strategies that promote investment and exports, while emphasising the removal of barriers to innovation in the form of household consumption and imports.

Keywords: Innovation success, Aggregate demand, Investment, Export, Import

1. Introduction

Innovation is an important driver of both national and regional development (Xu et al, 20-23). The link between economic growth and innovation remains an interesting concept for researchers and is frequently explored in the literature (Pece et al, 2015; Kijek, 2019). Currently, the world is entering the fourth industrial revolution (Schwab, 2017), which is characterised by new technological transformations in different fields. The ever-evolving artificial intelligence or new practices in the healthcare and financial sectors are just the tip of the iceberg of the transformation of the contemporary world. It is these changes and transformations that can be seen as the result of the much discussed and needed innovations (Malik, 2023).

Technological innovation not only supports economic growth, but also plays a key role in strengthening regional competitiveness (Pece et al, 2015; Zeboite et al, 2019; Szopik-Depczyńska et al, 2020). Thus, a region's ability to adapt to new technologies and implement them effectively becomes a critical factor for its success in the global economic space. For these very reasons, it is now imperative to properly measure and monitor innovation success within a region. The Global Innovation Index (GII) can be a useful tool for identifying and measuring the overall innovation success of countries. In this way, it can help individual economies to better monitor the innovation environment within a country, which can be seen as an important step towards enhancing overall growth in a global context (Jankowska et al, 2017; Yu et al, 2022).

Innovation is not only an important driver of growth for a region, but it is also an important source of competitive advantage for a region (Prokop et al, 2021). An evolutionary approach to technological change points to the fact that innovation is the result of interactions between individuals, firms and organisations in a specific socio-economic and institutional context (Iammarino et al, 2009; d'Agostino and Scarlato, 2013). In this context, it is therefore particularly important to measure innovation and discuss the outcomes associated with it. At the expert level, there are numerous discussions on the determinants that promote or, on the contrary, reduce the success of innovation in a region. Given the evolutionary approach to technological change mentioned above, in this paper we focus on the different actors of innovation success within a region. Thus, the aim of this paper is to use a regression model to test the influence of households, firms, government and other countries, as expressed by the determinants of aggregate demand - consumption, investment, government spending, exports and imports - on the innovation success of the 25 countries of the European Union, expressed as a Global Innovation Index score.

The paper is structured as follows: Section 2 presents recent findings from the known literature and hypothesis development, Section 3 briefly describes the methodology and data we used, Section 4 presents the results of our research, which are then discussed in more detail in Section 5. Section 6 presents conclusions, including theoretical and practical implications, limitations of the research, and suggestions for future research.

2. Literature Review and Hypothesis Development

Since the middle of the twentieth century, many schools of thought have considered innovation to be an important determinant of productivity. Following the pioneering work of Romer (1986) and Lucas (1988) on the endogenous growth model, there have been subsequent large-scale studies showing that innovation is an important driver of long-term economic growth and that innovation also increases the international competitiveness of regions (Prokop et al, 2021; Alekseeva et al, 2022; Tadevosyan, 2023). Innovation activities are an essential factor in the competitiveness of virtually any economic entity (Alekseeva et al, 2022; Wahyudi et al, 2023). As mentioned above, according to the evolutionary approach to technological change, the basic actors of innovation are individuals, firms and organisations.

The impact of individuals, expressed in this case as household consumption, on the innovation success of regions has been studied several times in the past. A positive relationship between household consumption and regional innovation can be observed, where higher levels of household consumption can lead to increased incentives for innovation and overall technological progress. Similarly, innovation can affect household consumption in a number of ways. For example, it can lead to the development of new products and services, which can fundamentally affect consumption patterns and preferences and subsequently affect overall consumption in the economy (d'Agostino and Scarlato, 2013; Schot, 2018). As household consumption is also closely linked to savings, the impact of savings on the innovation success of regions can also be examined. Empirical evidence shows that household savings have a positive impact on innovation success, especially in poorer emerging economies. In contrast, richer countries often have extensive innovation networks that do not depend on household savings to finance and subsequently implement innovation projects (Aghion et al., 2016). Based on these findings, we therefore put forward a first hypothesis:

H1: Household consumption has a positive impact on the innovation success of the region.

According to the evolutionary approach to technological change, the second actor of innovation is firms. In this case, firms are proxied by their private investment as a component of aggregate demand. There are several papers on the positive impact of private investment by firms on the innovation success of regions. Research has shown that firms' investment, especially investment through venture capital, can significantly boost regional innovation as well as the creation of new firms (Dyer et al, 2016; Fu, 2008). This finding is further supported by the positive impact of foreign direct investment (FDI) on regional innovation success, with the strength of this effect depending on the absorptive capacity and innovative complementary activities in the region (Fu, 2008). Hintosh et al. (2020) add that FDI has a positive impact and contributes significantly to the innovation performance of regions, but only if it is FDI from domestic firms. Dorzhieva and Kirillova (2019) then provide an opposing view of investment, emphasising that financial investment alone is not synonymous with innovation. On the contrary, they argue that strategic reorganisation and rationalisation of productive resources through competitive priorities is more important and can also lead to innovation in various fields, ultimately increasing both the competitiveness and economic growth of a country. Based on these findings, we therefore put forward a second hypothesis:

H2: Private investment by firms has a positive impact on the innovation success of the region.

The third actor in the region's innovation success is the state, represented in this paper by government spending on the purchase of goods and services. Different governments support innovation activity in the region in both the public and private sectors through different economic policy instruments (Avellar, 2011; Kijek, 2019). Public funding stimulates innovation activity in a region, but does not significantly increase innovation activity (Kokot-Stępień and Krawczyk, 2020). The level of public funding can also influence the adoption of new innovative practices, and the system of such funding is particularly important (Salmi, 2012). According to Salmi (2012), lower levels of public funding facilitate innovative practices. On the other hand, if we look at the most effective tool for stimulating innovation activities in the private sector - public procurement - we can find a rather significant positive impact of public procurement on innovation activities in the region (Kijek, 2019). Higher public spending in the form of public procurement also motivates companies to engage in innovative activities, which in turn increases the innovation success rate of a given region (Kijek, 2019). Based on these findings, we therefore present a third hypothesis:

H3: Public spending has a positive impact on the innovation success of a region.

The final innovation actor in our paper is foreignness, expressed as the size of each country's exports and imports. If only exports are considered, expert studies show that they have a significant impact on innovation activity, especially for firms operating in the region (Ebling and Janz, 1999; Fassio, 2018). However, it is important

to note that this impact varies significantly depending on the destination of the exports (Fassio, 2018). Aghion et al (2018) further add that while export shocks increase innovation incentives for all firms, independent of other factors, they can also indirectly reduce profits for firms with lower productivity. This claim is also supported by Cai et al (2020), who show, using the case of Chinese firms, that firms' export participation significantly increases the probability of innovation, with the effect of export market size being important. Based on these findings, we present a fourth hypothesis:

H4: Exports have a positive impact on the innovation success of the region.

On the other side of the external market are imports, for which academic publications also show a positive relationship between import-related activities and the innovation performance of the region. Blind (2004) and Bertschek (1995) in their studies have shown a clear positive relationship between imports and innovation using the services sector as an example. These claims are further extended by Chen et al. (2017), who present the finding that imports stimulate innovation mainly through knowledge spillovers from foreign firms, using the example of Chinese firms. A similar result is then presented by Montégu et al (2021), who confirm, using the example of Chilean firms, that import activity has a positive effect on promoting not only technological areas but also non-technological innovation in the region. The authors also agree that imports through the high-income channel have a much greater impact on innovation in the region than imports through the low-income channel (Chen et al, 2017; Montégu et al, 2021). Based on these findings, we therefore present our final hypothesis:

H5: Imports have a positive impact on the innovation success of the region.

Based on the findings from a comprehensive literature search of factors that influence innovation success and the formulated hypotheses, we present a conceptual model for our study (see Figure 1).

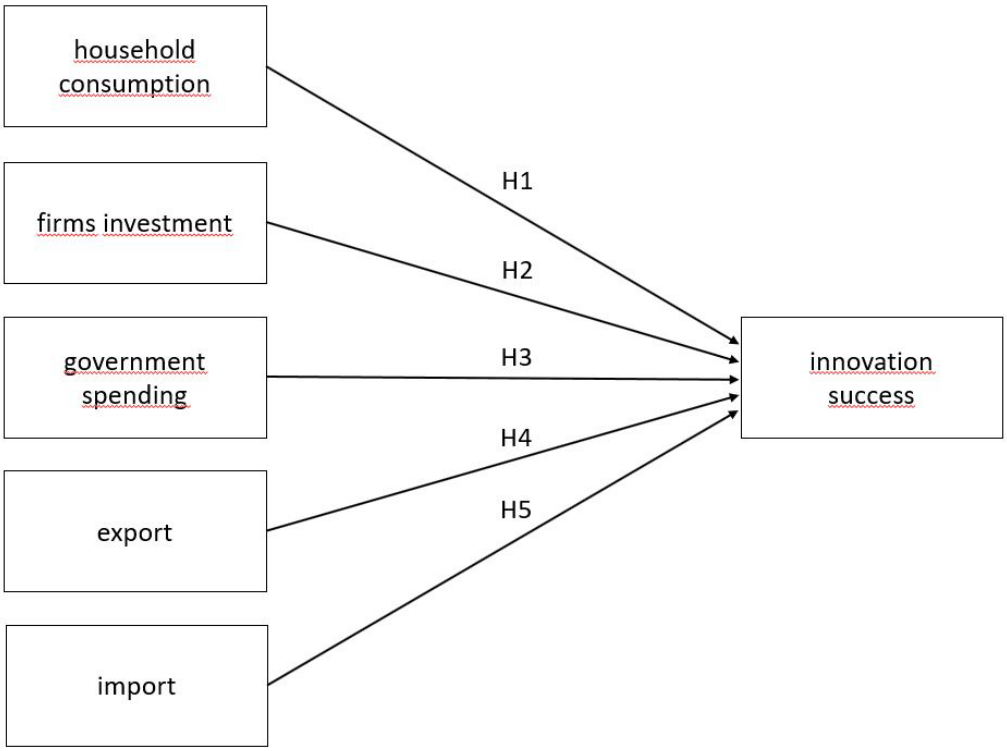

Figure 1: Research framework

3. Data and Methodology

To create the linear regression model that was chosen as appropriate for our analysis, we collected data from 25 European countries. We obtained these data from the OECD and Eurostat databases for the period 2013 to 2021, thus focusing exclusively on the period between the financial crisis and the pandemic crisis with spillovers to the pandemic crisis. The result was a panel dataset that includes 225 observations over 9 calendar years. The countries included are Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, Finland, France,

Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, and Sweden.

To quantify innovation success as a dependent variable, we used a widely accepted international indicator, the Global Innovation Index (GII). The independent variables in our model then represent the individual components of aggregate demand - household consumption (HSC), firms' investment (INV), government spending (GOV), exports (EXP) and imports (IMP). Finally, we supplement our model with a control variable very closely related to innovation – R&D expenditures (R&D). A more detailed overview of the individual variables, including their use in thematically similar studies, is given in the following table (see Table 1).

Table 1: Overview of Variables

Type	Variable	Description	Unit	Source	References
Dependent		Score of Global Innovation Index	Score (0-100)	GII	Rehman et al (2020)
Independent	HSC	Household Consumption	%GDP	Eurostat	d'Agostino and Scarlato (2013); Schot (2018)
	INV	Firms Investment	%change, previous period	OECD	Dyer et al (2016); Fu (2008)
	GOV	Government Spending	Thousands of US dollars/capita	OECD	Salmi (2012); Kokot-Stępień and Krawczyk (2020)
	EXP	Export	%GDP	OECD	Fassio (2018); Cai et al (2020)
	IMP	Import	%GDP	OECD	Chen et al (2017); Montégu et al (2021)
Control	R&D	R&D Expenditures	%GDP	Eurostat	Rehman et al (2020)

Before fitting the regression model, we first normalised the data using the min-max method. This ensured that all variables had the same range and were comparable. We then constructed a linear regression model that allowed us to analyse the relationship between dependent (GII) and independent (HSC, INV, GOV, EXP, IMP) variables. On the basis of the results, we can assess how these factors have an impact on the success of innovation in each country.

The coefficient of determination was also an integral part of our calculation. This allows us to assess how well our regression model fits the real data. A higher value of the coefficient of determination indicates a better fit of the linear regression model to our collected data. For a more detailed description of linear regression, see, e.g., Montgomery et al (2021).

All calculations in this study were performed in Gretl software.

4. Results

Several interesting findings emerge from the results of our linear regression model (see Table 2). The validity of these findings is further enhanced by the coefficient of determination, which reaches a value of 0.710. This means that up to 71% of the variability in the original data is explained by our model. The relevance of our analysis is further underlined by the 99% significance of our chosen control variable (R&D).

Table 2: Regression Analysis Results

Independent	Coeff. Estimate	Std. Error	*t*-value	*p*-value	
CONST	0,392	0,081	4,831	2,56E-06	***

Independent	Coeff. Estimate	Std. Error	*t*-value	*p*-value	
EXP	1,836	0,426	4,313	2,44E-05	***
IMP	−1,584	0,409	−3,876	0,0001	***
INV	0,255	0,119	2,149	0,0327	**
GOV	−0,136	0,095	−1,436	0,1523	
HSC	−0,475	0,080	−5,900	1,37E-08	***
R&D	0,611	0,050	12,28	1,05E-26	***
R-squared 0.710					

According to the results of the regression model, we first reject hypothesis H1 about the positive effect of household consumption on innovation success. On the other hand, there is evidence at the 99% level that household consumption has a negative effect on innovation success in the selected countries. On the contrary, hypothesis H2 confirms the positive effect of business investment on innovation success, but at the 95% level of significance. With regard to government expenditure, we cannot reject hypothesis H3 of a positive effect on innovation success, as this relationship is not statistically significant. Finally, the different impact on innovation success is illustrated by exports and imports - in both cases these variables are significant at the 99% significance level, but only exports have a positive impact on innovation success. Therefore, we confirm hypothesis H4 and reject hypothesis H5 regarding the positive effect of imports on innovation success.

5. Discussion

The following conclusions are possible about the research hypotheses identified in this study. Hypothesis H1 had to be rejected because in the regression model household consumption showed a negative effect on regional innovation success, which contradicts the claim of d'Agostino and Scarlato (2013) who argue that higher levels of household consumption can have a positive effect on regional innovation. The negative effect in our case can be explained, for example, by the fact that households in European regions often focus more on short-term consumption to satisfy their immediate needs. This in turn may lead regional firms to focus more on short-term products that are already on the market, leaving no room for innovation and research that could bring longer-term benefits to the region. Households may also have limited financial resources to devote to innovative services and products. This can lead to some limitation of the region's capacity to innovate.

We accept hypothesis H2 at the 95% significance level, which can still be considered a significant effect, confirming the positive impact of private investment on the innovation success of the region. This result confirms and complements the findings of Dyer et al. (2016) and Fu (2008), who also agree that private investment by firms has a positive impact on regional innovation. Given the private investment by domestic firms, this result is also consistent with the finding of Hintosh et al (2020), who highlight the positive impact of investment mainly by domestic firms on the innovation success of the region. However, our result is not consistent with Dorzhieva and Kirillov (2019). They find that investment should not be confused with the concept of innovation. However, it is important to point out the similarity between these two aspects of the economy, as our study mainly investigates the impact of private investment by firms and does not try to directly substitute innovation with private investment by firms.

Another aspect of aggregate demand included in hypothesis 3 is government expenditure on the purchase of goods and services, which was found to be insignificant in our regression model, so hypothesis H3 has to be rejected. This result contradicts the results of Avellar (2011) and Kijek (2019), who argue in their studies that public spending is a crucial tool of economic policy to influence innovation in a region. Our result also contradicts the finding of Salmi (2012), according to which the level of public expenditure facilitates innovation practices within a region. However, it is important to note that the model we examined only includes public expenditure on the purchase of goods and services, and thus does not include the total public sector or total public expenditure, which includes science and research expenditure, which was included as a control variable in our model.

Hypotheses H4 and H5 then included the foreign segment, represented in our model by the export and import variables. In the case of exports, we accept hypothesis H4, as exports have a positive parameter at the 99% significance level. This result is not surprising and confirms the claim of Ebling and Janz (1999), Fassio (2018) and Cai et al. (2020) that exports do indeed have a significant impact on innovation activity in a region through firms operating in that region. On the other hand, our results force us to reject hypothesis H5. Imports are significant at the 99% significance level, but with a negative parameter, which means that imports have a negative effect on a region's innovation performance. This result contradicts the findings of Bertschek (1995), Blind (2004), Chen et al. (2017) and Montégu et al (2017), who reported in their studies that imports are positively related to regional innovation. The difference between our results and those of other authors can mainly be explained by the nature of the countries studied. Most countries in the European Union are innovation performers, which means that they are often the carriers of their own innovativeness, which may explain why imports are not an important aspect of their innovative success.

6. Conclusion

From the results of our study, we can conclude that there is a strong relationship between aggregate demand indicators and the innovation success of regions. The implications of our findings are twofold. First, they show the importance of aggregate demand indicators as one of the key determinants of regional innovation success and suggest that policy makers should prioritise aggregate demand stimulation strategies with the clear objective of fostering innovation ecosystems. Second, the observed negative impact of government spending on the purchase of goods and services and the negative impact of imports calls for a critical rethinking of established policy approaches to fostering innovation. Government spending has traditionally been seen as a catalyst for economic growth and regional innovation. However, our findings suggest a somewhat different reality, where indiscriminate or inefficient spending may be hindering rather than facilitating innovation in the regions. Moreover, the negative impact of imports highlights the challenges posed by global economic dynamics. While international trade can facilitate knowledge transfer, it also exposes domestic industry to increased competition from abroad, which can undermine new incentives to innovate. Policymakers therefore need to strike a delicate balance between promoting open markets and protecting domestic innovation capabilities. In light of these implications, policymakers should rigorously assess and recalibrate their spending priorities to ensure that government spending is aligned with innovation objectives and complements rather than hinders private sector innovation initiatives. In addition, there is an urgent need for targeted policies to mitigate the negative impact of imports on domestic innovation ecosystems, such as strategic trade policies, investment in skills development and support for technology adaptation and diffusion.

Our analysis also introduces the positive effect of exports and private investment by firms, as well as a control variable in the form of R&D expenditure. Policy makers should therefore favour policies that promote exports, encourage private investment in innovation and strengthen R&D efforts to create an enabling environment for innovation at the regional level. These results suggest that aggregate demand indicators are one of the most important triggers of a region's innovation success.

Our research also has some limitations. Our research focused on the period 2013-2021, so it would be useful for future research to also cover 2022 and 2023, when the full impact of the current crises and challenges that have shaken the whole of Europe will be felt. Another limitation is the inclusion of the full range of EU countries in our model. For future research, it would be useful to categorise countries according to their innovation performance, for example, as our research included countries that can be considered innovation leaders, but also countries that struggle with low innovation performance. Such a categorisation could therefore yield further interesting results.

Future research should not only focus on aggregate demand indicators, but also include other indicators that are closely related to aggregate demand. For example, extending the model to include labour market indicators could provide insights into innovation success from another perspective - human capital in the labour market.

Business Transfers in Entrepreneurship Education: A Gap Covered by Buyer School and Successor School

Anmari Viljamaa, Elina Varamäki and Juha Tall
Seinäjoki University of Applied Sciences, Finland

anmari.viljamaa@seamk.fi

Abstract: Aging is a great challenge for European societies. When the time comes for the entrepreneur to retire, either a business transfer takes place or the firm ceases to exist. This means there is an increasing need for 'takeover entrepreneurs'. Entrepreneurship education to improve entrepreneurial competencies or learn about starting a business is common in European HEIs, but there is relatively little attention given to family business succession as a career choice and practically none to entrepreneurship through acquisition. Entrepreneurship courses focus on starting a business, implicitly carrying the assumption that this is the sole way of becoming an entrepreneur or implementing a business idea. In this descriptive paper, a Buyer School and a Successor School developed by one university to bridge the gap is showcased and the rationale behind their development is discussed. The authors conclude that Successor and Buyer Schools show promise in closing the distance between HEI entrepreneurship education and the lived experience of entrepreneurial life. It is hoped that other HEIs are encouraged to offer similar courses or, failing that, to refer to takeover entrepreneurship in their other courses.

Keywords: Entrepreneurship education, Family business, Succession, Acquisition, Entrepreneurship-through-acquisition

1. Introduction

Aging is a great challenge for European societies. The proportion of people over the age of 65 in the European Union countries will increase to around 29 % by 2080 compared to around 20 % in 2019 (EuroStat, 2023). As populations age, also entrepreneurs age, and firm continuity becomes an issue. When the time comes for the entrepreneur to retire, either a business transfer takes place, or the firm ceases to exist. This means that there is an increasing need for 'takeover entrepreneurs'. There is also evidence that even well before the actual retirement, the expectation of continuity, or the lack of it, has an impact on the growth intentions of a firm (Joensuu-Salo *et al.*, 2019).

A business transfer can refer to a family business succession, where a younger member of the family takes over, or to a business being sold to an individual or another business. Business transfers have a unique potential to transform firms and contribute to strategic renewal. The aging of entrepreneurs and the increasing number of firms looking for buyers and successors offer great potential for younger entrepreneurs to start a business or grow their existing businesses with an acquisitive strategy. Furthermore, the fact that family businesses, too, would need successors from within the family is often overlooked. Traditionally, about a quarter or third of family businesses have a successor in sight within the family (e.g., Varamäki *et al.*, 2021).

Higher education institutions (HEIs) are increasingly recognizing the importance and relevance of teaching entrepreneurship and entrepreneurial teaching. Today, improving entrepreneurial competencies or teaching about starting a business is common in European HEIs, but relatively little attention is given to family business succession as a career choice and practically none to entrepreneurship through acquisition. Entrepreneurship courses relate to entrepreneurial competence in the general sense (see e.g., Bacigalupo *et al.*, 2016) or to startup. The unspoken assumption in most of HEI lessons about entrepreneurship is that to become an entrepreneur, you must start your own business. The alternative, taking over an existing business, is rarely recognized, although business takeovers outperform starters in terms of survival (Xi *et al.*, 2020; van Teeffelen, 2012). Another point of view not often considered is that the students in higher education with a family business background have, from childhood on, been immersed in an entrepreneurship learning environment. Research on entrepreneurial intentions has long recognized the influence of role models (Chlosta *et al.*, 2012; Joensuu-Salo *et al.*, 2015; Zellweger and Sieger, 2012), and recently Joensuu-Salo, Viljamaa and Varamäki (2022) demonstrated that role models are also linked to entrepreneurial competences. Previous studies strongly indicate that students with a family business background generally have higher entrepreneurial intentions (e.g., Carr and Sequeira, 2007; Zellweger and Sieger, 2012; Hahn *et al.*, 2017). Furthermore, students with family business backgrounds are more likely to have business takeover intentions (Joensuu-Salo *et al.*, 2021). The available evidence suggests that the exclusive focus of HEI entrepreneurship education on starting a business is unjustified (Freyman and Durst, 2023).

In Seinäjoki University of Applied Sciences (SeAMK), where business transfers are among the focal areas in research and development (Seinäjoki University of Applied Sciences, n.d.), a specific effort was made to tackle

this gap. This paper describes two business transfer focused courses developed in SeAMK – the Buyer School and the Successor School – and the first experiences of implementing them.

2. The Buyer School

Buyer School, i.e. a course of study aimed at instilling the competences needed in acquiring an SME, was first implemented in SeAMK in 2022. The original Buyer School, i.e. *SME Acquisition (5 ECTS)*, aims to encourage future entrepreneurs to become entrepreneurs more often by buying a ready-made company or business, and at the same time to encourage existing companies to actively seek growth through an external growth strategy, i.e. acquiring others to expand operations. The objective is thus not only to instil competencies to handle an acquisition as a buyer but also to create a mindset that views M&As as a natural part of doing business. A graduate of the Buyer School is aware of the possibilities of mergers and acquisitions, has the basic skills to carry out a takeover, and has an idea of the external expertise that may be needed to buy a company.

The Bachelor level course is based on a multimodal structure, with online pre- and post-class assignments. The course is part of the free choice study offering and available to all degree programmes as well as to open university students. Classes (five times four hours) are organized online at scheduled times, with the interim work carried out by students independently. Interaction between participants in the class sessions is an important part of the learning process; discussion between those considering buying a business is a key element in developing a mindset that is conducive to acquisitions. The involvement of other participants helps to dispel the uncertainty of a first-time acquirer; it is encouraging to realize that many others are in the same situation and in need of further information. Discussion is facilitated by group work in the class sessions. Outputs of group work as well as independent assignments are included in the portfolio required for the completion of the course. A handbook describing the implementation in detail is available in Finnish (Viljamaa *et al.*, 2022).

After the first Buyer School, it quickly became apparent that a course once a year does not suffice. To make basic information on SME acquisitions available all year round, a slightly shorter non-stop course *Basics of SME Acquisition (3 ECTS)* was produced in 2023 as a scalable online course. Due to the different scope, the learning outcomes were modified to allow automated assessment. Non-stop implementations are characterized by complete independence of time and place, so also the content to be learned must be fully embedded in the material. In the case of this course, the material was compiled from a variety of sources. The core material consists of teacher and expert guest lecturer videos. The course also made extensive use of a variety of other online materials such as guides on the subject, research reports, blog posts, marketplaces, articles, and a collection of articles available online. The course is passed by successfully completing five online exams (multiple choice, with a time limit of 30 minutes and a maximum of three tries).

Despite the differences in methodology and learning outcomes, both courses cover five key themes. The first, *Thinking in terms of acquisition*, considers the acquisition mindset as discussed previously. The aim is to learn to view a business as a bundle of resources that can be shaped by a takeover and to understand the owner, with their skills and experience, as part of that resource bundle. In addition, the first theme discusses the stages of a takeover and compares the advantages and challenges of buying and setting up a business. The advantages of buying a business include ready cash flow, operating methods and partners, and the recognition of the business among customers. Challenges include financing and business development. The advantages of setting up a business include the absence of old burdens or ways of doing things, while the challenges include finding customers and generating cash flow. In both forms of entrepreneurship, developing profitability is equally a challenge.

The second theme, *Management challenges in acquisition*, focuses on self-management, management of the acquisition process, management of staff, and finally the takeover of the business. Clarifying the buyer's own vision and capabilities is a key starting point for a successful acquisition. Management of the buying process refers to the management approach required in the negotiation of a transaction, which includes familiarization with the target and making one's own calculations. In terms of managing staff, the emphasis is on gaining the trust of staff, and in planning a takeover, on pre-qualification. Strategic renewal through acquisition is not a given - a well-planned takeover plays an important role.

The theme *Acquisition targets and negotiations* looks at the development of acquisition criteria and different ways of identifying potential acquisition targets. It also looks at the process of negotiating a takeover, in particular in relation to the due diligence process. The fourth theme is *Valuation in acquisition*. Valuation is generally considered to be the biggest challenge in a takeover (e.g., Varamäki *et al.*, 2018, 2021). This section provides a comprehensive overview of the various factors that need to be taken into account in the valuation

process. A key element is also the clarification of the concepts of transaction price and value: finding the transaction price requires that the buyer, the seller and the financier find a common understanding. Although the determination of the intrinsic value may be simplistic, the buyer's expectations for the future are also key, and these in turn are partly buyer-specific. The final theme, *Execution and Financing*, discusses the differences between a share transaction and a business acquisition, in particular from the buyer's perspective, and possible financing channels for the acquisition. It also examines, inter alia, the financing criteria and collateral requirements of financiers and the risks associated with tying the purchase price to future revenues.

Both courses are also available to external students and non-degree students via the Open University of Applied Sciences, so there are no restrictions on eligibility. This is an important consideration, as the majority of individuals buying businesses are mature (Hoffmann *et al.*, 2023; Vanoorbeek and Spolverato, 2022)

Becoming an entrepreneur by buying an existing business is a more important theme than its popularity in entrepreneurship education would suggest. Businesses, especially in rural areas, urgently need successors from outside the family. The 3-credit online course on the basics of SME acquisition offers anyone interested in the subject, regardless of time, place and student status, the opportunity to learn about the subject under the guidance of competent and experienced experts. It could be said that the online implementation of the course fulfilled a long-standing dream of SeAMK's researchers and developers in the field of business ownership. It is particularly important that the content is accessible not only to students at SeAMK, but also to anyone interested in entrepreneurship. By becoming an entrepreneur through acquisition, one can get a flying start in realising one’s entrepreneurial dream.

As a pedagogical project, the design and implementation of both Buyer School courses was a good experience for the team involved, probably partly due to the fact that project resources could be used to develop the implementations. In both cases, thorough pedagogical scripts were devised at an early stage. The team members involved in the implementation had divergent skills and expertise, which is an advantage when it can be exploited in close cooperation. Particularly in the case of the scalable online course, the support given by SeAMK’s experts in digital pedagogy was of great importance.

A key element of successful implementation in both courses was also the willingness of external experts to contribute. In the schedule-based version, each class session had a special guest, either someone who could tell the story of their own acquisition or a consultant (business broker or similar specialist). The same guests also contributed to the educational videos immersed in the time-independent online implementation. With several different speakers, the message is conveyed in multiple voices, and it is easier for the student to remain interested in the content. In particular, the contribution of the individuals who were able to narrate their personal stories about their own SME acquisitions was an important addition to the overall experience.

3. The Successor School

As discussed earlier, taking over a family business is also an entry mode into entrepreneurship. It is, however, qualitatively very different from starting a new business or buying an existing business with no connection to one’s family. Taking over through family succession entails a level of commitment to maintaining the socio-economic wealth internalized in the business (Berrone *et al.*, 2012; DeTienne and Chirico, 2013; Makó *et al.*, 2018), and calls for dealing with family dynamics. Finding a successor within the family cannot be taken for granted (Schlömer-Laufen and Rauch, 2022), and family businesses, too, require awareness-raising activities aimed at making them aware of the issue. As Le Breton–Miller, Miller and Steier, (2004, p. 324) point out, “Succession is not an accident nor an event but a sophisticated process occurring over a very long period of time”.

Like both versions (3 or 5 ECTS) of the Buyer School, the Successor School is included in SeAMK studies as a course for credit (3-5 ECTS over the academic year), but students may also participate in monthly meetings without completing the written assignments. The Successor School is meant for family entrepreneurs’ children studying in higher education. It is thus limited to a very specific target group. However, the Successor School is open to students from all fields of study as well as through Open University of Applied Sciences to anyone interested who is not a degree student. This inclusive approach has proven beneficial, as the challenges and strengths of family businesses remain consistent regardless of the industry. As an added benefit, the multidisciplinary Successor School gives the students a natural opportunity to engage with students from different fields.

To reach the potential participants, i.e., students with a family business background, SeAMK utilizes a tool named Entre Intentio. This measurement tool of entrepreneurial intentions among students has been in constant

development since 2008 (e.g. Varamäki *et al.*, 2013, 2015) and has been complemented with specific family business-related questions (e.g. Joensuu-Salo, Viljamaa and Varamäki, 2022). The Entre Intentio survey is given to all first-year undergraduate students and includes questions on students' backgrounds. Students with a family business background are approached directly and offered the option of participating in the Successor School, assuming they have given their consent for contact in the survey.

The overall objective of the Successor School is to promote the continuity of family businesses. This is done by (a) providing family entrepreneurs' children with opportunities to consider the succession of the family business as a viable career option, (b) providing them with competences and tools for a possible future transfer of knowledge, management, and ownership, and (c) preparing them for the processing and management of the dynamism between family, work and ownership, and finally (d) providing them with tools for the creation of an open conversational culture at family businesses. The Successor School as a whole can be characterized as a framework for a personal growth process – a forum for thinking about a highly complex career choice.

The Successor School consists of the following elements: monthly meetings, discussions with experts, writing a learning diary, and preparation of a preliminary succession plan. The latter two are requirements for receiving credits for the course, but simply attending the monthly meetings is also possible. Each of the monthly meetings lasts 2 to 2.5 hours and has a specific theme. The meetings work best as face-to-face appointments, but during the COVID-19 pandemic, they were arranged over Teams or as hybrid implementations. A typical meeting has the following structure:

1. a fact section, e.g., previous research knowledge and literature, or an expert's personal experience,
2. a practical case story, primarily to be presented by a SeAMK alumnus with a family business background,
3. a joint discussion on the theme, and
4. review of the forthcoming independent learning assignment.

The themes for meetings vary, ranging from coping with siblings to the meaning of ownership, transfer of knowledge and tax relief in family succession. Further examples can be found in the course description (Seinäjoki University of Applied Sciences, 2024). The students are also invited to propose themes, and the students' entrepreneur parents can also be invited to attend some of the meetings if the theme is appropriate. In the meetings, SeAMK's own alumni are excellent "guest lecturers": they not only tell the story of their family business but also explain the process they went through, their succession implementation path, and, above all, what lessons they have drawn from the experience. Although other family business owners could share their experiences as well, alumni of the same university are particularly relatable. Another aspect worth particular highlighting is the peer support students get as they participate. Students who are similarly situated provide each other with a community of shared experiences and find new perspectives on the operations of their own family businesses.

The learning diaries of the Successor School consist of learning assignments relating to the themes discussed in the meetings. Two examples are provided in Table 1. One central purpose of learning tasks is for students to initiate open discussions within their own families about the upcoming succession process, and according to informal feedback received from students, this has indeed occurred in several cases. In addition to the learning diary, the students can prepare a preliminary succession plan, which includes nine sections, namely background and situational analysis, current roles, personal motivation, knowledge transfer, transfer of leadership, transfer of ownership, utilization of external experts, post-succession business development and role of the retiring entrepreneur.

The Successor School was first piloted in SeAMK in 2022 and has continued since. At the time of writing, there are 40 students enrolled in the Successor School, and it is particularly noteworthy that students from agriculture, a sector dominated by family businesses, have taken great interest. From the resourcing perspective, the ongoing operation of the Successor School demands approximately 150–200 hours annually, including tasks such as recruitment, marketing, appointment planning, expert coordination, assignment evaluation, and student engagement. In addition to the Entre Intentio survey mentioned previously, marketing efforts are extended to entrepreneurship and business courses, ensuring awareness among students of all academic levels. Importantly, marketing targets students of all study years, as enrolment in the Successor School is open throughout their studies.

Table 1: Examples of learning assignments in the Successor School

Learning assignment	Questions for reflection
Planning for unexpected events affecting the entrepreneur	• Think of three things that would be first assigned to you at your family business if your entrepreneur parents unexpectedly fell seriously ill, or even passed away? • What competences would you currently have to take care of these things? • How can you improve your own abilities / competence in relation to these things?
Exploring the concept of ownership and its implications for management and family dynamics.	• Do you think management also requires the ownership of your family business: does the owner also have to be CEO, or can the CEO also be someone from outside of the family? • Should the successors or all the family members working for the business own the business with equal shares? • Can some of the family members be owners of the business even if they do not work for the business? • What liabilities and rights does the ownership of the family business give you?

4. Student Feedback

At the time of writing this, student feedback on the 5 ECTS Buyer School for the current implementation is not available, as the course feedback collection is still underway. For the online 3 ECTS Buyer School, a continuous feedback survey has been established, with a single qualitative question: *Please tell us what worked well on the course and what needs improving*. Responses are fully anonymous. The current (ongoing) survey has resulted in 83 replies so far with a total of 169 participants registered for the course, giving a response rate of 49 %. For the purposes of this paper, the responses were analysed and sorted into categories (Table 2). Of the 83 responses, 60 had only positive comments, 6 only negative comments, and 17 were classified as having both or neutral. The responses included in total 29 suggestions for improving the course.

All in all, the feedback is quite positive and encouraging for the teaching team. It is also gratifying that so many students give constructive suggestions as to how to improve future implementations; although many of the suggestions are unfeasible or would expand the course beyond the set extent, the interest taken by the respondents demonstrates engagement on the students' part.

For the Successor School, in which a single implementation lasts a whole academic year, student feedback is collected through the formal SeAMK feedback system towards the end of the spring semester. At the time of writing, the collection is still underway, but the preliminary results indicate a good level of satisfaction with the course. The formal feedback system has two items ("In my opinion, the course was at least good" and "I think I learned a lot on the course") with a 5-point Likert scale (1 = totally disagree, 5 = totally agree) and one open question. For the Successor School 2023-2024, the average rating for both items was 4.6, with no respondents giving a rating below 4. Open-question responses (7 replies) were also very positive. In addition, informal feedback has been received from participants as both spontaneous individual messages and as part of the final discussions in the last sessions of each semester.

Table 2: Student feedback on online Buyer School (3 ECTS, non-stop implementation)

Category	No of responses	Illustrative examples (authors' translation)
Positive comments and thanks only	60	• In my opinion, the implementation of the course worked, and it also called for an effort to immerse oneself in the contents of the videos and texts. The tools provided by this course are a good starting point to consider buying a business! • The course gave a deep and practical view into business acquisitions, and it exceeded my expectations in many ways. I became excited about business acquisitions, and now I can't stop browsing the list of businesses for sale.
Negative comments only	6	• The content of the videos could have perhaps been a bit more extensive in some respects. I imagined that after this course, I would have a handle on business valuation, but it's not quite there yet. • A bit too many videos, it would be easier to study using slides.

Category	No of responses	Illustrative examples (authors' translation)
Both negative and positive comments / Neutral	17	• The materials were good. There was quite a bit of repetition in some of the materials though. • Especially the video materials of the course were very clear and straightforward - there was no unnecessary chatter. Some of the exam questions were formulated somewhat unclearly, it was difficult to associate them with the source material.
Total	83	
Suggestions for improvement	29	• It would have been nice to see a concrete example of, for instance, business valuation, even if it was from a totally imaginary company. • More written materials would be good, it is hard to retain information from videos. • Succession and especially succession-related taxation would be a nice addition. • Maybe the materials on the videos could be provided also as pdfs on the learning platform.

5. Conclusions

Focus on starting a business in HEI entrepreneurship teaching is understandable and perhaps unavoidable: starting a business resonates more strongly with the idea of opportunity-driven entrepreneurship than does taking over an existing business. To develop an entrepreneurial mindset, one needs to work on new ideas and value creation, and thus startup training is easier to view as a part of becoming more entrepreneurial in all working life roles. Yet, as European entrepreneurs age, successors from within and without the family are increasingly needed if viable businesses are not to be closed for the lack of a successor. For higher education students to at least be aware of the possibility is important. Having a Buyer School available sends a powerful message, and for those who attend it, it gives a good starting point for thinking about entrepreneurship-through-acquisition. Although there is little research available on such entrepreneurship, what evidence there is suggests that buying a business rather than creating one from scratch is potentially a successful entrepreneurial endeavour (Hoffmann *et al.*, 2023).

Unlike other students, students with a family business background are probably aware of the possibility of continuing the family business. For them the HEI can provide a growth process, conceptual tools, practical information, and the opportunity to reflect among their peers on issues relating to family business. Students with a business in the family have an opportunity that others lack – helping students to realize this, even if they choose not to take advantage of that opportunity, is a worthwhile goal in itself.

For both Successor and Buyer Schools, a survey of entrepreneurial intentions such as the Entre Intentio instrument used in SeAMK, is an invaluable tool. It helps identify the students with a family business background and can also be used to recognize the students with a high level of entrepreneurial intentions, to provide them with different support measures. It is advisable to conduct a survey to identify students with a family business background or high entrepreneurial intentions as early as the beginning of their studies. After the survey, a good practical measure is to invite the students with preliminary interest in successions to a face-to-face meeting for the presentation and marketing of the Successor School and to specifically advertise the Buyer School and startup support available to those with interest in becoming an entrepreneur. It is also important to bring up The Successor and Buyers Schools on courses in entrepreneurship, or in other business courses.

Successor and Buyer Schools show promise in bridging the gap between HEI entrepreneurship education and the lived experience of entrepreneurial life. On the societal level, a few courses in one university are not likely to make much difference, but if the practice spreads, it will help ensure qualitatively better family communications and successions, offer more secure starts for many aspiring entrepreneurs and promote growth through acquisitive strategies for SMEs. All these contribute to economic growth and resilience.

Seinäjoki University of Applied Sciences has over two decades of experience in researching, developing, and providing training in business transfers, with a significant number of experts in this field. Years of active work on regional, national and international development in the topic provide a fertile ground for the growth of business ownership transfer expertise. Furthermore, entrepreneurship is deeply ingrained in the university's strategy and vision, an entrepreneurial spirit being a core value of the HEI. Hence, establishing operational models for the Buyer School and the Successor School was a logical progression as well as a natural extension of the university's

ethos. By bringing the developed solutions to the notice of academic audiences, the authors hope to encourage also other HEIs to include in their entrepreneurship curricula similar courses, or if that is not feasible, to at least include in basic entrepreneurship courses a reference to the options of succession and acquisition.

For higher education students to at least be aware of the possibility is important. As Freyman and Durst (2023, p. 13) note, "…promoting more balanced models and approaches starting early in formal higher education may foster entrepreneurial activity that benefits both different types of students as well as society at large".

Acknowledgements

The Authors would like to express their gratitude for the ERDF grant A77038 which supported the creation of Successor and Buyer Schools.

Developing and Testing a Rural Business Incubator: A Best Practice Framework

Peetu Virkkala and Martti Saarela
University of Oulu, Finland

peetu.virkkala@oulu.fi
martti.saarela@oulu.fi

Abstract: Compared to an urban context, starting a business in a rural context has its distinctive challenges such as the lack of entrepreneurial support infrastructures typical in an urban context. Business incubators are types of entrepreneurial support organizations that support the creation and growth of new companies with tangible and intangible resources. They help incubatees transform their ideas and concepts into feasible products and services with tangible and intangible resources such as facilities, shared equipment, administrative services, knowledge, and access to networks. In the rural context, business incubators can help to address rural entrepreneurship challenges such as population and infrastructure deficiencies, and rural entrepreneurship opportunities such as strong social bonds and embeddedness to a rural environment. In this manner, they can help to mitigate entrepreneurial challenges and foster the use of entrepreneurial opportunities through direct and indirect effects to the local, regional, and national economy. However, rural incubators tend to perform worse than their urban counterparts. The reasons for this aren't well understood, as there is a lack of incubator research on how locational attributes affect rural business incubators. There is a need for further knowledge about how rural context influences business incubators to improve the development, tracking, and impact of rural business incubators. This study addresses this research gap by creating a rural business incubator best practice framework that addresses general incubator best practices and rural entrepreneurship-specific challenges and opportunities that should be addressed in rural business incubators. The proposed framework is tested in rural VAU!HAUTOMO business incubator and the results are analysed to review the framework´s capabilities and suggest future use cases and research avenues. The framework provides a novel approach to plan, measure, and manage rural business incubators which both researchers and incubator actors can use to develop rural business incubators that better take into account rural entrepreneurship challenges and opportunities.

Keywords: Rural business incubator, Rural entrepreneurship, Incubator model, Pre-incubator, Rural context

1. Introduction

Companies are molded by their environment which can be in turn shaped by their actions (Anderson, 2000; Mair & Marti, 2009). This is also true in rural contexts where rural companies are molded by their rural environment and vice versa (Baumgartner et al. 2013). However, entrepreneurship policies have considered rural entrepreneurship challenges and opportunities insufficiently, and rural entrepreneurship is often approached in the same manner as urban entrepreneurship (Korsgaard et al 2015; Fortunato, 2014). Business incubators can help to mitigate entrepreneurial challenges and foster the use of entrepreneurial opportunities (OECD, 2019; Hausberg & Korreck, 2021). While business incubators can improve entrepreneurship capabilities also in rural areas, studies have shown that rural business incubators tend to perform worse than their urban counterparts (Dickes, 2011). Rural business incubator challenges can be partially explained by rural entrepreneurship challenges from which very little is still known as most of the entrepreneurship research has focused on business incubators in an urban context (Cheng & Schaeffer, 2011; Pato & Teixeira, 2016; Freire-Gibb & Nielsen, 2014).

To address these knowledge gaps, this study creates a rural business incubator best practice framework to help researchers and rural actors to better identify, track, and manage rural entrepreneurship challenges and opportunities in rural business incubators. To do this, we first identify incubator best practices, and central rural entrepreneurship challenges and opportunities. This knowledge is then applied to create the framework which is tested to analyse VAU!HAUTOMO business incubator. Finally, avenues for further testing, use, and development of the framework are suggested.

2. Literature Review

2.1 Business Incubators

Business incubators are entrepreneurial support organizations that aim to enhance the local entrepreneurial climate (Dickes, 2011). Business incubators aim to develop the entrepreneurial competence needed to initiate and engage in the practice of entrepreneurship through the process of entrepreneurial learning and the development of entrepreneurial self-efficacy (Newman et al 2019). Some business incubators have a specific sector focus such as food processing, medical technologies, or tourism (Adkins et al 2001) while others have diverse sets of incubates from different sectors. Many localities have business incubators that have been

modified to meet local needs and maximize entrepreneurial yield (Dickes, 2011). Truly, business incubators differ from each other and some argue that there are no two business incubators alike (Allen & McCluskey, 1990). Incubator management team determines business incubator's objectives, designs the suite of services, builds relationships with affiliated organizations and institutions, and selects the incubatees (OECD/European Commission, 2019). The management team is responsible for incubation counselling, the actual dissemination of knowledge, and advice to incubatees, which has a critical role in the incubation.

2.2 Best Practices for Business Incubators

In their systematic literature review, Hausberg and Korreck (2021) identify 16 different typologies for business incubator. This comparison shows that identification of incubator best practices varies between authors according to selected incubator type and dimension. From these 16 typologies we select sponsor/partner focused typology originally presented by Zedtwitz (2003) to investigate business incubator best practices in further detail. In his study, Zedwitz presents different incubator strategies, business models, management practices, and incubator services. Due to its comprehensiveness and adaptability, we will use it as a base for the development of a rural business incubator framework.

Business incubators typically offer five types of services (Table 1). Business incubators offering all five types of services are called incubators in the strong sense of the term. Business incubators that offer only four types of services are called incubators in the weak sense of the term. Finally, business incubators that offer fewer than four of these services lack too many incubator services to be called incubators and should be therefore approached differently.

Table 1: Five types of incubator services (modified from Zedtwitz, 2003)

Service	Description of service
Access to physical resources	Physical incubator spaces such as office spaces
Office support	Office support such as bookkeeping and IT support
Access to financial resources	Venture capital opportunities through incubator activities
Entrepreneurial start-up support	Support activities in entrepreneurial topics such as idea development, management, and legal
Access to networks	Networking opportunities through incubator activities

For-profit and not-for-profit are two basic types of incubators. For-profit incubators´ main goal is to generate profit while not-for-profit incubators have non-profit-based main goals such as regional development. Incubators can be then associated further with five incubator archetypes which all have different degrees of competitive focus in terms of incubator segment, industry, and geography (Table 2). Incubators can be strictly one of these archetypes or have elements from multiple of them.

Table 2: Five incubator archetypes (modified from Zedtwitz, 2003)

Incubator archetype	Typical objectives	Typical establishers
Independent commercial incubators	Commercial objectives	Venture capital firms and independent entrepreneurs
Regional business incubators	Public objectives such as employment	Local governments and organizations with similar regional interests
University incubators	Commercial objectives	Universities and local technology transfer offices
Company-internal incubators	Commercial objectives	Companies with internal R&D capabilities
Virtual incubators	Commercial objectives	Service aggregators

In the generic incubator business model, investors provide venture capital to the incubator which supports incubatees through incubator services so that incubatees can generate value. This value then proceeds partly to the incubator from which it returns partly to the incubator´s investors. The incubator´s management plays a key role in the success of this model. Management´s goal is to leverage investors' venture capital to provide timely and efficient deployment of incubator services and create synergy potential between incubatees through segmentation of similar incubatees.

Regardless of the selected incubator archetype, there seem to be four incubator management practices that are considered valuable for good incubator management (Table 3). Together with a long-term commitment to the

incubator by the key investors, these management practices form the basis for a successful incubator business model.

Table 3: Key practices for incubator management (modified from Zedtwitz, 2003)

Incubator management practice	Description of the practice
Incubation charter	Incubator has a clear and well-communicated vision statement that motivates investors and incubatees
Day-to-day management	More personal hands-on coaching is provided by focusing on fewer incubatees at the time and by maintaining optimal incubatee capacit
Optimizing leverage	Individuals with relevant know-how and experience are recruited, selected and retained as incubator managers
Optimizing synergy	Incubatees are selected so that their synergy value can be maximized in the incubator

2.3 Entrepreneurship in Rural Context

2.3.1 Rurality and rural entrepreneurship

The essence of rurality is still under ongoing debate (Pato & Teixeira, 2016). Rurality can be seen as a set of hard measures (such as geographical scope and population density) and soft measures (such as characteristics of social networks) (Labrianidis, 2006; Stathopoulou et al 2004). Halfacree (1993) and Siemens (2007) identify three categories from the literature for rurality. These are social definition (focus on individuals' interpretation of rurality), a definition based on lack of population (focus on disadvantages of rural areas' population density compared to urban areas population density), and geographical definition (focus on physical location, natural resources, and geographical connections to urban areas).

There are a multitude of debatable definitions for rural entrepreneurship (Gaddefors & Anderson, 2019). For example, McElwee and Atherton (2021) define rural entrepreneurship as entrepreneurship that happens to occur in a rural environment. Rural entrepreneurship often involves engagement in the rural milieu and making use of different types of resources of a rural environment (Gashi & Tillmar, 2022). Rural entrepreneurship is thus seen as spatially bound to a particular setting (Korsgaard et al 2015) so the context of rural entrepreneurship matters as each rural setting is diverse in its way (Gaddefors & Anderson, 2019).

2.3.2 Challenges of rural entrepreneurship

Different rural entrepreneurship challenges and opportunities have been identified in the literature. Stathopoulu et al. (2004) present environment-based grouping (physical, social and economic dimension) that helps to compare rural entrepreneurship challenges and opportunities. Table 4 summarizes some of the most addressed challenges and opportunities in rural entrepreneurship literature. Although this comparison is not comprehensive, it helps us to form an overview of the topic.

Table 4: Summary of identified rural entrepreneurship challenges and opportunities in Stathopoulu et al. (2004) environment-based grouping

Dimension	Typical rural entrepreneurship challenges when compared to urban entrepreneurship	Typical rural entrepreneurship opportunities when compared to urban entrepreneurship
Physical dimension	Weaker accessibility to customers, suppliers and institutions (Stathopoulou et al 2004)	Better accessibility in terms of migration (Keeble & Tyler, 1995)
	Smaller local market size and demand (Stathopoulou et al 2004; Dabson, 2001)	Lower rent costs (Imedashvili et al 2013)
	Higher distribution and marketing costs to enter external markets (Lekhanya, 2016; Sternberg, 2009)	More natural resources that may offer business opportunities (Johnson & Rasker, 1995; Tennesen, 1994)
	More difficulties to reach economies of scale (Dabson, 2001)	Entrepreneurs have more knowledge about locally available resources (Müller, 2013)

Dimension	Typical rural entrepreneurship challenges when compared to urban entrepreneurship	Typical rural entrepreneurship opportunities when compared to urban entrepreneurship
	Weaker access to skilled and educated human capital (Deller et al 2019)	Rural landscape has the potential for greater work satisfaction and for a more ethical office environment (Tennesen, 1994)
Social dimension	Over embeddedness to local social networks decreases competitivenes (Uzzi, 1997) Stronger social obligations may cause irrational behavior (Kjeldsen & Svensen, 2011) Less potential interpersonal interactions (Francis & Sandberg, 2000) Stronger fears of social exclusion that decreases entrepreneurial behavior and culture (Spigel & Harrison, 2018) Attitude towards entrepreneurial actions is less encouraging (Honig & Dana, 2008)	Stronger social relationships and trust facilitate regional cooperation and networking (Müller, 2013; Kjeldsen & Svensen, 2011; Lee et al 2005) Rural cultural identity and embeddedness can be utilized to build specialty that attracts external resources (Ray, 1998)
Economical dimension	More skepticism towards digital technologies (Hardy et al 2019) Entrepreneurs are more inclined to use locally available resources even if they aren´t economically the best choice (Müller, 2013) Less finance and human capital to entrepreneurial development (Müller, 2013) Slower creation and adoption of innovations (Harrison & Kelley, 1996)	Less developed infrastructure offers more opportunities for innovation (Canfield et al 2019) Digital technologies offer opportunities to mitigate disadvantages of rural environments such as distances and small market size (Stathopoulou et al 2004)

2.3.3 Rural business incubators

Rural business incubators are business incubators operating in rural contexts. Studies have shown that rural incubators tend to perform worse than their urban counterparts likely requiring ongoing subsidization (Dickes, 2011). Both regional factors and incubator factors explain this but the relationship between them has been unclear until recent study by Harper-Anderson & Lewis (2018). They show that regional capacity has a weaker relationship to incubator outcomes than incubator quality. This indicates that optimal incubator program operations can compensate for the lack of regional capacity. However, when incubatees graduate from the incubator, regional capacity´s importance increases as graduated incubatees will hire employees at a faster rate in regions with higher capacity for innovation.

Rural business incubators' challenges can be at least partially explained by the challenges of rural entrepreneurship (Cheng & Schaeffer, 2011). Some approaches to mitigate these challenges have been proposed in the literature. For example, it has been proposed that rural incubators should be arranged as virtual incubators or hybrid incubators combining physical and virtual incubator approaches (OECD/European Commission, 2019). While virtual incubators have been shown to lower rural entrepreneurs' barriers to participate in incubator programs (OECD, 2021), they lack the richness of interaction common to physical incubators which may decrease synergy and commitment between incubatees. To mitigate this shortcoming, the incubator can be arranged as a hybrid incubator combining both virtual and physical incubator to achieve the advantage of both incubator models. (Zedtwitz, 2003) Virtual incubators offer two types of functions that can help to mitigate rural entrepreneurship challenges (Zedtwitz, 2003). First, they offer online matchmaking

such as online communication, seminars, and learning groups. Second, they offer service aggregation such as access to external professional services.

3. Research Design

3.1 Rural Business Incubator Best Practice Framework

We use previously presented Zedtwitz (2003) incubator strategy, management model, business model, and incubator services. For each of these, our rural business incubator framework (Figure 1) proposes an approach that takes into account both rural region and rural incubator program factors. Stathopoulu et al. (2004) environment-based grouping of rural entrepreneurship challenges and opportunities is used in the framework to distinguish different perspectives. Decisions that led to the framework are discussed in more detail in the next sub-chapters.

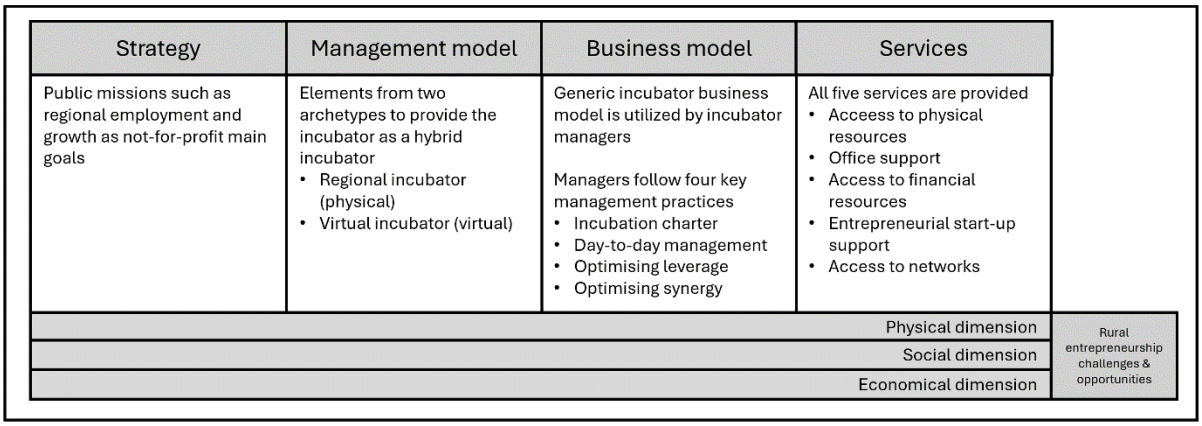

Figure 1: Rural business incubator best practice framework (Adapted from Zedtwitz, 2003 & Stathopoulu et al. 2004)

3.1.1 How Zedtwitz (2003) strategy, management model, business model and services is applied

Regional capabilities affect rural business incubators which in turn foster entrepreneurship in the area. Both rural regions and rural business incubators can benefit from incubators if their strategy and management model are chosen wisely. With this in mind, we argue that not-for-profit-based public mission goals are more fitting goals than for-profit-based goals for rural business incubators as they prioritize regional development over profitability. In the same manner, we argue that from different types of incubator archetypes, a hybrid mix of regional business and virtual incubator fit best to this use case. Regional business incubators focus on local communities and their priority is in public development. Rural entrepreneurship challenges and opportunities can be addressed in these incubators even better if virtual incubator capabilities are applied in them. Generic incubator business models can be adapted to rural environments. Incubator managers play a key role in the business model so special attention should be put on their managerial practices, especially in rural environments where skilled managers are rarer than in urban environments. Four key management practices are a good starting point for management and they can be expanded according to incubator-specific needs. Finally, rural business incubators should adapt all five types of services to be incubators in the strong sense of the term. Emphasis and content of these services should be planned case-by-case.

3.1.2 How Stathopoulu et al (2004) environment-based grouping is applied

Environment-based grouping helps to identify, distinguish, and track different types of rural entrepreneurship challenges and opportunities in rural business incubators. We argue that this knowledge can help rural incubator managers address the influence of the rural context better in their incubators and thus improve their incubation activities. While rural entrepreneurship challenges and opportunities vary in different rural environments, environment-based grouping sets a good starting point for a case-by-case review. Specific challenges and opportunities identified in previous studies can also help to identify challenges and opportunities for specific cases. We propose in the framework that rural entrepreneurship challenges and opportunities should be taken into account in the incubator´s strategy, management model, business model, and services. We see rural entrepreneurship challenges and opportunities as an overarching theme that helps to connect incubator best practices to the current rural entrepreneurship context.

3.2 Testing Framework in Development Project – Case VAU!HAUTOMO

To test the framework in practice, we used the framework to plan and track rural business incubators in Finland. The incubator was developed as a part of European Regional Development Fund development projects which aimed to start a business incubator in the Nivala-Haapajärvi sub-region area. The development project was conducted together with the Nivala-Haapajärvi sub-region´s business development organization NIHAK. Nivala-Haapajärvi sub-region is located to Southern part of Northern Ostrobothnia region in Finland. Sub-region´s population is small by European standards with a total population of 26 806 people in 5 municipalities: Haapajärvi, Kärsämäki, Nivala, Pyhäjärvi and Reisjärvi (Tilastokeskus, 2023). NIHAK, the Nivala-Haapajärvi sub-region development organization, is responsible for entrepreneurship development in the sub-region area. Its main missions are the regional development of sub-region municipalities and the development of the sub-region business environment for companies.

4. Results

4.1 Overall Results From the Incubator

64 incubatees took part in the incubator from which 20 utilized actively different types of incubator services throughout their stay in the incubator. The other 44 incubatees either only short time in the incubator or utilized incubator services only partially. From the 20 active incubatees, 4 incubatees were ideating, 12 incubatees were implementing their idea, and 4 incubatees were developing their innovation further and seeking funding when the development project ended. In total 38 workshops were organized on various themes such as team building, funding, innovation, marketing, and legal. The management team organized visits to several start-up competitions where incubatees presented their ideas and innovations, and sought funding from the investors. After the end of the development project, the incubator continued through a new still ongoing development project which aims to increase cooperation with the sub-region´s educational institutions and establish a sub-regional level capital investment fund for the incubator. Although these development steps are interesting for further study, our analysis is limited only to the first VAU!HAUTOMO development project.

4.2 Using the Framework to Analyze the Incubator

The incubator´s best practices and rural entrepreneurship challenges and opportunities which it addressed were analysed by using the framework (Figure 2). The incubator had a similar strategic objective and management model as in the framework. The main goals were not-for-profit and the incubator was organized as a hybrid incubator consisting of regional and virtual incubator. Business model actors and examples of four key management practices were easy to identify. The incubator offered many incubator services but didn´t offer access to financial resources as there were no in-house instruments for venture capital.

Different rural entrepreneurship challenges and opportunities were addressed in the incubator. In the physical dimension, challenges of small local market size, high marketing costs lack of skilled workforce, and opportunities for entrepreneurial local knowledge were addressed. In terms of the social dimension, challenges of over-embeddedness to local social networks reserved attitudes towards entrepreneurship, and opportunities of strong trust among local and rural cultural identity were addressed. In terms of the economic dimension, challenges of scepticism towards digital technologies and slow adoption of innovations, and opportunities of digital technologies were addressed.

The analysis indicates that the incubator managed to address different physical, social, and economical rural entrepreneurship challenges and opportunities. The incubator followed the framework´s best practices in many respects although its services lacked in terms of access to financial resources. The incubator´s results were analysed only subsequently when VAU!HAUTOMO development project had ended. Thus the framework´s potential use case to plan incubator activities couldn´t be analysed. However, the analysis can be utilized and expanded to plan activities in VAU!START+ to develop the incubator further. This could include topics such as fulfilling managers' expertise gaps, development of virtual incubator capabilities, development of day-to-day management practices, and design of sub-regional venture capital instruments. Location-specific rural entrepreneurship prerequisites could be also analysed further and the framework could be used to benchmark the incubator with other similar incubators to identify new best practices and rural entrepreneurship challenges and opportunities.

	Strategic objective	Management model	Business model	Services
Best practices	*Not-for-profit, public missions* • Development of local (rural) entrepreneurship capabilities • Sub-regional employment • Growth *Not-for-profit, indirect operation profits* • Increase of local SMEs' innovation capabilities	*Hybrid incubator model* *Regional incubator characteristics* • Regional interests • Secured funding through development project provides a safe-haven for starting incubatees • Lose screening of incubatees • Incubator managers with general business development skillsets, specific knowledge has to be gathered externally *Virtual incubator characteristics* Function 1: Online matchmaking • Workshops materials • Private communciation channels • Public communciation and news channels • Special interest groups for competitions Function 2: Service aggregation • Access to workshops experts for professional services • Access to NIHAK business development services	*Investor* Public funding from the European Regional Development Fund and NIHAK *Incubator (management)* NIHAK, 4 business developers *Incubatees* Individuals and SMEs, 64 in total *Key management practices* 1. Incubation charter • Clear main promise: "from idea to market" which is market diversly under VAU! Brand 2. Day-to-day-management • incubatees' individual needs and situations are tracked regularly • Workshops are designed according to incubatees needs 3. Optimizing leverage • Business developers with different skills are selected as managers 4. Optimizing synergy • Incubatees in similar situations are connected	*Incubator services* 1. Access to physical resources • Physical incubator spaces in municipality centers 2. Office support • Basic office support services such as printing and wifi access 3. Access to financial resources • No in-house venture capital • Incubatees are directed to external venture capital sources 4. Entrepreneurial start-up support • 38 workshops on various themes 5. Access to networks • Access to NIHAK business networks • Access to external networks through start-up competitions
Physical challenges	Small local market , high marketing costs & weak access to skilled workforce			
Physical opportunities	Entrepreneurs knowledge			
Social challenges	Over embeddedness to local social network & reserved attitude towards entrepreneurship			
Social opportunities	Strong trust among locals & local branding advantages			
Economical challenges	Skepticism towards digital technologies & slower creation and adoption of innovations			
Economical opportunities	Digital technologies			

Figure 2: Analyse of the incubator through rural business incubator best practice framework

5. Discussion

This study aimed to clarify best practices for rural business incubators to create a best practice framework for business incubators in the rural entrepreneurship context. This goal was achieved by forming the framework which combined Zedtwitz's (2003) incubator best practices and Stahopoulu et al (2004) environment-based grouping of rural entrepreneurship challenges and opportunities. The framework was then tested to describe best practices in VAU!HAUTOMO business incubator and suggestions were made on how the framework could be used to further develop VAU!HAUTOMO business incubator and compare rural business incubators with each other.

Business incubators aim to enhance the local entrepreneurial climate by focusing on the development of early-stage firms. Instead of measuring their performance according to individual practices, synergy among multiple practices, policies, and services should be emphasized to improve their quality. Growing business incubators make important contributions to their local environment and thus they can also help to improve entrepreneurship capabilities in rural contexts. Rurality and rural entrepreneurship can be defined and approached in many ways. Rural areas are often compared to urban areas in terms of social, population or geographical factors to identify specific challenges and opportunities for rural entrepreneurship. Its shown that both rural context and incubator capabilities impact the rural incubators which raises an interest to further study rural entrepreneurship challenges and opportunities, and business incubators' best practices. Zedtwitz (2003) and Stathopoulu et al (2004) were analyzed to identify best practices for incubators and environment-based grouping for rural entrepreneurship challenges and opportunities which were then populated with examples from the literature. This analysis led to the creation of the rural business incubator best practice framework which was then pilot-tested to analyze VAU!HAUTOMO incubator.

The analysis helped to identify practices in the incubator that followed and practices that didn´t follow the best practices mentioned in the framework. The framework also helped to separate different types of rural entrepreneurship challenges and opportunities that the incubator addressed. The framework was tested only in this one incubator and the analysis focused only on the results of the incubator which can be seen as the biggest limitation of this study. Further testing of the framework should be conducted to identify how the framework can be used to plan rural incubators and compare their results. This would help to identify the benefits of the framework and potentially help to clarify what kind of rural entrepreneurship challenges and opportunities are taken into account in rural business incubators and in which ways. This knowledge could be then further used to identify how rural context influences rural business incubators to improve understanding and development of entrepreneurial support activities in rural areas. Despite its limitations, this study provides a novel approach to rural incubator research which is still in its infancy (Nicholls-Nixon & Valliere, 2020, OECD, 2019; Barbero et al 2014), and helps to clarify antecedents for business incubators in rural environments and communities to fill

multi-level study research gap identified by Hausberg and Korreck (2021). Together with other models, the framework can be utilized to further clarify how rural context affects business incubator activities and vice versa.

albert.albers@kit.edu

Abstract: In the interconnected world of today, we experience the evolution of mechatronic systems into cyber-physical systems (CPS) through their connection to the Internet of Things (IoT). Despite their vast potential for groundbreaking applications already present, e. g. autonomous cars or smart production systems, startups face significant hurdles in developing CPS, primarily due to limited knowledge and resources. Currently, only few scientific contributions cover how hardware-containing products are developed in startups and what possible challenges can be expected. This gap highlights a pressing need for research into the specific challenges and methodologies of CPS development within the startup ecosystem. The research goal of this paper is to set an explorative foundation for understanding the product development of CPS in startups to enable further research and suiting support for future founders. This paper offers a first attempt to give a qualitative description of the status quo of the development of CPS in startups. It begins by establishing an understanding of the four main problem fields discussed in the literature on CPS development, entrepreneurship, and hardware development in startups: The impetus of entrepreneurs in CPS-developing startups (1), the ideation of the CPS in development (2), the prototyping of CPS in startups (3) and processes, methods, and tools used in CPS development in startups (4). They are discussed by semi-structured interviews. Due to the limited number of possible participants, the interviews are conducted with a sample of eight founders and employees from CPS-developing startups in Southern Germany. Their answers are used to deduce recurring patterns and contradicting positions in their subjective experience with CPS development. The result of this paper are twelve proposed characteristic aspects of current CPS development practice in startups based on the deduced patterns. With this first qualitative description of the status quo of CPS development, this paper identifies potentially relevant topics that occupy CPS founders, delivers connecting points to current research in established research disciplines and reveals current missing research activities.

Keywords: Cyber-physical systems in startups, Product development methodology in startups, Entrepreneurship with cyber-physical systems, Problems of product development in CPS-startups, Product development characteristics of CPS-startups

1. Introduction

Although European industries are known for their ingenuity in developing high-tech products in hardware-intensive industry sectors (European Commission, 2021), startups tend to focus more on the development of software-related products: Only a fifth of German startups identify technology development and production as their business model, while 65% of them identify an exclusively digital business model in their startup (Kollmann et al., 2023). This tendency to focus on exclusively digital or software-related business models and products in startups is also represented in established literature: Kollmann describes digital ventures mostly in the meaning of ventures creating exclusively software-related products (Kollmann, 2022). Although his collected description applies to many hardware-related digital ventures, he only describes the development of software products in startups. Blank and Dorf relate to technology risk as a risk easily avoided by simulations (Blank and Dorf, 2017). That statement is debatable considering aspects that cannot be simulated with reasonable computation efford, i. e. because of not fully understood design-function-relations in physical domains. The established perception of startup products as software fails to reflect the reality of hardware-intensive product development activities in startups. This is also displayed in the German Startup Monitor 2022, where product development is identified as the second biggest challenge after sales since 2020 (Kollmann et al., 2022).

We have identified a lack of scientific understanding of hardware-intensive development activities in startups, especially when describing cyber-physical systems (CPS). CPS are integration of computation with physical processes (Lee, 2010) expanding mechatronic systems through the possibilities of the Internet of Things (Graessler and Hentze, 2020). A CPS-example is a “smart toothbrush” including mechanics, sensors, actors, intelligent control systems and an internet connection to related services like a monitoring app.

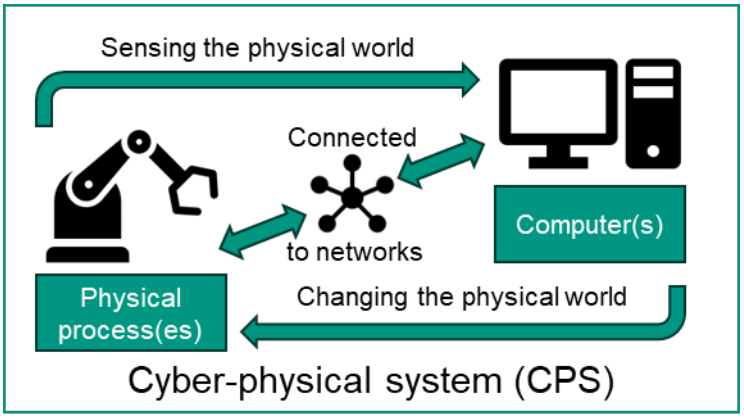

Figure 1: Definition of cyber-physical systems. Own illustration based on Lee, 2010

The character of CPS as enabling technology brings innovation potential for future applications and business models. However, the development of CPS has many potential risks in the interdisciplinary development of technology (Mosterman and Zander, 2016) and in the understanding of business relations, business models, and the self-conception as producer and client in an interconnected business ecosystem (Schneider et al., 2023). Current research is focussing on understanding requirements for agile development of CPS, but still is unclear about the boundary conditions, requirements and problems of established development environments (Albers et al., 2024). For startups, the threshold for developing complex systems like CPS coming with this uncertainty could be even worse.

Only a few publications investigate the development challenges of startups addressing complex technical hardware-related systems such as CPS. Therefore, we want to establish a first understanding of potential challenges and characteristic aspects of the development of CPS in startups with this paper.

2. Research aim, Research Questions, and Methodology

This study aims to exploratively investigate the status quo of current development practices in startups developing CPS to give a first qualitative understanding of the current situation of CPS development in startups. To achieve this, we want to answer the following research questions (RQ):

RQ1:What challenges and problems do CPS-developing startups face?

RQ2:What is the current development practice in CPS-developing startups related to those challenges and problems?

The first research question is answered in section 3 through an explorative literature analysis on publications from entrepreneurship and product development covering topics related to CPS- or hardware development in startups. They are selected by analyzing different literature search engines like *Google Scholar* or Web *of Science* by combining the following search keywords, i. e. “CPS”, “startup”, “hardware”, “IoT”, “Industry 4.0”, “development”, “challenges”, and “problems”. Papers are included when contributing to the questions described in Section 3. The resulting understanding is refined into proposed problem fields of startups developing CPS.

The second research question is answered in section 4. Based on the literature-based proposed problem fields from section 3, semi-structured interviews are conducted. Semi-structured interviews are chosen to achieve a certain level of reliability in acquiring comparable data but also allow individualised feedback from different interview participants. This is needed due to the explorative approach resulting in unpredictable outcomes.

The structure is oriented on Renner and Jacob (2020), including a brief introduction to the topic, followed by easy and intuitively answered questions in a quick-time question segment, one open question per problem field and a short breakdown at the end. Each interview takes about 30 minutes. Each interview was conducted in German. The interview guideline can be accessed on the following link:

https://bwsyncandshare.kit.edu/s/tQs6rcANmGZpFYc

A shortened and anonymised transcript of each interview based on a consensual recording is checked by the interviewees. Quotes from the interviews are allowed to be shared in this publication.

The interviews are conducted with eight participants from different startups located in Southern Germany. The selection was based on the following criteria:

- The startup is working on a CPS-idea.
- The startup does not only work on software.
- The participants have an insight into engineering and decision making processes.

Four out of eigth of the participants are involved as founders; the other half are involved as employees in the startup. The individual experience in the corresponding startup ranges from a few months to 10 years with an average of around two and a half years. The startups are active in different industries, i. e. production technology, mobility, financial technology, intralogistics and consumer goods.

The quotes derived from the interviews are clustered into reoccurring patterns related to the proposed problem fields. Those patterns are presented as the proposed characteristics of the status quo of CPS development in startups (see section 4).

3. Result of the Explorative Literature Review

To understand the possible challenges of CPS development in startups, literature is analysed by their contribution to answering three describing questions: Who participates in the development of CPS in startups (1), what describes CPS development in startups(2), and how do startups organise their development activites (3)?

3.1 Who Participates in the Development of CPS in Startups?

The participants in CPS development are entrepreneurs, employees, investors, and external stakeholders. Their role in startups is described in many publications, one is of particular interest: Zaheer et al. (2022) analysed the impetus of founders involved in multiple startups. They discovered that the work of founders on their system, the flexibility in working on the system in development (SiD) and the decision to pivot in their entrepreneurial and product development journey are key motivators for entrepreneurs. They identify an "entrepreneurial journey"-framework shown in Figure 2.

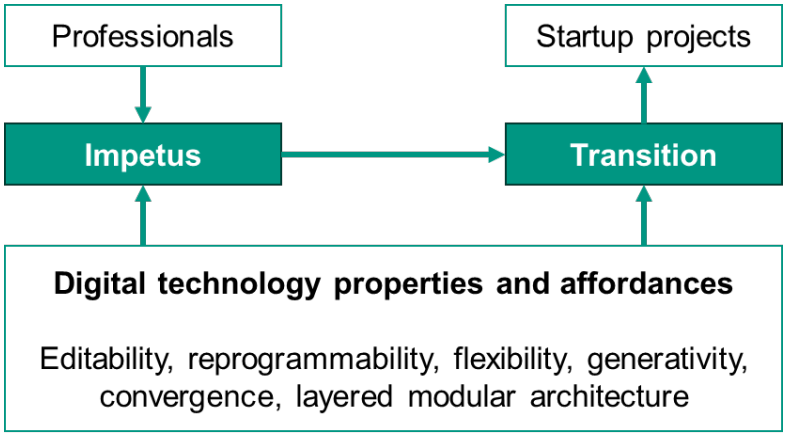

Figure 2: Digital Entrepreneurial journey framework. Own illustration based on Zaheer et al., 2022

Key enablers shown in Figure 2 are mainly found in software development environments. Complex constraints between engineering domains in CPS development are the strict opposite of these enabling factors, while generativity or layered modular architecture can be key aspects of CPS development activities. Thus, the motivation and impetus to get active in CPS-developing startups is questionable.

3.2 What Describes CPS Development in Startups?

The development of CPS in startups was not addressed in current literature. An answer has to be approached by the current understanding of related publications. This should include the driver of development (innovation), the development practice and related activities.

One of the main characteristics of startups is their *innovation orientation* (e. g. Kollmann et al. 2022, Kollmann et al. 2023, Steigertahl et al. 2018). Innovation can be described through many modeling approaches: Brown and Katz (2009) describe innovation as the overlap of the criteria "Feasibility", "Viability" and "Desirability", Albers et al. (2018) describe innovation as the combination of a demand situation (described in a product

profile), an invention (through an idea and technical solution) and a successful market launch (displayed in market presence).

Recent research has shown that systems are not developed independently but rather *in generations* leading to the development of the SGE – System Generation Engineering (Albers and Rapp, 2021). They are based on a reference system containing all planned and already realized elements from internal or external sources interacting with each other. The reference system is steadily changing as new knowledge and references are gathered during the product development process (Albers et al., 2019). The reference system is transferred to a new system generation through three types of variation: carryover variation addressing only small changes in interfaces (1), an attribute variation changing the attributes of a known principle (2), or the principle variation implementing a new solution approach (3) (Albers et al., 2020).

Berg et al. (2020b) identify the need for activities preceding or succeeding the core activities in software engineering when working on hardware products in startups (*remark: they understand hardware as the combination of software and electronics to embedded systems, this does not include mechatronic aspects of hardware development*). This includes the *development of prototypes*, the *production*, and *logistics*. Especially prototyping is described as the main time-consuming activity in hardware development in startups (Looney et al., 2022). The time consumed by prototyping activities is heavily related to the usage of evolutionary development approaches, Hardware-Software-Decomposing, and the usage of agile development approaches. (Berg et al., 2020b). The speed of development in startups mainly is limited by resources available for development and the quality trade-offs and technical debt occurring during development (Berg et al., 2020a). Using approaches such as the SGE in startups usually results in the development of a first system generation based on high shares of principle and attribute variation of external reference system elements which contains a huge development risk (Pfaff et al., 2021).

The core activity in startups (and startup support) is *validation on different levels*: e. g. the early validation of the risky main business hypothesis with minimum viable products (MVPs) (Ries, 2012) or the validation of customer needs through iterative customer hypothesis validation (Blank and Dorf, 2017), but also the validation of the feasibility and the management of risk identified within the development project (Pfaff, 2021).

3.3 How do Startups Organise Their CPS Development?

As implied by Berg et al. (2020b) and Pfaff et al. (2021), agile development processes are needed to develop hardware systems in startups. As agile CPS development in companies isn't scientifically described in industrial practice (as startups) (Ahmad, 2020). To describe startups organisation of development activities, related publications are used.

Agility is a challenge to hardware development in general, i. e. in the common understanding or view of agile development in physical products, in time restrictions in manufacturing processes, in physical restrictions or appropriate incrementation of the product (Atzberger et al., 2020). In startups, customized iterative practices, sufficient competence in teams, and collaborative decision-making are enablers for agility and quality (Berg et al., 2020b). Reference processes for hybrid approaches between planned and agile product development are proposed (e. g. Stock and Seliger, 2016), but not documented in practice.

Product development in the early stage of startups is characterized by the finding, the definition, and the realisation of the startup idea (Kollmann, 2022). In most cases, the idea for startups is already established. Many founders use accelarator or incubator programs to structure and develop their startup. Besides the structured environment, programs mainly contribute to enabling financing, help to validate the product idea and collaboratively work on the individual learning experiences (Crișan et al., 2021).

3.4 Proposed Problem Fields of CPS Development in Startups

Analysing the literature given above, four main problem fields of the development of CPS in startups arise:

Table 1: Proposed problem fields

Problem field	Explanation
I	*The unclear impetus for entrepreneurs and their ideas*: We cannot be sure how exactly ideas for CPS-developing startups come up and what motivates founders to work on CPS. Present literature mostly covers software-developing startups, the risks for developing CPS seem to be higher than for software-developing startups.

Problem field	Explanation
II	*Uncertainty in idea generation for and validation of CPS in startups*: Validation was identified as one of the main activities of startups in product development. This especially includes not only feasibility but more the viability and desirability of the startup idea. Typical methods of product engineering and entrepreneurship tend to not fully suit CPS-developing startups. The methods heavily rely on established knowledge (e. g. from SMEs' previous customer interactions) not present in startups or on boundary conditions not suiting hardware development (because of complications with potential intellectual property, i. e. Ries, 2012).
III	*CPS-Prototyping with limited resources*: Startups developing CPS rely on a fast product development process, cost-sensitive resource usage decisions and qualitative adequate results they can sell. Literature generally identifies prototyping as a key influencing factor on those objectives but does not propose sufficient support to deal with the challenges of technical debt, knowledge generation, and management, or development risk management.
IV	*Uncertainty in the acceptance and usability of processes, methods, and tools (PMTs) provided*: In a more general way, literature reported that neither established agile approaches nor classical project management methods fully satisfy the high demand for customized iterative approaches in CPS-developing startups.

4. Characteristics of the Status Quo of CPS Development in Startups

The following section will propose twelve characteristics of the status quo of CPS development in startups based on the results of the conducted interviews described in Section 2 and respective quotes underlining them. Each quote contains an identifier (letters A-H) and the actual quote in italics. They individually contribute to the initial clarification of the conducted problem fields.

Figure 3: Characteristic aspects regarding problem field I. Own illustration

Problem field I: the unclear impetus for entrepreneurs and their ideas

- *CPS founders are “Techies” searching for a challenge to learn:* Most of the participants describe themselves as technology-oriented rather than business-oriented with three of them identifying as “Techies” and three of them between both categories. They are driven by a will to learn (e.g. A: *“We wanted to manage something complex”*; D: *“After my studies I wanted to work in an environment I could learn the most”*). Also, CPS founders want to achieve the qualities of “generalists” working on many topics rather than expertise in one single field of action (D: *“I wanted to position myself broadly and act as a generalist rather than choosing the narrowness of a specialist.”*; G: *“I realise that I lack experience in certain tasks, especially in the execution of things and the various manufacturing techniques.”*, also H).
- *CPS founders regularly start with an idea:* Out of seven clear answers on the source of the vision or idea of the startups, six stated that the original idea was present way before the founder team for the startup came together. Only one participant stated that the team came together before the startup idea was found. This was due to the constellation as part of an innovation project in a student lab where students were joined together to openly search for an innovation idea. The most common source of ideas were personal needs rather than validated demand situations (e.g. B: “the co-founder had the given problem and has found no suitable solution on the market”) and existing technology from research (C based on the EXIST research transfer) or industry projects (E as an industry spin-off). Most of the ideas are technology-driven (rather than demand-driven) and are searching for a suitable business model.

- *For CPS founders, work on physical systems is a core benefit of CPS rather than software-only-systems:* The aspect of motivation in working on and shaping of software systems stated by Zaheer et al. (2022) could not only be confirmed but can be extended to the motivation of creation of physical and therefore touchable artifacts (H: *"My first internship was in a startup creating administrative software. That didn't work out. (…) For me, it's important to have something tangible, something I can touch. I am naturally talented with my hands and love building things."*). Contrary to our initial assumptions, this perceived benefit is not diminished by hardware-specific challenges such as hardware costs.
- *CPS ideas are motivated by single-domain views:* In the first section of the interviews conducted, one specific question addresses the self-understanding of the company and the product developed. Similar to the questions before and after, they could choose between two extreme statements: One the one hand software-driven development (Remark: *"the iPhone on wheels" if their company would develop a car rather than their actual product*) or a hardware-driven development (Remark: "the best *possible car with cool software features" if their company would develop a car rather than their actual product*). While in the other questions, many participants had problems deciding on one of the two extremes, this question has only extreme answers. Five out of eight participants identify software as the driving domain of their company. This leads to the hypothesis that current CPS development is mostly based on the view of one single technical domain as a dominant view rather than an integrated understanding of the interdisciplinarity of the system.

Figure 4: Characteristic aspects regarding problem field II. Own illustration

Problem field II: Uncertainty in idea generation for and validation of CPS in startups

- *Validating the CPS idea is the main challenge in CPS-developing startups:* Validation in general is already described as one key activity in startups by established literature. This is confirmed by the participants of the interview study (B: *"Finding the* right *idea is extremely difficult. (…) You have to try, test and watch things and have to evaluate if they work or not"*). Although difficult, only real customer contact is seen as the last instance of validation (D: *"Only the validation through concrete sales KPIs can give you an indication, if we are looking in the right direction"*).
- *An integrated view on feasibility, viability, and desirability is hard to find in CPS startup founders and workers:* CPS development needs interdisciplinary cooperation between technology domains, but its engineering in startups also needs an integration of technological and entrepreneurial thinking. Some of the most technologically trained founders do see the feasibility aspect as the most relevant for business. (C: *"There is no* minimal version *of hardware products"*, E: *"Answering the question of how the product can be monetized or how the business model fits into the overall image can be done later on."*). Business-oriented development aids, i. e. the Business Model Canvas (BMC), achieve mixed reviews by technology-oriented founders (A: *"Its usage was exhausting and annoying, but (…) many decisions [in hardware and software] do rely on this, especially what we are focusing on in our validation in prototyping activities"*, but also in D: *"I think there is no realistically filled BMC"*).

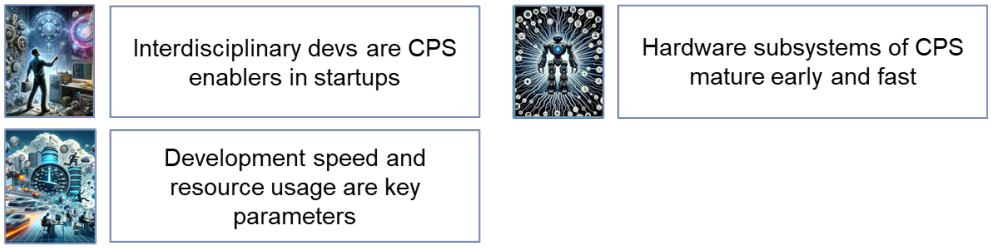

Figure 5: Characteristic aspects regarding problem field III. Own illustration

Problem field III: CPS-Prototyping with limited resources

- *Interdisciplinary developers are enablers for CPS development:* Developers who not only understand themselves as generalists in their respective domains but also look at different domains, are key resources for development activities and efficient prototyping in startups. (D: *"After my studies, I*

wanted to learn as much as possible. (…) I wanted to have a broader knowledge and become a generalist rather then a specialisit, [so I decided for a startup to work in].”, F: *“I have to few experiences in certain domains”*). Their ability to easily overcome communication burdens and inefficiencies is a major benefit for startup development activities (E: “*Our Electronics engineer has a very good understanding of software, (…) the resulting smooth communication was very helpful*.”

- This is also seen in the according competences of a CPS startup founder identified by a serial entrepreneur, Interviewee B: “*A good CPS founder has a systems talent* (meaning a combination and coordination ability) *and a development talent* (meaning a good problem understanding and a bond to software and hardware)”.
- *Hardware subsystems of the CPS have to mature early and fast:* Hardware in startup is a big factor for risk assessment. Therefore the hardware has to mature a lot earlier than software features (C: *“After 10 years in the market we have released the second generation of our product.”*, G: *“There are fewer adjustments in the hardware. We make continuous improvements, but there will be no radical redesign of the concept.”*). The early validation of the overall feasibility is the most relevant task in the early stages (A: *“This was our proof-of-concept: Our idea is possible, the rest is a question of money invested”*). Besides that, the desirability has to be validated through mock-ups centered on customers and investors (G: *“We first worked on the aspects customers and users would get in touch with, the technical details came later.”*, D: *“We first checked if the customer matches with the vision of the product.”*). An interesting observation was made in the description of Interviewee H: They are developing CPS for in-house solutions selling a product produced on their own CPS. Without their contact with customers, H describes that hardware and software changes can be implemented much faster and easier which would not be possible if they used their CPS directly with customers.
- *Speed and resource usage are the most important development parameters in Prototyping:* The relation of prototyping speed, resources, and achieved quality for hardware startups focused on embedded systems can be confirmed for CPS. Hardware availability and resource consumption is important for prototyping (A: *“Our [student] projects budget was 500€ while needed sensors cost about 100€. (…) The development focus has to slim down!”*). The focus on achieved quality in prototyping highly differs through the interview sample (B: *“If a too high-quality focus is set, the development becomes too slow. The optimum has to be readjusted over time!”*, E: *“Quality of prototypes is not important. Functionality is the centre of attention.”*, G: *“Quality is no problem for us, it's more the available resources and the achievable speed”*, but also D: *“In our industry, quality has to be fulfilled. It must be externally validated and approved, especially due to product liability.”*). Technical debt is a relevant factor but results in inefficient usage of resources (A: *“You mess around a lot, which you later regret. We could not reuse any of our prototypes.”*). That collides with the stated positive effect of evolutionary approaches in hardware design stated by Berg et al. (2020a).

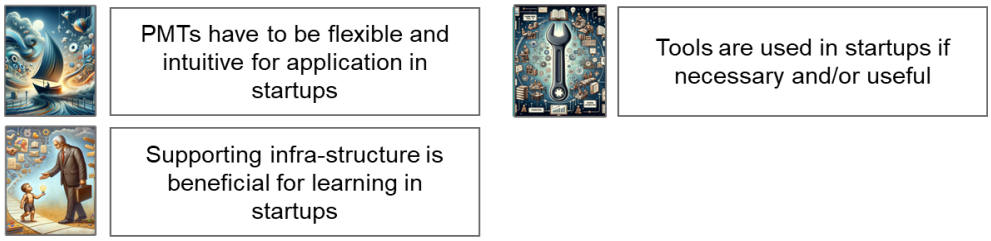

Figure 6: Characteristic aspects regarding problem field IV. Own illustration

Problem field IV: Uncertainty in the acceptance and usability of PMTs provided

- *PMTs have to be flexible and intuitive:* Seven out of eight s describe their development processes as very agile. Most of the participants are aware of the usage of methods and processes but describe a strong individualised (and sometimes repurposed) way of using them. (B: “*I would never use the method I developed as an expert in its entirety in a startup. In the thinking process of course, but in its entirety, we do simply not have the resources for that.*”, H: *“I do not use the methods learned in university in my everyday business in the startup, but I take a methodical approach based on them”.*) Most of the s describe their PMT usage as mostly intuitive, not as rigid following. (G: “*Our approach is so agile and free, we do not use an agile framework for our processes.*”, “*There are rough targets we are working on, but we do not formalize everything or structure it in a process”,* D: *“We are using kind-of SCRUM, but do not rigidly. (…) It is suited to our needs”*).

- *Tools are used if necessary and/or useful:* Especially tools for development activities are the most relevant tools used in everyday business (G: *"Without such tools [as e. g. CAD systems] the amount of work would not be realisable and it would not be up-to-date."*). Besides that, tools are used for collaboration and knowledge management (D: *"We use Miro or OneNote to collect ideas [and communicate our thoughts]."*).
- *Supporting processes and environments are beneficial for organising and learning startups:* Especially inexperienced founders and startup employees tend to benefit from supporting processes and environments like incubators, accelerators, or student labs. Key aspects are the transfer of needed basic knowledge on entrepreneurship and product development not present as well as the given structure through deadlines or workshops (A: *"All of us are Techies, we look at the system with our nerdy view, not a business view. Because of that our participation in the lab was good."*, C: *"What has given us a big benefit was an accelerator program. Many of our foundations were build up there.",* E: *"Student startup competitions where a good structure we could orientate ourselves on."*).

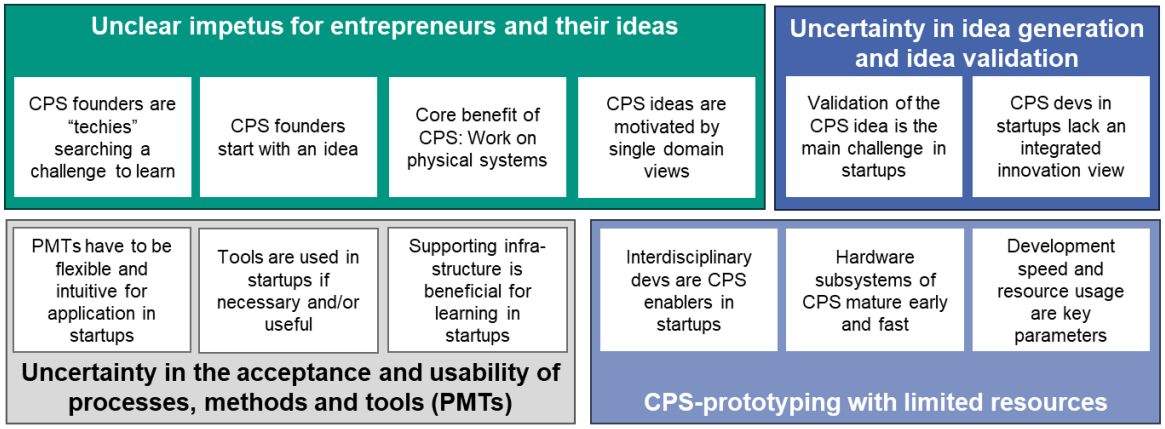

Figure 7: Twelve proposed characteristic aspects of CPS development in startups. Own illustration

5. Discussion

This paper is a step into describing and understanding the CPS development in startups. With the explorative approach of the study based on eight interviews, a qualitative overview of the perceived status quo of startups is proposed.

The validity of the results is influenced by many factors due to the explorative approach used. The broad, but not deep analysis of the respective literature in section 3 leads to the possibility for not included aspects and conceptions of hardware development in startups. Also, the number of interviewees and the diverging background of the participants leads to the possibility of a non-representative sample.

Because of these limitations, the proposed problem fields and characteristic aspects of CPS development in startups are first qualitative descriptions of the status quo of CPS development in startups and are open for discussion. Nevertheless, this study builds up an empirical dataset on CPS development in startups and a foundation for future research activities.

Future studies should verify the proposed problem fields with a systematic literature review and conduct more interviews in specific target groups (e. g. specific industries, in the same complexity levels of the SiD or with entrepreneurs with comparable backgrounds). In the long term, the development of suited support for CPS development in startups is needed. It should consider current research findings in product development as well as in entrepreneurship. A strong cooperation of both research disciplines is needed to generate a positive impact on the future entrepreneurship ecosystem for CPS startups.

Commercialisation Tools in Network Research Organisations

Marzena Walasik[1] and Beata Poteralska[2]
[1]Research Centre for Vocational Education and Innovation Management, Department of Commercialisation, Łukasiewicz–Institute for Sustainable Technologies, Radom, Poland
[2]Institute of Management, Faculty of Law and Social Sciences, Jan Kochanowski University of Kielce, Poland

marzena.walasik@itee.lukasiewicz.gov.pl
beata.poteralska@ujk.edu.pl

Abstract: The paper aims to identify which commercialisation tools (CT) are employed in network research organisations as exemplified by the Łukasiewicz Research Network, Poland. The authors analyse the state of the art by studying publications in the Web of Science database and present a longitudinal case study. The commercialisation tools identified as a result of the literature review are classified according to an original approach proposed by the authors. Then, the proposed classification is applied to indicate the commercialisation tools used in the Łukasiewicz Research Network, one of the largest recognised research networks in Europe. A longitudinal single case study is used. The data is analysed at two points in time, i.e., for periods before and after the establishment of the Łukasiewicz Research Network. Namely, the tools used by individual research institutes before and after their inclusion in the network as well as the joint use of tools by the institutes making up the network are examined. The presentation is followed by a discussion of the contexts of applying commercialisation tools in the network organisation and individual institutes. Suggested future research includes analyses of the relationship between the use of specific commercialisation tools and commercialisation effectiveness measured by means of a set of commercialisation performance indicators.

Keywords: Commercialisation, Commercialisation tools, Network research organisation, Infrastructure, Infostructure, infoculture

1. Introduction

Technological development and innovation play a highly important role in long-term economic growth. Not only the development of innovative solutions but primarily their effective market introduction are crucial. The commercialisation of research results is a key way universities and research organisations demonstrate their impact and the value they add to industry and society as a whole. Commercialisation is important for this group of organisations not so much as it generates income, but because: 1) they have a responsibility to transfer their research results into society for its benefit and 2) it increases industry engagement, which helps to find new R&D avenues, collaborators and funding, and enhance career prospects (Pesonen et al., 2008).

Commercialisation is treated as the design, development, making, and marketing of products based on new technologies to launch them in the market (Poteralska, Walasik, 2021). This a broad approach to commercialisation that includes its subsequent stages from concept to actions aimed at a practical application in the economic activity. It converges with the approach presented in literature, which identifies the stages key to the commercial success of a new solution (Bhasin, 2023). Products, services, and new technologies are listed among such new solutions (Meredith & Shafer, 2002, Atvare et al., 2022).

The paper focuses on commercialisation by research organisations. Their role involves providing services to firms in order to support innovation and enhance industry competitiveness (Pesonen et al., 2008). Organisations that are parts of networks are special cases. Network is defined as 'an institution facilitating innovative processes through cooperation that consists of (a) a set of measures enabling entities to realise joint projects and (b) a group of entities that creates, gains, processes, integrates, and utilises knowledge and skills for a technologically complex, economically viable, and socially acceptable innovation/change' (Blażlak, 2010). In this paper, network is a research organisation established within a formal network which is a cluster of its parts.

The authors are interested in commercialisation tools employed in network research organisations. They are understood as tools to support the commercialisation process (Huang et al., 2018). Specialist literature uses a similar concept of activities supporting commercialisation. The authors mean commercialisation tools as sets of specific rules, practices, methods, techniques, strategies, means, platforms, and systems serving to realise the process of commercialisation. They are practical elements supporting planning, implementation, and monitoring, a kind of navigation around the technical, regulatory-organisational, business, and marketing aspects of the process.

This paper aims to identify commercialisation tools employed by network organisations like the Łukasiewicz Research Network. It is structured as follows: firstly, the research methodology is presented, including the proposed approach to the analysis of commercialisation tools, the scope of the Web of Science analysis and the assumptions for a longitudinal single case study. This is followed by an analysis of the state of the art, focusing on the identification of commercialisation support tools, and the presentation of a longitudinal case study to compare the commercialisation tools used in the Network's individual institutes before and after the formation of the Łukasiewicz Research Network. The data used in the case study came from internal reports produced within the Łukasiewicz Network and from interviews with staff in units responsible for commercialisation processes in the Łukasiewicz Research Network institutes. The paper then discusses the diversity and effectiveness of commercialisation tools. The paper is summarised with conclusions and future research directions.

2. Method

An original approach to analysing commercialisation tools is applied. Their classification is based on (1) the definition by Bressand and Distler (1995), which says a network is a set of measures (infrastructure) and rules (infostructure) that enable entities that have access to them to undertake joint projects, provided these measures are appropriate to their needs and suitable for common use (infoculture) by the network (Ziółkowska, 2019) and (2) commercialisation assessment criteria in 4 areas covering the whole activity of entities analysed, namely: a) technological, b) market, c) economic, d) legal and organisational (Belina et al, 2013, Lipkova 2016). Infrastructure is an existing set of means, i.e., equipment, technology, system, and a cooperation network operated by specific principles; infostructure is a set of principles, that is, regulations, contracts, and an established method of operation, while infoculture comprises a set of resources, good practices, attitudes, values, trust.

Our analysis began with a Web of Science review to identify tools supporting commercialisation processes. The search criteria of ‘commercialisation tools’ and ‘activities supporting commercialisation’ were applied. Tools identified by the literature and employed by various entities, including research organisations, are classified along the following dimensions: infrastructure, infostructure, and infoculture.

The review provided the starting point for examining the Łukasiewicz Research Network and its commercialisation tools. Both all the Network's institutes (22 entities as of 31.12.2023) and the Network as such were studied. The case study method was selected because it helps answer ‘How?’ with reference to a contemporary set of events over which the investigator has little or no control (Yin, 2014). A longitudinal single case study was used. At the initial stage, data were collected from grey literature, or internal reports generated within the Łukasiewicz Network. Data on the use of commercialisation tools are collected continuously starting from 2019, when the Łukasiewicz Research Network was created. They are collected at least once a year. For the purposes of the paper, the authors used data from reports produced in 2020 and 2024 with information for the years 2019 and 2023, respectively.

The staff of units charged with commercialisation processes (directors, managers, specialists) in the Łukasiewicz Research Network Institutes were then interviewed. Data were analysed at two points in time, i.e., for periods preceding and following the establishment of the Network, which meant examining variables for individual research institutes before and after their inclusion in the Network. The use of a longitudinal single case study enabled 1) identifying the type of commercialisation tools applied by the Network as a whole and 2) comparing the use of commercialisation tools by the individual institutes before and after the formation of the Łukasiewicz Research Network. Commercialisation tools were designated with reference to infrastructure, infostructure, and infoculture and the areas of technology, market, economy, and law and organisation.

3. State of the art

The review focused on identifying tools assisting commercialisation. To this end, the Web of Science was searched using the criteria of ‘commercialisation tools’ and ‘activities supporting commercialisation’ (Table 1).

Table 1: A selection of articles in the Web of Science

Search criteria	Web of Science	Database after reading abstracts	Final database (after reading whole papers)
Commercialisation tool (topic)	249	20	11
Activities supporting commercialisation (topic)	154	40	16
Total	402	60	27
Total – on eliminating repeated publications			26

Source: The authors.

This analysis helped to identify commercialisation tools used by various organisations developing or implementing innovative solutions, including network research organisations. The tools identified were classified with regard to 3 dimensions: infrastructure, infostructure, infoculture (Table 2).

Table 2: The classification of commercialisation tools

Tool	Description	Author
	Infrastructure	
Prototyping and testing system	• Testing the readiness of technology through prototyping and tests • Products developed on campus can be built up as prototypes, then manufactured in small volumes before being transferred to a large-scale manufacturing facility	Huang et al., 2018, Youngleson & Jacobs, 2008
Structured product planning and marketing	• Creating a well-structured product planning and marketing exercise for technology, including major milestones and timeframes in the operational framework	Moncada-Paternò-Castello, et al., 2003
Innovation Radar	• The Innovation Radar is used as an intelligence platform providing insights on innovation activities in large collaborative projects	Napelski & Van Roy, 2021
Structured system for information compilation	• Maintaining a well-structured and updated system for a regular compilation of information to disseminate to likely interested users, collaborators and industry (information on: project advancements, new projects, research results, applications, etc.)	Moncada-Paternò-Castello, et al., 2003
Tools for uncertainty management	• Developing tools and procedures for uncertainty management supporting decision making already at early phases of front-end work, e.g., a tool called Opportunity Balance Matrix, an application of a known method called Potential Problem Analysis	Paasi et al., 2010
Established collaborative networks	• Virtual networks enabling greater collaboration between researchers and industry in the exchange and sale of Intellectual Property (IP) • Collaborative networks become the business ecosystem • Creating partnerships of existing or potential value network with an active role in different elements of fuzzy front end, new product development and commercialisation stages • Selecting business partners, nurturing healthy relationship with business partners, facilities and supports • Networking of appropriately skilled teams	Huang et al., 2018, Ismail et al., 2015, Cervantes & Meissner, 2014 Paasi et al., 2010, Taylor & StJohn, 2002
Open access journals	• Open access journals providing a channel for diffusing scientific results and open research data initiatives making research available for further investigation or innovation	Cervantes & Meissner, 2014
	Infostructure	
Standard contracts / agreements	• Introducing the Intellectual Property Framework, a set of online standard contracts to increase university-industry collaboration and research commercialisation, and the IP Toolkit • Creating standard licensing agreements often involving 'model' technology cooperation agreements that limit the potential of IP-related conflicts and disputes • Exchanging knowledge embedded in IP documents and contracts, particularly with industry	George &Tarr, 2023, Cervantes & Meissner, 2014

Tool	Description	Author
	Infrastructure	
Access to information on IPR	• Providing scientists with accessible information on Intellectual Property Rights (IPR)	Moncada-Paternò-Castello, et al., 2003
Formal technology transfer mechanisms	• Presence of formal technology transfer mechanisms, generally positively related to commercialisation	Perkmann, et al., 2013
Promotional and testing campaigns	• Promotional and testing campaign - providing enterprises with information on technical performance and requirements, alternative financing options and potential economic benefits	Moncada-Paternò-Castello, et al., 2003
Using external sources of information, including support of recognised experts	• Diffusing tailored information using the support of recognised experts • Designating and identifying an expert representative within the inventor's host institution, which has capacities to support and guide the inventor during commercialisation phases • Using external sources of information such as technology watch databases, foresight exercises, market databases and EU funding schemes that permit extending knowledge for positioning technology in the market	Moncada-Paternò-Castello, et al., 2003
Open innovation practices	• Using specific open innovation practices (open innovation information exchange and open innovation collaboration) impacting commercialisation enablers of high-tech SMEs	Pustovrh et al., 2017
Developing a technology evaluation plan, including ex-ante evaluation	• Developing an evaluation plan at an early stage, analysing the economic viability and commercial potential of technology • A prospective ex-ante evaluation of the economic value of technologies	Moncada-Paternò-Castello, et al., 2003
	Infoculture	
Post-Project Reviews	• Reviews at a research organisation consist in bringing "multifunctional and multilevel participants together at the end of a knowledge-creating project to discuss the application and commercialisation of project results" or become the basis for innovation or further research by industry	Bout et al., 2009
Involving a set of diverse actors	• Involving all necessary actors for the successful commercialisation of technology at an early stage, namely: inventor, host institution representatives and possible interested companies. • Sharing technology opportunities with possible interested parties • Involving suppliers and manufacturers in the new product development process • Creating partnerships of companies, universities and public research institutions to use external competences for fostering innovation	Huang et al., 2018, Cervantes & Meissner, 2014, Moncada-Paternò-Castello, et al., 2003
Personal contact	• Keeping repeated personal contacts and exchange of information	Cervantes & Meissner, 2014
Early linkages with industry	• Establishing early linkages with industry to prevent technology supplier from developing unrealistic expectations about the market potential and success of technology transfer process	Moncada-Paternò-Castello, et al., 2003
Corporate brand and reputation	• Corporate brand and reputation around efficacy based on legible measures of performance	Riep, 2019
Corporate culture	• Corporate culture and the innovation culture of a company as important factors affecting uncertainties related to radical innovation development	Paasi et al., 2010
Social media	• Social media fostering communication, connecting people and companies, and representing a vehicle for developing customer insights, accessing knowledge, co-creating ideas and concepts with users, and supporting new product launches	Bhimani, et al., 2019

4. Case Study

The study covers the Łukasiewicz Research Network, a network of institutes working with and for business and supporting the innovative development of Polish firms, with more than 7,000 staff, 4,500 researchers and engineers with 22 research institutes in 12 Polish cities. It is one of the largest research networks in Europe after the German Fraunhofer Gesellschaft and Finnish VTT (Technical Research Centre of Finland). Łukasiewicz's revenue is ca. EUR 400 m at present. The Łukasiewicz Network as a whole undertakes a range of actions to support commercialisation. Its flag activities include: the Challenge System (a tool to work with enterprises looking for solutions to technological or process problems), actions to expand participation in international projects (e.g. financial incentives for researchers), brand management (e.g. visual resources and contents like brand name, logo, slogans), and image actions like participation in fairs, conferences, congresses or an acceleration programme fostering the creation of spin-offs.

The longitudinal case study relates to 2 aspects:

- Designating the commercialisation tools used in the Łukasiewicz Research Network, including such dimensions as: infrastructure, infostructure, and infoculture and the following areas: technological, market, economic, legal and organisational (Table 3: columns 1-6).
- Comparison of the commercialisation tools used in the Network's particular institutes before they joined the Network and in the Network as a whole (Table 3: columns 7, 8).

Table 3: Classification of the commercialisation tools used in the Łukasiewicz Research Network addressing 4 areas of activity (columns 1-6) and indicating the tools used by Institutes before (column 7) and after joining the structure of Łukasiewicz Research Network (column 8)

No	Commercialisation tools	Technological area	Market area	Economic area	Legal and organisational area	Tools used by the individual Institutes before joining the Network	Tools used by the Institute after joining the Network
INFRASTRUCTURE							
1	Start-up and testing of the CRM customer support system in Łukasiewicz Institutes	☒	☒	☐	☐	Simple CRM systems functioned in 14% of the Institutes.	23%, the target is 100%
2	Łukasiewicz's technological range (catalogues of technological projects and of the Institutes)	☒	☒	☐	☐	100%	100%
3	Projects realised as part of subsidies aimed at commercialising results	☐	☐	☒	☒	Depending on competitions announced by intermediary units, e.g. POIR Fast Track – implementation/ commercialisation 60%	100%
4	Cockpit (aggregated management data on intellectual property, sales agreements, KPI and revenue monitoring in terms of commercialisation)	☐	☐	☒	☒	Reporting at the level of Institute directors using an excel tool – 60%	100%
5	Science and popular science, specialist or business journals issued by the Institute	☒	☒	☐	☐	23 journals, 9% Institutes have their own scientific publishing houses	No changes
INFOSTRUCTURE							
6	Rules for management of copyright and related rights and industrial property rights	☐	☐	☒	☒	18% Institutes had regulations in this area	100% - standard documents

No	Commercialisation tools	Technological area	Market area	Economic area	Legal and organisational area	Tools used by the individual Institutes before joining the Network	Tools used by the Institute after joining the Network
INFRASTRUCTURE							
7	Remuneration rules, including for sales and commercialisation	☐	☐	☒	☒	100% Institutes had remuneration rules	100% - standard principles of remuneration, including for sales / commercialisation
8	Model of indirect intellectual property commercialisation in the Łukasiewicz Research Network (guidelines)	☐	☐	☒	☒	9% Institutes had indirect commercialisation (companies)	14% Institutes had indirect commercialisation (companies)
9	Good practices of intellectual property protection and management in Łukasiewicz for authors and staff	☐	☐	☒	☒	Procedures of intellectual property management in 23% Institutes	100% - standard documents
10	Good practices for Łukasiewicz companies – key rules and processes for indirect commercialisation, preparing a legal structure for future startups and their market entry	☐	☐	☒	☒	Procedures of intellectual property management, including company foundation, in 14% Institutes	100% - standard documents
11	Preparation of standard agreements necessary for intellectual property commercialisation, e.g., joint rights to patent agreements	☐	☐	☐	☒	A variety of agreements were in place, 9% Institutes had joint rights to patent agreements	100% - standard documents
12	Sales model in Łukasiewicz - sales strategy and standards for the Łukasiewicz Network and Institutes	☐	☒	☒	☒	27% Institutes had regulations in this area	100% - standard documents
13	Production model (the project to improve effectiveness of production areas, their separation and transfer to third-party companies).	☒	☒	☒	☒	Production-related areas in 18% Institutes	The model implemented to all Institutes having production, production areas were separated and transferred to third-party companies in 5% Institutes.
INFOCULTURE							
14	Łukasiewicz Brand project (identify Łukasiewicz researchers and products, technologies and services with media potential)	☐	☒	☐	☐	18% institutes declared occasional media contacts	100% at the level of the whole Network and its Institutes
15	Conference with Polish emigre community – co-organise a regular international conference	☐	☒	☐	☐	Participation in conferences (100%), their organisation (32%)	Participation in conferences (100%), their organisation (50%)
16	Innovatorium – a regular internal event (staff integration, making and maintaining contacts with business partners	☒	☒	☐	☐	Occasional events for the Institute's staff and business partners (50%)	100%
17	A coherent image of the whole Łukasiewicz with clients and partners	☐	☒	☒	☒	Institutes had their logotypes, websites – 100%,	Coherent image – logo, website www, stationery: 100% Institutes

No	Commercialisation tools	Technological area	Market area	Economic area	Legal and organisational area	Tools used by the individual Institutes before joining the Network	Tools used by the Institute after joining the Network
INFRASTRUCTURE							
INFRASTRUCTURE, INFOSTRUCTURE, INFOCULTURE							
18	Pimcore-based Product + Service (P+S) and intellectual property databases aggregating Łukasiewicz institutes' products, services, and intellectual property rights (infrastructure – IT system, Infostructure – data aggregation/base, infoculture – procedure/dissemination)	☒	☐	☒	☒	Excel database – 100%	Web application 100%
19	Łukasiewicz accelerator: a project supporting indirect commercialisation, or formation of startup capital companies (infrastructure – programme, Infostructure – acceleration model, infoculture – demoday)	☐	☒	☒	☒	No part in the acceleration programme, but 14% Institutes realised indirect commercialisation (companies)	100%
20	Participation in key fairs, meetings with clients, presentation of products, services, and technologies (infrastructure – a modular exhibition stand, Infostructure – data aggregation/base, infoculture – procedure/dissemination)	☒	☒	☒	☐	Individual Institutes participated in selected fairs and other events, meetings with enterprises, 100% (smaller exhibition spaces, higher costs)	100%
21	Łukasiewicz's P+S challenges – solutions to problems reported by business to be offered within 15 days (infrastructure – IT system, Infostructure – data aggregation/ base/challenge hosts, infoculture – procedure/dissemination)	☒	☒	☒	☐	Offers presented at the Institute level (100%)	100%

Source: The authors

Our research implies all the CTs used by the Łukasiewicz Research Network now were operated by independent Institutes, too, though to a far lesser or more limited extent (often by a mere few of the 22 Institutes). This changed considerably after the Network's creation. Advanced infrastructure tools began to be extended to all the institutes. As far as infostructure is concerned, documents were standardised and implemented to all the institutes as guidelines (e.g., standard commercialisation rules and agreements, remuneration rules, e.g. for commercialisation, etc.). Infoculture was least affected, though the actions there relate to the crucial area of constructing the Network's coherent image and had already been undertaken by individual Institutes.

Interviews with several dozen commercialisation staff (directors, managers, specialists) of Łukasiewicz Institutes help to identify 3 groups of commercialisation tools depending on the scopes of their application:

- Basic tools – (7) CTs already used by all the Institutes before joining the Network, including product and service ranges, catalogues of technological projects completed, and a bulletin presenting the core fields of particular Institutes' activities, participation in fairs, websites, logotypes, training, remuneration rules. The changes on joining the Network standardised the regulations and layouts.
- Advanced tools – most (12) tools applied by some Institutes only. Joining the Network helped expand the range of tools, implemented to all the Institutes as guidelines (e.g. standard commercialisation rules and agreements). What is noteworthy, the larger the staff and revenue of an Institute, the longer the list of its tools.

- Specialist tools – (3) specific tools dedicated to several Institutes only. After joining the Network, their ranges were standardised only, not expanded (e.g. for Institutes running companies or production areas).

The Institutes continue reporting their needs for a continual improvement of their tools and development of their functionalities. No tools were identified used by isolated Institutes and then discontinued once the structures were formalised. Conversely, the growing numbers of tools employed by individual Institutes after joining the Network's structures, combined with rising commercialisation revenues and net profits after 1 April 2019 (Walasik, Poteralska, 2024), demonstrate their application is effective.

5. Discussion

Our state-of-the-art review helps to identify diverse commercialisation tools, most used in practice by the Łukasiewicz Research Network, the subject of this paper. The literature review failed to find a single publication, however, that would address the dimensions of infrastructure, infostructure, and infoculture at the same time. Our case study indicated this approach is possible and used in practice by the Łukasiewicz Network. The extensive ecosystem (infrastructure, infostructure, and infoculture) no doubt encourages and facilitates research. Actions involving three dimensions and becoming parts of at least 3 out of 4 areas defined acquire extra significance as tools supporting the commercialisation processes of organisations in a network. These are tools of maximum impact and thus maximum effectiveness supporting the commercialisation process. They can be described as, if not foundations of success of the network organisation discussed, certainly its strong distinguishing feature that contributes to its positive image and brand.

The diversity and effectiveness of commercialisation tools are crucial. Once the Łukasiewicz Research Network was established, the number of commercialisation tools applied by its Institutes clearly increased. What is noteworthy, the larger the staff and revenue of an Institute, the longer the list of its tools. There are of course CTs that, due to their unique operation, are dedicated to a few Institutes and their application was not expanded after they became part of the Network's structures, but standardised in most cases (e.g. for the Institutes with companies or production areas). Some CTs were utilised in independent Institutes, yet to limited extents, and then designed and implemented to all the Institutes to support the management (Cockpit, Pimcore Base), business (Łukasiewicz Challenges, Accelerator) or image (shared exhibition stand) of the Network as a whole.

Assessing the effectiveness of CT is another important aspect. The Network's formation enabled the particular Institutes to increase the numbers of their CTs and transfer of work, e.g., the accelerator or the challenge system, to the network level, which directly translated into higher profits and commercialisation revenues in the period of the Network's operation, i.e., 2019-2023. Becoming part of the Network, the individual institutes gained access to knowledge, unique resources and infrastructure, and opportunities for close and consolidated cooperation, thus building competitive advantage. Measuring the effectiveness of actions involving three dimensions: infrastructure, infostructure, and infoculture, is of special significance. It should be a key element of the Network management which not only allows for evaluating the effectiveness of actions and tools implemented but also provides foundations for an accurate setting of short- and long-term goals for both the particular institutes and the entire Network.

6. Conclusion

Based on the classification of commercialisation tools available in literature, comprising three dimensions: infrastructure, infostructure and infoculture, those employed by the Łukasiewicz Research Network are identified. Using CT brings a number of benefits, improving productiveness (automation of recurrent tasks – contact management, e-mail communication, e.g., CRM system, project management system), sales (tailor-made solutions, potential customer management – collaborative networks), and customer support (efficient responses to customer queries and personalised assistance – P+S challenge system, MSteams), helps reduce errors (supply of precise data, use of tracking tools – social media, Google Analytics). Commercialisation tools are a necessary part of setting a model action path that leads to conversion of research results into market products. They not only facilitate the management of commercialisation process but also assure an ongoing information transfer and thus provide management support (impact on decision making).

The approach adopted by the authors adds a cross-cutting dimension to this discussion and foundations for more extensive research into commercialisation tools as an extremely important aspect of new technology commercialisation. The comparison of commercialisation tools of the institutes before and after inclusion in the Network is the novel element of the study. The results presented can be used for the needs of building a

commercialisation strategy. Depending on the commercialisation practices already in place in a particular organisation and the challenges it faces, a tailor-made set of commercialisation tools can be selected, taking into account the dimensions: infrastructure, infostructure, and infoculture, and the areas: technological, market, economic, legal and organisational.

Some research into the real contribution of commercialisation tools to improving effectiveness and how to measure it could be a good idea in future. Analysing which tools can be the most effective at the particular stages of the commercialisation process is another area for research.

pattyxanth@gmail.com

Abstract: The study focuses on examining the entrepreneurial intention of university students through the method of diary research. Specifically, the aim of this research is to investigate the factors that influence the entrepreneurial intention of students throughout the duration of a semester in which they attended the theory and exercises of the "Entrepreneurship and Innovation" course. Furthermore, this study seeks to gain an in-depth understanding of the evolution of this intention over time, and to further analyze students' thoughts and experiences related to entrepreneurship during the course. The sample consists of 85 individuals who have never attended an entrepreneurship course before and their participation was voluntary. They asked to complete a diary lasting 13 weeks from the first week of the fall semester starting on October 2023 until the last one on January 2024. Findings showed that students formed a positive entrepreneurial intention over time and that their involvement in projects and exercises in groups regarding the formation of a virtual business were the two most important factors that increased their entrepreneurial intention. The factors that inhibited the entrepreneurial intention of the students were the understanding of the elements of the dark side of entrepreneurship and the increased risk taking as well as some specific course contents. An important originality of the research is the use of the diary research tool, which is still at an introductory stage in the social sciences. The analysis of the responses was carried out through content analysis. It is expected that the research will provide a deep understanding of how students perceive, develop, and implement their entrepreneurial over time while attending an entrepreneurship course. The findings are important for educators and curriculum planners as they will highlight the determinants and elements that positively or negatively influenced the formation of students' entrepreneurial intention, allowing the introduction of innovative teaching methods that will enhance individuals' entrepreneurial intention and mindset.

Keywords: Entrepreneurial intention, Determinants of entrepreneurial intention, University students, Diary research, Content analysis

1. Introduction

One of the greatest predictors of entrepreneurial behavior is thought to be entrepreneurial intention (Liñán and Chen 2009; Shirokova et al. 2016). Among many determinants of individuals' intention to be self-employed, entrepreneurship education has been recognized as a significant driver of people's intention to start their own ventures (Tsaknis et al. 2022; Kefis and Xanthopoulou 2015). A significant number of studies share the common finding that entrepreneurship education develops students' entrepreneurial skills and emphasizes the entrepreneurial path as a career option, by increasing their awareness of entrepreneurship and allowing them to further develop their entrepreneurial mindset (Shahid and Ahsen 2021).

The aim of this research is to explore the process of Entrepreneurial Intention of undergraduate students who attended a thirteen-week course of "Entrepreneurship and Innovation" as well as related activities including entrepreneurship videos, business canvas creation for their own entrepreneurial ideas etc., with a view to better understanding the effect of all these activities and theory in the development of their entrepreneurial intention, but also to understand their feelings or views on the entrepreneurship over the weeks. The originality of this study mainly lies in its methodological innovation, utilizing reflective diaries as a primary tool for observing students' entrepreneurial intention (EI) over time. This approach distinguishes it from the broader body of research within the field of entrepreneurship education, where such longitudinal, qualitative methodologies remain underexplored. Notably, only a handful of studies, such as Hägg (2021), as well as "An entrepreneurial-directed approach to teaching corporate entrepreneurship at university level" by Heinonen (2007), have ventured into similar territories. The diaries provide as a rich, longitudinal data source by forcing students to methodically explain their ideas, reflections, and experiences throughout the semester. This approach offers a lens through which changes, trends, and critical junctures may be identified, enabling a thorough understanding of the developmental trajectory of entrepreneurial identity and ambitions among students (Morrison 2002). Within this framework, the study's novel use of reflective diaries adds to the body of literature by presenting new perspectives on the acquisition of emotional intelligence (EI) and by providing a

scalable methodological framework for further research in the field of entrepreneurship education and beyond.

2. Literature Review

The economic success of national economies and employment are significantly impacted by the choice of careers in entrepreneurship. Consequently, governments have concentrated their efforts on encouraging entrepreneurship since it is essential. Furthermore, studies indicate that one of the major factors influencing entrepreneurial intention (EI) is entrepreneurship education (Fayolle and Gailly 2013; Xanthopoulou and Sahinidis 2022). People can thrive in society by acquiring the information, skills, attitudes, and values that education normally imparts. Many academics have attempted to address the fundamental topic of what drives someone's purpose to become an entrepreneur and why they choose to do so (Sultan et al. 2016). As a result, "intention" is the essential term for understanding human behavior, according to Sheeran (2002), and studies have revealed that EI is present in many of the factors that affect a person's readiness to launch a new company. According to several writers of papers and publications, Hernández-Sanchez et al. (2019) noted a rise in interest in the study of Entrepreneurship Education (EE) and its impact on EI.

2.1 The Conceptual Definition of Entrepreneurial Intention

The idea of entrepreneurial intention (EI) is the self-admitted belief that starting a new business is a good idea, as well as the deliberate preparation to make this goal a reality at some point in the future. According to Thompson's (2009) definition, emotional intelligence (EI) is a crucial component in the shift from intention to concrete entrepreneurial activity. Neneh (2014) supports this interpretation by highlighting the pre-venture phase of entrepreneurship. Numerous factors are identified in the academic debate as supporting entrepreneurial intention. These are personal characteristics that both encourage and mold the process of making decisions toward entrepreneurship. Along with demographic factors like education, gender, and familial history, these features might include, but are not limited to, personal views, value systems, and psychological traits (Bae et al. 2014).

A large amount of research suggests that education is a crucial factor in boosting emotional intelligence (EI), and that people who have completed more school have a higher tendency to take advantage of business opportunities (Neneh 2014). Entrepreneurial Intention (EI) is a behavioral antecedent that is based on a basis of consistent and logical knowledge about entrepreneurial actions that may be enhanced by different forms of reward (Barringer 2015). The field of entrepreneurship studies has experienced a notable surge in the investigation of emotional intelligence (EI), characterizing it as a person's inclination to participate in entrepreneurial endeavors, such as starting new businesses or working for themselves (Xanthopoulou and Sahinidis 2023). This aspect plays a crucial role in demystifying the entrepreneurial process and explaining why some people are more likely than others to start a business (Soria-Barreto et al. 2017). It also acts as a crucial lens through which the development of new ventures and the phenomenon of entrepreneurship can be understood. The information gained from secondary and higher school might lead to increased levels of entrepreneurial attitudes (Sánchez 2013). Each educational level tends to have a different influence on entrepreneurial decision due to its unique techniques, aims, and resources, in addition to the fact that its drivers frequently differ (Jiménez et al. 2015). According to some arguments (Passaro et al., 2018), entrepreneurship intention is positively impacted by the availability of entrepreneurship education. In this research, we examine the relationship between students' entrepreneurial purpose and the components of the theory of planned behavior as influenced by entrepreneurship education provided by university programs.

2.2 Entrepreneurship Education

The hypothesis that entrepreneurial intention precedes entrepreneurial activity was verified by Kautonen et al. (2015). Therefore, policy makers, practitioners, and educators should consider what factors impact entrepreneurial intention (Maresch et al. 2016). Education in entrepreneurship has changed significantly to date. A number of academic fields, including technical studies, management, finance, and education, gave rise to the topic of education (Bae et al. 2014). According to the literature, schooling may influence a person's personality, abilities, and competences. An entrepreneurship education program should raise students' awareness of entrepreneurship, give them the chance to hone their entrepreneurial skills, teach them how to put theory into practice, and highlight entrepreneurship as a career option, according to researcher (Fayolle and Gailly 2013; Bae et al. 2014).

Giving students the foundational information and support they need to acquire the skills they'll need to start their own businesses in the future is imperative right now. Even while entrepreneurship education is becoming

more and more popular, there are still not enough generally accepted teaching resources and methods (Matlay 2005). In their study, Asghar et al. (2016) examined the relationship between antecedents of entrepreneurial intention and components of entrepreneurship education. They found that course activities, their mode of design, discussions of entrepreneurial success stories, role-playing exercises, interaction with other participants, and additional discussion and presentation enhanced students' intention to become entrepreneurs and gave them more confidence (Asghar et al. 2016). Entrepreneurial intention and self-efficacy were shown to be positively impacted by Puni et al. (2018) findings that entrepreneurial knowledge acquisition and opportunity identification are components of entrepreneurship education. Ojogbo et al. (2016) state that while perceived attractiveness intention and entrepreneurial education are positively correlated, perceived feasibility and self-efficacy are not. The same writers contend that in order to foster student creativity and innovation, educational reform is required. Marire et al. (2017) assert that many prospective entrepreneurs are lost because higher education institutions have not yet provided students with sufficient instruction about self-employment as a career alternative (Barba-Sánchez and Atienza-Sahuquillo 2018).

Overall, the positive effect of entrepreneurship education on individuals' intention has been confirmed in a plethora of research (Bae et al.2014; Fayolle and Gailly 2013; Kefis and Xanthopoulou 2015; Barba-Sánchez and Atienza-Sahuquillo 2018; Otache 2019; Lavelle 2021; Xanthopoulou and Sahinidis 2023). These studies largely reported findings supporting that entrepreneurship education improved people's perceptions of their abilities to start new businesses.

3. Methodology

The present research took place during the 2023/2024 academic year, focused on second-year (third semester) undergraduate students enrolled in the “Entrepreneurship and Innovation” course at the Department of Business Administration at the University of West Attica, Greece. This specific cohort was chosen due to the scarcity of research on the formation of Entrepreneurial Intention (EI) during this pivotal educational phase, as highlighted by Nabi et al. (2018). The selection was underpinned by the hypothesis that the entrepreneurship education as well as the activities in which students were involved plays a significant role in their entrepreneurial intentions and mindset development. Adopting a social constructivist lens, this research recognizes EI as a subjective and evolving socio-cognitive construct, which, according to Leitch and Harrison (2016), is inherently unstable over time. This perspective informed the qualitative methodological approach of the study, which incorporated the use of reflective diaries to capture a diverse range of perspectives on students' entrepreneurial intentions. Data collection was facilitated through online Google Forms, with participants responding to a consistent set of questions weekly over the 13-week semester.

According to Xanthopoulou and Sahinidis (2023), obtaining well-written responses is a quick and effective way to collect rich, descriptive data. Written responses provide data that is easier to understand and evaluate since qualitative research involves a lot of transcription of verbal interviews into written texts and then abstracting important themes from these texts (Zdrowski and Letherby 1995). The primary data was analyzed using the QSR NVivo program. NVivo is increasingly used by researchers as it covers three major aspects of the research process, specifically the data analysis, the theoretical development, and the presentation of findings (Dalkin et al. 2021; Nabi et al. 2018). Students were informed that their participation was voluntary, with assurances provided that non-participation would carry no penalties in their studies. A total of 85 participants engaged in the process, completing diaries on a thirteen-week basis.

These diaries included the critical reflection model of “What So What Now What” to encourage a structured approach to self-assessment and reflection on their entrepreneurial journey. With a primary focus on the development of their intention to be self-employed, this model facilitated the exploration of their experiences during the course ('What'), the feelings, thoughts and implications of these experiences after attending each week of the course ('So What'), and the potential entrepreneurial actions they might take in the future in response to these reflections ('Now What'). The purpose of this reflective practice was to help students better understand their own identity development and entrepreneurial aspirations in relation to their academic and personal progress. Throughout the study, the research team offered guiding sessions to participants as a kind of support.

Our study primarily relies on self-reported data, which is subject to several biases and limitations. Self-reported measures can be influenced by social desirability bias, where participants may respond in a manner they perceive to be more favorable or acceptable. Additionally, memory recall issues can lead to inaccuracies in participants' responses. Moreover, the voluntary nature of participation may introduce a selection bias, as

individuals who choose to participate might be more motivated or have a stronger interest in entrepreneurship than the general student population. This could result in an overrepresentation of motivated individuals, potentially skewing the study's findings. To mitigate these biases, we assured anonymity and confidentiality to participants and recommend future studies to consider using additional data collection methods to validate self-reported data.

4. Results

To present the findings the authors structured the following Table 1 which showcases the evolution of students' entrepreneurial intention (EI) over the 13-week course period. This approach combines statistical analysis with indicative responses to highlight both the quantitative and qualitative dimensions of the study. Given the answers provided in students' diaries, the findings are presented below. The final percentages have been calculated by dividing the number of students whose EI increased or decreased by the total number of diary entries analyzed for each week, then multiplying by 100 to get a percentage.

Table 1: Evolution of Entrepreneurial Intention Over 13 Weeks

Week	Percentage of Students with Increased EI	Percentage of Students with Decreased EI	Notable Student Responses
Week 1	20%	5%	"I feel more empowered to set up my own business venture with the knowledge I have gained through my degree."
Week 2	25%	3%	"The case studies, like that of McDonald's, have significantly influenced my perception of persistence and adaptability in entrepreneurship."
Week 3	30%	10%	"Understanding the dark side of entrepreneurship made me rethink if I'm cut out for this journey."
Week 4	35%	8%	"This week's reflection made me realize the importance of timing in launching a business."
Week 5	45%	7%	"Ideas are buzzing; feeling incredibly inspired to innovate."
Week 6	40%	15%	"Financial planning week was overwhelming but crucial."
Week 7	35%	20%	"Legalities in business feel daunting but necessary to understand."
Week 8	60%	4%	"Marketing strategies week reignited my passion."
Week 9	65%	3%	"Pitching my idea built my confidence substantially."
Week 10	70%	2%	"Networking and mentorship have opened new doors for me."
Week 11	75%	1%	"Weighing the risks and rewards more meticulously now."
Week 12	80%	0.5%	"Stressed but more determined than ever for my final project."
Week 13	85%	0.25%	"Reflecting on my entrepreneurial journey has solidified my intention to pursue entrepreneurship."

Table 1 provides a statistical perspective of the students' changing engagement with the idea of entrepreneurship by tracking the percentage of students whose intention to start their own business either rose or decreased each week. These percentages show how students responded to particular learning objectives or topics that were addressed each week. Furthermore, the table contains student quotes verbatim, which act as qualitative data to give the figures context and depth. These answers are crucial because they express the students' individual experiences and show how they are responding both emotionally and mentally to the readings. Table 1 and Figure 1 show a general pattern where a greater proportion of students feel more oriented towards entrepreneurship as the course goes. Overall, the EI of students was increased during the course except from the Weeks 6 and 7, where for Week 6, the percentage of students with increased EI has been reduced from 50% to 40%, and the percentage with decreased EI has been raised from 6% to 15%. Similarly, for Week 7, the percentage of students with increased EI has been further reduced from 55% to 35%, and the percentage with decreased EI has been increased from 5% to 20%. This can be attributed in the content of these two weeks, as week 6 discussed "financial planning" and week 7 discussed legal issues, in which business management students were not very familiar yet.

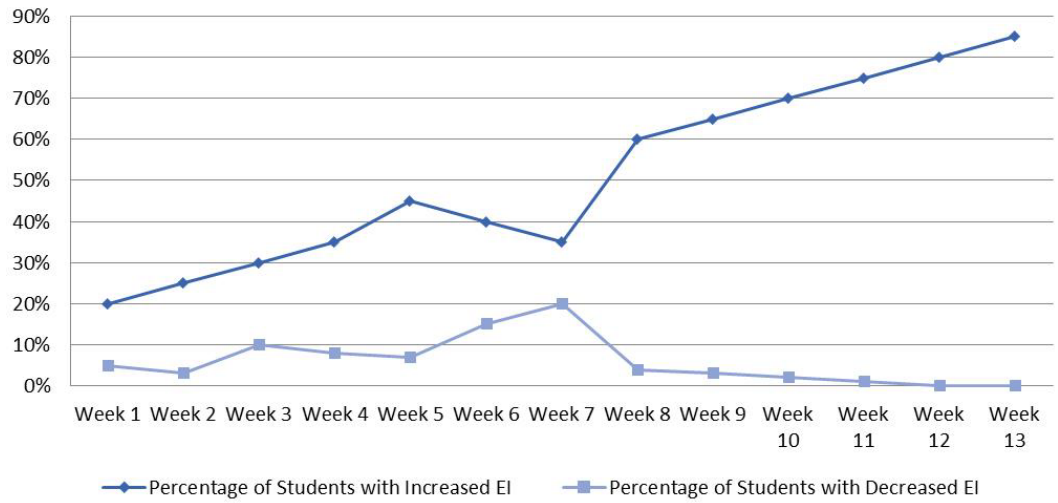

Figure 1: Evolution of EI over 13 weeks

The diary study was conducted from Week 1 to Week 13. A structured description of the students' progression of entrepreneurial intention (EI) during the course of the 13-week course is provided in Table 2, which combines qualitative observations with statistical analysis. The major ideas or crucial insights that arose from the students' weekly reflections are referenced in the "Key Insights" column. These conclusions are drawn from the qualitative data, which consists of the written reflections and conversations of the students. These insights emphasize recurring themes, key takeaways, difficulties encountered, and entrepreneurial discoveries. Based on the qualitative data, a developed metric called the "Average EI Score" will show how the course's effect may cause students' entrepreneurial intentions to change over time. Based on the replies, an overall score is calculated, and a higher score indicates a stronger desire to pursue entrepreneurship. On a scale of 1 to 5, “5” represents the strongest intention and “1” the lowest one.

In order to calculate the average EI score from the student responses, the first step was to sign a numerical value to each student's expression of their entrepreneurial intention, using a Likert scale where 1 represents the lowest level of entrepreneurial intention and 5 represents the highest one. This process was repeated for each week. Then, the authors divided the total score by the number of students (85) to get the average EI score for that week. The elements that constitute this score system include the students' self-assessed readiness, enthusiasm, commitment, and any other signs that they exhibit an entrepreneurial attitude. Finally, the third column “Highlighted Response” presents a particularly representative and powerful statement made by the students. This column captures the spirit of each week and its main theme as emerged from the thematic analysis of data. This offers an overview of the students’ experience or response with reference to EI in connection to the course's development.

Table 2: The "Average EI Score"

Week Number	Key Insights	Average EI Score	Highlighted Response
Week 1	Introduction to entrepreneurship; initial excitement	4.0	Excited about the potential of starting my own business.
Week 2	Exploring entrepreneurial traits; self-reflection	4.0	Realizing the importance of personal traits in entrepreneurship.
Week 3	Case studies of successful entrepreneurs; motivation boost	4.5	Inspired by the success stories of notable entrepreneurs.
Week 4	Understanding market needs; realism sets in	4.0	Starting to understand the real challenges in the market.
Week 5	Ideation and innovation; creativity peak	4.5	Feeling very creative and full of ideas for new ventures.
Week 6	Financial planning; realization of complexity	3.5	Overwhelmed by the financial complexities of starting a business.
Week 7	Legal aspects of business; awareness of	3.0	Concerned about the legal hurdles in

Week Number	Key Insights	Average EI Score	Highlighted Response
	challenges		entrepreneurship.
Week 8	Marketing strategies; renewed enthusiasm	4.0	Energized by learning effective marketing strategies.
Week 9	Pitching ideas; confidence building	4.5	Gaining confidence through pitching exercises.
Week 10	Networking and mentorship; understanding value of connections	4.5	Appreciating the importance of networks and mentors.
Week 11	Balancing risk and reward; cautious optimism	4.0	Weighing the potential risks and rewards more carefully.
Week 12	Final project preparation; stress and determination	3.5	Feeling stressed but determined to finalize my project.
Week 13	Course reflection; mixed feelings but overall positive outlook	4.0	Reflecting on the course, I feel more prepared yet cautious.

Table 2 summarizes how the students' entrepreneurial intentions evolved through the course, highlighting the fluctuating confidence and realization of the complexities involved in entrepreneurship. The average score of students' entrepreneurial intention (EI) throughout a 13-week period is displayed in Figure 2 below. The average EI score for a particular week is shown by each point on the line; scores are likely to range from 1 to 5. It is evident that the EI ratings across the weeks start at about 4, which suggests a rather high level of entrepreneurial ambition at the outset. EI scores fluctuate as the weeks go by, with a decline occurring between Weeks 6 and 7, which is then followed by a recovery. The scores exhibit a little declining trend toward the conclusion before stabilizing. Drawing from the influence of various course materials or activities each week, Figure 2 offers insight into the general patterns of the class's entrepreneurial mood as it fluctuates week to week. Additionally, it draws attention to how students' views and participation with entrepreneurship change throughout the course of the academic program.

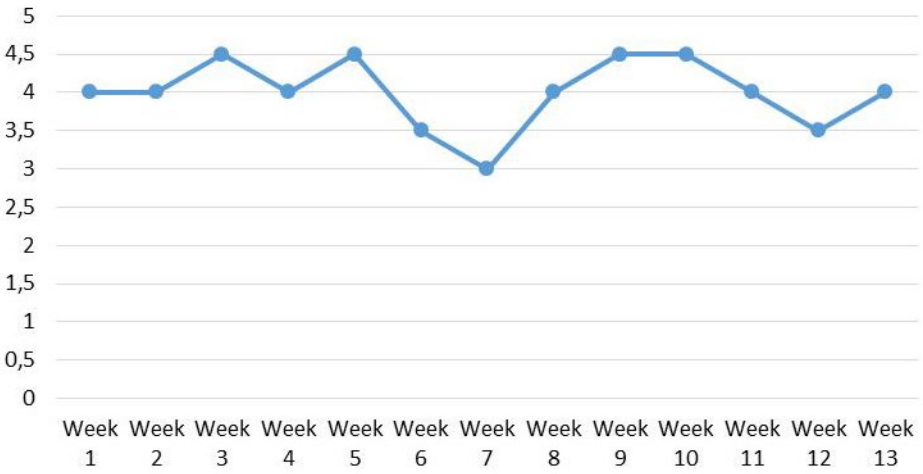

Figure 2: Average EI score

5. Conclusions

The present research aimed to shed light into the dynamics of entrepreneurial intention (EI) among university students, using a diary research as a research method. The selection of diaries contributes to methodological novelty of the study as this research tool is still relatively new in social sciences. The study was conducted during the third semester of studies where students attended the “Entrepreneurship and Innovation” course. Central to the findings is the revelation that students experienced a progressive development of their entrepreneurial mindset and intention mainly when started to attend entrepreneurship activities. Their active involvement in exercises such as the analysis of entrepreneurs’ profiles and the group creation of a business canvas of their personal entrepreneurial ideas, were major factors in their EI's upward trajectory, highlighting the importance of these activities in fostering their entrepreneurial intention. In some weeks, students showed

a decline in their intention to be self-employed, a trend which is attributed to students' theoretical exposure in the "dark side" of entrepreneurship and to their concerns about taking on more risk.

The empirical analysis produces various conclusions about how students' entrepreneurial intention (EI) changed during the 13-week course. Totally, the percentage of students displaying an increased intention to start their own business was shown to be usually increasing. This encouraging development confirms the literature regarding the positive impact of entrepreneurship education on students' intentions to become entrepreneurs. The week-by-week analysis identifies distinct points during the course when changes in emotional intelligence were more noticeable. For instance, the significant increase of entrepreneurial intention after Week 5, corresponds with the content of ideation and innovation. It was also observed a decrease in entrepreneurial intention in Weeks 6 and 7, due to the curriculum's emphasis during these weeks on the legal and financial sides of business. Responses provided insights into the emotional and cognitive spectrum from first elation to moments of uncertainty to final confirmation of the choice to pursue entrepreneurship. The students' answers through diaries allowed the recording of their experiences throughout their interaction with the course material and activities. Overall, the study draws the conclusion that entrepreneurship education is crucial in influencing students' intention to pursue entrepreneurship, especially when it includes experiential and reflective activities.

Future research could build on this work by exploring similar methodologies in different cultural or educational contexts to broaden the applicability of the findings. Different cultural and educational contexts can offer unique insights into factors influencing entrepreneurial intentions. Future research in these diverse contexts can significantly enrich entrepreneurship education and provide a comprehensive understanding of the factors driving entrepreneurial intentions. The reliance on self-reported data introduces potential biases such as social desirability and memory recall issues. Additionally, the voluntary nature of participation may result in a sample that is more motivated than the general student population, potentially skewing the results. To address these limitations, future research should consider using mixed-method approaches to validate self-reported data and ensure its accuracy. Expanding the demographic profile of participants to include a more diverse range of backgrounds will also improve the generalizability of the findings. Furthermore, incorporating a control group in the study design can help isolate the specific effects of the entrepreneurship course from other variables, providing a more robust analysis of its impact. By addressing these limitations, future studies can build on our findings and contribute to a more comprehensive understanding of the factors influencing entrepreneurial intentions across different contexts and populations.

The study acknowledges limitations despite its contributions, most notably that its environment is limited to a small group of Greek students. This acknowledgement creates space more research to duplicate the findings in various educational settings and cultural contexts, expanding knowledge on how entrepreneurial intentions are formed in various circumstances.

Abstract: The present study delves into the less explored relation between entrepreneurship and happiness and aims to deepen our understanding on entrepreneurship, entrepreneurial activities and lifestyle, and subjective well-being. A sample of 13 interviews conducted with entrepreneurs in Portugal was analyzed by a combination of qualitative interviews. By relying on self-reports to gauge the entrepreneurs' perception of their own emotional state, the research has found that happiness extends beyond the traditional scope of objective well-being and is closely linked to their cognitive and emotional experiences, such as life satisfaction and emotional balance. The results show that entrepreneurs scored higher on happiness levels than the country average, even spending most of their week, weekends and holidays at work. Despite the long hours, more than half of the entrepreneurs did not feel they were missing valuable time with family and friends. However, they did acknowledge not having the most balanced and healthiest lifestyle reflected in a higher propensity to experience stress that could have further implications in mental health. These insights are central to understanding the nexus between entrepreneurship and well-being when factors such as on lifestyle, motivation and job satisfaction come into play, and the broader implications for entrepreneurial success.

Keywords: Entrepreneurship, Happiness, Job satisfaction, Life purpose, Lifestyle, Subjective well-being

1. Introduction

Everyone pursues their own version of happiness, a concept that has been deeply explored and whose definition has significantly evolved throughout history. Philosophers often recognize two interpretations of happiness: the first is a state of mind characterized by satisfaction, pleasure, or a general sense of positive emotion, and the second as overall life well-being or good fortune in general (Haybron, 2020; Szczygiel, 2020). For the purposes of this study, we have adopted the definition of happiness as described by Lyubomirsky in her book *The How of Happiness*. She defines happiness as "the experience of joy, contentment, or positive well-being, combined with a sense that one's life is good, meaningful, and worthwhile" (Lyubomirsky, 2007).

In fact, many entrepreneurs are driven by a sense of purpose and the desire to create something meaningful, whether it is innovative products or services, or generating social value. Entrepreneurs also pursue business ventures to gain greater autonomy over their work and personal lives. According to Ryan and Deci (2000), the ability to make decisions and control one's destiny is a significant contributor to well-being and growth. Nowadays, the main motivations that drive entrepreneurs to develop entrepreneurial activities are either necessity (when they have no other options to turn to), or opportunity (to exploit a business opportunity by setting up a company) (GEM, 2012). However, whatever the reason for undertaking an entrepreneurial activity, characteristics, and skills that an individual must possess or develop in order to achieve the desired goal are substantial and not always easily attainable.

In exploring the intersection of happiness and entrepreneurship, it is crucial to assess their relationship critically. The pursuit of lifelong happiness is a common human interest, raising the question: Are we chasing an elusive ideal, or is happiness a transcendent concept that eludes simple definition? This study will utilize the data to delve into these questions and determine to what extent happiness and entrepreneurship are interlinked. Therefore, this research aims to explore the relationship between entrepreneurship and individual happiness in Portugal, contributing to the literature by bringing interdisciplinary insights such as implications of public policy implementations, and integrating concepts from psychology into the studies of entrepreneurship. Hence, entrepreneurs' perceptions on their lifestyle, job satisfaction, purpose in life and overall well-being are investigated qualitative techniques.

The structure of the paper is organized as follows: Chapter 2 reviews relevant literature; Chapter 3 outlines the methodology, data collection methods, and analysis techniques used; Chapter 4 discusses the results of the empirical study and Chapter 5 concludes the study, offering final thoughts and suggestions for future research.

2. Literature Review

Entrepreneurship involves recognizing and acting on opportunities to create products or services, driven by innovation and a keen understanding of market needs. This proactive approach not only fulfils personal ambitions but also significantly benefits families by fostering financial stability and job creation. On a larger scale, entrepreneurship stimulates economic growth, enhances community development, and contributes to the global competitiveness of counties and nations (Shane and Venkataraman, 2000). Levels of entrepreneurship vary from country to country. These differences can be attributed to several reasons, among the most notable: the motive for entrepreneurship, whether out of necessity or opportunity, and product and labour market regulations imposed by the government. For instance, the analysis of the regulations implemented in Portugal, it was found that in 2018 the government launched the "Startup Portugal+ Program" which added new measures to the original "Startup Portugal Program". Its main objective is to encourage and support entrepreneurs in Portugal (ePortugal Government n.d.). Also, Ardagna and Lusardi (2010) observed that regulations affect levels of entrepreneurship through social networks, work status, business skills and attitudes towards risk.

According to the study on entrepreneurship in Portugal in 2012 and 2016 carried out by the Global Entrepreneurship Monitor (GEM), which studies entrepreneurship levels on a global scale, in 2012, Portugal had an entrepreneurial activity rate (TEA) of 7.7% (GEM, 2012). Put differently, out of every 100 people, between 7 and 8 are involved in the initial stages of entrepreneurship. Additionally, the number of male entrepreneurs in Portugal is 50% higher than the number of female entrepreneurs (GEM, 2012). Likewise, in 2016, Portugal had a TEA rate of 8.2%, that is, approximately 86% higher than that recorded in 2010 (4.5%) (GEM, 2016; GEM, 2010). Furthermore, in 2019 the registered TEA was 12.9%, showing a growth of more than 50%, as opposed to the TEA in 2016 (GEM, 2019). In this sense, emphasizing the holding the Web Summit in Lisbon, which is a joint initiative between Startup Portugal and Web Summit, strengthening the national entrepreneurial ecosystem is continuously important.

It is recognized that entrepreneurship occurs in a specific context of economic, political and environmental factors that shall be considered to understand the entire entrepreneurship process (Baron and Henry, 2011) which is why a holistic approach rather should be adopted by policymakers (Ács et al. 2014). However, the dynamic nature of entrepreneurial ecosystems does not diminish the role of entrepreneurs or the importance of understanding what their motives, skills, perceptions and attitudes are in the entrepreneurial process (Baron and Henry, 2011). Several theoretical approaches have been used to explain entrepreneurial motivations, one of which is Ryan and Deci's (2000) self-determination theory (SDT). SDT is a framework that explores the motivation and personality of individuals through the examination of interactions and dependence on social environments. SDT posits that humans have three innate psychological needs: autonomy, competence, and relatedness, and differentiates between intrinsic motivation, which is driven by internal satisfaction, and extrinsic motivation, which is driven by external rewards. The theory also underscores the significant role of social and cultural contexts in either supporting or hindering these basic psychological needs, affecting people's sense of self-direction, performance, and overall well-being (Ryan and Deci, 2000).

Well-being is generally categorized into two distinct yet interrelated concepts: objective well-being and subjective well-being. Objective well-being evaluates tangible resources available to individuals that enable them to meet their fundamental needs for life and security. Subjective well-being, on the other hand, focuses on personal perceptions and evaluations of one's own life. It comprises emotional reactions and cognitive judgments, including life satisfaction, fulfilment, and positive emotions, reflecting how individuals experience and assess their own happiness and quality of life (Matamá et al, 2017).

Subjective well-being is regarded as a pivotal concept across various domains, particularly due to its significant influence on human behavior (De Neve et al, 2013). It is essential to explore how subjective well-being has been examined, especially within workplace settings. In analysing the work environment, researchers often focus on alternative – negative - constructs such as burnout or stress, which can overshadow the role of subjective well-being (Siqueira and Padovam, 2008). However, a better understanding of subjective well-being in the workplace can provide critical insights into employees' motivation, engagement, general performance, and job satisfaction, which are crucial for both individual fulfilment and organizational success (e.g., Bryson et al, 2017).

Higher subjective well-being is associated with the accumulation of positive emotional experiences and less negative emotional experiences. These experiences are not just related to certain aspects of life, but to life in general. It is expected that individuals' moods, emotions, and perceptions change over time and through individual experiences; thus, well-being is not something constant, but rather varies from individual to individual, and throughout everyone's life (Daniels et al, 2017).

At a country level, there are several indices that attempt to quantify its happiness. The World Happiness Report (WHR) and the Better Life Index are just two of them. These indices specifically, instead of focusing only on Gross Domestic Product (GDP) and economic statistics, also consider measures of well-being and quality of life (both with a direct impact on happiness levels). In 2020, WHR reported that Portugal had a score of 5,768 out of 10, placing it as the 57th happiest country among the 149 countries ranked (Helliwell et al, 2021). On the other hand, looking at the results of the Better Life Index, the average Portuguese person claimed to have an overall life satisfaction rating of 5.4; being almost one point below the average (6.5) of the countries studied in this index (OECD, 2020). In short, the average happiness of the Portuguese seems relatively low (OECD, 2020).

The analysis of the literature on entrepreneurship and happiness offers several key insights. For instance, van Zhao et al (2020) found that entrepreneurial decision-making and experience have a direct positive impact on family happiness, suggesting that families involved in entrepreneurial activities generally experience enhanced well-being. And although salary is often considered a crucial metric for assessing well-being, the financial outcomes for entrepreneurs do not consistently surpass those of employees. However, a study across 25 European countries by Schneck (2014) found that entrepreneurs tend to be happier than employees in most of these nations. One explanation for this fact could be entrepreneurs' psychological flexibility. Van Hugten et al (2021) argue that psychological flexibility is a significant factor in entrepreneurs' job satisfaction and, consequently, happiness. In their study, provided empirical evidence that entrepreneurs who have greater psychological flexibility tend to report higher satisfaction levels.

Of course, the daily demands and responsibilities inherent in entrepreneurship often lead to stress and anxiety, which can negatively affect overall well-being. Consequently, it is crucial for entrepreneurs to understand better the factors that have a triggering impact on their functioning and to develop effective coping strategies. These strategies, encompassing both cognitive and behavioural efforts, are essential for managing stress and maintaining mental health in the face of ongoing business pressures (Uy et al, 2013).

3. Methodology

3.1 Design

The study used a qualitative approach what allowed to get an insight into motivations, lifestyle patterns, job satisfaction and overall perceived happiness of the participants, while allowing to yield some descriptive data that could be compared to indicators available for the general population. Also, allowing the interviewees for responding open-ended questions was considered methodologically appropriate and relevant, and provided the research team valuable information on their perceptions and experiences.

Some potential obstacles that required special attention were identified. These included, for example, ensuring the participants did not feel judged so that they could talk openly about what they had in mind. The interviewer was trained to guarantee the questions were asked objectively and that the interviewees were not guided towards providing specific answers.

3.2 Collection Method and Data Composition

In order to achieve the study objectives, data collection was based on semi-structured interviews accompanied by descriptive data collection. For this purpose, a detailed interview guide was developed to steer the direction of the narrative and to allow for a complete answer to be dissected. The study was carried out in the last quarter of 2021, with a sample consisting of 13 entrepreneurs who work in Portugal in different sectors of the economy. For data collection, a structured interview consisting of 7 socio-demographic questions, 20 open-ended questions, and 4 questions measured by a Likert scale from 1 (lowest) to 10 (highest), separated into 4 blocks (lifestyle, job satisfaction, purpose in life and subjective well-being), was used. In addition, the recording of responses was simultaneous, and each interview, on average, lasted 30-45 minutes.

Socio-demographic information was collected to identify possible fluctuations in entrepreneurs' perceived happiness levels, which are not directly attributed to their entrepreneurial roles. Socio-demographic data were measured in terms of gender (0=male, 1=female, 2=other), age (categorized into 5 ranges), nationality (0=Portuguese, 1=other), marital status (0=single, 1=married, 2=other), number of children, highest level of education, and the type of business (start-up, partnership, LCC, etc).

Furthermore, in order to determine the degree of happiness from the entrepreneurs, as previously stated, four different question blocks were created. Since happiness is an emotional state with a variety of different definitions, we sought to find questions that complemented one another. These building blocks were: (i) job satisfaction, which directly correlates the happiness level of entrepreneurial work; (ii) lifestyle, which tells us on

how healthy (physically and mentally) the entrepreneur is, which also influences their perception of how happy they are; and (iii) purpose in life and (iv) subjective well-being, which provide an insight into people's thought processes and sense of accomplishment and fulfilment. Within these blocks, participants were able to give a more detailed description of their ideas. In addition, having a linear numeric scale question per block was used to measure the perceptions.

3.3 Data Analysis

The data was analysed in a manner that ensured participants' anonymity. No specific information that could identify the participant were included in the transcripts. Through the data analysis, it was possible to first quantify the frequency of occurrence of certain answers, and then proceed with further qualitative analysis. Consequently, each thematic block was carefully examined and compared with one another, in order to determine how entrepreneurs perceived their own well-being.

4. Results and Discussion

4.1 Sociodemographic Characteristics of the Participants

Eleven participants of the study were male, while only two were female. Four entrepreneurs fell within the 50-59 age range, and another four belonged to the 20-29 age group. The remaining five entrepreneurs were classified into two age groups: 30-39 and 40-49, with just one entrepreneur in the 60+ age group. Furthermore, four participants were married, six had between 1 and 3 children. In addition, it is worth noting that the highest level of education completed by most participants was a bachelor's degree. Interviewees reported having either a partnership or sole proprietorship as their type of business. Three participants were still in the early stages of the business venturing.

While analyzing the data, it became clear that demographic factors such as gender, nationality, a higher level of education and type of business did not affect the entrepreneurs' levels of perceived happiness. While this may be accounted for the size of the sample, some diversity of the answers was clearly the case.

On the other hand, variables such as age, marital status and number of children seemed to have an impact on the subjective well-being of entrepreneurs. As shown in Figure 1, for each of the age groups the average happiness goes up by 0.5-1 point. Similarly, people who are married and/or have children are on average ~1.4 points happier than entrepreneurs who are single and/or have no children. The latter did not come as a surprise, given that many entrepreneurs mentioned that their main motivation was the need to support their family. These results are consistent with previous ones. For instance, Peltzman (2023) has found that the married population tends to be happier than unmarried individuals.

Interestingly, when asked if they considered themselves successful, based on their own definition of success, which they had given previously, and how long it took them to achieve it, most of the positive responses came from older entrepreneurs who said it took them "a long time" or "their whole life" to achieve it; as opposed to younger participants who claimed they were "not yet successful", but seemed to believe they have a long life ahead to do more.

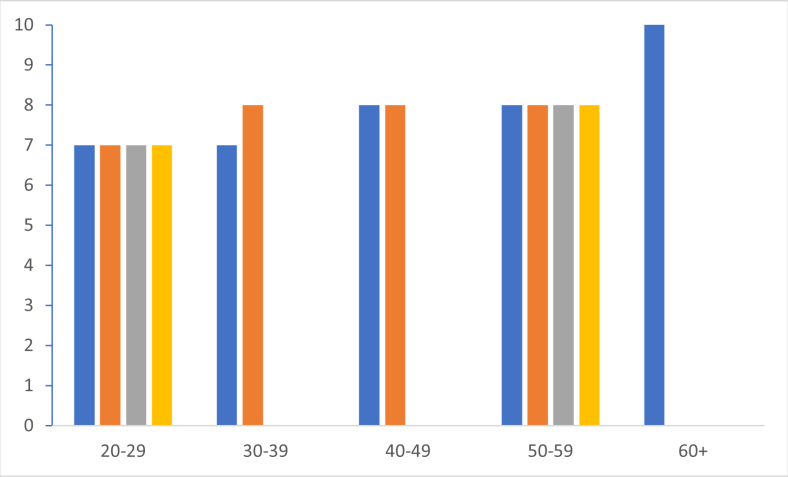

Figure 1: Perceived happiness as per participants age group (on a scale from 1 to 10)

4.2 Lifestyle

When examining the lifestyles of the entrepreneurs, it became evident that they share remarkably similar daily routines. All participants, when asked to describe a typical day, unanimously reported that they dedicate most of their time to work, including most weekends and holidays. To illustrate, one entrepreneur said: "I don't work all day like on a weekday, but there are always things that need to be done and cannot be left for the next working day". Another one claimed to enjoy working much more at weekends and on holidays, as he was not interrupted by various phone calls or meetings, "overall I am much more productive", he added. In this regard, evidence has shown that people who are more satisfied with their jobs work harder and are less likely to quit, and those who are mentally and physically healthy are more likely to work (Andersson, 2008).

Despite the long working days and weekends, more than half of the participants did not think that they were missing out on valuable time with family. Even though their schedules were similar, and they all used to go from "home to work and back home", they believed they could make up for the time in other ways. In Chinese context, Zhao et al (2020) conducted a study aimed at answering the question "How can entrepreneurship bring happiness to the household?" and concluded that entrepreneurial families were happier than non-entrepreneurial families and achieved a greater sense of well-being. Conversely, only two participants did not believe that their goals at work were somehow related to their goals in life. In addition, most interviewees agreed that they did not have the most balanced and healthiest lifestyle (Figure 2). While all entrepreneurs in the present study seemed quite satisfied with their daily routine and achievements, Andersson (2008) has noted that the self-employed find their jobs more stressful and mentally taxing because they work longer hours, have less free time and more responsibility for their own work and income. For the same reasons, the self-employed are thought to have more mental health problems and poorer general health. Numerous other studies have shown that long working hours are generally associated with health problems, such as physical health and fatigue (Klofsten et al, 2021; Van der Hulst, 2003).

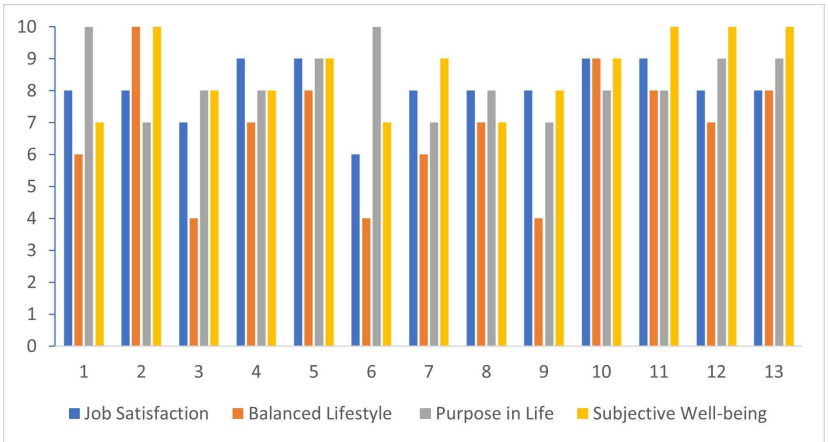

Figure 2: Ranking of participants' perceived job satisfaction, lifestyle, subjective well-being and the following of their purpose on a scale from 1 to 10)

Still, participants seemed to have some relevant personal resources such as social support they both received and provided. When asked what motivated them, six of them said that their friends and the need to support their family were the main drivers, while the others agreed that their main motivators were the love of what they do, the challenges that come with running a business, and the desire to become a better person and make the world a better place. And while some studies such as that of Hanglberger and Merz (2011), have argued that entrepreneurship is not associated with long-term happiness, the buffering role of social support may be one of the reasons for such findings. Therefore, although the general lifestyle of the entrepreneurs seemed to lack some healthy and balanced habits resulting in mean low value of only 6.46 / 10 (Figure 2), this did not affect their subjective well-being (Figure 3).

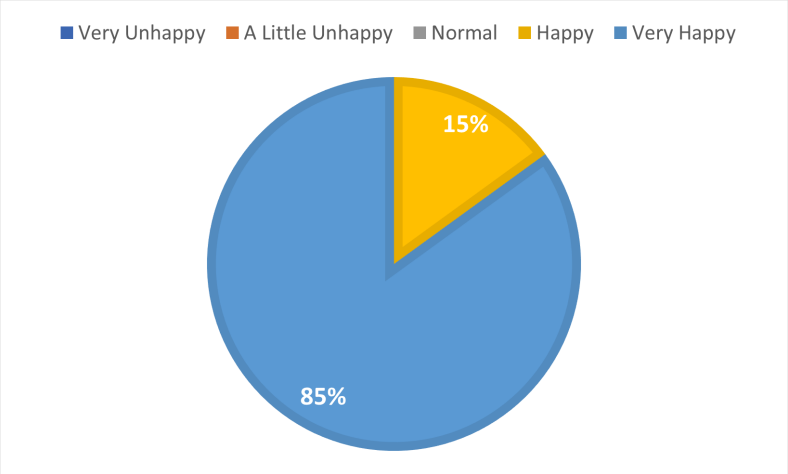

Figure 3: Entrepreneurs' subjective well-being

4.3 Job Satisfaction

The findings regarding job satisfaction were largely positive, which aligns with the inherent characteristics of entrepreneurs who generally pursue what they enjoy and, thus, remain motivated (Collins et al, 2004). Most participants owned their businesses, which likely influenced their high job satisfaction scores, with answers ranging from 6 to 9 out of 10. Interestingly, every entrepreneur surveyed reported working during holidays. Moreover, when asked if they worked on holidays, all respondents, without exception, answered in the affirmative. This might reflect the challenges of managing a small business with limited or no additional staff and limited financial resources, often compelling entrepreneurs to juggle multiple roles and extend their working hours into holidays to sustain and grow their ventures.

In terms of day-to-day tasks and responsibilities, interviewees affirmed they felt they managed the pressure well. However, when it came to compensation, entrepreneurs expressed that their earnings could be higher, considering the extensive hours dedicated to work. To our surprise, these results had no impact on their levels of happiness (Figure 3). This suggests that the entrepreneurs' happiness does not come from their earnings. Some scholars would obviously not agree with these findings. For example, Zhao et al (2020) have argued income is a very important factor in measuring well-being of entrepreneurs. According to Fowle (2019), entrepreneurs are attracted by the promise of freedom and autonomy, but many find that they have lost control of their personal, social and professional lives. Projects often involve high levels of risk, loss of control, fractured relationships, and damaged identities. These, combined with extreme lifestyles, lack of sleep and exercise, and poor diet, create extraordinary physiological and psychological distress. To understand this better, Su et al's research (2020) has explored how entrepreneurs sustain their motivation through apparently more positive emotions rather than financial gains and found that entrepreneurs persist in highly uncertain environments by deriving happiness and satisfaction from the entrepreneurial process itself, rather than from monetary rewards. Moreover, Chen et al (2018) have found that entrepreneurs' satisfaction is more influenced by personal creativity and strong social ties than by the financial performance of their business suggesting that entrepreneurs' happiness stems more from non-material aspects of entrepreneurship. This evidence could partially explain why our interviewees, when inquired about their career progression, seemed pleased with having achieved some status in the labor market. Ultimately, their happiness seemed positively related to job satisfaction rather than to the financial aspects of their work.

4.4 Subjective Well-Being

Interviewees' responses regarding their subjective well-being were consistent with the theoretical conceptualization of happiness. Participants felt satisfied and motivated because they worked on what they enjoyed. As they believed the goals of their companies were linked to their personal lives, they perceived that their work was meaningful. According to Zhao et al (2020), entrepreneurs choose to start their own business only when it is useful to them and those they care about, although this has a positive impact on creating a better life for others and promoting the harmonious development of society.

Harbi and Grolleau (2012) distinguish between the direct and indirect effects of entrepreneurship on life satisfaction, separating the impact on per capita income from the subsequent impact on life satisfaction, and suggest that entrepreneurship may inhibit household happiness. Specifically, they propose that while

entrepreneurship can increase individual income, it may not necessarily enhance (and might even diminish) the overall happiness within an entrepreneur's household due to factors such as increased stress and workload. In fact, our research has clearly identified some manifestations of stress and anxiety in entrepreneurs. A large proportion of the analyzed sample felt stressed, anxious, or worried at times. This is a natural emotional response, considering their decisions have significant implications not only for their own lives but also for their families, company employees, and the employees' families. According to Stephan et al (2023), entrepreneurs live between two emotional states, fluctuating between very happy or very stressed. This emotional imbalance is fueled by constant stressors like uncertainty and high workload, which are inherent in entrepreneurship and can significantly impact the individual's health.

When questioned about happiness (as for the question "are entrepreneurs happy?"), 85% of participants said that they were very happy, while the remainder 15% claimed to be happy. Overall, the happiness levels of the entrepreneurs averaged 7.769 (Figure 2), significantly exceeding the Portuguese national average of 5.4 according to the Better Life Index (OECD, 2020), and 5.768 as reported in the World Happiness Report (Helliwell et al, 2021). This high value underscores the exceptional well-being experienced by these entrepreneurs in comparison to the general population in Portugal. In general, a substantial body of research seems aligned with the idea that entrepreneurs have greater satisfaction than salaried workers (Andersson, 2008; Seva et al, 2016) and are happier (Oswald, 1997) but a clear consensus is yet to come (e.g., Hanglberger and Merz, 2011).

Interestingly, many participants expressed a desire to alter their lifestyles. Among various suggestions for change, the most prevalent was a wish for more time, highlighting a common struggle among entrepreneurs to achieve a better (and healthier) balance between their personal and professional lives what underscores the ongoing challenge entrepreneurs face in managing the demands of business ownership while maintaining personal well-being (Dijkhuizen et al, 2018). Time was therefore the most needed and lacking resource. Still, and despite this study carried out amid a pandemic situation, where the instability experienced has been much discussed, entrepreneurs felt confident and optimistic about the future.

5. Conclusion

5.1 Final Considerations

This study sought to explore the relationship between lifestyle, job satisfaction, and subjective well-being among entrepreneurs. Through interviews, we gathered insights into the lives and behaviors of entrepreneurs, enabling a thorough cross-sectional analysis. The findings show that despite long working hours, entrepreneurs find significant personal fulfillment in their work, which they deem meaningful.

The results align with the core principles of Self-Determination Theory, which posits that fulfilling the psychological needs of autonomy, competence, and relatedness enhances intrinsic motivation and well-being (Ryan and Deci, 2000). The findings suggest that entrepreneurs, despite the demanding nature of their work, experience high levels of subjective well-being largely due to the meaningfulness and personal fulfilment they derive from their ventures. This supports the idea that entrepreneurs' high autonomy - being able to make decisions and control their work environment - significantly contributes to their overall happiness. The reported happiness score of 7.769, well above the national average, underscores the importance of autonomy and competence in their perceived well-being.

Interestingly, our study also found that remuneration does not play a significant role in influencing entrepreneurs' elevated happiness. This is consistent with SDT, which emphasizes that intrinsic motivations, such as personal growth, the achievement of life goals, and the fulfilment derived from meaningful work, are more critical to well-being than extrinsic rewards. The positive relationship between job satisfaction and adherence to personal life goals highlights the role of relatedness, where entrepreneurs find a sense of purpose and connection through their work. These intrinsic motivators appear to outweigh the potential stresses and long hours associated with entrepreneurship, reinforcing the notion that when individuals are engaged in activities that resonate with their core values and aspirations, their overall well-being is enhanced.

However, despite recognizing the lack of a balanced lifestyle as an area for improvement, this did not negatively impact their overall well-being. This resilience can be attributed to their strong intrinsic motivation and the support structures they might have in place, which buffer the potential negative effects of stress and long working hours. Many entrepreneurs expressed a desire for more time for personal care, exercise, and family activities, indicating areas where enhancements could be made to further improve their well-being. This suggests that while their current lifestyle supports their psychological needs to a great extent, addressing these gaps could provide a more holistic improvement to their quality of life, supporting both their mental and physical health.

Moreover, the results highlight a potential area for policy intervention. By creating environments that support work-life balance, such as offering flexible working conditions and promoting health and wellness programs, policymakers and business support organizations can further enhance the well-being of entrepreneurs. This aligns with the broader implications of SDT, which emphasizes the need for social and cultural contexts that nurture individuals' psychological needs. Encouraging a more balanced lifestyle could mitigate the long-term risks associated with chronic stress and overwork, leading to more sustainable entrepreneurial practices. These insights not only contribute to our understanding of entrepreneurial well-being but also suggest areas for further research and potential interventions to support entrepreneurs in achieving a more balanced life.

5.2 Limitations

Despite the contributions of the study, some limitations must be pointed out. The study took place during the time of the Covid-19 pandemic and in one country only, what at the time of data collection resulted in difficulties in reaching out to the interested participants and does not allow for generalization of the results.

5.3 Paths for future research

Future research could examine how different sociodemographic factors (age, gender, socioeconomic status, stage of entrepreneurial venturing) influence the relationship between lifestyle, job satisfaction, and subjective well-being. For example, investigating gender-specific experiences in entrepreneurship could shed light on whether men and women face different challenges and rewards in their entrepreneurial journeys. This research could explore how gender impacts motivation, stress management, job satisfaction, and overall well-being, leading to more targeted interventions. Moreover, understanding the role of social support networks, including family, friends, and professional associations, in enhancing entrepreneurs' well-being could provide insights into how these networks buffer against stress. This could also highlight the importance of community and peer support in entrepreneurial success.

From the methodological point of view, future research could benefit from longitudinal designs to track changes in entrepreneurs' subjective well-being over time. Longitudinal studies would help establish causal relationships and observe the long-term effects of lifestyle changes on subjective well-being and job satisfaction, what could offer a better understanding of how various stages of business development, from startup to established enterprise, impact happiness and stress levels. It would also help identify any long-term effects of entrepreneurial activities on personal well-being.

Abstract: Uncollected solid waste has become an ever-growing threat to our livelihoods, posing many problems that span health risks, environmental pollution, and unpleasant aesthetics. Traditional methods of reporting uncollected solid waste have proven ineffective and we struggle to keep pace in addressing the growing volumes of waste. This study focused on developing a solid waste detection and reporting system based on machine learning and geotagging. The developed system sought to enable solid waste management entities to obtain verified solid waste reports and accurate location details of the uncollected waste instances. A ResNet model was trained on commonly used solid waste image datasets from online sources. The model achieved a provisional accuracy beforescore of seventy percent (70%) though this statistic can be improved by adjusting model parameters. A rapid iterative design approach was employed to facilitate the development of the crowdsourcing app. This enabled the researchers to swiftly build, evaluate, and refine functional prototypes of the system before finalization. The resulting system receives solid waste images together with their location data and verifies the correct image reports using the trained model, before finally visualizing the reports on a map. Overall, the system provides a platform for the general public to collaborate with solid waste management bodies in combatting uncollected solid waste. In the future, the system may be diversified to allow reporting other amenity issues besides uncollected solid waste.

Keywords: Solid waste detection, Solid waste reporting, Geotagging, ResNet, Machine learning

1. Introduction

The growing use of technology has not spared the solid waste management sphere as a growing number of studies have sought to develop smart systems based on emerging technologies to aid in waste management in cities (Mihai et al, 2019). The Swachh Bharat Mission launched in India has also driven the development of solid waste reporting systems. The mission launched the Swachh Technology Challenge, a competition that encourages entrepreneurs and innovators to develop new technologies for waste management (Anitha et al, 2022). This has led to the exploration of multiple avenues and resulted in the emergence of innovative solutions focusing on waste management. The annual volume of solid waste generated in sub-Saharan Africa is pegged at one hundred and seventy-four million (174 000 000) tonnes as of 2019 and only forty-four percent (44%) of it is collected (Adedara, 2023). The volume of solid waste produced is expected to triple by 2030 while the percentage of solid waste collected drops. Uncollected Solid Waste refers to waste that is generated but which remains uncollected due to lack of collection services (Mas, 2019)

In 2021, the World Health Organization underscored the significant health hazards associated with uncollected solid waste and indicated the seriousness of the issue. These included gastrointestinal infections with symptoms such as diarrhoea and vomiting stemming from the consumption of contamination of food and water, respiratory conditions induced by toxic pollutants released by burning solid waste, and vector-borne diseases like malaria and dengue fever-transmitted disease vectors like mosquitoes and flies. Local governments are obligated to facilitate the collection of both solid waste in bins and isolated waste, however since most of this waste is dumped in discrete areas, local municipals rely on citizens' reports to know about these areas. Taggio et al. (2022) allude that existing systems for citizen reports are ineffective in that they fail to provide meaningful location details of reported waste instances and there is no metric to guide what is worth reporting and what is not. The goal of this research, therefore, is to create a crowdsourcing mobile app that can be used to detect and report uncollected solid waste. To do this the following objectives were formulated:

Objectives

- To capture and submit images of uncollected solid waste
- To filter out valid submissions using a machine-learning model

- Tag and display the location of valid reported solid waste instances

According to Njiru & Takeuchi (2018), Sustainable Development Goal (SDG) 11 focuses on making cities and human settlements sustainable, while Target 11.6 specifically aims to reduce the adverse per capita environmental impact of cities by improving the management of municipal and other waste effectively by 2030. By providing details for reporting uncollected solid waste, the application supports waste collection leading to cleaner, healthier, and more resilient urban environments. The crowdsourcing approach particularly leverages the power of community involvement as the app ensures comprehensive coverage and timely reporting of waste accumulation and reduces its environmental impact on communities and cities. Ultimately, the system intends to simplify the reporting process, enable prompt waste collection, and eventually support more effective waste management strategies.

2. Literature Review

This section looks at the commonly used machine learning algorithms, datasets used to train models, and commonly used techniques for collecting uncollected waste.

2.1 Commonly Used Machine Learning Algorithms

Convolutional Neural Networks (CNN) are a type of machine learning neural network that is suited for image recognition and classification tasks and have gained adoption in the detection and classification of waste in images (Majchrowska et al, 2021). Across the reviewed studies, three types of pre-built CNN models were used for solid waste detection, and from their findings, each had its trade-offs which are explored below.

The first type, *AlexNet* was used by Susanth et al (2021) to identify solid waste objects and detect the type of waste from images while Majchrowska et al. (2021) used it to detect and classify waste in images. Findings from both studies concur that the *AlexNet* model performs fairly well in both detection and classification but is outperformed by other models. Its lightweight model makes it suitable for use in limited processing resources. The second, *ResNet* was proposed as a solution to challenges faced by the increase of convolutional layers in VGG Ziouzios et al.(2020). Rajakumaran et al.(2023) leveraged it for real-time identification of solid waste by a drone camera. They obtained a 95% accuracy score while Susanth et al.(2021) obtained a 93.5% score when using *ResNet50* to detect and map out solid waste in drone-captured and satellite images. Both studies concur that the model performs well with poor-quality images, is computationally efficient, and has a small memory footprint. This poses ResNet as an ideal image detection algorithm to be used on a solid waste detection mobile application. Majchrowska et al. (2021) compared our third type, *EffiecientNet,* with *AlexNet* and *ResNet* and they elucidated that it was more adopted for solid waste detection tasks while the other two are optimized for waste classification. This is contradictory to the findings of Mudemfu & Wayne (2023) who argue that this model is suited for image classification tasks. This contradiction might be due to the different scholars focusing on a different task as the first study focused on detection tasks while the second focused on classification tasks. Their contradictory findings may also be an indication that *EfficientNet* is well suited for both tasks. Mudemfu & Wayne (2023) compared it with *VGG, AlexNet, ResNet*, and *DenseNe*t and concluded that this is the best model to implement as it can be altered to outperform any other CNN-based model in any metric. By allowing the alterations to its architecture to achieve the desired balance between computational resources and detection accuracy, EfficientNet also becomes another prebuilt model that may be used in solid waste detection mobile applications although its performance may be greatly affected by the limited processing resources on mobile devices.

2.2 Datasets Used to Train Models

In all the studies reviewed, none created a new solid waste image dataset as all the studies used pre-created solid waste image datasets. Niu et al. (2023); Rajakumaran et al. (2023); Taggio et al. (2022; Ulloa-Torrealba (2023) used the *Trashnet* dataset to train CNN-based models in tasks of solid waste detection in aerial images. These studies managed to obtain acceptable performance metrics with this dataset that is suited for solid waste image classification though they hinted that different datasets could have guaranteed better performance. It is more suited for classification tasks as it spans six classes: glass, paper, cardboard, plastic, metal, and trash; this explains why Ma et al. (2020) obtained higher performance scores than all other waste detection studies as they used the *Trashnet* dataset for classification tasks. Majchrowska et al. (2021); and Mudemfu & Wayne (2023) created their custom datasets by extracting images from various public image datasets including *Trashnet, Open Litter Map, "Wassste", and TACO-Trash-Dataset*. According to Mudemfu & Wayne (2023), combining images

from different settings helped reduce overfitting. This poses the practice of merging different datasets as a possible solution to obtaining a reliable dataset for training a solid waste image detection model.

2.3 Commonly Used Techniques for Reporting Uncollected Solid Waste

Verma et al. (2022) , and Torres & Fraternali (2023) developed uncollected solid waste reporting systems based on images captured from an aerial flying craft that included drones and satellites. The architecture of these systems was similar to that of Wang et al. (2020) though it harnesses images captured from mobile phones in place of drones, in this architecture, the device capturing images acts as a client while the facility carrying the model acts as a server. Shahab & Anjum (2022) attempted to deploy both client and server on a mobile device and they reported that the algorithms required great processing power while mobile devices have limited processing power. To counter this, a choice has to be made between either scaling down the algorithm and reducing performance levels in the process or simply deploying the algorithm on the web end. This ultimately puts the former architecture ahead of the latter as the architecture of choice in solid waste reporting systems

To successfully add location details to images in their systems they integrated Map APIs. Wang et al.(2020) used a *Gaode API* which is presented fully in the Mandarin language making it unusable in non-Mandarin speaking regions. The other three studies used *Google Maps API* and they pointed out that it is easier to use and has a wide range of features compared to *OpenStreetMap API*. Ndlovu et al. (2023) used the Google Maps API to mark locations of reported potholes in a pothole reporting system and highlighted that it displays different levels of detail about reported potholes based on the zoom level used. Another added advantage of using Google Map API is that it allows free access to all features as long as the project is not yet commercialized. With this in mind, Google Map API can be utilized to locate uncollected solid waste

3. Methodology

The Rapid Application Development (RAD) methodology was chosen for the development of the uncollected solid waste detection and reporting system. Its focus on building and testing functional prototypes in short, iterative cycles aligns perfectly with this approach (Sooni, 2023). Each iteration concentrates on a specific component of the system, such as the mobile application's user interface or the server-side image detection model. This allows for independent testing and refinement of each component, ensuring optimal functionality before integration with the entire system.

3.1 Tools and Technologies Required to Develop the System Were Also Identified

Table 1: Required Tools

	Tool	Use Case
1	Python	Programming language for training the solid waste detection model.
2	Google Collab	Development environment for training and testing the solid waste detection model.
3	React Native	JavaScript framework for mobile app interface development.
4	Google Maps API	Map service for geotagging identified solid waste instances
5	SQLite	

3.2 Data Collection and Preprocessing

Using a pre-created solid waste image dataset, the study leveraged *Trashnet, "Wassste", and TACO-Trash-Dataset* datasets*.* The resulting dataset was then meticulously annotated and split into training, validation, and test sets. During the preprocessing phase, images were resized, normalized, and augmented to improve the model's robustness.

3.3 Selected Model

A *ResNet* pre-trained model was adopted as it yielded a good balance between accuracy and efficiency in five (5) previous studies reviewed in the literature review. In the developed system, the *ResNet* model would be trained in solid waste image detection rather than classification tasks as the system focuses on uncollected solid waste. The model's architecture comprises 50 layers, enabling it to capture intricate features within images. It uses residual blocks as its core building blocks as they ensure information flow throughout the network by adding

the input directly to the output of convolutional layers. The pre-trained model comes with weights already learned on a massive dataset for image classification, necessitating adjusting to enable object detection tasks.

3.4 System Design

The design was constructed as the blueprint of the developed system, defining the structure and interactions between different system components.

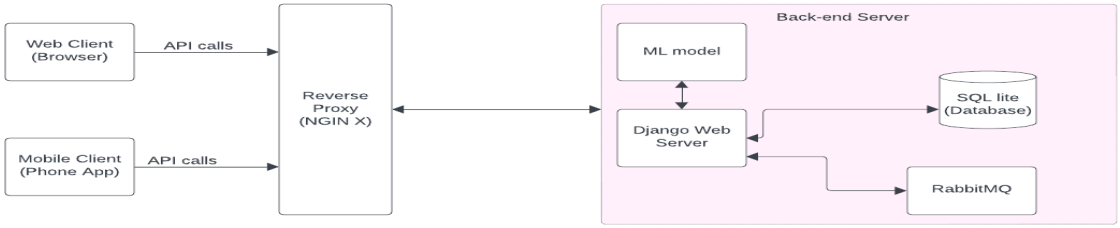

Figure 1: System Architecture

From the system design, the system would have two possible points of interaction with the back-end services; the Web Client, for use by the system administrators, and the Mobile Client for use by general users as highlighted in Figure 1. This was to ensure that the mobile end (for the contributing public) remains minimalistic and uncluttered to foster usability and hence boost adoption rates.

Solid Waste Reporting Sequence

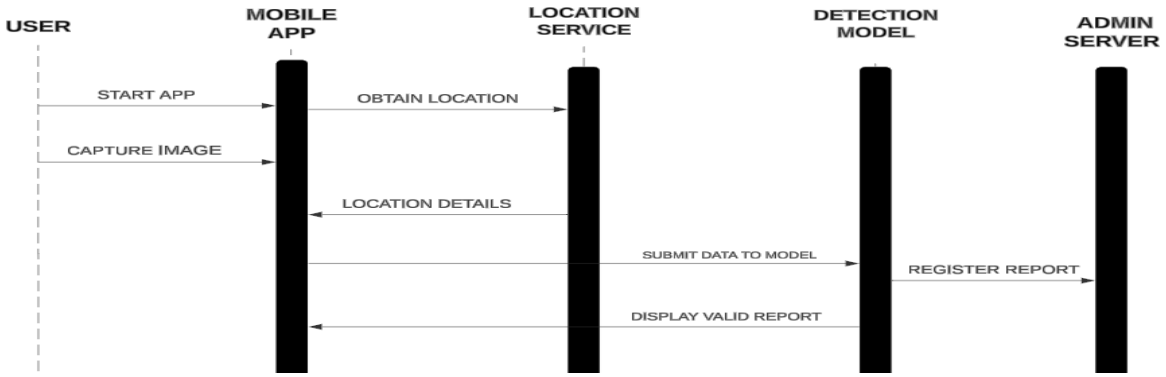

Figure 2: Solid waste reporting sequence diagram

Users initiate the solid waste image reporting process by launching the Mobile App, which allows them to capture an image of the solid waste they encounter together with the device's location and timestamp. Users are then prompted to fill in their details including their email address for purposes of user identity and future messages as highlighted in Figure 2. The is bundled together with the user's email address and sent to a central Django Web Server. The server then invokes the pre-trained *ResNet* algorithm and runs the image through the algorithm to detect any waste present in the image. If the reported image is detected to have solid waste, the server extracts the submitted location data (latitude and longitude). It makes a *Google Maps API* Call, that is, the server makes a request to the *Google Maps API* using the extracted location, and the API plots a point (marker) on the map at the specified location, visually representing the waste sighting.

4. Results and Discussion

The following section discusses the completed system that was achieved following the system architecture outlined in the previous section and also sheds details on the ResNet model.

4.1 Model Performance Statistics

Matplotlib and Pyplot tools (sub-modules of Matplotlib) were used for visualizing and analyzing the performance of the machine learning model's accuracy during the testing phase. It is important to note that this model was trained and deployed as an incremental learning model. This means it is a type of machine-learning model that can continuously learn and improve as it receives new data.

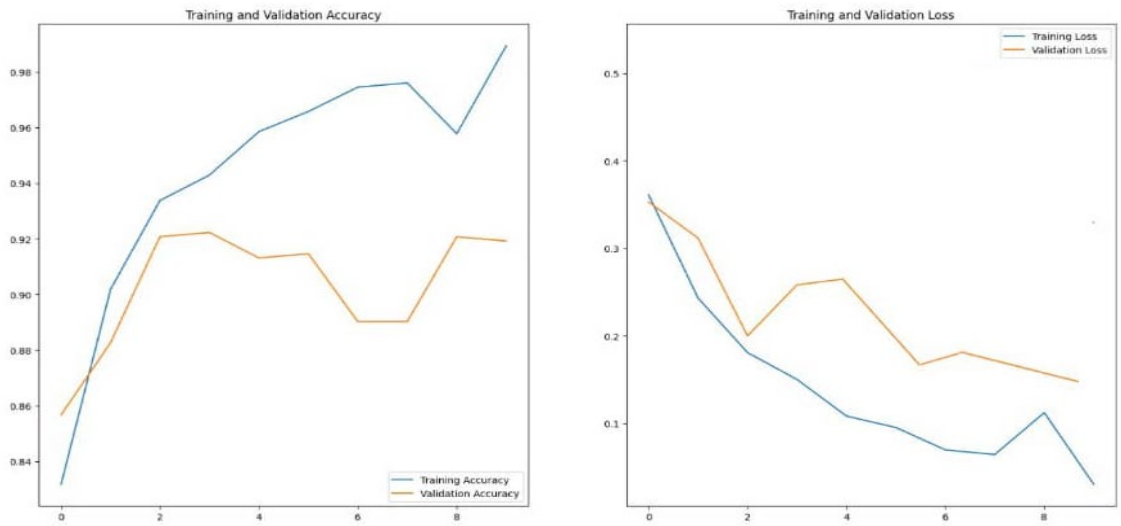

Figure 3: Training and Validation Accuracy Graph (left), Training and Validation Loss Graph (right)

The *training accuracy* increases steadily across epochs, indicating the model is progressively learning to classify images during training correctly. Ideally, this value should reach a high plateau (close to 1) as training progresses. The *validation accuracy* also increases thus indicating that the model is generalizing well and is not simply memorizing the training data. The *training loss* generally decreases across epochs, which is a positive sign as this indicates that the model is learning to reduce its errors and improve its performance on the training data. The *validation loss* generally decreases thus depicting that the model is generalizing well and is not overfitting to the training data. Overall, the metrics shown in these graphs indicate that the *ResNet* model is likely performing well during training.

The training accuracy is increasing, and the training loss is decreasing, indicating that the model is learning to classify images correctly. Throughout the training process, we monitored the model's performance on the validation set and made necessary adjustments. To measure the accuracy of our model, we employed early stopping. This technique involves halting the training process once the model's performance on the validation set ceases to improve, thereby avoiding overfitting and ensuring that the model generalizes well to unseen data. As a result of these efforts, our ResNet model achieved a significant milestone, attaining a 70 percent accuracy rate in detecting solid waste. This accomplishment marked a major step forward in the development and effectiveness of our image detection system.

4.2 Mobile App Interface

The app interface is simplified to guarantee usability for the general public who might have limited digital literacy skills. The app is solely for submitting solid waste reports without requiring user accounts which simplifies the user experience significantly. Users can simply open the app, capture and submit images of uncollected solid waste, and fill out their necessary details hassle-free. Since there are no user accounts involved, there's no need for users to remember login credentials or go through a registration process, making it more accessible to a wider audience. Additionally, this approach potentially encourages more people to report waste, as it removes barriers to entry such as account creation.

Mobile App Upload Flow:

1. The user clicks "Gets Started" and opens the mobile app camera
2. The user is prompted to grant access to the device location
3. User captures an image of suspected waste and
4. To complete the report the user is prompted to fill in their details (name, surname, email address, phone number)
5. Report is submitted for processing
6. App displays the validity of the report

Figure 4: Solid Waste Detection Status, Garbage Detected (left) No Garbage Detected (right)

Upon submission, the image is relayed to a web server which then runs the ResNet model to detect the presence of solid waste in the image. The resulting status together with the waste detection model's confidence level and error margins metrics are displayed to the user. The *confidence level* in an image detection model indicates the likelihood that the model's prediction is correct. *The error margin*, also known as the margin of error, quantifies the uncertainty or potential inaccuracy in the model's prediction. It is also often expressed as a percentage. Showing these metrics helps build trust with users by providing transparency about the detection process. Users can see how confident the system is in its detections, which can help them understand and trust the app's decisions. Using the two metrics developers can identify specific types of waste or scenarios where the model struggles, benchmark the model's performance over time, and a whole lot of aspects that need to be revised to improve the model.

4.3 Map of Reported Uncollected Solid Waste Instances

Only admin users on the web-side interface can access the valid submitted solid waste reports and their location details. This page displays a map showing the accurate location(s) of the reported uncollected solid waste reports. This allows the waste collection entities to traverse to the exact points where uncollected solid waste has been reported and conduct clean-ups. The accurate locations are obtained when the user submits an image of suspected solid waste. The map is facilitated by a Google Maps API. Once a report has been attended to, the admin notifies the user. The email addresses submitted by contributing users are used for real-time notifications whereby the users about informed about the progress of their reports. This fosters transparency and trust in the system.

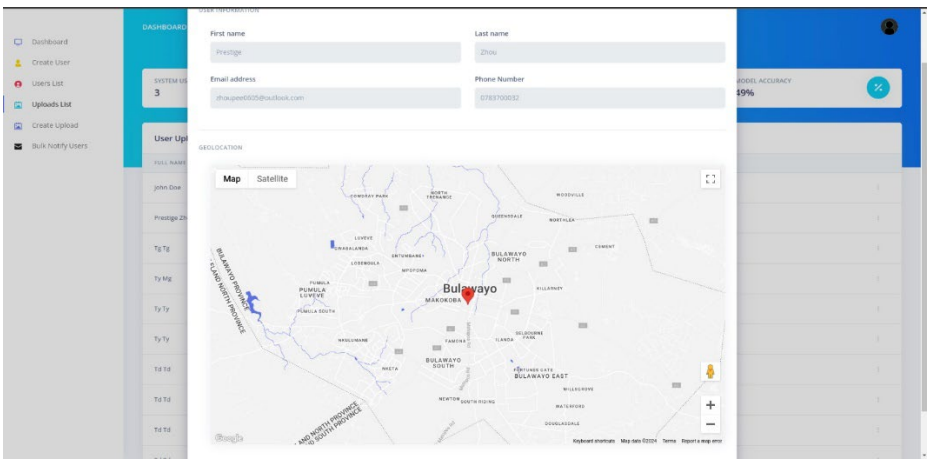

Figure 5: Map showing the location of a reported uncollected waste instance

4.4 Proposed Improvements

Zimbabwe, like other global counterparts, is grappling with the challenges posed by electronic waste (e-waste) in an increasingly digital world (Tsiko S, 2024) . Future improvements for the app could involve expanding its functionality to include the detection and reporting of electronic waste (e-waste). The ResNet model could be trained on e-waste datasets to enhance the app's capability to accurately identify various types of e-waste from user-submitted images, ensuring precise classification and appropriate handling of electronic devices. This would streamline the e-waste management process, allowing for more efficient and sustainable handling of electronic waste. Integrating gamification into the uncollected solid waste reporting app could affect its usability but has the potential to significantly enhance user engagement. Gamification features like points, levels, and leaderboards incentivize users to actively participate in waste reporting and community clean-up efforts. Challenges and badges further motivate users to contribute positively to environmental conservation, while virtual rewards offer recognition for their contributions. By combining these elements, the app transforms waste reporting into an engaging and rewarding experience, driving greater community involvement and fostering a culture of environmental responsibility.

5. Conclusion

This research explored the development of a crowdsourcing mobile application for solid waste detection and reporting based on machine learning and geotagging. The application aimed to address the growing challenge of neglecting solid waste by providing a user-friendly tool for waste identification and reporting. From this research, it can be concluded that machine learning models, particularly Convolutional Neural Network models, are effective for solid waste detection in images. By leveraging a binary classification pre-trained model, ResNet50, the application achieved high accuracy in identifying various types of solid waste in their natural environments. This backs all prior work conducted by scholars in the same field. Another takeaway point of note is the need to achieve a balance between model accuracy and computational efficiency. While complex models can offer higher accuracy, they might not be suitable for mobile devices with limited processing power. This research utilized a mid-range model and achieved good accuracy while maintaining efficiency for mobile deployment. Finally, in developing a system for use by the general public, user-friendly design principles should be adopted to achieve widespread adoption. This influenced the creation of two separate interfaces for the contributing users and for system admins to keep the interfaces clean, minimalistic, and uncluttered. To foster use, the app requires no sign-up for one to capture and upload an image but requires user details after the successful upload of a report. This research successfully demonstrated the feasibility of developing a crowdsourcing mobile application for solid waste detection and reporting using machine learning and geotagging. The application has the potential to empower citizens to participate in waste management efforts by facilitating waste identification and reporting.

Business Redemption in Recent Times: The Role of Dynamic Leadership, Digital Innovation, and Sustainable Performance in the VUCA World

Charles Randy Afful[1] and Jan Dvorsky[2]

[1]Tomas Bata University, Faculty of Business Economics, Zlin Czech Republic

[2]Zlinsky Technical University, Faculty of Business Economics and Transport, Slovakia

charlesafful29@gmail.com
jan.dvosky5@gmail.com

Abstract: Due to the evolution of firms from analogue structures to digital platforms, the digitalisation of SMEs has become necessary in the post-COVID era. Firms are diversifying their modulus Operandi to remain competitive in the market. This is due to the extrinsic and intrinsic factors mitigating the business environment. The growing Volatile, Uncertain, Complex and Ambiguous world known as VUCA in the business environment impacted by digital innovations, which entails the plague of war, and post-pandemic effects demands strategic research investigation to achieve a persistent sustainable business performance through dynamic leadership. This study harnesses a systematic review of the literature on digital innovations, dynamic leadership and sustainable performance in the VUCA world. The review utilises the SLR format reviewing articles from high-impact journals from 2018 to 2023 on ensuring sustainable business performance in VUCA, and the role of dynamic leadership. In effect, there is the need to develop strategic policies to guide businesses against unfortunate mishappening. This study seeks to explore a digitalised system with a dynamic leadership strategy to achieve sustainable firm performance. Digital managerial innovation policies and the influence of dynamic leadership will subsume sustainable business performance in the VUCA environment. The study outcome revealed that digital innovations and dynamic leadership significantly influence the current business environment in achieving sustainable performance and business continuity.

Keywords: VUCA, Digital innovation, Dynamic leadership, Sustainable performance

1. Background

Firms are currently facing the challenge of invigorating employees with digital skills to be highly competitive in the global business digitalization environment (Patra, A. K., & Dash, R., 2023), through dynamic leadership skills. This will allow the leader to sense, configure and transform to the changing work environment. For businesses to achieve sustainable performance, leaders must adopt dynamism and digital innovations aimed at quality, cost reduction or sustainable products and services. Most SMEs face a shortage of resources and technological adoption and usage challenges despite providing over 80% of jobs and cushioning the GDP of economies (Fang, G. G., Qalati, S. A., Ostic, D., Shah, S. M. M., & Mirani, M. A, 2022). Given the insurgency of wars in various continents (Africa, Europe, and rising tensions in Asia), the slow recuperating from the COVID-19 pandemic effect and the economic mis happenings, SME managers must adopt a dynamic leadership style to sail through the storm. Dynamic leadership style differs from the traditional leadership style which has dominated the work environment for some time (Khaliq, M., Usman, A., & Ahmed, A., 2021), however, the current evolving trends of digitalization and the exposure of firm to the global market demand a dynamic style to navigate the business to a sustainable performance. Organizations harness the capacities of digital equipment to grow their performance, innovation, and stakeholder involvement, thereby contributing to a more resilient and sustainable performance. Exploitation abilities permit corporations to optimize present market-associated knowledge to achieve sustainable performance. The current business environment is described as progressively dynamic, antagonistic and tumultuous known as VUCA. The continuous rise in hostility is attributed to heighten business competition, the entrance of new competitors, the merging of industries, and a decline in trust among competitors within various industries (D'aveni, R. A., & Ravenscraft, D. J. , 1994); (Hambrick, D. C., Davison, S. C., Snell, S. A., & Snow, C. C., 1998). In view of this, business must enact strategic policies to cushion their operation against any externalities and recover from economic distress conditions.

2. Problem Statement

Management of SMEs have been challenged with plethora of issues ranging from their low capitalization, poor managerial acumen, inefficiencies, ineffective managerial systems leading to frequent collapse and acquisition by large firms meanwhile they serve as the beckon of growth for most economies (Blake, 2022; Singh, 2022) by supporting the GDP with almost 80%, serving as source of employment to about 70-80% of the population. Business turbulence on the other hand, is primarily caused by the escalating pace of change and the disruptive impact of environmental and technological advancements. Given this, leaders need to exercise their strategic

plan to foster firm growth. Turbulent challenges are described as situations that arise unexpectedly, are hard to predict, irregular, and ambiguous (Ansell, 2021). Practically some businesses have enacted strategic emergency plan to help them sail through turbulence, but many others have non existing strategy to continuously remain sustainable. As such in times of losing a major customer, these firms will either wind up or cut operations by 50-70 per cent (Jiang, Y., Ritchie, B. W., & Verreynne, M. L., 2022). This re-echoes the imminent need for businesses through dynamic capability concept strategies to remain sustainable over the period.

Dynamic leadership skills require digital competence, planning skills and the ability to be innovative and manage people effectively (Gilli, K., Nippa, M., & Knappstein, M., 2023). Leaders without good followers are likely to fail in their pursuit. digital leadership competencies permit firms to include innovation using profound virtual capabilities and competencies. These capabilities include talent in digital literacy, strategic thinking, and adaptability. Dynamism in leadership necessitates leaders to implement swift modifications to enhance adaptability or marketing strategies to remain resilient and pertinent to the broader consumer base.

Additionally, for firms to be more resilient against economic and climate turbulence, there is a need to pursue this research. Dynamic leadership within an organization's management context is characterized by a leadership approach that emphasizes collaboration, teamwork, and strategic planning (Tucker & Lam, 2014).

3. Research Gap

Some researchers have recounted the impacts of leadership on SMEs sustainable performance and innovativeness. Whereas some perspective argues in support of innovation and digitalization in the SMEs segments, other loop on the nonexistence of sustainable performance measures in most of the SMEs firms in the developing context, mainly focused on business to business strategic measures(Profiteering oriented).The presence of a dynamic leaders in the business environment is crucial for promoting innovation and creativity, thereby improving the organization's resilience and competitive edge in the market, (Singh, S., Hong, P. C., & Jagani, S, 2023).Effective leadership involves a continuous cycle of validating, empowering, communicating, and interpreting actions that lead to diverse results (Brandt, E. N., Kjellström, S., & Andersson, A. C, 2019). A study by recommended future research to use the concept of entrepreneurial resilience to develop a synergic effect on effective crisis/disaster management at an individual level.

The objective of this study is to systematically review literature on business redemption strategy of dynamic leadership and digital innovation on SMEs sustainable performance. So, the specific objectives itemize to elaborate on this study is as follows:

- To measure the influence of dynamic leadership on the sustainable performance of SMEs
- To assess the relationship between digital innovation and dynamic leadership.
- To assess the digital innovation impacts on sustainable performance.
- To examine the influence of digital innovation, dynamic leadership, and sustainable performance on Business redemption.
- The outline of this research will revolve around the introduction, which will entail the research gap, research objective, of the research problem. the next section will be the literature review and then the methodology, result and conclusion.

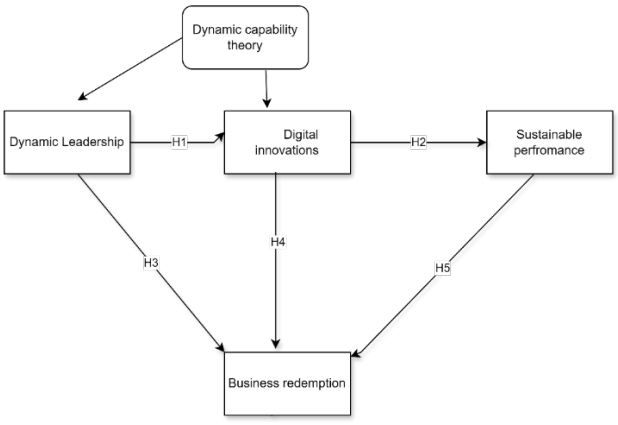

Figure 1: Conceptual Framework. Source: Authors source, 2024

Dynamic Leadership

Many scholars on leaders have enumerated various leadership style and their contribution to firm success and their defects. Some scholars have articulated that transformational leadership is the best however in the current business climate bereaved with increasing costs of goods and services, impacts from climate change and the impasse of wars. Dynamic leaders are leaders who aside interact and develop their followers to influence them and ensure the growth of their employees together (Basham, M. J., & Mathur, R. P., 2010). Dynamism in leadership necessitates leaders to implement swift modifications to enhance adaptability or marketing strategies to remain resilient and pertinent to the broader consumer base.

Additionally, for firms to be more resilient against economic and climate turbulence, there is a need to intricacies of leadership and its repelling effect on firms in this research. Dynamism in leadership in firms' management context involves leading with collaboration using digital systems, teamwork and strategic business environment analysis. (Tucker & Lam, 2014).

Digital Innovation

In the modern era of information technology, the process of digital transformation is seen as a crucial skill for organizations to thrive sustainably, (Xu, J., Yu, Y., Zhang, M., & Zhang, J. Z, 2023). A study conducted by (Gupta, S., Kumar, V., & Karam, E., 2020) illustrated that the implementation of Cloud-based Enterprise Resource planning (ERP) systems will significantly improve sustainable performance. Furthermore Raut, et al., (2021) highlighted the positive impact of big data analytics in enhancing the business performance of sustainable supply chains. in the pursuit of sustainable performance, business leaders should enforce strategies through dynamic capability of sensing and configuration to be sustainable in volatile, uncertain, conditions or means of diversifying an organization, either as a response to changes in the external environment or as a pre-emptive action to influence the business environment. Digital transformation in businesses helps provide significant advantages in tackling environmental challenges (Ghobakhloo, M., & Fathi, M., 2021); (Kiel,et al., 2021) Previous studies by Gupta et al., (2019) indicated a strong correlation between emerging technologies like big data analytics and artificial intelligence (BDA-AI) and positive environmental outcomes. This relationship has been substantiated by multiple research endeavours Nascimento, et al., 2019); (Queiroz, M. M., & Wamba, S. F, 2019). Digital transformation in businesses helps provide significant advantages in tackling environmental challenges (Ghobakhloo, M., & Fathi, M., 2021) ; (Kiel, et al., 2021). Previous studies Gupta,et al., (2019) have indicated a strong correlation between emerging technologies like big data analytics and artificial intelligence (BDA-AI) and positive environmental outcomes. This relationship has been substantiated by multiple research endeavours Nascimento, et al., 2019); (Queiroz, M. M., & Wamba, S. F, 2019) Researchers have emphasised that alleviating unprecedented sustainability challenges requires the deployment of innovative digital technologies and the cooperation of multiple actors (Pershina, 2022).

Sustainable Performance

Couched from the triple bottom approach of the sustainability index which encompasses environmental, social and economic factors. firms can better manage the volatile business environment by achieving sustainable performance considering the triple bottom line (TBL) approach (Bansal, 2005); (Elkington, 2013). Ensuring a safe, healthy, and humane working environment has been the target for multinational firms in achieving sustainable performance. This is because the effect of climate change is posing a devastating impact on food security, the co-existence of humanity, the effects of extremely low and high temperatures, and the emergence of various strange diseases as such the excellent mode of redeeming the universe (businesses and humanity) is through the implementation of sustainable and digital innovation paradigms.

Hypothesis

This systematic literature research is grounded on the under listed hypothesis to guide practice.

1. Dynamic leadership positively influence digital innovation.

Various studies have confirmed this hypothesis including Mihardjo, et al., 2019) who stated that digital leadership based on dynamic capability impacts directly and indirectly on firms developing innovation which leads firm owners to envision market sensing, seizing opportunities and reconfiguration of the business to ensure competitive advantage. Also, Benitez, et al., 2022) affirmed that digital leadership increases firm's innovation and performance by digitalizing the firm's platform and improving performance thus encouraging firms to imbibe into their organizational structure.

Digital innovation influences sustainable performance positively. However others articulated that in as much as digital leadership improve firm performance, they are also prone to disruptive technology effects and other challenges which SME firms much consider, (Brunner, T. J., Schuster, T., & Lehmann, C., 2023).

2. Dynamic leadership impacts positively on SMEs business redemption.

Redemption of businesses occur when firms are in distress situation of collapse if no intervention is employed, the term was formerly used in the religious aspect, till it veered off into the business management concept. Whereas some researchers attribute business redemption to the character traits of the employees (Cultural), others link it to financial distress situation and some leaders and management crisis, and the current business environment is polluted with several SMEs in this dire situation leading to their untimely collapse. However, some have stated that that utilizing a employee's redemptive approach could lead to greater loyalty and enhanced performance. Also cost reduction potential emanate in addressing turnover, hiring and potential litigation, and improved organizational commitment through greater performance (Bucci, J. J., & Bucci, J. J., 2016).

According to Bies, et al., (2021) redemption is defined as "the restoration of social identity, legitimacy, status, and/or reputation of an individual or firm, after the individual or firm has violated important moral or performance expectations that are publicly visible. Strategic policies are the best solution to redeem businesses image and restore customer confidence and ensure viability in these economically challenging times for some SMEs (Weaven, S., Quach, S., Thaichon, P., Frazer, L., Billot, K., & Grace, D., 2021).

Digital innovations impact positively on business redemption.

The theoretical concept of dynamic capability sort to enhance firm leaders' ability to sense business opportunities using digital innovations, reconfigure the business operations to align with market conditions for growth and ensure that distress firms recover. The application and effective use of digital innovation is expected to reduce firms' operational cost and ensure efficient raw material usage. The implementation of digital innovation reduces financial constraints on firms and ensure positive direction towards redemption (Ping, Y., & Li, Z., 2024).

Sustainable performance influences business redemption.

Business performance impacts on their current and future sustainability influencing the redemption rate of firms in distress. As Firms continue trajectory to remain sustainable over a period, there is the likelihood of been redeemed if strategic policies incorporate are followed o the latter. It is therefore important to hypothesis that firm's sustainable performance will influence their ability to redemption structurally, financially and leadingly.

4. Methodology

This article relied on the SLR systematic literature model to study on SME businesses could e redeemed through dynamic leadership and digital innovation in times of economic mis happenings.

A total of over 1,700 articles were identified after the first screening, in google scholar and finally 20 articles were selected from high impacts journals ranked either in web of science or Scopus.

After using keywords of VUCA, sustainable performance, dynamic leadership and a total of 21 articles were realised using the article keywords as related to the area of interest having scanned through the abstract.

Also, after the first review, some articles were eliminated due to time frame which was set from 2019 to 2024. The range took into inconsideration the intense effect of covid on humanity and the time that most businesses started the recovery processes.

Table 1: Literature review summary for 21 articles.

CG has a significant positive effect on performance [financial performance (FNP) and non-financial performance (NFP)] and SI. SI has a mixed impact on performance	This study supports the assumptions of theories (institutional, stakeholder and agency) as the basis for the usage of multiple approaches to determine the outcome of hypotheses, especially in developing climes.
21	Matteo Mura, Mariolina L ongo, Sara Zanni	Circular economy in Italian SMEs: A multi-method study	Results indicated that several circular economy (CE) practices are simultaneously implemented by SMEs, thus supporting the notion that CE implies a systemic approach to company's value creation	sample focused on SMEs, as they are relevant players in the diffusion of CE practices due to their prevalence in EU countries, Also, analyses explored a limited number of industrial sectors (i.e. plant engineering, manufacturing, service-based firms, tourism and ICT)

Thematically, most articles dwelled on sustainable performance and digital innovation with less research on business redemption. Issues on business redemption were on VUCA situations in the research arena. most of the study considered the relevance of dynamic capability theory and resource-based view in establishing strategic policy for firms during uncertainty.

5. Findings

The study found that before the pandemic, most of the research reviewed failed to unearth some business redemptive strategies especially studies from 2021 to 2024 but articulated the need firm digitalization and for SMEs' sustainable strategies for their innovativeness as evidence form the table 2.5.Also sustaining firms' operation in a VUCA environment was adequately researched and many suggestions on sustainability as the way forward for firms, however there was no direct link with digitalization strategies to performance but present on the triple system (Environment, economic and social issues).

Most of the literature refenced from table 2.5 discussed digitalization of firms whilst others highlighted the challenges envisage during digitalization and alighted firm owners and managers to be weary. The effective management of these VUCA situations at the workplace demands effective dynamic leadership skills which will conduct environmental scanning and employ available data analytic resources to improve business fortunes. According to Zhang-Zhang, et al.,(2022), while leaders need to develop their dynamic capabilities to adjust to new contexts, transformational leaders will function better in a highly dynamic VUCA environment than transactional leaders. Developing management systems through dynamic leadership skills using technology, allows managers to rely on business information analytics to critically assess the current and future business arena (Ashrafi, A., Ravasan, A. Z., Trkman, P., & Afshari, S., 2019) and make the right intervention through sensing, reconfiguring the firm and transforming the firm especially those in dying need of redemption. Thematically, the various review topics were closely related to SME firm redemption in times of uncertainty but failed to suggest practical recommendations to deal with the situation. Also, recent studies suggested the need to consider the enterprise orientation principle of SMEs and suggest emergency strategies to strengthen the firm's existence (Herbane, 2015). Additionally, most of the studies relied on dynamic capability theory, Resource-based View which whilst a few others used Technology adoption theories

6. Conclusion

The review identified that various scholars' concentration before COVID-19 was on businesses recovering from the effect of the pandemic, however, in the post-research review the studies have little focus on SMEs' ability to develop strategic resilient plans to redeem their operations from any untoward. This could be sensing the ability to measure business outlook in the future and proffer solutions or their ability to use both internal and external resources to improve their knowledge of business management practices and develop strategic plans.

Redemption was delineated by some researcher as employee character change, while other stated that redemption involves delivering firms from financial scam, however the research amid at proffering solutions to SMEs in distress need in time of economic crunch and ensure SMEs remain sustainable and remain resolute against all situations due to enabled strategic policy instituted. There is still a limitation in terms of leadership research on SME management and recommend future studies to consider considering the current digital times. The various review outcomes indicate that schoolers were more profound on business sustainability in the wake of COVID-19 however, just after that, firms have been silent on having strategic emergency plans that could be relied on in times of economic difficulty which some researchers have anticipated to reoccur. This study was limited by the small number of literature used, and those literature eliminated could also hep to improve on the study.

Abstract: This study reviews the state-of-the-art relationship between sustainable development and blockchain technology, which can be intertwined concepts within business language, enterprise structures, and managing processes. It explores further comprehension of concepts such as digital technologies, blockchain technology, and the United Nations' Sustainable Development Goals. A systematic literature review using the Prisma Protocol is conducted to identify the main researched topics and the most used sustainable development goals. In addition, the main articles, authors, and journals of the research field are identified. An analysis of the results is applied to acknowledge the findings' contribution. As an outcome, the study identifies 14 main subject research areas that can serve as a framework for the future, including 49 main topics relevant to blockchain technology's relation with sustainable development goals in business studies. This systematic literature review contains an extensively researched database about the subject, and its results and findings are valuable in the scientific and professional sectors for further studies in sustainable development using blockchain technology.

Keywords: Sustainable development goals, Blockchain technology, Business studies, Systematic literature review

1. Introduction

Blockchain technology (BT) growing interest is reflected in the accumulated use number of applications and research articles about the subject, with a particular focus on its relationship with sustainability and the circular economy from different industrial sectors emerging from it (Kouhizadeh et al., 2021; Saberi et al., 2019). Besides, distributed ledger technologies (DLTs), which BT is part of, not being new, the renewed interest grew, in 2008, with the publication of the white paper "Bitcoin: A Peer-to-Peer Electronic Cash System" (Nakamoto, 2008). Since then, this emerging technology has grown drastically regarding the number of intervenients. Its usage also supports decentralised transactions across various business fields, promoting disintermediation, authentication, data integrity, traceability, trust and transparency across different applications (Yadav and Singh, 2015).

However, the disparity of use cases and applications can lead to disconnected strategies and paths when addressing common causes such as sustainability. Therefore, as a framework, the United Nations Sustainable Development Goals (UN SDGs) can serve as a guideline for a renewed agenda to embrace organisations and individuals in an aligned sustainable development process until 2030. By substituting the old Millennium Development Goals and introducing a more complex approach, collaboration and engagement of the different intervenient is necessary (United Nations, 2023), and technology, in particular BT, can boost sustainability transition and must be considered vital to sustainable business models.

1.1 Importance of the Study

This research reviews the main concepts of BT and the SDGs in business studies to analyse their relationship. It also aims to understand the main applications of BT and how and in which particular topics and more extensive subject areas the technology addresses the SDGs.

The present systematic literature review (SLR) adds relevant research to the business studies literature and offers paths for further research. The present research addresses the question: "*What is the relationship between BT and SDGs and which topics are being explored in business studies?*".

1.2 Methodology

We developed an SLR based on Scopus and Web of Sciences (WoS) scientific databases to address this question and used the PRISMA protocol. We structured the article as follows: a) the next section presents the main concepts and the theoretical background of the SLR, presenting the SDGs and then the BT relationship with sustainability; b) afterwards, we expose the methodology used at the SLR, where the review focused on peer-reviewed articles published between 2008 and May 2024, resulting in a final selection of 441 articles after applying inclusion and exclusion criteria; c) then, we present and discuss our results by categorising the articles and analysing their contribution to the different SDGs and the business context they address; d) we finish the paper by addressing the conclusions and limitations of the paper.

1.3 Main Contributions

The study presents an extensive and comprehensive database of key articles, authors, and journals that can be used for further research on the intersection between BT and sustainable development. By bridging theoretical and empirical insights, it highlights BT as a promoter of sustainability across different sectors, emphasising supply chain, circular economy and smart cities subjects. These are included in a framework identification of 14 leading research areas and 49 topics addressing BT's impact on SDGs in business studies. They can serve for future research by outlining its potential research directions and exploring potential BT's applications to enhance sustainable practices within business models.

2. Theoretical Background

2.1 United Nations Sustainable Development Goals

The SDGs is a group of 17 interrelated goals and 169 associated targets representing a comprehensive and multidimensional approach to addressing the three pillars of sustainability – environmental, social, and corporate governance (ESG) - for today's world's challenges. The full SDGs list is shown below in Table 1. The UN General Assembly adopted them in 2015, and they were designated to be adopted as a framework to achieve a better and more sustainable future for all by 2030. The SDGs are a significative advancement from the previous Millenium Development Goals, as they integrate social needs and environmental limits in a more holistic approach to sustainable development (Howard-Grenville et al., 2019; Jägermeyr, 2020; Kleespies and Dierkes, 2022). These goals address global challenges, including poverty, inequality, climate change, environmental degradation, peace, and justice. They also recognise that ensuring health and well-being and providing quality education is essential for achieving proper development and sustainable prosperity, an inclusive and peaceful society and a global interconnected partnership (United Nations, 2023).

For SDGs' accomplishment, they must be perceived, accepted, and evaluated by people, but also by organisations worldwide, as their success depends on global engagement and commitment (Kleespies and Dierkes, 2022). Organisations play an essential role in achieving the 2030 agenda, and they need to promote sustainable practices and foster this mindset among their employees to drive the transformation (Elias et al., 2023). Only active engagement of organisations and integration of more sustainable practices can help realise this transformative vision and ensure a more sustainable future for all.

Table 1: UN SDGs

UN SDGs			
Goal 1: No poverty	Goal 2: Zero hunger	Goal 3: Good health and well-being	Goal 4: Quality education
Goal 5: Gender equality	Goal 6: Clean water and sanitation	Goal 7: Affordable and clean energy	Goal 8: Decent work and economic growth
Goal 9: Industry, innovation and infrastructure	Goal 10: Reduce inequalities	Goal 11: Sustainable cities and communities	Goal 12: Responsible consumption and production
Goal 13: Climate change	Goal 14: Life below water	Goal 15: Life on land	Goal 16: Peace justice and strong institutions
Goal 17: Partnerships for the goals			

2.2 Blockchain Technology and Sustainability

BT is a decentralised, transparent, and safe distributed ledger that can maintain transaction history along its chain in all nodes through peer-to-peer operations (Hastig and Sodhi, 2020; Hughes et al., 2019). Unlike centralised databases, where verification of information transactions is the responsibility of a central authority, BT employs cryptography and an agreement mechanism for confirming and enrolling new deals into a shared registry and removing intermediaries. These records can be shared either publicly or privately amongst the agents that participate in the BT (Kouhizadeh et al., 2021; Saberi et al., 2019).

The decentralised peer-to-peer operational and smart execution way that BT works allows it to have more transparency and traceability, giving more visibility, data integrity, and accountability to its operations and further enhancing also sustainability by giving more monitoring and verification allowance on the sustainability-related performance indicators (Park and Li, 2021; Saberi et al., 2019). It also allows for potentially reducing costs and more operational efficiency of business models by reducing or eliminating intermediaries.

When addressing sustainability and the SDGs, we can find a potential direct linkage benefit of using this technology by contributing to a more sustainable approach where there is more visibility and audibility on areas such as resource consumption, emissions, traceability, waste generation, fair trade and wages, and many others that can promote a transformative vision for a more sustainable future (Kamble et al., 2020; Park and Li, 2021; Saberi et al., 2019).

3. Methodology

This study aims to provide an overview of prior research on the relationship between BT and SDGs. SDGs are a guiding framework to expand the study's scope, and they conduct a comprehensive examination of the available literature focusing on the multifaceted relationship between the domains where BT can enhance sustainability from a business studies perspective. To establish a knowledge base for exploring various research streams, suggesting future research directions, and identifying commonalities and differences in research approaches and methods, we accessed and compiled an extensive database of relevant articles to guide this research process and outcome. We made an effort to access and collect crucial and trustable information accurately, as inaccuracies could bias the research results and compromise desired quality standards. Therefore, we used an appropriate and well-designed methodology to synthesise the research systematically, transparently, and context-sensitively and to help overcome the bias in the results (Tranfield et al., 2003). The findings of this study serve as a solid foundation for future scientific research by academics and professionals, which could inspire the development of an evidence-based strategy for addressing the critical challenge of sustainable development.

3.1 Question Formulation

A clear review question, developed at the beginning of the review process, is a crucial driver for a successful SLR (Nguyen et al., 2018). After defining the search strings and the scientific databases to search, based on the preliminary theoretical study, we formulated the following research question: "*What is the relationship between BT and SDGs and which topics are being explored in business studies?*". This question leads the way for an exploration focusing on the interconnection of the UN guidance framework for a sustainable future and the emerging usage of BT across the different SDGs, thereby addressing and agglomerating main subject areas that are fast developing within the academic and professional communities.

3.2 Definition of the Review Protocol and Studies Evaluation

The SLR process and objectives, when guided by PRISMA's diagram protocol (Page et al., 2021), lead to more reliable and precise findings. The use of unambiguous and systematic procedures, such as clearly defining inclusion and exclusion criteria, is instrumental in the identification and validation of relevant studies. It also plays a significant role in reducing the potential for errors or subjective decision-making. The endorsement of PRISMA by editorial organisations and its adoption by researchers conducting SLRs it is key in promoting transparency, reproducibility, and confidence in the reported findings (Moher et al., 2009). It also provides a comprehensive and reproducible search strategy, which is vital for the reliability, by minimizing bias, and the validity of the review (Mengist et al., 2020). Figure 1 shows the complete applied PRISMA's protocol interaction process steps through identification, screening, eligibility, inclusion, and final records result. The subsections following Figure 1 describe in detail each step of the research review process.

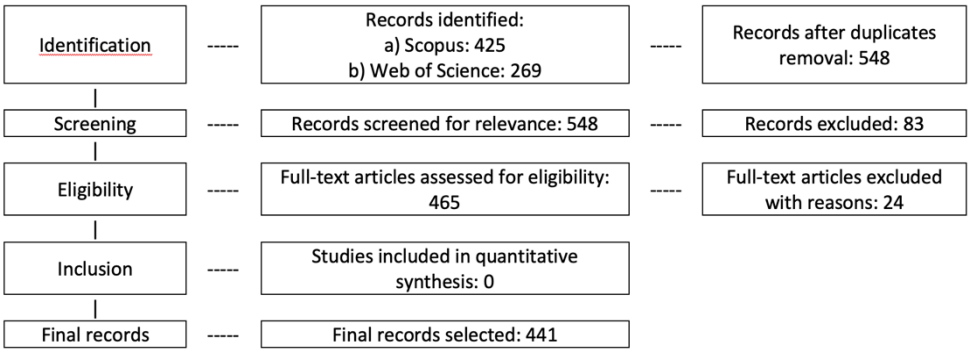

Figure 1: PRISMA's review process of the research

3.2.1 Database selection

We restricted the systematic review search to peer-reviewed journals listed in the Scopus and WoS databases. Both sources combine a vast range of results in business studies from top-level journals, which allowed search outcomes with the most important subjects' results.

3.2.2 Search and identification strategy

Given that the context of this review is about the relationship between BT and SDGs in business studies, our search started in 2008, because this was the published date of the Bitcoin paper (Nakamoto, 2008), and we ended it by May 2024. The search string applied in both databases used the mandatory search terms "sustainab*" and "blockchain", ensuring the relevance of the retrieved search results from titles, abstracts, and keywords. We only searched data in the subject areas of Business, management and accounting. All the documents' results were limited to peer-reviewed articles with a finalised publication stage and English language.

We exported the relevant articles to a reference management software package (Mendeley). After eliminating duplicates, the two databases combined contained 548 articles.

3.2.3 Screening and exclusion criteria

In the screening step, we defined the articles criteria for a full review eligibility. We analysed all the articles' titles, abstracts, and keywords to ensure they were directly related to the mandatory topics of sustainability and BT, both of which needed to be framed by the SDGs. From this screening, we excluded 83 documents with the following criteria: E1: Articles unrelated to BT; E2: Articles unrelated to sustainability; E3: Articles unframed within SDGs; E4: Articles unwritten in English; E5: Articles unpublished between 2008 and May 2024; E6: Articles from non-peer-reviewed scientific sources; E7: Articles unrelated with business, management and accounting subjects.

3.2.4 Eligibility and inclusion

In the eligibility phase, we analysed the text of the articles to ensure they were aligned with the pre-screening phase criteria, but now, in more detail. From this eligibility procedure, we excluded 24 articles and kept 441 records to include in the SLR's final selection. We decided not to include other documents from other sources and keep with the outcomes from the Scopus and WoS databases.

3.2.5 Data extraction, structuring and analysis

The final stage of our SLR involved data processing and creating data networks to extract meaningful insights from scientific publications. The data was exported to Microsoft Excel software to organise all the entries into a single database. The accuracy of the data was assured by verifying its reliability, and the articles' content information was categorised. Ultimately, we coded each article with the relevant search terms and the SDGs it addressed. This coding process allowed us to obtain specific outputs for a more focused analysis in each group later.

Furthermore, we processed and structured the data to enhance its legibility, which facilitated the extraction of results such: a) publications per year, b) top publishing sources and authors, c) journals' quartile distribution and h-index values, d) most researched subjects, and e) top-cited articles as well as the distribution of articles per SDG and the subjects they cover. Lastly, we generated a list of topics the SDGs address and grouped them into suggested future research subject areas.

4. Analysis of the Results

The selected articles mainly cover business, management, and accounting subjects as specified in the previous section and contribute essentially to the research area of business studies. Figure 2 also shows that the number of publications on the research subject has grown substantially over the past years, reaffirming its importance. Besides starting the search in 2008, we only have two first results in 2017, assuring this is a recent research area. We can identify a growing trend of publications until 2024. This trend continues in 2024 because we already have more than half of the publications by May compared with 2023.

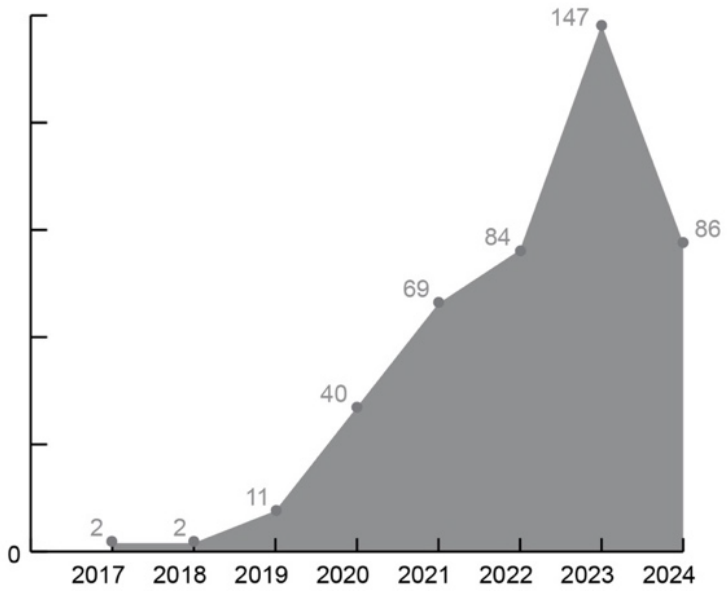

Figure 2: Publications by years

Table 2 presents a comprehensive summary of the most influential journals in our research. It details the number of published articles, the source, and the relevance. By utilising the Scimago Institutions Rankings, an internationally recognised ranking system for over 2000 research institutions and organisations (Dumay, 2014), we can identify that most articles integrate the first and second quartiles, except one journal classified in the third quartile. The outcome demonstrates the articles' scientific quality and relevance to the research field.

Three leading researchers are more active in the literature contribution: Kumar, Anil; Sarkis, Joseph; and Mangla, Sachin Kumar. Table 3 exhibits their significant contributions, detailing the number of publications, main research subjects, affiliation, and the h-index. This comprehensive view lets us disclose their impact on advancing knowledge in this field. Table 4 summarises the most cited articles in the research field, their publication source, quartile acknowledgement and the Chartered Association of Business Schools Journal Ranking 2021 positioning.

Table 2: Most contributing journals

Figure 3 resumes the number of articles contributing to each SDG and the related topic addressed. Each article can contribute to more than one SDG and, therefore, be linked more than once to the same topic. The result is 49 articles' addressed topics, highlighting the "supply chain's traceability, transparency and trust through blockchain technology" as being, by far, the most addressed topic by the articles.

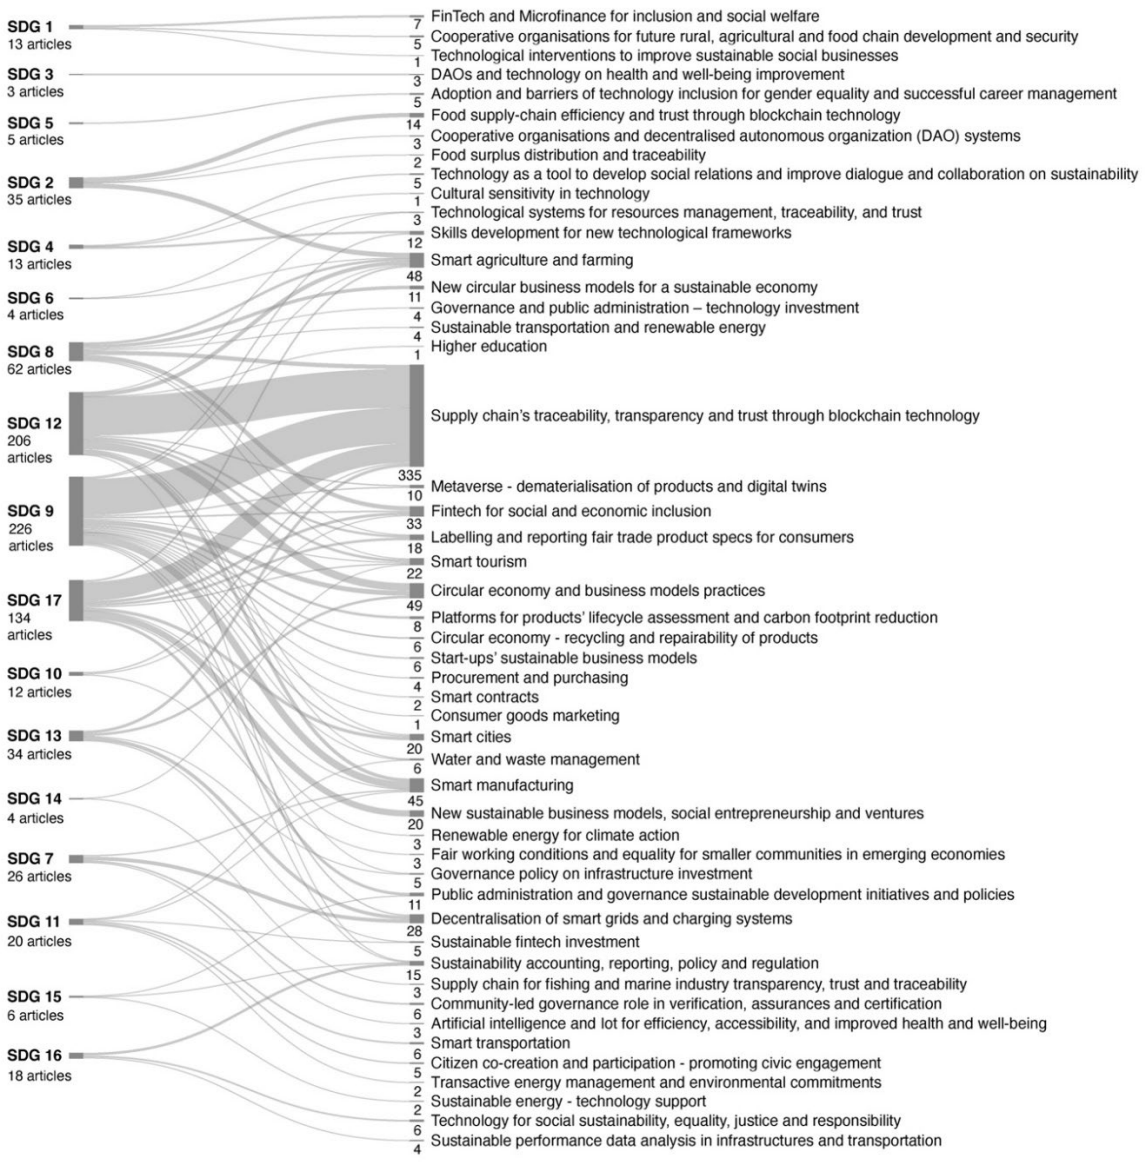

Figure 3: SDGs articles' topics

5. Conclusion and Future Research Directions

In this SLR, we analysed the main concepts, applications, topics, and subjects in which BT has intertwined with SDGs since 2008. The study's relevance and the information gathered allowed us to respond, along with the previous sections, to the initially defined research question: "What is the relationship between BT and SDGs, and which topics are being explored in business studies?". These insights resulted in acknowledging the growing trend of publications about the research area. We also gathered related information about the most contributing journals and authors and the most impactful articles crossing BT and SDGs in business studies. When using SDGs as a framework for BT in business studies, we found that SDG 9 and SDG 12 are the goals addressed the most, followed by SDG 17. The supply chain is, by far, the most addressed topic by the articles.

In order to foster future research areas in this field, we have identified 14 main subject research areas in which the explored topics are inserted. Figure 4 shows the exploration dimension of the overall research areas so far, and based on these, we describe what is addressed in each section. This information can inspire potential studies to shed more light on each and acknowledge new future research when crossing BT, SDGs, and business studies.

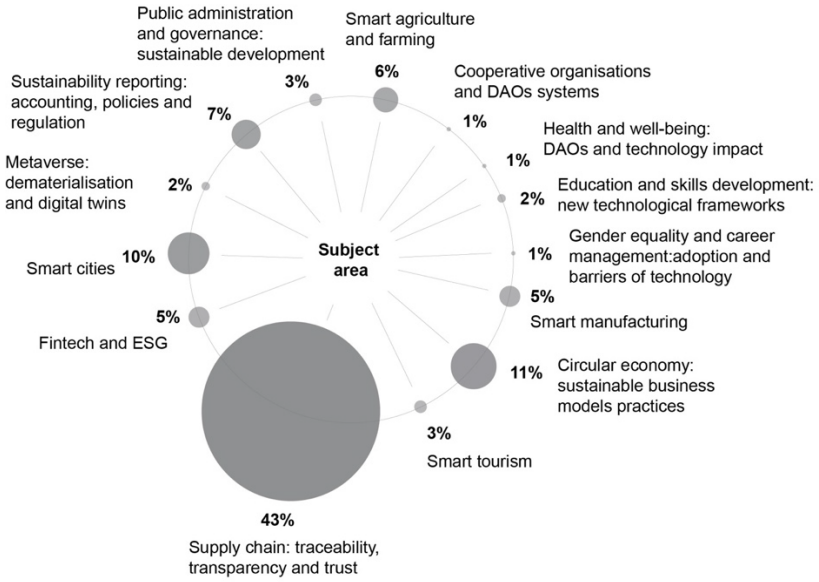

Figure 4: Subject areas

1. *Circular economy: sustainable business models practices (11%)*: with rising environmental concerns, innovative digital technology and circular business models enable a circular economy and enhance existing business models. BT, big data, Internet of Things (IoT), and other applications of digital technologies are all shaping different business fields and pushing them toward a transition with less resource consumption, less emissions, lower waste, and more organisational and private company performance and stability from an economic perspective (Khan et al., 2021; Saurabh and Dey, 2021).
2. *Cooperative organisations and DAOs systems (1%)*: although in many countries, organisations form cooperatives for business cooperation, a lack of formal mechanisms to enforce contractual agreements or other obstacles lead to decentralised autonomous organisations (DAOs) as an alternative form of governance independence (Amend et al., 2023).
3. *Education and skills development: new technological frameworks (2%)*: explores the sustainability determinants of adopting BT by higher education institutions and other stakeholders linked to the technology's growing popularity (Alshamsi et al., 2024). It also acknowledges that if we foster new technologies' knowledge and skills within organisations, this can turn into new forms of intellectual capital and have the potential to support value creation and realise SDGs (Al-Htaybat et al., 2019).
4. *Fintech and ESG (5%)*: fintech, powered by innovative technology, is driving a significant transformation in the financial industry by designing and delivering high-quality financial products and services. This transformation is being propelled by the key drivers of digitalisation and sustainability. The growing concepts of green fintech and financial inclusion prove this transformation and shape the industry's future (Mehrotra, 2023; Puschmann and Khmarskyi, 2024).
5. *Gender equality and career management: adoption and barriers of technology (1%)*: examines the role and potential of BT in promoting gender equality through the lens of new technology-oriented corporate governance models (Di Vaio et al., 2023). It also addresses financial inclusion and gender equality by exploring facilitating access to microfinance for female entrepreneurs (Kanegae et al., 2021).
6. *Health and well-being: DAOs and technology impact (1%)*: secure information holistically that can connect and assure its provenience and trustworthiness for the diverse stakeholders in healthcare, such as clinicians, scientists, and patients, and how to use technology to lead effective mechanisms for public administration (Jung and Pfister, 2020).
7. *Metaverse: dematerialisation and digital twins (2%)*: dematerialisation and digital twins, by substituting actual items for their digital counterparts, are adapting to consumer expectations (Schauman et al., 2023) and creating a relationship between the virtual and real world that can foster a more circular economy by promoting waste elimination and boosting continuous resource availability and traceability (Das et al., 2023).
8. *Public administration and governance: sustainable development (2%)*: the investigation is centred on the adoption of BT by public administration and governance in areas such as digital identity, social

provision, and innovative climate finance that can lead to more effective administrative mechanisms and decentralisation of power (Schulz et al., 2020). Besides the effort of the adoption, there are identified barriers to keeping BT as a support tool for sustainability, such as low dissemination and high cost, energy consumption and processing time (Bai and Sarkis, 2020).

9. *Smart agriculture and farming (6%)*: explores the design, development, and application of innovative methods to transform the field with more sustainable agricultural and farming practices where technology enhances food security and information (Leduc et al., 2021).
10. *Smart cities (10%)*: this area explores how to improve efficiency, transparency, accessibility, and quality of life in cities (Szpilko et al., 2023), from transport and logistics to smart grids and decentralisation of power energy (Said, 2023), BT enables sustainable future cities where there is empowered citizen participation and co-creation (Bagloee et al., 2021; Marsal-Llacuna, 2020).
11. *Smart manufacturing (5%)*: it demonstrates how manufacturing can become more sustainable by balancing ESG goals. To do so, it also includes explorations about digitalisation and the disruptive combination of technologies with BT, such as artificial intelligence, machine learning, the IoT, and big data (Agrawal et al., 2023).
12. *Smart tourism (3%)*: promoting new and innovative business models, improving the efficiency of the tourism service value chain, having a positive impact from a sustainable perspective, and enhancing the quality of the service provided to the end customer, mainly in related areas such as marketing, logistics, and smart business models (Prados-Castillo et al., 2023).
13. *Supply chain: traceability, transparency and trust (43%)*: BT has gained attention to ease global supply chain management issues. Managing and control have become complex in a globalised world where chains have gotten too long (Wong et al., 2020). Its sustainability is also challenging to track (Di Vaio and Varriale, 2020). However, with the pressure from local and global governments, in addition to the final consumers, BT and smart contracts are supporting a change with the potential to bring more efficiency, transparency and traceability to the chain (Upadhyay et al., 2021). The technology has seen rapid acceptance in food, healthcare, logistics, and other supply chains. However, there are still barriers keeping it from its potential, such as technological unpreparedness by the intervenient and the complexity of extensive supply chains. Besides BT being well-accepted and explored, inter and intra-organizational barriers also arise, and the true blockchain-led transformation is still in its early stages (Kouhizadeh et al., 2021; Saberi et al., 2019).
14. *Sustainability reporting: accounting, policies and regulation (7%)*: the pressure from authorities and supervisors on ESG reporting is demanding more consistency. Information unclarity can lead to different interpretations and non-comparability. BT addresses this area by creating frameworks for mitigation, automatisation, agility, and transparency either by publicly or privately undisclosing the data (Dario et al., 2021; Pizzi et al., 2022).

Academics and professionals can use the results of the present SLR as the starting point for elaborating new research and business strategies to foster the adoption of BT and promote sustainability, taking it into account within the SDGs framework to attain meaningful impact in achieving their objectives.

Finally, we shall consider the limitations of the SLR methodological approach since it can only give us a partial overview of the literature search from a limited number of databases. Other studies may also foster more profound content analysis research, particularly in this paper's outcome subject areas and topics list.

“Whatever It Takes”: Socioemotional Wealth and Endowment Preservation in Failing Family Firms

Mike Degmayr
Chair of Management Accounting, Technical University of Munich, Germany

mike.degmayr@tum.de

Abstract: Prior research has repeatedly highlighted the influence of socioemotional wealth (SEW) on decision-making processes in family firms, given that owner-managers seek to protect their SEW endowments and identity. Yet, little is known about how this influence unfolds in situations of firm failure and how far owner-managers will go to preserve their SEW and identity. Hence, this paper investigates the role of SEW in driving escalation of commitment to a failing family firm and the likelihood of reentering entrepreneurship after the firm’s failure. Furthermore, the role of fear of failure and attribution as moderators in the interplays are investigated. Two vignette studies leveraging 314 observations from owner-managers of family-owned craft businesses in Germany provide evidence for a positive impact of SEW on the degree of commitment escalation to a failing firm and the intention to reenter entrepreneurship after failure. Moreover, the results of the analysis suggest that fear of failure plays a moderating role in the interplay between SEW and escalation of commitment, reducing the extent of commitment escalation by owner-managers. Hence, fear of failure dispositions might either help fuel rationality in decision-making or trigger a “freeze” or “flight” coping strategy rather than direct failure avoidance via additional investments. The findings of this paper hold informative value for owner-managers seeking to reduce adverse or impulsive decision-making and governmental bodies trying to understand how economic wealth might be adversely influenced by a SEW-induced urge to protect failing family businesses. Furthermore, the underlying results enrich the current theoretical understanding of the dark side of SEW while clarifying manifestations of grief, attribution, and fear of failure in the family firm context. At last, this paper outlines various avenues for future research.

Keywords: Socioemotional wealth, Family firms, Escalation of commitment, Fear of failure, Attribution, Entrepreneurship

1. Introduction

Within the realm of family firms, owner-managers commonly form non-financial endowments and affective ties to their firms, which can range from emotional attachment and identification with the firm to a desire for dynastic succession (Berrone, Cruz, and Gomez-Mejia, 2012). Formally defined as socioemotional wealth (SEW), these non-financial considerations frequently put owner-managers in a position where non-economic considerations must be balanced with financial interests. In such situations, owner-managers have been found to protect their identity and SEW, even if non-economic decisions are required (Berrone, Cruz, and Gomez-Mejia, 2012). As their endowments and identity are tied to the firm’s destiny, owner-managers also tend to display a strong commitment to the firm’s survival (Sirmon and Hitt, 2003), which, however, can also escalate into a state of overcommitment. Escalation of commitment describes situations in which individuals stick to previous decisions and invest more resources despite contrary information regarding the viability of the course of action (Staw, 1976). However, even though further resources are invested, escalation of commitment often fails to solve the underlying issues and merely delays failure. Once the firm eventually fails, owner-managers thus lose their SEW and parts of their identity. In such situations, individuals share a tendency to try to recoup their losses, which could drive failed owner-managers to look for ways to restore or preserve their SEW and identity (Kahneman and Tversky, 1979). SEW and identity restoration, however, can usually only be achieved by founding a new firm. While researchers have made initial contributions to bring these interplays to the broader research agenda (e.g., Chirico et al., 2018; Hsu, 2013), both the phenomenon of escalation of commitment and the impact of SEW on the likelihood of founding a new firm after failure remain understudied fields in family firm research (Woods, Dalziel, and Barton, 2012). Hence, this paper conducts a quantitative analysis of the role of SEW in driving escalation of commitment to a failing family firm and the likelihood of reentering entrepreneurship after failure. Further, this paper answers prior research calls by assessing the role of fear of failure and internal attribution as moderating factors in the interplays (Cacciotti and Hayton, 2015; Costa, Ferreira, and Torres de Oliveira, 2023).

2. Theoretical Foundations

2.1 Socioemotional Wealth and the Desire for Endowment and Identity Protection

Family business researchers have long been captivated by the distinct behavior of family firms (Chrisman et al., 2010). On the matter, prior literature identified non-financial goals and affective endowments as key drivers for distinct decisions in family firms (Berrone, Cruz, and Gomez-Mejia, 2012). Formally defined as socioemotional

wealth (SEW) by Gómez-Mejía et al. (2007), these non-financial endowments comprise the "non-financial aspects of the firm that meet the family's affective needs" (p. 106) and span five dimensions ("FIBER"), including (F) family control and influence, (I) identification with the firm, (B) binding social ties with stakeholders, (E) emotional attachment, and (R) the renewal of family bonds through dynastic succession (Berrone, Cruz, and Gomez-Mejia, 2012). When owner-managers start to build SEW and identify with the firm, it transitions from a pure source of income to an extended part of the self and family (Gimeno et al., 1997). Consequently, commitment to the survival of the firm increases (Sirmon and Hitt, 2003), and protecting their endowment and identity becomes the ultimate objective for owner-managers, which takes priority over financial considerations (Berrone, Cruz, and Gomez-Mejia, 2012). Once the firm enters financial distress, however, balancing financial with non-financial interests becomes more challenging, as further resource investments to save the firm can lead to overcommitment.

2.2 Escalation of Commitment to a Failing Family Firm

Such overcommitment, called escalation of commitment, represents a phenomenon where individuals stick to a failing course of action and invest further resources despite mounting evidence that the course of action likely results in failure (Staw, 1976). Escalation situations commonly share three characteristics: (1) sunk costs, (2) feedback that a previous action resulted in failure, and (3) the choice of trying to recoup the loss via additional investment or complete withdrawal (Brockner, 1992). Escalation behavior, however, often only delays failure (Shepherd, Wiklund, and Haynie, 2009) and can have a severe business impact, particularly in situations of failure. In such situations, owner-managers frequently become trapped in a dilemma, torn between financial rationality and a strong commitment towards SEW (DeTienne and Chirico, 2013). As SEW preservation commonly prevails, owner-managers will likely try to keep the business alive, even if this requires further investments (Symeonidou, DeTienne, and Chirico, 2022). Among the theories that have sought to explain this phenomenon from a retrospective and prospective rationality standpoint, self-justification theory remains the most dominant retrospective theory (Schulz-Hardt, Thurow-Kröning, and Frey, 2009). According to self-justification theory, individuals continue to follow previous decisions to justify prior actions, show consistency, and prove their correctness (Brockner, 1992). In this regard, the feeling of responsibility plays a pivotal role. The more an individual feels responsible, the more likely the individual escalates commitment to protect his identity and self-image (Staw, 1976). While a tendency for continuity and persistence have been long-recognized traits of family firms (König, Kammerlander, and Enders, 2013), escalation of commitment remains an understudied field in family firm and entrepreneurial research (Nouri, 2023). To date, existing research in the family firm context remains widely limited to conceptual contributions (e.g., Chirico et al., 2018) and many of the proposed drivers of escalation of commitment, such as emotional attachment and SEW (Chirico et al., 2018), remain unassessed.

2.3 The Role of Fear of Failure in Escalation of Commitment

Beyond theories building on retrospective rationality, Whyte (1986) proposed prospect theory as an alternative explanation for escalation of commitment. According to prospect theory, individuals are loss averse, yet show a higher willingness to take risks when deciding between a certain loss and an uncertain one with the potential for a larger loss (Whyte, 1986). Hence, individuals tend to escalate their commitment in situations framed as a loss relative to their reference point to recoup their losses (Kahneman and Tversky, 1979). A related phenomenon that aligns with such prospective rationality and loss aversion is fear of failure. Cacciotti et al. (2020) define fear of failure as "a negative affective reaction based on cognitive appraisals of the potential for failure" (p. 1). Individuals experiencing fear will likely search for ways to reduce the likelihood of the feared event via three approaches: confrontation ("fight"), avoidance ("flight"), or paralysis ("freeze") (Cacciotti and Hayton, 2015). For failing firms, however, avoidance or paralysis often do not represent viable options, as they materialize failure or fuel the downward cycle. Thus, "fighting" often represents the most promising path. Fighting, however, usually comes with higher investments of time or money, hence fueling escalation.

2.4 Desire for Endowment and Identity Restoration After Failure

As previously outlined, escalation can delay failure but often not avoid it (Shepherd, Wiklund, and Haynie, 2009). When firms fail, owner-managers suffer the loss of their SEW while also losing parts of their identity (Gómez-Mejía et al., 2007). Consequently, owner-managers likely experience feelings of grief, especially as firm failure often translates into personal failure (Jenkins, Wiklund, and Brundin, 2014). To fully recover, owner-managers thus need to break the emotional bonds with the failed firm (Shepherd, 2003). On the matter, grief literature provides two approaches to grief recovery, comprising loss-oriented and restoration-oriented recovery. While loss-oriented recovery seeks to terminate emotional attachment by confronting and processing losses over time,

restoration-oriented recovery aims at avoidance and distracting oneself (Stroebe and Schut, 1999). Founding a new firm can thus often represent the most attractive restoration-oriented grief strategy, as it promises the recreation of SEW and restoration of identity. Further, it also enables a gradual way of parting with the old firm, allowing loss-oriented recovery along the way. Nevertheless, reentering entrepreneurship after failure might not always be rational. Rather, the desire for endowment and identity restoration could trigger impulsive decisions without objective validity, as the causes that led to the firm's demise often persist (Shepherd, 2003).

2.5 The Role of Attribution

In situations of failure, research has repeatedly confirmed responsibility as a key driver for self-justification and identity protection behavior. Nevertheless, most research has focused on the role of objective responsibility rather than subjective perception (Sleesman et al., 2012). However, this distinction is key, as perceptions differ between individuals (Block and Funder, 1986). Attribution theory offers a valuable framework to understand how individuals explain their own actions and the behavior of others (Yamakawa, Peng, and Deeds, 2015). In this regard, individuals either attribute the locus of causality to external (non-controllable) or internal (controllable) factors (Yamakawa and Cardon, 2015). How causes are attributed often depends on the outcome, specifically whether the outcome is positive or negative. As individuals often form biased attributions to self-enhance or self-protect (Rogoff, Lee, and Suh, 2004), they frequently attribute successes to internal factors and failures to external factors to negate responsibility. In case of internal attribution, individuals perceive a higher sense of responsibility, which can threaten their self-concept and thus trigger self-justification due to a stronger need for identity preservation (Luginbuhl, Crowe, and Kahan, 1975).

3. Hypothesis Development

As previously elaborated, ensuring the firm's continuity represents the paramount objective for owner-managers, given that the owner-manager's identity and SEW endowments are tied to its survival (Berrone, Cruz, and Gomez-Mejia, 2012). Concurrently, the desire for endowment and identity protection is likely amplified by a higher tendency for self-justification among owner-managers with higher SEW, given that a higher share of their identity and self-concept is at stake when the firm faces financial distress (Staw, 1981). Accordingly, owner-managers with higher SEW are expected to show higher levels of commitment escalation.

> ***H1:*** *Higher SEW is positively related to an increase in owner-managers' escalation of commitment to their failing family business.*

A key prerequisite for the need for self-justification and identity protection is the perceived responsibility of the owner-manager (Sleesman et al., 2012). When decisions lead to adverse outcomes, owner-managers will likely look for ways to attain self-justification by sticking to previous decisions and investing further resources (Staw, 1976). This justification need will be especially strong if internal attribution places responsibility on the owner-manager. Hence, attribution is expected to moderate the relationship between SEW and escalation of commitment.

> ***H2:*** *Internal attribution positively moderates the relationship between SEW and escalation of commitment.*

Moreover, as the owner-manager's identity, self-concept, and endowments hinge on the firm (Gómez-Mejía et al., 2007), exiting is perceived to be very costly (Zellweger and Astrachan, 2008). Therefore, picturing the consequences of failure in situations of financial distress will likely trigger a feeling of fear among owner-managers with a high fear of failure. Accordingly, these individuals will likely act to reduce the likelihood of failure by actively "fighting" against its occurrence, given that alternative paths to avoid failure rather accelerate the downward cycle (Cacciotti and Hayton, 2015). Consequently, fear of failure will fuel the protection and preservation behavior induced by higher SEW, thus acting as a moderator.

> ***H3:*** *Fear of failure positively moderates the relationship between SEW and escalation of commitment.*

If the firm fails despite escalation efforts, owner-managers face the loss of their SEW and parts of their identity (Gómez-Mejía et al., 2007). This loss will not only trigger a strong feeling of grief (Shepherd, Wiklund, and Haynie, 2009) but also a desire to restore and recover lost endowments and parts of their identity. However, this objective usually can only be achieved by founding a new firm, given that the foundation of a new firm enables owner-managers to recreate their previous state (Shepherd, 2003).

> ***H4:*** *Higher SEW is positively related to a higher inclination to find a new firm after the failure of the current firm.*

Once the firm fails, the cognitive, affective, and behavioral reactions of individuals likely depend on the attribution of its causes (Yamakawa, Peng, and Deeds, 2015). More specifically, attribution likely plays a central role in defining how strong the need for identity and self-concept restoration fueled by SEW will be after the firm's failure. If the causes for the failure are attributed externally, external justification will likely lead to a lower sense of responsibility (Luginbuhl, Crowe, and Kahan, 1975). However, if failure is attributed internally, owner-managers are expected to feel highly responsible. Consequently, they likely suffer a stronger detriment to their identity and self-concept. Therefore, they should also share a higher need to restore these parts of their identity and self-concept, which is best addressed by founding a new firm (Shepherd, 2003). Thus, attribution is hypothesized to take on a moderating role in the relationship between SEW and the likelihood of reentering entrepreneurship after the firm's failure.

H5: *Attribution moderates the relationship between SEW and the foundation of a new firm after failure.*

4. Methodology

Two vignette studies leveraging a between-subject design were conducted to investigate the interplays. As described in the following, internal vs. external attribution represented the manipulation in both vignettes. Each respondent completed both vignettes and was randomly allocated to one manipulation condition per study.

4.1 Sample

The focus of the sample collection was set on the German craft business sector due to its strong fundamentals regarding active companies, density of family firms, different firm sizes, and business sectors (Zentralverband des Deutschen Handwerks, 2023). Email addresses of 20,256 craft businesses were randomly collected from a public online directory. 405 complete responses were collected, yielding a 2.3% response rate, which is in line with other online surveys among small business executives (Seshadri and Broekemier, 2022). Subsequently, responses that did not fit the target group were discarded (e.g., family firm definition). Ultimately, 314 responses remained.

4.2 Design – Study 1

In Study 1, participants were confronted with a hypothetical scenario, which informed them that their current firm had been facing a steep decline in revenue and profits due to issues in client acquisition and satisfaction. Furthermore, the vignette stated the participant had already conducted an investment in measures seeking to improve client acquisition and satisfaction. This investment, however, had been ineffective, as profits declined further, even though the revenue decline was slightly alleviated. Subsequently, participants in the internal attribution group were informed that they attribute the low impact to internal causes. Contrarily, the external attribution condition defined a market recession as the key reason for the decline. Moreover, the vignette stated that the firm would need to be closed within the next 1-2 years if profits could not be improved substantially. Thus, participants faced a decision on how much additional funding they would be willing to commit. These funds would again flow into the initiatives they had already invested in, as these were deemed the sole means to potentially still avert the failure.

4.3 Design – Study 2

In Study 2, respondents were asked to imagine a situation where the profits of their current firm declined substantially and, despite efforts to save the firm, a closure of the firm was inevitable to avoid further losses and bankruptcy. Again, the attribution of the causes for the failure was manipulated. Consequently, participants were asked how likely they were to find a new firm.

4.4 Measures

4.4.1 Dependent variables

Escalation of commitment (Study 1 only). Escalation of commitment was measured by the investment of additional funds. To keep answers realistic, the investment was restricted to a range between 0% and 10% of revenues. To address the right-censored nature of the data, responses were categorized (Cat 1: 0-2.5% / Cat 2: >2.5%-5% / Cat 3: >5%-7.5% / Cat 4: >7.5%).

Likelihood of Founding a New Firm (Study 2 only). The likelihood of establishing a new firm after failure was measured via a 7-point Likert-type question ("very unlikely" (1) to "very likely" (7)).

4.4.2 Independent variables

Socioemotional wealth. SEW was measured using the 17-item SEW scale by Gerken et al. (2022), which was derived based on a validation of the "FIBER" scale. As opposed to Berrone, Cruz, and Gomez-Mejia's (2012) 5-factor structure, the scale suggests a 4-factor structure. All items were answered on 5-point Likert-scale questions ("strongly disagree" (1) to "strongly agree" (5)).

4.4.3 Moderating variables

Internal attribution. Attribution was manipulated in the vignettes.

Fear of failure (Study 1 only). Fear of failure was measured using the short version of the Performance Failure Appraisal Inventory (PFAI) by Conroy, Willow, and Metzler (2002). The construct comprises five Likert-scale questions ("strongly disagree" (-2) to "strongly agree" (2)).

4.4.4 Control variables

To control for relevant firm-specific characteristics, the variables *firm size* (only in Study 1 – # full-time employees), *sector*, and *liability* (based on the firm's legal form) were assessed. Concerning owner-manager-specific factors, information on the owner-manager's *age* and *gender* was collected. Further, *prior firm failure experiences* of owner-managers were measured. Finally, participants were asked about *other income sources and financial assets* they could rely on if the firm would need to be shut down.

5. Results

Descriptive statistics are provided in Table 1. The mean of 2.14 for the degree of escalation of commitment suggests that owner-managers decided to invest between 2.5-5% of sales despite negative feedback. This finding points to a significant overall tendency towards escalation of commitment among owner-managers, regardless of the prevalence of SEW. Concerning the likelihood of founding a new firm, the mean score of 2.70 indicates that owner-managers are "rather unlikely" to find a firm after failure. Finally, the mean SEW score of 61.39 reveals a notable level of SEW among owner-managers in the sample.

5.1 Results – Study 1

An ordered logistic regression analysis was performed to examine the underlying hypotheses on escalation of commitment (Table 2). Model 2 provides evidence that higher SEW increases the odds of commitment escalation, hence confirming H1. As hypothesized, a stronger identification and intertwining of the business with the owner-manager's identity seems to have a significant influence on endowment and identity protection via escalation of commitment. Further, while the moderation effect of attribution (H2) is not supported, the moderation effect of fear of failure is significant. However, the relationship between SEW and escalation of commitment is weakened by higher fear of failure, which contradicts H3.

5.2 Results – Study 2

Similar to Study 1, an ordered logistic regression analysis was performed to examine the hypotheses related to the likelihood of reentering entrepreneurship after failure (Table 3). Model 2 reveals significantly higher odds of reentering entrepreneurship when SEW is higher, hence confirming H4. Contrary to expectations, model 3 does not support the hypothesized moderation effect of internal attribution on the relationship between SEW and the likelihood of reentering entrepreneurship after failure. Rather, model 2 reveals that the manipulation of internal vs. external attribution has a significant main effect on the likelihood to find a new firm after failure. However, given that the odds ratio is below 1, the results suggest lower odds of reentering entrepreneurship if the causes for the firm's failure are attributed internally. This finding contradicts the positive effect one could expect from a need for identity restoration after failure.

6. Discussion

The findings of this paper provide evidence for a positive impact of SEW on the degree of escalation of commitment to a failing family firm, suggesting that SEW drives owner-managers to invest more resources in situations of failure, seemingly motivated by a desire to protect their firm, SEW, and identity. SEW might thus prove disadvantageous in situations of failure, as it can distort rational decision-making. Moreover, fear of failure was found to exert a significant negative moderation effect. Three lines of argumentation might explain these results. First, owner-managers might be more likely to "freeze" in such situations, which prevents them from "fighting" the failure. Accordingly, given the high stakes involved in the described escalation scenarios, owner-managers might be more hesitant in their investment choice or tend to abstain from additional investments. A second explanation might be that owner-managers with a higher fear of failure are more reluctant to conduct additional investments as they seek to avoid another failure ("flight" approach). Finally, a third explanation might be that owner-managers with a higher fear of failure subliminally expect or already accepted the failure. Regardless of the cause, fear of failure might therefore benefit owner-managers in situations of failure. Consequently, they might be less inclined to escalate commitment and rather seek clarity on the outcome. Concerning entrepreneurial intentions after failure, the findings yield evidence for a positive impact of SEW on the likelihood to start a new firm after failure, thus confirming the hypothesized desire among owner-managers to restore their SEW endowments, identity, and self-concept. Furthermore, the significant negative main effect of internal attribution suggests that owner-managers, who attribute the causes for the firm's failure internally, might not be blindly driven by their desire for identity and endowment restoration. Rather, they might recognize the need to work on their internal capabilities before founding another firm or fully abstain from it altogether.

6.1 Theoretical Contributions

This paper provides several novel contributions to prior literature. Firstly, it extends family firm literature by providing evidence that SEW fuels escalation of commitment to a failing family firm and the likelihood to find a new firm after failure. Therefore, this research enriches findings on the "dark side" of SEW and underlines its relevance post-exit (Kellermanns, Eddleston, and Zellweger, 2012). Secondly, the results provide further clarity on antecedents of escalation of commitment in organizations. In this regard, the study introduces new quantitative insights to support propositions brought forward by prior research on escalation of commitment in the family firm context (e.g., Chirico et al., 2018; Symeonidou, DeTienne, and Chirico, 2022). Thirdly, this research provides contributions to grief literature by investigating the foundation of a new firm as a coping mechanism (Shepherd, 2003). Finally, this paper answers prior research calling for both an investigation of the role of fear of failure in escalation of commitment and further research on the role attribution in predicting future entrepreneurial engagement after failure (Cacciotti and Hayton, 2015; Costa, Ferreira, and Torres de Oliveira, 2023).

6.2 Practical Implications

Concerning practical implications, the analysis informs owner-managers with affective ties to their firms about its adverse influences, helping them to initiate countermeasures to avoid non-economic and impulsive decisions.

Moreover, this research holds informative value for governmental bodies. Given that owner-managers with high SEW share a tendency to accept non-economic decisions and escalate commitment to failing firms, a significant share of firms might survive solely due to their owner-managers' desire for endowment and identity preservation. The survival of failing businesses, however, can impose costs on the economy and society, for instance by slowing growth or blocking resources (Ucbasaran et al., 2013).

6.3 Limitations and Future Research

This research faces several limitations. Firstly, the findings rely on hypothetical scenarios rather than real-life business situations. However, this approach allowed to isolate behavior related to commitment escalation and career choices in controlled settings, which would be nearly impossible to assess in real life (Richards, Kammerlander, and Zellweger, 2019). Additional limitations arise from the focus of the sample on the German craft business sector and an overrepresentation of firms in the core construction segment. Future research should thus replicate the study to confirm its representativeness. Finally, limitations arise in the measurement of fear of failure, as researchers have criticized the PFAI's interpretation of fear of failure as a stable construct (Cacciotti et al., 2020). Hence, future research might use alternative measurements to validate the described findings on fear of failure. Further, future research could investigate whether SEW also drives the likelihood of reentering entrepreneurship if the firm is exited despite strong financial performance (e.g., firm sales).

Perceived Success and Entrepreneurial Identity in West Africa

Nouha Hajji
Università di Corsica Pasquale Paoli, France

nouhahjj@gmail.com

Abstract: This research aims to understand the Fake It Until You Make It (FIUYMI) culture and its impact on entrepreneurial identity in the West African startup ecosystem. Self-presentation is important for entrepreneurs and often they tend to exaggerate their success. In West Africa, this is usually the case for entrepreneurs that want to gain social acceptance among their peers and to secure funding. It is represented by a desire of belonging and is amplified with digital social platforms and peer pressure. This study aims to evaluate the impact of perceived success using mixed methods research with both qualitative and quantitative data. The qualitative phase consists of semi-structured interviews with 20 startup founders from West Africa. The initial objective is to understand the motivations behind employing FIUYMI behaviour and its effect on the entrepreneurial identity and sense of success. A structured survey is then conveyed to 50 startup founders across the same region. The second objective is to quantitatively assess the prevalence of this behaviour and its impact on self-perception, and psychological well-being. Results suggest that FIUYMI is at first a good strategy for entrepreneurs to enhance perceived credibility and attract support and can be a positive tool for entrepreneurs to some extent as it boosts their confidence and network. It may later lead to psychological stress and has a perverse effect on entrepreneurs of not belonging to their community: Even when they achieve their desired outcome, they may consider their achievements to be fraudulent which is linked to a sense of imposter phenomenon. The research goal is to understand the complexities of perceived success and the 'Fake it Until You Make it' attitude in the West African context informing effective interventions in entrepreneurial behaviour. By showing its negative impact on an entrepreneur's journey, the research also aims to enhance accurate self-presentation and contribute to a more trustworthy entrepreneurial ecosystem in West Africa for entrepreneurs and investors.

Keywords: Entrepreneurial Identity, Perceived Success, Entrepreneurial Behaviour, West Africa

1. Introduction

Entrepreneurship constitutes a pillar of Africa's growth; In 2023, African tech startups attracted a record-breaking $1.4 billion in venture capital funding (Disrupt Africa, 2023). Entrepreneurship in Africa quickly became front and center of global news. As the market is in the spotlight with many opportunities for entrepreneurs, it is essential for entrepreneurs to project an image of success to attract support and secure funding (Davila, Foster, and Gupta, 2003). According to the African Development Bank Group (2024), West Africa, growth is projected to rise from an estimated 3.2% in 2023 to 4% in 2024 and 4.4% in 2025. In West Africa, it is relevant to make a good impression as social capital is as valuable as financial capital; social acceptance is a key pillar of entrepreneurial success (Light and Dana, 2013). Self-presentation is crucial for entrepreneurs. It has been explored by Goffman (1959) that defined it as the way individuals present themselves and their success to the world.

For entrepreneurs, self-presentation influences the perception of others and facilitates resource acquisition and social validation. Digital platforms like LinkedIn play an important role in this social validation process as they provide new means to reach wider audiences (Henderson and Bowley, 2010). Social platforms come also with their challenge as they intensify peer pressure and the necessity to conform to success norms while managing public image carefully (Afolayan and Folorunso, 2015).

In this dynamic ecosystem, it is easy for entrepreneurs to exaggerate their success and fall into the practice of acting as if they have already attained their objectives (Chen et al, 2009). Guided by a competitive, resource-constrained environment, and the pressure to always maintain a positive image, they tend to falsify the reality of their success to enhance their credibility (Pollack, Barr, and Hanson 2012). This has complex implications for entrepreneurial identity as the pressure to maintain this inflated image of success may impact mental health and authenticity (Parkman, 2016). This also affects building trust within the ecosystem. This research consists of understanding the motives behind this "Fake It Until You Make It" (FIUYMI) culture and measuring its impact on entrepreneurial identity in West Africa. The objective is to inform effective interventions in entrepreneurial behaviour in West Africa and to leverage the insights gained to enhance entrepreneurial practices across the continent.

2. Literature Review

Entrepreneurs' identity is defined by how entrepreneurs perceive themselves and how others see them within the entrepreneurial ecosystem (Jones et al., 2012). Entrepreneurial identity is dynamic and is constantly

challenged by social interactions and entrepreneur's experience (Navis & Glynn, 2011). In Africa, entrepreneurial identity is related to cultural and social beliefs that are specific to the region (Murugesan and Jayavelu, 2017). Social norms and community support are pillars of business success and shape how entrepreneurs present themselves and their startup (Kamoche et al., 2015). In Africa, social status and family ties are central and can either support or hinder entrepreneurial success (Ondiba and Matsui, 2019). Literature shows that family involvement is crucial, and entrepreneurs rely on their network for advice and financial support (Ondiba and Matsui, 2019). Entrepreneurial identity is made in these daily interactions and through peer influence as entrepreneurs look up to each other for validation and support (Sriram and Mersha, 2010).

These Entrepreneurs' behaviours impact their perceived success and constitute a central aspect in entrepreneurs' journey in evaluating their achievements. Perceived success is defined by both tangible results like financial gains and intangible concepts like social recognition (Fisher, Martin, and Lobo, 2016). For these reasons, the way entrepreneurs view their achievements is a critical aspect that affects their motivation and overall well-being (Obeng and Blunder, 2015).

Entrepreneurial identity and perceived success have a mutually reinforcing relationship. A confident entrepreneurial identity can enhance perceived success, entrepreneurs are likely to behave in a way that results in positive outcomes (Cardon et al, 2009). Conversely, perceived success can boost confidence of entrepreneurs in the way they perceive their work (Hoang and Gimeno, 2010).

Societal expectations in West Africa as in the continent, place a high value on visible signs of success and on entrepreneurs' validation by influential community members (George et al., 2016). Attaining entrepreneurs' business objectives is as important as showing one's success (George et al., 2016). Digital platforms like LinkedIn amplifies this need of positive self-presentation (Iwu and Allen-Ile, 2015). Speaking out loud about their achievement helps entrepreneurs gain social acceptance and more importantly, attract potential clients and investors (Shneor and Jenssen, 2014). This digital stage makes entrepreneurs project an image that often inflates their work as they want to appear more successful than they are (Murugesan and Jayavelu, 2017). This attitude is often the one of entrepreneurs who face challenges in attracting resources. It is the case for most entrepreneurs operating in the tech industry (Pollack et al, 2012).

Entrepreneurs who bluff their way to success may experience at first a boost in confidence and credibility (Maxwell, Jeffrey, and Lévasque, 2011). However, in the long run, this can lead to a misalignment between their self-perception and people's opinion which result in a sense of impostor phenomenon (Clance and Imes, 1978). In addition to that, it can cause anxiety for entrepreneurs and psychological stress because of the pressure to conform to their projected vision of success (Murugesan and Jayavelu, 2017). This fear of being unmasked can even cover their genuine achievements, creating a perpetual cycle of self-doubt and stress (Pollack et al, 2012).

For instance, research by Al Halbusi (2024) demonstrates how fear of failure and peer pressure can lead to anxiety among entrepreneurs in emerging countries and in Africa. Additional studies specific to the Nigerian market have shown how this pressure in portraying success creates a challenging environment for durable entrepreneurial growth in the region (George et al, 2016). A recent study by the World Economic Forum (2023), highlighted the importance of having the right growth mindset and how this significantly influences entrepreneurs' success. This requires fostering a culture of transparency and authenticity where entrepreneurs present their real work and achievements without fearing judgment and rejection (Pollack et al, 2012).

Understanding the dynamics between perceived success and entrepreneurial identity is essential to contribute to the broader discourse on entrepreneurship by providing context-specific insights and implications for theory and practice. Ultimately, the objective of this research is to enhance a more accurate self-presentation for entrepreneurs and encourage sustainable business practice to build a trustworthy entrepreneurial culture in Africa.

3. Methodology

The research conducted is non-experimental and consists of a data population of 20 West African Startup founders selected through purposive sampling for qualitative analysis and involves 50 founders selected through stratified random sampling for quantitative analysis. Data were gathered through semi-structured interviews for the qualitative scientific procedures and explained with thematic analysis. For the quantitative study, data were collected through a survey covering demographics, self-perception and psychological well-being. The last analysis used descriptive and inferential statistics in order to test and validate the research hypothesis. By combining qualitative and quantitative scientific procedures, the objective of this study is to offer a nuanced understanding of the complex dynamics at play in the FIUYMI culture among West African entrepreneurs.

For the qualitative phase, semi-structured interviews allowed to gather data from 20 startup founders. A diverse representation across various industries, ages, genders and business stages was possible thanks to purposive sampling and allowed for a rich exploration of participants motivation and experience with FIUYMI behaviour. The data population consists of tech startups from West Africa, representing startups at different stages of maturity and countries. The purpose of this first study is to get insight from West African entrepreneurs to better understand the perception they have about their entrepreneurial identity and their practices (if any) of amplifying their success. Participants anonymity is assured, encouraging them to share honestly about their journey. The interviews are guided by a structural framework based on existing literature and theoretical models related to entrepreneurial behaviour and psychological well-being (Kvale, 1996; Smith et al.,2010; Jones, 2015). Each interview lasts about an hour and is conducted either in person or virtually. Thematic analysis is then employed to identify patterns within the data to gather common entrepreneur's behaviour.

For the quantitative study, a structured survey was administered to 50 startup founders, selected using stratified random sampling. For this phase of the study, the objective was to ensure that the sample accurately reflects the broader population of West African startup founders to get relevant insights about entrepreneur's journey. The data population as for the interviewees, are assured of their anonymity and are tech startup founders from West Africa representing various industries and stages of business. The survey included measures on self-perception using the Rosenberg Self-Esteem Scale (Rosenberg, 1965) and on psychological well-being with the GAD-7 scale (Spitzer et al, 2006) and the Perceived Stress Scale (Cohen et al, 1983). The digital format allows for direct integration with statistical software. Descriptive statistics was used to provide an overview of the data, while inferential statistics allowed to test the study hypothesis and explore the relations between the variables.

4. Research Objectives

The objective of this research is to understand entrepreneur's behaviour when it comes to amplifying their success. The objective is also to measure the impact of exaggerating achievement on an entrepreneur's self-perception and well-being. Fake It Until You Make It (FIUYMI) behaviour will be discussed as FIUYMI throughout the study. They are defined and are not limited to exaggerating achievement, past experiences, enhancing qualification or overstating stage of development/partnerships.

To evaluate their impact, three hypotheses were formulated and allowed to guide the research:

H1: There is a negative relationship between frequent FIUYMI behaviour and entrepreneur's self-esteem.

H2: There is a positive relationship between frequent FIUYMI behaviour and entrepreneur's anxiety levels.

H3: There is a positive relationship between frequent FIUYMI behaviour and entrepreneur's stress levels.

5. Findings

5.1 Qualitative Study

The qualitative study is preliminary research that aims to understand the reasoning of entrepreneurs and why they may amplify their success. It is an essential step before measuring the prevalence and impact of this behaviour. Findings from the qualitative analysis provided in-depth insights into the experiences of entrepreneurs with FIUYMI behaviours and the motivation behind their actions.

The interviews revealed that entrepreneurs frequently exaggerate their success to navigate the competitive and resource-constrained environment they are part of. A significant theme that emerged in this regard was the role of social pressure and expectations, which pushed entrepreneurs to project an image of success. For many, amplifying their success was a necessity to be part of the ecosystem, gain social acceptance and attract first clients and investors. Regarding their behaviour, participants indicated for the most part that these practices initially boost their confidence and credibility and were indeed facilitating resource acquisition and peer validation. They also can't help but feel a sense of imposter syndrome that leads to stress and anxiety to maintain that always positive image of success. This behaviour was particularly evident among early-stage founders. The following table provides insights using original statements by the interviewees.

Table 1: Key findings from the qualitative study

Theme	Sub-Themes	Key Findings
Understanding what FIUYMI Behaviour are	Perceptions and Perceived Success	Some entrepreneurs exaggerate achievements, past experiences, number of clients, stages of development and or partnerships and collaboration.
Motivations Behind FIUYMI Behaviour	Social Pressure and Expectations, Resource Acquisition and Investment Attraction	Entrepreneurs feel compelled to exaggerate their success due to societal expectations and the need to secure funding.
Influence of Digital Platforms	Amplification of Success, Peer Pressure and Competition	Digital platforms like LinkedIn amplify the need for positive self-presentation which increases peer pressure and competition among entrepreneurs. Constant visibility intensifies the pressure to maintain an image of success.
Impact on Self-Perception	Short-Term Confidence Boost, Long-Term Psychological Strain	It initially enhances self-esteem but often leads to long-term psychological stress and anxiety. Entrepreneurs experience a conflict between their projected image and their genuine self-perception, contributing to imposter syndrome.
Cultural and Social Factors	Community Support and Validation, Family Involvement and Expectations	Cultural norms and family expectations significantly influence entrepreneurs' behaviour. Entrepreneurs rely heavily on their social network for support and validation.
Long-Term Effects	Sustainability of Success, Authenticity and Trust Building	Over time, maintaining an exaggerated image of success becomes unsustainable. The disconnect between perceived and actual success impacts trust in the ecosystem.

5.2 Quantitative Study

The quantitative study allowed us first to get insight on the frequency of FIUYMI behaviour and classify them based on their frequency and business stage.

The study showed that these behaviours are highly prevalent among West African startup founders. From our 50-population data, 44 entrepreneurs reported engaging in amplifying their work and exaggerating their success. This high prevalence underscores the significant role of perceived success and social acceptance in the entrepreneur's journey. Every industry is concerned, with a clear focus on tech industries which probably reflects a common response to competitive and resource-constrained environments. The highest percentage of respondents, 40%, occasionally engage in these practices. In that case, occasional use can be considered as a strategic tool rather than a habitual practice. The most concerning is the frequent and very frequent category that concerns about half of the population data. Very frequent engagement might correlate with higher levels of psychological stress and imposter syndrome, as maintaining such a facade can be mentally challenging.

Table 2: Frequency of FIUYMI behaviour

Frequency of FIUYMI behaviour	Percentage
Never	12 %
Occasionally (Every month)	40 %
Frequently (Every week)	26 %
Very frequently (Many times a week)	22 %

Looking at the data distribution by business stages showed that early and growth startups are the most concerned with frequent and very frequent FIUYMI behaviour. The high percentage for early stages can be attributed to the intense pressure on new businesses to validate their business concepts and to attract initial funding. Founders in the growth stage still rely on projecting an enhanced image of success but there is a slight decrease in frequent and very frequent engagement compared to the early stage. As businesses mature, the reliance on FIUYMI behaviours diminishes with 30% entrepreneurs that don't feel the necessity to project an

inflated image. These practices remain quite common occasionally even for mature businesses suggesting that even if the business has established its reputation and stability, there remains a need to occasionally project a slightly enhanced image to maintain their market position and appeal to potential investors or partners. It can also be linked to specific events that are part of the startup life like new product launches and funding rounds. This shows the necessity at every stage to address these dynamics fostering a culture of authenticity to contribute to a healthier and more sustainable entrepreneurial ecosystem.

Table 3: Prevalence of FIUYMI Behaviour according to the business stage

Business Stage	Never	Occasionally	Frequently	Very Frequently
Early Stage	8%	36%	32%	24%
Growth Stage	7%	39%	27%	27%
Maturity Stage	30%	50%	10%	10%

To better test the hypotheses, the second part of the quantitative analysis was about measuring the impact of these behaviours on self-perception and well-being among West African startup founders. The Rosenberg Self-Esteem Scale was then used to measure Self-Perception for entrepreneurs, it consists of 10 items rated on a 4-point Likert scale ranging from "Strongly Agree" to "Strongly Disagree." According to that scale, higher scores indicate higher self-esteem (Rosenberg 1965). For the surveyed entrepreneurs that never or occasionally used these practices, the mean self-esteem is 21 indicating a moderate level of self-esteem. Entrepreneurs who frequently and very frequently engaged in FIUYMI behaviour had lower self-esteem scores, with a mean score of 17. Data shows This can suggest that for entrepreneurs who tend to exaggerate their success, self-perception tends to decrease.

To measure psychological well-being the GAD-7 scale was used, it measured anxiety with 7 items rated on a 4-point scale ranging from "Not at all" to "Nearly every day" (Spitzer et al. 2006). Stress was also measured using the Perceived Stress Scale (PSS), that evaluates perceived stress with 10 items rated on a 5-point scale from "Never" to "Very often" (Cohen et al. 1983)

For both scales, higher scores were significantly correlated with frequent FIUYMI behaviour. The mean GAD-7 scores among participants who never or occasionally use this practice was 7 while it was 9 for the frequent and very frequent population. The pressure to maintain a facade of success can contribute to increased anxiety among entrepreneurs.

Regarding the PSS scale, the average PSS score for participants who never overstate their work was 15. It was 21,2 for the participants that frequently and very frequently amplify their achievements. Participants who engaged more frequently in FIUYMI behaviours reported higher stress levels.

The findings highlight the potential negative psychological impacts of such practices, reinforcing the need for interventions that promote authentic self-presentation and mental well-being within the entrepreneurial ecosystem.

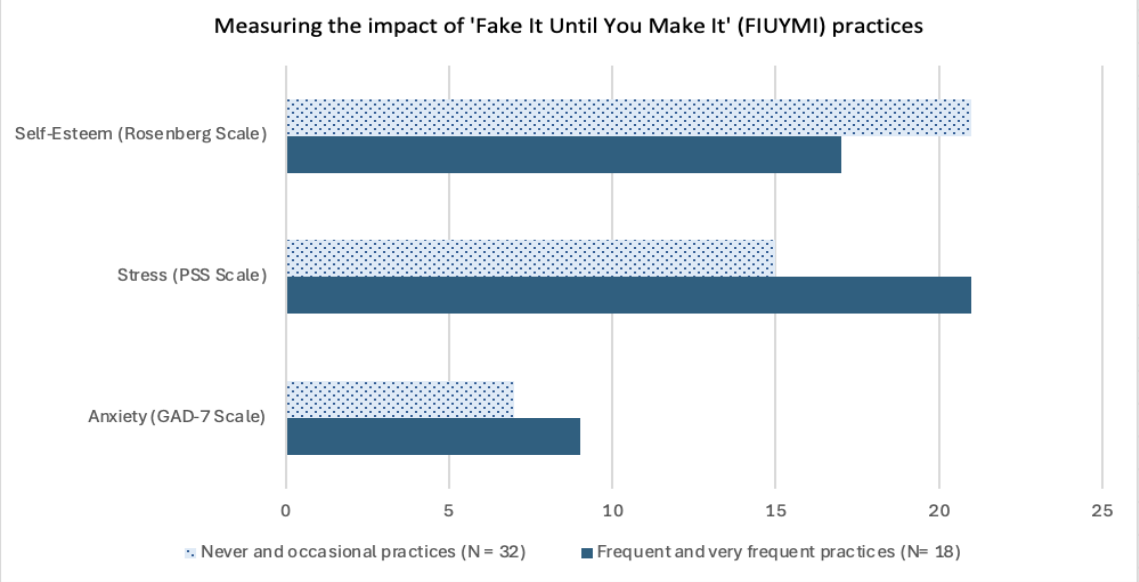

Figure 1: Measuring the impact of FIUYMI practices.

Pearson correlation coefficients were calculated for each of the three measures to further validate the impact of these behaviours on the self-perception and psychological well-being of the data population. The analysis focused on participants engaging frequently and very frequently in FIUYMI behaviours. By performing a correlation analysis, we can properly identify the strength and direction of these relationships. Measuring correlation clearly indicates that the hypotheses are validated, and entrepreneur's practices affect entrepreneur's identity.

Table 4: Measuring the correlation of FIUYMI behaviour against entrepreneur's well-being.

Measure	Correlation coefficient (r)
Self-Esteem (Rosenberg Scale)	-0,7
Stress (PSS Scale)	+0,6
Anxiety (GAD-7 Scale)	+0,65

6. Discussion and Conclusion

Table 5: Hypothesis validation from the study results

Hypothesis	Results
H1: There is a negative relationship between frequent FIUYMI behaviour and self-esteem among entrepreneurs.	Supported
H2: There is a positive relationship between frequent FIUYMI behaviour and anxiety levels among entrepreneurs.	Supported
H3: There is a positive relationship between frequent FIUYMI behaviour and stress levels among entrepreneurs.	Supported

These findings convey the need for practical interventions on both individuals and ecosystem level. For the individuals, it is about providing entrepreneurs with access to a support system and the right mental health resources. The objective is to mitigate the negative psychological impact of the FIUYMI culture. For the ecosystem, investors, incubators and accelerators should always prioritize transparency and authenticity as core values to promote open communication about the challenges of entrepreneurship. It is also about showing that failure is a possible option and should not be stigmatized. This study has shown that authenticity is essential to

foster an environment where entrepreneurs feel comfortable sharing their genuine progress and setbacks (Cohen, 1983). It is also important to address these issues as this can significantly reduce anxiety and stress among entrepreneurs (Spitzer, 2006).

This study also highlights the specific cultural and contextual factors influencing West African entrepreneurs and contributes to the broader literature on entrepreneurial identity and self-presentation. It provided qualitative and quantitative data to show a nuanced understanding of entrepreneurial behaviour and identity. The need for social validation often drives entrepreneurs to engage in FIUMI practices. Future research can build on these highlights by exploring how interventions aimed at promoting authenticity and mental health can be evaluated and implemented across different entrepreneurial ecosystems.

From Farm to Fork: Addressing Food Waste in Households

Beatriz Sobral Hoffmann-Kuhnt
Munich University of Applied Sciences (HM)/SCE, Munich, Germany

Beatriz_sobral.hoffmann-kuhnt@hm.edu

Abstract: With the rising environmental awareness, the issue of food waste is drawing considerable attention from civil society, scholars, industry practitioners and policymakers alike. Addressing food waste is crucial, as it incurs a variety of social, health, economic and environmental costs, including greenhouse gas emissions, soil degradation and the depletion of natural resources. The objective of this study is to analyze processes in food waste management to gain insight into factors influencing consumer behaviour, attitudes, and practices regarding consumption and food waste and loss prevention in the supply chain. This requires the analysis of decision making methods and waste reduction strategies and approaches, particularly for households. The goal is to emphasize the importance of raising consumer awareness and sense of individual responsibility, especially given the recent surge in collective community intentions to live more sustainably. However, translating these intentions into tangible actions is uncertain and filled with socio-economic complexities. Reports indicate that, households are responsible for approximately half of all food waste generated. Therefore, it's important to review the literature on barriers and triggers related to behaviour patterns and variations in food related lifestyle dimensions, to determine the factors that might influence food handling and food waste knowledge. Targeting households presents a promising starting point for future interventions, highlighting actions that may influence the current food consumption model to reduce the amount of food wasted. The methodological approach was structured into three steps. First, a literature review was conducted to gather insights and identify factors and interconnections between consumer behaviour and food waste. Second, related drivers and triggers were analysed. Lastly, the findings were summarized to highlight gaps and opportunities for improving attitudes towards food waste prevention.

Keywords: Consumer behaviour, Food waste, Sustainable consumption, EU Green Deal, Farm to Fork

1. Introduction

Integrating sustainable food management practices, including minimizing food waste requires a multidisciplinary and collaborative approach (Kim et al., 2019; Schanes et al., 2018; Simões et al., 2022). Targeted policies across the agri-food sector and adequate governance are essential to address the systemic nature of food waste and loss related challenges (EU, 2020). Complementary to policy initiatives, enforcing existing legislation and regulation tools, as those prescribed by the EU Green Deal of Innovation and the Farm to Fork. These policies are designed to manage human and animal welfare, and protect the planet while promoting the adoptionof green innovation strategies in support of sustainable long-term growth (Adamowicz, 2022). According to Siedschlag et al. (2022) targeted policy measures work to incentivize small and medium sized enterprises (SMEs) and, ultimately benefits end-users.

The EU recognizes that a transition to a more sustainable food system reshapes the economic landscape, thus the interaction patterns between food producers and consumers are underpinned by the Commission's regulatory system (EU, 2020). That is due to food production, processing, distribution and disposal being large contributors to greenhouse gas emissions, overexploitation of environmental resources (Canali et al., 2017; Cheng et al., 2023); ecosystem degradation (Birner, 2018; Štreimikienė et al., 2022) and biodiversity loss(EU, 2019). In response, the EU provides technical and financial assistance through existing instruments such as the European Agricultural Fund for Rural Development (EAFRT), EIT Food and European Interreg Projects among others, offering funding programs with national and regional reach.

As outlined in the Green Deal strategy, the EU's commitment to innovation is closely intertwined with its ambition to achieve climate neutrality by 2050 (EU, 2021; Kowalska et al., 2022). They drive change and mitigate risks while actively engaging citizens in fostering social innovation (Kowalska et al., 2022); and promote economic modernization guided by the SDGs framework (Birner, 2018). To support these transitions and transformations, the EU's strategy incorporates regular impact assessments. These assessments, informed by public consultations and the evaluation of environmental, social and economic impacts, analyze the effects on innovation and ensure that policy decisions are in alignment with the EU's goals (EU, 2020). This framework promotes policy coherence, embedding circular economy principles and outlining sustainable responsibilities and action across all food-related policies, to ensure resilience in the food supply chain (Chiaraluce et al., 2023; EU, 2020). It aims to establish sustainable standards the norm for food products in the EU market, benefiting both operators and consumers alike. For instance, this framework supports the integration of sustainable practices in the food industry through certifications and labelling(EU, 2020). These mechanisms aim to ensure vertical and horizontal policy integration in a "multilevel reinforcement" (Kreienkamp et al., 2022, p. 734) of best practices and coordination between industry

actors – consumers, producers, processors and policymakers (Sgroi & Marino, 2022), while creating feedback mechanisms within an interdisciplinary governance system (Conti et al., 2021; Oliver et al., 2018)

Active participation and collaboration among all stakeholders in the food supply chain is highly desirable (Fami et al., 2019) for promoting food waste reduction behaviours and consumption of environmentally-friendly food products (Secondi et al., 2015). It requires engaging with a broad range of partners, including farmers, food manufacturers, retailers, local authorities, community groups, and individuals (Secondi et al., 2015). Developing information sharing networks and creating partnerships are key to promoting behaviours to reduce food waste and facilitate the adoption of best practices at the individual and contextual levels (Secondi et al., 2015). Additionally, increasing consumer awareness of sustainable food consumption is vital (Canto et al., 2021).

2. Theoretical Insights into Food Waste and Consumer Behaviour

This section explores the characteristics of consumer behaviour and attitudes related to food waste, consumption decisions, and their role in accelerating the transition towards a sustainable food systems (Bedeau et al., 2021).

2.1 Food Waste

With the global population expected to grow from 8 billion to 9.7 billion by 2050, and 10.4 billion in 2100 (UN, 2022), policymakers worldwide are developing strategies in anticipation of predictable challenges, to ensure the integrity of social sustainable development (Bartelings & Philippidis, 2024). The United Nations's Sustainable Development Goals (SDGs) for 2030 provides a roadmap for sustainable progress, with the food system playing a key role (WHO, 2024). The UN is faced with a dual challenge, of feeding half a billion undernourished people while improving the diets of 2.8 billion overweight and obese adult individuals, as well as, millions of children and adolescents (WHO, 2024). Malnutrition in various forms, and diet related diseases remain a global cause of mortality, consequently, maintaining a sustainable food system is vital in this transformation from a human health perspective (Bartelings & Philippidis, 2024; Lindgren et al., 2018). Yet, access to nutritious food must not be at the expense of environmental, economic and social issues (Lindgren et al., 2018)

Meanwhile, the food system is responsible for approximately 30% of greenhouse gas emissions driving biodiversity losses (EC, 2021). It is estimated that as much as 40% of food produced is wasted or lost along the supply chain (WWF, 2021). Based on this evidence, the UN Sustainable Development Goal 12.3 targets a 50% reduction in per capita global food waste at the retail and consumer levels, along with minimizing food losses through production and supply chains caused by inefficiencies by 2030. According to Gustavsson et al. (2011, p. 1) and Thompson et al. (2020) "one third of all food produced globally is lost or wasted" amounting to 1.3 billion tons of food wasted annually. Yet, the FAO et al. (2023) estimate that approximately 8,9% (783 million) of the world's population suffered from hunger, while 2.4 billion people faced moderate or severe food insecurity in 2022, with 2.4 billion lacking regular access to sufficient and nutritious food (SDG indicator 2.1.2). On average, European consumers discard 123 kgs of food annually (Barone et al., 2019; Kunszabó et al., 2022) estimated at 88 million tonnes per year (EU, 2018). These percentages underscore the magnitude of this problem and its implications for resource utilization and environmental sustainability (Barone et al., 2019).

Thus EU policy roadmap for a more sustainable food system (EU, 2020), aims to achieve several goals including, "medium-term behavioural adjustments in consumption patterns" leading to social and economic impact (Bartelings & Philippidis, 2024, p. 568). It anticipates that household savings resulting from reductions in food waste can be spent elsewhere, either by purchasing the same food products (direct effect) or on other goods and services (indirect effect) (Bartelings & Philippidis, 2024). This phenomenon, known as the "rebound effect" (Albizzati et al., 2022; Bartelings & Philippidis, 2024), influences circular efforts, especially in terms of waste collection, resulting in financial benefits for businesses and consumers while having a positive impact on the environment (Aktas et al., 2018). Based on these insights, the importance of the bioeconomy cannot be underestimated (EU, 2012).

To achieve it's targets, the EU has implemented legislation mandating member states adopt methodologies for measuring food waste, as well as, introduce food waste prevention programs, in order to monitor and report food waste levels (EU, 2018). As stakeholders in the agri-food sector search for new product solutions and applications, the integration of well designed food policy interventions and recommendations for sustainable food consumption becomes fundamental (Falasconi et al., 2019; Mokrane et al., 2023). They underscore the importance of sustainable food management practices from the farm to the table, food waste reduction initiatives, and underscore the need for the implementation of preventative measures, thereby strengthening networks in food waste management (Mokrane et al., 2023). The food system affects the pillars of the sustainable development environment, economic and social goals (Aktas et al., 2018; Aureli et al., 2021; Fiore et al., 2017). In wealthier countries such as EU member states, households are a target group, partly because, according to Gustavsson et al. (2011) households generate

the largest volume of food waste compared to other actors in the food supply chain (Beretta et al., 2017; FAO et al., 2023).

2.2 Consumer Behaviour

From the Theory of Planned Behaviour (TPB) perspective, household food waste is examined alongside behavioural patterns in the context of social and psychological determinants over time (Ajzen, 2015; Thompson et al., 2020). This theoretical lens offers useful insights by exploring how perceived behavioural control (PBC), attitude, and social norms influence waste generation (Thompson et al., 2020). The TPB by (Ajzen, 2015) proposes that the decision process is the result of an intentional action to perform a specific behaviour. It is shaped by attitudes, norms and beliefs relevant to that behaviour (Ajzen, 2015). While, Quested et al. (2013) and Block et al. (2016) argue that food waste arises as the result of multiple interconnected behaviour variables. Other studies have empirically examined socio-demographic behaviour drivers and values, which include concern for the environment (Diaz-Ruiz et al., 2018; Setti et al., 2016); and concluded that consumers often face conflicting motivations that impact their efforts to reduce household food waste (Setti et al., 2016). To this effect, Setti et al. (2016, p. 694) state that food choices are rooted in "judgements, such as emotions, habits, and values, thus raising the cognitive dissonance between motivation and behaviour (intention-behaviour gap)" .

From an economic perspective, Pocol et al. (2023) identified five consumer groups based on waste behaviour, namely conservative, self-indulgent, indifferent, consumerist, and eco-responsible; while Di Talia et al. (2019) examined household income levels to categorize consumer types, classifying them into three groups: unaware, unaware but not wasteful and aware. Within socio-demographic and economic aspects, other factors to be taken into consideration are geographical aspects, food prices, typical purchasing habits and cultural influences (Aureli et al., 2021). Understanding and addressing food waste at the household level, involves recognizing its association with diverse behavioural aspects, such as, with social, norms, culture, demographics, family structure, among many other factors, that influence and drive change in consumer habits. Thus, identifying and comprehending these behavours is essential for effective strategies aimed at preventing food waste generation (Abeliotis et al., 2016). It is specially critical to encourage shifts in consumer behaviour for preventing food waste and loss across various stages of the supply chain.

To reduce the impact of their effect, the literature suggests that specific behaviours contribute to consumer food waste including buying or preparing too much food, incorrect storage methods, confusion over "best before" and "use by date" dates, lack of planning, impulse buying and lifestyle (Muresan, Harun, Andreica, et al., 2022). Marketing strategies, in combination with a lack of education and information about products, can inadvertently encourage food waste, even when items are still suitable for consumption (Muriana, 2017). This is often cause by labels like "use by date" or "sell by date" (Muriana, 2017) or the appearance of food (Chinie et al., 2021). Addressing these issues by improving consumer awareness and reducing biases related to food aesthetics or expiry dates could better align consumer choices with their intentions (de Visser-Amundson et al., 2023). This approach can significantly impact food waste management, as products often deemed waste due to visible imperfections or near expiry dates may still have inherent value (de Visser-Amundson et al., 2023). The complexity of food choices is further influenced by factors such as health concerns, taste preferences, budget, household structure, and cultural atittudes (Muresan, Harun, Brata, et al., 2022).

3. Methodology

This qualitative research study synthetizes existing literature to explore how consumer behaviour, attitudes and practices influence food waste and loss prevention at the household level. The analysis involved a thematic data extracted from scholarly articles, reports and other relevant sources. The key objective included identifying effective behaviour related and causes of food waste, food management strategies, and barriers and triggers to their implementation. The study aims to highlight insights that can inform policies and interventions to promote sustainable practices in food consumption and waste reduction.

To explore the interconnection between consumer behaviour and food waste, VOSviewer (van Eck & Waltman, 2014) was applied to perform a bibliometric analysis to examine the literature. SCOPUS and Web of Science (WoS) databases were used to select the articles following a search criteria that included the following keyword combination: "food waste" AND "consumer behaviour" OR "consumer behavior" AND "soci*" (for societal factors) (Figure 2). Limitations were set to peer reviewed journal articles; language: english; country: European countries; and discipline. Subsequently, Nvivo was used to code the articles in order to identify, and categorize interconnecting themes. VOSviewer identified distinct topics and perspectives on the subject by keyword search. The keyword examination revealed three clusters (figure 1 – green, red, blue). Words such as food waste, consumer behaviour,

consumer attitude, are some of the words that stand out to characterise this topic. The result indicates connections between the term “food waste” to “consumer behaviour” while at the same time illustrates the relationship between key subtopics.

The methodology was designed to address the following key question and subquestions (Bedeau et al., 2021):

- Q: 1. How do consumer behaviour, attitudes and practices impact food waste and loss prevention, particularly at the household level? 1.a) What methods and societal practices in food management for reducing waste exist? What are the triggers and barriers? 1.b) How can communication strategies be optimized into tangible actions to raise consumer awareness? Can policy measures and community engagement alone help?

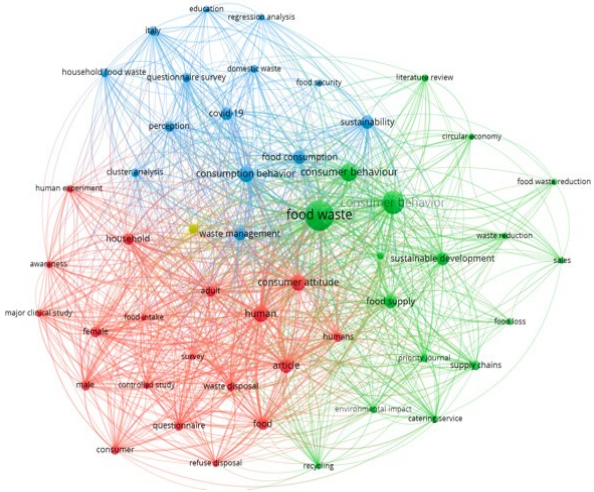

Figure 1: Keyword examination

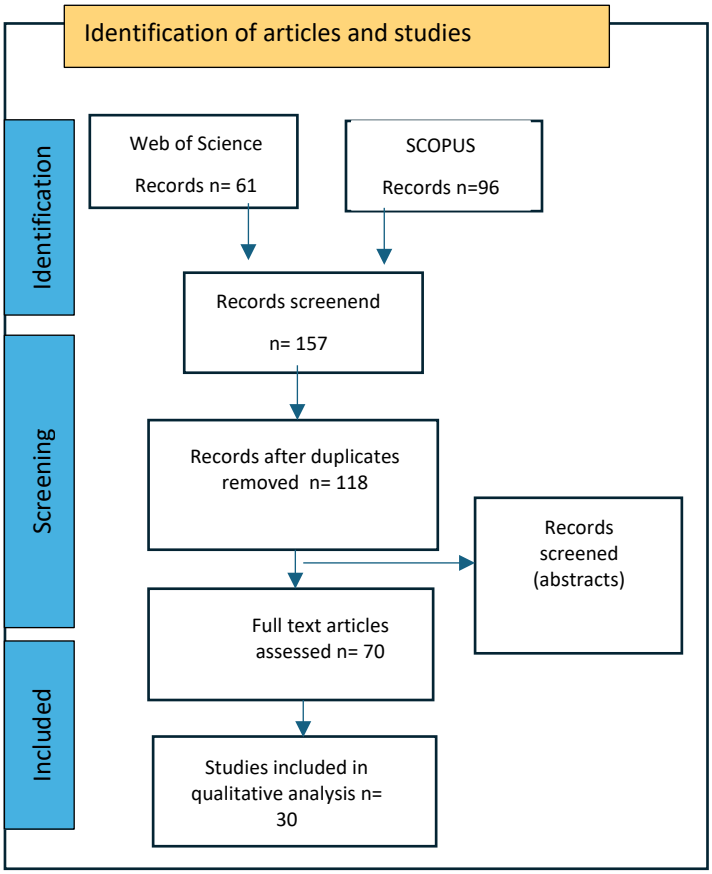

Figure 2: Identification of articles and studies

4. Findings and Discussion

This study highlights the need to primarily synthesize existing literature in order to design consumer behaviour strategies that are tailored to households. The goal was to gain a deeper understanding in the interplay between consumer behaviour, attitudes, and practices; and emphasize the role of mechanisms, refered to as “enablers” (Bedeau et al., 2021) in facilitating effective solutions. Where sustainable food consumpion is concerned, attitudes towards how food is handled vary depending on the unique characteristics and contexts between countries and communities. Thus, to effectively tap into their transformative potential, it is important to take local knowledge and practices in to account, and how these relate to food consumption, food waste potential (Bedeau et al., 2021) and preventative solutions.

The literature clearly shows a direct connection between food waste and socio-psychological factors , and it identifies the drivers and barriers that influence sustainable consumption (Özkaya et al., 2021) such as financial capacity, planning habits, attitudes, motivation, and family structure (Aktas et al., 2018). Motivation factors include “nutrition, health, consciousness, social identity, concern for farmers, ethical concerns, food security, perceived availability, store reputation, and animal welfare concerns among the factors that influence” (Özkaya et al., 2021, p. 5). Recently, a key motivator has become the preference for purchasing and consuming sustainable produce ie organic. Consumer food waste levels are also impacted by lifestyle factors including cooking practices, meal planning habits, price sentisitivity, social aspects of meals, and concerns about food safety (Aschemann-Witzel et al., 2018). Conversely, barriers to reducing food waste include “high prices, time limit, access, lack of information, trust in labelling, limited marketing communication and unawareness of environmental impact” (Özkaya et al., 2021, p. 5).

To address these challenges, Aschemann-Witzel et al. (2018) advocate targeted marketing strategies and policies designed aimed at specific consumer groups to reduce reduce food waste effectively. Their analysis reveals the role and importance of communication in shaping consumer perceptions of upcycled foods, raising consumer awareness, and encouraging sustainable consumption habits. Key interventions to boost awareness include product labelling, social media, educational programs, community campaigns and all types of print (Morone & Imbert, 2020).

Additionally, research by Amicarelli et al. (2022), Ankiel and Samotyja (2020), Aschemann-Witzel et al. (2020) and Falasconi et al. (2019) indicate that consumers often have low perception and lack awareness about the extent of food waste and its impact, a major barrier in sustainability efforts.

As the urgency to shift towards a circular economy and the demand for sustainable food systems intensifies, scholars illustrate the potential for converting food resources that would go to waste into products with value that can drive consumer demand (de Visser-Amundson et al., 2023). They further suggest that a higher degree of product transformation can attract consumers, with product design shaping consumer preferences. Achieving this requires innovation across the production value chain (BMZ, 2021; de Visser-Amundson et al., 2023; EU, 2018). To that effect, the EU promotes initiatives such as food donations, alternative uses in animal feed and applications in fashion, construction and energy. It is also funding projects like the Interreg CEFoodCycle Project (EU, 2022) to cut food waste and CO2 emissions. Overall, valuable insights are presented into how individual characteristics impact consumption behaviour (Cela et al., 2024).

5. Conclusion

Addressing food waste and behaviours associated with efforts towards prevention habits is a priority topic on the agenda of policymakers and society in general. Implementing practices to reduce food waste and loss holds potential to reshape the food system from the farm to the table (Castillo-Díaz et al., 2023; EU, 2012). Consequently, a thorough understanding of consumer behaviour, in particular household typology, is essential in order to develop measures that can bring about lasting improvement (Abeliotis et al., 2016). Despite the potential benefits, the uptake of waste prevention practices continues to be a challenge due to consumer perception.

Food waste management is increasingly prioritized in waste management strategies (Abeliotis et al., 2016), thus, understanding the characteristic of food waste behaviours, aids with prevention campaigns, identifying target groups, determining appropriate engagement channels, and the design of communications materials (Abeliotis et al., 2016). This approach requires a systemic and transdisciplinary collaborative approach, along with increased consumer awareness, skills and competencies to drive the transformation process (Canto et al., 2021; Stirnimann & Zizka, 2022). To effectively implement these strategies, the role of the university, as a key ecosystem player, becomes pivotal in bridging the gap between awareness, responsibility and action. This research explores how universities can fulfill this role by developing tailored educational programs and community campaigns that impart

critical knowledge about food waste, and empowers individuals with the skills and competencies necessary to engage in sustainable practices.

Acknowledgement

I'd like to express my gratitude to Prof.Bárbara Coelho Gabriel (Univ.Aveiro), Prof.João Marques (Univ.Aveiro) and Prof.Klaus Sailer (HM/SCE) for their guidance and insightful feedback. Their expertise has been instrumental in shaping the direction and quality of my work. I deeply appreciate their mentorship which continues to enrich my understanding and development as a researcher.

Innovative Frontiers: Exploring Factors Influencing Travel Podcast Consumption in the Web 4.0 Era

Manisha Manisha
Indian Institute of Technology Kharagpur, IIT Kharagpur, West Bengal, India

iammanishaprashar@gmail.com
iammanishaprashar@iitkgp.ac.in

Abstract: With the advent of Web 4.0, society is evolving online in every aspect. The online media platform and user-generated content have given a new face to people's interactions and communication, with the evolution of new media platforms and the changing consumption patterns of user-generated content. They have also become a new way of earning a livelihood for many. Among the various media influencers and business entrepreneurs' podcasts as a platform have proliferated in recent years, with millions of people listening to travel podcasts. This study aims to explore the unresearched terrain of travel podcast listening via exploring the consumption factors of travel podcasts and provide valuable insights for the travel podcast creators and, and destination stakeholders. besides this paper is of the interest to the various researchers of the multiple domain like audio media, content, marketing, and tourism. The study involved a systematic literature review followed by a Delphi survey. A total of eleven factors are shortlisted via Delphi analysis as the prominent influencers of travel podcast listening. Authentic content and subjective norms are added as new factors to the existing list of literature, and a few factors are discarded based on the expert's viewpoints, e.g., fashion. The study unfolded various practical, conceptual, and managerial implications for tourist destination marketing managers, DMOs, and various stakeholders (the government and host community) in the tourism industry.

Keywords: Travel innovation, Audio travel podcast, Listening motivations, Web 4.0, Delphi survey

1. Introduction

In the contemporary media landscape, Content marketing has undeniably carved a significant niche in modern marketing strategies, exemplified by successful campaigns like Volvo Penta's Adventurous Campaign (Kim Moutsos, 2023) and its subsequent brand success (Schivinski and Dabrowski, 2016). In the Web 4.0 and IoT era, content creation has become not only a viable source of income but also a full-time profession, with the global podcasting market reaching $23.56 billion in 2023 and projected to grow at a CAGR of 27.6% from 2023 to 2030 (Rohit Shewale, 2024), offering promising opportunities for aspiring entrepreneurs.

In industries like travel and leisure, content creation plays a pivotal role in attracting potential customers (Cunha Ferreira et al., 2023). As in travel, the importance of experiencing the product beforehand cannot be overstated in stimulating interest in destinations (Chen et al., 2014). Social media, blogs, YouTube vlogs, and emerging technologies like virtual reality and the metaverse are increasingly instrumental in drawing tourists, highlighting the integration of communication and marketing strategies (García-Haro et al., 2021).

Likewise, Podcasts have emerged as a powerful medium for content distribution in the travel industry, capturing the attention of a growing audience globally. Global podcast listeners reached 4,464.7 million in 2023, reflecting a significant annual increase (Daniel Ruby, 2023). Despite its popularity, the "Travel Podcast" genre remains relatively unexplored in the existing literature, prompting this study to delve into travel podcast consumption patterns and audience engagement. While podcast creation has become more accessible, captivating listeners remains challenging (Jesse Noyes, 2014). Thus, this study aims to identify the factors influencing travel podcast consumption and provide insights for creators to expand their audience and target specific markets, utilizing the Delphi survey methodology preceded via a systematic literature review.

2. Literature Review and Research Background

2.1 Podcasting, Social Media, and User-Generated Content Creation

"Podcasting," a portmanteau of "iPod" and "broadcast," represents a significant shift in online radio. Podcasts are It is defined as a form of digital media, usually audio like a radio program that can be downloaded and listened to on MP3 players, computers, or smartphones. podcasts are disseminated across streaming platforms like Spotify, Apple Podcasts, SoundCloud, and others on the internet. They typically follow a series format with episodes released periodically and cover a wide range of topics, from news and education to entertainment and storytelling.

While content creation predominantly occurs on social media (García-Haro et al., 2021): user-generated content, devoid of bias, has gained notable credibility. Social media marketing, mainly influencer marketing, is a potent tool for brand awareness and education (Lou and Yuan, 2019; Robert Rose, 2023).

In parallel, podcasting emerges as both an art and a lucrative business venture (Martin Spinelli and Lance Dann, 2019). With top podcasts like 'The Joe Rogan Experience' grossing $30 million in 2019 (Statista, 2021) and the US podcast revenue nearing $1 billion in 2020, podcasting is financially rewarding. This dynamic landscape attracts premier talent, fuelling economic growth and innovation (Giliberti, 2016).

Moreover, amid the COVID era, the significance of content marketing has evolved, as indicated by the Content Marketing Institute (CMI) report. While 45% of organizations' key audiences consume videos, there is a notable openness to alternative content formats (Robert Rose, 2023). Despite the demand for content marketing, organizations struggle to identify subject experts, highlighting the need for research and strategic insights.

In this context, exploring podcasts within the travel domain promises valuable insights into user-generated audio content and consumption patterns. This study aims to illuminate how organizations, entrepreneurs, and influencers can leverage podcasts to craft compelling content marketing strategies, addressing a crucial gap in contemporary marketing practices.

2.2 Travel Podcast

The past literature has identified different factors affecting the wish of the user to adopt the podcasts, such as usability, image, relative advantage, situational factors, lower levels of complexity, and functionality (Chang et al., 2012). They emphasized the importance of adopting podcasts in digital tourism.

Travel with Rick Steves, 'Musafir Stories', 'Indie Travel Pod', and 'Travel with RV Show' are popular travel podcasts already exploiting the podcast's capabilities. Referred to as 'audio travel podcasts' or 'travel podcasts' (Lee et al., 2017), these programs entail individuals (travellers, hosts, guests) sharing their travel narratives and original travel experiences and dispensing information through downloadable recordings on various platforms.

According to a study conducted in the United States, the primary motivations for engaging with podcasts were identified as entertainment, information, and the perceived superiority of audio platforms (Chan-Olmsted and Wang, 2020). The primary factors identified in the context of true crime podcast consumption were convenience, boredom, escape, voyeurism, and amusement (Boling and Hull, 2018). Previous studies have examined the underlying factors that drive individuals to engage in podcast consumption as a whole (Chan-Olmsted and Wang, 2020). However, there needs to be more literature regarding the motivations behind listening to travel-related podcasts despite research on other genres, such as true crime amusement (Boling and Hull, 2018), entertainment, and comedy. Notably, Xie and Lew (2008) stand out as an exception in exploring the realm of travel podcasts.

Apart from the listener's perceptions, the podcast has been explored during travel as a tour assistant for the on-side tours at national parks, museums, and historical and cultural sites. A few studies have already explored the effect of these narratives on innate intentions. However, there still needs to be a lag between the in-depth understanding of this emerging social media phenomenon among the study domains of travel, audio media and marketing. Despite its potential for influencing the audience through narratives and storytelling and its use in the advertising and branding world, podcasts have yet to be a focus of inquiry for many researchers. Considering its importance and dearth in the literature, it might be helpful for marketers to have insights into this emerging phenomenon. The present study will act as a founding study that provides insights into the podcasting world of travel and tourism and will explore this abundance of listeners and the constant increase in listenership.

3. Research Methodology

3.1 Delphi Survey in Tourism

The Delphi technique is one of the most widely accepted qualitative (Gupta and Clarke, 1996) and structured approaches for group studies (Rowe and Wright, 2001). Ng (1984) described it as an informed prediction using the expert's opinions once a consensus is reached among the panel of experts. Among the four forecasting techniques mentioned by (Lin and Song, 2015), the Delphi technique is found to be one of the most popular judgemental forecasting techniques used in tourism studies. Hence utilised for the present study.

The present study is conducted in two phases. The *first phase*, from prior literature, extracted many aspects of the reasons for various audio media listening (such as podcasts, radio, online music, etc.). In the *second phase*, these factors were refined and ranked using Lawshe's content validity ratio in two sequential rounds utilising the Delphi technique.

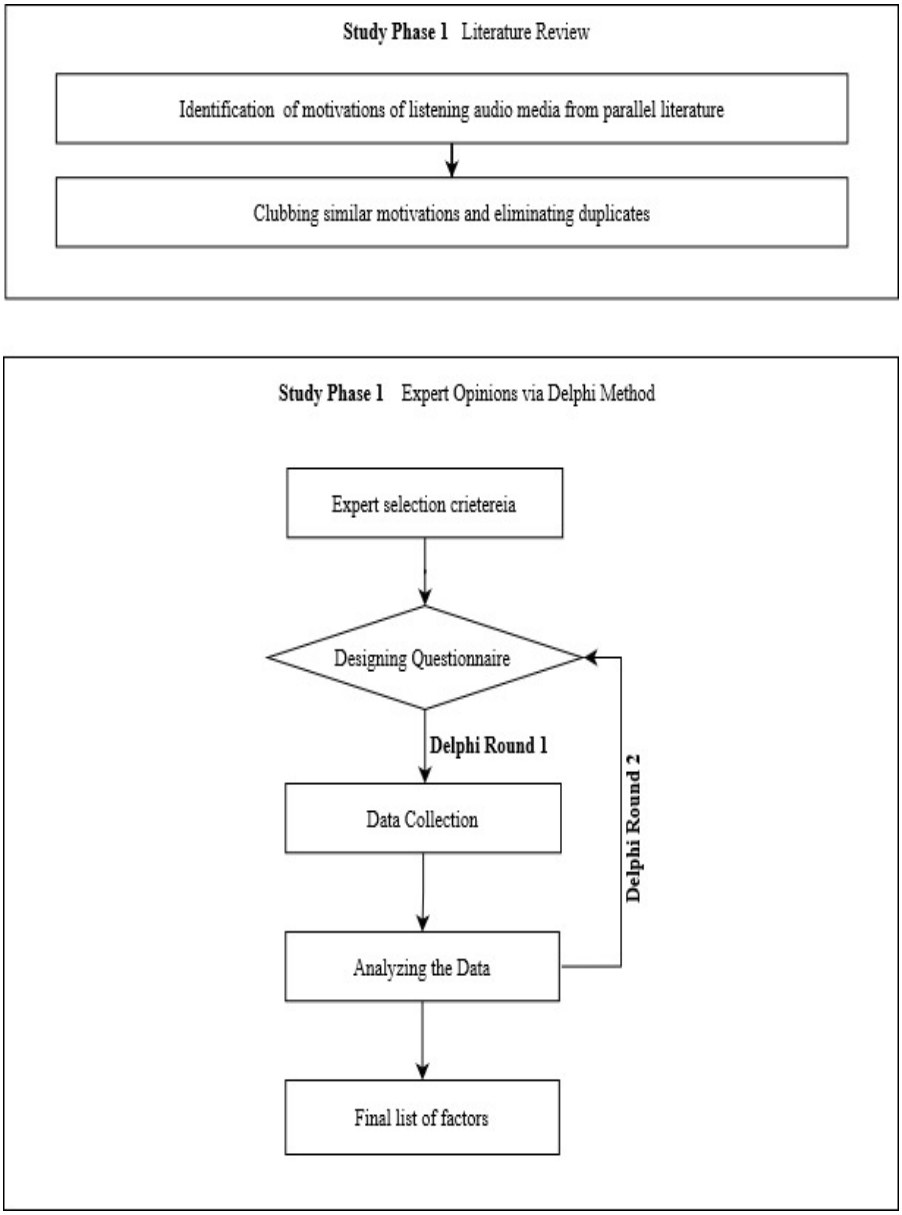

Figure 1: Design of research methodology

3.2 Study Phase 1

In the study's *first phase*, various factors that motivate listening to different audio media (like podcasts, radio, online music, etc.) are extracted from previous literature, and an exhaustive list of variables is created. Afterwards, this list is analysed carefully by the researcher, and a few variables that fit the study's objective are shortlisted in Table 1.

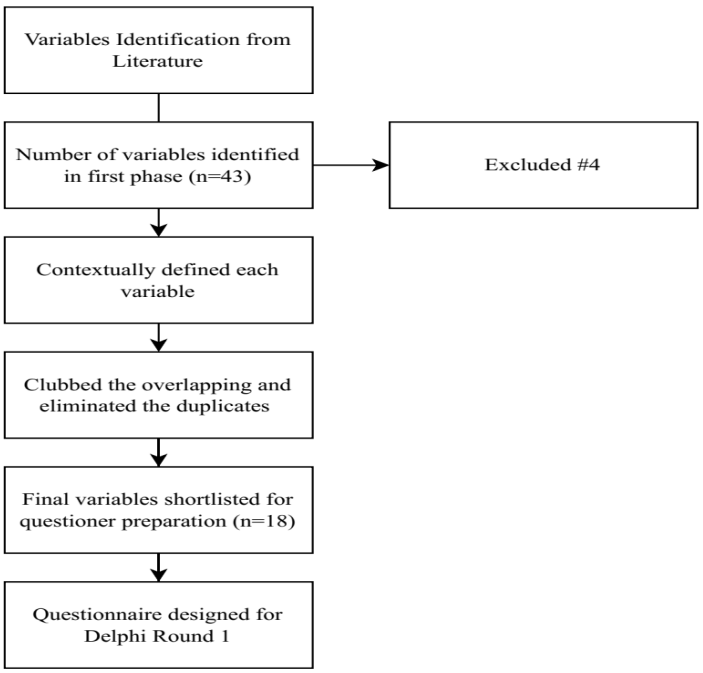

Figure 2: Study Phase 1, Literature review steps

3.3 Study Phase 2

The *study's second phase* is designed considering the limitations and advantages of the Delphi technique. The choice of criteria for this study is mentioned in Table 2. The experts have asked about their opinions on the relevance of these selected factors to the context of the present study in two sequential rounds. These factors are then rated based on their importance.

Table 2: Choice criteria for the study

Criteria Choice for Identifying the motivations and inhibitors of travel podcast listening study	
Purpose of the study	Exploring and shortlisting the factors of podcast listening
Number of rounds	Two
Experts	Heterogeneous group
Mode of operation	Remote
Anonymity of panel	Full
Communication media	Via e- mail and over call.
Concurrency of rounds	Sequential

Adapted from; Day and Bobeva (2005)

4. Data Collection and Analysis

4.1 The Expert Panel

The expert panel consisted of a perfect blend of academic marketing experts who worked in both tourism and non-tourism domains, with previous industry experience and avid podcast listeners. Using the Delphi method, the study utilised non-random sampling to select 15 experts as suggested for social studies (park, 2002). It includes purposive and snowball sampling to select panels.

Professors and associate professors with a keen interest in tourist behaviours, destination marketing, and branding from the top institutions of India spread over four corners, including Tourism Business Management schools and other management schools in general, were approached. To add a technological viewpoint, the academicians who had research interests in technological advancements in tourism were approached. In

addition, experts from a non-tourism background working in marketing and consumer behaviour were also included in the panel to have a perspective apart from tourism. A few avid podcast listeners are also part of the sample to make the survey more insightful from the listeners' perspective. In order to touch upon every aspect of the study, the researcher has included experts from all related domains to maintain the heterogeneity of the panel. For anonymity, all individuals were contacted through emails and phone; no experts knew each other. Among many contacted experts, a few showed interest in participating in the survey. Table 3 includes the final panel list and their respective designations.

Table 3: Expert panel composition

Academicians				**Total**
Domain and Designation	**Tourism Marketing and Management**		**Marketing and consumer behaviour**	
	Non-tech.	**Tech.**		
Professor	4	-	0	4
Associate professor	2	1	1	4
Assistant professor	1	2	1	4
Avid Listeners	-	-	-	3
Total experts				15

4.2 Delphi Round 1: Gathering and Analysing the Data

4.2.1 Delphi Round 1 Results

The objective of round one was a) to confirm whether the identified motivators from the literature appeared to be relevant or not and b) to get the new motivators and inhibitors of podcast listening that might be missing in the literature. Hence, in the first round of the Delphi survey, experts were presented with the questionnaire in Excel format, listing all the possible motivators of podcast listening along with their contextualised definitions. They were asked about the listed motivator and whether it should be included in the further course/phase of our study or not (for reference, the experts we provided with the travel podcast link in the description mail, which described the objective of our study and instructions to respond for questions). After analysing the frequency of disagreement, we found that digital collection and personal identification received the least, yes, i.e. 2 and 1, respectively. Hence, the author dropped these two variables in this phase.

To fulfil the second objective of this round, the subsequent section of the questionnaire was presented with open-ended questions to seek new possible motivators and inhibitors for travel podcast listening. The questions are as follows:

- What other possible motivators of travel podcast listening must be included in the study but are missing in these listed factors?
- What possible inhibitors of travel podcast listening must be included in the study?

Examples of travel podcast inhibitors also followed the second question to make it more transparent to the experts. No significant inhibitors of travel podcast listening were identified earlier in the literature; only some reports mentioned them in the form of paid subscriptions and advertisements (Spotify, 2022). Hence, we cited both examples and inquired about the travel podcast inhibitors except these.

To bring more confidence to the study and the suggestions from experts, not only were the experts asked about listing new factors, but they were also asked to give sufficient justification for considering their suggestions.

After collecting all the responses from experts, the analysis of the qualitative section of the questionnaire was conducted, and it was found that the answers to the questions were diverse; few of them were in the form of lists (only the new factor name), and few were in comments with elaborative descriptions. As the comments were comparatively few, the researcher analysed the comments and suggestions manually. To analyse these comments, the author followed a systematic thematic analysis approach as suggested by Braun and Clarke (2012). Thematic analysis followed due to its wide range of applications and its flexibility in a qualitative analytic approach. Thematic analysis applies to almost all types of qualitative research questions and designs

and, hence, to our study as well (Clarke and Braun, 2017). See Tables 4 and 5 for more detailed descriptions of the thematic analysis.

4.2.2 Delphi Round 1 Results

Based on the thematic analysis, we identified WOM (Word of Mouth) and subjective norm as new possible motivators for listening to travel podcasts. Traditionally, WOM is defined as face-to-face communication; however, nowadays, it has taken the new form of e-WoM (Electronic Word of Mouth). E-WOM is a consumer-to-consumer communication through blogs, vlogs, and websites where the consumers do not necessarily know each other. The present study considers both types of WOM, traditional as well as E- WOM.

Subjective norm appeared as a new motivator is defined as "a person's perception that most people who are important to him think he should or should not perform the behaviour in question" (Addison-Wesley, Reading, MA (1975).

From thematic analysis, other factors were identified as the inhibitors, like past performance and physical accessibility. Physical accessibility being a duplicate of convenience (previously on the list) and prior experience being less frequent did not emerge as a new theme. Further, the content of the travel podcast emerged as a possible inhibitor to listening. The content quality, its type, the authenticity of the information, diverse interests related to travel, podcast episodes in different languages, etc., reflected the possibility that a listener might not be interested in listening to travel podcasts due to these characteristics of podcast content, hence we consider it under an umbrella term 'content'. Other inhibitors like 'addiction' appeared, but due to less frequency of occurrence, those dropped.

Hence, three main themes emerged as the most talked about.

- WOM
- Subjective norm
- Content

Table 4: Coded comments illustration

Respondent	Comment	Comment coded as
R2: For the motivators	Suggestions to listen to a podcast by a close friend	WoM, Social Influence or Subjective Norms
R4: For the inhibitors	Besides a couple of inhibitors mentioned above, the major inhibitors are: the nature of information, authenticity of the facts and figures on a tourist's destination that are shared to tourists. Nature and typology of tourist interviewed; to know the experiences, what they had experienced during their sojourn to a specific tourist destination. What nature of coverage the podcast had made of the local community to know their customs and rituals and which were the tourist places where the operators of Podcast had made the coverage of tourist. Moreover, were the contents have been thoroughly vetted before getting them circulated. Further, what percent of content are understood by the foreign tourist and a tourist not know the language delivered through the podcast.	Nature of information, Authenticity of the facts and figures, Language barrier, Nature and typology of tourist's interviewed, Content quality
R7: For the inhibitors	Quality of content- drab and lack lustre, content not up to the mark may reduce listeners' interest and they skip episodes/sessions or negate channels all together.	Content Quality, Availability of better options.

Table 5: The frequency of occurring identified codes and their interlinkages; Changing Codes to themes

Respondent	The possible new motivator for podcast listening	Appearing Frequency	Final theme/ Construct
R2, R4	WoM, hearsay	2	WOM and Subjective norm
R3,R2	Social Influence	2	
R4,R7	Subjective norm	2	
R4	Physical Accessibility	1	
R4	Past experiences	1	

Respondent	Possible new inhibitors	Appearing Frequency	Final theme/ Construct
R1,R4	Unrelated content	2	Content
R3,R7	Unavailability of Content	2	
R3,R7	Quality of Content	2	
R4	Authenticity of the facts and figures	1	
R4	Language barrier	1	
R4	Nature and typology of tourist's interviewed	1	
R10	Addiction	1	
R3	Unpopularity		

4.3 Delphi Round 2: Gathering and Analysing the Data

In the second round of Delphi, we modified the questionnaire for Delphi round 1; we removed digital collection and personal identification, and new inhibitors were added. The modified questionnaire is then presented to the experts to rate the given factors based on their importance on a five-point rating scale, from least important to most important.

After collecting the data, the data was recorded against each factor of every respondent in Excel format. This round's data is analysed using Lawshe's Content validity Ratio (Lawshe, 1975).

The Critical value of 0.66 for Lawshe's CVR for accepting and rejecting the possible listening motivations obtained concerning the panellist's count (i.e. 15) for each factor. (Critical Values for Lawshe's Content Validity Ratio).

Calculating Content Validity Ratio (CVR):

Content Validity Ratio (CVR) = (ne- N/2) / N/2

ne= is the essential score

N= total number of experts

According to Lawshe, there are three types of values/scores in the rating scale. The top 2 values or parameters are essential, the middle is useful but not essential, and the last one is not necessary. In the context of our study, extremely important and very important are equivalent to essentials. Important was considered useful but not important, and somewhat important and least important were assumed as not necessary.

4.3.1 Delphi Round 2 results and discussion

The essential scores of each construct with CVR are presented in Table 6, along with the list of accepted and rejected. Out of 19 factors, eleven were selected through the second round.

Table 6: Essential scores of motivations with CVR and acceptance status

S. N	Podcast listening Motivation	Ne	CVR	Result
1	Curiosity of interest	15	1.00	Accept
2	Arousal	14	0.87	Accept
3	Educational	14	0.87	Accept
4	Subjective norm	14	0.87	Accept
5	WOM	14	0.87	Accept
6	Information	14	0.87	Accept
7	Story telling transportation /Participation/engagement	13	0.73	Accept
8	Content	13	0.73	Accept
9	Podcast perceived realism	13	0.73	Accept

S. N	Podcast listening Motivation	Ne	CVR	Result
10	Perceived travel risk/ Travel anxiety	13	0.73	Accept
11	Entertainment	12	0.60	Accept
12	Convenience /Multi-tasking	10	0.33	Reject
13	Escape/Relaxation	9	0.20	Reject
14	Communal identification/belongingness	9	0.20	Reject
15	Hobby	9	0.20	Reject
16	Podcast perceived affinity	8	0.07	Reject
17	Companion/connection/ Social	8	0.07	Reject
18	Fashion	6	-0.20	Reject
19	Habit	6	-0.20	Reject

5. Discussion

The study has uncovered insights into travel podcast consumption, revealing motivations and barriers perceived by experts and listeners.

The Delphi survey's first round identified WOM and subjective norms as motivators and content as new inhibitors. Subsequently, eleven factors were confirmed in the second round.

Among the identified motivations, factors such as curiosity, arousal, education, subjective norms, word of mouth, and information emerged as crucial drivers influencing travel podcast consumption. Previous research highlights the influential role of WOM and e-WOM in consumer behaviour, fostering credibility and adoption of new products/services. Similarly, subjective norms influence technology adoption and acceptance of innovation.

Conversely, inhibitors such as content quality, perceived risk, and podcast realism hinder listener engagement. Addressing these barriers is crucial for creators to broaden their audience appeal.

Strategies focusing on WOM and community promotion can enhance travel podcast accessibility and popularity. Additionally, prioritizing authentic, quality content tailored to traveller interests can bolster destination attractiveness via podcasts.

Given the convenience of audio media, promoting travel content through streaming platforms proves advantageous. Adapting to Gen Z preferences necessitates destination brands' presence across various media, including local language content, to boost domestic travel and local economies.

6. Research Implications

Theoretically, implications of this study go beyond the specific context and adds nuance to existing theories of consumer behaviour and media consumption by identifying the motivations and inhibitors influencing travel podcast listening.

Incorporating subjective norms and word of mouth into the analysis expands upon established frameworks, such as the Theory of Planned Behaviour and the Diffusion of Innovations theory, which emphasise social influences and interpersonal communication in shaping individual behaviours. Furthermore, recognising content quality and authenticity as critical determinants of listener engagement contributes to ongoing discussions surrounding media credibility and trustworthiness.

Practically, the results of this study demonstrate the potential for destination managers to utilise podcasting as a strategic tool for destination promotion.

The findings underscore the multifaceted nature of audience preferences, encompassing informational, social, and entertainment-driven motives. Authentic content and storytelling in engaging listeners, emphasizing the need for high-quality production and narrative delivery in travel podcasts. In the article 'Should your Company Start a Podcast' Jesse Noyes (2014) in Harvard Business Review noted how difficult it is to create and sustain a good podcast. Centralising the overall destination content through podcasts and other media channels will be

beneficial for the overall marketing and content strategy of the destination and its services. The utilisation of travel podcasts also has the potential to serve as a transformative mechanism for enhancing the image of destinations and promoting sustainability. We further suggest harnessing the potential and expertise of the podcasters by leveraging the exemplary collaboration efforts with them. The insights provided in the study will also hold significant value for anybody aiming to access the expanding market of travel content consumers, particularly Destination Marketing Organisations (DMOs Podcasts have the potential to be an effective tool for brand storytelling and consumer engagement if they are produced with the proper drive, support, and regularity (Jesse Noyes, 2014).

7. Conclusion, Limitations and Future Scope

This study has delved into the relatively uncharted territory of travel podcast consumption, identifying key factors influencing listener engagement and providing valuable insights for content creators and destination marketers. The findings from the Delphi survey highlighted eleven critical motivations for listening to travel podcasts, including curiosity, arousal, education, subjective norms, word of mouth, and information, while also recognizing content quality as a significant inhibitor.

The findings of this research provide important insight into what drives people to listen to travel podcasts, as well as the potential next steps for podcast producers, destination brands, and other stakeholders like destination brands. Integrating WOM and subjective norms into the analysis enriches existing consumer behaviour and media consumption theories, emphasizing the social influences and interpersonal communication in shaping podcast listening habits. These insights underscore the importance of authentic, high-quality content and engaging storytelling in attracting and retaining listeners.

The results underscore the strategic potential of travel podcasts in destination promotion. By leveraging the identified motivations and addressing the inhibitors, destination marketers can enhance the appeal and effectiveness of their podcast content. This study advocates for a comprehensive content strategy that integrates podcasts with other media channels, focusing on authentic narratives and quality production to engage audiences and promote destinations effectively.

While comprehensive, the study has a few limitations that should be acknowledged. The opinions expressed by the experts may not necessarily reflect the views of all podcast enthusiasts. The extension and generalization of this study to the general public should be approached with caution. However, it can be seen as a solid foundation for future research.

Furthermore, the factors considered in this study may only partially capture some of the various motivations behind consuming travel podcasts. For instance, the analysis did not include platform subscriptions and advertisements. Therefore, future research endeavours could explore the intricate psychological aspects associated with podcast consumption. Future research could also explore the intersectionality between travel podcast consumption and destination marketing strategies and employ different variables as predictors to enhance the precision of the findings. Additionally, it would be beneficial to validate the identified factors by conducting multiple measurements to ensure their reliability and consistency.

Acknowledgement

Author is thankful to Dr. Swagato Chatterjee, Lecturer at Queen Mary University of London, and Dr. Biplab Datta, Associate professor at Indian Institute of Technology Kharagpur for their invaluable guidance and support throughout this research.

Abstract: This study aims to comprehensively review the extant literature examining the intricate relationship between collective action (CA) strategies employed within industrial contexts and the consequent impact on organizational competitiveness. Utilizing a systematic literature review methodology, this study meticulously identifies and synthesizes the challenges and solutions associated with CA. Additionally, it delineates various factors that influence business competitiveness in relation to collective action strategies. The analysis culminates in the development of a conceptual model that elucidates the dynamic interplay between collective action problems and strategies, alongside key business competitiveness factors. Furthermore, the study highlights the moderating role that governance structures can exert on this relationship. This review stands out in the literature due to its unique focus on the intersection of collective action strategies and organizational competitiveness. It addresses a gap in existing research by providing a comprehensive synthesis of these variables within the context of business environments. The study underscores the imperative for a more profound theoretical exploration of business-related collective action. It suggests a critical examination of the role that existing business associations play in enhancing or impeding the competitiveness of firms. By doing so, it offers valuable insights for practitioners and policymakers aiming to leverage collective action for competitive advantage. The comprehensive analysis offered in this review provides a robust framework for understanding the factors that drive the effectiveness of collective action strategies and their implications for business competitiveness. By identifying the challenges and solutions associated with collective action, as well as the business competitiveness factors influenced by these strategies, this study contributes to a deeper understanding of the field. Additionally, the conceptual model proposed here highlights the crucial role of governance in moderating the relationship between collective action and competitiveness, offering a nuanced perspective that can inform both academic inquiry and practical implementation. Overall, this study provides a valuable foundation for future research and practice, emphasizing the importance of collective action in achieving and sustaining competitive advantage in the business world.

Keywords: Business competitiveness, Collective action, Governance, Innovation, Social capital, strategy

1. Introduction

The theme of CA, triggered by Olson (1965), has received the attention of several authors in different fields of knowledge. Similarly, business competitiveness has been approached from different perspectives, supported by different theoretical approaches, such as industrial economics (Porter, 1980) or resource-based view, RBV (Barney, 1991). However, the relationship between these two fields has yet to be the subject of attention by researchers. In this context, it is relevant to have a deeper understanding of the impact of CA strategies on business competitiveness.

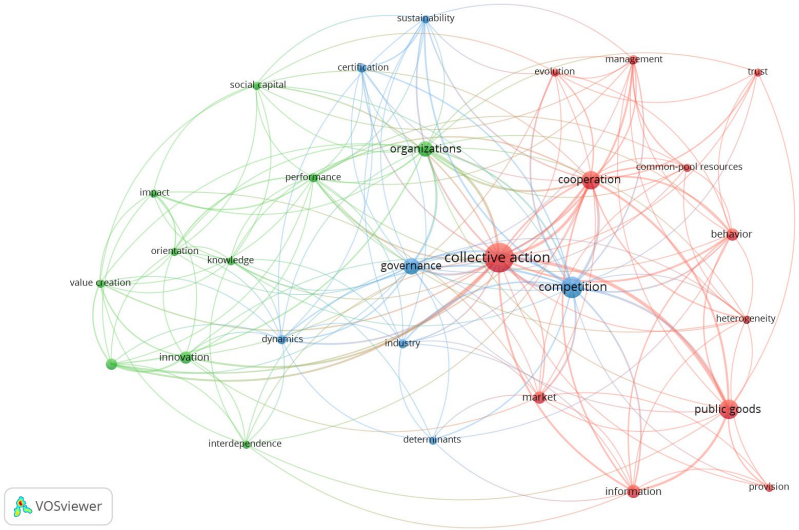
With his seminal work *The Logic of Collective Action*, Olson (1965) established the conceptual foundations for research in the field of problems that emerge from the conflict between individual and collective rationality, seeking to define a general theory that explains the factors that affect CA, focusing on the study of organizations that provide collective goods. A collective good is the result of the action of a group focused on a common objective, for example, ensuring food security. Public goods are all those that observe the characteristics of non-exclusion and non-rivalry, as in the case of defining public policies (Olson, 1965) or the characteristics of an industry that have non-rival application to all companies in a sector (Barnett, 2006). Common-pool resources are characterized by their joint use by a particular group, whose exclusion from their use is problematic, (Ostrom, 1990). This subtraction distinguishes public goods problems from common-pool resources problems.

Organizations that provide collective goods can take on a diverse nature, such as unions, pressure groups, professional orders, various business associations, consortiums, or clubs, and can take on a formal or informal nature (Brito, 2001). To generate collective benefits, organizations generally rely on resources from their members or funds made available by government entities. Problems of CA in these organizations can arise when their members have the option of contributing or not to the generation of collective benefits.

The study of competitiveness has generally been approached at the macro level, which encompasses national, regional, or industry-wide issues (Porter, 1980), and addresses the company's competitiveness from the perspective of the competitive advantages that it can obtain from industry factors in which it operates and, therefore, are external to it; and the micro level perspective that bases the company's competitiveness with a focus on its internal resources, tangible and intangible, the resource-based view (RBV) built from Barney (1991).

2. Methods

A Systematic Literature Review (SLR) is a powerful tool for scientific research (Xiao and Watson, 2019). The literature review protocol guarantees a rigorous, transparent, and repeatable process (Okoli and Sharaban, 2012, Tranfield *et al*., 2003,) and ensures that the advancement of scientific knowledge is adequately supported by existing knowledge. Data analysis combines a bibliometric and a thematic approach (Bahoo *et al*., 2020). Bibliometric analysis is a suitable tool for identifying the most relevant works (Zupic and Cater, 2015) and is vital for analysing relationships and gathering topics from academic articles (Liu, 2017). For bibliometric analysis, one used the VOSViewer v1.6.18 software.



In January 2023, a bibliographical search was carried out in the Web of Science (WoS), a database recommended for systematic literature reviews (Bengtsson and Raza-Ullah, 2016), as the journals included in this database are carefully and rigorously evaluated, which give them adequate scientific validity (Ankrah and Al-Tabbaa, 2015). The following search terms were used: WoS - All fields: "collective action" and competit*. One obtained 832 documents, which were refined by combining ten keywords from each of the two domains, CA and competitiveness (Zuñiga-Collazos *et al*., 2019). This refinement resulted in 199 articles, which were submitted to inclusion and exclusion criteria. We use several WoS filters as inclusion criteria and we exclude articles unrelated to collective action and competitiveness in a business environment, which resulted in a final sample of 67 articles.

3. Findings and Discussion

3.1 Thematic Relations

To understand the structure of a network of relationships between themes that represent a construct of a given area of research, we can use a bibliometric method (Zupic and Cater, 2015), which is vital to analyse relationships and gather topics from academic articles (Liu, 2017). A co-keyword occurrence analysis was used to construct a conceptual structure of the research domain (Callon *et al*., 1983). In the set of 67 articles, 550 co-keywords were found. Considering the minimum occurrence of 3 times per keyword, it resulted in 29 co-keywords (Figure 1). These three clusters show a network of thematic relationships.

The first (red cluster) encompasses 12 items and has CA as its central theme, highlighting public goods and cooperation issues. Business competitiveness factors constitute the central body of the second cluster (green), encompassing 10 items, with innovation, knowledge, and performance being the most relevant. The themes of governance and competition stand out in the third group, with seven items (blue cluster). The position of this cluster in the network points to the interconnection that governance can establish between CA and business competitiveness.

Source: Own elaboration using the VOSViewer v1.6.18 software

Figure 1: Co-keyword occurrence analysis

According to Zupic and Cater (2015), bibliometric analysis is not a substitute for traditional analyses, so a thematic analysis was also used for all articles under study.

3.2 Thematic Analysis

The thematic analysis of the 67 articles led us to define thematic areas and respective categories and subcategories as illustrated in Table 1.

Table 1: Categories and subcategories by thematic areas

Thematic Areas	**Categories**	**Subcategories**
Collective Action	CA Problems	Barriers Adherence Participation
	CA Strategies	Corporate Political Activity Consortia and Alliances Cooperation
Business Competitiveness	Resources	Social Capital
	Innovation	Quality Differentiation
	Markets	Access Certification
	Performance	Productivity Decision Making
Governance	Coordination	Competition Collaboration
	Regulation	Monitoring Lobbying Self-Regulation

Source: Own elaboration

3.2.1 Collective action

CA problems

The successful management of common-pool resources is one of the most challenging and pressing problems facing natural resource management and environmental economics (Ostrom, 2010). Many obstacles to CA are related to the inadequate use of existing regulations, such as the institutional configuration of the tax regime (Rixen, 2011; Skurray, 2015).

A lack of social capital reduces the ability to act (Kokthi et al., 2021), and a lack of motivation to change a current situation can also result in a CA problem (Monios and Lambert, 2013). The degree of commitment and consequent contribution to common objectives depends on the partners' perceptions regarding the behavior of others (Fonti et al., 2017). Low participation in collective activities can reduce the ability of groups to provide valuable services to their members (de Reuver et al., 2016). However, to ensure long-term success more is needed to rely solely on pre-existing levels of trust and reciprocity between those involved in CA (Ostrom, 2010). Active participation in supply chain management can be achieved by developing organizations capable of managing supply in volume and quality (Dervillé and Allaire, 2014). Formalization sets forth regulations, procedures, and standards within an inter-organizational setting, fostering stability, while also binding both parties to the relationship. Interaction, on the other hand, promotes the exchange of information, coordination, cooperation, and deeper engagement among participants, restricting opportunism.

Opportunism is one of the main problems that emerge in collective actions, as in the case of strategic alliances with partners of different natures and other inter-organizational networks and is decisive in the effectiveness of CA (Fonti et al., 2017). Despite the action problem within them, alliances are often attractive (Konrad, 2018). A collective problem of opportunism is the inability to internalize a positive externality (Cheikbossian, 2021). Opportunism acts as a hindrance, undermining CA in two distinct ways: individuals may either be swayed to act selfishly and opportunistically, or they may become hesitant to cooperate due to the apprehension of others' opportunistic behaviour which leads to the dilemma of initiating CA (de Reuver et al., 2016). Opportunism has also harmful effects on the performance of franchisees in a franchise network, that may be limited by establishing appropriate normative expectations and cultivating strong ties between parties (Kidwell et al., 2007). In advocacy groups, some activists may decide to take the lead, which introduces a CA problem (Reuben et al., 2015).

The tension between the collective interests of the group and the individual interest of each member impacts the dynamics of intergroup cooperation and competition (Coen, 2013). Analysis of the interactions between intra-group CA problems and inter-group conflict shows that inter-group competition promotes intra-group cooperation and that larger groups are more effective in overcoming their CA problems (Cheikbossian, 2012). When forming alliances and faced with a conflict in a framework with incomplete information about the relative strength of the potential ally, participants anticipate the selection of other players and the informative value of their own and others' choices (Konrad and Morath, 2018). In the case of consortium formation, conflict management and strong protection of the competitive advantages of associated companies are also crucial to motivating participants' contributions (Xia et al., 2012). In multifaceted digital platforms characterized by rapid growth, distributed innovation, and role flexibility operating in different geographic locations, it is recommended that business models are designed in a way that allows the creation of joint value from the beginning and avoids the emergence and escalation of conflicts (Ricart et al., 2020). From the above findings, we can derive the first proposition:

(P1): CA problems may lead to less business competitiveness.

CA strategies

Members of interest groups appear to value both the private goods they receive in the form of selective incentives and the lobbying services purchased with their members' money (Pecorino, 2001). The incentives for CA to influence policy are high since the potential benefits are significant and concentrated (Chase, 2004). The multifaceted relationships between collusion, lobbying and group formation, and environmental policy highlight the role of trade liberalization in product market competition and its consequent impact on the incentive to lobby for less stringent environmental policies (Damania and Fredriksson, 2003). An ownership community that embodies consent, jurisdictional competition, and residual claim (incentive alignment) mitigates CA problems (Makovi, 2019).

Cooperation mechanisms established by social capital play a positive role in creating trust in a group of people, which reduces opportunistic behaviour and facilitates the development of collective activities in the form of security mechanisms (Kokthi *et al*., 2021), such as security food, a collective good assumed to be desirable for this entire industry (Pouliot and Sumner, 2013). Solidarity and reciprocity are essential ingredients of social capital and influence the degree of cooperation between local stakeholders, which are necessary preconditions for successful collective actions (Kokthi *et al*., 2021). Reciprocity can also be facilitated if the cooperative intentions of others can be assessed with information gathered through communication and face-to-face interaction (Price, 2006). The level of reciprocal cooperation is a critical element of community resource management, which helps resource users to collaborate (Tembata and Takeuchi, 2018). It is suitable to design relationships that help establish appropriate normative expectations and cultivate strong ties between parties (Kidwell *et al*., 2007).

Participation in consortia benefits companies in two ways: through the final products that companies develop together and through the cooperation process, which includes inter-organizational learning and the construction of social capital (Xia *et al*., 2012). Through networked CA activities, participants identify common interests, share market knowledge, and develop new business opportunities (Devaux *et al*., 2009), which leads to higher incomes for small agricultural producers (Kazangi *et al*., 2009), benefit from the technological, commercial and institutional innovations generated. Creating public-private consortia can be a way to develop new markets (Monios and Lambert, 2013) and participation in alliances improves the ability of partners to access and share some goods produced within alliances without restrictions (Monge *et al*., 1998). Based on the findings of these authors we can derive the second proposition - (P2): CA strategies contribute to solving CA problems.

3.2.2 Business competitiveness

Resources

Social capital is a collective resource and is crucial for those involved in CA to share resources with other members. Among the components of social capital are reciprocity, reputation, information, knowledge, and trust (Enriquez-Sanchez *et al*., 2017). Reciprocity suggests that people cooperate more when they perceive that others are cooperating and less when they perceive that others are opportunistic (Price, 2006) and collective effort is a public good for group members (Cheikbossian, 2021). Reciprocity motives are essential predictors of individual decisions in CA situations (Fisher and Qaim, 2014) and influence participation in collective activities. However, to ensure long-term success more is needed to rely solely on pre-existing levels of trust and reciprocity among those involved in CA (Ostrom, 2010). Reciprocal preferences in groups should provide the voluntary offer of public goods, the size of which is associated with greater levels of trust among group members (Guttman, 2013).

The reputation generated by the satisfaction of users of a technological platform is a collective good, which, when benefiting all participants, takes on the characteristics of a commonly produced good (Cennamo and Santaló, 2019). Traceability protects an industry's reputation from randomly occurring incidents, identifying and isolating the product that caused the problem, and limiting the size of recalls (Pouliot and Sumner, 2013). The information transmitted by the density of relationships provided by the existence of social capital allows for better decision-making and obtaining advantages for those who have access to them, as long as the information is accurate and reliable (Kokthi *et al*., 2021; Laussel *et al*., 2022).

Innovation

The quality and differentiation of food products are critical dimensions for success in modern food markets, and producer-controlled market organizations have the potential to significantly impact the sharing of fixed costs associated with innovation and certification thereby exerting influence over the quality of distributed products in the market and regulating supplies (Saitone and Sexton, 2010). In the complementary innovation process (Maciel and Fisher, 2018), companies exchange critical resources to promote peer entry, growth, and continuous product innovation. National innovation policies interact strategically to enable more effective business environments, fostering global entrepreneurship and innovation (Potts, 2016). However, some established sectors share common characteristics that resist change, particularly disruptive innovation, which impedes the launch of innovations or innovative practices in the market (Jaffee and Freeman, 2002; Weiss and Bonvillian, 2013). CA is essential for innovation in the agricultural and construction sectors and to encourage investment in innovative technologies in the energy sector. Complementary innovation is fostered by

heterogeneous companies belonging to ecosystems based on technological platforms, which promotes the creation of value (Cennamo and Santaló, 2019).

Markets

Conditions for market access are best achieved with the collective organization of producers, which increases levels of social capital to strengthen internal and external relationships (Lutz and Tadesse, 2017). Market infrastructure is fundamental for the CA of collective actors to extract value from their private capabilities, which is why it is crucial for successful market formation (Struben *et al*., 2020).

Performance

Productivity is positively related to engagement in the exchange of strategic information in both the short and long term (Barnes *et al*., 2017) and with improved coordination of inter-group competition (Cheikobossian, 2012). CA, solid leadership, and a focus on technical, organizational, financial, and marketing innovation are essential for improving performance in dynamic markets (Kazangi *et al*., 2009). Government regulation can reinforce corporate profitability by inducing CA to mitigate environmental risks (Pang, 2018) and promoting reforms that improve labour quality, social harmony, and economic security (Karsten, 1995), thus reinforcing productivity.

The context of decision-making is vital for structuring and developing CA through resource allocation and strategy performance (Pittz and Adler, 2016). Using common-pool resources is often a competitive activity and raises essential questions about the costs and benefits of engaging in cooperative behaviours and the socio-structural dynamics that form the basis of decision-making by stakeholders (Barnes *et al*., 2017). Now we can define two other propositions relating to CA strategies and business competitiveness:

(P3): CA strategies have an influence, positive or negative, on business competitiveness.

(P4): The pursuit of business competitiveness factors stimulates CA strategies.

3.2.3 Governance

Coordination

The need for a governance mechanism for CA in ecosystems (Cennamo and Santaló, 2019), and collective institutions are necessary to obtain orderly market behaviour (Harriss-White, 1995). The effectiveness of collaborative collective actions to manage common-pool resources depends on the scale of the issue being assessed (Bowen *et al*., 2018). Collective governance entails the implementation of institutional innovations and investments by resource users thereby aligning interests in resource exploitation with those focused on maintaining stock balance. Collective management or governance is an alternative to, or can complement, centralized and market-based management approaches for common-pool resources, whose sources of inefficiency can be reduced through coordinating efforts and defining rules of using (Costello and Deacon, 2017; Skurray, 2015). In the case of multi-sector partnerships involving several stakeholders, an open strategy governance platform is appropriate (Pittz and Adler, 2016).

To mobilize collective coordination capabilities to face global changes in different regional contexts, market agents need material and immaterial investments and the help of regional public actors to build new local collective capabilities (Dervillé and Allaire, 2014). To encourage CA by companies to reduce polluting emissions (Pang, 2018), it is required cooperation and coordinated CA for the use of resources and the imposition of joint restrictions (Tembata and Takeuchi, 2018). Market-based instruments (MBI) are generally used to promote competition, with individualized approaches to improving ecological values framed around the farm scale (Cooke and Moon, 2015). Initiatives depending on relational governance are inclined to foster collaboration to a greater extent. Non-financial incentives, such as reputational benefits and shared intellectual property rights, are more likely found in projects that rely on relational governance (de Reuver *et al*., 2016).

The coordination of collaborative conduct by business associations and consumer alliances plays a central role in the complementary innovation process, allows the development of a market and increased global competitiveness (Maciel and Fischer, 2018).

Regulation

Implementing and enforcing institutional rules are responsible for success, and comparing successes and failures can help understand what works and what does not to support CA (Buhren and Dannenberg, 2021).

Institutions affect social processes and the system's outcomes vary depending on the agency's reactions to output and voice (Shin, 2022). The polycentric approach (Ostrom, 2014), overseen by engaged local, regional, and national stakeholders, offers a significant advantage over a single governmental unit to solve global CA problems. Regulation based on market instruments can limit the incentive to share information about common-pool resources (Costello and Deacon, 2007), while at the same time, it can generate tension between the focus on property and political environmental management leading to insufficient conservation of public goods (Cooke and Moon, 2015). The quality of environmental public goods, such as air quality and drinking water, or quasi-public goods such as health care varies with the number of local governments and the relationships between different jurisdictions (Hatfield and Kosec, 2019, Karsten, 1995).

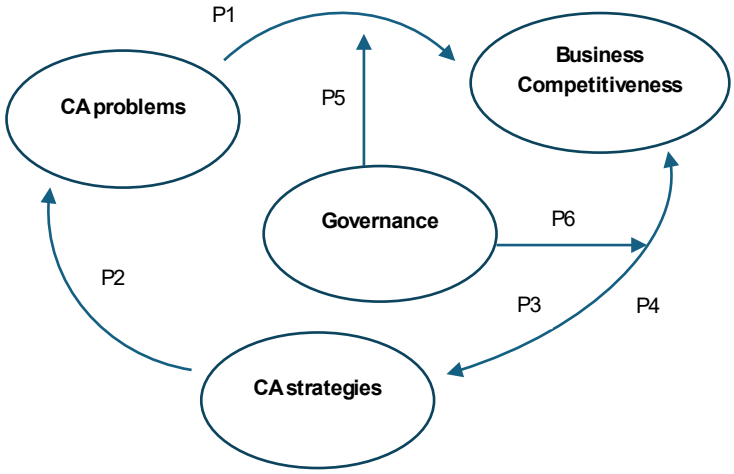
Monitoring is an essential factor in the success of CA by reducing opportunistic behaviours, which can also be achieved through government imposition of mandatory participation (Saitone and Sexton, 2010). Increased monitoring opportunities and a formal or informal penalty system may deter opportunism (Price, 2006). The imposition of food safety standards or a traceability system on the industry can be carried out through self-regulation or government regulation (Pouliot and Sumner, 2013), but the existence of a great number of voluntary standards organizations may constitute a problem (Reinecke *et al*., 2012).

Sectors characterized by a greater degree of competition and low concentration levels tend to exert pressure jointly, that is, through sectoral business associations. In contrast, individual lobbying predominates in sectors with greater concentration and more differentiated products (Bombardini and Trebbi, 2012). The process of competition and CA that leads to change reveals a complex picture that highlights the contradictory motives of organizational actors who fight for and against institutional change (Jaffee and Freeman, 2002). Competition can trigger the need for institutional change, but it can also prevent it from happening when the change threatens organizations' current distribution of resources. Pressure from political entities representing producing companies hindered by the constraints of national market sizes often leads to the emergence of protectionist measures and the formation of trading blocs.

Self-regulation may not prevent market manipulation, so the roles of law, regulation, and self-regulation in deterring manipulation depend on the costs and benefits of available alternatives (Pirrong, 1995). The industry's coordinated response to a CA problem, associated with the need for moderation in price increases, proves to be preferable to government intervention (Ellison and Wolfram, 2006). However, sometimes the intervention of state institutions is necessary to resolve common problems (Kokthi *et al.*, 2021).

The rules of the collective organization determine the type of relationship that is established between the members of a sector (Bowen *et al*., 2018) and the definition of norms and codes of conduct by the organizations coordinating CA constitutes a mechanism for managing the tensions and conflicts generated by the opportunistic behaviour of members (Maciel and Fischer, 2020). We can define two other propositions about the role of governance:

(P5): Governance mechanisms moderate the relationship between CA problems and business competitiveness.



(P6): Governance mechanisms moderate the relationship between CA strategies and business competitiveness.

This thematic analysis and the propositions derived from it led us to propose a conceptual model that presents the relationships between the primary variables.

4. Conceptual Model

The existence and production of collective goods are essential conditions for the economic development of society. The very nature of these goods leads to companies needing to get involved in collective actions in which actors of other types also participate. CA produces a set of collective goods valuable for business competitiveness. However, it also gives rise to problems whose nature and resolution require developing CA strategies. The main problems of CA can occur at different stages: in formation, structuring, adherence and participation in collective actions; the dynamics and context in which CA unfolds, as well as the characteristics of markets, also influence CA problems. The number and size of participants in the CA are equally relevant to the outcome of that action. Opportunism, particularly in situations involving common-pool resources, is one of the main problems that emerge in collective action, generating tensions and conflicts between participants. There is a very close relationship between business competitiveness and CA strategies. Solving CA problems involves defining and implementing CA strategies.

Governance can play a relevant role in ensuring the success of collective actions in different areas of socioeconomic activity and is essential for strategies to have an impact. The social capital generated by governance is a fundamental antecedent for the dynamization and existence of CA and the production of collective goods. Regulation and self-regulation emerge as two relevant governance mechanisms to guarantee this success, which is also strongly linked to the type of coordination exercised. Governance mechanisms, therefore, contain CA strategies and must contribute to resolving CA problems and fostering business competitiveness.

Figure 2: Conceptual Model for Collective Action and Business Competitiveness

5. Conclusion

This paper examined the relationship between CA and business competitiveness based on a systematic literature review that combined bibliometric and thematic analysis, leading to the development of six propositions within a conceptual model. These propositions address both the endogenous and exogenous interaction between CA problems and strategies and business competitiveness. The paper also highlights the role that governance is likely to play in moderating these relationships, whether as a coordinating agent or as an actor in regulation and self-regulation.

This investigation has some limitations, related to the sole use of the WoS database to select articles for analysis within business, economics, and management. CA and its relationship with business competitiveness present a vast field for further investigation. It is possible to expand the study with contributions from other scientific fields, as could be the case with Sociology. More theorical and empirical studies carried out with business associations will be able to shed light on the governance of CA and its impact on business competitiveness. Defining a systemic model that relates CA to business competitiveness makes sense, considering antecedent, process, and consequent variables.

The Power of Proximity: The Impact of Proximity Between Early-Stage Investors and Universities

Ole Peters and Louisa Heiduk
HHL Leipzig Graduate School of Management, Germany

ole.peters@hhl.de
louisa.heiduk@hhl.de

Abstract: Early-stage investors and universities are crucial stakeholders in entrepreneurial ecosystems, yet their combined impact remains underexplored. This paper examines how the proximity between early-stage investors and universities affects the founding rate and success of affiliated startups. The analysis utilizes data from the Crunchbase 500 list for Germany. Findings indicate a positive correlation between the proximity of early-stage investors and universities with higher success rates and founding rates of affiliated startups. However, the results show varying dynamics and partial statistical significance, suggesting different implications for small versus large universities. Should these tendencies be confirmed with a more extensive dataset, the findings could have practical implications for early-stage investors and universities, tailored to their size.

Keywords: Venture capital, Start-ups, Entrepreneurial ecosystem, Start-up founding rate, Start-up success rate, Investor start-up proximity

1. Introduction

Start-ups backed by venture capitalists (VCs) significantly contribute more to economic growth than those without VC support (Gompers et al. 2020; Samila & Sørensen 2011; Sørensen 2007). VCs invest in start-ups primarily due to high return expectations. Because start-ups typically exhibit asymmetric returns, VCs aim to identify outliers within their portfolios that can provide substantial returns (Cochrane 2005). Although VCs evaluate factors like team, product, market environment, and strategy, they often face significant information asymmetry compared to the founders (Gompers et al. 2020; Kaplan & Strömberg 2004). To mitigate this, VCs syndicate and exchange information within their networks (Alexy et al., 2012; Ljungqvist et al., 2005). Universities are crucial to the entrepreneurial ecosystem, providing research for new technologies and attracting and educating the human capital necessary for launching businesses (Padilla-Meléndez et al. 2021; Rodríguez-Gulías et al., 2016). However, there is a scarcity of studies examining the interrelation between universities and VCs. Existing literature, such as works by Atkinson, Croce et al., and Kremer et al. (1994; 2014; 2022), focus on university-affiliated or university-managed VC funds, while Cai et al. (2016) concentrate on VC-backed founders and executives from the US with MBAs from top-ranked business schools. There is a notable gap in the literature concerning the impact of proximity between universities and early-stage investors on start-up founding rates and success. This study aims to fill this gap by. The proposed hypotheses are:

> ***H1****: Investors that have closer relationships with universities are investing in more successful start-ups.*
>
> ***H2****: Universities with closer relationships with early-stage investors are associated with more successful start-ups founded by their former students.*
>
> ***H3****: Universities with closer relationships with early-stage investors have a relatively higher founding rate of start-ups among their former students.*

These hypotheses were chosen to explore the multi-dimensional impacts of proximity, including its role in facilitating knowledge transfer, fostering trust, and enhancing coordination between investors and academic institutions. By testing these hypotheses, we aim to provide insights into how localized interactions within entrepreneurial ecosystems can foster innovation and growth.

2. Background and Context

2.1 Impact of Early-Stage Investors

Funding is critical for start-up success (Cantamessa et al. 2018). Different types of investors, including family and friends (F&Fs), business angels, crowd investors, and VCs, contribute varied resources such as financial capital and social capital. F&Fs often provide initial seed funding and emotional support, which is crucial for nascent entrepreneurs (Berger et al. 2020). Their involvement can reduce the perceived risk of entrepreneurship and provide a safety net. However, their lack of experience in start-up investments can lead to complex ownership structures and administrative challenges (Bessière et al. 2020). Business angels offer both financial capital and

valuable networks, often investing locally and actively participating in the start-up's growth (Kelly 2007; Mason et al. 2016). They typically have entrepreneurial experience and provide mentorship, strategic advice, and access to their networks. Studies have shown mixed results on the impact of business angels, with some indicating significant positive effects on start-up success (Fili & Grünberg 2016; Kerr et al. 2014), while others find no substantial contribution (Cavallo et al. 2019). Crowd investments have gained importance, allowing start-ups to raise funds from a large number of small investors. This method is particularly effective for consumer products, as it combines capital raising with market validation and feedback (Brown et al. 2018). However, crowd-funded start-ups may struggle to attract traditional VC funding due to perceived lower quality and regulatory complexities (Mochkabadi & Volkmann 2020). Despite these challenges, crowd investors can provide a quick infusion of capital and initial customer engagement, critical for early-stage validation and growth (Mollick 2014). VCs are crucial in providing substantial financial resources and expertise. They perform rigorous due diligence and contribute to the start-up's strategic direction, leveraging extensive networks to facilitate growth (Gompers et al. 2020). VCs prioritize factors such as the founding team, business model, market potential, and product innovation when making investment decisions (Kaplan & Strömberg 2004). Their involvement often signals quality to other investors and stakeholders, thereby enhancing the start-up's credibility and access to additional resources (Barry et al. 1990).

2.2 Impact of Universities

Universities play a pivotal role in entrepreneurial ecosystems by generating knowledge, fostering innovation, and nurturing human capital (Audretsch 2014). The economic impact of universities has evolved from primarily political and social contributions to significant economic drivers, particularly through technology transfer and start-up support (Romer 1986). Universities contribute to start-up ecosystems by providing research, attracting and educating talent, and fostering an entrepreneurial mindset (Padilla-Meléndez et al. 2021). Knowledge spillovers from university research can lead to the development of new technologies and business models (Audretsch et al. 2012). This spillover effect is facilitated through collaborations, publications, and the mobility of skilled graduates who transfer knowledge to the industry (Acs et al. 2009). High-ranking universities with strong entrepreneurship programs tend to produce more successful founders (Cai et al. 2016). Entrepreneurship education provides students with the skills and knowledge needed to start and manage new ventures. These programs often include practical components such as business plan competitions, mentorship from experienced entrepreneurs, and access to incubation facilities (Franklin et al. 2001). Universities also facilitate start-up formation through technology transfer offices, incubators, and proof-of-concept centers, providing essential resources and support to nascent entrepreneurs (Audretsch 2014). These support structures help bridge the gap between academic research and commercial application, increasing the likelihood of successful start-up formation (Gaspar 2009). The concept of "entrepreneurial universities" highlights the shift towards a more proactive role in commercializing research and fostering start-up ecosystems (Harrison & Leitch 2010).

2.3 Proximity of Investors and Universites

The intersection of early-stage investors and universities is critical in the formation of university spin-offs. Existing literature evaluates the performance of university-led VCs (Atkinson, 1994; Croce et al., 2014; Kremer et al. 2022) and universities' roles in spin-offs (Alexy et al., 2012; Hayter, 2013; Lerner, 2004; Padilla-Meléndez et al. 2021; Wright et al., 2006). Additionally, factors such as coordination (Hayter, 2016b) and faculty entrepreneurial behavior (Hossinger et al., 2020) are significant, with venture capital being crucial to spin-off creation and success (Munari & Toschi 2011; Smith & Bagchi-Sen 2012). Notably, university-led VCs exhibit lower investment exit rates (Kremer et al., 2022). Knowledge spillover theory, where universities act as knowledge intermediaries and VCs as capital intermediaries, further elucidates the dynamics (Acs et al. 2013; Hayter 2016). For instance, VC-backed university spin-offs have a 20-26% higher commercialization rate (Hayter 2013), consistent with other studies (Harrison & Leitch 2010; Samila & Sørensen 2010). Universities can enhance start-up support through strict admission criteria and initiatives like incubator programs and pitch events, which positively signal to investors and improve founding rates (Berger et al. 2020; Cai et al. 2016). Early-stage investors provide not only financial but also social capital, vital for start-up success. However, university spin-offs often face an equity gap as traditional investor types like friends and family are less available (Widding et al. 2009). The benefits of investor proximity to universities are debated. Some studies show that specialized networks or extensive diverse networks enhance investment performance (Alexy et al. 2012; Ljungqvist et al. 2005), while a mix of these networks does not (Alexy et al. 2012). Gompers et al. (2009) find that specialization and experience, rather than extensive networks, improve VC performance. Furthermore, VC-backed start-ups where the founder and VC executive share a business school background tend to be more successful (Cai et al. 2016).

3. Data and Methodology

3.1 Data Collection

The underlying data for this study was sourced from Welpe et al. (2021), who enhanced the Crunchbase 500 (cb) list by adding German universities of the founders. The cb list from December 2020 ranks 500 German start-ups based on criteria like the number of connections a profile has, the level of community engagement, funding events, news articles and acquisitions. An entity's rank is fluid and subject to rise and fall over time. Time-sensitive events such as product launches, funding events, leadership changes and news affect a company's Crunchbase rank (Crunchbase 2021). The ranking position is assumed to correlate with start-up success. The given data set is not without its limitations. First, the data has a strong success bias since the data set only considers the best-ranked start-ups, according to Crunchbase. At the same time, the measurement of success is not 100% transparent since it is based on the intransparent Crunchbase algorithm. It cannot be guaranteed that Crunchbase's ranking does not consider the educational background or the list of investors for their ranking. Alternative success measurements like IPO rate or failure rate are not suitable for the given list of start-ups due to the young age and recency of the analyzed start-ups (Gompers et al., 2009) and creation of job opportunities due to the different business models of the compared start-ups. From this list, 426 start-ups were identified with at least one founder who graduated from a German university. If founders studied at different universities, all were considered. University size was measured by the number of enrolled students as collected by Welpe et al. (2021). Ownership data were analyzed using the Amadeus database. Of the 426 start-ups, early-stage investor data were available for 401 start-ups. Early-stage is defined as an average of three years, encompassing periods from incubation/pre-seed to seed phase and seed phase to series A, typically lasting 12 to 24 months each (Cavallo et al. 2019). Dates of incorporation were verified through various online sources, including Germany's commercial register. The investor list included all shareholders, including founders who invested in other start-ups. For instance, a founder from one of the 401 start-ups investing in another start-up counted as two start-up investments.

3.2 Data Analysis

This paper uses data from the Crunchbase 500 list for German start-ups from December 2020, supplemented by the educational background of founders and the respective start-ups' early investors. Two proprietary proximity scores were calculated to quantify the relationships between universities and investors.

The proximity score PS(*Investor*) for an investor to universities has been calculated according to the following formula:

$$PS(Investor) = 1 - \sum_i \frac{U(i)}{i\ U}$$

Here, i denotes the number of investments the investor has with one university. U(i) denotes the number of universities which are affiliated with the investor i times. The proximity score is high for investors who invested in start-ups affiliated with fewer universities, but more often with the same universities. A score of 0 would mean that all of the invested start-ups are associated with different universities. A score of 1 would mean that the investor invested in an infinite number of start-ups at the same university. In short, the PS(*Investor*) proximity score measures how concentrated an investor's investments are within a few universities

Accordingly, the proximity score PS(*University*) for a university to investors is defined as follows:

$$PS(University) = 1 - \sum_i \frac{I(i)}{i\ I}$$

Here, i denotes the number of investments at one university from the same investor. I(i) denotes the number of investors which are affiliated with the university i times. The proximity score is high for universities who received many start-up investment from a low number of investors. A score of 0 would mean that each start-up from the university was funded by different investors. A score of 1 would mean that an infinite number of start-ups at the university were funded by only one investor. The proximity score is higher for universities with fewer affiliated investors but more affiliated investors that invested in more start-ups from this university. The score ranges between zero – no investor invested in two or more start-ups from this university – and one – all investors invested in two or more start-ups from this university. In short, the PS(*University*) proximity score measures how concentrated a university's investments are from a few investors.

3.3 Descriptive Statistics – Investors

The investor list was manually consolidated to identify related entities and individuals. The dataset comprised two tables. The first identified 237 investors with at least three investments in the 401 start-ups within three years post-incorporation, with 16 investors making ten or more investments. The second table included 86 universities affiliated with at least three start-ups, with 26 universities affiliated with ten or more start-ups. The investors have been filtered for those with at least three investments in the given data set to have more reliable proximity scores that would be otherwise highly influenced by the small number of investments and, therefore, associated universities. The considered investors have between three and 37 different investments in the data set. The distribution of the number of investments can be seen in Table 1 and is highly concentrated at the lower end, with 44% of the investors with only three investments in the given data set and 19% with four investments. More than 93% have less than ten investments.

Table 1: Frequencies of Variables in the Data Set Regarding the Investors

	Mean	Percentile 25	Median	Percentile 75	Std. Deviation
Number of investments	5	3	4	6	4
Average cb rank of investments	213.72	156.14	204.33	263.67	77.76
Proximity of investors to universities	.19	.00	.17	.30	.17
Proximity of investors to universities without zero scores	.28	.17	.25	.35	.13
Number of universities associated with investments - counted once	10	6	9	12	7

The scores are not normally distributed, with a high number of zero scores (Figure 1 (c)). The distribution of proximity scores larger than zero is almost perfectly normal (Figure 1 (d)). However, the large number of 78 investors with a proximity score of zero results in an uneven distribution (Figure 1 (c)), which demands the use of non-parametric statistics for the analysis. The last relevant variable in this data set is the number of universities an investor is associated with. This variable is lognormal distributed, which is why all subsequent calculations use this variable's natural logarithm (ln).

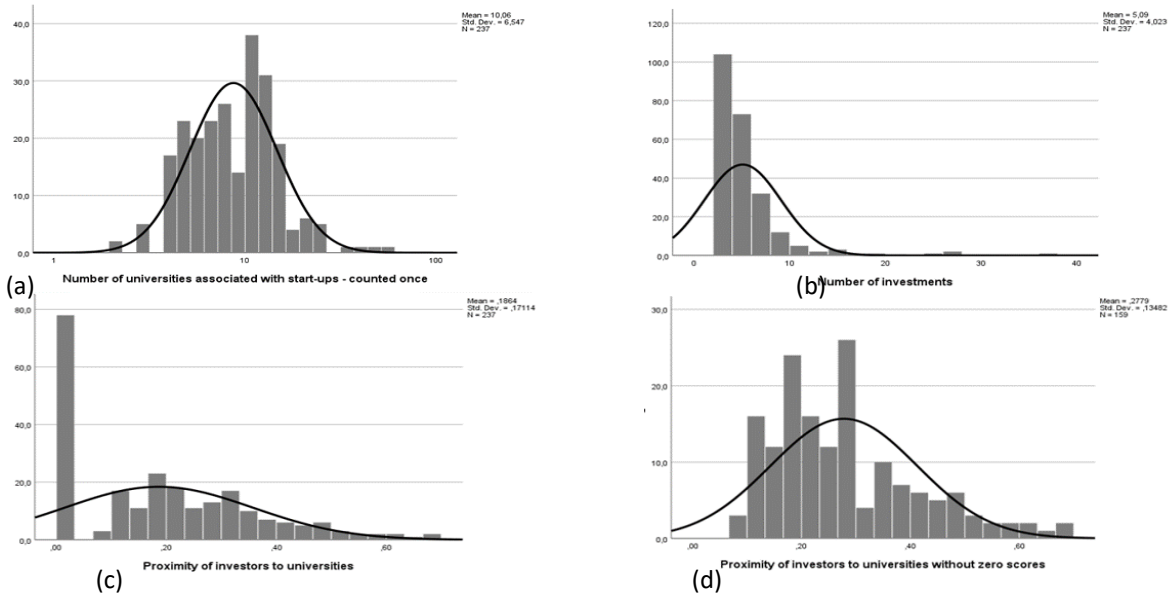

Figure 1: Histograms of Investor Related Variables

3.4 Descriptive Statistics – Universities

After filtering the data for universities with at least three start-ups in the data set, 86 universities are left to be analyzed. Those universities have a median of 17.952 students. The number of students is distributed close to a lognormal distribution; hence all subsequent calculations use the ln that shows a slight negative skew (see Figure 2 (a)). The same applies to the number of start-ups affiliated with a university. However, compared to the ln of

the number of students, the ln of the number of start-ups has a strong positive skew due to the high number of universities with three and four start-ups in the data set (see Figure 2 (b)).

Table 1: Frequencies of Variables in the Data Set Regarding the Universities

	Mean	Percentile 25	Median	Percentile 75	Std. Deviation
Number of students	20.662	8.350	17.952	30.153	15.110
ln of number of students	9.54	9.03	9.80	10.31	1.06
cb Startups per 100 students	.1685	.0231	.0390	.0694	.5267
ln of cb Start-ups per 100 students	1.58	.83	1.36	1.93	1.20
Number of startups	10	4	6	11	11
ln of number of startups	1.92	1.39	1.79	2.40	.78
Average cb rank of startups	266.14	225.23	267.28	303.53	58.73
Proximity to investors	.0309	.0000	.0000	.0410	.0552
Number of investors associated with this university	115	39	68	122	141

The number of students and the number of start-ups affiliated with a university in the given data set is deviating a lot which is why also the cb start-ups per 100 students deviate heavily across the universities. Again, the natural logarithm is used, which shows weak positive skew (see Figure 2 (c)).

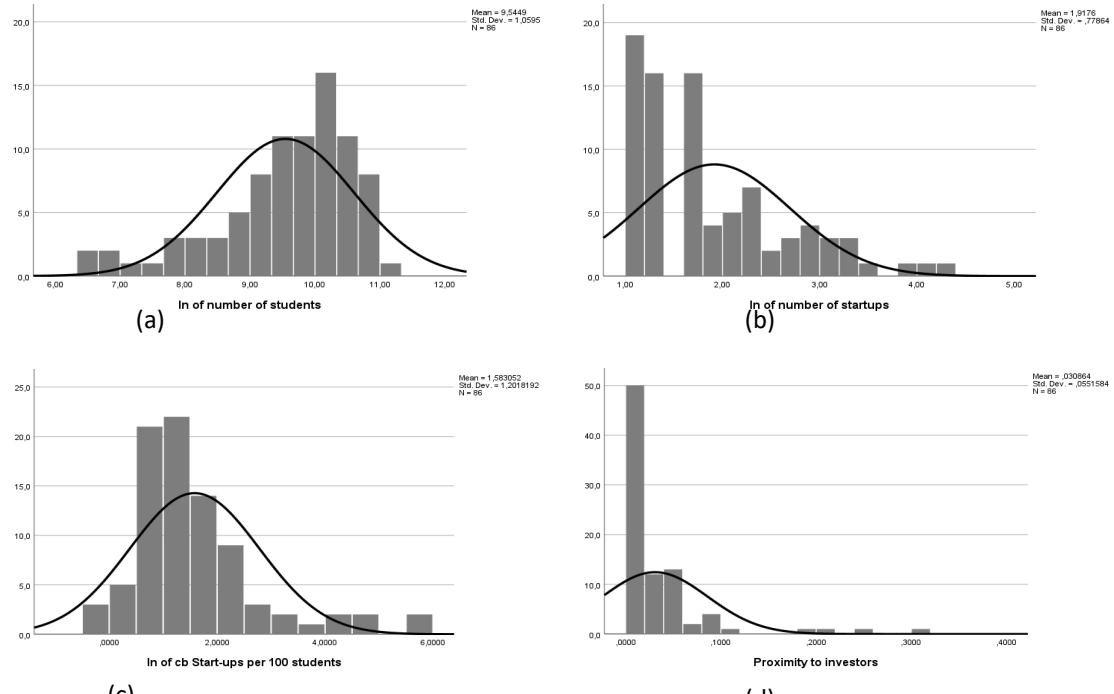

Figure 2: Histograms of University Related Variables

4. Results

The first hypothesis (H1) posits that investors with higher proximity scores are more likely to invest in successful start-ups. This analysis was conducted using the Kruskal-Wallis test, to account for the non-normal distribution of data. As Table 1 indicates most investors tend to invest in start-ups from a limited number of universities. This pattern suggests that certain investors may have a preference or specialization. In addition, Table 3 categorizes investors based on their proximity scores and the number of investments they have made. It can be deducted that investors with higher proximity scores frequently invest in start-ups from the same universities, suggesting a focused investment strategy.

Table 2: Distribution of Classed Investors According to their Proximity Scores

			Proximity of investors to universities				
			Count	Count (%)	Mean	Median	Std. Deviation
Proximity of investors to universities (classed)	No proximity		78	32.9%	.00	.00	.00
	Low proximity		19	8%	.11	.12	.02
	Medium proximity		45	19%	.18	.17	.03
	High proximity		47	19.8%	.27	.28	.03
	Very high proximity		48	20.3%	.45	.43	.10

However, the K-test results show that there is no statistically significant correlation between higher proximity scores and the success rates of start-ups (*p = 0.515*). While there is a non-significant tendency for investors with higher proximity scores to invest in more successful start-ups, the correlation is not strong enough to be statistically significant (Table 4). Even though the mean ranks have the right direction for the stated hypothesis, the null hypothesis must be retained due to the high scattering of the cb rank average. The findings suggest that proximity is one of many factors influencing start-up success, and further research is needed to explore additional variables that might play a more decisive role. The pairwise comparison of the proximity scores of successful and less successful start-ups additionally aids the tendency for higher proximity scores to be associated with more successful start-ups. However, the statistical analysis confirms that this tendency is not significant, reinforcing the conclusion that proximity alone is not a decisive factor in start-up success.

Table 3: K-test Results for H1

Ranks

	Proximity of investors to universities (classed)	N	Mean Rank
Average cb rank of investments	No proximity	78	128.07
	Low proximity	19	123.42
	Medium proximity	45	117.73
	High proximity	47	116.73
	Very high proximity	48	105.92
	Total	237	

Test Statistics[a,b,c]

	Average cb rank of investments
Kruskal-Wallis H	3.259
df	4
Asymp. Sig.	.515

a. Kruskal Wallis Test
b. Grouping Variable: Proximity of investors to universities (classed)
c. Some or all exact significances cannot be computed because there is insufficient memory.

The second hypothesis (H2) posits that universities with higher proximity scores are associated with more successful start-ups. Table 5 categorizes universities based on their proximity scores and the number of start-ups they have produced. Higher proximity scores indicate that universities frequently produce start-ups that receive investments from the same investors. The categorization helps in understanding the concentration and focus of start-up investments at different universities.

Table 4: Distribution of Classed Universities According to their Proximity Score

		Proximity to investors				
		Count	Count (%)	Mean	Median	Std. Deviation
Proximity to investors (classed)	No proximity	45	52.3%	.0000	.0000	.0000
	Low proximity	6	7.0%	.0163	.0163	.0045
	Medium proximity	18	20.9%	.0362	.0380	.0073
	High proximity	17	19.8%	.1120	.0931	.0794

The K-test results (see Table 6) show a statistically significant correlation between higher proximity scores and the success rates of start-ups (*p = 0.065*). This finding suggests that universities with higher proximity scores tend to produce more successful start-ups, indicating the importance of close relationships between universities and investors. The null hypothesis can be cautiously rejected. A subsequently conducted pairwise comparison between the different types of universities grouped by their degree of proximity (no proximity to high proximity) showed a significant difference between the groups with the highest proximity and the ones with no proximity

(see Figure 3), supporting the statement that universities with high proximity to investors are associated with more successful start-ups on average than universities with no proximity to investors.

Table 5: K-test Results for H2

Ranks

	Proximity to investors (classed)	N	Mean Rank
Average cb rank of startups	No proximity	45	48.02

c. Some or all exact significances cannot be computed because there is insufficient memory.

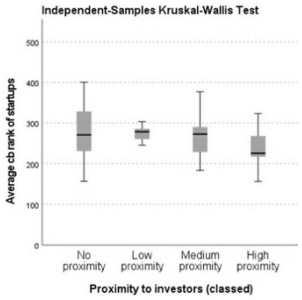

Figure 3: Pairwise Comparison of H2

The third hypothesis (H3) posits that universities with closer relationships with early-stage investors have a relatively higher founding rate of start-ups. Again, this hypothesis was tested using the Kruskal-Wallis test, due to the non-normal distribution of the data. For H3, the groups based on the proximity of universities to investors are compared based on the relative founding rate. The relative founding rate is captured in the variable cb start-ups per 100 students that divids the count of start-ups in the given data set per university by the number of students the university had in December of 2020. The results of the K-test show an asymptotic significance of 0.003 (see Table 7), which indicates that the null hypothesis can be rejected. In other words, the groups of universities with different proximity to investors show statistically significant differences in relative founding rates. Of particular interest is the pairwise comparison, which reveals a statistically significant difference between universities with no proximity to investors and those with high proximity (see Table 7). Although other pairwise comparisons exhibit a similar trend—especially the group with high proximity—they do not reach statistical significance. This lack of significance could be attributed to the relatively small sample size of universities in the dataset.

Table 6: K-test Results for H3

Ranks

	Proximity to investors (classed)	N	Mean Rank
cb Startups per 100 students	No proximity	45	36.20
	Low proximity	6	38.00
	Medium proximity	18	45.94
	High proximity	17	62.18

Medium proximity-High proximity	-16.232	8.445	-1.922	.055	.328

Each row tests the null hypothesis that the Sample 1 and Sample 2 distributions are the same. Asymptotic significances (2-sided tests) are displayed. The significance level is .050. a. Significance values have been adjusted by the Bonferroni correction for multiple tests.

To accurately interpret this result, one must consider the potential confounding effect of the number of start-ups affiliated with a university. This variable likely influences both the proximity score and the cb start-ups per 100 students score. Specifically, a higher number of start-ups at a university will naturally elevate the cb start-ups per 100 students score. Concurrently, a greater number of start-ups tends to attract more investors, thereby increasing the proximity score between universities and investors (see Figure 4 and Figure 5). To address this potential confounder, we conducted a comparison of the proximity groups with respect to the natural logarithm of the number of start-ups associated with each university. This K-test resulted in even higher explanatory values for the group with no proximity (Table 7). At the same time, it does not show the strong tendency for the universities with high proximity to investors compared to the cb start-ups per 100 students (Table 8).

Table 8: Pairwise Comparisons of Proximity to investors (classed)

Sample 1-Sample 2	Test Statistic	Std. Error	Std. Test Statistic	Sig.	Adj. Sig.[a]
No proximity-Medium proximity	-26.000	6.894	-3.771	<.001	.001

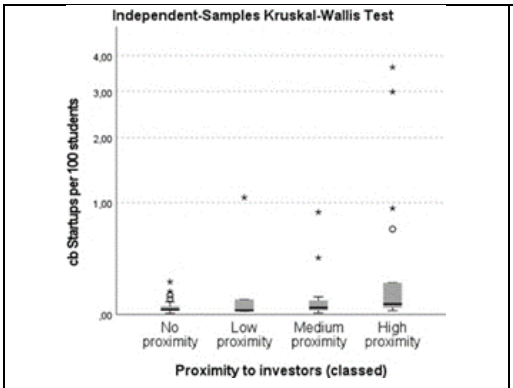

Figure 4: Pairwise Comparison for H3

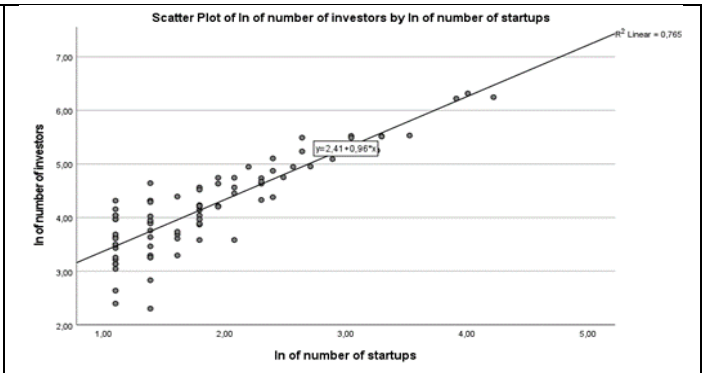

Figure 5: Scatterplot of ln of Number of Startups and ln of Number of Investors Associated with this University

This mixed result permits various interpretations. For instance, despite the increased sensitivity of the proximity score for universities with fewer start-ups and consequently fewer investors, universities with a very low number of start-ups do not exhibit high proximity scores to investors. This may be because universities with few start-ups are less attractive to investors, or because the lack of investor focus leads to fewer start-ups being founded by students at these universities. This contradictory interpretation underscores a significant limitation of this finding, namely that it does not establish causality.

5. Discussion

As presented in "4. Results" in detail, the test for H1 does not show statistically significant correlation between higher proximity scores of investors to universities and the success rates of their start-up investments, but they do hint towards the right tendency. For H2, the test results in a statistically significant correlation between higher proximity scores of universities to investors and the success rates of start-ups from former students of these universities. For H3, the tests show mixed results with statistically significant explanatory values for universities with no proximity to investors having lower founding rates of start-ups among their former students." The findings suggest practical implications for both universities and investors. Universities should foster relationships with early-stage investors to enhance start-up success and founding rates. For investors, focusing on universities with strong entrepreneurial programs could yield better investment outcomes. Universities can enhance their entrepreneurial ecosystems by providing resources and support to facilitate start-up formation. This includes creating incubators, hosting pitch events, and connecting students with potential investors. Investors, in turn, can benefit from focusing on universities with strong entrepreneurial cultures and support systems, which are likely to produce more successful start-ups. The findings align with existing literature on the importance of networks and social capital in entrepreneurial ecosystems (Alexy et al. 2012; Gompers et al. 2020). Strong relationships between universities and investors can enhance the flow of information, resources, and support, leading to higher success rates for start-ups. The proximity score developed in this study provides a quantifiable measure of the relationship between universities and investors. Higher proximity scores indicate stronger relationships and higher levels of interaction, which can positively impact start-up success and founding rates. This score can be used as a benchmark for universities and investors to assess and improve their collaborative efforts.

6. Conclusion

This study underscores the importance of proximity between universities and early-stage investors in enhancing start-up ecosystems. The findings suggest that universities with strong relationships with investors tend to produce more successful start-ups and have higher founding rates. Future research should explore larger datasets and additional variables to confirm these findings. The limitations of this study include the focus on German start-ups and the use of the Crunchbase 500 ranking, which may introduce a success bias. Additionally, the proximity score is a simplified measure and may not capture all aspects of the relationships between universities and investors. Despite these limitations, the study provides valuable insights into the dynamics of entrepreneurial ecosystems and highlights the need for strong collaborations between universities and early-stage investors. Overall, fostering closer collaborations between universities and investors can significantly enhance the entrepreneurial ecosystem. Future research should aim to establish causality and expand the dataset for more comprehensive insights.

Abstract: Artificial Intelligence (AI) can move beyond mere task automation and can actively foster the very process of innovation. As startups are the organizational entities which rely heavily on creativity and innovation, it is intriguing to evaluate the use of AI in startups and in the entrepreneurship field. As AI is already becoming increasingly pervasive and indispensable in the startup ecosystem, the question arises, how exactly startups are using AI. We used the Q-methodology to investigate this topic empirically. This methodology was chosen because it combines the strengths of both qualitative and quantitative methods. The Q-samples (i.e., set of statements) were developed from secondary sources like literature and primary sources like interviews. In this context three in-depth-interviews with entrepreneurs were conducted to comprehensively cover the topic. The concourse comprised a set of 43 statements, that each provided one aspect of "How do startups use AI?". The collection of the Q-Samples was then followed by the Q-sorting, in which participants were asked to rank the items according to their degree of agreement. In this study 30 entrepreneurs from different startups in Germany were interviewed. The interviews were conducted online via a video chat to give participants the chance to comment on their ranking. We used the QMethod Software for data collection and analysis. The research illuminates current AI practices among startups, identifies common fields and highlights areas for further development. The findings of this study reveal the prioritization of operational efficiency as the driving force behind AI implementation. However, it is quite concerning that ethical considerations are largely ignored, posing risks of potential ethical oversights in AI utilization. Furthermore, most startups see AI as a facilitator of human creativity rather than a replacement. Overall, this paper is relevant to a diverse audience interested in understanding the current landscape, challenges, and opportunities associated with the usage of AI technologies within the startup ecosystem. This audience includes entrepreneurs, investors, researchers, educators, and policy makers.

Keywords: Artificial intelligence, Entrepreneurship, Startups, Q-methodology

1. Introduction

In the past years much research has focused on Artificial Intelligence. In this context it can also be noted that the integration of Artificial Intelligence (AI) technologies has become a hallmark of innovation within the startup ecosystem (Chalmers et al., 2021). Using AI could disrupt entrepreneurship practices and create new opportunities and challenges. It can change how startups operate and how they get information (Lévesque et al., 2022; Schiavone et al., 2023). Nevertheless, most research has focused on the opportunities for AI in startups; it remains unclear whether these opportunities reflect the reality. The research question of this study is "How do startups use AI?".

2. Literature Review

2.1 Artificial Intelligence

AI is defined as a system interpreting external data to achieve goals through adaptable approaches (Kaplan & Haenlein, 2019). It encompasses various types and techniques, notably machine learning and deep learning. Machine learning involves designing algorithms that enable computers to act without explicit programming (Ashri, 2020; Dua & Du, 2016). On the other hand, deep learning utilizes neural networks to process data-driven learning approaches (Sheikh et al., 2023). Unlike machine learning, deep learning does not rely on human-labelled training data but autonomously extracts features from raw data through algorithms (Bini, 2018; Taye, 2023).

AI´s roots trace back to the mid-20th century (Sheikh et al., 2023), but recently AI has gained widespread public interest. Notably in 2023, marked by significant breakthroughs in generative AI. Large language models (LLMs) like OpenAI's ChatGPT, Claude2 and Alpaca serve as notable examples of generative AI, exhibiting core mental capabilities such as reasoning and creativity (Dou et al., 2023; Bubeck et al., 2023). AI is transforming

various sectors by personalizing services, updating products, and optimizing business processes, with notable effects seen in customer service and marketing (Sheikh et al., 2023; Kaplan & Haenlein, 2019). While all industries are expected to face disruption, those heavily reliant on knowledge, such as finance, pharmaceuticals, and education, are likely to experience profound changes due to AI (Chui et al., 2023).

2.2 Artificial Intelligence in Startups

For the purposes of this study, a startup is defined as an early-stage organization prioritizing innovation and technology for new products or markets (Skala, 2019). Furthermore, a startup is usually not older than three years, as beyond this timeframe, most startups tend to lose their distinctive startup characteristics (Cockayne, 2019). Startup activities include idea generation, creativity, innovation, and opportunity recognition (Markovic & Salamzadeh, 2012).

According to the extant research, the role of AI in the startup processes is focused on improving operational efficiency and enhancing human capabilities in opportunity identification, data analysis and decision-making (Giuggioli & Pellegrini, 2023; Kisielnicki et al., 2022). In detail AI stands for streamlining research, analysing markets, and fostering innovative idea creation (Schiavone et al., 2023; Gerlling et al., 2022).

AI also enhances marketing, financial planning, customer service (Huang et al., 2019; Schiavone et al., 2023). and customer needs identification (Giuggioli & Pellegrini, 2023). However, over-reliance on AI predictions may limit entrepreneurs' adaptability to unforeseen events (Kisielnicki et al., 2022; Townsend, 2023).

While the implementation of AI in startups offers many benefits, it also poses significant challenges. A key challenge is the lack of transparency and trust in AI results (Kisielnicki et al., 2022). Ethical concerns, such as legal implications of AI-generated content and data privacy risks, are also prominent (Chalmers et al., 2021; Townsend, 2023). Additionally, many startups limit AI use due to factors like limited knowledge and cost concerns (Ahmad Mashat, 2020; Townsend, 2023). Overall, according to the literature AI adoption in startups presents opportunities for efficiency and innovation, but entrepreneurs must navigate challenges to maximize its benefits.

3. Research Methodology

As the goal of this paper is to give an answer to the question “How do startups use AI” getting insights from founders and co-founders is especially important. Since the Q-methodology combines the strengths of both qualitative and quantitative methods in research (Brown, 1996), it can provide the necessary insights.

The Q-methodology is widely applied across various fields, such as psychology, political science, communication, health sciences, and education (Brown, 2000). The decision in favour of the Q-methodology results from the fact that the study requires subjective experiences and attitudes (Kamal et al., 2014).

The Q-Methodology relies on the Q-sort technique, which involves ranking a set of statements collected as Q-samples. Participants rank the items based on their level of agreement. According to McKeown & Thomas (2013), the methodology includes developing the Q-samples, selecting the P-set, conducting the Q-sort, analysis of the Q-sort-data, and factor interpretation.

3.1 Developing the Q-Samples

The Q-samples are representative statements from a larger concourse (McKeown & Thomas, 2013). In this study they were developed from both secondary and primary sources. This examination included a review of ten research papers related to the use of AI in startups. Additionally, interviews were conducted with three founders who were asked about the current state of AI usage in their startups, as well as their opinions on the limitations and opportunities of AI in the entrepreneurship field. To ensure diversity in the views represented, a structured approach was used to select Q-samples. This involved including both positive and negative aspects, as well as various types of AI usage across multiple fields. Each Q-sample was formulated as a simple, short phrase. Q-methodology based studies commonly employ between 40 and 80 Q-samples (Watts & Stenner, 2013), in this study 43 statements were included (shown in Table 1).

3.2 Selecting the P-set

In Q-methodology, the P-set (participants), is purposefully selected to encompass diverse and comprehensive views relevant to the study (McKeown & Thomas, 2013). As this process emphasizes the selection of participants with expertise and knowledge of the research topic (Kamal et al., 2014), certain criteria were applied to the selection process. The role of the participants in the startups should either be a co-founder or a

founder. In addition, the startups should be under three years old. The participants were recruited from the entrepreneurship center of the Hochschule München University of Applied Sciences in Munich. As according to Brown (1980), a suitable number of participants is 20 to 40, in this study 30 participants were interviewed.

3.3 Conducting the Q-Sort

During the Q-sorting procedure, participants arrange statements (Q-samples) based on their degree of agreement, from "most disagree" to "most agree" (Brown, 1996). Within this sorting-procedure the participants should also provide reasons for their ranking (Kamal et al., 2014). The instructions encouraged the participants to give their subjective opinion. The QMethod Software was used to create a predefined grid for the participants (an example is depicted in figure 1). As for the grid a range of -5 to +5 was chosen, because according to Brown (1980) this range is suitable for 43 Q-samples.

The interviews were conducted from January to March 2024 online via a video chat, allowing participants to comment on the ranking of the items. Each interview lasted between 45 and 60 minutes. All interviews were recorded and transcribed for later data interpretation. The outcome of the Q-sort is a pyramid of sorted statements that is used for subsequent data analysis (Kamal et al., 2014).

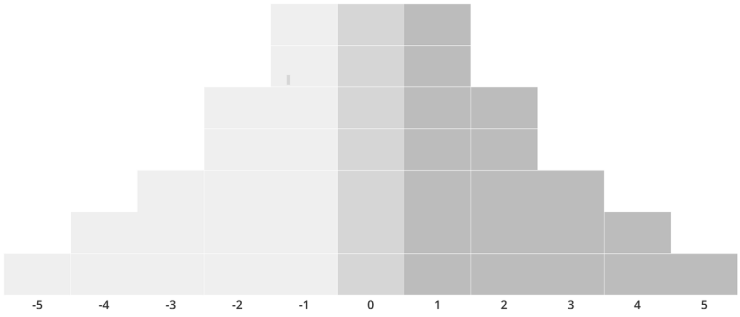

Figure 1: Example for a grid (framework) for the Q-sorting-procedure

3.4 Analysis of Q-Sort Data

The goal of the analysis is to identify factors (Churruca et al., 2021), which represent groups of participants with similar views (Brown et al., 2008). To identify these factors, the QMethod Software was utilized to conduct three statistical procedures: correlation of Q-sorts, factor analysis, and factor rotation. The spearman coefficient was used as the correlation coefficient in this study. As it is common to attempt various rotations and factor consolidations to find the most interpretable solution (McKeown & Thomas, 2013), several solutions were explored and analysed in this study. Each solution was verified and checked for plausibility. In the final factor analysis, the centroid factor analysis was utilized, followed by the varimax rotation method. Ultimately, three distinct factors were extracted.

4. Empirical Results and Interpretation

4.1 Results

After completing the analysis, the total weighted scores (z-scores) for each item gives an initial insight into the viewpoint of each factor, revealing the items that are most strongly and weakly related within each factor (table 1). For example, as shown in table 1, statement 1 is strongly related to factor 2, but not so much to factor 1 and 3. This is the starting point for the last step in Q-methodology, the interpretation by examining their differences and similarities of factors.

The three factors identified in this study, are described below, each accompanied by a memorable label and a short clarifying phrase.

- Factor 1 - Dedicated Optimizer: AI boosts efficiency, legal and ethical concerns can be disregarded.
- Factor 2 – Cautious Cost Saver: AI leads to cost-benefits but has risks of dependency and mistrust.
- Factor 3 - Selective Enhancer: AI enhances operations and marketing but is not a suitable search tool.

Regarding the P-set of this study, the first factor comprises 15 participants, the second factor includes ten participants and the third represents five participants

Table 1: Z-score for each statement

Statement Number	Statement	Factor 1 Z-score	Factor 2 Z-score	Factor 3 Z-score
1	AI is applied individually, without being integrated into the overall structure of the company	-0.06705	142.352	0.02698
2	AI lacks integration with other operational processes	-0.24348	0.50413	-114.761
3	AI is utilized as an advanced search tool for acquiring a comprehensive understanding of new emerging topics	160.717	124.307	-140.064
4	AI serves the purpose of quickly providing definitions when confronted with unfamiliar subjects	116.212	106.361	-0.02228
5	AI is used for marketing and helps with crafting or enhancing textual content for websites	11.531	0.65233	193.652
6	AI is employed for translation purposes	186.681	228.422	136.644
7	The application of AI extends to the transcription of meetings	0.86285	0.17413	0.85079
8	AI proves indispensable in the analysis and prediction of markets and trends	-0.79498	-0.90058	-0.66375
9	AI systematically analyzes datasets and can recognize patterns	0.42583	0.44803	165.812
10	AI is used for testing purposes for the product	-163.151	-194.984	-0.8367
11	The utilization of AI extends to refining existing solutions or conceiving similar alternatives	0.40523	0.47399	0.82887
12	Within the design process, AI is employed to come up with various design possibilities	-0.63368	0.20605	-0.39587
13	AI plays an important role in the development of innovative and unforeseen solutions	0.08544	-108.102	-0.42421
14	AI is utilized in generating potential problem statements	-0.67844	-132.863	153.033
15	AI plays a crucial role in enabling startups to navigate and adapt to market changes	-0.43353	-100.073	-0.40038
16	AI serves as an intelligent auto-corrector, streamlining processes and conserving time	178.366	0.72154	195.973
17	The incorporation of AI aids startups in formulating impactful communication strategies	-0.58565	-0.04716	0.01766
18	AI takes charge of operational tasks and optimizes efficiency	206.361	-0.44292	15.329
19	Startups deploy AI to automate processes and repetitive tasks	145.502	0.41581	0.42224
20	AI finds application in programming, for both code creation and correction	123.425	0.76547	0.34716
21	AI is instrumental in crafting presentations, especially image creation	-0.28714	0.07607	-0.54673
22	AI is strategically employed in the formulation of comprehensive business plans	-109.639	-0.57105	-0.26422
23	For financial planning, AI is utilized to refine financial plans and improve cash flow prediction	-170.864	-121.733	0.00649
24	AI serves as a valuable asset in communicating with investors	-0.3784	-161.012	-139.433
25	AI facilitates objective and data-driven decisions	-0.10427	-0.43765	-0.29212
26	AI reduces uncertainty during the decision-making process, with intelligence prediction	0.32152	-117.019	-0.70396
27	AI is utilized to summarize large amounts of data sets	0.53093	0.64466	0.22275
28	AI plays a crucial role in identifying and predicting customer needs	0.14971	-202.022	-0.71051
29	AI can be utilized for personalizing and enhancing customer service	-0.20804	0.66575	0.29487
30	AI finds application in efficient prototyping	-142.143	-0.35201	-0.2598
31	The integration of AI in HR simplifies the process of identifying and hiring qualified employees	-0.9052	-158.053	0.29402
32	The adoption of AI results in product benefits	-0.11247	-0.05984	0.74096

Statement Number	Statement	Factor 1 Z-score	Factor 2 Z-score	Factor 3 Z-score
33	The usage of AI leads to cost benefits	103.566	173.822	0.41882
34	The challenge of AI is the lack of transparency	0.33273	0.19281	-191.512
35	There is a lack of trust in the results of AI	-0.04975	0.78956	-0.69312
36	The tendency of AI to produce generic ideas highlights that AI cannot replace human creativity	-0.04882	0.45039	-0.81486
37	AI is used with pleasure and great anticipation	0.8247	0.78719	0.1453
38	The majority of Startups limit their use of AI to a basic level, because the lack of knowledge about AI	-0.60309	0.0202	0.83756
39	A lot of startups only use AI on a basic level, because of costs	-0.57672	-0.37284	-123.112
40	With the use of AI legal challenges regarding AI-generated content emerge	-150.447	-0.07095	0.41771
41	Over-reliance on AI can restrict the creative freedom and the problem-solving skills of entrepreneurs	-0.62485	135.727	-0.52967
42	The use of AI in startups raises concerns about data privacy and the risk of data breaches	-113.135	0.03763	110.178
43	Applying AI in a startup comes with profound ethical challenges	-1.471	-0.92201	-231.098

4.2 Interpretation

Although the z-scores indicate how each statement loads on each factor, interpreting the results based solely on these numbers is challenging. Merely focusing on the items with the highest and lowest ranking is insufficient for Q-methodology. Therefore, a crib sheet should be utilized to enable a comprehensive interpretation. A crib sheet includes four categories: it lists the highest and lowest ranked items in a factor array, as well as items that that relevant factor has ranked higher or lower than any of the other factors in the study. These categories help researchers identify the most prominent issues (Watts & Stenner, 2013).

4.2.1 Factor 1 - Dedicated Optimizer: AI boosts efficiency, legal and ethical concerns can be disregarded.

The “Dedicated Optimizer” revolves around the topic of AI-driven operational optimization within startups. This factor emphasizes the role of AI in enhancing efficiency and streamlining various tasks. The highest-ranking statements within factor 1 include its utilization in operational tasks, translation services, auto-correction mechanisms, and advanced search capabilities, as displayed in table 2. These statements reflect the perception that AI serves as a valuable tool for optimizing processes and conserving time. One participant in this factor claimed, that he uses AI instead of Google, as a search tool to understand new topics faster. Another participant stated that AI is mainly used for literature research, in order to get a quick overview of a topic. Conversely, the lowest-ranking statements within factor 1 are topics related to financial planning, product testing, legal challenges, and ethical considerations associated with AI. As the items financial planning and prototyping are ranked lower than in any other factor, it suggests a lesser emphasis on these aspects within the narrative of operations. In addition, participants in this factor generally don't view ethical and legal challenges associated with AI implementation as significant. Most participants in this factor simply see AI as an assistant and don't even think about legal or ethical aspects. Regarding the challenge of false information, a participant claimed, that it is just important to use other sources of information as a reference. In summary, factor 1 portrays a narrative of AI-driven operational optimization, while not acknowledging the ethical and legal complexities that accompany its use.

Table 2: Crib sheet for factor 1

Statement number	Statement	Ranking
	Highest ranking	
18	AI takes charge of operational tasks and optimizes efficiency	5
6	AI is employed for translation purposes	4
16	AI serves as an intelligent auto-corrector, streamlining processes and conserving time	4
3	AI is utilized as an advanced search tool for acquiring a comprehensive understanding of	3

Statement number	Statement	Ranking
	new emerging topics	
	Lowest ranking	
23	For financial planning, AI is utilized to refine financial plans and improve cash flow prediction	-5
10	AI is used for testing purposes for the product	-4
40	With the use of AI legal challenges regarding AI-generated content emerge	-4
43	Applying AI in a startup comes with profound ethical challenges	-3
	Higher ranking than in any other factor	
18	AI takes charge of operational tasks and optimizes efficiency	5
19	Startups deploy AI to automate processes and repetitive tasks	3
26	AI reduces uncertainty during the decision-making process, with intelligence prediction	1
33	The usage of AI leads to cost benefits	2
	Lower ranking than in any other factor	
23	For financial planning, AI is utilized to refine financial plans and improve cash flow prediction	-5
30	AI finds application in efficient prototyping	-3
40	With the use of AI legal challenges regarding AI-generated content emerge	-4
42	The use of AI in startups raises concerns about data privacy and the risk of data breaches	-3

4.2.2 Factor 2 - CautiousCost Saver: AI leads to cost-benefits but has risks of dependency and mistrust.

Factor 2, described as the "Cautious Cost Saver" highlights the practical applications of AI, such as its role in translation services, advanced search capabilities, and cost-saving measures, as shown in table 3. These statements focus on efficiency improvements and financial gains. Participants in this factor point out that AI saves time for the employees and leads to fewer mistakes, which also leads to cost savings.

Statements regarding the potential drawbacks of over-reliance on AI and the lack of trust in AI-results receive high attention within this factor. This reflects concerns regarding the dependency on AI and its implications for creative freedom and problem-solving skills among entrepreneurs. Furthermore, factor 2 distinguishes itself from other factors by consistently ranking statements related to the missing integration of AI into organizational processes higher than any other factor. Conversely, statements concerning AI's role in investor communication, customer needs identification, and HR processes receive lower rankings within factor 2 compared to other factors, suggesting a lesser emphasis on these aspects within the narrative of organizational integration. For example, one participant claimed, that even though AI can predict a lot of theoretical things, customer needs are very complex, and therefore the reliability of AI in this area is questionable. In summary, factor 2 highlights the cost benefits of AI while also acknowledging the need for careful consideration of its integration to avoid pitfalls such as over-reliance and trust issues.

Table 3: Crib sheet for factor 2

Statement number	Statement	Ranking
	Highest ranking	
6	AI is employed for translation purposes	5
33	The usage of AI leads to cost benefits	4
1	AI is applied individually, without being integrated into the overall structure of the company	4
3	AI is utilized as an advanced search tool for acquiring a comprehensive understanding of new emerging topics	3
	Lowest ranking	
10	AI is used for testing purposes for the product	-5
28	AI plays a crucial role in identifying and predicting customer needs	-4
24	AI serves as a valuable asset in communicating with investors	-4

14	AI is utilized in generating potential problem statements	-3
	Higher than any other factor	
33	The usage of AI leads to cost benefits	4
1	AI is applied individually, without being integrated into the overall structure of the company	4
41	Over-reliance on AI can restrict the creative freedom and the problem-solving skills of entrepreneurs	3
35	There is a lack of trust in the results of AI	1
	Lower than any other factor	
24	AI serves as a valuable asset in communicating with investors	-4
28	AI plays a crucial role in identifying and predicting customer needs	-4
14	AI is utilized in generating potential problem statements	-3
31	The integration of AI in HR simplifies the process of identifying and hiring qualified employees	-3

4.2.3 Factor 3 - Selective Enhancer: AI enhances operations and marketing but is not a suitable search tool.

As displayed in table 4, for factor 3, statements which emphasise the operational benefits of AI, such as its role as an intelligent auto-corrector and its ability to optimize efficiency by streamlining processes are important. In addition, it also highlights the significance of AI in marketing, particularly in crafting and enhancing textual content for websites. Some participants even claim that they haven't written a marketing text without generative AI since they are able to use it. As this underscores the role of AI in bolstering marketing strategies and improving customer engagement through personalized and optimized content creation, this factor is called the "Selective Enhancer".

Conversely, statements highlighting the challenges of lack of transparency and the usage of AI as a search tool receive lower rankings within factor 3, compared to other factors. Insights from the interviews explain that participants in this factor think that the transparency is not lacking, because they are only interested in the results. At the same time, they are using AI less as a search tool in comparison to other factors because they fear that the tool cannot deliver up-to-date information.

Table 4: Crib sheet for factor 3

Statement Number	Statement	Ranking
	Highest ranking	
16	AI serves as an intelligent auto-corrector, streamlining processes and conserving time	5
5	AI is used for marketing and helps with crafting or enhancing textual content for websites	4
9	AI systematically analyses datasets and can recognize patterns	4
18	AI takes charge of operational tasks and optimizes efficiency	3
	Lowest ranking	
43	Applying AI in a startup comes with profound ethical challenges	-5
34	The challenge of AI is the lack of transparency	-4
3	AI is utilized as an advanced search tool for acquiring a comprehensive understanding of new emerging topics	-4
24	AI serves as a valuable asset in communicating with investors	-3
	Higher than any other factor	
5	AI is used for marketing and helps with crafting or enhancing textual content for websites	4
9	AI systematically analyses datasets and can recognize patterns	4
42	The use of AI in startups raises concerns about data privacy and the risk of data breaches	2
14	AI is utilized in generating potential problem statements	3
	Lower than any other factor	
43	Applying AI in a startup comes with profound ethical challenges	-5

Statement Number	Statement	Ranking
3	AI is utilized as an advanced search tool for acquiring a comprehensive understanding of new emerging topics	-4
39	A lot of startups only use AI on a basic level, because of costs	-3
2	AI lacks integration with other operational processes	-3

5. Conclusion and Implications

5.1 Conclusion

The presented research explored the different usage of AI in startups in Germany. To achieve this, Q-methodology was utilized for data collection, analysis, and interpretation. Findings show that there are many different views and practices regarding the usage of AI in startups. Among the 30 interviewed startups three factors could be extracted, these are “Dedicated Optimizer: AI boosts efficiency, legal and ethical concerns can be disregarded”, “Cautious Cost Saver: AI leads to cost-benefits but has risks of dependency and mistrust”, “Selective Enhancer: AI enhances operations and marketing, but is not a suitable search tool”. When comparing these factors, it is interesting, that all participants recognize the improvement of efficiency. According to insights from the interviews, some startups use AI to become more efficient in their daily operations, describing AI as a kind of robot that streamlines processes. Particularly, factor 2 focuses on the cost benefits, as participants in this factor anticipate that they won´t have to hire as many employees as startups did five years ago, thanks to AI.

In contrast, attitudes regarding AI in terms of ethical considerations and mistrust, vary among startups. Most participants reported that they use AI without thinking about ethical challenges, prioritizing the positive impact of AI. Furthermore, most participants claimed that they don´t let AI make a final decision. Every result of AI is checked by someone in the end. Therefore, ethical considerations are not ranked high.

It should be noted that statements highlighting the innovative nature of AI, such as “The utilization of AI extends to refining existing solutions or conceiving similar alternatives” and “AI plays an important role in the development of innovative and unforeseen solutions” are often placed in the middle of the distribution. This indicates that AI is primarily used to improve efficiency but plays a limited role in the innovative idea generation of startups. Participants stated that the creativity of AI is contingent upon human creativity, meaning it mainly supports humans in idea generation. Additionally, some participants mentioned that, so far, humans have been slightly more creative than AI, and that AI requires substantial information to generate appropriate ideas. Furthermore, one participant stated, that start-ups can be way more creative in talking to other people than in chatting with AI. Statements regarding the identification of customer needs were consistently ranked in the middle or negatively across all three factors. Participants commented that understanding customer needs is an area where direct interaction with real people is essential.

While existing research broadly sketches out the impact of AI on startups, this study delves deeper to reveal how German startups perceive and prioritize AI's capabilities. Both existing literature and our findings highlight AI's proficiency in automating and streamlining operations within startups. This reinforces the well-established value of AI in optimizing processes, saving time, and maximizing resources. However, this study unveils a key distinction from the literature's portrayal of AI as an innovation engine. Our findings suggest a more limited role for AI in generating groundbreaking ideas within German startups. Participants emphasized AI's role as a supporter of human creativity, underscoring the critical need for human-centric approaches. Furthermore, while the literature emphasizes the importance of ethical frameworks, the reality paints a different picture. Many startups prioritize the immediate benefits of AI, potentially overlooking the associated ethical challenges.

5.2 Practical Implications

This analysis and interpretation serve as basis for several practical implications. As operational efficiency thanks to AI is ranked continuously high in this study, it suggests that startups prioritize the optimization of their operational processes and resource utilization through AI implementations. Consequently, it underscores the significance of AI as a tool for reducing manual effort, and enhancing productivity, all of which are crucial for the success and sustainability of startups operating in competitive environments. Therefore, this finding emphasizes the practical importance of efficiency gains as a driving force behind AI adoption strategies among startups.

The finding that ethical considerations with AI are often overlooked by most startups implies a potential risk of neglecting ethical dimensions of AI. Consequently, there is a substantial risk of unintended consequences, such as biased algorithms or privacy violations, due to this lack of ethical oversight.

Participants highlighted that AI primarily supports, rather than replaces human creativity, suggesting that AI still plays a complementary role in the creative process. This suggests that while AI technologies can enhance the efficiency and effectiveness of idea generation processes, they are predominantly viewed as tools that support and facilitate human ingenuity, not as autonomous generating ideas. This underscores the importance of maintaining human agency and creativity in the innovation processes, even with the presence of AI capabilities. Startups should recognize the collaborative potential of human-AI interaction, leveraging AI tools to augment and amplify human creativity rather than supplanting it.

6. Limitations and Future Research Directions

While providing valuable insights into AI usage in startups, this study has limitations that affect interpretation and generalizability. Firstly, this study was constrained by its location-specific participants, as the insights derived from interviews with startups from Munich. This may limit the results and implications to the viewpoints of this region. Secondly, external factors beyond the scope of the study may have influenced participants' responses while assessing the use of AI in their startup. Current events, cultural shifts in the startup, or individual circumstances occurring during the study period may have shaped participants' perspectives in ways that were not fully captured.

Future research in this fast-paced field could explore several avenues to deepen our understanding of AI adoption in startups and its implications. First, a cross-cultural-comparison could be insightful. Comparing AI adoption practices and perceptions across diverse cultural contexts and exploring how cultural factors influence ethical considerations and innovation processes, could yield valuable insights for the global startup ecosystem. Furthermore, the impact of AI adoption on organizational culture warrants investigation. This could involve investigating how AI technologies shape values and practices within startups and identifying strategies to foster a culture of innovation and ethical responsibility in AI-driven environments. Moreover, analyzing startups that have successfully integrated AI into their operations could be highly beneficial. By scrutinizing the strategies, challenges, and outcomes of AI adoption in these cases, researchers can identify best practices and valuable lessons for other startups.

Abstracts: This paper has charted the dynamic evolution of Shenzhen's lithium-ion battery (LiB) industry through four distinctive stages, thereby elucidating the complex interplay between industrial growth, policy interventions, and technological advancements. The framework illustrated not only the vital role of resource pool at each stage of the LiB industry's evolution but also underscored how shifts in industry trends reciprocally influenced the structure of resource pool. In the first stage, the nascent LiB in Shenzhen was driven by local companies, operating on a traditional manufacturing model based on public knowledge. It benefited from the urban development advantages of Shenzhen, including its strategic location, industrial structure, and supportive government policies, setting the stage for subsequent evolution. The second stage marked the formation of a comprehensive industry chain, encompassing both upstream and downstream sectors, driven by the increasing demand for LiBs and the proliferation of consumer electronics manufacturing in Shenzhen. The expansion was not just in capacity but also in the scope, fostering a more interconnected and resilient industry ecosystem. The third stage witnessed a strategic shift from low value-added consumer electronic batteries to high value-added power batteries, propelled by national policy guidance and increased R&D investments. This shift was crucial in transitioning from conventional consumer electronics batteries to more sophisticated and lucrative energy solutions for automotive and industrial uses. The current stage, the fourth, is characterized by continuous innovation, talent development, and an emphasis on synergistic innovation between universities and enterprises. The establishment of intermediary organizations helped to promote the integration of resources and standardized division of labour within the innovation ecosystem. Throughout these stages, Shenzhen's LiB industry has navigated through varying challenges and opportunities, demonstrating remarkable adaptability and resilience. The LiB industry has continually responded to changes in the resource pool, adjusting interaction mechanisms to catalyse growth and innovation. Meanwhile, transformations in the industry have informed resource pool establishments, creating a dynamic feedback loop.

Keywords: Lithium-ion Battery Industry, Innovation ecosystem, Industrial upgrading

1. Introduction

Shenzhen, a special economic zone in China, has been at the forefront of modern industrialization with its manufacturing industries playing a vital role in the city's economic growth over the last three decades. Recognizing the limitations of relying solely on low-skill, low value-added manufacturing for sustainable growth, both national and municipal governments have been driving economic restructuring and industrial upgrading since the 2000s. A prime example of this transformation is the rise of the LiB industry in Shenzhen.

Initially, in 2000, Japan dominated the global LiB market with a production of 500 million units, accounting for over 95%. By 2021, China's LiB industry had captured 60% of the global market, producing approximately 324 GWh, with Shenzhen contributing two-thirds of this output (Xu, 2022). This dramatic shift, where Shenzhen quickly caught up and surpassed Japan's long-held dominance within two decades, is considered an industrial miracle. The city's government played a crucial role by supporting high-tech enterprises, maintaining the manufacturing industry as the city's economic foundation, and innovating in investment attraction and resource allocation. As a result, Shenzhen's GDP surged from 0.22 trillion yuan in 2000 to 2.77 trillion yuan in 2020. Furthermore, among China's 139 listed LiB companies, 21 are based in Shenzhen, each with a market value over 10 billion yuan (Peng, 2023).

The success of Shenzhen's LiB industry can be analyzed through the lens of innovation ecosystems, which have evolved from traditional innovation systems research focusing on institutional roles to more dynamic, habitat-oriented models that emphasize evolution (Zeng et al., 2013). This ecosystem evolves through four stages: birth, expansion, leadership, and self-renewal (Chen et al., 2014; Moore, 1993). In its nascent stage, Shenzhen's LiB industry refined the "pioneer-followers model," integrating it with opportunity studies to map out the best strategies for value creation and market entry (Ardichvili et al., 2003). The expansion stage saw collaborative innovations that drove sustainable development and product upgrading within the industry (Humphrey et al., 2000). Rabelo and Bernus (2015) also noted that most attempts at building an innovation ecosystem fail, which makes the case of the LiB industry in Shenzhen even more interesting and unique. Thus, this paper explores the

competitive advantages and transmission mechanisms of Shenzhen's LiB industry from the perspectives of industrial upgrading and innovation ecosystems. It also investigates how this specific industry has built and sustained its innovation ecosystem in conjunction with its industrial upgrading models, offering unique insights into why some LiB enterprises succeed while others fail.

2. Literature Review

2.1 Industrial Upgrading

In 1998, Dieter Ernst first introduced the concept of industrial upgrading when he analyzed the successful experience of the development of the Korean electronics industry. By integrating international trade and industrial upgrading, Gereffi et al. (1999) defined industrial upgrading as "a process of improving the ability of a firm or an economy to move to more profitable and/or technologically sophisticated capital and skill-intensive economic niches". Afterward, the concept of global commodity chains has been gradually replaced by global value chains. Humphrey and Schmitz's study describes the three different phases of up-grading that industrial firms must undertake: channel upgrading, process upgrading, product upgrading, and functional upgrading.

2.2 Ecosystems Theory

An innovation ecosystem is a typical socioeconomic system that makes innovation happen (Fransman,2010). Business ecosystems are often based on geographical boundaries, and can be classified as local, regional, national, and international levels (Pombo-Juárez et al., 2017). In the regional level, Roundy (2017) introduced the concept of entrepreneurial ecosystems in small towns, with seven elements that constituted the ecosystems: capital, markets, networks, support, culture, finance, and politics. From a dynamic perspective, an ecosystem life-cycle model evolves in four distinct stages: emergence, expansion, leadership, and self-renewal (Chen et al., 2014; Moore, 1993).

Existing research on business ecosystems has been developed to explore mechanisms, structures, and strategic options in different industries and countries, but there are very few studies focused on Asian countries. (Rong et al., 2018). In the context of China, previous innovation ecosystems work in the field of sustainable development are mainly focused on new energy vehicles (NEVs) from a national perspective (e.g. Rong et al., 2017, Wu and Yang, 2018, Gong, 2023), while fewer are from a regional point of view (e.g. Shang and Shi, 2013). Since LiB is often passed over as part of NEV rather than being explored in depth, the emergence and transformation of LiB innovation ecosystem from a regional perspective is still worth researching.

2.3 LiB Product and Industry

A modern LiB is a materially complex, manufactured product designed for a particular end market rather than a fully fungible commodity. In terms of historical development, the initial theoretical breakthrough of LiB technology was accomplished by the United States in the 1950s, while the industrialization of LiB originated in Japan. In terms of production, Japan used to lead the world in mass production of LiB, but was later overtaken by South Korea (Gong, 2023). By 2015, China surpassed both South Korea and Japan to become the top exporter of LiB. Currently, China has been the single largest LiB producer for seven consecutive years. It is also the world's undisputed king of battery production, with Shenzhen has contributed to about 2/3 of the total national output.

3. Method

The data comes mainly from primary data based on field research and interviews, and secondary data based on third-party reports, company annual reports, media news, company websites and existing literature, and all data used are cross-validated to ensure authenticity. Furthermore, based on the single case analysis and cross case analysis, grounded theory is utilized to investigate the coevolutionary relationship between the upgrading pattern of Shenzhen's LiB industry and its innovation ecosystem. Additionally, Term Frequency-Inverse Document Frequency (TF-IDF) was used to extract keywords from news media data and create word clouds to validate the proposed developmental stage frameworks.

4. Case Study

4.1 A Case Study on BYD

The initiation of China's LiB industry began with BYD. The innovation of BYD's LiB business can be divided into three main phases.

4.1.1 Establishment and rapid expansion (1998-2002)

BYD commenced its journey in 1995 with nickel-cadmium batteries and entered the lithium-ion consumer battery market in 1998. By 2002, the company had established itself as a significant player, becoming the first Chinese LiB supplier to Motorola in 2000 and to Nokia in 2002. This period marked BYD's swift production scale-up and its initial forays into high-energy-density lithium-ion materials research, setting the foundation for future advancements.

4.1.2 NEVs and breakthroughs in power batteries (2003-2016)

Post-2003, following its acquisition of QinChuan Automobile, BYD intensified its focus on NEVs and power batteries. The company innovated with iron-phosphate and NCM LiB, launching its first iron-phosphate power battery in 2005. Significant public and private sector collaborations bolstered BYD's standing, particularly in Shenzhen, a city keen on establishing itself as a hub for electric vehicles and associated technologies. Strategic initiatives like the public transport electrification in Shenzhen underscored this phase.

4.1.3 Platformization and technological innovation (2017-Present)

Since 2017, BYD has sought external breakthroughs, accelerated its open supply system, and partnered with companies like Changan Automobile. The introduction of its "e-platform" in 2018 encapsulated various technologies, including power batteries and low-voltage control, in one system. BYD's strategic transition to a platform-based approach facilitated by an open and collaborative economic environment in Shenzhen led to significant milestones such as the unveiling of the highly safe "Blade Battery" in 2020, aimed at addressing safety concerns in the market.

4.2 A Case Study on Sunwoda

Sunwoda was established in Shenzhen in 1997 and is one of the earliest enterprises in China to engage in the LiB industry. Sunwoda's evolution in the LiB sector unfolds over three distinct phases.

4.2.1 Rapid development during China's "Golden Decade" of consumer electronics (1997-2008)

Established in 1997 in Shenzhen, Sunwoda quickly became a pioneer in China's LiB industry, embracing the mobile communications boom. Early successes included becoming a customized mobile battery producer for Konka in 1999 and entering the international market with Philips in 2003. By 2005, Sunwoda had formed significant partnerships with global giants like Haier and Lenovo, and by 2007, its battery modules were integrated into Apple's supply chain, marking significant industry penetration.

4.2.2 Establishment of power battery technology and revenue growth from consumer electronics batteries (2009-2018)

In 2009, Sunwoda established a power battery division, focusing on the design, development, and testing of power batteries. This period saw significant R&D advancements, supported by governmental projects and certifications. In 2011, Sunwoda’s power battery testing laboratory received CNAS accreditation, underscoring its dedication to cutting-edge technology and sustainability.

4.2.3 Full industry chain layout and development of an independent brand ecosystem (2019-Present)

Confronting fluctuations in raw material costs, Sunwoda strategically secured upstream mining interests to stabilize its supply chain. This era is defined by intensified R&D, driven by market needs and customer focus. Key achievements include becoming a battery supplier for Renault-Nissan in 2018 and initiating the development of high-performance solid-state batteries in 2016. By 2022, Sunwoda's role in developing a sophisticated battery industry chain ecosystem was acknowledged, with its intelligent battery manufacturing industry park recognized as a key project in Shenzhen's strategic "20+8" industrial clusters.

4.3 A Case Study on BAK

BAK's evolution in the LiB industry, marked by rapid growth and strategic shifts, can be summarized into three phases.

4.3.1 Expansion in consumer electronics batteries (2001-2007)

Established in Shenzhen in 2001, BAK rapidly became one of the top three lithium cell producers globally by 2005, challenging the dominance of Japanese giants like Sony and Sanyo. This period was characterized by aggressive production expansion to meet the booming demand for mobile batteries, with daily production

capacity reaching 500,000 units by 2003. Despite its rapid growth, the company initially lacked a focus on technological innovation and intellectual property, which it began to address in 2004 by establishing a post-doctoral workstation and a technical school, moving towards innovation-driven growth.

4.3.2 Industry position decline and power battery transition (2008-2014)

As one of China's pioneers in power batteries and lithium iron phosphate cells, BAK developed the first lithium iron phosphate battery in partnership with A123 in 2004. However, disagreements over technological direction led BAK to prioritize high-energy-density LiBs. Despite entering the power battery market in 2006 and establishing China's first automated 18650 battery cell production line, the company's lack of a distinct strategic focus resulted in a "me-too" strategy that ultimately did not translate into a leading market position.

4.3.3 Financial volatility and development of cylindrical power batteries (2015-Present)

With the resurgence of the NEVs market in 2015, BAK experienced a surge in capacity and sales, driven by capital inflow. The company focused on cylindrical batteries to diversify its applications beyond automotive to sectors like electric bikes and tools, mitigating financial risks. In 2021, BAK launched the large cylindrical 4680 battery, marking significant advances in performance, cost, and safety, and re-established its position in the high-end electric vehicle market.

4.4 A Case Study on OptimumNano

OptimumNano, established in Shenzhen in 2002, was one of China's earliest companies to successfully develop and mass-produce lithium iron phosphate batteries for NEVs. OptimumNano's journey can be segmented into two main phases:

4.4.1 Rapid growth period (2002-2016)

OptimumNano's founder, Li Yao, previously a senior manager at BYD, established OptimumNano in 2002. The company targeted bus companies and focused on developing, producing, and selling lithium iron phosphate power batteries. Despite early challenges in a nascent market, by 2006, OptimumNano gained recognition from the Shenzhen government as a "High-tech Enterprise" and began to significantly impact the market during the 2010 Shanghai World Expo as a technical supporter for electric buses. OptimumNano's growth continued with government support, allowing it to expand production and achieve large-scale applications.

4.4.2 Transition to power batteries and decline (2008-2019)

Initially, OptimumNano was among the first in China to engage in power battery production, including lithium iron phosphate cells. However, as the market shifted towards higher energy density batteries, OptimumNano's focus on lithium iron phosphate, known for its safety but lower energy density, became a disadvantage. Substantial changes in subsidy policies and market demands exacerbated financial strains, leading to bankruptcy in 2019. Despite attempts to innovate and adapt, OptimumNano struggled with technological shifts and market dynamics, ultimately unable to sustain its business under the changing landscape of China's NEVs policies.

5. Analysis and Discussion

5.1 Stage 1: 1998-2002

The early development of Shenzhen's LiB industry marked a significant advancement, primarily driven by local companies exploiting city-specific advantages and public knowledge. Located near Hong Kong, Shenzhen quickly became a key site for foreign investment and manufacturing, enhancing its manufacturing capabilities and positioning itself at the centre of the burgeoning mobile technology demand. This period saw local manufacturers like BYD leverage cost efficiencies and growing expertise to capture significant market opportunities.

Shenzhen's supportive policies towards technological innovation and entrepreneurship also played a crucial role in the industry’s development. The city's dynamic environment encouraged entrepreneurs like Wang Chuanfu of BYD to innovate and expand rapidly, despite high risks. This entrepreneurial spirit helped establish a robust business framework and spurred further industry participation.

At the enterprise and manufacturing capabilities from zero to one, uncertainty and high possibility of failure made electronics companies hesitate to enter this new industry, but with BYD being the first mover, its success gave them confidence promoting followers to identify business opportunities and offering reference for their business model design and market identification logic (Figure 1-1). Meanwhile, the commercial success of

follower companies reciprocally laid the foundation for Shenzhen to form a Lib industry cluster and enhanced the market loudness (Figure 1-2). Through collaborative R&D with end customers such as Nokia, this group of companies achieved domestic manufacturing of LiB in Shenzhen, fostering the initial development of an upstream and downstream industry chain.

In this phase, the financial support of the government for technological innovation became the early sources of operating capital for companies (Figure 1-3), while the direction of R&D was primarily driven by the market demands of end customers (Figure 1-4).

However, the initial innovation ecosystem was limited by the scant involvement of broader research institutions and venture capitals, which somewhat hindered potential growth and technological advances. Despite these challenges, the government, pioneering companies, and the resulting upstream and downstream supply chains have formed the minimum viable ecosystem for the LiB industry in Shenzhen (Adner,2013).

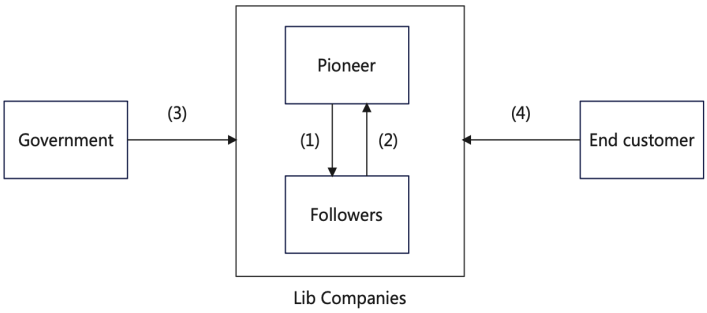

Figure 1: Interaction mechanisms in the first stage

5.2 Stage 2: 2003-2010

During this period, the demand for LiBs surged due to their widespread use in consumer electronics like mobile phones, digital cameras, gaming consoles, and laptops, further boosted by the introduction of 3G services in China in 2008. Shenzhen emerged as a major production hub for LiBs, benefitting from the growth in the consumer electronics sector (Figure 2-1). This demand led to increased LiB production and fostered collaborations between battery manufacturers and electronics companies, enhancing R&D in battery technology and stimulating growth in related sectors. This created a virtuous cycle that reinforced Shenzhen's role as a significant player in the global LiB market.

Simultaneously, Shenzhen developed a comprehensive LiB industry network encompassing manufacturing, materials, equipment, and recycling, supported by its prowess in applied electronics and information technology. This network facilitated further specialization in the LiB industry and the development of NEVs (Figure 2-2).

Another notable characteristic of this period was the formation of clustering bases for the LiB industry in Shenzhen, supported by government policies and funding (Figure 2-3). Meanwhile, LiB had become an important pillar industry in Shenzhen (Figure 2-4). However, the industry also faced challenges such as the proliferation of small-scale factories, inconsistent product quality, lack of coordinated planning, and a shortage of core technologies. Despite substantial local government support, national support was perceived as lacking, and Shenzhen-based companies were less involved in national forums or funding programs focused on new energy, compared to firms from other cities with stronger academic and research ties.

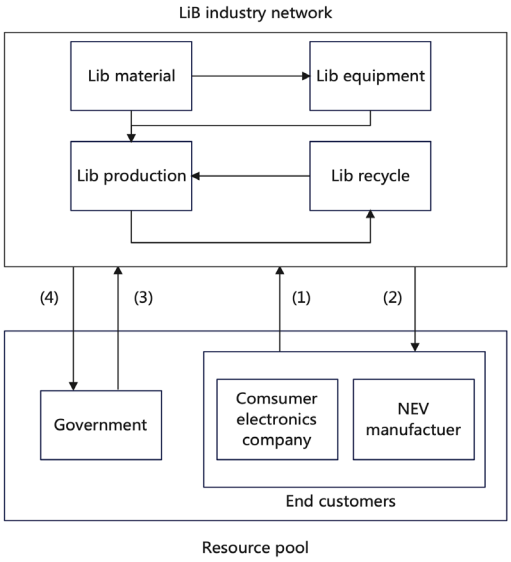

Figure 2: Interaction mechanisms in the second stage

5.3 Stage 3: 2011-2017

During this stage, Shenzhen's LiB industry has undergone significant transformation, upgrading from low value-added consumer electronic batteries to high value-added power batteries, facilitated by intensive research and development (Figure 3-1). This shift aligns with China's 2009 identification of the NEVs industry as one of its seven strategic emerging industries with substantial growth potential (Figure 3-2). Various regions, including Shenzhen, have endeavoured to develop their own power LiB production systems, leveraging their established strengths in consumer battery technologies (Figure 3-3). This early groundwork allowed Shenzhen to rapidly advance and take a leadership position in the power LiB sector (Figure 3-4).

As stated by Wang Mingwang (Ji, 2022), founder of Sunwoda, the transition to power batteries, despite its complexities in manufacturing, capital, human resources, and technology R&D, is a natural progression due to the similarities in the research and development systems of both consumer and power batteries (Figure 3-5).

Another key feature of this stage is the significant impact of national guidance and research support policies. National policies like subsidies for new energy have catalyzed the industry's evolution, leading to market differentiation and the exclusion of companies like OptimumNano that failed to meet high-end market criteria (Figure 3-6). Additionally, major national research projects have started aligning with Shenzhen's industry needs (Figure 3-7), as evidenced by the success of the "Graphite and Graphene Materials for High-Performance LiBs" project at Tsinghua University's Shenzhen campus, which underscores the region's advanced R&D capabilities under national policy guidance (Figure 3-8).

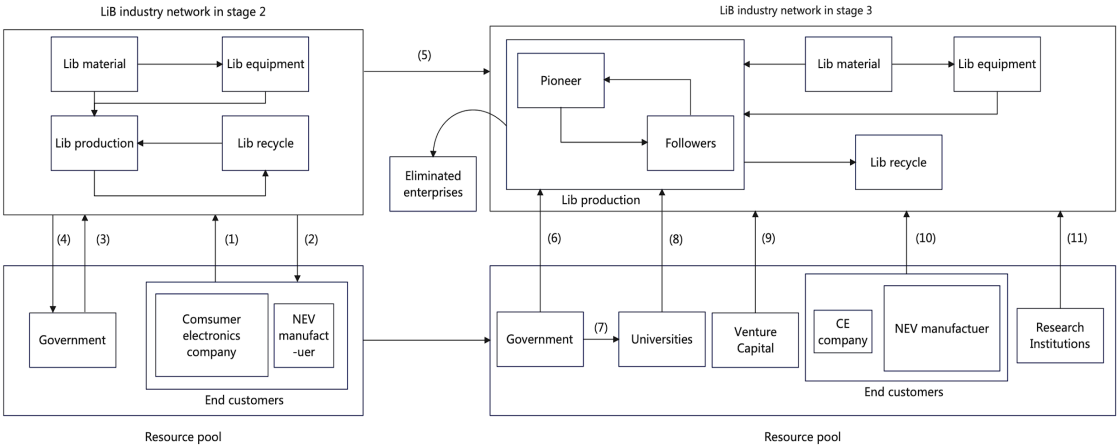

Figure 3: Interaction mechanisms in the third stage

5.4 Stage 4: 2018-Present

The rapid advancement of Shenzhen's LiB industry is largely due to technological breakthroughs and continuous innovation, facilitated by national regulations and local government efforts to attract and retain key talent (Figure 4-1). Shenzhen has become a hub for R&D in new energy and materials by creating favorable conditions for talent, which drives innovation in the LiB sector. As Ren Jianguo from BTR notes (Liang et al., 2019), retaining R&D headquarters in Shenzhen leverages its rich talent resources (Figure 4-2). The "Peacock Plan" by the Shenzhen government has successfully attracted high-level overseas talents, enhancing the city's innovation capacity, as seen with Dynanonic's establishment of a postdoctoral innovation practice base in 2021, offering tax-free subsidies to researchers (Figure 4-3).

Shenzhen has also improved its innovative talent management and professional title evaluation system, introducing a "LiB engineer" title in 2021 to support technical personnel needs in new technology fields (Figure 4-4). The phase marked a shift towards synergistic innovation between universities and enterprises, exemplified by collaborations like the Tsinghua-BYD Joint Laboratory and the establishment of the Shenzhen Battery Industry College in 2023 through partnerships among Shenzhen Polytechnic, the local battery industry association, and leading LiB enterprises (Figure 4-5). This "Shenzhen Model" provides technological support and assures talent for the LiB industry's development, creating a mature innovation ecosystem that standardizes talent cultivation and resource integration (Figure 4-6).

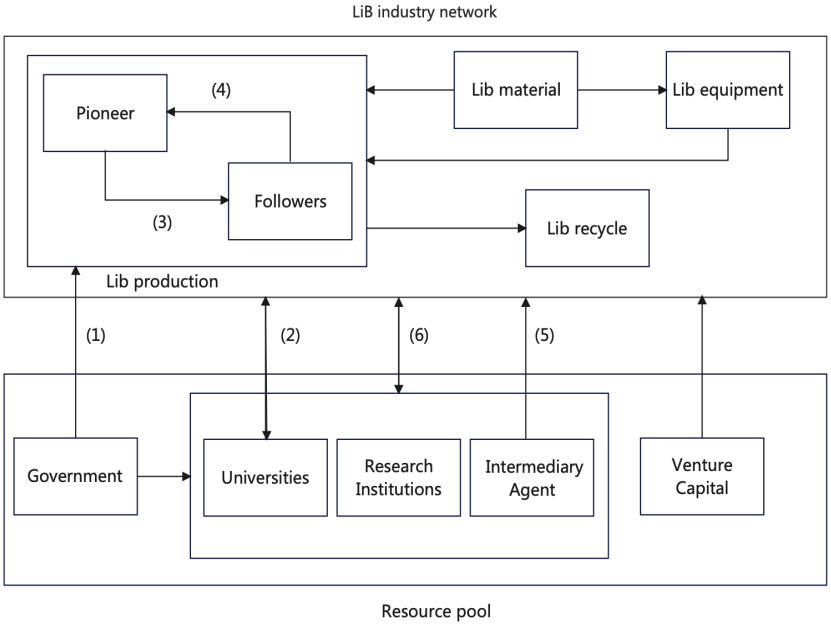

Figure 4: Interaction mechanisms in the fourth stage

5.5 Evidence from Social Media

In the initial phase of the LiBindustry in Shenzhen, keywords such as "BYD," "charging," "R&D," and "enterprise" prominently appeared in the word cloud. These terms highlighted BYD unveiling the development of the LiB industry in Shenzhen, establishing a foothold in the market through cost efficiencies and increasing expertise. This also indicates that in this phase, BYD's market leadership and pioneering role as a leading enterprise were significant.

In the second stage, keywords such as "consumer electronics" and "industry" saw a surge in demand for LiBs due to their widespread use in consumer electronics. The term "collaborations" signifies the growing partnerships between battery manufacturers and electronics companies. "Government policies" reflect the supportive measures that facilitated the formation of industry clusters and the establishment of Shenzhen as a major production hub for LiBs.

The third stage marks a transformation with the shift towards high value-added power batteries, as evidenced by keywords like "power batteries," "NEVs." The emphasis on "R&D" highlights the intensive research and development efforts that enabled Shenzhen to transition from consumer electronic batteries to power batteries.

This stage also underscores the importance of national guidance and research support policies in fostering market differentiation and technological advancements.

In the current stage, keywords such as "breakthroughs," "innovation," "talent," and "government" are prominent. These terms highlight the role of continuous innovation and the importance of attracting and retaining key talent in driving the industry's growth, signifies the ongoing technological advancements that have positioned Shenzhen as a hub for R&D in new energy and materials.

The longitudinal analysis of keywords across the four stages shows a clear progression in the focus areas of the LiB industry. Initially, the emphasis was on establishing manufacturing capabilities and early R&D efforts. As the industry matured, the focus shifted towards collaborative efforts, government support, and specialization in consumer electronics. The transition to power batteries marked a significant milestone, driven by national policies and intensive R&D. In the current stage, continuous innovation and talent attraction have become the primary drivers of growth.

Cross-sectionally, the word cloud of each stage provides a snapshot of the main themes at that time. In the early stages, companies primarily relied on government support to achieve initial success. The middle stages emphasized cooperation along the supply chain and strategic shifts toward new energy applications, while the later stages highlighted technological advancements and talent acquisition. The recurring themes of R&D, government support, and industry collaboration throughout the stages underscore the consistent factors that have driven the industry's evolution.

This evidence form social media clearly shows a picture of the Shenzhen's LiB industry during 1998 – 2023 and also supports the previously described 4 stages of it's development.

Figure 5: The word cloud for each stage

5.6 Discussion

The bankruptcy of OptimumNano highlights the dangers of over-reliance on government subsidies and unchecked rapid expansion, underscoring the need for sustainable, market-oriented business models. Similarly, BAK's experiences emphasize the importance of a flexible supply chain to maintain operations despite market fluctuations. Sunwoda's proactive approach in diversifying products and tapping into new market segments illustrates the benefits of adaptability in a rapidly changing market environment.

BAK's cautionary tale of premature investment without fully understanding market readiness also demonstrates the necessity of strategic and measured market entry and expansion. Companies must evaluate their capabilities and market conditions thoroughly before diving into new ventures and must consider timing their market entry to coincide with both product readiness and market demand maturity.

In Shenzhen's LiB innovation ecosystem, the roles of government and intermediary organizations have been crucial at different stages of development. Initially, the local government was instrumental in propelling the fledgling industry by offering financial incentives and policy support, which helped to attract businesses and foster innovation. As the industry matured, the local government facilitated the expansion of the industry value chain, while the national government played a pivotal role in steering the industry towards advanced battery technologies with strategic policies and support for research and development.

Intermediary organizations emerged as vital components in later stages, acting as facilitators that connected various stakeholders within the ecosystem, including government bodies, universities, and businesses. They

provided platforms for knowledge exchange, business cooperation, and industry promotion, helping to integrate resources and drive innovation. These organizations filled crucial gaps in the ecosystem, especially as the industry evolved towards more standardization and continuous innovation, highlighting the importance of collaborative networks in sustaining industry growth, and fostering a competitive market environment.

6. Conclusion

Over the past few decades, Shenzhen's LiB industry has undergone significant evolution, driven by government policies, market dynamics, talent development, and continuous innovation. Initially, from 1998 to 2002, the industry benefited from Shenzhen's strong manufacturing base and government support for technological innovation, establishing a foundation centred on local business-driven manufacturing.

From 2003 to 2010, the LiB industry saw substantial growth due to rising demand in consumer electronics, supported by both local government initiatives and private sector market forces. However, this period also revealed challenges such as product homogeneity and a shortage of core technologies, highlighting the need for more strategic national support.

Between 2011 and 2017, the industry experienced a significant transformation, shifting from low to high value-added power batteries. This shift was marked by an alignment of national research resources with Shenzhen's burgeoning R&D capabilities, moving the industry towards more active, company-led innovation and establishing Shenzhen as a leader in China’s LiB sector.

Since 2018, the industry has been characterized by technological breakthroughs and strategic talent acquisition. Government initiatives like the "Peacock Plan" have bolstered Shenzhen as an R&D hub, with enhanced collaboration between universities and enterprises leading to the formation of key educational and research institutions. This has standardized interaction within the industry’s innovation ecosystem and facilitated resource integration, signalling the industry's move towards maturity.

This analysis provides an analytical framework for understanding the dynamic interaction between the industry’s development and the resource pool, illustrating how changes in one can reciprocally influence the other, thereby fostering a cycle of growth and innovation.

Exploring the Potential of AI to Increase Productivity in Small Marketing Teams

Aniko Szenftner, Stefan Stumpp and Tobias Knopf
Anhalt University of Applied Sciences, Bernburg, Germany

aniko-szenftner@web.de
tobias.knopf@hs-anhalt.de
stefan.stumpp@hs-anhalt.de

Abstract: Marketing scientists as well as practitioners believe that artificial intelligence (AI) holds the promise of productivity gains for organizations. However, there has been little scientific research into these theories. This study investigates the role of AI in enhancing marketing productivity, deriving insights from a case study conducted with the marketing team of an industrial software start-up. Drawing upon Case Study Analysis by Yin (2018) and Participatory Action Research by Kemmis and McTaggart (2007), the study employs a combination of survey interviews, AI tool research and AI tool testings. Key findings indicate that productivity gains are more likely than productivity impairments with the use of marketing AI tools. This effect is even stronger when knowledge workers possess high levels of AI skills and utilize AI tools with suitable capabilities. Having closely analyzed six marketing disciplines, particularly SEO / content and design demonstrated significant productivity gains including generative AI (GAI) tools the team already subscribed to like ChatGPT 4 and Canva, but also new AI solutions. While an AI tool's level of integration only showed a weak positive productivity impact, future studies are suggested to further investigate this variable by comparing the effects of less advanced but more accessible tools like generative AI versus highly advanced, but less accessible business AI. Having navigated the vast and dynamic landscape of AI tools, insights further emphasize the importance of AI experience sharing and informed decision-making, implying knowledge of own user rights and always staying updated on AI advancements. Zooming out from process level, the work's literature review further highlights the role of environmental and organizational AI enablers, like budget allocation, fostering AI trust and mindset, but also implementing AI routines and responsibilities. Overall, this research underscores the imperative for companies, especially startups and SMEs, to explore AI technology as a means to enhance productivity and gain a competitive edge.

Keywords: Artificial Intelligence, Large language model, ChatGPT, Case study, Marketing productivity

1. The Interest of (Small) Businesses in AI

AI seems to be of substantial value for businesses – not only from a product perspective, but also a productivity perspective. The OECD describes *productivity* as "ratio between the volume of output and the volume of inputs" (OECD iLibrary, no date). What makes studying AI's impact on productivity so relevant, is the aim of countries, companies and our analyzed startup case to improve business productivity by optimizing their relation of input factors like HR, time and costs, and output factors, namely high quality and quantity results and, eventually, turnover. Further, the investigated startup has gone through layoffs resulting in a HR decrease of 30 % company-wide and 60 % within the marketing team down to three employees. So while input resources were extensively cut, the start-up did not want to accept equally high marketing output losses. One answer to this situation was the use of AI tools in daily operations.

Late studies confirm how input and output aspects of productivity drive AI adoption: IBM (2022) finds that 42 % of companies worldwide adopt AI because they want to reduce costs, Salesforce (2023) evaluates marketing time savings through AI of roughly 32.5 days per year, and Dell'Acqua et al (2023) show how consultants who were using ChatGPT produced 40 % higher quality results than those who did not. According to Chui et al (2023), such effects are especially high in marketing and sales, where the use of generative AI (GAI) has the potential to generate $760 to $1,200 billion in value – significantly more than other functions such as customer operations ($340 to $470 billion) ranking second, and R&D ($230 to $420 billion) ranking third. With such productivity potential and a general AI hype, it is no wonder AI adoption rates among marketing teams go up to 87 %.

As to the latter, SMEs or startups, indeed show lower AI adoption rates between 26 % and 36 % than bigger companies (Constant Contact, 2023; Unbounce, 2022). Despite a generally high interest of SMEs in adopting AI amounting to 74 %, their top concerns are data security (44 %), high costs to implement AI (41 %) and that it would take too much time to learn or adopt it (33 %), as Unbounce's survey of 486 US American SME managers with less than 250 employees showed. This brings up, what can be called an *AI dilemma of smaller companies* and teams: Those who are in biggest need of AI productivity effects have the least resources and higher constraints to adopt it, which again holds back their potential for growth and more sophisticated AI. So while AI could, in the long run, free up much time and thus save personal and financial resources, there must be an initial

minimum investment to implement and educate on the technology. SMEs must take on this debt before they can benefit sustainably from AI. This explicitly applies to more integrated and costly business AI, but does not exclude less integrated GAI tools, which are a good starting point for SMEs as they are usually free or inexpensive, user-friendly, accessible, and have many use cases.

Mirroring the status quo of the analyzed startup, the following research question was posed:

RQ: How does Artificial Intelligence influence productivity in small marketing teams?

To answer this question along with the marketing team of an industrial software startup, an explorative, embedded Single Case Study by Robert Yin (2018) was performed. This includes an initial literature review which supported the derivation of propositions to guide the study and answer the research question. Then, data was collected by conducting semi-standardized survey interviews with each marketer. Based on these interview evaluations and requested 'AI tickets', AI tools were then researched, tested and presented to the team in nine meetings for a period of three months in orientation to the PAR method by Kemmis and McTaggart (2007). Eventually, all data sets including the interviews and AI tool testings were merged in a triangulating manner resulting in 20 practical implications. Lastly, based on these results and literature insights, an AI White Board was created to help the startup and other small (marketing) teams leverage AI for productivity gains in the future.

2. Theoretical Background

2.1 AI Productivity Potential on Organizational and Process Level

Literature has different answers to how marketing or more broadly business productivity can be increased using AI. Starting on organizational level, a number of scientists highlight the *requirements* teams must fulfill to successfully adopt AI. So do Enholm et al (2022) in their TOE framework theorize how technological enablers (data and technology infrastructure), organizational enablers (top management support, organizational readiness, culture, employee AI trust, AI strategy and tech-task-compatibility), and environmental enablers (ethical and moral aspects, regulations and environmental pressure) will lead AI to positive productivity effects.

At process level, hands-on recommendations are made by practice: Kaput (2021) defines steps on how marketing teams can systematically *find performant AI tools*: Firstly, teams must evaluate their use cases such as 'create blog post', 'create newsletter' etc. Out of all use cases, one should be picked, e.g. 'create blog post', which then must be broken down into many steps, e.g. brainstorm topics, pick topics that perform, build an editorial calendar etc. Turned to keywords, one can then research AI provider's websites, AI tool review pages and articles. The next step involves testing the most interesting tools by registering online, signing up for demos or waitlists and, lastly, building an AI strategy for the chosen tool/s including budget allocation and a rollout with all stakeholders.

There further exist several guidelines on *how to prompt* in order to quickly receive high quality output e.g. by Bozkurt and Sharma (2023) who define ten rules to consider when prompting: (i) define the objective, (ii) understand the model's capabilities, (iii) be clear and concise, (iv) provide context, (v) provide examples, (vi) fine-tune, optimize and debug, (vii) specify the format, (viii) include key details, (ix) test and iterate, and (x) consider safety and ethics. But also instructions by the most used and known providers like OpenAI and Google can and should be trusted, as they pass on even more detailed and technical tips such as "use delimiters to indicate distinct parts of the input", "specify each step required to complete a task", or "ask the model if it missed anything on previous passes" (OpenAI, no date).

What moreover supports AI to unleash its productivity potential is a proper *setup of the AI tools* themselves (MacDonald and Harris, 2024). This includes (i) making use of a shared prompt library to apply or copy and paste prompts, (ii) feeding the document library or 'custom instructions' with data on the company, target group, content samples, past campaigns and corporate design, (iii) including approval flows ensuring generated content gets checked e.g. on biases, and (iv), if relevant, security suites to keep content private before publishing. If wished, teams should further make use of the possibility of (v) setting up time frames for prompt auto-deletion, and (vi) opting out of data processing.

These last two settings would not exist in many AI tools, if *privacy laws* like the GDPR (2022) and the CCPA (State of California, 2023) did not defend user rights, hence, knowing of them is key when using AI. In accordance with these two laws, and considering the data privacy terms of the biggest AI providers, in the present study the researchers made sure the following legal aspects were covered when checking out AI tool websites: (i) tools have privacy policies, data protection terms or FAQs, (ii) offer information on how long data is stored, ideally

not exceeding three months, (iii) comply with known data privacy regulations, (iv) show user access controls on how prompts can be deleted, or data storage be refused, (v) encrypt data before processing or when in transit, and (vi) show data ownership (e.g. that data was shared with LLM providers like OpenAI).

2.2 How the Technology Influences AI Productivity Potential

Taking the technology's perspective, it is sensible looking at the different *types of AI tools* and how their characteristics impact productivity. As to Davenport et al (2021), the level of intelligence decides whether a tool uses 'only' automation as the least intelligent type of AI, or machine learning as the most intelligent type of AI. The second dimension on their 'Four kinds of marketing AI' matrix is the level of integration, differentiating between isolated and integrated tools. Process-wise, marketing teams would start with the first cluster of "stand-alone task automation tools" and gradually implement more intelligent and more integrated AI tools until the fourth cluster of "integrated machine learning apps" is reached "which has the potential to create the most value" (Davenport et al, 2021) and was, hence, considered for proposition 5.

A much more prevalent categorization of AI, however, is the one into generative AI (GAI) and non-GAI. Susarla et al (2023) define GAI as "a category of AI systems capable of creating apparently new content through text, images, or other forms of media". Little and Lucas (2023) delimit non-GAI or 'classical AI' as "the subset of AI models that does not generate new content but rather focuses on tasks such as classification, recognition, and prediction". So while the ability to quickly generate content holds great productivity potential for marketing teams, non-GAI is still critical for key tasks like analysis (e.g. sentiment or KPI analysis) or personalization (e.g. ad targeting or customer segmentation in CRM systems). In an interview for onlinemarketing.de, Dr. Markus Wübben, who has been involved with AI in businesses since the 1990s, has a clear opinion on the value of GAI and non-GAI, stating: "By the way, AI-supported data analysis and decision optimization ultimately determine the success of a campaign far more than the AI-generated visuals and ad texts, I'm sure of that. So if companies are planning to use AI, they should never equate AI with ChatGPT or other generative tools – business AI is in a completely different league." (Lewanczik, 2023).

Besides different levels of integration and intelligence, also the *capabilities of an AI* were shown to positively impact productivity effects. Having 758 consultants execute easier and more difficult tasks with and without AI, Dell'Acqua et al (2023) found that easier tasks were 40 % better and 25 % faster solved by the consultants who were supported by AI, whereas the more complex tasks were better off without AI, as consultants using AI were 19 % less likely to produce correct solutions. Hence they figured that AI indeed has the potential to improve productivity, but the degree depends on the AI tool's capabilities, which for some tasks are higher and for others lower. Moreover, Bozkurt and Sharma's (2023) second rule for prompting is 'understand the model's capabilities'. According to them, familiarizing oneself with the AI's strengths, limitations, and the types of queries it performs well on, helps crafting prompts that align with the model's expertise.

2.3 How Users Influence AI Productivity Potential

Moving away from the technology's expertise towards the *user's expertise*, Dell'Acqua et al (2023) further found that less experienced consultants increased their performance with the use of AI to 43 %, whereas more skilled worker's performance with AI only increased by 17 %. This is consistent with the findings of an online experiment by MIT researchers Noy and Zhang (2023). They evaluate that with the help of ChatGPT, writing professionals who received a low grade on a first writing task increased in grades and decreased in time spent on a second task, while workers who initially received a high grade only maintained their grade level.

Further, different AI productivity studies place emphasis on the variable *'AI skills'*. Different from the variable 'personal expertise' which refers to a worker's operational abilities for tasks, 'AI skills' investigates a workers abilities in working with and getting the most of AI tools. Whereas several studies found that employees are concerned of not having enough AI skills or time to acquire them (Constant Contact, 2023; Salesforce, 2023; Wamba-Taguimdje et al, 2020), other studies support such concerns suggesting that today's executives and leaders in fact expect their employees to assess AI skills. For instance, EdX (2023) concludes that 87 % of 800 US C-level managers say they have a hard time acquiring talent with AI skills while 79 % are worried of being unprepared for the future of work, if employees do not improve AI skills. Such skills can be prompting skills and knowing where to add custom instructions, but also knowing how to double-check LLM answers (talking 'explainable AI') or to recognize and avoid biased output (talking 'responsible AI'). While acquiring such skills seems doable, dealing with more integrated machine learning requires data maintenance skills e.g. for deduplication or data enrichment that marketers might find more challenging.

In accordance with the literature presented, the following propositions were posed:

Table 1: Research propositions derived from literature

	Propositions
P1	There is a higher potential to *increase productivity* than to decrease it via AI.
P2	The lower the *user's expertise* for a task, the higher the productivity gains via AI.
P3	The higher the *user's AI skills*, the higher the productivity gains via AI.
P4	The higher the *AI's capabilities* for a task, the higher the productivity gains.
P5	The more *intelligent and integrated* an AI is, the higher the productivity gains.

3. Methodology: Yin's (2018) Case Study and Kemmis and McTaggart's (2007) PAR

To answer the research question, an explorative, embedded single case study (type) was conducted on how AI influences productivity (phenomenon) for the different tasks (analysis unit) of a startup's marketing team (case) influenced by selected AI context factors (propositions), as can be seen in figure 1.

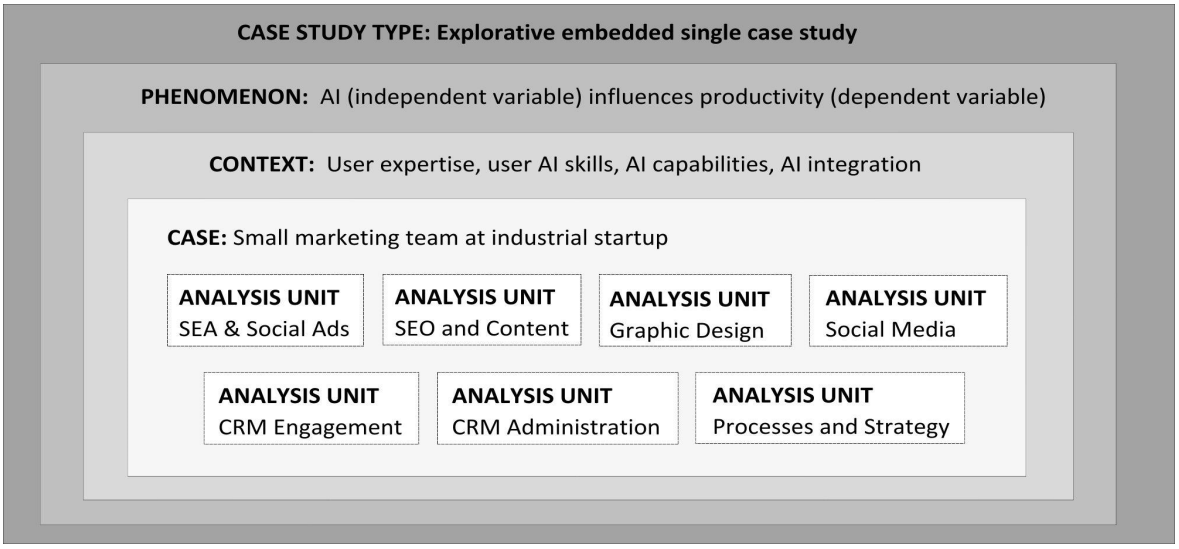

Figure 1: The research design – Components of the embedded single case study based on Yin (2018)

After the 'research design' was set up in step one of the case study, step two involved the 'preparation of data collection' and with that the creation of an Asana Board that acted as case study protocol and database. It helped showing the course of the study and important deadlines for both researchers and participants e.g. when the next AI tool presentation happens or until when the survey interviews should be returned. During step three, the 'collection of data', the Asana board supported the participants in handing in 'AI tickets' such as titled "AI to help design the perfect sign-up page" or "AI transcribing and summarizing meetings". This way, participants could describe marketing issues which the researchers would then seek AI tools for, test them and evaluate their productivity potential by commenting on the Asana task or during the 'Weekly AI updates'. Further marketing issues were collected from the answers of three survey interviews conducted with all participants.

In accordance with the method of Participatory Action Research (PAR) by Kemmis and McTaggart (2007), the data collection in step three happened in a collective and interactive, reflexive and action-oriented manner between researchers and participants. The method holds "the belief that those who are most impacted by research should be the ones taking the lead in framing the questions, the design, methods, and the modes of analysis of such research projects" (Torre, 2009). PAR is originally grounded in social justice and critical theory (e.g. feminist or indigenous perspectives) which aims to actively include minorities into research to challenge power dynamics for positive change. While the startup marketing team is neither an oppressed group within the company, nor suffering from top-down-management, it is the idea of "bring[ing] people together to learn from each other's experiences" (Kemmis and McTaggart, 2007), which appeals to the present case. In this context, the PAR's 'spiral of self-reflective cycles', as shown in figure 2 and adopted during the whole data collection period, suits this case study very well.

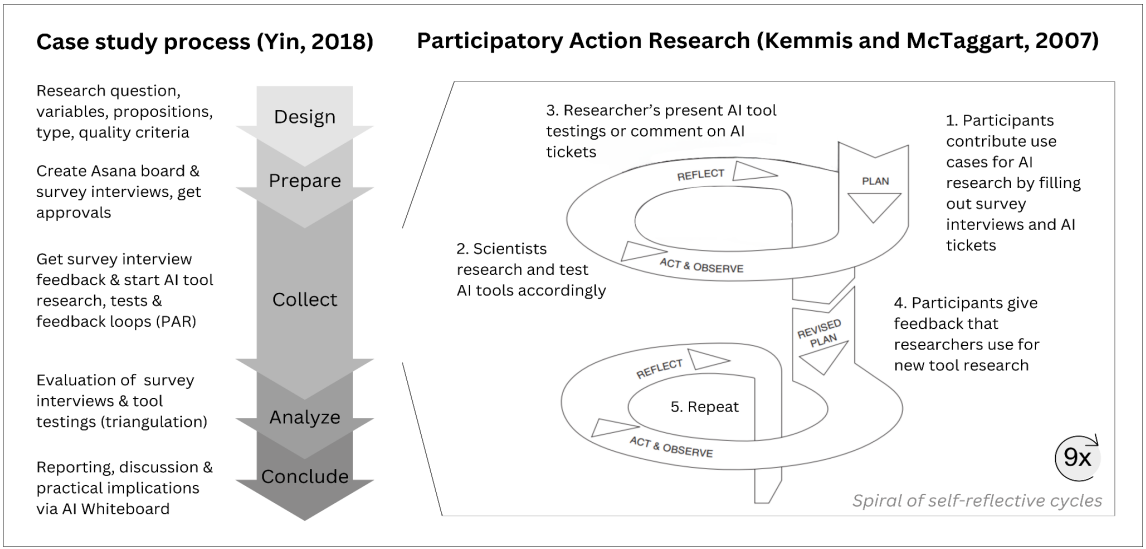

Figure 2: Overview of the case study process

After three months of data collection, in step four of the case study the sources of evidence were analyzed along all five propositions and in a triangulating manner to pay tribute to the quality criteria of qualitative research. Eventually, these insights then were reported, discussed and translated into 20 practical implications as well as a proposal of an AI board for small (marketing) teams to use for their purposes.

4. Research Results

The evaluation of the three survey interviews showed that respondents saw the highest urge for productivity gains through AI in graphic design, SEO / content, and processes / strategy. Accordingly, most AI tools were researched in these analysis units. The following table, on the one side, visualizes selected issues and use cases that participants mentioned in three survey interviews and 21 AI tickets. On the other side, based on all 49 AI tool testings and 22 tools that were more closely checked out but not tested, the researchers propose promising AI solutions rated with a high productivity score of 3, 4 or 5 out of 5 including suggestions from literature. In the tool research process, AI features, apps or extensions of tools which the start-up already uses like Notion, HubSpot, Canva, Slack, Wordpress or Google Workspaces were preferred towards new tools. Furthermore, review websites such as thereisanaiforthat.com and AI newsletters like the one from the Marketing AI institute supported a mostly search engine driven research via Google.

Table 2: Selected AI issues and solutions as derived from survey interviews, AI tickets and AI tool testings

Issues: Input from survey interviews & AI tickets	**Solutions: Promising tool testings & literature**
Interview: "I am pretty sure that they [*data*] are not used for training the model itself"	Legal education: This statement was proven wrong as the data privacy terms of OpenAI and Google showed
Interview: "the first *prompt* doesn't work, you edit it, but results are not getting any better"(prompting trap)	Prompting practice and education (e.g. Bozkurt and Sharma, 2023; OpenAI, no date)
Interview: "It's harder to get great *German language texts*."	Neuroflash or Mindverse (also trained on German datasets); GPT4 prompt "take care of natural German"
Interview: "they struggle with creating correct in-depth metal-*industry specific content*"	Create a customized GPT in ChatGPT 4, that answers technical questions like expert colleagues ('NateGPT')
Design ticket: "Create quicker and better videos"	Text-to-speech: Canva apps 'Voiceover' for natural overlays or 'Deepreal' for realistic, speaking avatars URL-to-video: Pictory (uses stock images & page text) Video-to-shorts: VidyoAI (5 shorts from 1 video)

Issues: Input from survey interviews & AI tickets	**Solutions: Promising tool testings & literature**
SEO/SEA ticket: “automate keyword clusterization”	GPTs like Keyword Clustering GPT by juliangoldie.com
CRM Administration ticket: “deduplicate CRM records”	HubSpot marketplace apps like Koalify, or integrated deduplication features in HubSpot
Process ticket: “summarize communication channels”	Slack AI (announced, not yet in-app), Spoke.AI for Slack and bundling channels (public beta available)
CRM Engagement ticket.: “AI to calculate & automate newsletter sendings for each contact’s optimal sending time”	HubSpot app ‘Email delivery optimization’

Besides this list of promising AI solutions, there were 13 solutions with a score of 1 or 2 out of 5 considered rather lowering productivity. For example, did the three LLMs with search engine access ChatGPT 4, Microsoft Copilot and Google Gemini perform similarly poorly, when asked to generate short, up-to-date news of the German metal industry for Q1 2024. Either the output was referring to the wrong time frame or the attached sources were outdated or irrelevant. Another tool which seemed promising, but disappointed is ChatSpot. Intended to act as LLM for the CRM System HubSpot, unfortunately it is not yet capable of executing prompts such as “Which 10 companies opened our newsletters most often the past 30 days?” reliably.

Ultimately, with regard to the propositions of the survey, P1 can rather be supported. Even though in the survey interviews respondents only rated productivity gains through AI with a 6 out of 10, the tool testings painted a brighter picture as the majority of testings resulted in productivity gains instead of impairments. While the analysis units Design and Content / SEO profited the most of mostly GAI tools with productivity scores of each 4 out of 5, CRM administration tools usually consisting of non-GAI tools showed the lowest productivity potential with 2 out of 5 productivity points.

Also P2, which suggests that higher AI skills improve productivity can rather be supported. Though in the survey interviews respondents were rather confident that, besides AI struggles, they do not need extra AI training, the majority of tool testings showed that AI education leads to more and better results - may it be due to prompting skills in GAI tools or being able to quickly navigate in more complex non-GAI tools.

The impact of general expertise as stated in P3 was harder to be proven in this context. Insights here are mixed. On the one hand, people with a high experience in their field of expertise profited more from AI, as they know which task-specific problems need to be solved in what way by an AI. On the other hand, less experienced people benefit from AI tools as they can help solve tasks better and faster. For example, ChatGPT 4 saved the coding-inexperienced researchers a lot of time when trying to create HTML email templates. Nonetheless, general expertise is nothing that, for the perks of AI, should be actively tackled, but rather it is a moderating factor with differing effects.

Switching from the user’s to the technology’s perspective, AI indeed for some use cases shows higher capabilities than for others which accordingly influences productivity and therefore supports P4. Thus, users should learn which kind of tools have what kind of capabilities for which tasks, and which do not. For example, remembering that the big LLMs are simply not (yet) able to give trustable news content, or that CRM LLMs like ChatSpot are not (yet) able to answer or execute prompts with CRM data, can already save a lot of time.

Lastly with regard to P5, the level of intelligence and integration of AI tools does not seem to matter much for small marketing teams as data heavy tools like the HubSpot CRM, Asana or ChatSpot and their AI features were not automatically more performant. Though much potential is seen in integrated tools that machine-learn from huge amounts of internal data, their execution is on many levels – especially regarding data quality, time, costs, expertise – much more difficult than simply using less integrated tools, which often happen to be GAI tools.

5. Limitations and Future Work

Though the exploratory case study approach was a suitable choice for the case and researcher’s resources, it came with limitations. Firstly, the method requires many different sources of evidence for triangulation and reliable results. While the researchers considered adding a ChatGPT4 analysis of all prompt inputs and AI outputs for a month, this idea was soon rejected for different reasons. Though some LLM tool testings consisted of

analyzing prompts, adding a more extensive standardized prompt analysis would have enriched the results even more.

Following on here, one could criticize that, despite the collaborative PAR method, AI tool testings were mostly up to the researchers. Future works would profit even more from PAR's ideas of collective learning, if AI tool testings were distributed more across all participants. This way, the Weekly AI Updates could have been presented by another person each week.

Further criticizable is the small sample size of participants. Though semi-structured interviews were all the more extensive and in-depth, it was not possible to cover all analysis units. For example, one social media interview was missing due to the researcher not having attended, and the input of designers who were dismissed before. At least, thanks to the work's multi-method approach, this social media and design gap could be filled through respective tool testings.

Furthermore, besides extensive testing of GAI tools, the present study could just to a limited degree test more integrated, often non-GAI, like ChatSpot, or HubSpot Marketplace apps. Also, literature and news coverage on integrated AI is scarce which lead participants to not even seeing this kind of AI as noticed in the survey interviews. Therefore, future studies should more often research on marketing use cases like predictive analytics, segmentation and personalization, that can just hardly be covered by GAI tools like ChatGPT.

6. Practical Implications and Conclusion

The question of how AI can increase productivity in small marketing teams is an extensive one. This qualitative case study represents an approach to systematically tackle project AI. Insights were generated not only in the data analysis phase, but throughout the entire course of the case study. Based on all findings, 20 implications were documented as part of an AI whiteboard, which is intended as a practical guide for SMEs as visible in figure 3.

Abstract: This research-in-progress explores the impact of digital work instructions (DWI) in sheltered workshops, environments designed to provide employment opportunities for individuals with disabilities. The research commenced with a literature review on studies that compared digital to paper-based instructions. The review highlighted several potential benefits of DWI. Next, semi-structured interviews were conducted with C-level managers of sheltered workshops who are early adopters of DWI technologies. The interview findings provided real-world insights into the application of DWI in sheltered workshops, confirming several benefits identified in the literature. Notably, enhancements were observed in rapid interpretation of instructions, reduced training duration, increased employee autonomy, fewer execution errors, and a diminished need for prior knowledge. Future research steps include a second round of semi-structured interviews and a focus group to validate and synthesize the findings.

Keywords: Digital work instructions, Sheltered workshops, Disabled workers, Assembly processes

1. Introduction

Incorporating individuals with disabilities into meaningful and productive employment remains critical, yet challenging due to diverse impairments. Sheltered workshops play a pivotal role in facilitating this inclusion by customizing work processes tailored to individual needs and capabilities. Such setups help balance productivity with inclusivity, addressing the specific needs of disabled workers to foster their participation in the workforce (Bächler & Behrendt 2023).

In recent times, the complexity of assembly processes in manufacturing has escalated significantly due to the trend toward mass customization (Leder et al. 2023), a challenge that also extends to sheltered workshops. Therefore, the demand for context-aware assistance systems has surged. These systems are crucial in offering cognitive support and guiding workers through their tasks, improving workflow efficiency. Traditional paper-based instructions often create a complicated correlation between directions and actions. By adopting digital work instructions (DWI), these challenges can be significantly alleviated, simplifying processes and enhancing productivity (Pimminger, Neumayr, Panholzer, Augstein & Kurschl 2020).

This work-in-progress reports on the preliminary findings of a DWI project in Flanders, Belgium. The research investigates DWI in sheltered workshops and compares them to their paper-based counterparts. It concerns a comprehensive project that is funded by Flanders Innovation and Entrepreneurship, consisting of several work packages and objectives. The project focuses on a technology scan, DWI competencies for individuals with disabilities, experimental setups, and implementation strategies. The present paper discusses the implementation and implications at the organizational level. An in-depth discussion of the available technologies, effects at the individual level, and experimental results is out of scope.

This research project contributes to the exploration of the multifaceted impacts of digital innovation. More concretely, DWI can be analyzed within the framework of the Triple Bottom Line (TBL) (Elkington 1999), including economic, social, and environmental sustainability. Economically, the project investigates how DWI can streamline manufacturing processes, potentially reducing production times, decreasing costs, and enhancing output, thereby improving overall operational efficiency. Socially, the focus is on the implementation of these digital systems in sheltered workshops, examining their role in creating meaningful and economically beneficial employment opportunities for individuals with disabilities. Environmentally, the research extends beyond the mere reduction of paper use. It can uncover how DWI can lead to more

sustainable practices by pinpointing and diminishing inefficiencies in the consumption of energy, water, and raw materials, thereby fostering a smaller ecological footprint.

2. Methods

We aim to explore the employment of DWI within sheltered workshops. To the best of our knowledge, this area has received limited academic attention. To address this gap, we will employ a multi-faceted approach, beginning with a literature review. Because we are not aware of research on DWI in sheltered workshops, academic publications on DWI in mainstream industries will serve as a foundational framework. The rationale is that insights from experiments conducted within regular companies might offer valuable perspectives for the applications and benefits of DWI within sheltered workshops.

To further enrich our understanding of DWI implementation and its effects, we will proceed with semi-structured interviews. This first round of interviews targets early adopters which we define as sheltered workshops that currently have operational activities relying on DWI. As these sheltered workshops have experience with DWI, it will allow us to validate and corroborate the findings obtained from the literature review. Moreover, we might also capture insights and perspectives that extend beyond the scope of existing academic literature.

Next, we will proceed with a second round of semi-structured interviews targeting sheltered workplaces that are participating in the experiments within this research project. Distinguishing them from the first group, these workplaces have not yet commenced operational activities with DWI. Instead, their experience is solely based on their participation in experimental trials. Despite not having operational activities with DWI, we posit that their engagement in the experiments equips them with valuable insights and perspectives regarding the implementation and potential effects.

Finally, we will convene a focus group as the final step of our methodology. Building upon the insights gleaned from the literature review and the semi-structured interviews with two groups of sheltered workplaces (i.e., respectively operational experience and experimental experience), the focus group serves as a platform for comprehensive validation and synthesis of our research findings.

3. Preliminary Findings

This research-in-progress includes the literature review and the first round of semi-structured interviews. The second round of semi-structured interviews and the focus group were not completed yet.

3.1 Literature Review

A literature review was conducted to assess the impact of DWI as compared to traditional paper-based methods. Utilizing the SCOPUS database, a targeted search was performed using the term "digital work instructions", yielding 36 scientific studies. Conforming the research objective, only those studies that explicitly compared digital and paper-based work instructions were included. This refinement process led to the exclusion of 28 studies, resulting in a core set of eight academic contributions. Notably, all identified studies were conducted within the regular economy; none were carried out in sheltered workshops. The technologies deployed in these studies varied, including AR headsets, AR projections, touchscreens, and monitors. They focused predominantly on assembly tasks across diverse industries such as machinery, automotive, and aerospace. Each study was examined to extract the potential effects of DWI. The findings are synthesized in Table 1, which lists the effects identified from each article. For each study, the observed effects are indicated with an “X”. The absence of an "X" does not necessarily imply the contrary; it could simply indicate that the potential effect was beyond the scope of the study.

Table 1: Effects of DWI compared to paper-based instructions identified in academic literature

	(Gors et al. 2021)	(Leder et al. 2023)	(Li et al. 2018)	(Lotsaris et al. 2021)	(Papetti et al. 2023)	(Pimminger et al. 2020)	(Yang et al. 2023)	(Zogopoulos et al. 2022)
Accelerated creation of instructions	X							
Enhanced adherence to instructions						X		
Accelerated execution				X	X	X	X	
Improved user experience				X	X			
Accelerated interpretation							X

Reduced perceived workload			X					
Increased employee autonomy	X							X
Reduction in execution errors	X			X	X			X
Enhanced employee confidence				X				
Reduced requirement for prior knowledge	X							X

3.2 Semi-Structured Interviews (Round 1)

Following the literature review, a series of semi-structured interviews were conducted to investigate the applicability of DWI effects observed in the regular economy to sheltered workshops. For the initial round, C-level managers of sheltered workshops in Flanders recognized as early adopters of DWI were targeted. These individuals were identified through a LinkedIn search, resulting in 24 potential candidates. Of these, invitations were sent, and eight interviews were successfully conducted. The interview protocol was designed to ensure comprehensive data collection, including items such as the introduction of the study's purpose, background questions to establish the context of each sheltered workshop, specific questions about the use and impacts of DWI, and open-ended questions allowing respondents to elaborate on their experiences. Rather than systematically reviewing the list of DWI effects identified in the literature, participants were asked to discuss the effects they had observed within their own operations. Conducted in Dutch, these interviews were recorded and transcribed using Microsoft Teams, and the transcripts were subsequently analyzed using Nvivo to compare against the DWI effects outlined in the literature review. The findings from this analysis are presented in Table 2. For each interviewee, the observed effects are indicated with an “X”. The absence of an "X" does not necessarily imply the contrary.

Table 2: Effects of DWI compared to paper-based instructions identified in sheltered workshops

	Interviewee 1	Interviewee 2	Interviewee 3	Interviewee 4	Interviewee 5	Interviewee 6	Interviewee 7	Interviewee 8
Accelerated creation of instructions								
Enhanced adherence to instructions								
Accelerated execution	X		X	X	X	X	X	
Improved user experience								

	Interviewee 1	Interviewee 2	Interviewee 3	Interviewee 4	Interviewee 5	Interviewee 6	Interviewee 7	Interviewee 8
Accelerated interpretation	X	X	X			X	X	X
Improved retention								
Accelerated training processes	X	X		X	X		X	X
More objective training								
Facilitated management of diverse production								
Reduced perceived workload								
Increased employee autonomy	X	X	X	X		X	X	X
Reduction in execution errors	X		X	X	X	X	X	X
Enhanced employee confidence								
Reduced requirement for prior knowledge	X	X		X	X	X	X	

4. Preliminary Discussion

The C-level managers observed several key effects of DWI that align with the academic literature, albeit within the unique context of sheltered workplaces. Firstly, accelerated interpretation and execution was highlighted, with managers noting a marked decrease in the time required for employees to understand and carry out the instructions. Secondly, the accelerated training processes effect was evident, as managers observed that DWI significantly shortened the training period, enhancing the speed of skill acquisition among new employees. This is particularly beneficial in sheltered workshops where varying capabilities may necessitate more dynamic training approaches. Additionally, an increase in employee autonomy was noted, suggesting that DWI empowers employees by providing them with the tools to manage their tasks more independently. This empowerment is linked to the reduction in execution errors, another effect managers observed. This underscores the precision and reliability that DWI brings to task execution. Finally, the managers recognized a reduced requirement for prior knowledge, indicating that DWI allows employees to perform tasks with less dependence on pre-existing knowledge. This is an important finding as it might broaden the scope of tasks the employees can undertake.

It is important to acknowledge that some effects highlighted in the literature did not surface in discussions with C-level managers. This discrepancy may arise because certain effects are less apparent in real-world settings as opposed to controlled experimental environments. Effects such as "improved retention," "reduced perceived workload," and "enhanced employee confidence" exemplify this possibility. Additional research is necessary to further explore and clarify these observations.

Understanding Patient Attitudes Towards the Use of AI in Medical Diagnosis Using Necessary Conditions Analysis

Magdalena Czerwinska[1], Joanna Ejdys[2] and Agnieszka Rzepka[1]
[1]Lublin University of Technology, Poland
[2]Białystok University of Technology, Poland

m.czerwinska@pollub.pl
j.ejdys@pb.edu.pl
a.rzepka@pollub.pl

Abstract: The recent years have brought a rapid growth in the use of artificial intelligence (AI), particularly in medical applications. One of the areas where AI can find application is in medical diagnostics. AI has the potential to revolutionize the field of medical diagnostics by improving the predictive accuracy, speed and efficiency of the diagnostic process. The literature provides many studies on the applications of AI in medical diagnostics, including the attitudes of medical personnel towards this technology. However, few studies focus on evaluating the use of AI in medicine from the perspective of consumers. The article concerns the issue of using artificial intelligence in medical diagnostics. The authors analyse the attitudes of potential patients towards medical applications of AI. They examine the factors determining social acceptance of AI usage in medical diagnostics. They use a new research method based on necessity logic - Necessary Condition Analysis (NCA).

Keywords: AI, Medical diagnostics, Trust to AI, NCA

1. Introduction

Acceptance of artificial intelligence (AI) applications in medical diagnostics is crucial for the future of healthcare. Despite some concerns and challenges, AI has the potential to transform the way we diagnose and treat diseases by improving diagnostic accuracy, reducing waiting times for test results, and increasing access to healthcare (Rawat et al., 2023).

Understanding patient preferences, addressing concerns, and highlighting the benefits of artificial intelligence in diagnostics are crucial for the successful integration of AI technology in healthcare.

Positive attitudes and social trust are essential for the widespread adoption of AI in medical diagnostics (Kumar et al., 2023).

Incorporating trust-building measures, data categorization guidelines, and risk level assessments can further enhance the effectiveness of AI solutions in medical diagnostics (Wolff et al., 2021).

2. Research Methods and Results

The authors of the article designed and conducted a survey study among a group of 1063 adult respondents in Poland in June 2023.

Based on the survey statements, the following research hypotheses, which are necessity hypotheses, were formulated:

Main Hypothesis (H1): Patients' belief that AI will improve healthcare is a necessary condition for building trust in AI as a tool in diagnostic and treatment processes.

Sub-Hypotheses:

Ha: Patients' belief that AI will improve the quality (accuracy) of medical diagnoses is a necessary condition for building trust in AI as a tool in diagnostic and treatment processes.

Hb: Patients' belief that AI will improve the relationship between patients and doctors is a necessary condition for building trust in AI as a tool in diagnostic and treatment processes.

Hc: Patients' belief that AI will improve the accuracy and appropriateness of selected treatment methods is a necessary condition for building trust in AI as a tool in diagnostic and treatment processes.

Hd: Patients' belief that AI will improve their health condition is a necessary condition for building trust in AI as a tool in diagnostic and treatment processes.

To verify the hypotheses, Necessary Condition Analysis (NCA) (Dul, 2024) was applied. NCA identifies conditions that must be met for a specific outcome (effect, result) to occur. Individual necessary conditions act as bottlenecks to achieving the outcome. If such a condition is not met, achieving the outcome is impossible, as it cannot be compensated for by the presence of other factors. However, meeting the necessary condition does not guarantee success, meaning that a necessary condition is not always sufficient.

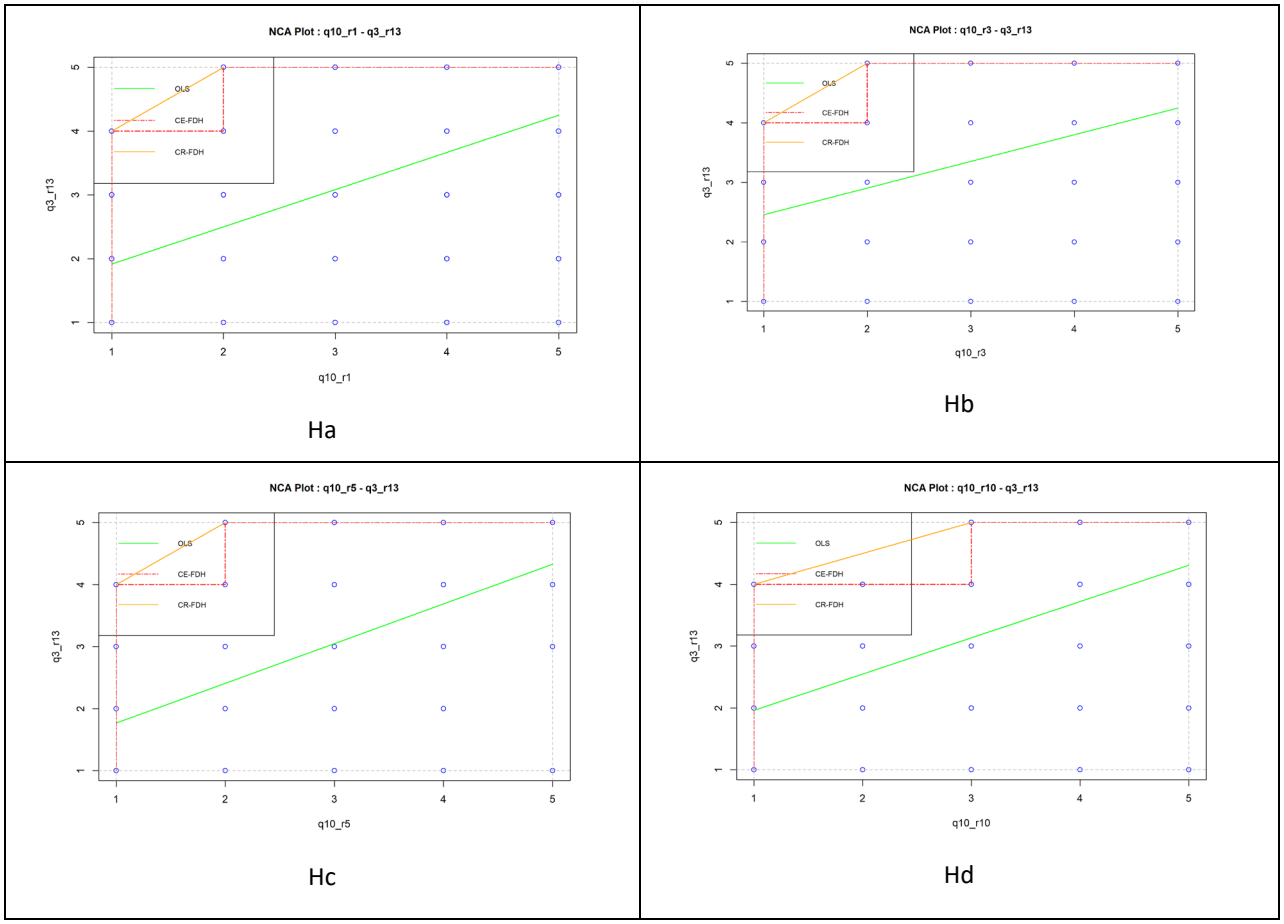

Table 1 presents the effect size of the necessary condition for the formulated sub-hypotheses.

Table 1: Effect size of the necessary condition for the formulated sub-hypotheses (determined using the CE-FDH method)

Hypothesis	The value of the necessary condition effect
Ha	0.06
Hb	0.06
Hc	0.06
Hd	0.12

Source: Own study on the basis of conducted research

For the hypotheses, a ceiling line was presented (Fig. 1).

Source: Own study on the basis of conducted research

Figure 1. Ceiling lines determined by the CE-FDH method for research hypotheses

The obtained results can be interpreted as follows: the most powerful necessary condition for building trust in the medical applications of AI is the patient's belief that AI will improve the patient's health status. As for the other factors, necessary conditions of lesser strength include the patient's belief that AI will improve the quality (accuracy) of medical diagnoses, improve patient-doctor relationships, and enhance the accuracy and effectiveness of selected treatment methods.

Additional information is provided by the constraint analysis (Table 2), built on the basis of the determined ceiling line.

Table 2: Required minimum levels of necessary conditions for various desired levels of achieved outcomes

The response variable (trust in AI as a tool in diagnostic and therapeutic processes) as a percentage of the observed values range		0	10	20	30	40	50	60	70	80	90	100
Explanatory variables, as % of the range of observed values	a	NN	NN	NN	NN	NN	NN	NN	NN	25	25	25
	b	NN	NN	NN	NN	NN	NN	NN	NN	25	25	25
	c	NN	NN	NN	NN	NN	NN	NN	NN	25	25	25
	d	NN	NN	NN	NN	NN	NN	NN	NN	50	50	50
NN – Not Necessary												

Source: Own study on the basis of conducted research

The results from Table 2 indicate that the necessary condition for patients to trust medical AI applications is:

- patients' belief that AI will improve the quality (accuracy) of medical diagnoses at a level of 25%,
- patients' belief that AI will improve the patient-doctor relationship at a level of 25%,
- patients' belief that AI will improve the accuracy and effectiveness of selected treatment methods at a level of 25%,
- patients' belief that AI will improve the patient's health status at a level of 50% of the adopted research scale.

3. Conclusion

The aim of the conducted research was to identify the necessary conditions for building trust in AI as a tool in diagnostic and therapeutic processes. Four potential factors were examined as necessary conditions for such behaviour among patients (hypotheses Ha-Hd).

The results obtained showed that a high level of trust in AI for diagnosis or treatment is conditioned by the patient's belief that AI will improve the quality of diagnoses, the relationship between the patient and the doctor, the accuracy and effectiveness of selected treatment methods, and above all, the patient's health status. This means that in order to build trust in AI among patients, it is crucial to focus on raising awareness among patients about the benefits of medical AI applications mentioned above, as they constitute necessary conditions.

The value of the research conducted is the use of a relatively new method (NCA) that can be useful for analysing issues concerning the identification of the necessary factors that determine certain human behaviours (in this case, acceptance of AI).

Abstract: By annually accommodating a growing number of students, higher education institutions contribute significantly to the daily flow of individuals. This flow exerts a significant impact on greenhouse gas emissions caused by transportation. Several studies have addressed promoting sustainable transportation at the individual level, while little attention has been drawn to examining the impact of organisations in this realm. This paper proposes a model of organisational influences on pro-environmental behaviours. Therefore, we thus identify a set of variables within organisations that expect to influence these behaviours. Among these variables, organisational culture appears as a major predictor. Organisational culture is a set of values, norms, beliefs, meanings and behaviours. Based on this definition, we propose to study organisational culture through measurable elements such as the organisation's values, norms and perceived practices. Additionally, we have identified variables directly influenced by organisational culture, such as leadership and organisational trust. Further variables, including personal norms and facilitating conditions, interact with the organisational culture and provide a more precise understanding of pro-environmental behaviours. This framework will be used to investigate student transportation behaviours. The results are expected to provide valuable insights for developing a culture of sustainable transportation at the organisational level.

Keywords: Organisational culture, Transportation, Pro-environmental behaviour, Sustainability, RSE, leadership

1. Introduction

Growing awareness of environmental challenges should lead organisations to adopt more sustainable practices. These practices depend on organisational culture, which is rather difficult to capture in its complexity. This study aims to model organisational culture's impact on stakeholders' environmental behaviour. We introduce this model in Figure 1 and explain it step by step afterwards.

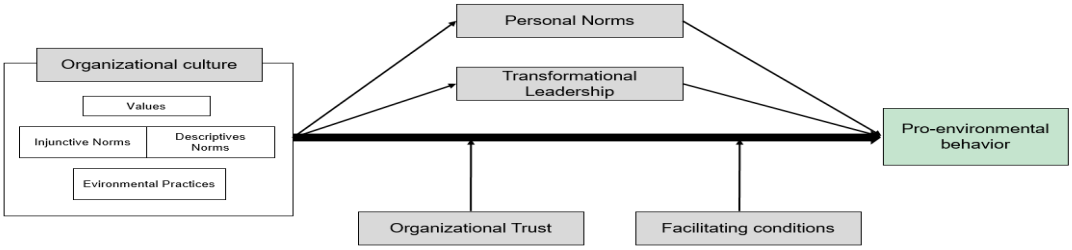

Figure 1: Representation of the Model: Effect of organisational culture on environmental behaviours

2. Organisational Culture and Environmental Behaviours

Pettigrew (1979) defines organisational culture as a set of values, norms, beliefs, meanings, and behaviours. In this spirit, we approach organisational culture by combining organisational social norms, which define acceptable behaviours and practices, values underlying those norms, and practices resulting from them. These three elements are often measured independently to identify an organisation's culture, perhaps limiting a more comprehensive understanding. We, therefore, propose to integrate these variables to the same extent.

For Cameron and Quinn (2011), understanding organisational values highlights organisational internal dynamics. These authors model organisational culture by focusing on two axes of opposite values: internal vs external focus and stability vs flexibility. This model maps four major organisational cultures: Clan, Adhocracy, Hierarchy and Market. Perennial organisations have their own cultures that spread in each quadrant. Concerning our subject, it appears that Adhocracy, Clan and Hierarchy cultures facilitate the integration and anchoring of environmentally friendly practices (Osei et al., 2023).

Each of the four major organisational cultures defined by Cameron and Quinn (2011) carries specific values that promote distinctive social norms within the organisation. Social norms refer to socially valued behaviours in a group (Cialdini, 1990). They can be divided into injunctive and descriptive categories (Cialdini, 1990). Injunctive norms are related to organisational concerns and prescribed practices. Descriptive norms, meanwhile, deal with practices actually implemented (Norton et al. 20,14; Mouro & Duarte, 2021). Social norms affect the environmental behaviour of members of the organisation (Thogersen, 2006). Indeed, they mediate the relationship between environmental policies and green behaviour (Norton et al., 2014).

On the other hand, organisations also frequently implement a corporate social responsibility (CSR) policy as part of the organisational culture (Aguinis, 2011, p. 855). These practices have a tangible impact on stakeholder behaviour (Aguinis, 2011). CSR strengthens employees' engagement and organisational identification (Turker, 2009). High-perceived CSR affects environmental behaviour (Lin et al., 2010). Green culture and green management practices within organisations standardise green behaviours, leading employees to be more likely to adopt green practices (Paillé et al., 2013; Pinzone et al., 2016).

3. Elements Influenced by Organisational Culture

We explore two variable categories constantly intertwined with organisational culture to identify how culture influences environmental behaviours. The first is related to individual-organization interaction, such as transformational leadership and trust; the second is to individual and material characteristics, such as personal norms and facilitating conditions. Both are significant predictors of environmental behaviours and cannot be overlooked.

Transformational leadership is defined as a process of social influence (Bass, 1985) that relies on vision and values (Wang et al., 2018). It predicts the adoption of environmental behaviours in the workplace (Robertson & Barling, 2013). Robertson and Barling (2013) identified descriptive norms as the antecedent of leadership, suggesting that transformational leadership mediates the relationship between organisational culture and environmental behaviours.

Organisational trust is a psychological state where individuals accept vulnerability based on their beliefs about the intentions or actions of others (Rousseau et al., 1998). The development of organisational trust depends on the social exchange process and perceptions of leader decisions (Singh & Srivastava, 2016). When organisational trust is strong, its members are less suspicious of leaders' actions and guidance (Singh & Srivastava, 2016), which can influence pro-environmental behaviours. We anticipate a moderating effect of organisational trust on environmental behaviours.

Personal norms refer to behaviour individuals feel morally obligated to have (Schwartz, 1992). There are significant predictors of environmental behaviours (Javaid et al., 2020; Stern, 1999) and are partially predicted by social norms (Stern, 1999). We expect them to mediate the relationship between organisational culture and environmental behaviours.

The facilitating conditions refer to infrastructures, equipment's, and adaptations designed to promote the desired behaviour. When members perceive infrastructure and equipment as easily accessible, they tend to act more responsibly (e.g., Adams et al., 2017). We anticipate these conditions will moderate the relationship between organisational culture and environmental behaviour.

4. Conclusion

This paper proposes a model of organisational influences on pro-environmental behaviours. To show this relation, we start by defining organisational culture and identifying the variables that compose it, like norms, values, and practices. We also enrich this relationship with mediators and moderators, which can influence it. We will apply this framework to transportation behaviour. Indeed, in 2019, the transport sector in France emitted the highest amount of greenhouse gases (GHGs), totalling 136 million metric tons of CO2 equivalent. This represents 31% of the national GHG inventory, compared to 22% in 1990 (Notre Environment, 2022). In France, the number of students in higher education has risen sharply over the past thirteen years, contributing to the daily flow of people. More attention should be paid to the impact of organisations, including higher education institutions, on student transportation patterns.

We aim to investigate the effect of higher education institutions' culture on their students' transportation behaviours. We therefore plan to run a survey among our institute's students. Our campuses are distributed all over France, some of them in locations that don't seem favourable for adopting sustainable modes of transport

(no on-campus accommodation, limited or no distance learning, etc.). We aim to investigate the impact of this organisational culture on student behaviour in this type of institution. The results are expected to offer valuable insights into promoting a sustainable transportation culture within organisations and identifying individual and situational factors that affect transportation behaviour. Additionally, we strive to engage institutions, individuals, local authorities, and policymakers in confronting this global challenge by promoting sustainable transportation practices at the organisational level.

Between Control and Complexity: RRI in the Norwegian Biotechnology Advisory Board

Olga Mikhailova[1] and Beniamino Callegari[2]
[1]Norwegian University of Life Sciences, Ås, Norway
Kristiania University College, Oslo, Norway

olga.mikhailova@nmbu.no
Ben.Callegari@kristiania.no

Abstract: This paper investigates the integration of Responsible Research and Innovation (RRI) principles with focus on public engagement within the Norwegian Biotechnology Advisory Board (NBAB). RRI, as an inherently relational set of practices, requires flexibility and adaptability from the State to promote responsible innovation. The NBAB case study provides insights into the complexities and tensions of State intervention, highlighting the necessary shift from rigid control to a more flexible approach. This shift is crucial for effectively fostering RRI among citizens, firms, and organizations. By examining NBAB's role in evaluating and advising on the ethical implications of biotechnology, this study demonstrates the importance of inclusive and deliberative governance. The findings suggest that public institutions must adapt to changing societal needs and engage diverse stakeholders to promote responsible innovation practices effectively.

Keywords: RRI, Biotechnology, Public engagement, Norwegian biotechnology advisory board

1. Introduction

Responsible Research and Innovation (RRI) is a framework that aims to align the processes and outcomes of research and innovation with societal values, needs, and expectations. RRI emerged in response to the increasing complexity and societal impact of technological advancements (Owen, Bessant, and Heintz 2013), particularly in fields like biotechnology. Modern biotechnology and gene technology raise numerous ethical questions, necessitating ongoing interaction between science and society (Solbu 2021).

The concept of RRI goes beyond traditional ethical considerations, integrating public engagement, ethical reflection, and anticipatory governance (Von Schomberg 2013). It requires researchers, innovators, and policymakers to be responsive to societal concerns and to work collaboratively with various stakeholders, including the public, industry, and academia. This relational approach necessitates flexibility and adaptability, challenging the conventional top-down regulatory frameworks (Stilgoe, Owen, and Macnaghten 2013).

As the State is involved in various research and innovation processes, both directly and indirectly, it faces the challenge of navigating a complex and diverse landscape of responsibility. This paper explores the implementation of RRI principles within the context of the Norwegian Biotechnology Advisory Board (NBAB). The NBAB, established by the Norwegian government, is tasked with evaluating the ethical, social, and legal implications of biotechnological advancements. By analyzing the NBAB's processes and practices, this study aims to provide insights into how public institutions can operationalize RRI and foster responsible innovation.

2. Literature Review

The concept of RRI has evolved significantly over the past decades (Rip and Rip 2018), reflecting broader shifts in the governance of science and technology. Initially framed within the Ethical Legal and Social Aspects (ELSA) of emerging technologies, RRI has expanded to address the complex interplay between innovation and society. The European Union has been at the forefront of promoting RRI, embedding it in its Horizon 2020 framework to tackle Grand Societal Challenges (European Commission 2012).

RRI includes four dimensions, including anticipation, inclusiveness, reflexivity, and responsiveness (Stilgoe, Owen, and Macnaghten 2013). Anticipation involves foresight and the identification of potential impacts of research and innovation. Inclusiveness emphasizes the involvement of a diverse range of stakeholders, ensuring that different perspectives are considered. Reflexivity requires researchers and innovators to critically reflect on their practices and assumptions. Responsiveness entails adapting research and innovation processes based on societal needs and concerns.

The literature highlights the importance of public engagement in RRI, arguing that involving citizens in decision-making processes enhances the legitimacy and social acceptability of innovations (Chilvers and Kearnes 2015). However, putting RRI into practice remains challenging, requiring institutional support and cultural change within organizations.

This paper builds on existing literature by examining the integration of RRI principles within a specific institutional context, NBAB. It contributes to understanding how public institutions can foster responsible innovation through inclusive and adaptive governance.

3. Methods

This study uses an interpretative case study approach, focusing on the NBAB. Established in 1991, NBAB serves as an independent advisory body to the Norwegian government, evaluating the ethical, social, and legal implications of biotechnological advancements. The case study methodology allows for an in-depth exploration of the NBAB's processes and practices, providing insights into their implementation of RRI principles. This case was chosen to understand a broader issue: aligning innovation processes with societal needs, values, and expectations to promote responsible practices at the national level.

Data collection involved qualitative methods, including semi-structured interviews with NBAB members, analysis of official documents, and participant observation of public events organized by NBAB. The interviews aimed to capture the perspectives and experiences of NBAB members regarding the integration of RRI principles in their work. Document analysis provided additional context and understanding of NBAB's mandate and activities. Participant observation allowed for direct insights into the NBAB's deliberative processes and stakeholder engagement practices.

The data were analyzed using thematic analysis (Clarke and Braun 2017), identifying key themes and patterns related to the implementation of RRI principles. The analysis focused on how NBAB incorporates anticipation, inclusiveness, reflexivity, and responsiveness in its evaluations and practices. The study also examined the challenges and tensions encountered by NBAB in public engagement in biotechnology development.

4. Case Study: NBAB

NBAB plays a crucial role in evaluating the ethical, social, and legal implications of biotechnological advancements in Norway. Established by the Norwegian government, NBAB’s mandate extends to various tasks: providing independent advice on biotechnology-related issues, fostering public debate and informing the public about biotech developments.

For internal discussions and governmental consultations, NBAB relies on evidence-based science and reports from reputable organizations. NBAB’s efforts to balance expert opinions with public concerns involve a range of stakeholders, including scientists, ethicists, policymakers, and industry representatives. NBAB organizes public events, often in a format of panel debates, and provides an option on their website for submitting questions and comments. In its activities, NBAB focuses on disseminating knowledge about recent developments in biotechnology. While ensuring the legitimacy of information generated in research centers and universities is more routinized and structured, the collection of diverse opinions still has room for improvement.

The case study of NBAB highlights several key challenges in implementing RRI principles within a national framework. One significant challenge is balancing the need for expert knowledge with the importance of public engagement. It is crucial to recognize that a substantial portion of the population lacks interest in specific biotechnology topics, often relying on experts and elected officials to handle such matters. Therefore, NBAB must navigate the tensions between scientific expertise and public values, ensuring that its recommendations are both scientifically sound and socially acceptable. While solutions to these challenges are not yet fully developed, the NBAB continues to adopt a scientific approach when evaluating new knowledge.

Another challenge is maintaining flexibility and adaptability in the face of evolving biotechnological advancements. NBAB must continuously update its knowledge base and adapt its processes to address new ethical and social issues. Encouraging public participation in these discussions becomes even more challenging as individuals with high professional knowledge struggle with extrapolation. Operationalizing a broad, holistic debate proves to be a difficult and resource-demanding task. The challenge in discussing controversial topics lies in reconciling different values and beliefs, creating an environment for dialogue, and acknowledging diverse arguments.

Despite the NBAB's shortcomings in engaging the public, it possesses resources such as time, information, and expertise that the public lacks. Provided a different strategy is adopted, NBAB might be able to effectively represents public interests within the biotechnology domain.

5. Discussion

The case study of NBAB offers valuable insights into the complexities and challenges of implementing RRI principles within a national framework. The study highlights the importance of flexibility, adaptability, and stakeholder engagement in fostering responsible innovation.

A key finding is the need for public institutions to move beyond rigid control mechanisms and adopt a more relational approach to governance. RRI calls for a shift from traditional top-down regulatory frameworks to more inclusive and adaptive practices (Von Schomberg 2013). The NBAB case underlines that a focus on rapid development of knowledge-based industries may lead to the neglect of responsible governance practices. An excessive reliance on scientific expertise can undermine the primary goal of RRI– establishing trust between science and society. Overreliance on biotech experts may encourage siloed thinking, restricting the scope of discussions and limiting participation of the public in the evaluation of science and technology.

Another important finding is that engaging mainly with experts can obscure the diversity of societal concerns. The current formats of intentional dialogue with citizens – such as panel debates and written feedback – often result in one-way communication, lacking opportunities for reaction, reflection, or response. The NBAB, as a governmental agency, lacks participatory architecture necessary to support RRI activities effectively. RRI activities require a communicative framework and an institutional platform to facilitate engagement between civil society, stakeholders, and both the policy and technical communities.

Finally, shifting from a unidirectional flow of information to genuine interaction involves more than just generating a chaotic array of opinions. While diverse viewpoints are valuable, establishing a platform for structured debate is crucial. The goal of RRI isn't merely to collect a multitude of opinions, but to facilitate a continuous exchange that prompts a reevaluation of the existing status quo. Consequently, integrating mechanisms for interactivity and feedback into public engagement becomes imperative for the collaborative construction of knowledge in biotechnology domain.

6. Conclusions

In conclusion, integrating RRI principles into public institutions like the NBAB requires a shift from traditional bureaucratic practices to more adaptive and inclusive approaches (Owen et al. 2021). Currently, the evaluation of emerging technologies in decentralized and profit-oriented technology development settings is limited to a group of individuals.

The findings from this case study highlights the need for a broader understanding of the State's responsibility in fostering responsible innovation through flexibility, stakeholder engagement, and ethical reflection. The findings above strengthen the emerging argument that RRI should be understood within the framework of New Public Governance, rather than New Public Management (Loeber et al. 2022). The latter approach does not appear compatible with the demand for flexibility inherent in the relational work required by the implementation and diffusion of RRI practices. To move beyond reliance on experts and enhance public participation, it is necessary to re-think institutional boundaries. This will enable the development of responsible yet flexible governance in biotechnology, rather than a strict set of managerial principles, which may hinder the actual collaborative process of fostering RRI practices among private actors.

Further research should explore the potential role of national public institutions as platforms for communication between society and biotech stakeholders, emphasizing a network-based approach that fosters collective and relational responsibility. Additionally, the identification of RRI practices and interpretations across key organizations in the biotech industry should be investigated. This can reveal variations and commonalities in how responsibility is perceived and enacted.

d.j.rees@swansea.ac.uk
w.p.jones@swansea.ac.uk

Abstract: This paper presents insights from emerging work to support the development of a Culture of Innovation in Wales. The region has been subject of much public policy debate, not least for Innovation Policy during the 20 years since a previous Welsh Government Innovation Strategy. This work focuses on how innovation culture intersects with government policy to develop and implement the Innovation Strategy across all sectors of WG responsibility. The co-production approach adopted by WG presents an open approach to public policy, informed through written submissions, public events, and other stakeholder-specific fora. Drawing upon themes from academic literature and those identified and explored through the consultation, the paper explores the level of alignment between stakeholders and the potential actions to enhance conditions for innovation within Wales. The Wellbeing of Future Generations (Wales) Act 2015 provides a unique context for this work, which resonates with the United Nations Sustainable Development Goals. It forms part of a broader and longer-term study intended to support the refinement and delivery of the Innovation Strategy.

Keywords: Innovation, Public policy, Wales, Strategy

1. Introduction

Wales has been transitioning from an economy, and society dominated by coal and steel production. At the turn of the millennium, the Welsh economy was weak, despite its comparatively vibrant and productive manufacturing sector. Since the 1970s, when coal and steel sectors were still significant, Wales' GDP broadly tracked overall UK performance, but at a lower level. This persistent relative gap meant, until Brexit that Wales qualified for the highest level of EU Regional Aid (Objective 1 in 2000, to Convergence funding in 2017). The ending of strong foreign direct investment (1980s/90s) exposed the challenges of deindustrialisation and weak underlying economic performance, including limited home-grown enterprise and low levels of Business investment in Research and Development (BERD) (Mom et al., 2012). The relatively limited indigenous business base limited the scope to capitalise upon Open Innovation (Chesbrough and Appleyard, 2007) and Smart Specialisation (Foray et al., 2009) (Morgan, 2013). Combined with persistently lacking higher-level skills availability this has presented an enduring challenge (RLP, 2013).

Devolution gave Wales responsibility for regional economic policy, leading to strategies (WAG, 2004, WAG, 2005, WAG, 2010), aiming to harness innovation to nurture technology-focused clusters (WAG, 2003). Weak BERD brought focus to the regional science base, consisting primarily of university research output (WAG, 2009). This led to research and policy debate (Salvador and Harding, 2006, Abbey et al., 2008), including comparison with other devolved UK nations (Cooke and Clifton, 2005). It also emphasised the 'triple helix' (Leydesdorff and Etzkowitz, 1998) with the role of government and academia to support innovation and development of a knowledge-based economy. This questioned these connected roles supporting the potential effectuation proposed by Sarasvathy (2001), from state through to firm levels.

Innovation, a central policy thread from Welsh Assembly Government's (WAG) 2001 ten-year economic development plan 'A Winning Wales' (updated 2003), presented a vision of '*a prosperous Welsh economy that is dynamic, inclusive and sustainable, based on successful, innovative businesses with highly skilled, well-motivated people*.' This focus is being revisited, though amidst very different local and global contexts of a post-Brexit Wales following the Covid-19 pandemic and ensuing economic turmoil. An important development since earlier policies has been the Wellbeing of Future Generations (Wales) Act 2015, bringing a new lens to legislation and actions of public bodies. This required longer-term and more integrated actions, with consideration of broader societal and environmental impacts. The role of broader civic society and citizens also extends the helices into the quadruple and n-tuple (Leydesdorff, 2012). It therefore relates to fundamental consideration of modern roles and relationships of the public, private and third sectors, as discussed by Mazzucato (2011) (Mazzucato and Li, 2018).

An enduring challenge for Wales to achieve these ambitions has been the development of an indigenous culture of innovation and enterprise. A broad description of culture as shared values, perspectives and customs (Moussa et al., 2018) resonates with looking across these helices in the shared geography, economy and society in Wales.

This carries importance as the impact and nature of innovation within a country relates to national culture (Waarts and Van Everdingen, 2005) (Taylor and Wilson, 2012) (Efrat, 2014) (Strychalska-Rudzewicz, 2016). This presents the question of understanding how policy may interpret and address the question of innovation culture within Wales, forming the basis of this work.

2. Approach

The open consultation undertaken to support the strategy development offered a unique data collection opportunity to explore innovation culture in Wales. This presents a pragmatic ontological, epistemological and methodological approach. Routed in the pragmatist paradigm, the works reflect '*solving practical problems in the real world*' (Yvonne Feilzer, 2010), supporting the translation of insight for policy into programmes and projects. Combined with direct researcher engagement, the work lends itself to Action Research (Stringer, 2013), being embedded in the environment with continuous access to data and participants. Based upon this position, the following phases outline the planned approach to creating a research space and question for exploration;

> *The strategy aims to create a culture of innovation in Wales, one which collaborates, shares risk, encourages participation and supports the ecosystem to innovate.*
>
> *What does an innovation culture mean to you? What is needed to develop an innovation culture in Wales?*

The following section presents a high-level examination of responses across the stakeholder groups, which are being fed into further analysis to inform strategy and delivery plan development.

3. Responses/Findings

The consultation attracted 153 unique responses from across Wales and generated discussion notes from five focus groups. Of these responses, 101 submissions included contributions relating to the Innovation Culture questions. These data were extracted and analysed using NVivo. Of the relevant submissions and focus group notes, there were 684 comments linked to culture. The comments were coded using an inductive coding method, against topics identified from the literature and relating to WG policy development. Focus group discussion data were coded, though presented separately as they could not be attributed to specific stakeholder groups, for sessions were openly promoted through a range of channels.

Table 1: Consultation Responses by Group

Type of respondent	Number of responses
Citizens	4
Advisory/Lobbying Organisations	6
Private Sector	14
Third Sector	10
Academic/Research Organisations	20
Public Sector	31
Unknown	16

As shown in Table.1 above, the consultation attracted responses from a broad range of stakeholders. Public sector organisations provided the largest proportion of responses, although this is perhaps unsurprising because of their propensity to engage in the policy agenda. However, private sector organisations and advocacy groups (e.g. industry sector fora) provided significant contributions, helping ensure effective consultation.

From the data collected, Figure 1 shows that at a high level, across all stakeholders, the most frequently noted topics were Skills and Training, followed by Funding & Finance. There was a notable range of topics, suggesting a level of complexity in unpicking innovation culture.

The frequency of issues being raised offered a level of insight, although becoming more nuanced at the level of stakeholder groups. Tables 2 and 3, following, show how the comments from each theme are grouped by sector, or stakeholder group, reflecting the proportion of comments from each theme originating from respondents identified within a sector or stakeholder group. The 'unknown' group represents those written responses that opted not to include this information with their response, while focus groups involved diverse respondents, and hence are considered separately.

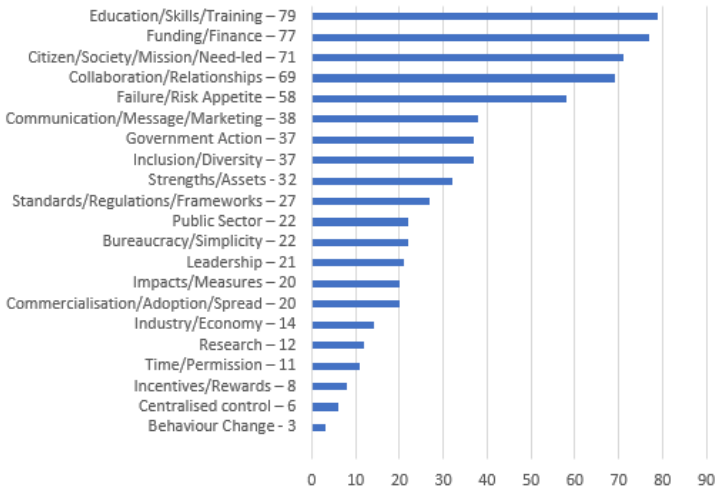

Figure 1: Frequency of responses by topic

Table 2: Balance of responses by topic and stakeholder group

Topic/Code	Citizens	Advisory/ Lobbying	Private Sector	Third Sector	Academic/ Research Org	Public Sector	Unknown	Focus Groups
Education/ Skills/ Training	0	6.30%	6.30%	10.10%	29.10%	24%	14%	10.10%

Centralised Control/Body	-	-	-	1.77	4.41	-	-	-
Behaviour Change	-	-	-	3.53	-	-	-	14.14

Public Sector and Academia stakeholder groups contributed the largest proportion of commentary across most codes. Across stakeholder groups, there was discussion of aspects such as Funding/Finance. Further common areas include collaboration, relationships, and leadership, where government policy may also foster innovation culture without requiring significant investment during particularly challenged times for public expenditure. However, certain considerations, such as centralised functions or standards and incentives, were more focused

amongst from specific groups. This suggests some misalignment in at least some priorities, if not approach, for fostering an innovation culture.

4. Integration and Implications

The helix models, from triple though to n-tuple (Leydesdorff, 2012) highlight the interconnection of stakeholders. Therefore, this presents a complex challenge across the broad range of identified topics and differing emphasis across the groups presents. This complexity reflects in considering how effectuation (Sarasvathy, 2001) can be realised, including specifically for the desired innovation culture.

5. Next Steps for Research and Practice

Initial review of the consultation responses has shown a complex picture amongst relatively diverse stakeholders involving a range of issues. However, deeper review of the data will be undertaken to examine the issues in greater detail.

This will include reflection against academic literature and practice from other regions to identify behaviour and actions supporting positive culture development. This will allow subsequent stages of policy formulation and delivery actions to be defined.

Abstract: This paper explores the transformative potential of digital ecosystems through the lens of Peter Drucker's management philosophy. By examining case studies of Audi, M-PESA, and Apple CarPlay, it identifies several key success factors such as a clear vision, customer-centricity, effective leadership, robust technology, a supportive culture, strategic partnerships, and data-driven insights. These elements are crucial for driving innovation and maintaining a competitive edge. The study integrates Drucker's principles with contemporary strategies, emphasizing innovation, customer focus, leadership, and the role of knowledge workers. It offers valuable insights for organizations aiming to thrive in the digital age and outlines a comprehensive business model to navigate digital transformation successfully.

Keywords: Digital transformation, Digital ecosystems, Innovation management, Strategic leadership, Customer-Centric approach, Business model development

1. Introduction

The advent of digital technologies has fundamentally transformed business operations, leading to the rise of interconnected digital ecosystems. These ecosystems have revolutionized traditional business models, creating unprecedented value opportunities. Sussan and Acs (2017) describe the digital entrepreneurial ecosystem as "self-organizing, scalable, and sustainable." Companies such as Amazon, Google, and Alibaba have set new benchmarks for digital integration and ecosystem development (Reinartz et al., 2019). The COVID-19 pandemic further accelerated digital transformation, underscoring the imperative for businesses to adapt to interconnected digital networks.

Despite their transformative potential, there remains a critical gap in the literature regarding comprehensive frameworks for developing and managing digital ecosystems. Senyo, Liu, and Effah (2019) underscore the need for a holistic framework that captures the key components and interrelationships of digital business ecosystems. The critical gap impedes businesses from fully leveraging digital ecosystems for sustainable competitive advantage. This research addresses the gap by integrating Peter Drucker's management principles with contemporary digital strategies, by examining case studies of Audi, M-PESA, and Apple CarPlay. This study demonstrates the practical application of Drucker's principles in modern digital contexts (Hein et al., 2020) and not only identifies critical success factors but also offers actionable recommendations for sustainable growth.

Jacobides, Cennamo, and Gawer (2018) lament the lack of a coherent framework to study ecosystems systematically. This research aims to fill the void by providing a structured approach that merges Drucker's timeless principles with cutting-edge digital strategies. By doing so, it offers invaluable insights for businesses striving to foster innovation and maintain a competitive edge in the digital age.

2. Literature Review

The digital revolution has significantly transformed business ecosystems, challenging traditional management principles. This literature review integrates Drucker's management principles (1985, 1993), digital ecosystem theory (Hein et al., 2020), digital transformation strategies (Vial, 2019), and organizational capabilities (Paul et al., 2024) to create a comprehensive framework for managing digital ecosystems. The aim is to bridge the gap between traditional management and the demands of the digital era, providing both theoretical grounding and practical perspectives.

Combining these concepts serves three key purposes: Drucker's principles (1985, 1993) offer foundational insights into enduring management challenges; digital ecosystem theory sheds light on modern business structures (Hein et al., 2020); and research on digital transformation and organizational capabilities provides practical strategies for adaptation (Vial, 2019; Paul et al., 2024). This synthesis aids in understanding how organizations can effectively navigate and leverage digital ecosystems.

Foundational Management Principles

Drucker's (1993, p.8) insights on the knowledge economy and innovation form the theoretical bedrock of this study. His assertion that "Knowledge has become the key economic resource and the dominant—and perhaps even the only—source of competitive advantage" is particularly relevant in digital ecosystems, where knowledge and information flow are paramount. Additionally, Drucker's emphasis on systematic innovation as a core business process offers valuable insights for managing digital transformations (Drucker, 1985).

Digital Ecosystem Dynamics

Hein et al. (2020, p.88) define digital ecosystems as "sociotechnical networks of digital platforms and complementors," highlighting their interconnected nature. This underscores the need for integrated management approaches aligned with Drucker's holistic view of organizations. Jacobides et al. (2018, p. 2256) further refine our understanding of the structure and dynamics of ecosystems, complementing Drucker's insights on organizational strategy and innovation.

Digital Transformation Strategies

Vial's (2019) review highlights the need for strategic management frameworks in digital ecosystems, aligning with Drucker's emphasis on strategic vision and leadership. Paul et al. (2024) advocate for multidisciplinary approaches that consider technological, organizational, and strategic factors, resonating with Drucker's holistic approach.

Empirical Insights and Critical Perspectives

Empirical studies, such as Dremel et al.'s (2017) analysis of Audi's digital transformation and Morawczynski's (2009) examination of M-PESA, provide practical insights into digital ecosystem management, aligning with Drucker's principles on innovation and social responsibility. Zuboff (2019) warns about surveillance capitalism, challenging researchers and practitioners to consider the ethical implications of digital transformation, aligning with Drucker's emphasis on responsible management.

Organizational Capabilities and Industry Insights

Li et al.'s (2022) examination of digital transformation in SMEs highlights the role of dynamic capabilities in navigating digital ecosystems, resonating with Drucker's focus on adaptability and innovation. Additionally, industry reports, such as McKinsey & Company's (2023) on AI adoption, underscore the practical importance of effective digital ecosystem management, aligning with Drucker's focus on innovation and practical management solutions.

3. Methodology

This research examines case studies of Audi, M-PESA, and Apple CarPlay to explore the complex nature of digital ecosystems. It aims to provide a comprehensive understanding of successful digital ecosystems by integrating theoretical perspectives. An extensive literature review identified relevant studies and frameworks related to digital ecosystems and Drucker's management principles, including works by Morakanyane et al. (2017), Vial (2019), Hess et al. (2016), and Drucker (1985, 1993).

The PRISMA flow diagram (Page et al., 2021) guided the systematic review process, ensuring a structured approach through identification, screening, eligibility, and inclusion phases. Ultimately, 20 high-quality and relevant recent articles were selected, offering comprehensive insights into digital transformation and ecosystems aligned with Drucker’s philosophy (Figure 1).

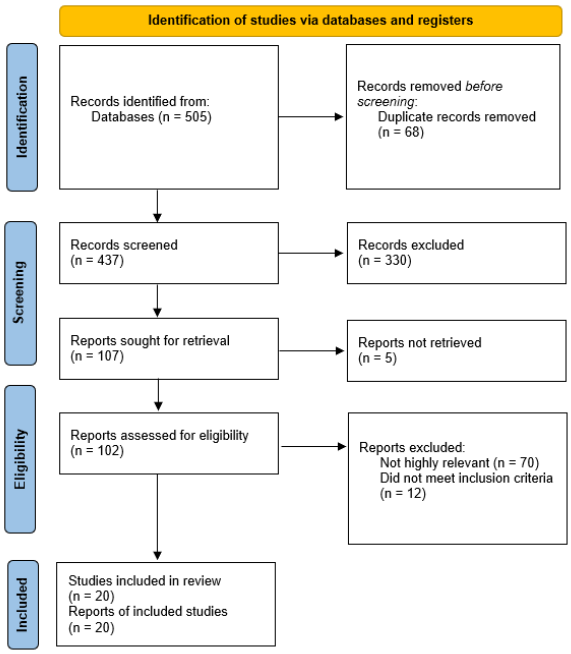

Figure 1: PRISMA flow diagram (PRISMA, 2020)

4. Detailed Analysis of Case Studies

The selection of Audi, M-PESA, and Apple CarPlay as case studies was deliberate and strategic, aimed at providing a diverse yet complementary set of examples. Audi represents a traditional industry undergoing digital transformation, showcasing how established companies can leverage digital ecosystems to enhance customer experiences and operational efficiency. M-PESA illustrates a digital ecosystem's potential in emerging markets, highlighting its capacity for significant social impact, particularly in financial inclusion. Apple CarPlay demonstrates how a technology giant can extend its ecosystem into new sectors, exemplifying cross-industry digital integration. This diversity allows exploration of digital ecosystems across different contexts, industries, and scales, enhancing the generalizability and robustness of our findings.

This process entailed an in-depth examination of each case individually, followed by a comparative analysis to identify common themes and divergences. Subsequently, we mapped these themes to Drucker's management principles, ensuring a theoretical grounding for our findings. This systematic approach yielded seven critical attributes of successful digital ecosystems: clear vision, customer-centric approaches, effective leadership, robust technology, supportive culture, strategic partnerships, and data-driven insights. By analyzing and comparing these diverse cases with Drucker's principles, we can highlight the enduring relevance of innovation, customer-centricity, and visionary leadership in the digital age.

4.1 Audi: Digital Showroom Transformation

Audi's digital transformation turned traditional car showrooms into immersive digital experiences (Table 1), significantly boosting sales and customer satisfaction. This shift, aligning with Drucker's focus on innovation and customer-centricity, allowed customers to explore the full model catalog through digital interfaces, increasing sales by 60% in some areas (Dremel et al., 2017). The digital showrooms offered a personalized experience, enhancing customer satisfaction and enabling car customization and visualization. Additionally, they reduced the need for large physical inventories, cutting costs and improving resource allocation.

Table 1: Key Findings from Audi's Digital Showroom Transformation

Key Findings	Details
Sales Increase	60% increase in sales in some regions
Enhanced Customer Satisfaction	Personalized experiences through digital interfaces
Inventory Cost Reduction	Reduced need for Physical inventories due to virtual models

4.2 M-PESA: Financial Inclusion and Economic Growth

M-PESA revolutionized mobile financial services in Kenya, demonstrating the potential of digital ecosystems to enhance financial inclusion and economic growth (Table 2). Developed by Vodafone and Safaricom, M-PESA transformed the financial landscape by offering accessible and convenient services to millions. Before M-PESA, only 25% of Kenyans had access to formal financial services. M-PESA increased financial inclusion to 80%, reaching millions of previously unbanked individuals (Jelassi & Ludwig, 2016). Its ease of use and accessibility drove widespread adoption, with users growing to 30 million. This expansion significantly boosted Kenya's economy by improving financial access and enabling various economic activities. Businesses and individuals benefited from secure and efficient transactions facilitated by M-PESA.

Table 2: Key Findings from M-PESA's Financial Inclusion and Economic Impact

Key Findings	Details
Increased Financial Inclusion	Financial inclusion rose from 25% to 80%
User Growth	The number of users grew to 30 million
Economic Impact	Significant economic benefits through enhanced financial access

4.3 Apple CarPlay: Seamless In-Car Experience

Apple CarPlay linked vehicles to customers' iPhones, providing a seamless in-car experience and integrating Apple's ecosystem with the automotive industry. This solution enhanced vehicle functionality and drove sales. The integration of Apple CarPlay contributed to a significant increase in vehicle sales, with sales growing from 861,000 units in 2015 to 37 million units by 2020 (WEF, 2020). Apple CarPlay improved customer satisfaction by offering familiar and user-friendly interfaces, which enhanced safety through hands-free controls and better integration with vehicle systems. Additionally, Apple established partnerships with over 20 automotive manufacturers, expanding the reach and adoption of CarPlay. These strategic partnerships facilitated the widespread availability and integration of the technology, further driving its success.

Table 3: Key Findings from Apple CarPlay Integration Impact

Key Findings	Details
Vehicle Sales Growth	Vehicle sales increased from 861,000 units in 2015 to 37 million units by 2020
Improved Customer Satisfaction	Enhanced safety and user experience through integrated functionalities
Established Partnerships	Partnerships with over 20 automotive manufacturers

5. Integrating Drucker's Framework into a Comprehensive Business Model for a Digital Ecosystem

Peter Drucker's management principles, especially from "Innovation and Entrepreneurship" (1985) and "Post-Capitalist Society" (1993), provide a solid framework for managing digital ecosystems. Key principles like innovation, customer-centricity, effective leadership, knowledge workers, strategic vision, and continuous improvement are crucial for digital transformation. Integrating these ensures a technologically advanced, strategically aligned and customer-focused business model supported by strong leadership and innovation.

A comprehensive digital ecosystem business model includes Vision and Strategy, Customer-Centric Approach, Leadership and Governance, Technology and Infrastructure, Organizational Culture and Skills, Partnerships and Collaborations, Data and Insights, Customer Engagement and Channels, Value Creation and Delivery, and Continuous Improvement. This model aligns with Drucker's principles and modern digital strategies. Figure 2 shows this interconnected framework, where each component supports and influences the others, creating a cohesive digital ecosystem.

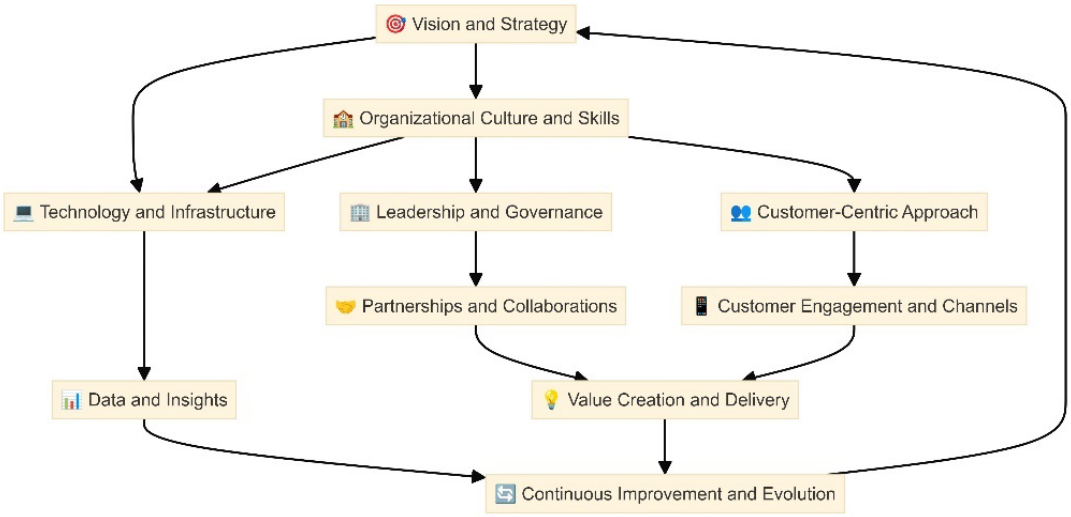

Figure 2: Comprehensive Business Model for a Digital Ecosystem by integrating Drucker's Framework

The integration of these key concepts with our proposed framework (Figure 2) is both seamless and synergistic. The comprehensive Business Model for a Digital Ecosystem presented in Figure 2 synthesizes these attributes into a cohesive structure, illustrating their interdependencies and collective impact. For instance, the 'vision and strategy' attribute forms the core of the model, influencing all other components, while 'data and insights' permeate throughout, informing decision-making at all levels. This integration demonstrates how Drucker's principles can be effectively adapted and applied in the digital age.

6. Discussion

Considering the evolving digital landscape, this study examines the intricate dynamics of digital ecosystems through the prism of Peter Drucker's seminal management principles. By analyzing the case studies of Audi, M-PESA, and Apple CarPlay, we have distilled key attributes that underpin successful digital ecosystems, thereby illuminating the path for organizations navigating this complex terrain.

Our proposed Business Model for Digital Ecosystems offers a structured framework that harmonizes the identified components, providing organizations with a blueprint for sustainable digital transformation. This model not only contributes to the theoretical understanding of digital ecosystems but also offers pragmatic insights for organizations embarking on digital transformation journeys.

Future research should explore the long-term impacts of digital ecosystems across industries, and the role of artificial intelligence in enhancing their efficiency and innovation. Longitudinal studies could deepen our understanding of the evolution of digital ecosystems.

7. Conclusion

This research integrates Drucker's management principles with contemporary digital transformation strategies, offering a unique perspective on managing digital ecosystems. Through detailed case studies, it identifies critical success factors and provides actionable recommendations for achieving sustainable growth. A comprehensive business model for digital ecosystems is introduced, emphasizing key elements such as vision, customer-centricity, leadership, technology, culture, partnerships, data insights, customer engagement, value creation, and continuous improvement.

In conclusion, this research bridges the gap between Drucker's timeless principles and modern strategies, making significant contributions to both theory and practice. It offers valuable insights for businesses to innovate and secure a competitive advantage in the digital era.

Abstract: The South African Clothing and Textile manufacturing industry has encountered substantial hurdles, notably job losses attributed to imports from regions with lower wage rates and inefficiencies within the value chain, exacerbated by the COVID-19 Pandemic. This situation underscores the potential for industry rejuvenation, particularly in light of escalating costs associated with importing clothing, encompassing labour and transportation expenses. A significant impediment to the industry's advancement is the absence of a robust design sector capable of generating innovative designs. The forthcoming research will delve into an exploration of literature pertaining to international fashion incubators, fashion districts, and fashion clusters. The insights gleaned will serve as the foundation for crafting a model aimed at expanding a clothing and fashion technopreneurship hub located in Cape Town, South Africa, with the specific aim of supporting graduates in the fields of clothing, textiles, or fashion. This strategic approach involves active engagement with emerging entrepreneurs to expedite their journey towards achieving pivotal economic objectives such as innovation and sustainability, thereby augmenting their competitive edge. Furthermore, this initiative aids these entrepreneurs in navigating the complexities associated with launching small businesses by facilitating access to pertinent best practices and customized technology support services tailored to their unique requirements.

Keywords: Fashion; clothing, Entrepreneurship, SMMEs, Incubators, Sustainable fashion

1. Introduction

The South African clothing sector has come under severe strain over the last few years especially due to low cost imports entering the country from low wage areas. It was reported in the Business Day (Phakathi, 2012) that the clothing sector had been affected by cheap imports from China and that it had then lost at least 50 000 jobs in a period of 10 years. The South African clothing sector has since its early days been mainly production and not designed orientated i.e. companies sent their buyers and designers to the leading European fashion shows, exhibitions and store visits from which they would return to replicate what they saw and try to produce it cheaper. In 2009 the South African Minister of Economic Development, Mr. Ebrahim Patel in an address to the clothing industry employers and labour emphasized that the industry had to develop a new survival strategy which he termed the "high-road of development" (Crotty, 2009). Mr. Patel a former General Secretary of the Southern African Clothing and Textile Workers Union(SACTWU) noted that the opportunities for South Africa was to develop a high value-add industry using one or more factors "that may include quality, design, innovation, new product development, speed-to-market, or short-run production." One fashion designer can stimulate the creation of many more jobs than one manufacturer. e.g. a leading design centre in Cape Town provides work to at least 30 subcontracting (CMT) firms employing on average 30 people per firm. The paper therefore proposes the establishment of a Fashion Incubator or "Design Park" to develop and grow sustainable emerging fashion designers.

2. Literature Review

2.1 Incubators in the Fashion Industry

Fashion incubators are specialized entities that cater to the unique needs of fashion start-ups. They address specific challenges such as high production costs, supply chain complexities, and the necessity for creative design and marketing strategies (Hausmann & Heinze, 2016).

Mills (2012) notes that business skills taught in design programmes were valuable but "designers who were associated with a fashion incubator reported engaging in what could be described as entrepreneurship education". In addition, "the incubator experiences were most successful at providing the social capital needed to access start-up resources". Mills, (2011) in a previous article highlight "the creativity-business tension". Mills then proposes a "triangular enterprise orientation" as a way to navigate this "creativity-business tension", viz. the creative enterprise orientation (CEO), the creative business orientation (CBO) and the fashion industry orientation (FIO) as depicted in figure 1.

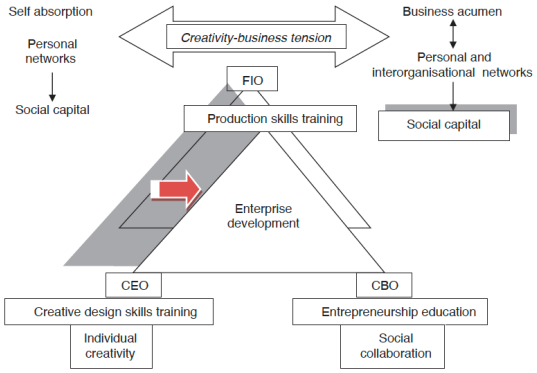

Figure 1.
Education and enterprise: bringing it all together

Figure 1: CBO & FIO

In Figure 1 Mills (2012) to capture the shift and the relationships between the key concepts viz. enterprise orientation, creativity-business tension, social capital, business acumen, individual creativity, design education and collaborative action and entrepreneurship education in the shift from a CEO towards a CBO. Mills (2012) notes that this requires more entrepreneurship education of the sort found in incubators (i.e. education in enterprise) and the shift from CEO to CBO, involves a move from a preoccupation with individual creativity towards collaborative action, which is what is required to innovate (i.e. exploit creative ideas). Fashion incubators offer tailored support, including access to design studios, manufacturing facilities, and industry-specific mentorship. Successful examples include the Fashion Incubator San Francisco and the British Fashion Council's Designer Fashion Fund, which have significantly contributed to the growth of emerging designers (Wong, 2017).

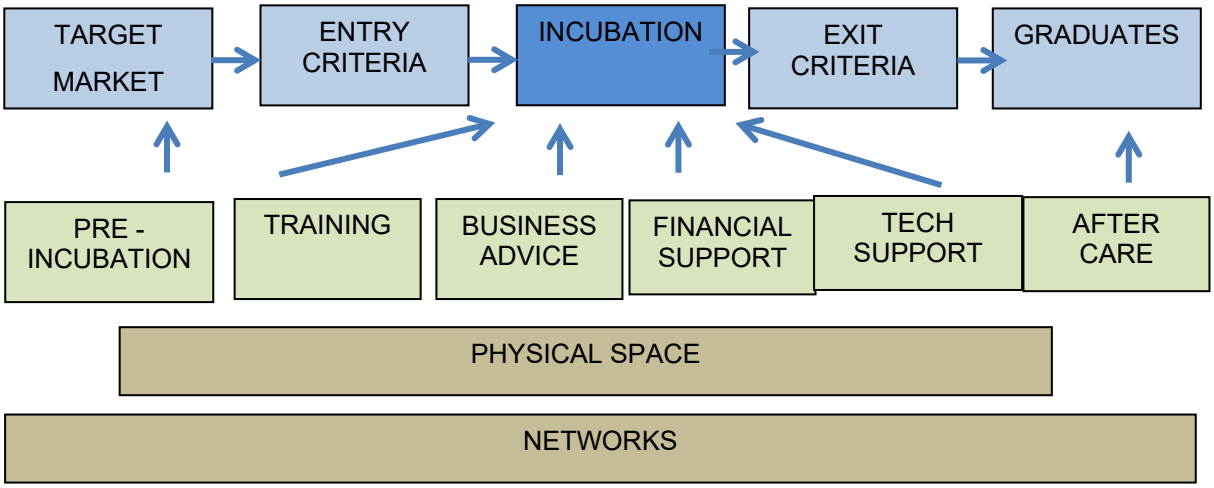
2.2 Establishing a Sustainable Fashion Incubator

Establishing a sustainable fashion incubator involves several critical steps:

1. Needs Assessment: Understanding the specific needs of sustainable fashion SMMEs, including resource requirements, market access, and training needs (Peters & Becker, 1999).
2. Funding and Resources: Securing funding from public and private sources, and providing access to sustainable materials, manufacturing facilities, and design tools (Mian et al., 2016).
3. Mentorship and Training: Offering specialized mentorship and training programs focusing on sustainable practices, business management, and market strategies (Schwartz & Hornych, 2010).
4. Networking and Partnerships: Facilitating networking opportunities with industry stakeholders, including suppliers, retailers, and investors, to create a supportive ecosystem (Hausmann & Heinze, 2016).
5. Monitoring and Evaluation: Implementing monitoring and evaluation mechanisms to assess the impact of the incubator and continuously improve its services (Bergek & Norrman, 2008).

3. Methodology

The paper reviewed literature and websites related to support for SMME fashion designers internationally as well as analysis of current data available from fashion SMME support organisations in Cape Town.



3.1 Incubators

Incubators have evolved over time and meant different things to different stakeholders. It was initially established to promote and develop high level innovation and therefore efforts were concentrated on science, engineering and information technology development. The Centre for Strategy and Evaluation Services in a report to the European Commission's Enterprise Directorate General (2002:9), defines an incubator as "an organisation that accelerates and systematises the process of creating successful enterprises by providing them with a comprehensive and integrated range of support, including: Incubator space, business support services, clustering and networking opportunities".

Entrepreneurship support centres have evolved over the years with many types of support centres arising to accommodate different needs. International Business Innovation Association (INBIA): https://inbia.org/) based in the USA has identified and defined the following types of support centres.

Incubators	Charge monthly program or membership fees or dues for office/desk space and access to program offerings such as mentoring, education/training, and informal learning opportunities. They host events to provide networking and learning opportunities for member companies and the local community. Member companies must apply and meet the incubator's criteria e.g. industry, stage of development, demographics, etc. Normally a graduation policies is in place based on achievement criteria and residence is for 1-3 years
Co-working spaces	Open, collaborative, community-based workspace for like-minded individuals or early-stage companies. Flexible workspaces in the form of hot desks, private (dedicated) desks or offices. Member businesses pay for their space through rent or membership dues. Co-working spaces typically do not offer formal programs, although they may have speakers, meetups or other optional, informal learning opportunities. Members are encouraged to stay or retained as a sustainable revenue stream.
Economic Development Center or Organization	Responsible for creating, managing and supervising programs and activities that promote, assist and enhance economic development. The focus being on economic development efforts on the creation of jobs and new investment in a region.
Higher Education Academic Department	Housed in institutions of higher education and may provide space for student entrepreneurs while offering courses and curricula focused on entrepreneurship. Attendance in courses is mandatory for students to pass/graduate, and some as well as offering events for networking, pitching, or demonstrating products.
Makerspace	Non-program-based community workspaces providing equipment for specific sectors of manufacturing (e.g., technology, 3D printing, woodworking, food) as well as tools, training and specialized equipment necessary for creating and building physical products.
Pre-Accelerator	Do not have equity-based funding, however, they may have grant funds available or access to a community-based evergreen fund. Pre-accelerators have a competitive application process, have mandatory attendance and include a culminating event at the end of the program.
SBDC	Small Business Development Centers (SBDC) are cooperative service-based centers that are subsidized. SBDCs provide learning opportunities and mentoring for small businesses in any industry. There may be a fee to participate in SBDC training/educational programs. Some centers may have space available for rent, although most are walk-in counseling or training center configurations. The goal of a SBDC is to support small business growth and foster local and regional economic development
Seed Accelerator	Highly competitive application process, and will invest equity capital in selected companies. Short-term, ranging from 3-6 months. provide learning opportunities and intense mentoring to each company, with a culminating graduation /pitching event to present concept or product in front of investors and other key stakeholders. Space can be provided for the duration of the program, or can run virtually with attendance at educational or networking events.
Student Entrepreneurship Center	Programs offered by institutions of higher education (e.g., universities, colleges) and provide entrepreneurship learning opportunities and mentoring to foster entrepreneurship development among students. Some centers offer space while others do not. Participation is open to students enrolled in the institution and could have a competitive application processes.
Super Hub	Blend of several models of entrepreneurial growth listed into a single location, supporting entrepreneurs with a wide range of critical services. It is often the anchor hubs for urban innovation districts
Technology Transfer or Commercialization Office	Technology transfer and commercialization offices are focused on providing information, guidelines and resources to faculty, students or staff interested in commercializing research or intellectual property developed at the university through spin-out or technology startup companies.

In a World Bank initiative known as, Information for Development Programme (Infodev: 2010) a policy document describes a business incubator as 'focussing a range of services on clients that are designed to help them launch a well - managed business". In this policy document it illustrates in figure 2 a very simple model for business incubators.

(Infodev, 2010)

Figure 2: Simple business incubator model

In general therefore business incubators were established in identified sectors to provide support to SMMEs that would accelerate their success as sustainable businesses. The support could range from taking up residence in the incubator premises to providing business and technical support services and network opportunities to SMMEs outside of the incubator premises. Incubation is a fairly costly SMME development instrument especially if it accommodates residents. The focus is therefore concentrated on SMME development where the probability for success is highest which should also be an important lesson for any newly established incubator.

The Department of Trade and Industry, South African (2014) describes Business incubators as "physical and/or virtual facilities that support the development of early-stage SMEs through a combination of business development services, funding and access to the physical space necessary to conduct business". They further define incubators as (1) supporting SMEs in the early stages of growth; (2) incubators offer services aimed at strengthening the capacity of SMEs to operate on their own; and (3) incubation is temporary therefore provide services to meet certain needs so that SMEs can grow independently once incubation ends. Importantly "early stage" is not a measure of time, but of how much a business has developed. Incubators, focus on entrepreneurs who wants to grow their businesses, not merely survive.

3.2 International Fashion Incubators

As described earlier, incubators play different roles in different environments and mean different things to different organisations. The emphasis in all the international examples found was on business support and networking. Incubators could be separated into two broad groups viz. residence based incubators or non-residence incubators. Another category of incubators also emerged post COVID and due to cost constraints which could be categorised as virtual incubators viz. providing on line advice and platforms.

Information was extracted from the fashion Incubator websites listed in table 1 below and courtesy email was sent to all the incubators (for further study) to verify data available on the websites. The author acknowledges responses from the following incubators viz. the DC Fashion Incubator in the USA, Philadelphia Fashion incubator and Textile Clothing and Footwear Resource Centre of Western Australia

Toronto Fashion Incubator	Canada	https://fashionincubator.com/

The services provided by the fashion incubators listed covers the following general support, some to a greater or lesser degree. This is a general compilation of the information and not specific to a particular incubator.

For residential and non-residential incubators:

General and business seminars : Seminars/workshops in range of areas i.e. business plan writing, basic accounting, finance, product costing, pricing, branding marketing, social media marketing, retail management, range presentations/ visual merchandising, cash-flow strategic programs, production and manufacturing, Importing/Exporting, human resources, etc.

Technical Workshops: Courses range from sewing, design, pattern making, product development, draping, styling and textiles.

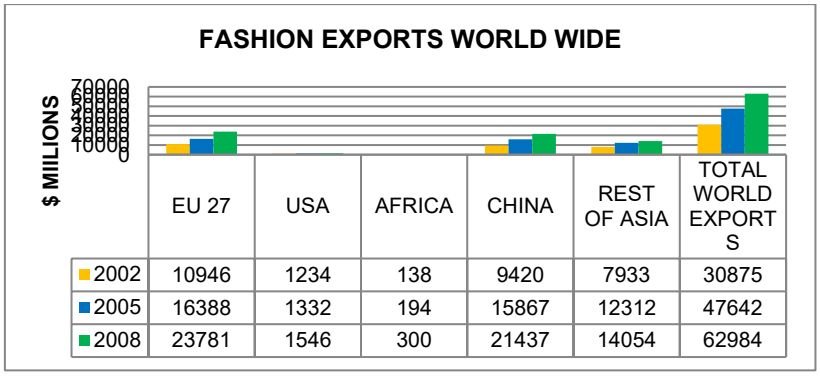
Marketing: Showcase, Fashion shows, pop up boutiques (temporary retail space, normally in warehouse type environments), Media exposure

Other: Negotiated discounts, fashion trend websites, shipping costs, Networking opportunities, fabric suppliers, between designers, funding support, Advocacy, Mentorship, consultation

3.3 Residential Incubators

This is where the fashion designer physically takes up residence on the premises of the incubator as compared to just making use of the services of the incubator.

As listed for non-residence



- Residence for a limited period (normally 1 year) on application, phased approach
- Shared administration, office space and show rooms
- Subsidised rental
- Strict criteria with emphasis on potential for success.

- Some have build-in partnership with retail outlets.

Fees charged

Courses fees range from free to between $500 and $1500 for technical courses. Membership fees ranges from $150 to $250 per month for non-residence and $ 275 to $ 550 for residence. Cost would be lesser for shared work space increasing substantially for a private studio. South Africa and particular Africa is lagging behind in fashion exports. The data extracted from the 2010 Creative Economy report illustrates (table 2) this point clearly (UNCTAD, 2010). It is important to note that Europe still commands a significant share of exports even though its manufacturing base has been eroded. This illustrates that Europe's strength is in fashion brand and design as opposed to manufacturing.

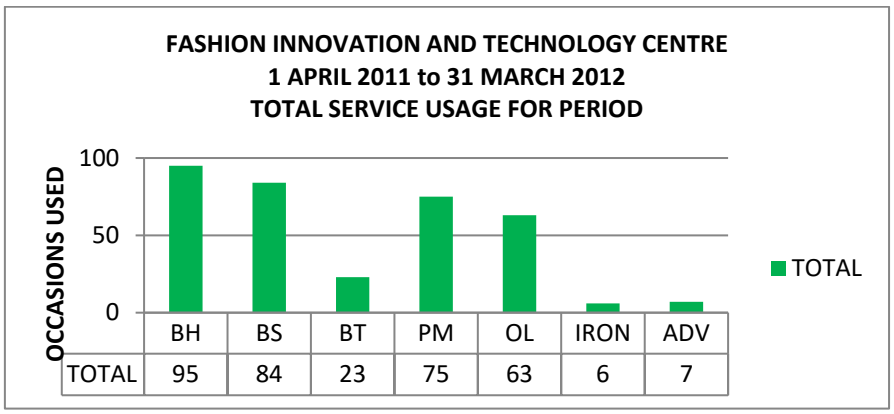
Table 2: Fashion exports worldwide (UNCTAD, 2010)

	EU 27	USA	AFRICA	CHINA	REST OF ASIA	TOTAL WORLD EXPORTS
2002	10946	1234	138	9420	7933	30875
2005	16388	1332	194	15867	12312	47642
2008	23781	1546	300	21437	14054	62984

3.4 South African Incubation Support

An agency of the Department of Small Business DSBviz. the Small Enterprise Development Agency (Small Enterprise Development Agency, n.d.) through its Technology Programmes supports incubators. The SEDA Technology Programme has 24 incubators across the country based on 3 different models of technology business centres (SEDA, 2012) i.e.

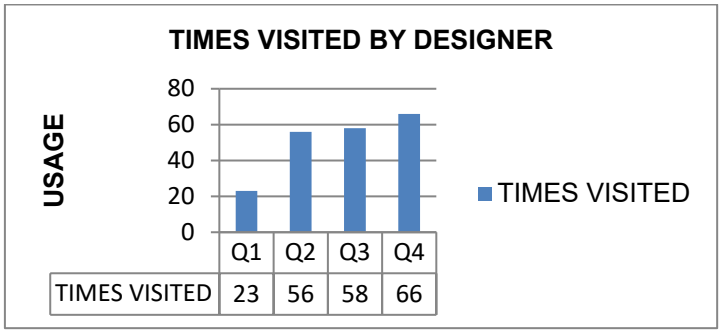
- Technology Demonstration Centres (TDCs) for demonstration of value adding technology,
- Technology Incubators (TIS), sheltered environment for technology based start-ups.
- Hybrid Centres combination of the two. These centres cover a wide range of sectors viz. ICT, manufacturing, biotechnology, small scale mining, construction, bio-fuels, Chemicals Floriculture Automotive, Agriculture, Essential Oils, Aluminium Stainless Steel and Furniture. However no known incubator supports the fashion sector in South Africa.



3.5 Support For The Smme Fashion Sector In Cape Town

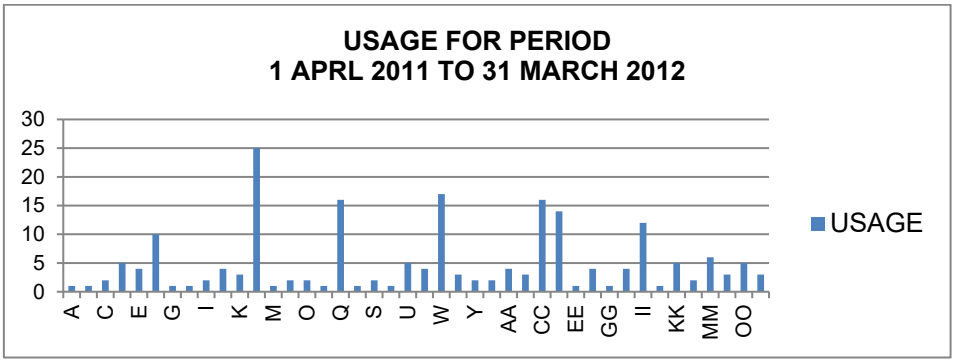
The Technology Station:Clothing and Textiles(TSCT), based at the Cape Peninsula University of Technology, to provide technology support to the clothing and textile sector especially SMMEs as part of its community engagement programme. The unit is supported by the Technology Innovation Agency TIA to assist SMMEs to prototype their innovations. The TSCT partnered with the Cape Town Fashion Council and set up a satellite Station on the Cape Town Fashion Council premises known as the Fashion Technology and Innovation Centre (FTIC). The pilot project provided 3 specialised machines and 2 basic machine viz. a plain machine and an overlocker as well as an iron supported by a full time technician.

The following data (tables 3, 4 and 5) was extracted from the Annual report of the TSCT recorded on a quarterly basis for a period of one year, viz. 1 April 2011 to the 30 March 2012 (Isaacs, 2012).



To be able to analyse the data in graphs the various machines and services were first coded (table 3).

Table 3: The most popular machines and services used for the period.



In a period of one year the growth in usage has been steadily increasing (table 6) from 23 users in the first quarter to 66 users in the fourth quarter. It is noted in table 5 that a number of designers are repeat users of the facility. This information would be used to develop the model for an incubator.

Table 4: The number of times visited by designers

In table 6 below it shows in coded form the frequency of the 42 designers who visited the FTIC during the period measured. Each letter represents a designer and how often they made use of the services. There are designers vi. L, Q, W, CC, DD that are candidates for a more permanent arrangement as noted in the international fashion incubators residential programme.

Table 5: The frequency of use by various designers

The data collected for the period measured show a linear growth in usage of the services of the FTIC as designers become familiar with the support offered. The designers that use the service work at their own premises and use the FTIC for completing their products. Various designers especially those from disadvantaged backgrounds have informally indicated a need for residence space to help them grow their business.

3.6 A Fashion Incubator Scenario for Cape Town

A centre would be available to fashion entrepreneurs against a set criteria viz.

- Graduate of an accredited tertiary education institution in Fashion, Clothing or Textiles.
- Registered business with a Business plan
- Payment of subsidised service fee.

STAGE 1

- Access to specialised technology to complete prototypes i.e.
- Various specialised sewing machines
- Sample embroidery machine and design facility
- Linkages to subcontractors also known as CMT(Cut Make and Trim) factories
- Technical advise

STAGE 2

- Provide up to date information on future fashion trends through access to trend reports magazines journals web information.
- CAD facilities
- CAD pattern making and grading
- Monthly network meetings
- Mentoring for presentation to buyers
- Show rooms
- Business and accounting support.
- Promote sustainable design

LONG TERM OBJECTIVES

- Sustainable centre through membership fees and sponsors.
- Organise group tour packages for young designers to attend international shows/exhibitions (access to DTI&CExport funds)
- Develop the South African fashion tourist market
- Retail outlets at strategic venues (e.g. Waterfront)
- Link to trade house for export
- Exhibition/ Fashion show
- Sustainable Fashion awards

4. Conclusion

The proposed fashion incubator in Cape Town aims to rejuvenate South Africa's clothing industry, addressing challenges from low-cost imports and a historical lack of design focus. Drawing on successful international models, this incubator would support emerging designers, helping them navigate industry complexities, boost creativity, and build sustainable businesses. Fashion incubators are proven to foster entrepreneurship and innovation, offering access to specialized equipment, technical advice, and industry networks. This support helps designers transition from purely creative roles to entrepreneurial ones, essential for developing a competitive fashion sector. Successful examples like the Fashion Incubator San Francisco and the British Fashion Council's Designer Fashion Fund highlight the positive impact on job creation and economic growth.

The Cape Town Fashion Incubator would provide similar support, including technical assistance, business mentorship, and networking opportunities. It would cater to the needs of fashion SMMEs, offering access to specialized sewing machines, CAD facilities, and current fashion trends. By supporting designers from disadvantaged backgrounds with subsidized services, the incubator aims to democratize industry resources, fostering a more inclusive and diverse fashion industry in South Africa.

Moreover, the incubator would promote sustainable practices, encouraging the use of eco-friendly materials and processes. This aligns with global sustainability trends and positions South African designers as leaders in ethical fashion. Long-term goals include organizing international tours, developing the fashion tourist market, and establishing retail outlets to integrate South African fashion into the global market. In summary, establishing a fashion incubator in Cape Town offers a strategic opportunity to rejuvenate the South African clothing sector. By addressing both the creative and business needs of emerging designers, the incubator would foster a new generation of fashion entrepreneurs, supporting economic development, job creation, and promoting sustainable and inclusive growth within the industry.

Abstract: Recent trends in Lisbon's winter tourism indicate a shift towards off-peak travel, attracting diverse visitors with its rich cultural heritage, sustainable initiatives, and extended stay options for digital nomads. The city's culinary scene, arts, wellness activities, and tech-driven tourism options enhance its appeal. Aligned with these recent trends, tourism in Lisbon's region during the winter season presents a unique and dynamic landscape influenced by a wide range of motivations, tourist profiles, and travel behaviours. This study aims to define distinctive clusters of winter tourists in Lisbon by analysing these key variables, providing valuable insights specific to the winter travel context. Based on a compiled dataset from the winter season in Lisbon, this study delves into examining the factors driving tourist visits, encompassing socio-economic backgrounds, travel frequency, and age demographics. We aim to reveal the distinctive subgroups that define Lisbon's winter tourist population, employing data analysis techniques such as cluster analysis. From an academic perspective, this study offers a novel tourist segmentation model based on motivations, profiles, and behaviour. This model enriches the existing body of knowledge in tourism studies, providing a valuable reference for future research. For tourism agents in Lisbon, this study provides actionable insights to enhance strategic decision-making. By segmenting winter tourists, they can tailor marketing strategies and product development to cater to diverse tourist segments. Moreover, this approach can lead to economic benefits, optimising resource allocation, and revenue generation.

Keywords: Travel motivations, Push factors, Segmentation, Urban tourism, Winter tourism

1. Introduction

Winter tourism in urban settings has increasingly become a focal point for research, driven by the realisation that cities offer a unique blend of attractions and activities during the off-peak seasons that attract a diverse array of visitors (Ashworth and Page, 2011; Koens and Milano, 2023; Richards, 2018). Lisbon's rich cultural heritage and vibrant arts scene provide a compelling case study for examining these dynamics. Despite the growing interest, there remains a significant gap in the academic literature specifically addressing winter tourism in Lisbon, especially from a segmentation approach that considers the distinct profiles of tourists during this less typical tourism season.

Recent studies have argued for the importance of understanding the distinct seasonal patterns of tourist activities and how they contribute to the economic sustainability of urban destinations (McKercher et al., 2023; Vergori, 2017). Furthermore, literature on tourist segmentation highlights the need for city destinations to tailor their marketing strategies to different tourist segments to enhance destination appeal and competitiveness. The burgeoning interest in niche tourism markets, such as LGBTQ+ travel and digital nomadism, further emphasises the need for such targeted approaches (Dolnicar, 2020).

Based on data collected from tourists visiting Lisbon during the winter, three clusters were identified based on distinct travel motivations - push factors. This study advances tourism segmentation theory by identifying distinct clusters characterised by specific travel motivations and nuanced travel behavioural and sociodemographic aspects. Additionally, the findings help city planners and tourism marketers tailor strategies to meet the particular needs of different tourist segments, enhancing Lisbon's appeal as a winter destination.

2. Literature Review

2.1 Travel Motivations

Motivation is extensively recognised as fundamental in understanding human behaviour across various academic disciplines, including psychology, sociopsychology, and marketing. It has a critical role in shaping consumer decision-making, a topic scholars have rigorously explored over the years (Fodness, 1994; Gillison et al., 2019).

Motivation significantly influences tourist behaviour in the tourism industry, guiding everything from destination choice to activity selection during travel. Rooted in tourists' internal desires and values, these motivations often subconsciously shape decision-making processes and ultimately determine the travel experience (Pereira et al., 2019; Yoo et al., 2018).

In recent decades, the study of travel motivations has garnered extensive attention in tourism research, underscoring a direct link between motivational factors and travel intentions and behaviours. This body of research suggests that a deep understanding of travel motivations is essential for effectively meeting the needs and preferences of tourists, ultimately influencing their overall travel experiences (Lin and Nawijn, 2020; Wong et al., 2018).

The push and pull theory of motivations (Dann, 1977) is a widely accepted theoretical framework in tourism research. It postulates that the push and pull effect determines tourists' decision to travel: people travel because they are pushed by internally driven socio-psychological motives and pulled by externally driven destination-related motives (Crompton, 1979). Hence, push factors correspond to the internal aspects of the individual, to their psychosocial motivations for travel (Prayag and Hosany, 2014), while pull factors relate to aspects external to the individual, including the set of attributes and characteristics of tourist products (Yoon and Uysal, 2005).

The push-pull model has been applied across various tourism contexts to explore tourist motivation (Dancausa et al., 2023; Liu, 2023), including food tourism (Su et al., 2018), culture and heritage tourism (Chen and Mo, 2014; Yousefi et al., 2015), adventure tourism (Giddy, 2018.), and cruise tourism (Whyte, 2017). These studies reveal that both internal and external factors play a role in influencing tourist motivation. Anyway, the relative importance of these factors may vary depending on the specific context.

As a result, a considerable number of travel motivations have been identified, such as escape, prestige, challenge, adventure, excitement, relaxation, self-discovery, ego-enhancement, social circles, gaining knowledge, spiritual needs, and family togetherness (*e.g.,* Baniya and Paudel, 2016; Rita et al., 2019).

2.2 Urban Winter Tourism

Tourism seasonality represents a significant challenge in the tourism industry, affecting destination management and economic stability (Baños-Pino et al., 2023; Böcker et al., 2013; Coromina and Camprubí, 2016). Urban winter tourism refers to the phenomenon of tourists visiting urban destinations during the winter season, attracted by the city's cultural and urban experiences rather than traditional snow-centric activities. This form of tourism leverages the unique attributes of cities to offer diverse attractions and activities even in colder weather (Connell et al. 2015; Duro 2018).

Urban winter tourism moves away from traditional activities like skiing and snowboarding, focusing instead on cultural events, festivals, markets, and outdoor activities suitable for cold weather. This shift from snow-centric to cultural and urban experiences highlights the versatility and appeal of cities as winter destinations. Cities leverage their cultural assets to host diverse winter events and activities that capitalize on the unique features of urban settings. This strategy enhances traditional tourist offerings, reduces dependency on specific weather conditions, and attracts visitors during the off-peak season, leading to significant economic benefits (Bausch & Unseld 2018; Bichler & Pikkemaat 2021).

Tourists, especially those from snow-deprived regions, are drawn to urban destinations seeking novelty in winter landscapes and are further motivated by the festive ambience of holiday celebrations like New Year's Eve, for

instance, fostering socialising and exploration. Overall, this blend of seeking novelty and participating in seasonal festivities significantly motivates tourists to choose urban destinations during winter (Cocolas et al., 2016).

Winter tourism in Lisbon offers a unique chance to experience the city's notable features during the cooler months, influenced by several push factors that draw visitors. The city's mild climate, vibrant cultural events, affordable travel options, and unique culinary offerings are significant attractions. These elements and tourists' internal motivations - such as comfort, cultural engagement, value, and culinary curiosity, fundamentally influence their decision to visit. Understanding these pull and push factors provides deeper insights into why Lisbon continues to captivate diverse visitors during winter, highlighting the complex interplay between destination attributes and personal travel motivations (Loureiro and Sarmento, 2019; Machete et al., 2014).

2.3 Tourist Segmentation Based on Push Factors

Segmenting tourists according to their push factors is vital in the tourism sector, shaping marketing approaches, resource allocation, and sustainable development. By understanding tourists' internal motivations, destinations can customise marketing strategies to cater to diverse needs effectively, thereby boosting promotional efficacy and overall destination attractiveness.

Identifying specific segments such as escape, novelty, or passive seekers enables destination managers to craft targeted marketing strategies that resonate with each group's unique motivations, as highlighted by Tsegaw (2023). This strategic approach not only improves marketing outcomes but also optimises the use of resources, particularly in digital and social media platforms, where content can be specifically configured to attract tourists based on their motivational factors (Katsikari et al., 2020).

Furthermore, understanding tourist push factors aids in strategically allocating resources, ensuring that services are tailored to meet the expectations of distinct tourist groups. This not only enhances the tourist experience, potentially increasing destination loyalty, but also aligns with sustainable tourism practices by addressing the specific needs of tourists in a manner that promotes resource efficiency (Mesić et al., 2022).

3. Method

3.1 Data Collection and Instruments

A self-administered questionnaire was used to collect data from a convenience sample of Lisbon region tourists. The respondents answer the questionnaire autonomously at their own pace, without interference from the interviewer. This process assures the respondent a sense of anonymity and security, promoting honesty in responses and reducing social desirability bias. Thirteen sampling points were identified to cover the region as best as possible, and the data was collected between January and February 2024. The winter season in Lisbon was defined based on climatic and tourism industry standards. In the Lisbon region, winter spans from December to February and is characterised by cooler temperatures and a distinct shift in tourist activities and motivations. The tourism industry in Lisbon aligns its marketing and operational strategies with this seasonal framework, promoting winter-specific attractions and events. Our study excluded December due to the particular characteristics of the holiday season events that could affect travel motivations and tourists' decisions.

The list of sources of tourism information that people usually consider when organising tourism travels (rated by respondents from 1- Not at all Important to 7- Extremely Important) was adapted from the literature (Coromina and Camprubí, 2016; No and Kim, 2015), as well as the list of reasons to take the trip (1- Totally Disagree; 7- Totally Agree) (Rita et al., 2019; Sangpikul, 2008, Yung-Kun et al., 2015); other variables included in the questionnaire intended to describe the participants' demographic profile and travelling behaviour.

3.2 Sample Profile

The convenience sample comprises 306 observations. The age distribution reflects a broad spectrum, with a greater percentage falling within the 26 to 35 years bracket (38%). The 18 to 25 years group (20%), the 36 to 45 years group, and the 46 to 55 years group (15% each) are also noteworthy. The gender distribution reveals a slight predominance of women, constituting 55% of the sample. 77% of respondents indicated possessing 'Tertiary education', and 21% hold secondary education. Among the respondents, 60% are employed full-time, and 13% are students. Entrepreneurs constitute 12%; the remaining sample was formed by retirees, part-time employees, and unemployed participants. 45% of the participants reported an annual gross income below 20,000 euros, while 42% reported between 20,000 and 40,000 euros. The rest of the sample reported more than 40 000 euros. Respondents originate from a diverse range of 31 countries, but the majority comes from European countries (76%), with Spain (17%), Italy (15%), and France (12%) emerging as the most represented.

Related to travel behaviour, 71% of the tourists were visiting the Lisbon region for the first time. The other participants have visited the area one to three times before. 69% consider their travel arrangements independent, and 30% purchased the service from a travel agency or tour operator. 31% visited the region with family, 30% with friends, 26% with a spouse or partner, 11% were solo travellers, and 1% with colleagues or co-workers. The main reasons for the trip were cultural exploration and experience (58%), leisure (56%), and adventure and exploration (22%).

3.3 Data Analysis

A K-means algorithm analysis was performed for two, three, four, and five clusters. The solution of three segments was confirmed as the best option statistically. The discriminant analysis revealed that 98% of the cases were correctly classified. The Wilks statistic for the two discriminant functions was 0,081 (<0,01), confirming significant differences between the three groups. The canonical correlations were 0,861 and 0,829 for functions 1 and 2, respectively. Figure 1 shows the position of the clusters according to the two discriminant functions. ANOVA tests confirm the differences between the motivation variables among the three groups, except for 'I wish to relax' and 'I wish to see the beauty of the place'. Segment characterisation was done through descriptive statistics, and differences were tested using Qui-square and ANOVA /Kruskal-Wallis tests.

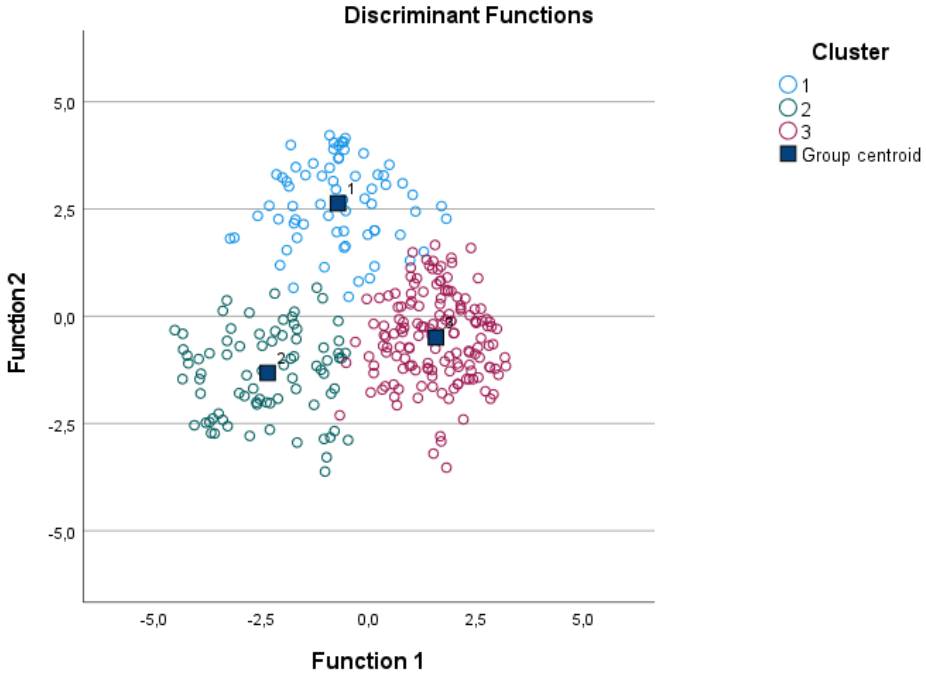

Figure 1: Clusters position supported by travel motivation

4. Results

We begin by describing the traits that are shared across all segments. Then, the characterisation of each cluster is presented, considering travel profile, motivations, sources of tourism information, and sociodemographic characteristics.

Regarding travel profile, there was no significant difference between tourists visiting the region for the first time across the three segments (between 65% and 77%). 'Cultural exploration and experience' is the primary reason for travelling, cited by 50% to 60% of respondents across all segments, although nearly 80% of those in cluster 2 also travelled for 'leisure' purposes. Adventure and exploration are other common travel reasons, with 19% to 24% of responses in each segment. Motives such as 'family reunions', 'work-related travel', 'honeymoons', and 'educational' pursuits received minimal responses, ranging from 0% to 6%, with "work and business" travel slightly more prevalent in cluster 3.

Regarding travel motivations, 'I wish to relax' and 'I wish to see the beauty of the place' are consensual across all three segments. Regarding the motivation, 'I wish to relax,' Cluster 1 had a 79.7% total agreement, cluster 2 had 77.5%, and Cluster 3 had a 73.2% total agreement. Concerning 'I wish to see the beauty of the place', cluster 1 had 98.6%, cluster 2 had 91.3%, and cluster 3 had 90.8%

Concerning sources of tourism information, all segments similarly valued 'official websites (e.g., websites of locals, attractions, tourism organisations)' and 'search engines (*e.g.,* Google)'.

As for the sociodemographic profile, there were no significant differences among the three segments regarding the 'Current professional situation' of participants, with 59% to 65% being 'Employed full-time'.

4.1 Cluster 1: Cultural Explorers

Travel profile - Regarding travel arrangements, 49% of the respondents from this segment opted for independent travel arrangements, while the remaining (44%) preferred services purchased through a travel agency. Most travellers prefer to go with 'family members' or a 'spouse/partner', making up nearly 90% of the segment, while fewer choose to travel with 'friends' or 'solo'. Trips of 1-7 days are most common, comprising over 70% of responses from this segment, but 1–2-week stays are also notable at 26%. The main motivation for travel is 'cultural exploration or experiences', which nearly 60% of participants cite, closely followed by 'leisure' at 49%.

Travel motivations- Tourists in this segment strongly disagree with the statement, 'I wish to have a break from everyday life'. Conversely, they show the highest level of agreement for 'Interactions with families' and 'I wish to interact with other people'. Additionally, there is a higher agreement, compared to other segments, with 'I wish to be in contact with nature' and 'I wish to observe animals that are not living in the country where I live'.

Tourism information sources - In this segment, the most influential sources of information, ranked by their degree of importance, are 'Search engines (e.g., Google)', at 81.2%, 'Official websites (e.g., websites of locals, attractions, tourism organisations)', at 66.7%, 'Friends and relatives' recommendation', at 59.4%, and 'Sites of reviews (e.g., TripAdvisor, Booking, Trivago)' at 55.1%. For 'Travel agencies', 40.6% of respondents consider it extremely important, while 24.6% do not attribute any importance to it. 'Tourism brochures' also see an equal split at 24.6% between those who find them extremely important and those who don't find them important at all. Press, radio, and television are deemed important by 66.7% of respondents from this segment. 'Tourism blogs' exhibit a similar pattern, with 55.1% agreement. On the less favourable side, 'Tourism fairs' are considered "not at all important" by 38.2% of respondents, 'Social networks (Facebook, Instagram, YouTube, etc.)' by 44.9%, and 'Digital influencers' by 60.9%.

Sociodemographic profile – In this segment, most respondents are male (55%). There is nearly an equal split between individuals with 'Secondary/Professional education' and those with 'Tertiary-University' qualifications (47% versus 49%). This segment also comprises the highest percentage of 'Employed-full time' (65%) and 'Retired' (25%) individuals among the three segments. Furthermore, 59% of the respondents report an income bracket of €20,000 to €40,000.

4.2 Cluster 2: Leisure explorers

Travel profile - Regarding travel arrangements, 50% of respondents from this segment indicated independent travel arrangements, while the other 50% preferred services purchased through a travel agency. Regarding the travel party composition, this segment has the highest proportion (24%) of 'solo travellers'. However, there is a stronger preference for travelling with 'Family members' or a 'spouse or partner', which accounts for 73% of the total. Additionally, the data reveals a preference for stays lasting '4-7 days' and '1-2 weeks', representing 84% of responses. Regarding the reason for travel, 'Leisure' notably stands out in this segment, with a significantly higher percentage (79%) of affirmative responses, nearly twice as many as in the other segments.

Travel motivations - 'I wish to have fun' garners the highest level of agreement among the listed motivations in this segment, while 'I need to study or work' encounters complete disagreement. There is also a strong disagreement about 'I wish to interact with my friends'. Furthermore, 'I wish to do what most people think is necessary to do at least once in life' receives lower levels of agreement than the other two segments.

Tourism information sources - This segment distinguishes itself by placing greater importance on 'Tourism blogs', demonstrating less variability in this preference. It assigns the least significance to 'Friends and relatives' recommendations.

Sociodemographic profile - This segment exhibits a nearly equal distribution of male and female participants (50% versus 49%). It primarily comprises individuals aged 26 to 55, constituting approximately 80% of its demographic. Notably, 89% of respondents hold a 'Tertiary-University' degree, the highest proportion among all segments. Regarding their 'Current Professional Situation', it ranks second in the percentage of 'Employed-full time' respondents (61.3%), has the highest rate of 'Entrepreneurs' (19.8%), and uniquely includes 'Unemployed'

respondents at 4%. Income levels are relatively evenly distributed, with 48% earning less than €20,000 and 44% earning between €20,000 and €40,000.

4.3 Cluster 3: Social Explorers

Travel profile - This segment is distinguished in 'Travel arrangements' by a significant preference for independent travel arrangements, with 85.6% choosing this option compared to only 14.4% opting for the more traditional services purchased from a travel agency or tour operator. Concerning the 'Travel Party', this segment is notable for a high rate (56%) of 'travelling with friends' and a low rate (11,1%) of travelling with a 'spouse or partner'. It shows a preference (73,2%) for stays ranging from '4-7 days' (42,5%) to '1-2 weeks (28,8%)'. The primary reason to travel is 'Cultural exploration or Experience' (60%), followed by 'Leisure' (49%).

Travel Motivations - This segment exhibits the most disagreement and greatest variability concerning the desire 'to know different cultures'. Conversely, 'I wish to interact with my friends' receives the highest level of agreement. Both 'I wish to feel more independent' and 'When discussing with my friends on social media (such as Facebook) I raised the impression that I would do it' also show high levels of agreement. Additionally, this segment shows strong agreement for motivations such as 'I wish to have fun', 'I wish to see the beauty of the place', 'I wish to have a break from everyday life', 'I wish to know different cultures', and 'I wish to relax'. Motivations such as: 'I wish to feel more independent', 'I wish to interact with my friends', 'When discussing with my friends on social media (such as Facebook), I expressed the intention to do it', 'I wish to experience beautiful natural landscapes', 'I wish to be in contact with nature', 'I wish to do what most people think is necessary to do at least once in life', 'I wish to interact with other people', and 'I feel connected to the Lisbon region' also have relatively high levels of agreement. However, there is an important level of disagreement for motivations such as 'I wish to observe animals that are not native to my country', 'I wish to interact with my family (partner, children, mother, father, brothers, etc.)' and 'I need to study or work'.

Tourism information sources - The more traditional 'Travel agencies', 'Tourism brochures', and 'Press, radio, and television' are deemed least important by this segment, whereas 'Review sites' are highly valued and considered very important. Additionally, 'Digital influencers' and 'Social networks' are rated highly important and exhibit the least variability in this group.

Sociodemographic profile- In this segment, female participants constitute the majority (62%), with a significant portion (85%) aged 18 to 35 years and none over 65. Regarding education, 84% hold 'Tertiary-University' qualifications, with no respondents having only 'Primary' education. Regarding their 'Current Professional Situation', this segment includes the highest proportion of 'Students' (21%), the lowest level of 'Employed-full time' (58%), and nearly 11% are 'Entrepreneurs'. Financially, this group has the largest share (52%) in the lowest income (less than €20,000), reflecting the high number of students, and also holds the second-highest proportion (11.3%) within the €40,001 to €50,000 income range.

5. Discussion

This study provides a comprehensive insight into the dynamics of winter tourism in Lisbon, highlighting its evolution and the diverse tourist segments it attracts. Next, we present a breakdown of the theoretical and practical contributions. The theoretical insights help build a solid academic foundation on urban winter tourism dynamics. At the same time, the practical applications provide actionable strategies for enhancing Lisbon's appeal and economic benefits during the winter months. These contributions are vital for sustaining tourism growth and adapting to changing tourist behaviours in urban settings.

5.1 Theoretical Contribution

The research enriches the theoretical landscape. It contributes to urban tourism theory by illustrating how cities can leverage their inherent cultural and infrastructural advantages in less busy seasons. Moreover, the study enhances tourism segmentation theory by pinpointing distinct clusters grounded in travel motivations and profiling each based on nuanced behavioural and sociodemographic variables. It helps understand how different segments perceive and consume tourism differently, particularly in an urban winter context. Furthermore, integrating socio-economic factors like employment status, income levels, and educational backgrounds into the analysis provides a deeper theoretical understanding of how these elements influence travel preferences and behaviours, aligning with theories of consumer behaviour in tourism.

5.2 Practical Contribution

The study's findings offer valuable guidance for tourism marketers and city planners in Lisbon on tailoring their offerings to meet the distinct needs of various tourist segments during the winter. By understanding the primary travel motivations of each segment, tourism providers can diversify their products and services to better cater to these preferences. Additionally, insights from the study can aid in efficient resource allocation and policy formulation, helping to prioritise investments in tourism infrastructure such as enhancing cultural sites, improving public transportation, and developing winter-specific festivals and events. Understanding each segment's specific needs and preferences, including their length of stay and travel party composition, enables tourism operators to create more targeted and satisfying experiences that could lead to higher rates of repeat visitation and positive word-of-mouth.

5.3 Limitations and Further Research

The use of convenience sampling in the study on Lisbon's winter tourism poses a significant methodological limitation due to its susceptibility to selection bias, which may affect the sample's representativeness and limit the generalizability of the findings. Furthermore, the study's reliance on cluster analysis, which is heavily dependent on the chosen variables and data integrity, could be compromised by the limitations of the sampling method. Consequently, while the study offers valuable insights into the dynamics of winter tourism in Lisbon, these findings should be taken with caution, considering the potential biases and limitations of the study's design and methodology. Further research can be done by adding other research variables while keeping the questionnaire with a reasonable dimension.

Addressing these limitations in future research could involve expanding the scope of data collection across multiple seasons, including a broader geographical area, incorporating more granular demographic data, conducting longitudinal studies, and integrating more qualitative analyses to understand the cultural and social nuances affecting tourist behaviours.

Greenwashing in the FinTech Sector: The Role of the EU Corporate Sustainability Reporting Directive (CSRD)

Kamila Pawlak
University of Economics, Katowice, Poland

kamila.pawlak@edu.uekat.pl

Abstract: FinTech companies, along with other financial institutions, face increasing pressure to take the lead in promoting a more environmentally sustainable future. The EU lately incorporated Corporate Sustainability Reporting Directive (CSRD) which offers both possibilities and challenges. This study examines the most recent modifications to Environmental, Social, and Governance (ESG) standards, identifying potential shifts that could affect FinTech firms. The problem of "greenwashing," a tactic used by businesses to misrepresent themselves as environmentally conscious, is especially concerning. Through literature analysis, this study attempts to explain terms related to greenwashing. While greenwashing instances were revealed so far within the confines of traditional banking, this study ventures beyond, including FinTech firms. FinTech companies are the focus of analysis because they are expected to play a significant role in the increased regulatory scrutiny starting in 2024. The paper addresses the opportunities and challenges that financial technology companies may face as they navigate this complex field. Relevant stakeholders looking for deep insights into the relationship between financial technology and environmental responsibility will find great value in the research's conclusions. This paper adds to an ongoing conversation on sustainability and regulation, enhancing the discussion of ethical financial activities.

Keywords: Greenwashing, FinTech, EU corporate sustainability reporting directive, Environmental, Social, and governance (ESG) criteria, Regulatory implications

1. Introduction

The world is witnessing the pressing need to meet the 2030 Sustainable Development Goals (SDGs). SDGs are an example of a few international agreements, primary among them the Paris Agreement, which contains a promise to attain the net-zero aim (Lee et al., 2023). The financial sector noted the challenge and opportunity of contributing to sustainable innovation. All three pillars—economic, environmental, and social—are driven by the FinTech sustainability nexus, according to the literature (Abad-Segura et al., 2020; Goldstein et al., 2019).

Few studies have identified FinTech as a key player in energy transition and emissions reduction. Low-carbon FinTech is promoting sustainable development by facilitating green finance, lowering costs, and offering efficient, sustainable lifestyles (Sreelekshmi et al., 2023). The number of climate tech startups and scaleups is rising, with the thriving green technology sector emerging. The sector is expected to grow to $9.5 trillion by 2030. Only positive for the investors and for all the workers that the sector employs, but also for the planet. Green tech companies use innovation and new business models to reduce greenhouse gas emissions, replace unsustainable materials, and lower demand for non-renewable natural resources (Time, 2024). This new trend is only showing the speed and the need for more enablers to bring us closer to sustainability goals.

The current European Union (EU) regulatory scene helps businesses move towards greener practices.

With the implementation of the new European Union Directive (EU) 2022/2464 of the European Parliament and of the Council of December 14, 2022, the non-financial disclosures for large companies are now regulated. The Directive aims to increase transparency and comparability of Environmental, Social, and Governance (ESG) disclosures while also ensuring due diligence of the information presented. Previously, the audit of non-financial statements was not secured, leading to irresponsible practices by some companies and financial institutions. This practice was coined in literature as "greenwashing," a tactic described by companies that misleads stakeholders about their environmental practices and approaches.

There are a handful of previous studies, published just over the last year and currently, that investigated the effects of the new CSRD directive on the FinTech sector. Zhou & Wang (2024) examined FinTech's role in sustainable finance and discovered that, in the end, it promotes sustainable finance by helping to expose greenwashing by making financial services more accessible to environmentally conscious businesses. Xie et al. (2023) focused on the topic of how FinTech inhibits corporate greenwashing. The impact of bank FinTech on ESG greenwashing was studied by Liu & Li (2024). The findings included that FinTech reduces greenwashing by minimizing financial constraints and information asymmetry, particularly in high-polluting industries. While some studies examined the implications of recent regulations on the FinTech sector, including CSRD, there is a notable gap in research specifically focusing on how the FinTech sector adapts to new regulatory regimes, particularly in combating greenwashing. FinTech, as an emerging sector, is not known as well as traditional banks

for adhering to ESG practices or guidelines. Given the limited studies in this specific area, this study aims to address this gap by investigating existing literature on greenwashing in FinTech and studying the implications of the new CSRD directive on the regulatory landscape of FinTech.

Although most cases of greenwashing reported so far concerned traditional banking institutions that disclosed non-financial information on a voluntary basis, this study expands the discussion to include FinTech companies. This paper contributes to a more nuanced understanding of greenwashing within the evolving regulatory framework (CSRD) by focusing specifically on the FinTech industry. It also contributes to the growing body of literature on the implementation of the CSRD directive, with a particular focus on assisting FinTech firms to detect and combat greenwashing.

This study is guided by the following research questions:

Q1: What conclusions can be drawn from the literature on greenwashing that are particularly relevant to the FinTech sector's adaptation to new regulatory regimes?

Q2: What role can FinTech play in mitigating greenwashing?

The implementation of the directive shall be considered a legal factor, however, if it is deemed to affect the entire business environment of the companies. The implementation and its effects are therefore multi-related and connected to other elements. This study, exploratory in nature, aims to show the effect of these potential elements by reviewing the existing literature (desk research). To address the research questions, the study will employ a combination of inductive, deductive, and synthetic approaches. The methodology applied in the study adapts the SLEPT (Social, Legal, Economic, Political, and Technological) framework. Although the analysis does not strictly follow the traditional SLEPT framework categories, it does modify these elements in order to fully analyze the directive's complex effects. SLEPT adaptation aids in structuring the study's deductive nature.

The article is organized as follows for the remainder of it: The second section provides a synthesis of recent regulations such as the Corporate Sustainability Reporting Directive (CSRD) that aim to encourage FinTech companies (and not only) to integrate environmental sustainability into their operations. The third section gathers and explains the main terminology relevant to the study: greenwashing and FinTech. The explanation of the terms is based on the Scopus database searches of these two terms relevant to the study. The fourth section, titled "CSRD contribution to FinTech's business landscape," presents arguments for the research questions. In the "Conclusions" section, the findings, recommendations, and contributions are presented.

2. Regulations as a Driver for FinTech's Environmental Sustainability

Environmental sustainability is an important topic that has gained attention through the implementation of CSRD. Regulations acknowledge the significance of sustainability. New regulatory frameworks encourage FinTech companies to incorporate environmental sustainability into their operations (Vergara & Agudo, 2021).

By requiring businesses to integrate sustainability into their activities, the Corporate Sustainability Reporting Directive (CSRD) contributes to the advancement of green technology. A systematic framework that requires thorough reporting on environmental, social, and governance (ESG) factors is made available by the implementation of the CSRD. The directive itself orders the companies, and FinTech's among them, to include sustainability aims, such as absolute greenhouse gas emission reduction targets for 2030 and 2050. CSRD also mandates to include a description of the company's progress towards attaining its aims, as well as a declaration on whether its environmental targets rely on conclusive scientific evidence (European Union, 2022, Article 19a, 2b).

FinTech, also being in the scope of this regulation, will be required to present a plan, including how it will carry out actions and make related financial and investment plans to make sure that its business model and strategy are in line with the shift to a sustainable economy. The goal is limiting global warming to 1.5°C under the terms of the Paris Agreement, adopted on December 12, 2015, by the United Nations Framework Convention on Climate Change, and achieving climate neutrality by 2050 as set forth in Regulation (EU) 2021/1119 of the European Parliament and of the Council (European Union, 2022, Article 19a).

The directive encourages environmental practices by establishing criteria for environmentally sustainable economic activities, which "may encourage economic operators not covered by this Regulation, on a voluntary basis, to publish and disclose information on their websites regarding the environmentally sustainable economic activities they carry out (European Union, 2022, Recital 15).

3. Definitions of FinTech and Greenwashing

Two concepts relevant to this study are financial technology (FinTech) and "greenwashing." There does not appear to be a single, accepted definition of FinTech. Admittedly, there is a conceptual diversity of the term in the academic literature (Milian et al., 2019). According to Zhou et al. (2022), the Financial Stability Board (FCB) characterizes FinTech as financial innovation propelled by technology that presents innovative applications, procedures, and goods that have a noteworthy influence on financial markets, establishments, and offerings. Another definition describes the FinTech phenomenon as an innovation aimed at providing alternative financial services, followed by practical examples of FinTech: peer-to-peer lending, digital-only banks, mobile money, cryptocurrency, and regulatory technology (RegTech). Mobile money is a prominent example of a widely adopted FinTech innovation (Senyo et al., 2022). However, the Goldstein et al. 2019 study describes FinTech as focusing on integrating recent technology into established financial operations while downplaying the importance of the Internet. This latter FinTech definition is unique in that it places FinTech in the context of its contributions to current financial systems, highlighting the aspect of incorporating new technological advancements into already existing financial systems and procedures.

The intricacy of recognizing and comprehending greenwashing—a practice in which businesses may mislead stakeholders about their environmental efforts or effects—is within the scope of this study. Because greenwashing takes many different forms—from deceptive environmental labels on products to inflated sustainability claims in corporate reports—even to the most knowledgeable, it is challenging to identify it.

There are a range of terms that are used to describe greenwashing. These include corporate social responsibility decoupling, greenwashing, pinkwashing, bluewashing, CSR washing, or recently, social washing. These terms are interchangeable. Although greenwashing is used broadly, it will be consistently applied throughout the whole study.

Existing scientific publications on the subject of greenwashing feature methodical literature reviews. This study will rely on the outcomes of the analysis made by De Freitas Netto et al. (2020) to structure and systematize the terminology. However, the definitions gathered in Table 1 covered up to and until 2020, leaving a gap of four years of academic literature that evolved and equilibrated the terminology. To fill this gap, a more extensive search was conducted, which enhanced and completed the list of definitions of greenwashing found in scholarly publications after 2020. Aiming to refine a variety of existing definitions of greenwashing, a narrow search of the existing academic literature focused on the issue of greenwashing in the context of FinTech was done. The search was conducted using the Scopus database. Search terms that matched the definitions used in the study were included in the search string: (TITLE-ABS-KEY (greenwashing) AND TITLE-ABS-KEY (FinTech))).The search result returned seven papers, with no time bounds. It is important to note, however, that most papers were published recently in 2024 and 2023.

Table 1: Selected definitions of term greenwashing

Year	Author	Definition
1976	Weick	Decoupling among authorities in educational institutions.
1977	Meyer and Rowan	Decoupling as action of upholding formal, standardized structures while adjusting their operations to suit real-world needs.
2010	Jamali, Egels-Zandén, et al.	Separation of CSR policies from daily operations.
2012	Walker and Wan	CSR Decoupling as symbolic CSR initiatives that seek to improve society and the environment without requiring the company to materially adjust its actual business processes. Companies that have a negative CSR performance which at the same time apply a positive communication about their CSR performance.
2016	Pope and Wereas	"CSR-washing," referring to separation of CSR action from communication and a business's ability to compete.
2016	Haack et.al	Improvements to the environment and society, symbolic in nature.
2019	Sauerwald, S. and Su, W	The gap between how firms communicate CSR and what firms do in terms of CSR.
2020	Glozer and Mori	CSR decoupling as hypocritical presentation of themselves, which deviates from their true selves.

Year	Author	Definition
2020	Du, 2015; Akituran, 2018; Huang et al., 2020; Torelli et al.	Greenwashing as a type of CSR decoupling in which businesses signal their environmental responsibility publicly through environmental certification or other means, frequently without making significant changes to their actual environmental practices.
2022	Minh and Quang	Misleading information or false impressions about company's products are environmentally friendly. Businesses will use "strategic" environmental speculation.
2023	Xie et al.	Presenting false information or misleading impressions about how environmentally friendly a company's products are.

Source: Own elaboration based on De Freitas Netto et al. (2020), Minh and Quang, (2022), Xie et al., (2023).

In the academic literature, both terms "green finance" and "FinTech" are relatively new and largely unexplored, so their nexus research is even more relevant. Green FinTech gained entrepreneurial attention as evidenced by their growth in terms of number, areas under operation, regions of operation, number of employees, and recognition from funding agencies (Wan et al., 2023) According to the StartUs Insights Report, there are currently 863 green finance companies globally. Among these, green FinTech stands out for their innovative solutions in green financing, including areas like green funds, traceable investments, and ESG financing. These startups operate in hubs such as London, New York City, San Francisco, Singapore, and Berlin (StartUs Insights, 2024).

The academic literature mentions that some scholars consider only environmental issues when defining greenwashing, distinguishing it from the term bluewashing, which stands for social issues. Other researchers do not make this distinction and consider greenwashing to have a social and environmental focus. Greenwashing can be perceived from several different angles, from product-level claims with environmental labeling to firm-level elements being a part of sustainability reports. This multifaceted way of greenwashing offers consumers difficulty in identifying and addressing this phenomenon (De Freitas Netto et al., 2020).

Over the course of decades, several academics and researchers have contributed to our understanding of the concept of "greenwashing." Although the concept has evolved over time, it still presents a persistent challenge to ensuring corporate actions match their stated intentions.

3.1 FinTech Greenwashing in Scientific Research

The searches for definitions of FinTech and greenwashing in the academic database of Scopus sought to highlight so far carried out research that would center around the problem in a specific FinTech environment. Zhou and Wang (2024) state that their research examines how FinTech can help historically non-environmentally conscious companies (referred to as "brown firms") recognize and minimize their greenwashing practices, with an emphasis on the convergence of sustainable finance and FinTech. The study claims that many brown businesses may falsify their environmental friendliness to obtain sustainable financing, therefore finding themselves participating in greenwashing. According to the study, financial institutions can now choose companies that genuinely qualify for sustainable finance based on their environmental contributions, thanks to this technological capability. The study highlights the pivotal function of FinTech in augmenting the effectiveness of sustainable finance. This is achieved by providing the necessary instruments to counteract greenwashing, thereby guaranteeing that financial support is allotted to authentically sustainable endeavors instead of those preventing them. A similar outcome is included in the study by Xie et al. (2023. The research highlights that corporate greenwashing behavior is inhibited by financial technology and that this inhibitory effect is positively reinforced by financial constraints. The article illustrates that FinTech is perceived as a powerful tool to help achieve transparency when identifying greenwashing. It also underscores the importance of financial constraints reinforcing this effect, which will contribute to more sincere and sustainable corporate practices. The most recent study by Liu and Li (2024) shows that by removing financial barriers and reducing information asymmetry, FinTech successfully lowers ESG greenwashing.

Although the academic literature seems to be limited, the studies agree that FinTech contributes to diminishing greenwashing by improving straightforwardness and transparency, monitoring, and guaranteeing the genuineness of environmental claims. The integration of advanced technologies used by FinTech creates an environment where honest and genuine sustainable practices are stimulated and the opposite is discouraged.

4. The CSRD Contribution to FinTech's Business Landscape

This study draws on the SLEPT framework to investigate the broader environmental factors influencing FinTech's under new regulations. While not strictly adhering to the conventional categories of SLEPT framework, the analysis adapts these elements to thoroughly analyse the directive's multifaceted influences. Adapting SLEPT helps to structure the deductive character of this study.

4.1 CSRD Implementation

The Corporate Sustainability Reporting Directive (DIRECTIVE (EU) 2022/2464) went into effect on January 5, 2023. The implementation of CSRD is linked to the European Green Deal that envisions the EU as a contemporary, resource-efficient, and competitive economy.

CRSD introduced the requirement to report on sustainability by large companies (with an average number of employees exceeding 500) and publicly traded corporations. Parent undertakings being a part of a large group (with an average number of employees exceeding 500 on a consolidated basis) are also in scope. In the case of non-European-based companies with an annual turnover exceeding EUR 150 million on the EU market or companies with securities traded on EU-regulated markets, these companies will also be required to issue sustainability reports. Additionally, all subsidiary undertakings are exempt from reporting non-financial information under Directive 2013/34/EU's Articles 19a(3) and 29a(3), provided that both the parent undertaking and its subsidiary undertakings are included in the consolidated management report, and the report also includes non-financial information reported in compliance with that Directive (European Union, 2022, Recital 25). This could be seen as a regulator's latitude to ease the load on certain companies. Regardless of the industry, businesses covered by the CSRD are subject to these standards. They complement and add to global standardization efforts while being adapted by EU policies. One of the major differences of the recently launched directive is that the non-financial reports are called "sustainability reports" (Directive 2022/2464, EN-CCSRD Directive, EUR-LEX). The information that undertakings should disclose regarding the business-relevant principles of ESG in sustainability reporting standards is collected in Table 2.

Table 2: Reporting requirements per ESG factor based on CSRD

ESG Factor	Reporting topic	Disclosure information
Ecological	Climate	Risks and resilience related to climate scenarios, including adaptation plans for achieving climate neutrality by 2050
Ecological	Climate	GHG emissions and removals, usage of offsets and their sources
Ecological	Energy	Reducing energy use and increasing energy efficiency
Ecological	Climate	Climate, air, land, water and biodiversity
Social	Human rights	Forced and child labour
Social	Forced labour	Import of goods produced through human rights abuses
Social	Employment	Risks, trends, conditions of employment
Social	Inclusion	Equal opportunities and workplace conditions
Social	Gender equality and equal pay	Gender and pay gap
Social	Disability	Accessibility measures
Social	Training and skills development	Access to training
Social	Collective bargaining	Policies and strategies related to collective bargaining
Social	Participation of workers	Participation in administrative and supervisory boards
Social	Diversity	Gender diversity in leadership and board representation
Governance	Sustainability oversight	The expertise and skills needed to fulfil roles of board members
Governance	Risk management	Risk and control systems related to sustainability
Governance	Corporate ethics	Anti-corruption and anti-bribery
Governance	Suppliers	Payment practices, terms, interest, recovery costs

Source: European Union, 2022, Recital 14,49

Enhancing the comparability and transparency of ESG disclosures made by companies is the directive's main goal. The regulator wants to encourage uniform and consistent ESG information disclosure. It mandates that information on policies, key risks, and results pertaining to environmental matters, social and employee factors, human rights, anti-corruption issues, and diversity on the board of directors be included in annual sustainability reports. Firms in the scope of the directive will now be required to use EFRAG (European Financial Reporting Supervisory Group), which is a private association established in 2001 with the encouragement of the European Commission to serve the public interest (EFRAG Today, EFRAG). These unified standards replace GRI (Global Reporting Directive), SASB (Sustainability Accounting Standards Board), or the Task Force on Climate-Related Financial Disclosure (EFRAG, n.d.).

4.1.1 S for social contributions of CSRD

Except for the impact on the engagement of stakeholders, investors, consumers, and civil society the new directive will have, the regulation supports the system of classification for environmentally sustainable economic activities with the aim of scaling up sustainable investments and combating greenwashing of financial products that unduly claim to be sustainable (European Union, 2022, Recital 2). This measure aims to mitigate the risk of greenwashing by guaranteeing transparency, consistency, and accountability in the promotion of environmentally sustainable investments. All are particularly important for sustaining social trust in FinTech companies and their practices.

CSRD emphasizes how crucial sustainability reporting is to preserve public confidence and business reputation. The absence of trustworthy sustainability data may cause a deficiency in accountability, which in turn may diminish public confidence in companies and impede the smooth operation of the social market economy. In addition, the inability of investors to allocate capital to initiatives that mitigate social and environmental problems undermines the goals of the Green Deal, the Action Plan on Financing Sustainable Growth, and the Paris Agreement. Organizations lack the ability to hold companies accountable for their effects on people and the environment when sustainability reporting is weak. The public's trust in businesses may be damaged by this lack of accountability, which would reduce the efficiency of the social market economy (European Union, 2022, Recital 14).

The directive contributes to addressing social responsibility issues by specifying disclosures on social factors such as working conditions, social partner involvement, collective bargaining, equality, non-discrimination, diversity, and inclusion, as well as human rights. Such data should help to address how this will affect people, employees, and people's health and wellbeing. The details that undertakings reveal regarding human rights should, where appropriate, incorporate information regarding child labour and forced labour into their value chains. The implementation of sustainability reporting requirements pertaining to forced labour should not prevent public authorities from fulfilling their obligation to confront the import of goods resulting from human rights violations, including forced labour, through trade policy and diplomatic channels. Businesses should also be able to report on potential hazards and changes in employment and income trends, the inclusion of people with disabilities, and accessibility measures taken by undertakings. The reporting standards assume the reporting obligation to disclose information on available workers' training and skill development. Bargaining should include information about work councils, collective agreements, and the proportion of workers covered by them. Sustainability reporting standards should include disclosures on worker participation in administrative and supervisory boards. Gender diversity at top management and the representation of underrepresented groups on boards are integral parts of the directive (European Union, 2022, Recital49).

In summary, enhancing the social responsibility of the undertakings is the goal of the CSRD Directive, which requires a comprehensive and transparent way of reporting. This should be an enabler to promote public trust in companies through their actions and policies. All these factors support the effective operation of the social market economy.

4.1.2 L for legal contributions of CSRD

The sustainability reports should be published with an assurance opinion expressed by a person or firm authorized to give an opinion on the assurance of sustainability reporting, either under the national law of the third country undertaking or of a Member State, in order to ensure the quality and reliability of the reporting. The subsidiary undertaking or branch of the third-country undertaking should make a statement in case such an assurance opinion is not provided. The public should have free access to the sustainability report via the central, commercial, or company registers of the Member States or via the subsidiary undertaking's website (European Union, 2022, Recital 20). Furthermore, the European Union (2022) permits annual reports from Member States

to the Commission on subsidiary or third-country undertakings, including those where the subsidiary or branch claimed inability to obtain relevant data (European Union, 2022, Recital 60).

The regulations governing the actions and sanctions that apply to any violations must be established by the Member States. Member States establish effective investigation and sanction systems to detect, correct, and prevent poor statutory auditing and sustainability reporting. Additionally, the directive suggests that the Member States must impose effective, proportionate, and dissuasive sanctions on statutory auditors and audit firms that fail to comply with the directive. Member States may choose not to establish administrative sanctions for infringements already covered by national criminal law. In this case, they must notify the Commission of any relevant criminal law provisions (European Union, 2022, Article 2, Recital 30).

Summarizing, the directive imposes legal obligations on companies in scope to issue sustainability reports, not leaving FinTech companies alone. It is anticipated that this change will have a significant impact on how FinTech businesses function within the EU, encouraging them to apply their technology and novel nature to the approach towards sustainable reporting. However, the anticipated challenge for FinTech businesses may come from their unregulated nature, and more scrutiny is being applied to the consequences of noncompliance.

4.1.3 E for economic contributions of CSRD

The European Union has standardized regulations to address the gap between user needs and current corporate sustainability data, warning against the potential for disparate national standards, higher compliance costs, and eroded capital market coherence (European Union, 2022, Recitals 15, 16).

Investors may struggle to assess risks in the absence of sustainability information, which could result in systemic financial hazards. Acknowledged by organizations like the European Central Bank and the Financial Stability Board, especially regarding climate change, this shortcoming inhibits investors from funding initiatives that support social and environmental advancement objectives like the Green Deal and Paris Agreement. In addition, the lack of uniform standards for evaluating sustainability impedes the endeavours of labour unions and civic society, to proficiently deliberate on sustainability practices with corporations (European Union, 2022, Recital 14).

In conclusion, the directive indicates that there will be financial savings and benefits that the businesses will experience in the medium- to long-term when it comes to a decline in reporting expenses. However, there is no mention of the extra expenses businesses will incur as a result of hiring experts in the field of sustainability or using the right software to facilitate reporting. ESG is the third area that CFOs will be looking to outside experts for assistance with because it will be challenging to automate, according to the most recent State of European FinTech 2023 report. Not to mention the mandatory audits that FinTech companies must follow, these will generate expenses.

4.1.4 P for political contributions of CSRD

In the Green Deal, the Commission committed itself to supporting businesses and other stakeholders in developing standardized natural capital accounting practices within the Union. Internationally, with the aim of ensuring appropriate management of environmental risks and mitigation opportunities and reducing related transaction costs (The European Green Deal, 2021). This European Union agenda is a key step in the European political arena towards a more sustainable future.

By implementing CSRD, the consistent way of reporting, data capture, and comparison is standardized, which is a major enabler of cooperation between member states. Such harmonization of reporting will position Europe as a pioneer in collectively achieving the goals of the European Green Deal. European FinTech will have a chance to demonstrate that they can lead the way with their access to technology and expertise to carry out ESG matters.

4.1.5 T for technological contributions of CSRD

The EU Commission hopes to enhance the comprehensiveness, comparability, completeness, and reliability of non-financial reporting (European Union, 2022, Recital 39). The so-far gap exists in a lack of common steer with regards to approaching ESG-related topics, also by FinTech businesses. With the implementation of the new CSRD, these gaps are filled. As a result, both the reporting regime's application and reports' contents are expanded; this applies to FinTech as well. However, European FinTech shall prepare to comply with such a development, which may require additional resources in terms of technology, experts, or internal advice. Although some elements of the directive might still be ambiguous and need more extended exemplification, the

directive can be considered a major step in progressing with businesses on ESG-related matters. The intense time constraints that are placed on businesses, in addition to the uncertainty they experience regarding the contents of both the CSRD's final draft and the European Sustainability Reporting Standards (EFRAG), play a role (Baumüller & Grbenic, 2021).

It is expected that the practices of sustainability reporting standards will be harmonised and standardized. There is a likelihood that third-party data providers will improve and that expertise will grow in this area, with the potential for job creation. This is a great challenge for FinTech businesses but also an opportunity for new product propositions to be offered to the market.

5. Conclusion

This paper aimed to address the latest alterations in Environmental, Social, and Governance (ESG) criteria regulations, pinpointing anticipated changes that may impact FinTech companies. Through the literature review and analysis of the CSRD directive, this paper aims to consolidate the diverse terminology surrounding greenwashing as well as focus on FinTech advancements and market trends with utilizing the technology to progress on the implementation of SDGs.

Regarding the FinTech industry's ability to adjust to new regulatory frameworks and its function in reducing greenwashing, this study aimed to address two important research questions: What conclusions can be drawn from the literature on greenwashing that are particularly relevant to the FinTech sector's adaptation to new regulatory regimes? Analysis shows that the literature on greenwashing places a strong emphasis on the necessity of accountability and transparency in business sustainability initiatives. This is especially important for FinTech companies getting ready to support and comply with the EU's Corporate Sustainability Reporting Directive (CSRD), which requires consistent disclosures about sustainability. The CSRD minimizes the risk of greenwashing by ensuring that sustainability claims are true and verifiable, which helps to reduce information asymmetry and increase investor trust. The following was the second research question: "What role can FinTech play in mitigating greenwashing? According to the analysis, FinTech, also through the recent emergence of companies active in the green technology sector (green tech), can make a big difference by utilizing its technologies to track business behavior, enable compliance, forecast sustainability trends, and identify possible instances of greenwashing. FinTech businesses can also create thorough sustainability reporting systems that compile information from multiple sources to enable truthful disclosures and adherence to legal requirements.

The study had limitations. Due to the CSRD Directive that applies to companies for the reporting period of 2024, with first reports expected to be published only in 2025, the analysis is not yet supported by the application of the directive and empirical evidence. However, this presents an opportunity for further research in the identified area of this study. Empirical data and its analysis will serve as confirmation of the direction FinTech companies take towards the application of ESG factors into their business models. Gaining more insights will enhance understanding the advancements and contributions to achieving net zero targets.

In summary, the recently launched CSRD directive can help FinTech companies normalize standards and utilize technology, big data, data mining, and AI to advance their product offerings. Recently noticeable trends of FinTech companies that become active around green technology are a sign that only advancing on the scope of activity is the scenario and the direction for these businesses moving forward. FinTech companies, in contrast to traditional banking institutions, regularly perform market research and instantly respond to the needs of the market or consumers. Compliance with recently launched regulations or FinTech's ability to serve other businesses to prevent greenwashing is one of the examples of FinTech leading the way to a more sustainable future.
