No reproduction, copy or transmission may be made without written permission from the individual authors.

Review Process
Papers submitted to this conference have been double-blind peer reviewed before final acceptance to the conference. Initially, abstracts were reviewed for relevance and accessibility and successful authors were invited to submit full papers. Many thanks to the reviewers who helped ensure the quality of all the submissions.

Ethics and Publication Malpractice Policy
ACIL adheres to a strict ethics and publication malpractice policy for all publications – details of which can be found here:
http://www.academic-conferences.org/policies/ethics-policy-for-publishing-in-the-conference-proceedings-of-academic-conferences-and-publishing-international-limited/

Self-Archiving and Paper Repositories
We actively encourage authors of papers in ACIL conference proceedings and journals to upload their published papers to university repositories and research bodies such as ResearchGate and Academic.edu. Full reference to the original publication should be provided.

Conference Proceedings
The Conference Proceedings is a book published with an ISBN and ISSN. The proceedings have been submitted to a number of accreditation, citation and indexing bodies including the Web of Science and Scopus.

Author affiliation details in these proceedings have been reproduced as supplied by the authors themselves.

Since 2022 all ACIL conference proceedings are open access and freely available to read from https://papers.academic-conferences.org/index.php/ecie

The Conference Proceedings for this year and previous years can be purchased from www.proceedings.com

Contents

Preface **xvii**
Biographies **xviii**
Committee **xxii**

Academic Papers

Digital Transformation and Performance of E-Service Businesses in West Africa
Hakeemat Adeleye 1-8

Universities as Living Labs for Circular Economy Entrepreneurship in the GCC
Nasser Alyahya'ei
9-18

An Empirical Study of Social Entrepreneurial Intention among Public Sector University Students in Pakistan: The Mediating Role of Entrepreneurial Self-Efficacy and the Moderating Role of Need for Achievement
Muazam Ali, Sidra Pervez, Iqra Shamshad, Atta Ullah Khan, Sohail Raza 19-28

When the Model Moves: Entrepreneurial Adaptation to Foundation-Model Dependency in AI Startups
Fahad Aljadaan 29-37

Teaching Risk, Assessing Certainty: The Hidden Paradigm in Entrepreneurship Education
Sarah Allam 38-45

Digital Technologies as an Enabler of Internal Audit Practices in the ESG Context: A Thematic Analysis of Recent Practices
Ivana Barišić, Marina Ercegović, Ivana Mamić Sačer 46-53

Public Attitudes Toward ChatGPT in Türkiye: Evidence from Instagram Sentiment Analysis
Cigdem Baskici, Yunus Gokmen 54-63

Interpersonal Relationships in Entrepreneurial Team Research: a Meta-Analysis Using Advanced Computational Methods
Mikhail Bogach 64-72

Successful Finnish Social Enterprises: A Case Study of Foundation-Based Social Enterprises in the Nordic Welfare Context
Kristiina Brusila-Meltovaara, Heidi Myyryläinen, Georgios Lampropoulos 73-80

Privacy Policies and the use of Personal Data as Strategic Variables for Entrepreneurs in the Health Apps Market
Cláudia Cardoso, Cândida Sofia Machado, Natália Lemos 81-88

Digital Transformation in SMEs: How Strategic Orientation and Digital Capabilities Drive Value Creation and Innovation
Shu-Hsiang Chen, Chaojie Ma, Yi Ke, Claus Schreier, Jillaine Farrar 89-97

Circular Migration and Entrepreneurship in the Western Balkans: From Brain Drain to Innovation Potential
Eldisa Cirogu 98-104

Structured Innovation as a Driver of Collective Transformation in Traditional Industrial Clusters
Oscarina Conceição, Teresa Dieguez, Diana Freitas 105-113

Market Validation as a Pedagogical Strategy for Developing Entrepreneurial Competences in Higher Education
Teresa Costa, Pedro Mares 114-124

Co-Creation and Blended Research Training: A Pedagogical Innovation for Early-Stage Researchers in Higher Education
Teresa Costa, Pedro Pardal 125-134

Measuring Emotional and Rational Drivers in Retail Customer Journeys Beyond Surveys
Tamás Darázs 135-142

The Socio-Environmental Canvas: Making Invisible Value Visible in Sustainable Ventures
Cecilia de Soto 143-149

Social Capital and Entrepreneurial-Specific Knowledge as Key Drivers of Innovation
Ronald Jean Degen 150-155

Sustainable Fashion: Examining Purchase Intention in Digital Second-Hand Platforms
Maria Ioanna Marmoutzaki, Georgios A. Deirmentzoglou, Eleni E. Anastasopoulou , Harry Ph. Sophocleous 156-163

The Role of GenAI Startups in Reshaping Business Consulting
Massimiliano Dell'Orto, Giuseppe Guercio, Mattia Magnaghi, Antonio Ghezzi, Andrea Rangone 164-172

Artificial Intelligence in Startup Investment Decision-Making
Wawan Dhewanto, Taufik Faturohman, Siti Insani Adiwinata, Arianne Muthia Zahra 173-181

Determinants and Intensity of Science-Business Collaboration
Zbigniew Drewniak, Iwona Posadzińska, Małgorzata Michalcewicz-Kaniowska, Agnieszka Goździewska-Nowicka, Urszula Słupska 182-189

Creativity and Innovation for Sustainable Development in Saudi Architectural and Engineering Firms
Mahmood Fakeerah, Yaser Obad, Khalil Alqady, Wajdy Qattan 190-198

Navigating Entrepreneurial Stress: How Egyptian Female Entrepreneurs Build and Sustain Resilience
Hadia Fakhreldin, Dalia Mounir, Rania Miniesy 199-207

Using Experience Design to Develop an Interactive Co-Laboratory for Inner Development Goals in Social Entrepreneurship Education: A Design-Based Case Study
Carolyn Finck, Michael Sarbacher, Christian Schlimok, Stefan Hanke, Daniel Michelis 208-216

Technical and Economic Gaps in Freight Diesel-to-Natural Gas Transition – A Conceptual Analysis
Lennon de Almeida Freire, Savio Figueira Corrêa, Sérgio Evangelista Silva 217-225

From Intention to Action: The Role of Entrepreneurial Education and Opportunity Recognition in Tourism Students' Business Aspirations
Anderson Galvão , Rafael Medeiros, Carla Marques, Telma Mendes 226-234

When Generative AI Builds or Undermines Entrepreneurial Capability
Violetta Bacon-Gerasymenko, Andrew C. Corbett, William J. Wales 235-244

Emergent Strategy and Innovation in Entrepreneurship: A Complex Adaptive Systems Perspective
Ghayur Ahmad 245-253

Building Innovation Capability Through Entrepreneurship: Evidence from Universities of Applied Sciences
Minna Hämäläinen, Kati Peltonen, Sanna Joensuu-Salo 254-262

Gen Y to Gen Z Female Entrepreneurs and the Entrepreneurial Ecosystem: Exploring New Challenges and Opportunities
Angela Hamouda, Kate Johnson, Bronwyn Wood 263-269

A Trilevel Framework for Innovation Management in National Innovation Systems
Fabian Hecklau 270-277

Understanding Sustainable Travel Choices through the Value-Belief-Norm Theory: Implications for Tourism SMEs
Elina Järvinen, Jonna Kielenniva, Sanna Joensuu-Salo 278-286

Reassessing MSME Classification Thresholds in the Philippines: Evidence of Structural Finance Misalignment from Sectoral Cluster Analysis
Ian Jester M. de Vera, Rizza G. Valdez-de Vera 287-294

Understanding Entrepreneurial Intentions: A Mediation Model of Self-Efficacy, Gender, and Role Models
Sanna Joensuu-Salo, Anmari Viljamaa, Elina Varamäki, Matti Muhos, Pauliina Björk, Martti Saarela 295-302

Public Funding, Collaboration and Intellectual Assets in a Moderate Innovator: Evidence From Portugal
Cidália Jorge, Florinda Matos 303-309

Venturethon: A Validation-First, Studio-Templated Pedagogical Model for Entrepreneurship Education
Artūras Jurgelevičius 310-318

Aligning the Expectations for University–Industry Cooperation: Experiences from the Field
Pasi Juvonen 319-325

Students' Experiences and Reflections Following an Impact Entrepreneurship Course: An Exploratory Study
Verena Kaiser, Bettina Maisch, Malgorzata Krzywonos 326-336

Network Capital as a Success Factor for Entrepreneurs: Beyond the Buzzword
Eva-Yasmine Kaiser, Jan Schikofsky 337-345

Communicating the Dual Mission: Analysis of Websites of Finnish Social Enterprise Mark Holders
Päivi Karhunen 346-352

The Global State of Digital Transformation Across Organisations: Evidence from a Large-Scale Survey
Florian Kidschun, Ronald Orth, Rusudan Kavtaradze 353-361

Beyond Profit: Sustainable Business Model Innovation in Ireland's Emerging Seaweed Bioeconomy
Ronald Wankya, Ciarán Ó hAnnracháin 362-370

Bridging Regional Innovation Gaps: The Innovation Bridge Model for SME Support and Cross-Regional Competence Sharing
Heta Hotokka, Anna-Maija Kiukas, Kati Korhola 371-378

Governance of Innovation Ecosystems: Evidence from Lisbon through the Quadruple Helix Lens
Leani Lauermann Koch, Graciele Tonial, Florinda Matos, Aline Luiza Brusco Pletsch 379-386

Organisational Aesthetics in Sustainable Human Resource Management: A Four-Dimensional Framework
Daniela Kond, Arvi Kuura 387-395

From Strategic Planning to Innovation: The Mediating Role of Environmental Proactivity in Food Industry Firms
Laura Könönen, Sanna Joensuu-Salo, Emilia Kangas 396-405

The Infiltration of Corruption and Money Laundering in Indonesia's Startup Ecosystem
Kristiawanto, Rina Shahriyani Shahrullah, Vanessa Riarta Atmaja, Hakimah Muhammad Zin, Muhammad Fatkhu Rizal Sofan Fitri 406-413

Circular Business Models of Biocomposites - Value Creation in an Industrial Ecosystem
Anu Kurvinen, Alexander Matrosov 414-423

Attracting and Retaining Innovative Talent in Region
Nathalie Lachapelle, Julie Bérubé, Naomie Allard 424-431

From Utility to Belonging: Re-Socializing the Technology Entrepreneur through Evolutionary Psychology
Sami Lanu 432-440

Challenges in Developing Student Entrepreneurship in the New Startup Ecosystem of Eastern Finland
Emma Latvala, Vesa Alatalo 441-447

Crafting the Entrepreneurial Persona: Insights From the Narratives Entrepreneurs Tell
Katherine Lewis, Anh Mattick, Simon Buchart 448-457

Bridging the Readiness Gap: A Framework for Transitioning Generation Z into Practice
Melany Lotter 458-465

Developing Entrepreneurial Competencies in Tourism Higher Education: A Design-Based Curriculum Innovation
Michal Lukáč, Ján Ganobčík, Stanislava Honzová, Peter Pisár 466-472

Innovation Measurement During Organizational Constraints: Opportunities and Challenges.
Kinga Lundholm-Reinert, Thomas Østergaard 473-484

Business Model Strategies in Mobile Health: The Role of In-App Purchases
Cândida Sofia Machado, Cláudia Cardoso, Natália Lemos 485-493

Content Marketing and Digital Advertising in Cypriot SMEs: Relevant Strategies, Challenges and Opportunities
Andreas Masouras, Rafaella Evgeniadou, Sotiris Apostolopoulos, Nicholas Theodorakopoulos 494-503

Preliminary Techno Economic Factors Shaping Industrial Adoption of Biocomposites
Alexander Matrosov, Anu Kurvinen, Kirsti Cura 504-513

Dynamic Signal Formation: A Longitudinal Case Study of Steve Jobs's Voice
Satoshi Miyajima 514-521

Measuring What Matters - or What Can Be Measured? Social Impact as Sensemaking
Heidi Myyryläinen, Kristiina Brusila-Meltovaara, Ieva Žebrytė 522-529

Value Co-Creation in Social Innovation Ecosystem: The Translational Role of Higher Education Institutions
Thao Nguyen, Minh-Hieu Thi Nguyen, Vy-Thuy Pham, Trang Thu Tran, Hai-Ninh Do, Ha-Thanh Thi Nguyen 530-538

Designing A System That The Intrapreneur Cannot Build Alone: Institutional Design for Non-Core Business Creation and the Corporate Relay Model
So Nishina 539-544

BI4Impact: Business Intelligence for Employability-Oriented SEOs
Ana Fernandes, Pedro Oliveira 545-553

From Digital Skills to Competitive Advantage: The Impact of Digital Business Training on SMEs
Anna Ollanketo, Saara Pylvänäinen, Mervi Rajahonka 554-562

Educational Partnerships and Innovation in Small Firms: Evidence from Finland
Outi-Maaria Palo-oja, Sofi Granö 563-570

Examining the Challenges of Indian Deep-Tech Startups: Pathway for Sustainable Entrepreneurial Practices
Shalini Katare, Vimala Raja Priya Mudapaka, Jayshree Patnaik 571-579

Max Weber on Entrepreneurship: Exploring His Examples
Tor Helge Pedersen 580-587

Digitalisation and Innovation in the Largest Czech Family Businesses: Innovative Behaviour and Generational Decision-Making
Jindra Peterkova, Matej Sehnal, Stefan Kolumber, Peter Starchon 588-597

Making Academic Entrepreneurship Measurable: An Interpretive Framework for Comparative Indicators
Sara Proença, João J. Ferreira 598-605

From Execution to Curation: Generative AI Adoption and the Reshaping of Design Work in the Creative Industries
Marina Quijano Paiva, Kelly Dias, Bernardo Henrique Leso, Marcelo Nogueira Cortimiglia 606-614

Bridging Institutional Fragmentation: Designing a Coordinated Support Infrastructure for Deep-Tech Scale-Up in Europe
Olga Rantanen 615-622

From Non-STEAM to Innovation: Developing Entrepreneurial and Technological Competencies through Hackathons
Claudia Rodrigues, Liliana Pereira, Rúben Carvalho, Cristina Pereira, Pedro Melo 623-629

Designing Entrepreneurial Viability for Mid-Career Entry under Static Uncertainty
Yohei Sato 630-638

Business Model Canvasses Revisited: Complementing Dynamic Layers for Start-up Investment and Entrepreneurial Perceptions
Ulrich Schmitt 639-647

Digital Twins in Industrial Transformation: A PRISMA-Based Review with Human Resource Implications
Manisha Gupta, Mamta Singh 648-656

Enhancing Grassroots Entrepreneurship Development through Market Orientation
Sonal Hukampal Singh, Birud Sindhav, Bhaskar Bhowmick 657-665

Predictors of Green Entrepreneurship Intentions Among Business Students: Evidence From Croatia
Marina Lovrinčević, Vlatka Škokić, Rita Grubišić 666-675

Challenges of Scaling Cultural Edupreneurship in an Institutionalized Educational Ecosystem: The Case of a Digital Platform Startup
Victoria Slettli 676-683

The Human vs The Artificial, and Entrepreneurial Opportunities of Training the AI
Andre Slowak, Souad Slyman 684-693

The Efficiency Indicators of the Involvement of Scientific Institutions on European and International Patents Formation as Innovations Management Tools
Inese Spica, Sarmite Jegere, Kalevs Kants, Lada Kalinina, Paula Jegere 694-702

Firms' Innovation Behaviour Under Constraints in Central and Eastern Europe
Ada Spiru, Armelina Lila, Maria Buonarota 703-712

Digital Governance of the Women Entrepreneurs Organization (PERWIRA) in Empowering MSMEs
Elza Syarief, Rina Shahriyani Shahrullah, Agustina Fitrianingrum 713-721

How Does an Iconoclast Venture Studio's Investment Model Ensure the Scaling of an Early-Stage Deeptech Venture?
Laurent Téoule-Dorey 722-729

Impact of Entrepreneurial Orientation and Artificial Intelligence on Digital Entrepreneurial Resilience: The Mediating Role of Commitment to Learning
Oumeima Toumia 730-734

Understanding the Multilevel Aspects of Resistance to AI Adoption in Higher Education
Olga Tunkevichus, Konstantin Bagrationi 735-742

Knowledge Exchange and Entrepreneurial Value in University–SME Collaboration
Jaani Väisänen 743-750

Complexity and Paradox in Smart Port Transformation: Evidence from Sines' Port Case
Ricardo Veloso-Carvalho, Soumodip Sarkar 751-761

Decarbonising Smart Ports: A Complexity and Paradox Perspective of Sines and Leixões
Ricardo Veloso-Carvalho, Soumodip Sarkar 762-770

Capital Conversions in the Interaction Space between Social Entrepreneurship and Academic Field
Ksenija Vuković, Kristina Detelj , Irena Konecki 771-777

Legal Requirements for Data Trustees
Anja La Combe, Sven Kurrle, Julian Hoffmann , Patrick Weber 778-787

Strategic Responses to Barriers Affecting Sustainable Entrepreneurship Performance: Ethiopian Apparel Manufacturing Case
Leake Weleabzgi Gebrehiwot, Lohithaksha M. Maiyar, Jayshree Patnaik 788-795

Competitiveness of Small Rural Tourist Establishments in Northern Norway
Knut Ingar Westeren 796-803

Fostering Intrapreneurial Skills: Trait-Pedagogy Fit in Corporate Training Innovation
Wen-Kuei Wu 804-810

Organisational Culture, Innovation and Performance in SMEs: A Systematic Literature Review of Emerging Research Trends
Panagiota Xanthopoulou, Alexandros Sahinidis, Apostolis Gikas, Vassilis Vyttas 811-820

Bridging Social and Environmental Impact Through Social Entrepreneurship: Insights from the Shanshui Partners Case Study
Yi Ke, Shu-Hsiang Chen, Tong He 821-827

PhD Papers

Entrepreneurship Support Programmes and Business Growth in Brunei
Norizan Abdullah, Paul Smith, Olga Maslovskaya 829-837

Institutional and Cultural Constraints on Women's Entrepreneurship in SMEs: A Conceptual Framework in the Context of Saudi Vision 2030
Sheroog Alhedhaif, Victor Y. Atiase 838-842

Integrating Clinical Trial Evidence into Design Thinking Processes for Healthcare Product Development
Mohamed Atwy 843-850

Measuring Entrepreneurship Competence Progression: Evidence from Muslim Youth in Australia
Rinto Muhammadsyah Azhar, Zuleyha Keskin 851-859

A Conceptual Maturity Framework for Digital Twin Technology Adoption and Scaling
Mohammad Arief Dharmawan, Wawan Dhewanto, Eko Agus Prasetio 860-867

Mapping the Literature on Entrepreneurial Coaching: A Two-Layer Scientometric Analysis
Hassan Bellihi, Fatima Zahra El Hadim, Laila Amzil 868-877

Organizational Culture and Digital Transformation: Capabilities in SMEs: A Comparative Study of AI/ML adoption in German and Italian SMEs
Kamran Jamshed, Verena Mates 878-888

Innovation intermediaries in cross-sector partnerships: A role–phase framework for innovation in wicked problem contexts
Andrea Kerstens, Angela Greco, Hans Wamelink 889-895

From Accelerator Programs to Business Model Innovation in Startups: The Roles of Program Quality, Knowledge Spillovers and Founder Absorptive Capacity
Safae Khloufi Belhachmi, Luis Miguel Molina Fernández 896-904

Lean startup for Opportunity Exploitation in Sustainable Entrepreneurship: Evidence from India's Sustainability-oriented Ventures
Mantry Priyathee, Jayshree Patnaik, Pradeep Kumar Tarei 905-913

Agentic AI in Supply Chains: Balancing Trust and Autonomy in Disruption Scenarios
Ana Josefa Matos, Bráulio Alturas, Ahmed Kamel 914-921

Iterative Stakeholder-Driven Commercialization Pathways in Academic Entrepreneurship and MVP Learning
Alexander Matrosov 922-930

Building Biodigital Clusters in Emerging Economies: A Conceptual Framework Integrating Technological Capabilities and Governance in the Pharmaceutical Sector
José Luis Meza de la Rosa, María del Rocío Soto Flores 931-938

Benefits Management Model in the Industry 5.0 Era
Liliana Anacleto Silva 939-948

Exploring Digital Transformation in Organizations: A Typological Perspective
Mirela-Andreea Tudose 949-955

Entrepreneurial Innovation in Experimental Cinema: Digital Technologies, Immersive Media and New Educational Business Models
Adrian Zăvoianu 956-964

Masters Papers

An Interpretable Framework for Startup Success Assessment Using Entrepreneurial Ecosystem Intelligence
Fardin Sarrafnia, Ahmad Movahedian Attar, Shahabaldin Gheysari 966-974

Reframing the Ecosystem: Ranking Organizations as Emerging Stakeholders in Entrepreneurial Ecosystems
Maximilian Stadler, Herbert Gillig, Steve Gedeon 975-984

Non-academic submission

Patent Portfolio Management in Utility Organizations: An Innovation-to-Value Framework for Transforming Invention Disclosures into Strategic Organizational Assets
Mariam Alqasimi 988-998

Work in Progress Papers

Brain-Driven Opportunity Validation: A Multimodal Design-Based Framework for Entrepreneurial Education
Itzel Cruz-Martínez, José Eduardo Mallén-Lomas, Jessica Alejandra Ruiz-Ramírez, Alma Catalina Carmona-Vega 1000-1003

From Empathy to Impact: Examining Opportunity Recognition for Impactful, Socially Relevant Entrepreneurship
Moses Faleafaga 1004-1007

Entrepreneurial Temporal Design: Reframing the Sustainability Intention-Action Gap in Food Waste
Marwa Gad Mohsen 1008-1011

Top 100 Global Sustainable Solutions- Ten Years on
Dr Christopher J Moon 1021-1012

Regulatory Incentives and Knowledge Dynamics in Pharmaceutical Innovation: Evidence from Breakthrough Therapy Designation
Jaekwan Park, Youngha Chang, Daniele Rotolo 1022-1026

Late Submissions

Benchmarking Analysis of Innovation and Technology Transfer in HEIs From Central and Eastern Europe (CEE)
Andreea Maria Gabriela Militaru, Bogdan Fleaca, Hira Wajahat Malik, Răzvan Mihai Dobrescu 1028-1038

From Conceptual Foundations to Digital Platforms: Trends, Influential Works, and Future Directions of Islamic Crowdfunding
Suci Aprilliani Utami, Wawan Dhewanto, Oktofa Yudha Sudrajad 1039-1049

Building Entrepreneurial Resilience Through Islamic Social Finance and Microfinance
Vania Nur Rizqi R, Wawan Dhewanto, Sri Herliana 1050-1057

Corporate Climate Resilience Innovation Among Malaysian Energy Firms: Evidence From CCRASI
Noor Raida Abd Rahman, Maslinawati Mohamad, Hairul Suhaimi Nahar, Nor Hasimah Johari 1058-1064

About the 21st European Conference on Innovation and Entrepreneurship, 2026

The European Conference on Innovation and Entrepreneurship (ECIE) is a prominent academic conference that has been held annually for 21 years. The conference serves as a vital forum for scholars, researchers, entrepreneurs, and practitioners to explore the latest trends, research findings, and practical applications in the fields of innovation and entrepreneurship. ECIE is committed to advancing the understanding of how innovation and entrepreneurship drive economic growth, competitiveness, and societal progress.

ECIE is recognized for its rigorous peer-reviewed conference proceedings, which ensure that the research presented is of high academic quality and practical relevance. The Proceedings of the 21st ECIE, 2026 includes academic research papers, PhD research papers and Master's research papers as well as work-in-progress papers, which have been presented and discussed at the conference. The proceedings are of an academic level appropriate to a research audience including graduates, post-graduates, doctoral and post-doctoral researchers. All papers have been double-blind peer reviewed by members of the Review Committee.

Aims and Scope

The primary aim of ECIE is to foster a comprehensive understanding of innovation and entrepreneurship by bringing together, from around the world, diverse perspectives from academia, industry, and policy-making. The conference seeks to bridge the gap between theory and practice, offering insights into the processes that fuel innovation and entrepreneurial ventures. ECIE encourages the exploration of new ideas, the development of innovative business models, and the identification of best practices that can be applied across different sectors and regions.

The scope of the conference is broad and interdisciplinary, encompassing a wide range of topics related to innovation management, entrepreneurial ecosystems, and the role of technology in driving business growth. ECIE also emphasises the importance of education and training in fostering entrepreneurial skills and mindsets, as well as the role of policy and government in supporting innovation and entrepreneurship.

Topics Covered

ECIE covers a diverse array of topics that reflect the dynamic and evolving nature of innovation and entrepreneurship. The call for papers asked for contributions that considered the following topics. In addition, the committee welcomed papers on a number of specialist mini-tracks which can be seen at the end of this list.

Social Entrepreneurship and Innovation

- Strategies for creating social value in business.
- Case studies of successful social enterprises.
- The role of entrepreneurship in addressing social and environmental challenges.

Nature-Based Solutions (NBS)

- Innovative approaches to integrating NBS in business and urban planning.
- The impact of NBS on community resilience and environmental sustainability.
- Cross-sector collaborations for implementing NBS.
-

Responsible Business Practices

- Corporate Social Responsibility (CSR) and its evolving role.
- Integrating sustainability into core business strategies.

- Balancing profitability with social and environmental impact.

Digital Transformation in Business

- Leveraging digital tools for enhanced innovation and efficiency.
- Digital platforms for scaling social enterprises.
- Opportunities and challenges of digital transformation in traditional industries.

Artificial Intelligence (AI) and Entrepreneurship

- AI-driven business models and innovation.
- Ethical considerations of AI in society.
- The role of AI in supporting social entrepreneurship and addressing social issues.

Innovation in Sustainable Development

- Entrepreneurship's role in achieving the Sustainable Development Goals (SDGs).
- Green technologies and sustainable business practices.
- Fostering a circular economy through innovative ventures.
-

Entrepreneurial Ecosystems and Social Impact

- Building supportive ecosystems for social entrepreneurs.
- Regional approaches to fostering innovation and social entrepreneurship.
- The impact of universities and research institutions on social innovation.
-

Public-Private Partnerships and Cross-Sector Collaboration

- The role of government, private sector, and NGOs in fostering innovation.
- Models of collaboration for tackling social and environmental challenges.
- Financing mechanisms for social enterprises and innovative projects.
-

Future Trends in Entrepreneurship and Innovation

- Emerging trends shaping the entrepreneurial landscape.
- Technology-driven changes in entrepreneurship.
- Preparing the next generation of entrepreneurs for socially responsible innovation.

Measurement and Evaluation of Social Impact

- Metrics for assessing social and environmental value.
- Tools and methodologies for impact measurement.
- Reporting and accountability in social enterprises.

Mini Tracks

Experts in the field proposed mini tracks on the following topics. Papers accepted on these topics after the double-blind peer review process were presented as mini tracks at the conference and are also published in these proceedings.

- Academic Entrepreneurship and Entrepreneurial Ecosystem Dynamics
- Technology Transfer Processes and Innovation Systems
- Beyond Profit: Rethinking Business Models for a Sustainable Future
- Women in Intelligent Systems and Entrepreneurship
- Entrepreneurial Ecosystems and the Role of Education in Fostering Sustainable Startup Growth

- Brain-Driven Entrepreneurship: Cognitive Performance, Learning Design, and the Future of Entrepreneurial Education
- Entrepreneurial value creation through university–industry collaboration
- Interorganizational Relationships for Innovation and Sustainability
- Innovation and Resilience in Supply Chains

The programme from the 2026 conference can be downloaded from here and full details about the conference can be seen from the conference website: https://www.academic-conferences.org/conferences/ecie/ecie-programme/

ECIE Preface

These proceedings represent the work of contributors to the 21st European Conference on Innovation and Entrepreneurship (ECIE 2026), hosted by ISCTE-IUL University Institute of Lisbon, Lisbon, Portugal on 17-18 September 2026. The Conference Co-Chairs are Prof. Florinda Matos and Prof. Pedro Sebastião from ISCTE-IUL University Institute of Lisbon, Lisbon, Portugal.

ECIE is now a well-established event on the academic research calendar and now in its 20th year the key aim remains the opportunity for participants to share ideas and meet the people who hold them. The scope of papers will ensure an interesting two days. The subjects covered illustrate the wide range of topics that fall into this important and ever-growing area of research.

The opening keynote presentation is given by Prof. Soumodip Sarkar, from the University of Évora Portugal, who will be speaking about "Vernacular AI: The Bottom-up Domestication of Innovation." The second day of the conference will open with an address from António Bob Santos, ISCTE-IUL University Institute of Lisbon, Portugal on the topic of "Innovation-Oriented Public Policies for a Sustainable AI-Driven Future."

With an initial submission of 276 abstracts, after the double blind, peer review process there are 96 Academic research papers, 16 PhD research papers, 2 Masters papers, 1 Non-Academic paper and 5 work-in-progress papers published in these Conference Proceedings. These papers represent research from Albania, Australia; Belgium; Brazil; Canada; China; Colombia; Croatia; Cyprus; Czech Republic; Denmark; Egypt; Estonia; Finland; France; Germany; Greece; India; Indonesia; Ireland; Israel; Italy; Japan; Latvia; Lithuania; Malaysia; Mexico; Morocco; Netherlands; Nigeria; Norway; Oman; Pakistan; Philippines; Poland; Portugal; Romania; Saudi Arabia; Slovakia; South Africa; Spain; Taiwan; The Netherlands; Tunisia; Turkey; UAE; UK; Uruguay; USA and Vietnam.
We hope you enjoy the conference.

We would like to thank everyone who participated in this event.

Prof. Florinda Matos and Prof. Pedro Sebastião

ISCTE-IUL University Institute of Lisbon, Portugal

Biographies of Chairs and Keynote Speakers

Conference Co-Chairs

Florinda Matos is a Professor of General Management at ISCTE Business School, ISCTE – University Institute of Lisbon, and an associate research fellow at DINÂMIA'CET – IUL – Centre for Socioeconomic and Territorial Studies, where she leads several international projects, including the CoVE Future Skills Factory. As the editor of several journals and books, she has authored numerous works on knowledge and intellectual capital management, resilience, sustainability, and digital transformation. She is a distinguished conference chair for numerous conferences in the fields of intellectual capital, knowledge management, and innovation. Additionally, she is the Founder and President of ICAA – Intellectual Capital Association and serves as Portugal's ambassador for The New Club of Paris.

Pedro Sebastião is a Full Professor at ISCTE-IUL and President of AUDAX-ISCTE, leading national and international initiatives in innovation and entrepreneurship. A researcher at the Institute of Telecommunications, his work covers the low-altitude economy, drone and unmanned systems communications, stochastic processes, IoT, and efficient communication systems. He has supervised numerous theses, authored over 200 publications, and led or evaluated more than one hundred R&D projects. He has also developed several postgraduate and doctoral programs, supported technology-transfer initiatives and startup creation, and previously worked in defence industries and at Nokia-Siemens. He holds a PhD in Electrical and Computer Engineering from IST – University of Lisbon.

Keynote Speakers

Prof. Soumodip Sarkar has a distinguished international career. He holds a Masters and PhD in Economics from Northeastern University and is Full Professor at the University of Évora and researcher at CEFAGE-UE. His academic leadership has included serving as Vice-Rector, where he led initiatives in technology transfer and entrepreneurship. He is currently Executive President of the Alentejo Science & Technology Park (PACT), where he is an active practitioner and promoter of entrepreneurial ecosystems. Through PACT, he has overseen partnerships and innovation projects in sectors such as energy, AI, aerospace and healthtech. Prof. Sarkar's research focuses on how innovation emerges and scales under constraints, at the intersection of human adaptability, institutions and technology. His work appears in leading journals. His leadership portfolio covers governance, innovation scaling and inter-institutional coordination, including multi-stakeholder investment programmes and strategic partnerships with corporations and governments. He has authored influential books, supervised numerous PhD candidates, and was recently awarded a European project to design an immersive AI-based learning lab. He is also a past Fellow ((2015 2025) at the Asia Center of Harvard University. Prof. Sarkar has played key roles in academic evaluation and accreditation, serving as Chair of the Social Sciences 2 panel of the Lithuanian Science Council (2014–2018), as a member of the Portuguese university evaluation agency A3ES, and as an evaluator for the CEEMAN international accreditation board.

António Bob Santos holds a PhD in Economics from ISCTE-IUL and is currently a Board member of the Agency for Research and Innovation, E.P.E. (AI2). Between 2021-2022, Antonio was the Executive Coordinator of the "Impulso Programs" at the Directorate-General of Higher Education. He joined the Board of Directors of National Innovation Agency, between 2018-2021, as well as the Executive Administration of Fund for Innovation, Technology and Circular Economy. Since 2001 he has collaborated with several governmental structures in Innovation Policy area, the Technological Plan, the Digital Agenda, the Lisbon Strategy, the National Reform Plan and the National Program for Entrepreneurship and Innovation. António Bob Santos was a manager of innovation projects at UMIC responsible for the conception of the b-ON, OTIC and Excellence Centers programs, and at CEiiA - Center for Engineering and Product Development, in Smart Cities area. António Bob Santos is the author of several academic articles in scientific publications and opinion articles in innovation, technology and digital.

Mini Track Chairs

Paul Coyle is the Director of the Entrepreneurial Mindset Network, a global community of practice, with members in 107 countries, and special interest groups for the application of the entrepreneurial mindset in business, education, healthcare and social entrepreneurship. The Network's vision is that everybody, not just entrepreneurs, can benefit from having an entrepreneurial mindset including employees in the public, private and not-for-profit sectors. An entrepreneurial mindset enables each person to make their unique contribution to the world. Paul is an expert in the entrepreneurial mindset, innovation, entrepreneurship, leadership and organisational change.

Marco Lamas is a Post-Doc in Education (Entrepreneurship), with a PhD in Education (Entrepreneurship) and Bsc in International Relations. He is a Senior Professor at the Polytechnic Institute of Management and Technology in Porto, Portugal where he Leads the Business and Innovation LAB (BIL). He is a founder member of SHINE - Scaling Higher Education Innovation for Europe (https://shine-project.eu/) and he is recognized as an EntreComp Practitioner.

Dr. Victor (Vik) Pérez, is an educator-researcher-practitioner whose work has shaped the emergence of brain-driven entrepreneurship, integrating neuroscience, technology, innovation, and education. He serves as Editor-in-Chief of the forthcoming World Encyclopedia of Neuro-Entrepreneurship (World Scientific Publishing) and is the creator of the WNYLE Method, an award-recognized, brain-based approach to cultivating the entrepreneurial mindset. Dr. Pérez also developed Cognitive Performance Music (CPM), a neuro-algorithmic intervention designed to enhance focus, motivation, and reflective learning. His book Entrepreneurship and Neuroscience: Researching Brain-Driven Entrepreneurship (Routledge) articulates the conceptual foundations of this field, while his forthcoming Mastery of Emotions in Entrepreneurship Education (MEE) (Edward Elgar) explores its affective dimension.He is the founder of the international research networks BRANET and INNOMUSIC Global, which connect scholars and creators advancing this new frontier.

Alexander Matrosov supports early-stage academic entrepreneurial teams by advising, sparring, and coordinating their initial steps toward market-oriented development. His work focuses on helping researchers and entrepreneurial teams identify opportunities, shape preliminary value propositions, and align their activities with realistic commercial pathways. Acting as a mediator between academic groups and industry stakeholders, he facilitates structured experimentation, early customer exploration, and opportunity evaluation. His practical experience across multiple radical innovation cases contributes to understanding how collaborative, cross-sector processes enable entrepreneurial value creation within university–industry ecosystems.

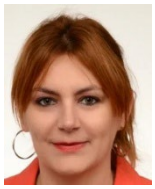
Dr. Thao Kim Nguyen is a Lecturer in Management and Director of the International Business Master's Program at the School of International Business and Marketing. Her research interests include interorganizational relationships, innovation strategies, and sustainable business practices. She has published and presented work on innovation ecosystems, firm innovation, and firm competitiveness development in international contexts

Carlos Miguel Oliveira has a Ph.D. in Management. He is a Coordinating Professor and Director of the School of Management at ISLA – Polytechnic University of Management and Technology. He is editor-in-chief of the Management in Review Journal and a collaborating member of CEOS.PP – Centre for Organisational and Social Studies. In recent years, he has published several articles in journals and conferences. He is a reviewer in some journals in the management area..

Outi-Maaria Palo-oja is Head of the Growth and Commercialisation (GroCo) Research Group at LAB University of Applied Sciences. She specialises in innovation management, research commercialisation, and university–industry collaboration. Her work examines technology transfer, co-creation, and critical sensemaking in innovation ecosystems. With extensive experience in national and international research collaborations, she is an expert in qualitative and interpretive methods. Her recent publications focus on AI in innovation management, science commercialisation, and societal entrepreneurship within academic–industry partnerships.

Marta Rosa holds a Master's degree in Social Studies of Environment and Sustainability from ISCTE – Lisbon University Institute. She is a research assistant at DINÂMIA'CET-ISCTE, working within the Innovation and Work Research Group. She is currently part of the European project CERERE (Cereals Resilience Revolution for Agile Supply Chain Management in the Mediterranean). She has also collaborated on the SocioDigital Lab's Strategic Project (Thematic Line 1), supporting dissemination efforts on regenerative territories and pathways towards carbon neutrality.

Sara Proença is a professor at the Polytechnic University of Coimbra (PUC), Portugal, and an integrated researcher at CERNAS – Research Center for Natural Resources, Environment and Society. She served as Director of the INOPOL Entrepreneurship Academy (2021–2025) and as Pro-President for Innovation and Entrepreneurship (2019–2021) at PUC. She holds a Ph.D. in Economics from ISEG–University of Lisbon, and a Master's and Bachelor's in Economics from FEUC–University of Coimbra. Her doctoral dissertation, Impact Assessment of Energy and Climate Policies: A Hybrid Bottom-up General Equilibrium Model (HyBGEM) for Portugal, received the António Simões Lopes Prize and was published by Almedina Editions. She has contributed to national and international R&D+I projects, published in peer-reviewed journals, and participated in numerous conferences. Her current research focuses on entrepreneurship and innovation ecosystems, academic entrepreneurship, academia–industry collaboration, business model innovation, and applied economics.



João J.M. Ferreira is a Full Professor at the University of Beira Interior (UBI), Portugal, where he also coordinated the Business Sciences Research Unit (NECE). He earned his Ph.D. in Management from

UBI in 2004, after attending the European Doctoral Programme in Entrepreneurship and Small Business Management at the Autonomous University of Barcelona, Spain, in 1999. He has edited or co-edited several books on innovation and entrepreneurship and has published over 200 articles in leading international journals, including Business History, Regional Studies, Technovation, Journal of Business Research, IEEE Transactions on Engineering Management, Management Decision, R&D Management, and Technological Forecasting & Social Change, among others. He currently serves as Associate Editor for Management Decision and the Journal of Small Business and Enterprise Development. His research interests span strategy, competitiveness, and entrepreneurship. According to Stanford University (USA), he is ranked among the top 2% of the most influential scientists worldwide in the field of business and economics.

Andreea Maria Gabriela MILITARU is a PhD candidate at the Doctoral School of Entrepreneurship, Business Engineering and Management, National University of Science and Technology POLITEHNICA Bucharest. She is currently ERASMUS+ KA131 HEI expert, and is an associate teaching assistant at the Faculty of Entrepreneurship, Engineering and Business Management (FAIMA). As a researcher, she has authored several articles on innovation systems and entrepreneurial behaviour and has participated in conferences on related topics. Andreea's ongoing research topic is improving innovation and technology transfer systems at the HEI level. She is passionate about mentoring her students and understanding the cultural dimensions of educational performance through visits to other universities and countries.

Ludmila Walaszczyk, PhD in Management Sciences, is a researcher in the field of sustainable development and business innovation, focusing on integrating environmental, social, and economic dimensions into business models. She is particularly interested in the role of digital technologies in supporting sustainability transitions, as well as methods for measuring and communicating triple bottom line outcomes – people, planet, and profit. Ludmila Walaszczyk conducts empirical research, case studies, and conceptual work to develop frameworks that guide the implementation of sustainable business models. Her goal is to understand how companies can remain competitive in dynamic markets while contributing to systemic socio-economic change.

Dr Souad Slyman is a Principal/Senior Lecturer and former Interim Deputy Head of the MOSI (Marketing, Operations, Supply Chain and Innovation) cluster. Her teaching and research span artificial intelligence, digital innovation, entrepreneurship, simulation technologies, and data-informed pedagogy. Her current work focuses on empowering women in intelligent systems and entrepreneurship, developing evidence-based frameworks for ethical AI, venture validation, and capability-building. She is Founder & CEO of AWEiSE (Acumenous Women Empowerment in Intelligent Systems & Entrepreneurship. She has led initiatives that enhance engagement, critical thinking, and employability in science and business education. Supervision and collaboration interests include responsible AI, technology-enabled entrepreneurship, learning analytics, and simulation for management education.

ECIE Review Committee

ECIE is fortunate to have a significant number of international experts in the field willing to review papers. Care is taken to ensure that a fully double-blind peer review process is followed, and reviewers are not selected if they have any research or organisational connection to the author/s.

Digital Transformation and Performance of E-service Businesses in West Africa

Hakeemat Adeleye
Nile University of Nigeria, Abuja, Nigeria

Abstract: In an era where digital innovation is essential for enhancing service delivery and competitiveness, understanding how these technologies influence firm performance is both timely and critical. Thus, this study examined the effect of digital transformation on the performance of e-service businesses in West Africa. Digital transformation was viewed using two dimensions: Artificial Intelligence (AI) adoption and cloud computing adoption. A cross-sectional survey research design was adopted to collect quantitative data from 348 owners and managers of e-service businesses across Nigeria, Ghana, Senegal, Côte d'Ivoire, and Sierra Leone using purposive sampling. Data were gathered through digitally administered structured questionnaires and analysed using Partial Least Squares Structural Equation Modelling (PLS-SEM) with SmartPLS. The findings revealed that AI adoption had a positive and significant effect on the performance of e-service businesses, particularly in terms of service efficiency, customer experience, and decision-making processes. Similarly, cloud computing adoption demonstrated a positive and significant effect on organisational performance. These findings indicate that digital technologies are not merely supportive tools but strategic resources that enable firms to achieve sustainable competitive advantage in the rapidly evolving West African digital economy. The study contributes to the growing literature on digital transformation by providing empirical evidence from e-service businesses across five West African countries, thereby extending existing studies that have largely focused on broader SME contexts.

Keywords: Digital Transformation, Artificial Intelligence, Cloud Computing, E-Service Businesses, Performance, West Africa.

1. Introduction

Globally, enhancing e-service business performance through digital transformation has become a major concern for scholars and practitioners. In West Africa, this transformation has accelerated due to increased internet penetration, mobile connectivity, and the expansion of digital platforms across finance, education, and commerce. The growth of e-service businesses has significantly contributed to economic activities and improved access to services in the region. This is because digital connectivity and platform-based services are expanding rapidly across West Africa, supporting inclusive growth and innovation (Lawal & Abdulyekeen, 2025).

Artificial Intelligence (AI) and cloud computing have emerged as key dimensions of digital transformation. AI uses algorithms and machine learning to automate processes, enhance decision-making, and generate predictive insights, while cloud computing provides internet-based storage, servers, and software that enable firms to scale operations without heavy capital investment. Their adoption is widely recognised as a major driver of productivity, innovation, and competitiveness in the digital economy (Arachie et al., 2025).

In West Africa, AI is used in fintech, customer service automation, and fraud detection, while cloud computing supports scalable platforms and cross-border service delivery. These technologies reduce operational costs, improve efficiency, and enhance service delivery, while also enabling data storage and analytics for innovation (Lawal & Abdulyekeen, 2025).

Despite these benefits, challenges such as weak digital infrastructure, limited technical skills, regulatory uncertainties, and cybersecurity concerns continue to hinder digital adoption. In addition, disparities in digital literacy and internet access limit the full benefits of digital transformation (World Bank, 2024).

1.1 Statement of the Problem

Despite the rapid growth of digital technologies in West Africa, the adoption of digital transformation in e-service businesses remains inadequate. While some firms have improved efficiency, customer reach, and innovation through digital tools, many have not fully integrated AI and cloud computing into their operations (Mkhize et al., 2025; Akinriwa et al., 2025). This limits competitiveness and service accessibility.

Across Nigeria, Ghana, Senegal, Côte d'Ivoire, and Sierra Leone, infrastructural limitations, weak digital literacy, high costs, and regulatory challenges continue to affect digital adoption (Lawal & Abdulyekeen, 2025). Unreliable internet access and weak data protection frameworks also create uncertainty for digital investment (Lawal, 2025).

Although previous studies have demonstrated the importance of AI and cloud computing for organisational performance, most have concentrated on SMEs generally or on specific sectors, with limited emphasis on e-service businesses operating across multiple West African countries.

1.2 Objectives of the Study

The general objective of this study is to examine the effect of digital transformation on the performance of e-service businesses in West Africa. The specific objectives are to:

i. assess the effect of Artificial Intelligence adoption on the performance of e-service businesses in West Africa.

ii. evaluate the effect of cloud computing adoption on the performance of e-service businesses in West Africa.

1.3 Research Hypotheses

H_{o1}: Artificial Intelligence adoption has no significant effect on the performance of e-service businesses in West Africa.

H_{o2}: Cloud computing adoption has no significant effect on the performance of e-service businesses in West Africa.

1.4 Performance

Performance refers to the extent to which an organization achieves its objectives efficiently and effectively, including productivity, quality, profitability, and value creation (Taouab & Issor, 2019). In e-service businesses, performance is measured through effective service delivery, operational efficiency, customer satisfaction, and competitiveness (Barba-Sánchez et al., 2024). For the purpose of this study, performance is assessed through indicators including operational efficiency, service delivery, customer experience, and decision-making effectiveness, reflecting the multidimensional outcomes of digital transformation in e-service businesses. These performance dimensions are influenced by digital technologies such as Artificial Intelligence (AI) and cloud computing (Mkhize et al., 2025).

1.5 Digital Transformation, AI and Cloud Computing

Digital transformation refers to the integration of digital technologies into business operations (Verhoef et al., 2021). In West Africa, it enables e-service businesses to improve service delivery, expand customer reach, and enhance operational efficiency. In this study, digital transformation is operationalised through two key dimensions: Artificial Intelligence and cloud computing.

Artificial Intelligence refers to the simulation of human intelligence by machines, enabling learning, problem-solving, and decision-making. It is widely used to automate operations, enhance customer engagement, and support data-driven decision-making (Russell & Norvig, 2021).

Cloud computing refers to the delivery of computing services through the internet, enabling scalable and cost-effective infrastructure (Marston et al., 2011). It enables firms to scale operations, manage data efficiently, improve reliability, and support the integration of AI technologies (Barba-Sánchez et al., 2024).

1.6 Empirical Review

Lawal and Abdulyekeen (2025) examined the effect of cloud computing and AI adoption on operational efficiency among SMEs in West Africa, focusing on Nigeria, Ghana, and Senegal. Using a mixed-methods approach involving literature review, surveys, and interviews, the study assessed how both technologies influence scalability, cost efficiency, decision-making, and automation. Findings revealed that cloud computing and AI significantly improved SMEs' ability to scale operations, enhance data management, automate processes, and reduce infrastructure costs ($p < 0.05$). The study concluded that both technologies are key enablers of operational performance, although outcomes are influenced by infrastructure quality, digital skills, and affordability constraints. While this study provides valuable evidence on SMEs, it primarily focuses on operational efficiency. The present study extends this line of inquiry by examining the broader performance of e-service businesses across five West African countries using a PLS-SEM approach.

Akinboyo (2025) investigated AI adoption and firm performance in Nigerian commercial banks using a quantitative survey of 200 professionals. The study found that AI tools such as machine learning, automated

customer service, and predictive analytics significantly improved operational efficiency ($\beta = 0.54$, $p < 0.01$) and service quality ($\beta = 0.47$, $p < 0.05$). It concluded that AI enhances performance through automation and data-driven decision-making, although its banking-sector focus limits broader applicability.

1.7 Theoretical Framework

1.7.1 Resource-Based View (RBV)

This study is anchored in the Resource-Based View (RBV), which emphasises firm-specific resources and capabilities as drivers of competitive advantage (Barney, 1991). Artificial Intelligence (AI) and cloud computing are conceptualised as strategic resources that enhance operational efficiency, innovation, decision-making, and service delivery in e-service businesses. However, managerial competence, digital skills, organisational culture, and external factors such as infrastructure, regulation, and market conditions in West Africa may influence the extent to which these resources generate competitive advantage (Verhoef et al., 2021).

2. Methodology

A cross-sectional survey research design was employed to examine the effect of digital transformation on the performance of e-service businesses in five West African countries (Nigeria, Ghana, Senegal, Côte d'Ivoire, and Sierra Leone).

Purposive sampling was used to select 380 owners and managers of identifiable e-service businesses across the five countries. The sampling frame was developed from accessible e-service firms identified through business directories, digital platforms, fintech associations, and professional networks. The selection focused on firms actively utilising digital platforms in service delivery. The distribution of respondents comprised Nigeria (120), Ghana (80), Senegal (60), Côte d'Ivoire (70), and Sierra Leone (50).

A total of 380 questionnaires were administered digitally, of which 348 (91.6%) were completed and found suitable for analysis. The questionnaire comprised items adapted from previously validated instruments. Items measuring AI adoption were adapted from Akinboyo (2025) and Arachie et al. (2025), while items measuring cloud computing adoption were adapted from Ansong and Boateng (2023). All items were measured using a five-point Likert scale. A pilot study involving 30 respondents in Nigeria was conducted to assess the clarity and reliability of the instrument. Minor revisions were subsequently made, and Cronbach's Alpha values for all constructs exceeded the recommended threshold of 0.70, indicating acceptable internal consistency.

Table 1: Sampling Frame and Sample Distribution

S/N	Country	Sampling Frame (Accessible E-Service Business Owners/Managers)	Questionnaires Distributed	Questionnaires Retrieved & Valid
1	Nigeria	120	120	110
2	Ghana	80	80	74
3	Senegal	60	60	55
4	Côte d'Ivoire	70	70	65
5	Sierra Leone	50	50	44
	Total	380	380	348

Source: Field Survey (2025).

Table 1 showed the sampling frame and sample distribution across the five selected West African countries. Nigeria accounted for 120 respondents (31.6%), Ghana 80 (21.1%), Senegal 60 (15.8%), Côte d'Ivoire 70 (18.4%), and Sierra Leone 50 (13.2%). Of the 380 questionnaires distributed, 348 were valid and used for analysis, representing a response rate of 91.6%, which indicates strong participation.

PLS-SEM was employed for data analysis because of its predictive capability and its suitability for analysing complex relationships involving latent constructs. To minimise common method bias, measurement items were adapted from validated instruments, organised into separate sections, and respondent anonymity was assured.

Furthermore, Variance Inflation Factor (VIF) and full collinearity assessments conducted in SmartPLS confirmed that common method bias and multicollinearity were not significant concerns.

The structural model used was follows:

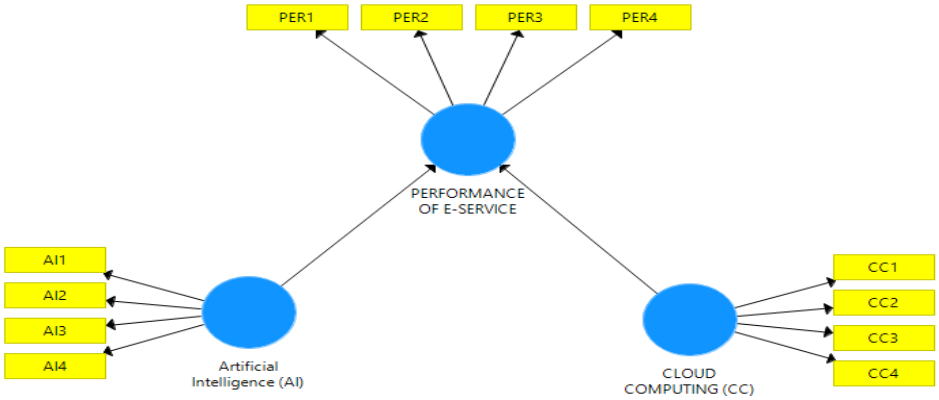

Figure 1: structural Model

Source: SmartPLS Output (2025).

3. Data Analysis

Table 2: Response Rate of Respondents

	Number of Questionnaires Administered	Number of Questionnaires Completed	Number of Questionnaires Not Completed or Returned	Number of Questionnaires Used for Analysis	Total
Number	380	348	32	348	380
Percentage	100%	91.6%	8.4%	91.6%	100%

Source: Field Survey, 2025.

Table 2 shows the response rate from 380 owners and managers of e-service businesses across Nigeria, Ghana, Senegal, Côte d'Ivoire, and Sierra Leone. Of these, 348 (91.6%) were completed and valid for analysis, while 32 (8.4%) were incomplete.

3.1 Evaluation of Measurement Model

To evaluate the measurement model, the outer loadings of the measurement items were analysed. According to Hair et al. (2021), a loading value exceeding 0.70 indicates that the construct explains more than 50% of the variance in the corresponding indicator, thereby demonstrating satisfactory indicator reliability.

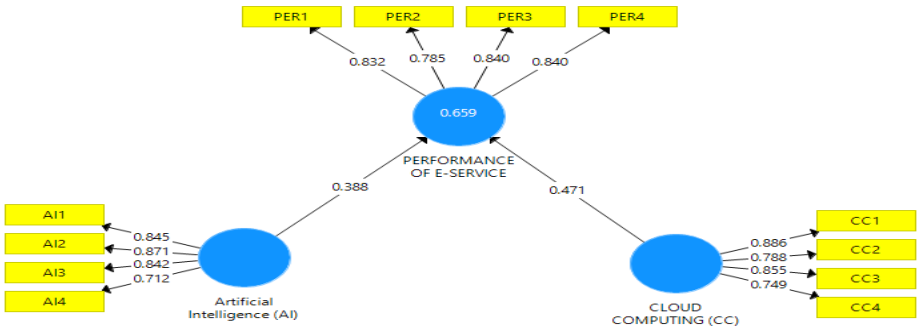

Figure 2: Measurement Model

Source: SmartPLS Output (2025).

3.2 Assessment of the Structural Model

Hair et al. (2021) recommend assessing the structural model using the coefficient of determination (R^2), path coefficients (β), and t-values obtained through bootstrapping (5,000 resamples) to evaluate the model's predictive power and determine the significance of the hypothesised relationships.

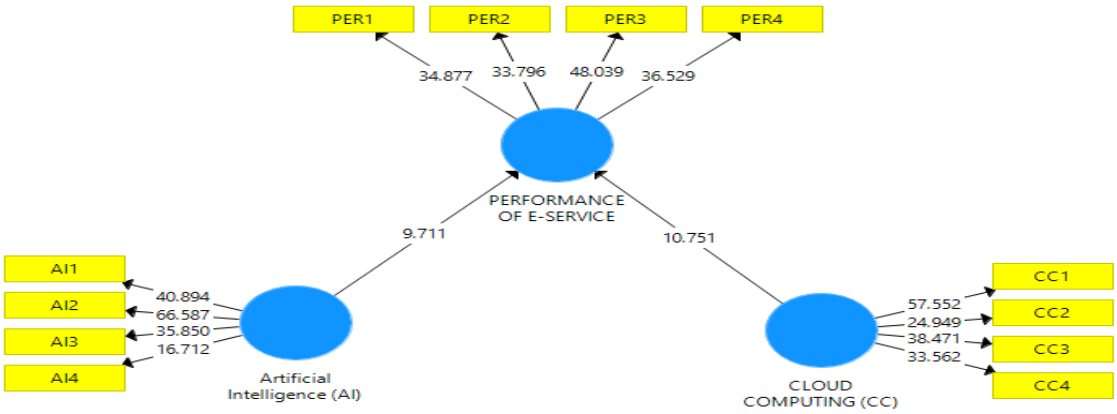

Figure 3: Structural Model Assessment

Source: SmartPLS Output (2025).

3.3 Assessment of the Coefficient of Determination (R^2)

The R^2 value of 0.659 (see Figure 2) indicates that Artificial Intelligence (AI) and cloud computing jointly explain 65.9% of the variance in organisational performance, suggesting substantial predictive power. The remaining 34.1% of the variance may be attributed to other factors not included in the model, such as regulatory conditions, infrastructure, and other organisational or environmental influences.

Table 3: Descriptive Statistics, Reliability, Convergent Validity, and Collinearity Assessment

Variable	Mean	Standard Deviation	Cronbach's Alpha	Composite Reliability	AVE	VIF
Artificial Intelligence (AI)	3.9321	0.34538	0.837	0.891	0.672	2.056
Cloud Computing (CC)	4.4248	0.32145	0.837	0.892	0.675	3.253
Performance (PER)	3.8974	0.33732	0.843	0.894	0.679	-

Sample Size (n) = 348

Source: SmartPLS Output (2025).

Table 3 presents the descriptive statistics, reliability, convergent validity, and collinearity assessment of the study constructs. The mean scores ranged from 3.8974 to 4.4248, indicating that respondents generally expressed positive perceptions of AI adoption, cloud computing, and organisational performance. Cronbach's Alpha values ranged from 0.837 to 0.843, while Composite Reliability values ranged from 0.891 to 0.894, exceeding the recommended threshold of 0.70, thereby confirming satisfactory internal consistency (Hair et al., 2021). Similarly, the Average Variance Extracted (AVE) values ranged from 0.672 to 0.679, exceeding the recommended minimum of 0.50, which confirms adequate convergent validity. Furthermore, the Variance Inflation Factor (VIF) values of 2.056 and 3.253 were below the recommended threshold of 5.0, indicating that multicollinearity was not a concern.

Table 4: Discriminant Validity (HTMT), Effect Size (f^2), and Hypotheses Testing Results

Panel A: Heterotrait-Monotrait Ration (HTMT)

Variable	AI	CC	PER
Artifical Intelligence (AI)	-		
Cloud Computing (CC)	0.620	-	
Performance (PER)	0.757	0.775	-

Source: SmartPLS Output (2025).

Panel B: Effect Size (f^2)

Relationship	f^2	Intepretation
AI > Peformance	0.184	Medium
Cloud Computing > Performance	0.310	Medium

(interpretation based on Cohen, 1988).

Panel C: Hypotheses Testing

Hypothesis	β	t-value	p-value	Decision
H_{01}: Artifical Intelligence > Peformance	0.388	9.711	0.000	Rejected
H_{02}: Cloud Computing > Performance	0.471	10.751	0.000	Rejected

Source: SmartPLS Output (2025).

Table 4 presents the results of the discriminant validity, effect size, and hypothesis testing analyses. The HTMT values ranged from 0.620 to 0.775, all of which were below the recommended threshold of 0.85, indicating satisfactory discriminant validity (Henseler, 2017). The effect size (f^2) values of 0.184 for AI and 0.310 for cloud computing indicate medium effects on organisational performance based on Cohen's (1988) guidelines.

The hypothesis testing results further show that Artificial Intelligence had a significant positive effect on organisational performance ($\beta = 0.388$, $t = 9.711$, $p < 0.001$), leading to the rejection of H_{o1}. Similarly, Cloud Computing had a significant positive effect on organisational performance ($\beta = 0.471$, $t = 10.751$, $p < 0.001$), resulting in the rejection of H_{o2}.

4. Discussion of Findings

The findings revealed that Artificial Intelligence (AI) adoption has a significant positive effect on the performance of e-service businesses in West Africa ($\beta = 0.388$, $p < 0.05$), indicating that increased AI adoption enhances operational efficiency, decision-making, and service innovation. This finding is consistent with Akinboyo (2025) and Arachie et al. (2025), who reported that AI improves organisational performance through automation and data-driven decision-making. Similarly, cloud computing adoption exerted a stronger positive effect on organisational performance ($\beta = 0.471$, $p < 0.05$), suggesting that cloud technologies improve scalability, flexibility, and cost efficiency. This finding aligns with Lawal and Abdulyekeen (2025) and Ansong and Boateng (2023), who identified cloud computing as a key driver of organisational performance.

4.1 Limitations of the Study

This study has several limitations that should be considered when interpreting the findings. Firstly, the cross-sectional research design captured respondents' perceptions at a single point in time and therefore does not establish causal relationships. Also, the use of purposive sampling may limit the generalisability of the findings beyond the selected e-service businesses in the five West African countries. In addition, the study relied on self-reported data, which may be subject to response bias despite the measures taken to minimise common method bias.

5. Conclusion

This study examined the effect of digital transformation on the performance of e-service businesses in West Africa using Artificial Intelligence (AI) and cloud computing as key dimensions. The findings revealed that both technologies significantly improve organisational performance, with cloud computing exerting a stronger effect. This suggests that scalable digital infrastructure plays a critical role in enhancing operational efficiency, data management, and service delivery.

5.1 Recommendations

i. E-service businesses should increase investment in Artificial Intelligence (AI) technologies to enhance automation, customer experience, and data-driven decision-making. Greater AI adoption will improve operational efficiency, strengthen decision quality, promote service innovation, and enhance competitiveness in increasingly dynamic digital markets.

ii. E-service businesses should adopt and expand cloud computing platforms to improve scalability, operational efficiency, and cost management. Increased cloud computing adoption will enable flexible resource utilisation, reduce infrastructure costs, enhance data accessibility, and support seamless service delivery, thereby improving overall organisational performance.

Ethics Declaration

Ethical approval was obtained prior to data collection, ensuring compliance with research ethics. Participation was voluntary, with informed consent obtained from respondents. Confidentiality and anonymity were maintained, and data were used solely for academic purposes.

AI Declaration

Artificial Intelligence (AI) tools were used to support writing, editing, and clarity in this study. However, all conceptualization, data analysis, and interpretation were conducted independently by the author. AI was not used to generate data or alter findings, and all sources were properly verified and referenced.

Universities as Living Labs for Circular Economy Entrepreneurship in the GCC

Nasser Al Yahyaei
Arab Open University, Muscat, Oman

nasser.y@aou.edu.om

Abstract: Universities are increasingly expected to contribute to sustainability transitions while fostering innovation and entrepreneurship. However, green campus sustainability practices are often implemented as operational initiatives, with limited integration into entrepreneurship education and student venture development. Drawing on the entrepreneurial university perspective, experiential learning theory, and the living lab approach, this study conceptualises universities as living labs for circular economy entrepreneurship and empirically examines the mechanisms through which campus sustainability practices translate into entrepreneurial outcomes. The study proposes and tests a sequential model in which students' perceptions of green campus sustainability practices influence experiential learning engagement, which in turn enhances circular economy competencies and subsequently leads to entrepreneurial intention and early entrepreneurial behaviour. A quantitative, survey-based research design was adopted, using data collected from 313 students across multiple campuses of a higher education institution in the GCC context. Partial least squares structural equation modelling (PLS-SEM) was employed to analyse the data. The results provide strong support for the proposed model. Green campus sustainability practices significantly enhance experiential learning engagement, which in turn drives the development of circular economy competencies. These competencies were found to have a significant positive effect on both entrepreneurial intention and early entrepreneurial behaviour. Furthermore, the findings confirm a sequential mediation mechanism, indicating that the influence of sustainability practices on entrepreneurial outcomes operates through structured learning and competency development processes. This study contributes to the literature in three ways. First, it extends the entrepreneurial university and sustainability education literature by empirically linking green campus practices to entrepreneurship outcomes through a living lab logic. Second, it advances circular economy entrepreneurship research by highlighting the mediating role of experiential learning and competency development. Third, it offers practical insights for higher education leaders and policymakers on how campus sustainability initiatives can be strategically leveraged to foster innovation, entrepreneurship education, and early venture creation in emerging and transition economies.

Keywords: Living Labs, Circular Economy Entrepreneurship, Entrepreneurial Intention, Experiential Learning, Sustainability In Higher Education.

1. Introduction

Universities are increasingly recognised as key actors in sustainability transitions, innovation systems, and entrepreneurial ecosystems, extending their roles beyond teaching and research to address challenges such as climate change and sustainable development (Trencher et al., 2014; Gibbons et al., 2023). In response, many institutions have implemented green campus initiatives; however, these are often treated as operational practices with limited integration into student learning and entrepreneurship development (Lozano et al., 2023; Evans et al., 2024). Recent scholarship calls for a reconceptualisation of universities as entrepreneurial and sustainability-oriented ecosystems that connect knowledge production with real-world experimentation (Guerrero et al., 2020; Audretsch & Belitski, 2023). Within this context, the living lab approach has emerged as a promising framework, positioning campuses as environments for experimentation, co-creation, and experiential learning (Schliwa et al., 2022; von Wirth et al., 2024). Despite its growing adoption, empirical evidence explaining how sustainability practices translate into entrepreneurial outcomes—particularly in circular economy contexts—remains limited.

The circular economy has gained prominence as a regenerative model emphasising resource efficiency and sustainable value creation (Geissdoerfer et al., 2017; Kirchherr et al., 2023). Universities are seen as key platforms for developing circular economy competencies, including systems thinking and innovation (Leal Filho et al., 2024), yet existing research often focuses on curricula or institutional performance rather than students' direct engagement with sustainability practices (Bocken et al., 2022; Franco et al., 2024). Experiential learning theory provides a useful lens for addressing this gap, as it explains how real-world engagement fosters competencies and entrepreneurial behaviour (Kolb, 2015; Pittaway & Cope, 2021). However, empirical studies rarely examine experiential learning as a mediating mechanism linking sustainability practices to competencies and entrepreneurial outcomes, particularly in emerging contexts (Morris et al., 2023; Alharbi et al., 2023; Urban & Kujinga, 2024).

The GCC region offers a relevant setting for this investigation, given its shared sustainability agendas and higher education structures (Al-Abri et al., 2022; Saleh & Bontis, 2024). This study therefore conceptualises universities

as living labs for circular economy entrepreneurship and examines a sequential mechanism whereby students' perceptions of green campus practices influence experiential learning engagement, which enhances circular economy competencies and leads to entrepreneurial intention and early behaviour. Using data from a multi-campus GCC institution, the study tests this model through hypotheses linking sustainability practices, learning, competencies, and entrepreneurial outcomes, including mediation effects. By doing so, it contributes to the entrepreneurial university and sustainability education literature, advances understanding of circular economy entrepreneurship, and provides practical insights for leveraging campus sustainability initiatives as platforms for innovation and venture creation.

2. Theoretical Background and Literature Review

The concept of the entrepreneurial university has evolved significantly over recent decades, shifting from a narrow focus on commercialization and technology transfer toward a broader institutional role encompassing innovation, regional development, and societal impact (Etzkowitz, 2003; Guerrero et al., 2020). Rooted initially in the Triple Helix model of university–industry–government interaction (Etzkowitz & Leydesdorff, 2000), this perspective now increasingly incorporates sustainability as a core dimension of the university's "third mission" (Trencher et al., 2014; Leal Filho et al., 2024). Universities are thus expected not only to generate knowledge but also to contribute actively to addressing societal challenges such as climate change, resource scarcity, and sustainable economic development (Audretsch & Belitski, 2023; Cunningham et al., 2022). In this context, sustainability-oriented and circular entrepreneurship have emerged as key domains linking education, innovation, and societal value creation (Cohen & Winn, 2007; Geissdoerfer et al., 2017). Despite this shift, many institutions continue to treat sustainability initiatives as operational activities rather than integrating them into entrepreneurship education and venture development pathways (Lozano et al., 2023; Bocken et al., 2022). Moreover, existing research has largely focused on structural and policy-level aspects of entrepreneurial universities, with limited attention to micro-level mechanisms that shape student competencies, intentions, and behaviours (Guerrero & Urbano, 2012; Cunningham et al., 2022).

The living lab approach offers a promising framework for bridging this gap by embedding real-world experimentation, stakeholder engagement, and experiential learning within university settings (Bergvall-Kåreborn et al., 2009; von Wirth et al., 2019). Living labs are defined as user-centered innovation ecosystems operating in real-life contexts, enabling co-creation and iterative problem-solving (Evans & Karvonen, 2014; Schliwa et al., 2022). In higher education, campus living labs transform sustainability practices—such as energy systems, waste management, and circular procurement—into experiential learning environments where students engage directly with real-world challenges (Trencher et al., 2014; Leal Filho et al., 2024). This shifts sustainability from an administrative function to an educational and innovation platform, fostering systems thinking, collaboration, and innovation capabilities essential for circular entrepreneurship (Frantzeskaki et al., 2018; von Wirth et al., 2019). However, while living labs are increasingly adopted, empirical evidence linking campus sustainability engagement to entrepreneurial outcomes remains limited, particularly at the student level.

Experiential learning theory provides a critical lens for understanding how such engagement translates into competencies and entrepreneurial behaviour. According to Kolb (2015), learning is a cyclical process involving experience, reflection, conceptualization, and experimentation. In entrepreneurship education, experiential learning is widely recognized as essential for developing entrepreneurial mindsets through active engagement, problem-solving, and iterative learning (Pittaway & Cope, 2021; Morris et al., 2023). Similarly, sustainability education requires experiential approaches due to the complexity and interdisciplinary nature of sustainability challenges (Wiek et al., 2011; Lozano et al., 2023). Active participation in sustainability initiatives enables students to understand resource flows, stakeholder dynamics, and systemic interdependencies in practical terms (Brundiers et al., 2019; Leal Filho et al., 2024). Despite this, empirical research rarely examines experiential learning as a mediating mechanism linking institutional sustainability practices to entrepreneurial outcomes, particularly in emerging and transition economies (Alharbi et al., 2023; Urban & Kujinga, 2024).

The circular economy further reinforces the importance of such competencies. As a regenerative paradigm focused on resource efficiency, waste minimization, and sustainable value creation, the circular economy requires entrepreneurs to develop capabilities such as systems thinking, lifecycle analysis, and sustainability-driven innovation (Geissdoerfer et al., 2017; Kirchherr et al., 2023). Circular economy competencies extend beyond traditional entrepreneurial skills by emphasizing the ability to redesign resource flows, identify waste-to-value opportunities, and create regenerative business models (Cohen & Winn, 2007; Brown et al., 2019). While higher education institutions are increasingly recognized as platforms for fostering such competencies

(Leal Filho et al., 2024; Franco et al., 2024), empirical studies linking competency development to entrepreneurial intention and early entrepreneurial behaviour remain limited. Entrepreneurial intention theory suggests that competencies enhance perceived feasibility and opportunity recognition, thereby influencing both intention and behaviour (Ajzen, 1991; Liñán & Chen, 2009; Nabi et al., 2017). Emerging research further indicates that sustainability competencies strengthen opportunity recognition in environmental domains and increase the likelihood of sustainable venture creation (Ploum et al., 2018; Urban & Kujinga, 2024).

The GCC region provides a particularly relevant context for examining these dynamics. Universities in the region operate within policy frameworks emphasizing sustainability, innovation, and economic diversification, positioning higher education as a key driver of green growth and entrepreneurship (Alharbi et al., 2023; Saleh & Bontis, 2024). Many institutions adopt centralized governance structures across multiple campuses, creating consistent institutional environments for implementing sustainability initiatives and entrepreneurship programs (Al-Abri et al., 2022). Despite this, empirical research in the region has largely focused on policy-level or country-level analyses, with limited attention to institution-level and student-level mechanisms linking sustainability practices to entrepreneurial outcomes. This gap highlights the need for theory-driven empirical studies that integrate institutional practices, learning processes, and competency development within a unified framework.

Building on these perspectives, this study conceptualizes universities as living labs for circular economy entrepreneurship, where sustainability practices embedded in campus operations function as catalysts for experiential learning and competency development. It proposes a sequential mediation model in which students' perceptions of green campus sustainability practices influence experiential learning engagement, which in turn enhances circular economy competencies and ultimately leads to entrepreneurial intention and early entrepreneurial behaviour. Specifically, green campus practices—such as energy management, waste reduction, and circular resource initiatives—are expected to provide experiential contexts that stimulate active engagement (Kolb, 2015; Pittaway & Cope, 2021). Experiential learning engagement is then expected to facilitate the development of circular economy competencies through applied problem-solving and iterative experimentation (Wiek et al., 2011; Ploum et al., 2018). These competencies, in turn, are hypothesized to positively influence entrepreneurial intention and early entrepreneurial behaviour by enhancing opportunity recognition and innovation capabilities (Ajzen, 1991; Liñán & Chen, 2009; Nabi et al., 2017).

Accordingly, the study proposes the following hypotheses: green campus sustainability practices positively influence experiential learning engagement (H1); experiential learning engagement positively influences circular economy competencies (H2); circular economy competencies positively influence entrepreneurial intention (H3) and early entrepreneurial behaviour (H4); experiential learning engagement mediates the relationship between sustainability practices and competencies (H5); and a full sequential mediation exists linking sustainability practices to entrepreneurial outcomes through experiential learning and competency development (H6). By empirically testing this model, the study contributes to the entrepreneurial university and sustainability education literature by explicating the living lab logic through which campus sustainability initiatives generate entrepreneurial value. It further advances circular economy entrepreneurship research by highlighting experiential learning and competency development as critical micro-level mechanisms, while offering practical insights for universities and policymakers seeking to leverage sustainability initiatives as platforms for innovation and venture creation.

3. Methodology

This study adopts a quantitative, cross-sectional survey design to examine the proposed sequential mediation model linking green campus sustainability practices, experiential learning engagement, circular economy competencies, and entrepreneurial outcomes at the individual student level. Data were collected from undergraduate and postgraduate students across a multi-campus higher education institution in the GCC, operating under a unified governance structure. A stratified sampling approach ensured representation across campuses and disciplines, with a target population of approximately 35,000 students. Sample size was determined using G*Power 3.1 (Faul et al., 2009) and Cochran's formula; while the minimum required sample ranged between 119 and 380 respondents, the final sample of 313 is adequate for PLS-SEM analysis (Hair et al., 2022). All constructs were measured using validated scales adapted to the study context on a 7-point Likert scale (1 = strongly disagree, 7 = strongly agree). Specifically, green campus sustainability practices were adapted from campus sustainability literature (Trencher et al., 2014; Lozano et al., 2023), experiential learning engagement from experiential learning theory (Kolb, 2015; Pittaway & Cope, 2021), circular economy competencies from sustainability competency frameworks (Wiek et al., 2011; Ploum et al., 2018), entrepreneurial intention from

Liñán and Chen (2009), and early entrepreneurial behaviour from established entrepreneurship education measures (Nabi et al., 2017).

4. Results

A total of 313 responses were analysed. The sample is predominantly undergraduate (88.5%), aged 18–24, with a higher proportion of females (62.0%). Students mainly represent IT/Computing and Business, followed by Law, across GCC campuses (Saudi Arabia, Oman, Bahrain, Kuwait). Only 39.0% had taken entrepreneurship courses and 31.6% engaged in sustainability activities, indicating limited prior exposure. Overall, the sample reflects a diverse student population suitable for examining sustainability-driven entrepreneurial learning.

Table 1: Demographic and Academic Profile (N = 313)

Variable	Category	Frequency	Percentage
Gender	Female	194	62.0
	Male	119	38.0
Age Group	18–20	106	33.9
	21–24	104	33.2
	25–29	37	11.8
	30–39	36	11.5
	40+	26	8.3
Level of Study	Bachelor	277	88.5
	Diploma	23	7.3
	Postgraduate	12	3.8
Field of Study	IT / Computing	133	42.5

	No / Not sure	191	61.0
Sustainability Participation	Yes	99	31.6
	No / Not sure	214	68.4
Prior Entrepreneurship Exposure	Any exposure	152	48.6
	None	161	51.4

The measurement model was evaluated for reliability and validity following PLS-SEM guidelines (Hair et al., 2022). Results (Table 3) show high internal consistency, with Cronbach's alpha (0.900–0.938) and composite reliability above 0.70. Convergent validity is confirmed, with AVE values between 0.669 and 0.800. Discriminant validity is established using the Fornell–Larcker criterion (Table 4) and HTMT ratios below 0.90 (Table 5). Overall, the model demonstrates strong reliability and validity for structural analysis.

Table 3: Measurement Model Results

Construct	Alpha	CR	AVE

The structural model was assessed to examine the hypothesised direct relationships among the study constructs. The results are presented in Table 6, while the explanatory power of the model is reported in Table 7. Collinearity diagnostics are presented in Table 8.

Table 6: Structural Model Results

Hyp	Path	β	t	p	CI	f^2	Decision
H1	GCSP→ELE	0.517	9.449	<.001	[.405,.618]	0.364	Yes
H2	ELE→CEC	0.651	10.868	<.001	[.533,.765]	0.734	Yes
H3	CEC→EI	0.643	13.284	<.001	[.545,.733]	0.704	Yes
H4	CEC→EEB	0.618	15.371	<.001	[.538,.695]	0.617	Yes

Table 7: Coefficient of Determination (R^2)

Construct	R^2	Interpretation
ELE	0.267	Moderate
CEC	0.423	Moderate
EI	0.413	Moderate
EEB	0.381	Moderate

Table 8: Collinearity (VIF)

Path	VIF
GCSP→ELE	1.000
ELE→CEC	1.000
CEC→EI	1.000
CEC→EEB	1.000

The structural model results are presented in Table 6. The findings show that green campus sustainability practices have a significant positive effect on experiential learning engagement (β = 0.517, *t* = 9.449, *p* < 0.001), thereby supporting H1. In turn, experiential learning engagement has a significant positive effect on circular economy competencies (β = 0.651, *t* = 10.868, *p* < 0.001), providing support for H2.

As further shown in Table 6, circular economy competencies exert a significant positive influence on both entrepreneurial intention (β = 0.643, *t* = 13.284, *p* < 0.001) and early entrepreneurial behaviour (β = 0.618, *t* = 15.371, *p* < 0.001). These findings support H3 and H4, respectively.

The explanatory power of the model was assessed using the coefficient of determination. As reported in Table 7, the model explains 26.7% of the variance in experiential learning engagement, 42.3% of the variance in circular economy competencies, 41.3% of the variance in entrepreneurial intention, and 38.1% of the variance in early entrepreneurial behaviour. These values indicate moderate explanatory power across the endogenous constructs.

Collinearity diagnostics were examined using variance inflation factor (VIF) values. As shown in Table 8, all VIF values equal 1.000 and remain well below the recommended threshold, indicating that multicollinearity is not a concern in the structural model.

Finally, the effect sizes reported in Table 6 indicate that the hypothesised relationships range from moderate to substantial, with the strongest effect observed for the path from experiential learning engagement to circular economy competencies. Overall, the structural model provides strong support for the proposed direct relationships and offers a sound basis for the mediation analysis presented in the next subsection.

5. Mediation Analysis

The mediation effects were assessed using bootstrapping procedures, and the results are presented in Table 9. The findings indicate that experiential learning engagement significantly mediates the relationship between green campus sustainability practices and circular economy competencies, supporting H5. The indirect effect is positive and statistically significant (β = 0.336, *t* = 8.972, *p* < 0.001), with the confidence interval not including zero, confirming the presence of mediation.

Furthermore, the results provide strong support for the proposed sequential mediation mechanism. As shown in Table 9, the indirect effect of green campus sustainability practices on entrepreneurial intention through experiential learning engagement and circular economy competencies is significant (β = 0.216, *t* = 7.845, *p* < 0.001), supporting H6a.

Similarly, the sequential indirect effect on early entrepreneurial behaviour is also significant (β = 0.208, *t* = 8.163, *p* < 0.001), providing support for H6b.

The absence of a direct path from green campus sustainability practices to the outcome variables, combined with the significance of the indirect effects, suggests indirect-only (full) mediation, indicating that the influence of sustainability practices on entrepreneurial outcomes operates entirely through experiential learning and competency development.

Overall, the results confirm that universities function as living labs, where sustainability practices indirectly foster entrepreneurial outcomes through structured learning and competency-building mechanisms.

Table 9: Mediation Results

Hyp	Path	β	t	p	CI	Type	Decision
H5	GCSP→ELE→CEC	0.336	8.972	<.001	[.252,.417]	Full	Yes
H6a	→EI	0.216	7.845	<.001	[.153,.287]	Full	Yes
H6b	→EEB	0.208	8.163	<.001	[.149,.275]	Full	Yes

Table 10 summarises the hypothesis testing results, showing that all proposed relationships are positive and statistically significant. The findings support the direct effects among sustainability practices, experiential learning, competencies, and entrepreneurial outcomes. Mediation analysis confirms both simple and sequential effects, where experiential learning links sustainability practices to competencies, and together they explain entrepreneurial intention and behaviour. Overall, the results provide strong support for the model and the role of universities as living labs for circular economy entrepreneurship.

Table 10: Summary of Hypotheses

Hyp	Path	Result
H1	GCSP→ELE	Supported
H2	ELE→CEC	Supported
H3	CEC→EI	Supported
H4	CEC→EEB	Supported
H5	GCSP→ELE→CEC	Supported
H6a	→EI	Supported
H6b	→EEB	Supported

6. Discussion

This study examined how universities can function as living labs for circular economy entrepreneurship by testing a sequential mechanism linking green campus sustainability practices, experiential learning engagement, circular economy competencies, and entrepreneurial outcomes. The findings provide strong empirical support for the proposed model, demonstrating how institutional sustainability initiatives translate into student-level entrepreneurial development .

The results confirm that green campus sustainability practices significantly enhance experiential learning engagement (H1), reinforcing the view that sustainability initiatives can act as active learning environments rather than purely operational activities. This aligns with prior research highlighting universities as experiential learning ecosystems where real-world sustainability practices promote engagement and applied learning (Trencher et al., 2014; Lozano et al., 2023). In line with recent studies, embedding sustainability initiatives within campus operations provides opportunities for problem-based and practice-oriented learning essential for developing entrepreneurial capabilities (Leal Filho et al., 2023). This is particularly relevant in the GCC context, where universities can move beyond awareness-building toward hands-on sustainability engagement.

Furthermore, experiential learning engagement was found to significantly enhance circular economy competencies (H2), confirming the importance of learning-by-doing in developing systems thinking and sustainability-oriented innovation capabilities. This finding is consistent with experiential learning theory (Kolb, 2015) and supported by empirical studies linking active engagement in sustainability tasks to competency development (Wiek et al., 2011; Ploum et al., 2018; Lambrechts et al., 2023). It highlights that competencies are not developed through traditional instruction alone but require immersive and practice-based learning environments, such as campus living labs.

The results also demonstrate that circular economy competencies significantly influence both entrepreneurial intention and early entrepreneurial behaviour (H3 and H4), confirming their role as a critical bridge between sustainability learning and entrepreneurial action. This aligns with prior research indicating that sustainability-oriented competencies enhance opportunity recognition and innovation in emerging green markets (Ploum et al., 2018; Nabi et al., 2017; Bocken et al., 2022; Patzelt et al., 2023). Notably, the stronger relationship with early entrepreneurial behaviour suggests that competency development translates into tangible entrepreneurial actions, highlighting the practical value of sustainability education.

A key contribution of this study lies in confirming both simple and sequential mediation effects (H5 and H6). Experiential learning mediates the relationship between sustainability practices and competency development, while a full sequential pathway links sustainability practices to entrepreneurial outcomes through experiential learning and competencies. These findings provide strong empirical support for the living lab perspective, which conceptualises universities as integrated environments connecting sustainability practices, learning processes, and innovation outcomes (Trencher et al., 2014; Evans et al., 2015). Consistent with recent research, the impact of sustainability initiatives on entrepreneurship is indirect and operates through structured learning and capability development processes (Marin et al., 2022; Leal Filho et al., 2023). This highlights that sustainability practices alone are insufficient; their effectiveness depends on how well they are embedded within learning and competency frameworks.

These findings have important implications for the GCC context, where universities are increasingly expected to support sustainability and economic diversification agendas. The results suggest that institutions can foster circular economy entrepreneurship by leveraging sustainability initiatives as learning and innovation platforms. Expanding experiential learning opportunities—such as sustainability projects, living labs, and interdisciplinary initiatives—can enhance student engagement and entrepreneurial capacity, particularly in emerging and transition economies.

Overall, the findings confirm that sustainability practices enhance experiential learning engagement, which drives circular economy competency development and ultimately leads to entrepreneurial intention and behaviour. The relationship operates through a sequential mediation mechanism, demonstrating that sustainability-driven entrepreneurship emerges through structured learning and competency-building processes. These insights provide strong evidence for the role of universities as living labs for circular economy entrepreneurship and highlight their potential to contribute to sustainability transitions through integrated institutional, educational, and policy approaches.

7. Conclusion

This study set out to examine how universities can function as living labs for circular economy entrepreneurship by investigating the relationships between green campus sustainability practices, experiential learning engagement, circular economy competencies, and entrepreneurial outcomes within a multi-campus higher education institution in the GCC context.

The findings provide strong empirical support for the proposed model. Specifically, the results demonstrate that green campus sustainability practices significantly enhance experiential learning engagement, which in turn facilitates the development of circular economy competencies. These competencies were found to have a direct and positive impact on both entrepreneurial intention and early entrepreneurial behaviour. Furthermore, the study confirms the presence of both simple and sequential mediation effects, indicating that the influence of sustainability practices on entrepreneurial outcomes operates through structured learning and competency development processes.

These findings contribute to the literature by providing empirical evidence for the living lab perspective, demonstrating that universities can serve as integrated environments where sustainability practices, learning processes, and entrepreneurial outcomes are interconnected. The study also advances research on circular economy entrepreneurship by highlighting the central role of competencies as a mechanism linking sustainability education to entrepreneurial action. In addition, the study extends the entrepreneurial university framework by incorporating sustainability practices as drivers of innovation and entrepreneurship.

From a practical perspective, the results underscore the importance of designing sustainability initiatives as experiential learning platforms and integrating them into broader educational and entrepreneurial ecosystems. For policymakers, the findings highlight the potential of higher education institutions to contribute to sustainability transitions and economic diversification, particularly in emerging and transition economies such as those in the GCC region.

Abstract: The significance of entrepreneurship has been widely recognized by scholars and practitioners across the globe; however, social entrepreneurship remains an emerging and evolving field of inquiry. Social entrepreneurship is significant not only for its economic contributions but also for its capacity to address pressing social challenges such as poverty alleviation and community welfare, thereby serving as a catalyst for sustainable social change. Despite its growing relevance, empirical evidence explaining the determinants of social entrepreneurial efforts in developing countries remains limited. Hence, this study seeks to examine the level of youth Intention toward social entrepreneurship in Pakistan. Specifically, it investigates the influence of various antecedent factors on social entrepreneurial intention, while also exploring the moderating role of Need for Achievement and mediating role of entrepreneurial Self-Efficacy. Adopting a quantitative research strategy and a survey-based research design, data were collected from 309 students enrolled in public sector universities located in Rawalpindi Islamabad. Structural Equation Modelling was employed to analyze the data and test the proposed hypotheses. The results demonstrate that ESE failed to significantly transmit the effects of these support variables to social entrepreneurial intention at QAU and FJWU, showing only a weak direct link at NUST. However, the need for achievement emerged as a powerful and highly robust moderator across all three universities. The interaction effects (NFAxPES and NFAxPSS) consistently strengthened the impact of perceived institutional support mechanisms on SEI. These results underscore that instead of relying purely on building student self-efficacy, higher education institutions must strategically pair robust educational and structural infrastructure with high-achievement student traits to effectively drive youth social entrepreneurial participation.

Keywords: Social Entrepreneurial Intention; Perceived Educational Support; Perceived Structural Support; Perceived Relational Support and Need for Achievement, Self-Efficacy

1. Introduction

Entrepreneurship has always remained an emerging recognizer for building a strategic mechanism towards innovation, economic development, social transformation and employment generation. Globally, the entrepreneurial process is undergoing a transitional phase, not only in policy and academic disclosure but also in transforming from traditional entrepreneurial profit mechanism into social entrepreneurships combining the practices regarding entrepreneurships with strategies to resolve environmental, social and community-based targets. Social entrepreneurship has been identified as key contributor to germinate sustainable social value through devising innovative solutions as an endeavor to resolve the issues of social concern such as unemployment, poverty, unequal wealth distribution, educational system diversity and lack of healthcare facilities. The study of Lyu et al. (2024) revealed that social entrepreneurship is not only the promoter of economic resilience but at the same time it also promotes the long-term social sustainability and collective societal development.

The significance of growing social entrepreneurship is becoming palpable among emerging economies of developing countries in which unemployment, social inequalities and institutional weaknesses remain active to challenge the development efforts sustainability. Pakistan is also one of the emerging economies with a rapidly increasing youth population facing multiple socio-economic challenges including social exclusion, poverty, unemployment and limitations in accessing quality public incentives. Encouraging entrepreneurial inclination among Pakistani youth and identifying pathways toward sustainable social innovation remains challenging,

compounded by macroeconomic fragility and ecosystem complexity in the form of currency instability and drastic inflation fluctuations (Mehboob et al., 2025). In this situation social entrepreneurship has a positive emerging avenue for educated Pakistani youth who may contribute in social innovation and collective community development making a persuasive path toward their sustainable career growth opportunities. Subsequently, universities in Pakistan are highly expected to inculcate and upgrade the entrepreneurial capabilities by building institutional support mechanism, fostering a socially responsible mindset among university students and making them active agent for building a positive social change (Farooq, 2026).

University students are the representatives of society to participate in various societal segments which also include entrepreneurial and social entrepreneurial representation in society. Universities serve as institutional hub which molds student's competencies, capabilities, attitude into career intention through knowledge driven approach. Previous research revealed that university environment has greater influence in fostering entrepreneurial tendencies by inculcating institutional support, relational networks, educational exposure and mentoring opportunities (Duong et al., 2024). It's a fact the entrepreneurial education has got attention in university education system but empirically antecedents regarding social entrepreneurial intention (SEI) are still remained limited in developing countries among university students. More specific is that an insufficient understanding has been noticed that how various forms of university support mechanism inspire students to understand university ecosystem for germinating an inclination towards understanding and resolving the social issues through social entrepreneurial initiatives. This study is an endeavor to build a clearer understanding of the university support system mechanism and how it influences social entrepreneurial intention among university students studying in public sector universities in Pakistan

Another important construct associated with entrepreneurial behavior is Entrepreneurial Self-Efficacy (ESE), which refers to an individual's belief in his or her capability to successfully perform entrepreneurial tasks and activities. According to Social Cognitive Theory, individuals with higher levels of self-efficacy are more likely to exhibit entrepreneurial motivation, persistence, and opportunity-seeking behavior. Existing research indicates that supportive educational and social environments positively enhance entrepreneurial self-efficacy, which subsequently strengthens entrepreneurial intentions and Intention (Duong et al., 2024). In the context of social entrepreneurship, self-efficacy becomes particularly important because social entrepreneurs often operate under uncertain conditions while addressing complex social problems.

Among the psychological factors influencing entrepreneurial Intention, Need for Achievement (NFA) has received substantial scholarly attention. Rooted in McClelland's motivational theory, Need for Achievement reflects an individual's desire for excellence, accomplishment, goal attainment, and personal success. Individuals possessing a high need for achievement are generally more motivated to take initiative, overcome challenges, pursue innovation, and engage in entrepreneurial activities. Recent studies have found that Need for Achievement positively influences entrepreneurial and social entrepreneurial intentions among university students (Lyu et al., 2024). Individuals with strong achievement motivation are more likely to transform supportive educational and social environments into entrepreneurial action. Therefore, Need for Achievement may strengthen the relationship between perceived support mechanisms and Social Entrepreneurial Intention.

Although previous studies have examined entrepreneurial intention and entrepreneurial self-efficacy in various contexts, limited research has simultaneously investigated the combined effects of perceived educational support (PES), perceived structural support (PSS), and perceived relational support (PRS) on Social Entrepreneurial Intention within the Pakistani higher education context. Furthermore, empirical evidence regarding the moderating role of Need for Achievement in strengthening these relationships remains scarce, particularly among students enrolled in public sector universities.

This study addresses these gaps by empirically examining the influence of perceived educational support, perceived structural support, perceived relational support, and entrepreneurial self-efficacy on Social Entrepreneurial Intention among students of public sector universities in Rawalpindi and Islamabad. In addition, the study investigates the moderating role of Need for Achievement in enhancing the relationships between support mechanisms and Social Entrepreneurial Intention. The proposed research model contributes to the growing literature on social entrepreneurship by integrating institutional, relational, and psychological dimensions within a single conceptual framework.

The significance of this study is multifaceted. Theoretically, the study extends the literature on social entrepreneurship by integrating support-based and motivational perspectives to explain social entrepreneurial Intention among youth. Practically, the findings may assist policymakers, university administrators, educators, and entrepreneurship development institutions in designing effective educational programs, support systems,

and entrepreneurial ecosystems that encourage socially responsible entrepreneurship among students. Moreover, the study contributes to Pakistan's broader socio-economic development agenda by highlighting the importance of empowering youth toward socially innovative and sustainable entrepreneurial activities.

2. Literature Review

The proposed research model is grounded in Social Cognitive Theory (SCT) and the broader entrepreneurship support literature. Social Cognitive Theory suggests that individual behavior is shaped through the interaction of environmental, cognitive, and motivational factors. In this study, perceived educational support, perceived structural support, and perceived relational support represent environmental factors that influence students' entrepreneurial cognitions and Intention. Entrepreneurial self-efficacy functions as a cognitive mechanism through which students evaluate their entrepreneurial capabilities, while Need for Achievement operates as a motivational factor that strengthens entrepreneurial tendencies. Furthermore, students possessing a higher Need for Achievement are expected to demonstrate stronger entrepreneurial Intention when exposed to supportive entrepreneurial ecosystems.

2.1 Social Entrepreneurial Intention

Social entrepreneurial Intention is defined as an individual's commitment, intention and tendency towards identification and persuasion of entrepreneurial activities intended to generating social value instead of concentrating only financial profit. Literature shows that social entrepreneurial behavior is affected through the combination of institutional psychological, contextual and relational factors. Amongst these antecedents, perceived relational support, perceived structural support and perceived educational support have considered the important elements of entrepreneurial Intention.

2.2 Perceived Educational Support

Perceived Educational Support refers to students' perceptions regarding the extent to which universities provide entrepreneurship-related education, training, knowledge, skill development opportunities, and motivational encouragement. Universities that actively promote entrepreneurial learning through courses, workshops, incubation centers, and experiential learning environments are more likely to enhance students' entrepreneurial confidence and Intention (Attah, et al., 2026). Recent studies suggest that educational support positively shapes entrepreneurial self-efficacy and entrepreneurial intention among university students (Duong et al., 2024). Similarly, the provision of entrepreneurship-oriented curricula and practical exposure can motivate students to engage in socially driven entrepreneurial initiatives.

2.3 Perceived Structural Support

Perceived Structural Support encompasses the institutional and environmental mechanisms that facilitate entrepreneurial activities, including government policies, financial assistance, legal frameworks, incubation facilities, and access to entrepreneurial resources. In developing economies, supportive institutional structures play a significant role in encouraging entrepreneurial participation among youth (Manolova, et al., 2019). When students perceive the existence of supportive policies, funding opportunities, and entrepreneurial infrastructure, they are more likely to view entrepreneurship as a viable and socially impactful career path (Lu et al., 2021). Recent empirical evidence demonstrates that university and institutional support systems significantly strengthen entrepreneurial intentions and opportunity recognition among students (Otache, et al., 2024).

2.4 Perceived Relational Support

Perceived Relational Support refers to emotional, informational, and motivational support received from family members, peers, mentors, teachers, and social networks. Social and relational networks are considered essential for entrepreneurial development because they provide guidance, encouragement, trust, and access to opportunities (Xie et al., 2021). Previous studies have emphasized that social support mechanisms enhance students' entrepreneurial confidence and positively influence entrepreneurial Intention and intentions (Yesmin et al., 2024). In collectivist societies such as Pakistan, where family and social relationships strongly influence career choices, relational support may significantly contribute toward shaping social entrepreneurial tendencies among university students (Ali et al., 2023).

2.5 Need for Achievement

The need for achievement represents an individual's internal drive to excel, overcome challenges, and meet high standards of performance. While external environmental configurations such as PES, PSS, and PRS provide the foundational resources, institutional frameworks, and social backing necessary to foster social entrepreneurial intention, their ultimate efficacy often depends on personal psychological traits (Dzomonda & Neneh, 2023). Within this conceptual framework, the need for achievement acts as a crucial moderating variable that amplifies the relationship between these external support structures and an individual's intent to start a social venture. According to Cao & Ngo (2019), individuals with a high need for achievement are intrinsically motivated to optimize and leverage their educational resources, exploit formal structural support mechanisms, and mobilize relational networks to achieve impactful goals. Thus, the need for achievement serves as a psychological catalyst, determining the strength with which perceived external support ecosystems successfully translate into a definitive commitment to address societal issues through social entrepreneurship.

2.6 Entrepreneurial Self-Efficacy

Entrepreneurial self-efficacy the belief in one's capability to successfully perform various entrepreneurial roles and tasks acts as a vital cognitive mediator between external ecosystems and social entrepreneurial intention. When individuals perceive high levels of educational support (such as specialized knowledge and training), structural support (including institutional, policy, or financial assistance), and relational support (validation from family and immediate social networks), these environmental assets collectively enhance their internal confidence and situational mastery (Sharma et al., 2023). This heightened sense of personal competence and self-efficacy subsequently drives and crystalizes their ultimate intention to design and execute social ventures (Zhang, & Huang, 2021).

3. Research Methodology

This research study followed the quantitative research method. The data were collected from public sector universities of Rawalpindi and Islamabad. The survey questionnaire was used from the previous research studies and the scale of 5-point Likert scale 1-strongly disagree to 5-strongly agree were used to measure the constructs. The dimensions of perceived educational support, perceived structural support, and perceived relational support were adopted from the Entrepreneurial Support Model questionnaire used in the study by Zubair et al. (2021). Similarly, the need for achievement dimension and self-efficacy scale were adopted from the research of (Mahmood et al., 2019). The data were collected through random probability sampling technique from the university students via google online data collection forms.

The respondents of this research study are the final year students of public administration department students from Quaid-i-Azam University (QAU), National University of Science and Technology (NUST) and Fatima Jinnah Women University (FJWU) Pakistan. "The basic motivation for the selection of the final year students in this research was their certain position of entering practical life. In the final year, most of the students decide their future plan and career intention (Perveen, 2016)". A total of 309 questionnaires were used for the data analysis, with 96 from QAU, 112 from NUST and 101 FJWU. Moreover, the nature of the research was an exploratory study; hence, Smart PLS was used for the data analysis as suggested (Zeb et al., 2019).

4. Data Analysis

This study used Partial Least Squares Structural Equation Modelling (PLS-SEM) for our data analysis. This method is ideal for complex models and works well with data that is not normally distributed. Since our main goal was to predict and explain our target results, PLS-SEM is the right choice, even though it is limited to standard linear models.

4.1 Results

Initially, computed descriptive statistics as they are a critical aspect providing necessary information about the population through inferential statistical tests (Kaur et al., 2018). "The demographic characteristics of respondents from both QAU, NUST and FJWU are detailed in table below, presenting attributes, frequencies, and percentages. Respondents were categorized into six main groups: gender, age, program, semester, and university".

Table 1: Demographic profile of the respondents

Attributes	QAU (96)		NUST (112)		FJWU (101)	
	Frequency	Percentage	Frequency	Percentage	Frequency	Percentage
Gender						
Male	54	56.0%	65	58.0%	0	0.00%
Female	39	40.6%	43	38.4%	97	96.0%
Transgender	3	3.12%	2	1.8%	4	4.0%
Age						
21-25	84	87%	92	82.1%	89	88.1%
26-30	19	19.7%	18	16.1%	9	8.9%
31 & above	3	3.12%	2	1.8%	3	3.0%
Program						
BPA	82	85.4%	74	66.1%	91	90.1%
MPA	22	22.9%	38	33.9%	10	9.9%
Semester						
Second last	61	63.5%	46	41.1%	71	70.3%
Last semester	45	46.8%	66	58.9%	30	29.7%

The demographic profile of respondents from the three participating universities: QAU, n=96, NUST, n=112, and FJWU, n=101. In terms of gender, FJWU respondents were entirely female (96.0%), with no male respondents, consistent with its status as a women's university, while QAU and NUST showed a more balanced distribution, with males comprising 51.0% and 58.0% and females comprising 35.4% and 38.3%, respectively; transgender respondents represented a small minority across all three institutions, ranging from roughly 1.8% to 4.0%, reflecting the gradual inclusion and representation of gender-diverse individuals within Pakistani higher education institutions.

With respect to age, the majority of respondents across all universities fell within the 21–25 age bracket (82%–88%), consistent with the study's focus on final-year students, while smaller proportions were aged 26–30 or 31 and above. Regarding academic program, undergraduate (BPA) students formed the dominant share of respondents at all three universities (66%–90%), with postgraduate (MPA) students making up the remainder. Finally, in terms of semester standing, respondents were distributed across second-last and last-semester students, with FJWU showing a notably higher proportion of second-last semester respondents (70.3%) compared to QAU (53.1%) and NUST (41.1%).

4.2 Measurement Model

The measurement model examines the relationships between observed indicators and their underlying latent constructs. “Construct validity and reliability were assessed through tests of convergent and discriminant validity. Convergent validity was established through high factor loadings, Composite Reliability (CR) values above 0.7, and Average Variance Extracted (AVE) values above 0.5. Discriminant validity was confirmed using the Fornell-Larcker criterion”.

Table 2: Measurement model

Constructs	Items	Factor Loadings	Alpha Value	AVE	C.R
Perceived Educational Support			0.765	0.682	0.865
	PES1	0.818			
	PES2	0.849			
	PES3	0.811			
	PES4	0.798			
Perceived Relational Support			0.633	0.580	0.805

Constructs	Items	Factor Loadings	Alpha Value	AVE	C.R
	PRS1	0.815			
	PRS2	0.728			
	PRS3	0.738			
Perceived Structural Support			0.627	0.513	0.787
	PSS1	0.702			
	PSS2	0.648			
	PSS3	0.685			
	PSS4	0.700			
Entrepreneurial Self-Efficacy			0.745	0.501	0.827
	ESE1	0.664			
	ESE2	0.687			
	ESE3	0.759			
	ESE4	0.733			
	ESE5	0.655			
Need for Achievement			0.741	0.551	0.830
	NFA1	0.744			
	NFA2	0.740			
	NFA3	0.728			
	NFA4	0.758			
Social Entrepreneurial Intention			0.799	0.556	0.860
	SEI1	0.577			
	SEI2	0.841			
	SEI3	0.847			
	SEI4	0.705			

Table shows results acquired from the analysis of measurement and structural models path coefficients, respectively. The range of all constructs lies between 0.658 to 0.902 that's confirms the item loading value is above 0.5 and the items have a higher loading, and this signifies that the model has an adequate convergent validity. The values of components reliability of every construct of the model; the values show a value between 0.614 – 0.885, as all the values have a higher score from 0.6; this confirms that all constructs are considered highly reliable.

Most items exceed 0.70, indicating high individual item reliability, with only a few items (such as PSS2 at 0.648, ESE1 at 0.664, ESE5 at 0.655, and SEI1 at 0.577) falling between 0.50 and 0.70, which is still acceptable in exploratory studies. Cronbach's Alpha: The values range from 0.627 to 0.799. Since all values exceed the recommended baseline threshold of 0.60 for exploratory research, the internal consistency of the scales is well-supported. Similarly, all the values of C.R. are above 0.787 this demonstrates excellent reliability. Lastly, the six constructs satisfy the standard criterion of an AVE 0.50, ranging from 0.501 to 0.682. It shows that these constructs explain more than half of the variance of their indicators.

4.3 Discriminant Validity

According to Hair et al. (2017), the discriminant validity shows that how a particular construct is unique and covered phenomena not presented by other constructs of the model.

Table 3: Discriminant validity (Fornell-Larcker criterion)

Constructs	ESE	NFA	PSS	PES	PRS	SEI
ESE	**0.703**					
NFA	0.701	**0.743**				
PSS	0.497	0.533	**0.693**			
PES	0.538	0.599	0.538	**0.826**		
PRS	0.549	0.604	0.601	0.757	**0.764**	
SEI	0.535	0.588	0.540	0.693	0.662	**0.746**

As endorsed by Fornell and Larcker (1981), AVE values of all study constructs and their respective square root were greater than the correlations among constructs. "Our results also show that all the constructs are well different and discriminant from each other. The diagonal values are 0.703 ESE, 0.743 NFA, 0.693 PSS, 0.826 PES, 0.764 PRS, and 0.746 SEI". The results indicate that all the constructs demonstrate acceptable discriminant validity, as their diagonal values are greater than their corresponding inter-construct correlations.

4.4 Structural Model

Coefficient of determination or commonly know it the R^2 is one of the crucial criteria in the assessment of the structural model in Smart PLS-SEM through bootstrapping. According to the Hair et al, (2017) the R-square and path analysis are the most important tool to assess the model inner evaluation.

Table 4: Coefficient of determination R^2

Variables	QAU		NUST		FJWU	
	Direct	Indirect	Direct	Indirect	Direct	Indirect
Perceived Educational Support	0.668	0.755	0.274	0.423	0.721	0.755
Perceived Relational Support						
Perceived Structural Support						
Entrepreneurial Self-Efficacy						
Need for Achievement						

Cohen et al. (1989) recommended the acceptable values of R^2 which are 0.26, 0.13 or 0.02 respectively representing strong, moderate and weak effect of the exogenous variable on the endogenous variable. The total effect of the exogenous variables on the endogenous variable is 0.343 of QAU, 0.823 of NUST and 0.579 FJWU. All the R^2 values are greater than 0.26 and 0.50 as suggested.

4.5 Path Analysis

"The path coefficient described the hypothesized correlation of the constructs; as suggested by Hair *et al*., (2014) the range of values are -1 to +1. Similarly, it further explained the most influencing factor like closer to +1 shows a strong correlation, and closer to -1 shows vice versa". This study presents a path analysis comparing the impact of various factors on social entrepreneurial intention of the QAU, NUST and FJWU".

Table 5: Path Analysis

Variables	QAU	Decision	NUST	Decision	FJWU	
	P values		P values		P values	Decision
ESE -> SEI	1.063	Not supported	0.135	Not supported	-0.104	Supported
NFA -> SEI	-0.938	Supported	0.563	Not supported	0.854	Not supported
NFA x PES -> SEI	-0.964	Supported	0.018	Not Supported	-0.868	Supported

Variables	QAU	Decision	NUST	Decision	FJWU	
	P values		P values		P values	Decision
NFA x PRS -> SEI	0.584	Not supported	0.049	Supported	1.103	Not supported
NFA x PSS -> SEI	-1.005	Supported	-0.118	Supported	-0.498	Supported
PES -> ESE	0.446	Not Supported	0.333	Not supported	-0.601	Supported
PES -> SEI	1.585	Not Supported	0.026	Supported	-0.887	Supported
PRS -> ESE	0.190	Not supported	-0.007	Supported	1.100	Not supported
PRS -> SEI	-1.402	Supported	-0.099	Supported	0.572	Not supported
PSS -> ESE	0.276	Not supported	0.374	Not supported	0.260	Not supported
PSS -> SEI	-0.671	Supported	0.098	Not supported	-0.213	Supported

The table reports the path coefficients (t-statistics/p-values as labeled) and indicates whether each hypothesis is supported or not supported. Low P-value (typically less than 0.05): This suggests that the observed results are statistically significant and vice versa. It compares the hypothesized relationships among the study variables across three universities: QAU, NUST and FJWU. These results suggest that the influence of ESE, NFA, PES, PRS, and PSS on SEI differs across universities. However, the interaction effects involving NFA × PES and NFA × PSS consistently show significant positive effects across all three institutions, indicating that these moderating relationships are robust regardless of the university context. Moreover, the findings further indicate that ESE does not significantly transmit the effects of the support variables to social entrepreneurial intention in the case of QAU and FJWU. Furthermore, the relationship between ESE and SEI is positive but relatively weak ($\beta = 0.135$) in the case of NUST. This finding suggests that students with higher entrepreneurial self-efficacy tend to exhibit slightly stronger social entrepreneurial intentions.

5. Discussion

The findings from this study provide valuable insights into the determinants of social entrepreneurial intention among university students in Pakistan, with notable variations across the three institutions. The measurement model demonstrated robust psychometric properties, with all constructs showing satisfactory convergent and discriminant validity. Composite reliability values exceeded 0.787, Cronbach's alpha values were above 0.627, and all Average Variance Extracted (AVE) values surpassed the 0.50 threshold, confirming the internal consistency and reliability of the measurement scales. The Fornell-Larcker criterion further established discriminant validity, as the square roots of AVE for each construct were greater than their inter-construct correlations, indicating that the latent constructs are empirically distinct. These findings align with Hair et al. (2017) and confirm that the measurement model adequately captures the theoretical constructs under investigation.

The structural model results, however, present a more comprehensive picture of the relationships between the study variables across the three universities. The coefficient of determination (R^2) values demonstrated strong explanatory power, particularly for NUST (0.823) and FJWU (0.579), indicating that the exogenous variables substantially explain the variance in social entrepreneurial intention. However, the path analysis revealed considerable institutional differences in the significance and direction of hypothesized relationships. The interaction effects of need for achievement with perceived educational support and perceived structural support consistently showed significant effects across all three institutions, suggesting that the moderating role of need for achievement in the relationship between support mechanisms and social entrepreneurial intention is strong and context-independent. Interestingly, the direct effect of entrepreneurial self-efficacy on social entrepreneurial intention was only supported for FJWU, while the relationship was non-significant for QAU and NUST. Similarly, perceived educational support positively influenced SEI only in the NUST sample ($p = 0.026$), while perceived relational support showed significant negative effects on SEI for QAU ($p < 0.001$) and NUST ($p = 0.099$). These variations may reflect institutional differences in academic culture, pedagogical approaches, and the availability of entrepreneurial resources and mentorship opportunities.

6. Conclusion

The results show that the interaction effects of need for achievement with perceived educational and structural support consistently showed significant effects across all three universities, indicating these moderating relationships are strong regardless of institutional context. The findings suggest that universities should design integrated support systems that address both psychological needs and structural resources, moving beyond theoretical instruction to incorporate experiential learning opportunities, mentorship programs, and achievement-oriented curricular activities.

The study offers three key implications. Theoretically, it challenges existing models by demonstrating that the interaction between need for achievement and support mechanisms is stronger than direct effects alone, while revealing that entrepreneurial self-efficacy's influence is context-dependent rather than universally applicable. Practically, universities should develop integrated support systems that combine experiential learning, mentorship programs, and achievement-oriented activities. At the policy level, the institutional variations observed necessitate context-specific strategies rather than uniform approaches, with targeted funding for social entrepreneurship infrastructure, gender-sensitive interventions, and formal integration of social entrepreneurship into national curricula that address Pakistan's developmental challenges.

Despite its contributions, this study has several limitations, including its cross-sectional design, reliance on self-reported measures. Future research should employ longitudinal designs to examine how social entrepreneurial intention evolves over time, adopt mixed-methods approaches to capture qualitative insights, and conduct cross-cultural comparative studies across different regions and institutional types. These future directions would provide more robust evidence to guide policy and practice in entrepreneurship education, ultimately contributing to the development of a more socially conscious and entrepreneurial workforce in Pakistan.

Ethics Declaration

This research did not require ethical approval as it did not involve any secret human participants, personal data collection, or sensitive information. All the sources and examples cited in this paper are publicly available and properly referenced/cited.

AI Declaration

AI tools, such as Google Gemmini and DeepSeek, were used to assist in refining academic language, and organizing the structure of the manuscript. All content generated by AI was critically reviewed, edited, and verified by the author(s) to ensure accuracy, originality, and adherence to scholarly standards. However, this manuscript similarity index was checked using plagiarism detection software and found to be within the acceptable range, indicating proper academic integrity and originality.

When the Model Moves: Entrepreneurial Adaptation to Foundation-Model Dependency in AI Startups

Fahad Aljadaan
Independent Researcher, Kuwait City, Kuwait

F.K.Aljadaan@gmail.com

Abstract: Foundation models allow artificial intelligence (AI) startups to develop sophisticated products without owning the underlying model, but this speed creates dependence on providers that control model behaviour, availability, pricing, safety settings and lifecycle decisions. This paper examines how the AI venture ecosystem publicly constructs that dependence as manageable and which adaptation strategies it makes available to downstream ventures. The study uses qualitative content analysis of 15 organisation-controlled online sources published by model providers, AI gateways and routers, developer frameworks, and observability and evaluation platforms. Sources were selected using explicit criteria concerning ecosystem role, public accessibility, recency and substantive treatment of model lifecycle, switching, routing, fallback, evaluation or integration. Provider materials are treated as strategic discourse rather than neutral evidence of implementation; interpretations are therefore bounded, compared across ecosystem roles and contextualised using recent independent research on platform power, transparency, competition and AI business models. The findings identify model volatility as the operating condition and five responses: multi-model hedging, abstraction-layer building, failure routing and fallback, evaluation-based capability monitoring, and workflow ownership. Together these responses form a dependency-management architecture. The paper defines workflow ownership as venture-specific control over the customer process, data context, integration logic, evaluation criteria, governance and assurance surrounding model inference, so that customer value can persist when the upstream model changes. The analysis develops the concept of resilient dependence: ventures may remain reliant on external models while reducing the ability of any single provider or model version to determine continuity. Economically, the architecture trades additional integration, evaluation and governance costs for lower exposure to supplier power, service interruption, margin volatility and forced migration. The study contributes a process model for research on AI entrepreneurship and a practical framework for assessing whether a downstream venture can continue delivering and capturing value when its upstream model moves.

Keywords: AI Entrepreneurship; Foundation Models; Platform Dependence; Dynamic Capabilities; Resilient Dependence; Workflow Ownership

1. Introduction

Foundation models have lowered the cost and time required to build artificial intelligence (AI) products. Startups can access large language models, multimodal systems and hosted inference through application programming interfaces rather than developing the underlying technology. This expands entrepreneurial opportunity, but it also places a critical part of the product outside the venture's control. A provider can retire a model, alter prices or rate limits, change safety behaviour, or release a successor whose outputs differ from the version on which the product was designed.

Provider documentation shows that such movement is routine rather than exceptional. OpenAI maintains deprecation notices, Anthropic publishes migration guidance between Claude generations, and Google distinguishes stable, preview, latest and deprecated Gemini models (OpenAI, 2026; Anthropic, 2026; Google AI for Developers, 2026). For a downstream venture, an apparently technical change can affect customer promises, unit economics, latency, reliability and legitimacy. Prompt logic may need to be revised, evaluations rerun, fallbacks introduced and contracts reconsidered.

Recent research reinforces the strategic character of this problem. Generative AI is increasingly analysed as a multi-level system in which application value depends on models, infrastructure and organisational integration rather than on a model alone (Feuerriegel et al., 2024). Innovation-management and business-model research likewise emphasises ecosystem governance, value creation and organisational boundaries (Mariani and Dwivedi, 2024; Jorzik et al., 2024). Most directly, Nzembayie and Urbano (2026) show how generative-AI platforms enable entrepreneurship while creating dependence on non-substitutable, platform-governed capabilities. Competition research also warns that the foundation-model layer may concentrate power and shape downstream innovation (Schrepel and Pentland, 2025).

Digital entrepreneurship research explains how digital technologies reshape entrepreneurial uncertainty and action (Nambisan, 2017). Platform research further shows that complementors gain access to shared infrastructure while remaining exposed to interfaces and governance controlled by platform owners (Gawer and Cusumano, 2014; Jacobides, Cennamo and Gawer, 2018). Cutolo and Kenney (2021) describe platform-

dependent entrepreneurs as actors facing structural power asymmetries. Foundation-model markets intensify this condition: the upstream actor does not only govern access or distribution; it supplies part of the product's cognitive performance.

This paper defines foundation-model dependency as a condition in which a venture's product performance, cost structure, reliability and strategic direction depend materially on external model providers that the venture does not control. It asks: How does the AI venture ecosystem publicly construct foundation-model dependency as a manageable condition, and which adaptation strategies does it institutionalise? The paper develops an ecosystem-level typology and interprets it through resource dependence and dynamic capabilities. Its central argument is that AI ventures build resilient dependence by embedding sensing, switching and reconfiguration into technical architecture while locating defensibility in the workflow surrounding the model.

2. Theoretical Background

2.1 Resource and Platform Dependence

Resource dependence theory holds that organisations become vulnerable when another actor controls a resource that is important and difficult to substitute (Pfeffer and Salancik, 1978). Young ventures are particularly exposed because they have limited slack, bargaining power and established routines. A foundation model is an unusual critical resource: it can simultaneously determine output quality, reasoning capability, response style, latency, safety behaviour and serving cost. The provider is therefore both an enabler of venture creation and a continuing source of strategic constraint.

Platform ecosystems create similar tensions. Shared standards and interfaces can accelerate innovation, but complementors remain exposed to rule changes, interface restrictions, appropriation and shifting participation economics (Gawer and Cusumano, 2014; Jacobides, Cennamo and Gawer, 2018). Foundation-model dependency is a deeper form of this relationship because changes can enter the functional behaviour of the downstream product. The relevant shock is not only a commission or ranking change; it can be a new refusal pattern, altered reasoning performance, different token use or model retirement.

Recent independent evidence strengthens the need for caution toward provider-centred accounts. The Foundation Model Transparency Index documents continuing opacity around downstream impact and other areas despite improved disclosure (Bommasani et al., 2024). Research on competition highlights the possibility that a small number of foundation-model firms can shape access, prices and innovation conditions for downstream actors (Schrepel and Pentland, 2025), while large-scale analysis of open-model activity shows that openness can redistribute participation without eliminating concentration or intermediary power (Longpre et al., 2025). Dependency management therefore concerns not only technical substitutability but also bargaining power, information asymmetry and value capture.

2.2 Dynamic Capabilities Under Model Volatility

Dynamic capabilities describe how firms sense changes, seize opportunities and reconfigure resources in changing environments (Teece, Pisano and Shuen, 1997; Teece, 2007). In high-velocity settings, these capabilities often take the form of identifiable processes rather than one universal routine (Eisenhardt and Martin, 2000). This lens is useful for AI startups because model markets change frequently and adaptation can be encoded in software architecture.

Evaluation and observability can support sensing by exposing regressions, refusal changes, latency and cost. Routing, fallback and access to alternative models can support seizing by creating immediate options when conditions change. Common interfaces and workflow-specific assets can support reconfiguration by allowing the venture to replace or rearrange the model layer while preserving its own application logic. The empirical question is therefore not simply whether a venture is dependent, but which publicly available architectures make that dependence more resilient.

2.3 Business-model and Economic Consequences

AI-driven business-model innovation involves more than adding a new technical feature; it changes value propositions, activities, partners, cost structures and value-capture mechanisms (Kanbach et al., 2024; Jorzik et al., 2024). For an application-layer startup, foundation-model dependence creates variable inference costs, migration expenditure, duplicated testing, possible downtime and exposure to unilateral changes in upstream

terms. At the same time, building gateways, evaluations and assurance routines requires investment before their value is visible. Resilience is therefore an economic allocation problem: the venture incurs option-building costs today to reduce the expected cost and bargaining impact of future provider movement.

3. Method

3.1 Design, Unit of Analysis and Source Rationale

The study uses qualitative content analysis of public online materials. The unit of analysis is the organisation-controlled source artifact: documentation, migration guidance or product material describing model lifecycle, switching, routing, fallback, observability, evaluation or integration. These materials are appropriate because the research question concerns how the ecosystem represents dependency and adaptation to prospective users. They are not treated as neutral evidence that every advertised feature is effective, widely adopted or economically beneficial.

Provider discourse is analytically relevant because it helps define the repertoire of actions made visible and legitimate to downstream ventures. At the same time, the organisations have commercial incentives to portray dependence as manageable. The analysis therefore separates the stated mechanism from the paper's interpretation of its entrepreneurial function. A higher-order response was retained only when supported by a concrete operational description and repeated across more than one organisation or ecosystem role. Recent independent research on transparency, platform power, competition and business models was used for contextual triangulation and to identify counter-arguments; it was not counted as part of the 15-source empirical corpus.

3.2 Sample Selection

Fifteen organisations were selected purposively in July 2026 using maximum variation across the infrastructure that connects foundation models to downstream applications. A source was included only when it met all five criteria: (1) it was official and organisation-controlled; (2) it was publicly accessible in English; (3) it was current or actively maintained at the time of retrieval; (4) it contained substantive, mechanism-level material on model lifecycle, switching, routing, fallback, evaluation, observability or application integration; and (5) the organisation directly supplied or governed a technical component used by downstream AI applications.

General commentary, end-user application marketing, duplicate pages and sources containing only broad claims such as 'more reliable' or 'provider agnostic' without operational explanation were excluded. Sampling sought role diversity rather than statistical representation: model providers reveal the upstream condition; gateways and routers expose switching and continuity mechanisms; development frameworks show application-layer separation; and observability or evaluation platforms reveal how change is detected. The final set of 15 was reached when additional sources repeated the existing higher-order categories rather than adding a new response.

Table 1:

Ecosystem Role	Organisations and Material	Evidence Coded
Model providers	OpenAI; Anthropic; Google AI for Developers	Deprecation, migration guidance and model lifecycle categories
Gateways, routers and unified access	Vercel; LiteLLM; Portkey; OpenRouter; Helicone; Eden AI; Requesty	Multi-provider access, routing, fallback, retries, budgets, health checks, cost and latency
Development frameworks	LangChain; LlamaIndex	Common interfaces, provider integrations and application-layer separation
Observability and evaluation	Langfuse; Humanloop; Braintrust	Tracing, prompt comparison, evaluations, regression detection and production monitoring

3.3 Coding and Analytic Procedure

Coding proceeded in three stages. First-cycle descriptive codes captured deprecation, retirement, migration, provider switching, common interfaces, retries, fallback, routing, load balancing, cost control, latency, prompt comparison, evaluation, regression detection, provider agnosticism, integration and workflow context. Second, related codes were grouped into an operating condition and five higher-order responses. Third, the themes were compared with resource dependence and the sensing-seizing-reconfiguring framework to identify their entrepreneurial function.

The analysis was conducted by a single coder and maintained an audit trail of source URLs, access dates, descriptive codes and theme assignments. Negative implications were recorded alongside claimed benefits, including non-equivalence between models, intermediary dependence, additional testing costs and the possibility that advertised controls do not reflect production performance. The claims are consequently interpretive and ecosystem-level: they concern a publicly available repertoire of adaptation, not causal effects on venture performance.

4. Findings

The analysis identifies model volatility as the operating condition and five responses. Table 2 presents the relationship between public mechanisms, entrepreneurial functions and dynamic-capability roles.

Table 2:

Condition or Response	Public Mechanism	Entrepreneurial Function	Capability Role
Model volatility	Deprecation, migration and changing lifecycle status	Creates dependency pressure and exposes unit economics	Environmental turbulence
Multi-model hedging	Access to several models or providers	Diversifies supplier dependence and creates options	Seizing
Abstraction layers	Common interfaces and provider integrations	Protects application logic and lowers direct switching costs	Reconfiguring
Failure routing	Retries, routing rules and fallback chains	Buffers outages, constraints and revenue interruption	Seizing
Evaluation and observability	Tracing, evaluations and regression monitoring	Makes drift, cost and quality changes visible	Sensing
Workflow ownership	Data context, integrations, assurance and customer process	Relocates defensibility and value capture around the model	Reconfiguring and renewal

4.1 Model Volatility is Normalised

Model-provider documentation presents retirement and migration as part of normal production use. OpenAI records deprecated models and replacement paths; Anthropic explains changes in model names, parameters, prompting, cost and latency; and Google's lifecycle categories warn that preview or latest versions may change more quickly (OpenAI, 2026; Anthropic, 2026; Google AI for Developers, 2026). These materials frame continuity as conditional rather than guaranteed.

For downstream ventures, improvement can therefore be destabilising. A more capable model may change output structure, refusals, token use or response speed. The entrepreneurial risk is not only market demand but the ability to maintain a promise when upstream cognitive infrastructure moves. Economically, movement can alter gross margins, trigger unplanned engineering and validation expenditure, delay sales or require price and service-level renegotiation. This normalised volatility creates the need for the remaining responses.

4.2 Multi-model Hedging Creates Optionality

Gateways and unified APIs repeatedly present access to multiple models and providers as a core benefit. Vercel, Helicone, Eden AI and Requesty emphasise common access, provider choice, cost controls and model-selection

policies, while OpenRouter and LiteLLM expose routing across alternative endpoints (Vercel, 2026; Helicone, 2026; Eden AI, 2026; Requesty, 2026; OpenRouter, 2026; LiteLLM, 2026). The strategic logic is supplier diversification: dependence remains, but it is spread across external sources.

This converts model multiplicity into operational optionality. A venture can redirect a workload when a provider is unavailable, slow, expensive or unsuitable for a task. The economic value is a reduction in the expected loss from outage or unilateral price change and an improved negotiating position when credible alternatives exist. Yet optionality is not free: connectors, duplicated evaluations, data-governance reviews and minimum spend across providers can raise fixed and coordination costs. Multi-model access is therefore valuable when the avoided disruption exceeds the cost of maintaining tested alternatives.

4.3 Abstraction Layers Protect Venture-Specific Logic

LangChain, LlamaIndex and Vercel's AI SDK describe common interfaces and broad integrations across model providers (LangChain, 2026; LlamaIndex, 2026; Vercel, 2026). Such abstraction separates application logic from provider-specific calls. Without it, migration may require extensive rewriting; with it, more of the venture's orchestration, user interface and domain logic can remain stable when the model changes.

Abstraction is therefore more than engineering convenience. It lowers direct switching costs and supports reconfiguration, but it can also shift dependence to the framework or gateway that supplies the common interface. Lowest-common-denominator design may prevent use of distinctive provider features, while intermediary fees can affect margins. The strategy is strongest when the venture retains portability of its prompts, evaluations, logs and business logic rather than merely replacing one opaque dependency with another.

4.4 Failure Routing Converts Disruption Into Managed Continuity

Portkey, LiteLLM, OpenRouter, Helicone and Requesty describe retries, health checks, routing rules and fallback chains that move requests away from a failed or constrained model (Portkey, 2026; LiteLLM, 2026; OpenRouter, 2026; Helicone, 2026; Requesty, 2026). These mechanisms buffer upstream outages, rate limits and performance problems before they become customer-facing failure.

Fallback is a seizing capability because it enables action under constraint, but it requires prior choices about acceptable substitutes. A lower-cost or faster model may not preserve quality, compliance or output format. Effective routing therefore depends on workflow-level service criteria and evaluation, not merely on the existence of a second endpoint. Its economic role is continuity protection: routing can preserve transactions, user trust and contractual service levels, but poor fallback can create hidden quality costs that emerge later through complaints, rework or liability.

4.5 Evaluation and Observability Provide Sensing Infrastructure

Langfuse, Humanloop and Braintrust present tracing, prompt comparison, evaluations, production monitoring and regression detection as continuous elements of AI application development (Langfuse, 2026; Humanloop, 2026; Braintrust, 2026). Gateways also expose cost, latency and error information. Together, these systems make upstream change visible to the downstream venture.

This is the clearest sensing response. Changing an endpoint does not show whether the replacement still performs the task acceptably. Evaluation routines allow a venture to compare model versions, identify weakened workflows and decide whether prompts, routing rules, prices or customer promises must change. Economically, evaluation converts an uncertain migration into a measurable decision and reduces the risk of silent degradation. It also creates a reusable organisational asset: test cases, acceptance thresholds and production traces accumulate knowledge that remains valuable across providers.

4.6 Workflow Ownership Relocates Defensibility

Workflow ownership is defined here as venture-specific control over the customer process surrounding model inference: problem framing, domain data and context, integration logic, evaluation criteria, governance, human escalation, assurance and the user relationship. It does not mean legal ownership of the customer's process or independence from all external infrastructure. Rather, it means that the venture controls the configuration through which generic model capability becomes a reliable, accountable and economically valuable outcome.

If foundation-model access is externally controlled and widely available, access alone is a weak basis for defensibility. Hedging, abstraction, routing and evaluation allow a venture to remain valuable while changing the underlying model. The venture becomes less reducible to one provider when customers depend on its data connections, operational controls, verified outcomes and embedded process knowledge. Workflow ownership can support recurring revenue, retention and differentiated assurance, but defensibility is durable only when it reflects genuine customer value rather than artificial lock-in.

4.7 The Economic Logic of Resilient Dependence

Across the five responses, resilient dependence is not costless independence. It is a portfolio of real options. The venture pays for integration, monitoring, evaluation, duplicate testing and governance in exchange for lower expected losses from forced migration, downtime, quality drift and supplier price changes. The optimal level is therefore contingent. A low-risk consumer feature may tolerate single-provider dependence; a regulated or mission-critical workflow may justify extensive redundancy and assurance.

The architecture also influences where value is captured. Upstream model providers retain scale economies and control over core capability, while gateways and frameworks may capture value by reducing transaction and switching costs. Downstream startups can defend margins when they convert generic inference into workflow-specific outcomes that customers are willing to pay for and that survive provider substitution. This creates a central tension: the same abstraction that improves portability may commoditise the model layer, increasing pressure on the venture to differentiate through data, integration, distribution, trust and verified performance.

5. Discussion

5.1 Theoretical Contributions

First, the findings extend platform-dependent entrepreneurship. Foundation-model dependency is not only dependence on access, distribution or governance; it is dependence on externally controlled product behaviour. This helps explain why AI ventures may remain vulnerable even when they retain their customers and application interface. It also complements recent work showing that generative-AI platforms simultaneously enable resource access and reproduce power asymmetries (Nzembayie and Urbano, 2026).

Second, the paper extends resource dependence into AI entrepreneurship by treating model capability as external cognitive infrastructure. The response is not full independence but resilient dependence: diversification, visibility and switching reduce the extent to which one provider can determine venture continuity. The concept preserves the relational insight of resource dependence while recognising that substitution is partial, costly and often mediated by other platforms.

Third, the findings make dynamic capabilities architectural. Sensing appears in evaluations and observability; seizing appears in routing, fallback and multi-model choice; reconfiguration appears in abstraction and the relocation of value to workflow-specific assets. The technical stack is therefore part of the organisation's adaptation capability, not merely an implementation detail. Repeated evaluations, routing rules and integration patterns can become routines through which a young venture learns under technological volatility.

Fourth, the paper links dependency management to business-model economics. Resilience mechanisms affect costs, supplier bargaining power, revenue continuity and the location of defensibility. This addresses a gap in technology-centred accounts by showing that architecture is also a value-capture decision. The venture must decide which dependencies to diversify, which to accept and which complementary assets to own.

5.2 A Process Model of Resilient Dependence

The themes form a process model. Anticipated or realised model movement creates migration pressure. Evaluation and observability reveal the consequences; multi-model access and routing create response options; abstraction reduces the cost of changing the stack; and workflow ownership preserves the venture's distinctive value. The outcome is not freedom from foundation models but a more resilient relationship with them.

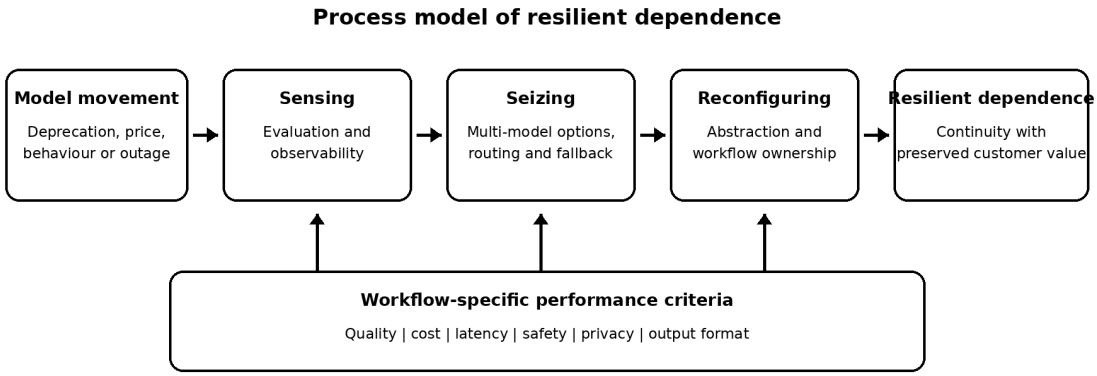

Figure 1: Process model of resilient dependence

Figure 1 clarifies the sequence and its boundary condition. Architectural flexibility is valuable only when the venture knows what must remain invariant. Quality, latency, cost, safety, privacy and output format may matter differently across workflows. These criteria guide sensing, determine acceptable fallback options and define what reconfiguration must preserve. The process is iterative: once the model or workflow changes, production evidence feeds back into evaluation and may trigger another cycle.

6. Implications

For founders, model choice should be treated as a strategic dependency decision rather than a one-time engineering choice. Due diligence should ask whether critical workflows can switch models, whether fallback options are tested, whether regressions and costs are monitored, and what the venture owns beyond prompts and API access. The relevant metric is not simply the number of supported models but the time, cost and quality loss associated with a realistic migration.

For investors and accelerators, dependency architecture can be a signal of venture maturity. A useful assessment is whether customer value and gross margin would survive a provider change. Evidence may include portable evaluation sets, tested fallback routes, concentration of inference spend, contractual exposure, customer-specific integrations and the share of value located in workflow assets rather than raw model access.

For policymakers and ecosystem builders, support should extend beyond access to models and include evaluation sandboxes, interoperability, open and portable infrastructure, procurement guidance, data governance and assurance capabilities. Competition policy should also consider how upstream concentration and intermediary control affect downstream experimentation and value capture (Schrepel and Pentland, 2025). Such support can reduce thin, captive positions without assuming that open models or multi-provider access automatically remove dependence.

7. Limitations and Future Research

The study analyses public organisation-controlled materials rather than internal decisions or verified technical performance. Marketing and documentation may selectively emphasise controllability, understate implementation difficulty and omit failures. The source design is legitimate for analysing the public repertoire through which dependency is framed, but it cannot establish adoption, effectiveness or causal impact. Contextual triangulation with independent research reduces the risk of accepting provider claims at face value, but it does not replace independent empirical observation.

The purposive sample is infrastructure-oriented and cannot represent all AI startups, while single-coder analysis limits reliability claims. The sample also captures a rapidly changing ecosystem at one point in time, and several organisations are themselves intermediaries with incentives to expand the perceived need for their services. The typology and process model are therefore exploratory.

Future research should interview founders who have experienced migrations, outages, safety changes and pricing shocks; compare advertised mechanisms with logs and post-migration performance; and contrast single-provider, multi-provider and open-weight architectures. Longitudinal studies could test whether dependency-management capability predicts survival, enterprise adoption, growth or gross-margin stability. Further work should examine when abstraction creates new intermediary dependence, when workflow ownership becomes

sufficiently proprietary to create durable advantage, and how the optimal resilience investment varies by regulation, workflow criticality and venture stage.

8. Conclusion

AI startups build with powerful models that they do not own and whose behaviour can change. This paper identifies model volatility as the operating condition and five ecosystem responses: multi-model hedging, abstraction layers, failure routing, evaluation and observability, and workflow ownership. Together, these mechanisms constitute a dependency-management architecture.

The central implication is that resilience comes from controlling the relationship between model capability and customer value. The most defensible downstream ventures may not own the foundation model, but they can own the workflow, data context, evaluation routines, integrations and assurance layer that allow the product to keep working when the model moves. Resilient dependence is therefore both a dynamic capability and an economic design choice: it balances the cost of maintaining options against the risk that an upstream provider can interrupt continuity, alter margins or appropriate a larger share of value.

Teaching Risk, Assessing Certainty: The Hidden Paradigm in Entrepreneurship Education

Sarah Allam
Mundiapolis University, Casablanca, Morocco

s.allam@mundiapolis.ma

Abstract: An entrepreneurship education module teaches risk, iteration, opportunity. Then it assesses through caution, the complete dossier, the five-year forecast. Students notice the difference, and they adjust what they submit to what the grade rewards. Over two decades, entrepreneurship education has moved its discourse from planning toward a way of acting under uncertainty. This reform reshaped what is taught. It has reached assessment more slowly, and the instruments that grade students still ask largely for plans and forecasts. Yet assessment, as much as discourse, shapes what students do and the entrepreneurial disposition they develop. The point where a programme grants its grades is also where it signals what it truly values. Drawing on a reflexive thematic analysis of open-ended responses from 58 students across a range of disciplines in Moroccan universities, this exploratory study examines how students perceive the gap between what entrepreneurship education espouses and what its assessment rewards, how they make sense of it, and how they respond to it. The gap is consistent. Assessment that speaks of risk rewards certainty. Assessment that speaks of iteration rewards the finished dossier and the multi-year forecast. The polished presentation scores. Students adjust to what the grade rewards. They de-risk their idea. Some keep their innovation to themselves, others fabricate market data, many disengage while producing the expected compliance. Where assessment matches what was taught, coherence and engagement return. The trigger is the match itself. Assessment then appears as a carrier of the predictive logic, where pedagogy has already moved toward an entrepreneurial one. The business plan and the forecast keep a causal paradigm inside reformed programmes, and can slow the entrepreneurial turn at the very point where it is measured. Impact studies built on these instruments may measure compliance as much as entrepreneurial learning. What an aligned assessment would instead reward remains to be named, and entrepreneurial marketing offers the horizon, an assessment built for uncertainty and for the value students can actually create.

Keywords: Entrepreneurship Education, Assessment Design, Causation and Effectuation, Entrepreneurial Marketing, Reflexive Thematic Analysis

1. Introduction

An entrepreneurship education module teaches risk, iteration and opportunity. Then it assesses through caution, the complete dossier and the five-year forecast. Students notice the gap, and they adjust to it.

Over the past two decades, entrepreneurship education has moved its discourse from planning a venture toward acting under uncertainty (Neck and Greene, 2011; Sarasvathy, 2001). The field increasingly presents entrepreneurship as a method rather than a plan, and it questions the central place long held by the business plan (Honig, 2004). This shift has reached what educators teach and how they teach it. What students are rewarded for has followed more slowly.

Assessment is not a neutral endpoint of this reform. By the logic of constructive alignment, assessment shapes how students engage and what they come to value, often more than the stated aims of a course (Biggs, 1996; Gibbs and Simpson, 2004). The point at which a programme grants its grades is also the point at which it signals what it treats as valuable. An entrepreneurial disposition, then, is formed as much by the conditions of assessment as by the content of teaching.

This study examines that overlooked point. It treats assessment as one of the conditions under which an entrepreneurial mindset can form, and asks how students perceive the gap between what entrepreneurship education espouses and what its assessment rewards, and how they respond to it. Drawing on a reflexive thematic analysis of open-ended responses from 58 students across a range of disciplines in Moroccan universities, this exploratory study maps that gap from the students' point of view.

The analysis suggests that the gap is consistent, and that it runs in one direction. Assessment that speaks of risk rewards certainty. Assessment that speaks of iteration rewards the finished dossier. Students adjust to what the grade rewards. They de-risk their idea, they align their project with what the marking favours, and some disengage while producing the expected form. Where assessment matches what was taught, coherence and engagement return.

The paper makes three contributions. It repositions assessment as a carrier of the predictive and planning logic that the field's pedagogy has begun to leave behind, a paradigm that persists at the point of measurement. It

offers a typology of the perceived divergence between what is espoused and what is rewarded, together with the adaptive responses it produces. It then names, through the lens of entrepreneurial marketing, what an assessment aligned with uncertainty might instead reward. In doing so, it raises a further concern. If assessment carries the older paradigm, impact studies built on these instruments may capture compliance as much as entrepreneurial learning.

2. From Plan to Method: a Shift That Stops at Assessment

2.1 Entrepreneurship Education and its National Framing

Entrepreneurship education covers a wide range of provision, and definitions shift with what a programme is asked to achieve. A common distinction separates learning about entrepreneurship, learning for it, and learning through it, the first transmitting knowledge of the phenomenon, the second preparing students to start a venture, and the third developing entrepreneurial capabilities through action (QAA, 2018). Competence frameworks take the third route furthest. EntreComp defines entrepreneurship as acting upon opportunities and ideas to create value for others, and builds the competence around ideas and opportunities, resources, and action (Bacigalupo et al, 2016). This study adopts that broad understanding. Entrepreneurship education is treated here as provision intended to develop a capacity to act under uncertainty, whether or not students go on to found a venture.

The Moroccan setting gives this a particular shape. National pedagogical norms governing degree accreditation allow programmes to offer entrepreneurship as a complementary module alongside their disciplinary core, which is how students in engineering, law or science come to take an entrepreneurship module at all. The current national reform, PACTE ESRI 2030, makes entrepreneurship and employability an explicit priority, funding student entrepreneurship support centres and career centres across universities (Ministry of Higher Education, Scientific Research and Innovation, 2023). These texts set out what should be offered and what students should develop. They remain silent on what assessment should reward, and that decision is left to individual programmes.

2.2 The Shift From Planning to Method in Entrepreneurship Education

Entrepreneurship education has long carried two competing logics. The first is causal. It treats the venture as a goal to be reached through prediction and planning, with resources assembled in advance (Sarasvathy, 2001). The business plan is its central artefact, and for many years it defined both the content and the outcome of entrepreneurship courses (Honig, 2004). The second logic is effectual. It treats the future as something shaped through action, where the entrepreneur begins with available means, accepts affordable loss and adapts as circumstances unfold (Sarasvathy, 2001; Chandler et al, 2011).

Over time, the field has moved toward the second logic, a shift documented across four decades of pedagogical research (Hägg and Gabrielsson, 2020). Scholars have argued that entrepreneurship is better taught as a method than as a body of content, a practice to be enacted rather than a plan to be written (Neck and Greene, 2011). Honig (2004) questioned the dominance of the business plan and proposed a contingency-based approach to venture education. This movement reshaped what entrepreneurship educators say they want to develop. The stated aim became a capacity to act under uncertainty, and to treat experimentation as part of learning rather than a deviation from it.

2.3 Assessment as the Driver of Student Learning

While the discourse of teaching has shifted, a separate body of work explains why teaching alone does not determine what students learn. Constructive alignment holds that learning is shaped by the alignment between intended outcomes, teaching activities and assessment (Biggs, 1996). Within this view, assessment operates as more than a measure applied at the end. It is the signal that tells students what a course truly values, and it steers the way they work.

Assessment shapes learning most strongly through what students perceive it to reward. Gibbs and Simpson (2004) show that the conditions of assessment, more than its stated purpose, determine whether students engage deeply or strategically. When students read assessment as rewarding recall or compliance, they adopt surface approaches, whatever the aims written into the syllabus. Assessment, in this sense, carries a hidden message about what counts.

2.4 The Blind Spot at the Point of Measurement

These two bodies of work meet at a point that has drawn little attention. Research on assessment practice in entrepreneurship education remains scarce, and existing work shows that conventional instruments continue to dominate (Pittaway and Edwards, 2012). Recent work has begun to examine how assessment aligns with intended learning outcomes in experiential settings (Kenny, Venkatesh and Mc Guirk, 2026). The question of which paradigm assessment carries, however, remains open. If assessment sends the message about what a course values, what message does entrepreneurship assessment actually send?

The instruments that dominate entrepreneurship assessment remain those of the causal paradigm. The written business plan, the multi-year financial forecast and the graded final pitch reward prediction, completeness and polish (Honig, 2004; Pittaway and Edwards, 2012). A programme may teach iteration and risk while assessing through instruments that reward planning and certainty. The pedagogy may have moved, yet the point of measurement may hold the older logic in place. This study takes that possibility as its starting point, and examines it from the perspective of the students who experience it.

3. Analytical Framing: Assessment as a Paradigm Carrier

This study works abductively. It moves between the data and existing theory to build a provisional frame, rather than testing hypotheses derived in advance (Dubois and Gadde, 2002). The frame rests on one mechanism and one distinction, and it borrows a normative reference that is held back until the discussion.

The mechanism comes from constructive alignment. Assessment signals what a course values, and students steer their work by that signal (Biggs, 1996; Gibbs and Simpson, 2004). The distinction comes from entrepreneurship theory. Causal reasoning starts from a defined goal and works backward through prediction and planning. Effectual reasoning starts from available means and works forward through action, partnership and affordable loss (Sarasvathy, 2001). Entrepreneurship education claims to have moved from the first logic toward the second (Neck and Greene, 2011; Hägg and Gabrielsson, 2020).

Placed together, the mechanism and the distinction produce the frame of this study. Every assessment instrument rewards something. What it rewards can be read as belonging to one of the two logics. A business plan graded on completeness and the credibility of its forecasts rewards causal reasoning. An instrument that rewarded tested assumptions, documented pivots or value created with limited means would reward effectual reasoning. When the teaching espouses one logic and the assessment rewards the other, the instrument becomes a carrier. It transports the older paradigm into a reformed programme, and it does so quietly, because assessment is rarely examined at the level of paradigm.

This frame remains provisional. It guided the reading of the data, and the data were allowed to push back against it. The study does not measure dispositions or outcomes. It examines how students perceive what assessment rewards, and what they do in response. Entrepreneurial marketing, which describes marketing behaviour under uncertainty through opportunity orientation, customer intensity, resource leveraging and value creation (Morris, Schindehutte and LaForge, 2002; Read et al, 2009), enters later in the paper. It serves in the discussion as a way of naming what an assessment aligned with uncertainty might reward. It plays no part in the coding of the data.

4. Method

4.1 Design and Context

The study adopts a qualitative and exploratory design, suited to a question about perception that existing theory frames only partially (Dubois and Gadde, 2002). Data were collected through an open-ended written questionnaire administered online. Respondents had completed at least one module falling within the understanding of entrepreneurship education set out above, whether delivered as a dedicated entrepreneurship module or as a complementary module within another programme. They were enrolled across undergraduate, master and engineering cycles, and came from management and finance as well as from engineering, science, law and humanities programmes. The questionnaire asked students to recount their experience of these modules in their own words, including moments where the discourse of the module and its requirements appeared to diverge, how they reacted, and what they perceived the module to value.

Sixty-three responses were collected in two waves. Five were excluded for insufficient length or duplication, leaving fifty-eight retained responses. The exact number of institutions represented is not known. The questionnaire recorded institution type, public or private, rather than institution name, so that no response could be traced to a specific programme or teacher, and respondents spanned several such institutions in both categories. Because the study examines what assessment rewards, the analysis anchors its claims on respondents from management and finance programmes, who can be expected to read business-oriented instruments with ease. Responses from other disciplines serve as secondary support, and disciplinary distance is held outside the scope of this paper.

4.2 Analysis

The material was analysed through reflexive thematic analysis (Braun and Clarke, 2006). Coding proceeded abductively, moving between the corpus and the analytical frame set out in section 3 (Dubois and Gadde, 2002). A codebook was developed for this study around four axes, the assessment instrument named by the student, the perceived divergence between what the module espoused and what its assessment rewarded, the student's adaptive response, and the logic the instrument was perceived to reward. Coding remained open to responses that contradicted the frame, and perceived coherence between teaching and assessment was coded on the same footing as perceived divergence. Thematic saturation was reached before the end of the corpus, with later responses confirming the themes without adding new categories.

The analysis was conducted from an insider position within the Moroccan higher education system, in which the researcher teaches marketing and entrepreneurship. This position gave access and interpretive depth, and it carried a risk of confirmation that was addressed through the trustworthiness criteria of Lincoln and Guba (1985), credibility through sustained engagement with the corpus, transferability through thick description of context, dependability through an explicit codebook and audit trail, and confirmability through systematic anchoring of every claim in quoted material. Quotations were translated from French with the support of an AI-based translation tool, and each translation was checked against the original wording to preserve register and nuance.

The study reports perceptions. It makes no claim about the actual quality of the modules concerned, about educators' intentions, or about measured learning outcomes.

5. Findings

5.1 A Consistent Divergence Between What is Espoused and What is Rewarded

Forty-three of the fifty-eight retained responses describe at least one moment where the module espoused one thing and its assessment rewarded another. Fifteen describe coherence between the two. The divergence takes recurring forms, summarised in Table 1.

Table 1: Perceived divergence between espoused discourse and rewarded behaviour

Form	The Discourse Espouses	Assessment is Perceived to Reward	Illustrative Case
Risk to certainty	Risk-taking, accepting failure	Certainty of the figures	R19, audit
Novelty to conformity	Innovation, originality	The safe, well-presented idea	R45, finance
Iteration to completeness	Agility, testing, pivoting	The finished, linear dossier	R28, engineering
Substance to form	Practical reasoning	Polish, slides, delivery	R22, management
Real to fictional	Real venture creation	A simulated exercise	R61, agronomy

The first form runs deepest, because it touches the logic the reform claims to have left. A student in audit and management control recounts a jury that criticised his team's idea for lacking disruption while their financing plan was the strongest in the room. His reading is direct. “They grade the dream, not the mathematical viability. Risk is asked for in the discourse, but the grade goes to the absolute certainty of the numbers” (R19). A student in financial engineering describes the same trade made in advance. “If you propose a very new idea, the forecasts are called unrealistic. We chose a moderately innovative idea so we could justify our numbers and secure a sixteen” (R55).

The penalty attached to novelty appears in grades themselves. A finance student compares two projects in the same cohort. “Our complex and risky idea got twelve. A neighbourhood nursery with beautiful slides got seventeen. The professor said our business plan was not reassuring” (R45). A law student describes the group's response to a dossier graded largely on legal form. “We did a classic project, with no risk of error” (R37).

Students who work in iterative environments read the instrument itself as carrying the older logic. An engineering student contrasts the module with his practice. “They ask me for a forty-page dossier before my first sale. In real life you launch your MVP on Instagram” (R28). A big data student names the two logics side by side. “The school teaches entrepreneurship in waterfall mode, but in tech we work agile, you release and you test. I pretended to follow their method for the dossier” (R56).

The remaining forms follow the same pattern. A management student who proposed a personal branding strategy on social media was told it was not real marketing. “I put radio advertising in my dossier for the grade, and continued my collaborations on Instagram” (R48). Responses from engineering programmes echo the pattern on the side of feasibility, from prototypes required without any budget, “we improvised with cardboard” (R57), to a real project judged insufficiently scalable and replaced by an invented application “that we knew would serve no purpose” (R61).

5.2 Rational Adjustment to the Signal of the Grade

Faced with this divergence, students describe adjusting rather than protesting. The most common adjustment is strategic compliance, producing what the marking values. Some responses describe self-censorship, where the risky idea is abandoned before submission (R55, R37). Others describe fabrication, from invented market data to entire invented projects (R43, R28). A student in international commerce, already running an import and export activity, summarises the exchange. “He said it was not innovative enough. We invented an eco-friendly application to pass” (R43). Disengagement appears where the exercise is read as disconnected from anything real. One case of open conflict appears, and it is the graded twelve of R45. An IT student extends the logic to the collective instrument. “The grade was a group grade, unfair to those who work more. I did the whole business plan alone to secure the seventeen” (R47).

These adjustments run in one direction. Each one moves the student's visible work toward prediction, completeness and polish, and moves the student's own initiative, where it exists, outside the module.

5.3 Where Assessment Aligns, Coherence Returns

The fifteen responses describing coherence carry the analytical weight of a contrast group. An accounting student found the final exam consistent with what had been taught. “It was very coherent with my revisions. I took the accounting part and secured eighteen out of twenty” (R42). A tourism student judged the whole module coherent, taught by practitioners, with one reservation, business plans projected over five years in a sector that changes constantly (R49).

Two responses show the instrument itself producing entrepreneurial reasoning when its demand aligns with action. An electrical engineering student describes costing his prototype inside the business plan. “I realised my idea was too expensive. I had to lower the quality for it to be profitable. I understood that this is real life” (R63). A chemistry student credits a module built on lean methodology. “I did not need a perfect lab to start validating an idea on the market” (R39). A student in water engineering recounts a jury that interrupted the presentation to ask who the target customer was, and reads the moment as formative (R44).

The contrast cases locate the mechanism. Engagement follows the match between what is taught and what is rewarded, in both directions. Where the match holds, students engage with instruments as demanding as a costed business plan. Where it breaks, students comply, censor, fabricate or withdraw.

6. Discussion

6.1 Assessment as the Carrier of a Paradigm

The findings can be read through the frame set out in section 3. The reform of entrepreneurship education has moved the discourse, and in the modules described here the discourse has largely arrived. Students hear about risk, iteration and opportunity. What they describe meeting at the point of assessment is the older logic, prediction, completeness and polish. The instrument, more than the discourse, tells students what the module

values, which is the central claim of constructive alignment (Biggs, 1996; Gibbs and Simpson, 2004). Read together with the direction of the divergence, this suggests a specific role for assessment in entrepreneurship education. The business plan and the forecast operate as carriers of the causal paradigm (Sarasvathy, 2001; Honig, 2004). They transport prediction and planning into programmes whose teaching has moved on, and they do so at the one point every student must pass through, the grade.

The contrast cases sharpen this reading. Students engage with demanding instruments when the demand matches what was taught, and a costed prototype can produce exactly the reasoning the reform hopes for (R63). The mechanism, in the students' own accounts, sits in the match between the espoused and the rewarded, and the adjustments they describe follow the reward. This is what the frame anticipated, and it is also where the perceived misalignment does its quiet work. Each adjustment moves visible student work toward the causal pole, and moves real initiative outside the module.

6.2 What an Aligned Assessment Might Reward

Naming the problem calls for a language to name the alternative. Entrepreneurial marketing offers one. It describes value creation under uncertainty through opportunity orientation, customer intensity, resource leveraging and calculated risk-taking (Morris, Schindehutte and LaForge, 2002), and it converges with the effectual logic the reform espouses (Read et al, 2009). The contrast cases already contain its traces. A jury that interrupts a technical presentation to ask for the target customer is grading customer intensity (R44). A business plan used to confront a prototype with its cost of production is grading resource-constrained value creation (R63). An assessment aligned with uncertainty would reward what these moments reward, tested assumptions, documented pivots, evidence of contact with real users, and value created from limited means, rather than the completeness of a forecast. This remains a normative horizon. The data show students responding to aligned instruments, and the design of such instruments is a task the data cannot settle.

6.3 Implications

Three implications follow, each calibrated to what perception data can carry. For educators, the finding relocates a familiar problem. Reforming content and pedagogy while keeping the dossier, the forecast and the graded pitch may leave the older paradigm in charge of the signal students actually follow Assessment design deserves the attention that pedagogy has received (Pittaway and Edwards, 2012; Kenny, McGuirk and Moylan, 2025).

In practical terms, aligning assessment with an effectual logic means grading what the reform claims to value. A brief could ask students to document one pivot and the evidence that prompted it, rather than to defend a fixed plan. It could reward proof of contact with real users, a tested assumption or a single validated hypothesis, over the completeness of a five-year forecast. It could credit value created with limited means, as one contrast case shows when a costed prototype forced a genuine trade-off (R63). None of this requires abandoning the business plan, only turning its demand toward action.

For research, the finding raises a measurement concern. If assessment rewards conformity to the causal form, then impact studies that rely on graded outcomes may capture compliance as much as entrepreneurial learning, a possibility that sits alongside longstanding concerns about the rigour of impact research in the field (Rideout and Gray, 2013). For institutions, the contrast cases suggest that alignment is achievable with existing instruments, since even a business plan can be turned toward effectual reasoning when its demand is connected to action.

6.4 Limitations

The study reports perceptions, collected retrospectively, in one national context. Because institutions were recorded by type rather than by name, the number of programmes represented in the corpus is unknown, and institutional variation cannot be examined. It says nothing about educators' intentions or about measured outcomes, and the anchoring on management and finance respondents leaves disciplinary distance outside its scope. The direction of the findings is consistent, and its generality is a question for further work, ideally through designs that pair student perception with the content of actual assessment criteria.

7. Conclusion

An entrepreneurship module can espouse risk and reward certainty, espouse iteration and reward the finished dossier. The fifty-eight accounts examined here suggest that students perceive this divergence clearly, and that they respond to the reward rather than the discourse. They de-risk, they conform, some fabricate, and some carry their real ventures outside the classroom while producing the expected form inside it. Where assessment matches what was taught, the same students engage, and the most demanding instruments become the most formative ones.

The step from perception to design is where this work now points. Future research could pair what students perceive with the actual criteria of the instruments that grade them, and could test whether assessment turned toward effectual reasoning shifts what students choose to attempt. The claim here is narrower, and it is a starting point. Before an instrument can be redesigned, the paradigm it quietly carries has to be seen.

The contribution of this paper is to name the role assessment plays in this pattern. The business plan, the forecast and the graded pitch operate as carriers of the causal paradigm, holding prediction and planning in place at the point of measurement while the pedagogy around them moves on. The entrepreneurial turn in education has reformed what is taught. Its next task may sit in the grade book. Students, the accounts suggest, worked this out before their programmes did.

Ethics Declaration

The study draws on an anonymous, voluntary, open-ended questionnaire completed by adult university students. Participation implied informed consent, responses contained no identifying information, and quotations are reported under anonymised codes. Under the regulations applicable to the institutions concerned, this type of anonymous educational survey required no formal ethical clearance.

AI Declaration

An AI-based language tool was used to translate quotations and draft text from French into English and to check consistency of formatting. All analytical decisions, coding, interpretations and conclusions are the author's own, and every translated quotation was checked against the original French wording.

Digital Technologies as an Enabler of Internal Audit Practices in the ESG Context: A Thematic Analysis of Recent Practices

Ivana Barišić, Marina Ercegović and Ivana Mamić Sačer
University of Zagreb, Faculty of Economics and Business , Zagreb, Croatia

ibarisic@efzg.hr
imamic@efzg.hr
mmicin@efzg.hr

Abstract: The role of the internal audit function in the context of sustainability, as well as the impact of digital technologies on the transformation of the internal audit function, is receiving increasing attention in both professional and academic literature. However, it is not possible to draw clear conclusions about the involvement of internal audit in sustainability, nor about the contribution of digital technologies to the audit process in this context. All of the above indicates the need for systematic research that will contribute to a better understanding of internal audit practice and the possibilities for its greater involvement in the context of sustainability. The paper examines the role of internal audit function of the in ESG context and the contributions of digital technologies such as data analytics and artificial intelligence in strengthening internal audit for the analysis of ESG data and supporting its role in sustainability. The aim is to analyse how the application of these technologies can contribute to more effective internal audit activities in the context of sustainability. The paper employs a semi-structured literature review of scientific papers published between 2018 and 2026 in relevant scientific database. In addition, a thematic analysis is conducted in order to explore the research topic in greater detail. The paper contributes to the understanding of digital transformation in business by examining how digital technologies reshape internal audit practices and support ESG-related decision-making and governance processes.

Keywords: Internal Audit, ESG, Sustainability, Digital Technologies

1. Introduction

Sustainability has become a key element of modern business and sustainability reporting is gaining increasing significance. ESG brings together three dimensions (environmental, social, and governance) against which an organization's conduct can be evaluated as sustainable, responsible, and ethical (The Institute of Internal Auditors, 2021). Internal audit, a traditional ally of management and boards in providing assurance over internal controls and risk management, is becoming an indispensable partner in ensuring the reliability of sustainability information, both in the public and private sectors. In line with the expectations of professional internal audit associations, regarding the role of the internal audit function in ESG, internal auditors are considered able to engage through both types of core activities: assurance engagements and advisory activities. Advisory activities are more appropriate when a company is only just becoming subject to sustainability reporting requirements, whereas assurance engagements concerning the effectiveness of risk management, reporting and compliance will be more frequently present after the initial phase (ECIIE 2023). Such an approach confirms the need for internal audit to be systematically involved in the processes of sustainability, thereby contributing to the improvement of the overall corporate governance system, in line with its purpose and the public interest.

Internal audit is evolving from a compliance-oriented function into a proactive business partner in the sustainability and ESG transformation (de Leeuw and de Draaijer, 2025). There are evidences that indicate that role and activities of the internal audit function in ESG processes vary according to the multiple combinations of the companies ESG maturity level and the chief audit executive's perception of the internal audit function stakeholder's salience (Rakipi and D'Onza, 2024). The adoption of internal audit's expanded roles is strongly shaped by the influence of digital technologies, which enable greater efficiency and effectiveness of the function across all aspects of its work. According to practitioner perspective, internal audit increasingly uses data analytics for more effective collection and analysis of ESG information, thereby contributing to greater accuracy in assessing ESG risks and their effects (KPMG, 2023).

Although the role of internal audit in the area of sustainability and ESG is increasingly emphasised in professional guidelines and the position papers of relevant professional associations (The Institute of Internal Auditors 2021.; ECIIA 2023.), the academic literature on this topic is still developing, and empirical insights into the actual practice and impact of the internal audit function remain limited (Hazaea et al. 2022). Recent systematic literature reviews analyse internal audit practices in ESG (Vo Van, Abu Afifa and Bui Van 2026; Sheta, Osman and Elamer 2025), but without focusing on the use of digital technologies in this context. This reveals that research has largely addressed what internal audit does in ESG, while how digital tools can strengthen that role remains underexplored. This paper focuses on the role of internal audit in the ESG context and the contribution of digital

technologies to that role, aiming to analyse how the application of these technologies can contribute to more effective internal audit activities in the context of sustainability. Based on those objectives, the following research questions were identified:

> RQ1: What are the responsibilities and roles of the internal audit function in the ESG context, and what obstacles prevent it from maximising its role in ESG processes?
>
> RQ2: How can digital technologies such as data analytics (DA) and artificial intelligence (AI) benefit the internal audit process in ESG-related engagements?

The remainder of the paper presents the methodology and the results of the research on recent literature regarding the roles of internal audit in ESG as well the benefits of using digital technologies in this context, and the conclusions of the research

2. Methodology

This paper employs a semi-structured literature review based on Snyder (2019), and this approach was chosen because the aim is to map how internal audit's role in ESG is addressed in the literature and to identify the research gap concerning the use of digital technologies. The review process involved scoping of the research, identification of search terms, identification of data sources and paper collection, paper filtering, and content evaluation and synthesis, broadly following the steps outlined in Amani and Fadlalla (2017) and Khlif and Chalmers (2015). In addition, thematic analysis was applied following Braun and Clarke (2006). Coded segments were grouped into predefined themes describing the role of internal audit in the ESG context and the benefits of using digital technologies for the internal audit process in that context.

To investigate the activities of internal audit in the ESG context, as well as the contribution of digital technologies (data analytics and artificial intelligence), a search of Web of Science indexed papers was conducted for the period from 2018 to 2026. The year 2018 was chosen as the starting point as it marks the beginning of the application period of the Directive 2014/95/EU, known as the Non-Financial Reporting Directive (NFRD). Search terms combined three concept groups: internal audit, ESG/sustainability, and digital technologies (data analytics, AI, machine learning, RPA, etc.), using Boolean operators. Two search strings were used, both combining internal audit terms with ESG-related terms (485 papers identified) and digital technology terms (84 papers identified). After an initial screening of titles and abstracts, 75 papers (sample includes studies using both qualitative and quantitative methodologies, as well as mixed-methods and conceptual/review) papers relevant to the topic were included. Following a thorough reading of all papers, 42 papers were retained for final analysis, while the remainder did not match the research focus.

After the final definition of the papers that were taken into consideration, further investigation was conducted following Braun and Clarke's (2006) six-step analysis approach. In order to achieve the research objectives, the authors started with a predominantly deductive approach, searching for predefined themes which included the following: the activities of internal audit in the ESG context, the challenges that internal audit faces regarding involvement in ESG processes, and the benefits of using digital technologies by internal audit in the ESG context. In addition, given that it was expected that the analysis would not include a large number of papers simultaneously analysing the aforementioned themes, two new themes were included in the analysis, the benefits of applying data analytics and artificial intelligence in internal audit. The analysis was therefore extended to papers that discuss the use of these technologies in internal audit even when they do not describe internal audit activities within the ESG process, so that these benefits could be placed in the context of the contribution of internal audit activities to ESG processes. As the analysis continued, the predefined themes were refined to capture the codes more precisely and to prevent overlap between them. Finally, the themes were used to address the research questions concerning the activities of internal audit in the ESG context and the ways in which the use of digital technologies can enhance the work of internal auditors and strengthen the significance of their role in this context. The software MAXQDA Analytics Pro was used to code and track codes within the identified themes more systematically.

3. Analysis of Recent Literature Regarding the Role of Internal Audit in ESG and Benefits of Using Digital Technologies in This Context

According to the results presented in Table 1, of the 42 analysed papers, 74% address the role and activities of internal audit in ESG, while only 10% link that role to a specific technology (data analytics, AI). This imbalance

suggests that the field is at an early stage of development and the benefits of using digital technologies for internal audit in ESG context have yet to be explored.

Table 1: Frequency of themes across the analysed papers[1]

Themes	Number of analysed papers	% of sample (n=42)
Challenges of involving IA in ESG	11	26%
Benefits of using AI in internal audit process	4	10%
Benefits of using DA in internal audit process	8	19%
Use of digital technologies in IA process in ESG	4	10%
Internal audit role in ESG	31	74%

Source: Compiled by the authors

The research results relate to a total of 22 different countries (Australia, Brazil, China, Egypt, Germany, Austria, Switzerland, Ghana, Nigeria, Indonesia, Italy, Jordan, Libya, Malaysia, Pakistan, Portugal, Romania, Saudi Arabia, South Africa, Turkey, USA, Vietnam), although some studies were conducted at a global level or across several European countries.

Theme *Role of internal audit function in ESG* addresses activities performed by internal auditors within assurance and consulting engagements, as well as the overall contribution of the internal audit function to ESG processes**.** According to analysed papers, a greater prevalence of assurance engagement activities can be identified, that is, activities that form part of that type of engagement. Accordingly, within the ESG context internal audit provides assessment the effectiveness of internal controls regarding sustainability processess (Alsaid and Alyousef 2026; De Simone et al., 2021; Kolsi and Al-Hiyari, 2024; Puci and Guxholli, 2018; Rakipi and, 2024) of companies from various sectors such as manufacturing (Amoako et al., 2023). In addition to the above, internal audit provides evaluation of implementation and effectiveness of company ESG policies (Alsaid and Alyousef 2026), evaluating company's ESG related activities such as use of alternative materials or energy reduction, assess effectiveness of company's' green policies and analyse violations (Van, Abu Afifa, and Bui, 2025) and performs oversight and review related to environmental performance and emissions Hashed et al. 2025).

Internal audit activities in risk management related to sustainability are also prominent part of its assurance role in the ESG context. In this regard internal audit is actively engaged in evaluating governance and risk management processes (Engelbrecht et al. 2018; Kolsi and Al-Hiyari 2024; Lampropoulos et al. 2025; Olteanu Burca and Badea Florea 2024;) as well as the adequacy of formulated ESG objectives (Engelbrecht et al. 2018). Internal audit assesses the robustness of risk management processes related to climate risk (Alsaid and Alyousef, 2026), creating maps of company's sustainability risks (Aureli et al. 2020), enabling companies to proactively manage sustainability-related risks and embed sustainability objectives within their strategic and operational activities (Bezverkhyi et al. 2025). Internal audit function is also actively identifying emerging sustainability risks (Liu et al. 2025), such as risks regarding environmental and social issues (Van, Abu Afifa and Bui, (2025), risk factors (Sheta, Osman and Elamer 2025) and monitors risks (Puci and Guxholli 2018).

Internal audit also reviews ESG reporting practices, as well as alignment of sustainability objectives with strategy (Puci and Guxholli 2018), providing measurement over ESG goals (Rakipi and D'Onza 2024; Van, Afifa, Van 2026) and assessing accuracy of data for ESG reporting (Al-Qadasi (2024). Given how sustainability reporting reliability is affected by data accuracy, it is interesting to note that internal audit also participates in defining procedures regarding the collection of ESG data, both qualitative and quantitative (Aureli et al. 2020), also has a key role in enhancing transparency of ESG reporting (Maleki Vishkaei et al. 2025; Bonsu et al. 2025; Gherai et al. 2024; Hazaea et al. 2022) and reliability of sustainability data (Bezverkhyi et al. 2025) as well as its accuracy (Amoako et al. 2023; Alsaid and Alyousef 2026; Mihaylova and Blumer 2025). Internal audit bridges operational data and corporate-level ESG assurance within complex governance structures (Yildirim 2026).

Considering that sustainability/ESG practices are highly regulated, it is not surprising that activities related to conducting compliance audits are also part of the internal audit activities identified within this theme. Within assurance engagements, internal audit also reviews compliance with regulations or proposed framework (Amoako et al. 2023; Alsaid and Alyousef 2026; Soh and Martinov-Bennie 2018; Sheta, Osman and Elamer 2025)

[1] Note: Percentages exceed 100% in total because papers could be coded under multiple themes.

such as those of human rights and environmental issues (Rakipi and D'Onza 2024), labor policies and labour regulation (Van, Abu Afifa, and Bui, 2025) or environmental regulation (Wehrhahn 2025).

Regarding advisory engagements, internal auditors are engaged in educating management on sustainability reporting regulation and compliance (Liu et al. 2020), providing advisory recommendations for performance improvement (Puci and Guxholli, 2018) and advising improving ESG practices (Van, Afifa, Van 2026) as support (Ferreira et al. 2024). Activities such as assisting management in risk assessment, control design and KPIs regarding ESG (Rakipi and D'Onza 2024) were also identified, as well as evaluating KPI regarding ESG goals (Purnamasari and Umiyati 2024; Rakipi and D'Onza 2024). It also performs due diligence on sustainability issues (Puci and Guxholli 2018) such as supply chain (Rakipi and D'Onza 2024). Internal auditors are identified as facilitators for managers in the process of creating materiality matrix, being active support in ESG processes instead of the pursuing the role of inspector (Aureli et al. 2020;Ridley and Gulko 2025). Overall “internal audits can be a leader, a driver that stimulates the creation, development and assurance of ESG strategies” (Kolsi and Al-Hiyari 2024, p.1444). Despite this, it is also found that internal audit contributes to ESG and sustainability reporting, but its assurance and advisory role in this area remains limited and rare (Engelbrecht et al. 2018; Gherai et al. 2024).

Based on the analysis of the predefined theme *Role of internal audit function in ESG*, it can be concluded that the internal audit function within the ESG context is undergoing a transformation: from its initial appearance as a compliance-oriented "key implementing actor of sustainability culture" (Aureli et al. 2020, p.2400) it develops into a "strategic governance mechanism" (Alsaid 2026, p.36), with an emphasis on providing assurance through the management of ESG risks and internal controls.

Regarding the attributes of theme *Challenges of internal audit inclusion in ESG processes* that refers to obstacles that prevent the internal audit function from maximising its role in ESG processes we identified several ones. Most often mentioned is the need for specialized skills or lack of competence (Engelbrecht et al. 2018); Rakipi and D'Onza 2024; Sheta et al. 2026; Sheta, Osman and Elamer 2025; Wehrhahn 2025) which often causes less inclusion of internal within ESG context due to negative perception of internal audit capacity among stakeholders (Simpson et al. 2021). Lack of internal resources is also one of the identified challenges (Masoud 2025; Liu et al. 2020), frequently associated with lack of financial resources that causes limited investment in skills development (Van, Afifa, Van 2026) and specialized educational programs (Engelbrecht et al. 2018). Absence of methodology for assurance (Sheta, Osman and Elamer 2025: Engelbrecht et al. 2018) also present a challenge for internal audit in order to provide greater value in ESG context as well as conflict of internal audit roles (ESG assurance vs consulting) (Sheta, Osman and Elamer 2025). Limited financial capacity to invest in digital tool (Sheta, Osman and Elamer 2025) may be regarded as a cause of “Environmental, Social, and Governance (ESG) Helplessness Syndrome in internal auditing” in which risk is recognised but the operational tools to address it are missing (Yildirim 2026, p.4356).

Concerning the attributes of the theme *Benefits of using digital technologies in the internal audit process in ESG-related engagements,* which refers to the practical benefits of using digital technologies across all phases of the internal audit process in ESG-related engagements, it is important to note that this is the theme analysed in the smallest number of papers, and in some of them it is only mentioned indirectly, through the analysis of other authors' research. The analysed papers mention using digital technologies predominantly for risk identification such as using Chat GPT for identification of ESG risks and to support the application of regulatory requirements (Eulerich and Wood 2025) or AI-driven sustainability risk models (Sheta, Osman and Elamer (2025). In their review, Masoud (2025) point to emerging technologies (AI, blockchain and big data analytics) being linked to ESG-related auditing, drawing on earlier studies for tracking ESG metrics. Similary, Purnamasari and Umiyati (2024) note that emerging digital technologies such as big data analytics help detect and verify mismatches between actual and reported ESG performance.

In order to identify the possible benefits of applying digital technologies (DA and AI) in internal audit within the ESG context, papers addressing their use in internal audit outside the ESG context were also analysed, in order to identify benefits that could also be applied to this area of internal audit responsibility. The above refers to the attributes of the themes *Benefits of using DA in the internal audit process and Benefits of using AI in the internal audit process*, both concerning the practical benefits of these technologies in the internal audit process.

The analysed papers identified numerous benefits of applying DA in the internal audit process, which can be applied across all phases of the internal audit process (Betti et al. 2024), from planning to follow – up. In general, there is broad agreement that these benefits increase the efficiency and effectiveness of internal audit activities (Betti et al. 2021; Wagener et al. 2023; Salman Almahuzi 2026; Andrade, Penha and Silva 2021) and audit quality

(Wagener et al. 2025). Through descriptive analytics, internal auditors can examine past trends and patterns that point to potential irregularities; diagnostic analytics then helps uncover why current problems arise, for instance weak internal controls or policies (Salman Almahuzi 2026). DA enables integration of diverse sets of data from various sources which allows internal auditors more comprehensive view of organizational risks (Salman Almahuzi 2026) and enables risk identification and prediction (Salman Almahuzi 2026; Betti et al. 2024). DA also enables fraud detection (Alvarez-Foronda 2023; Betti et al. 2024) since DA tools enable internal auditors population testing (Betti et al. 2024; Alvarez-Foronda 2023) and better value extraction from big data (Rakipi et al. 2021). All of the aforementioned increases the of value of audit findings for stakeholders (Betti et al. 2021; Wagener et al. (2025), enables better visual presentation of audit findings (Alvarez-Foronda 2023) and increases the perceived internal auditors' competence and capability (Betti et al. 2024; Wagener et al. 2025).

The analysis of papers concerning the benefits of applying AI also shows that the use of AI tools in internal audit increases the efficiency and effectiveness of internal auditors' work (Alassuli 2025; Salman Almahuzi, 2026; Wassie and Lakatos 2024). The use of AI tools enables internal auditors testing population of large data amounts and large data sets (Alassuli 2025; Salman Almahuzi 2026), risk identification and more efficient risk-based audit planning (Alassuli 2025; Eulerich and Wood 2025), as well as more efficient detection of frauds and anomalies (Salman Almahuzi 2026). Alongside the above AI tools can help in preparing questions for interviewing, draft findings, generate well-structured reports and track implementation of recommendations (Alassuli 2025; Eulerich and Wood 2025) which suggests that the benefits of their application are reflected across all phases of the internal audit process, as is the case with the application of DA tools.

4. Conclusion

Based on the analysis, it can be concluded that a substantial research gap exists regarding the application of digital tools in internal audit within ESG processes. According to the findings, internal audit is engaged in ESG processes mainly with its assurance role but also through advisory activities. Notably, only a small fraction of the analysed papers connects this role to specific digital tools, revealing that the technological dimension of internal audit's ESG work is still largely unexplored. Some findings suggest that this role remains limited in certain cases, and several challenges that hinder the maximisation of internal audit's value in the ESG context were also analysed. In this respect, a notable finding concerning challenges is that, alongside a lack of competencies, stakeholders tend to have a poor perception of internal auditors' capabilities. The use of digital technologies could help overcome this challenge, given that, according to the findings, their use in internal audit outside the ESG/sustainability context significantly increases the efficiency and effectiveness of internal auditors' work. DA and AI-based tools can assist internal auditors in identifying risks and analysing large volumes of data from various internal and external sources, which is a big concern in the ESG context.

Given the identified research gap, future research could focus on the benefits of applying digital tools in internal audit within the ESG context. Concrete findings would promote their wider use, demonstrate their value to internal audit stakeholders, and thereby help address some of the identified challenges, such as the financial investment required for digital tools. A limitation of this study stems from the analysis of papers from a single database and the size of the sample, as well as the reliance on the authors' judgement in coding, although coding was carried out jointly by the authors to improve consistency.

yunusgokmen@baskent.edu.tr

Abstract: ChatGPT has rapidly emerged as one of the most widely used generative AI applications globally, and its adoption has expanded considerably in Türkiye. As individuals increasingly rely on ChatGPT for information, education, creativity, and problem-solving, understanding public perceptions of this technology has become essential for both academic research and policy development. However, systematic empirical evidence on how Turkish users perceive and emotionally respond to ChatGPT remains limited. This study examines public attitudes toward ChatGPT in Türkiye through sentiment analysis of Instagram user-generated content shared between 2022 and 2025. By analysing captions, comments, and replies related to ChatGPT, the research seeks to identify prevailing emotional patterns in online discourses. The study employs sentiment classification techniques to determine whether public discourse is predominantly positive, negative, or neutral. By utilizing social media as a primary data source, this research contributes to a deeper understanding of how emerging AI technologies are perceived within the Turkish context. The findings contribute to academic discussions on human–AI interaction and provide empirical evidence for future research on public perceptions of generative AI.

Keywords: ChatGPT, Sentiment Analysis, Social Media, Public Perception, Generative AI

1. Introduction and Background

In recent years, rapid advancements in artificial intelligence have led to the widespread integration of generative AI applications into everyday life. In this context, systems based on large language models such as ChatGPT have assumed a significant role in information access, education, content creation, and problem-solving processes. The rapidly growing global user base demonstrates that these technologies are not merely technical innovations but also integral components of broader societal transformation (Dwivedi et al., 2023). In Türkiye, increasing digitalization and the extensive use of social media have contributed to a noticeable rise in interest toward ChatGPT. This trend highlights the importance of examining users' perceptions and attitudes toward such technologies.

Public attitudes toward emerging technologies play a crucial role in their adoption and sustainable use. Particularly in the context of artificial intelligence systems, factors such as trust, concern, and expectations play a direct role in shaping users' experiences (Glikson & Woolley, 2020). Social media platforms provide rich and dynamic data sources where individuals spontaneously express their opinions, emotions, and experiences regarding such technologies. Accordingly, the analysis of user-generated content has emerged as a powerful approach for understanding public perception (Zhou et al., 2014). Despite the rapidly growing adoption of ChatGPT and other generative AI applications, empirical evidence regarding public perceptions of these technologies remains limited in non-Western contexts. Existing studies have primarily focused on English-language platforms, Western societies, or technology-oriented user groups, leaving important questions regarding cultural differences in AI acceptance unanswered. Nevertheless, the available literature provides valuable insights into general public attitudes toward ChatGPT and highlights several recurring patterns across different contexts.

Studies examining public perceptions of ChatGPT have generally reported predominantly positive sentiments. Analyses of Twitter/X data conducted by R et al. (2023), Talan et al. (2023), Tounsi et al. (2023), Erfina and Alamsyah (2023), Koonchanok et al. (2024), Gazaz and Ayvaz (2024), and Demirel et al. (2025), using datasets ranging from 5,000 to 1.1 million posts, consistently found that positive attitudes toward ChatGPT were more prominent than negative ones. Positive sentiments were commonly associated with trust, anticipation, productivity, and practical benefits, whereas concerns mainly focused on academic integrity, the potential decline of critical thinking skills, privacy, cybersecurity, and the misuse of AI technologies. In contrast to these global trends, Zhou et al. (2024) identified a predominantly negative attitude (55.92%) in an analysis of 28,122

Chinese web comments. Their findings highlighted social, technological, and educational concerns, with "improvement", "company", and "technology" emerging as the most prominent discussion topics.

Furthermore, existing evidence is derived predominantly from Twitter/X datasets and English-language environments, with only limited research examining Turkish-language content (e.g., Gazaz & Ayvaz, 2024). In contrast, Instagram—a platform characterized by distinct interaction patterns, communication styles, and audience demographics—remains substantially underexplored. To address this gap, the present study investigates public attitudes toward ChatGPT in Türkiye through sentiment analysis of Instagram captions, comments, and replies shared between 2022 and 2025. The analysis identifies dominant emotional trends in online discourse by classifying user-generated content as positive, negative, or neutral. Beyond describing the distribution of sentiments, the study explores the keywords associated with different sentiment categories, providing further insight into how ChatGPT is discussed on Instagram in Türkiye.

This study contributes to the literature in two ways. First, it extends research on public perceptions of generative AI beyond predominantly Western and English-language contexts. Second, it broadens the empirical scope of AI perception research by examining Instagram, a comparatively understudied social media platform. Overall, the findings contribute to academic discussions on human–AI interaction and provide a foundation for future research on public perceptions of generative AI.

Accordingly, the study addresses the following research questions:

RQ1. What is the overall sentiment toward ChatGPT on Instagram in Türkiye?

RQ2. How does sentiment vary across captions, comments, and replies?

RQ3. Which keywords are associated with positive, negative, and neutral sentiments toward ChatGPT?

2. Methodology

We conducted a sentiment analysis of Instagram user-generated content shared between 2022 and 2025 to examine public attitudes toward ChatGPT in Türkiye. The rapid growth of social networking platforms has stimulated research on methods for analysing user-generated content and extracting meaningful information from online interactions. Among these methods, sentiment analysis has become one of the most widely used approaches for identifying the opinions, emotions, and attitudes expressed in textual data. As a subfield of natural language processing (NLP), sentiment analysis aims to determine the polarity of a text, typically classifying it as positive, negative, or neutral. Because public opinion has long played an important role in decision-making, sentiment analysis has attracted considerable attention in both academia and industry and has continued to evolve over the past two decades. Depending on the level of analysis, sentiment analysis can be performed at the document, sentence, phrase, or aspect level. Figure 1 illustrates these different levels of sentiment analysis (Wankhade et al., 2022).

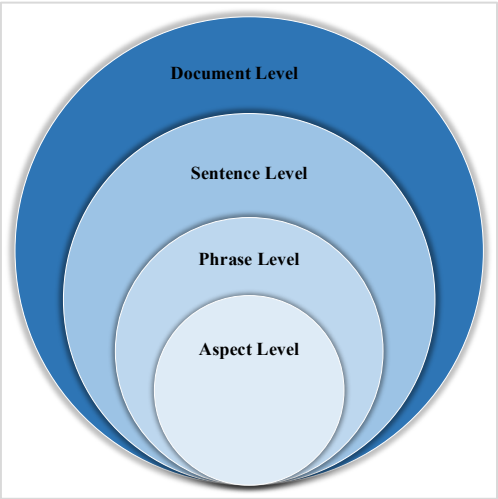

Figure 1: Levels of Sentiment Analysis

Source: Adapted from Wankhade et al. (2022).

The sentiment analysis process involves collecting textual data (e.g., reviews and social media posts), pre-processing the data (e.g., removing stop words and punctuation), applying classification models (e.g., rule-based, machine learning, or deep learning approaches), and interpreting the results to understand stakeholders' opinions and attitudes. The overall workflow of sentiment analysis is illustrated in Figure 2.

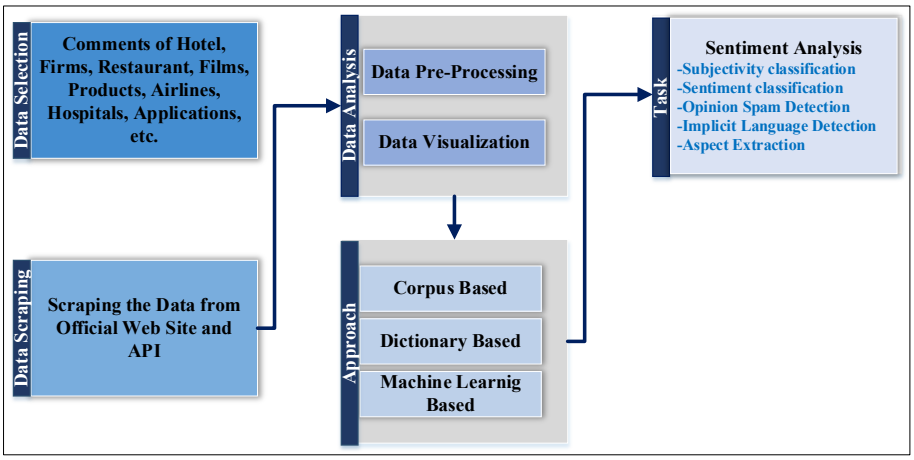

Figure 2: The General Outlines of Sentiment Analysis

Source: Adapted from Wankhade et al. (2022).

Sentiment analysis comprises several tasks, including subjectivity classification, sentiment classification, opinion spam detection, implicit language detection, and aspect extraction (Figure 2). In the present study, sentiment classification was employed to examine public attitudes toward ChatGPT in Türkiye.

2.1 Data Collection and Pre-processing

The initial step in sentiment analysis is data collection. Textual data can be obtained from various online sources, including social media platforms, news websites, e-commerce websites, online forums, weblogs, and other web-based platforms, often through web scraping techniques, as illustrated in Figure 2. To document the data collection procedure, we developed the flowchart shown in Figure 3, which illustrates the process used to identify and select the hashtags, posts, comments, and replies included in the analysis. Specifically, the selection process consisted of four phases: specification, checking, suitability, and inclusion.

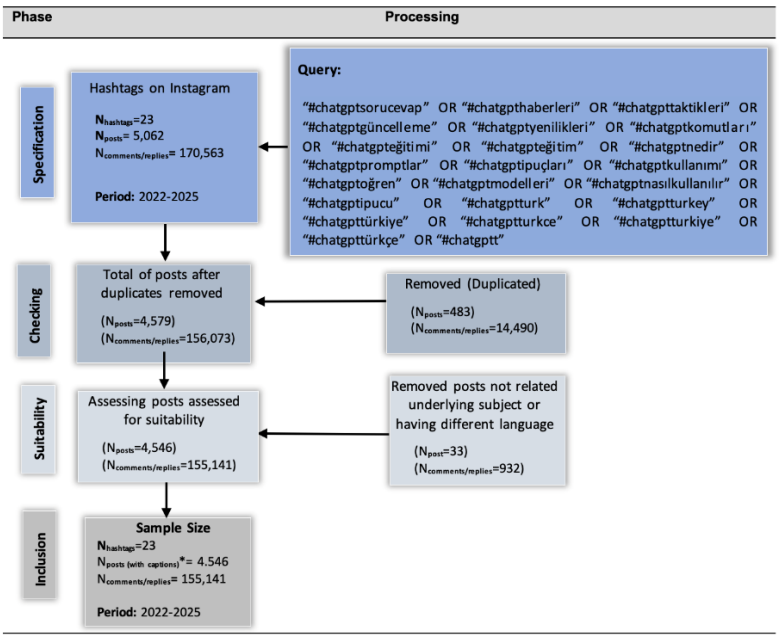

Figure 3: Flow Chart for Data Collection

(*): All posts in the sample have a caption.

Source: Adapted from Moher et al. (2009).

Specification: In the first stage, we developed a hashtag-based search query consisting of the following hashtags: “#chatgptsorucevap” OR "#chatgpthaberleri" OR "#chatgpttaktikleri" OR "#chatgptgüncelleme" OR "#chatgptyenilikleri" OR "#chatgptkomutları" OR "#chatgpteğitimi" OR "#chatgpteğitim" OR "#chatgptnedir" OR "#chatgptpromptlar" OR "#chatgptipuçları" OR "#chatgptkullanımı" OR "#chatgptoğren" OR "#chatgptmodelleri" OR "#chatgptnasılkullanılır" OR "#chatgptipucu" OR "#chatgptturk" OR "#chatgptturkey" OR "#chatgpttürkiye" OR "#chatgptturkce" OR "#chatgptturkiye" OR "#chatgpttürkçe" OR "#chatgptt". The search targeted Instagram content related to ChatGPT in Türkiye and covered the period from 2022 to 2025. This process yielded 23 hashtags, 5,062 posts, and 170,563 comments and replies.

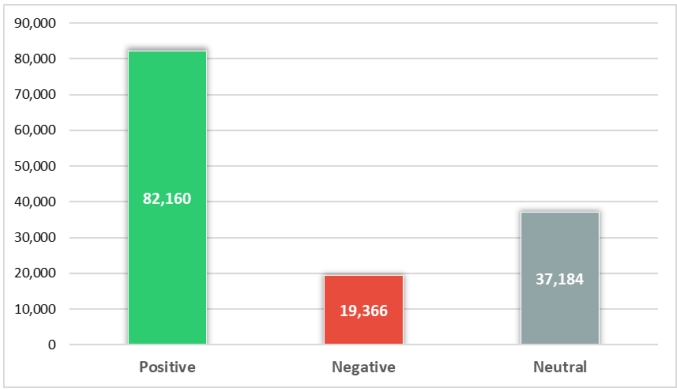
Checking: In the second stage, the collected dataset was standardized. Duplicate posts (483) were identified and removed based on the permalink (platform shortcode) assigned to each post. The resulting dataset comprised 4,579 posts and 156,073 comments and replies.

Suitability: In the third stage, the posts were screened to determine whether they were relevant to the research topic and written in Turkish. A total of 33 irrelevant posts were excluded, resulting in a dataset of 4,546 posts and 155,141 comments and replies.

Inclusion: In the final stage, the dataset consisted of 23 hashtags, 4,546 posts (including captions), and 155,141 comments and replies collected between 2022 and 2025 for pre-processing.

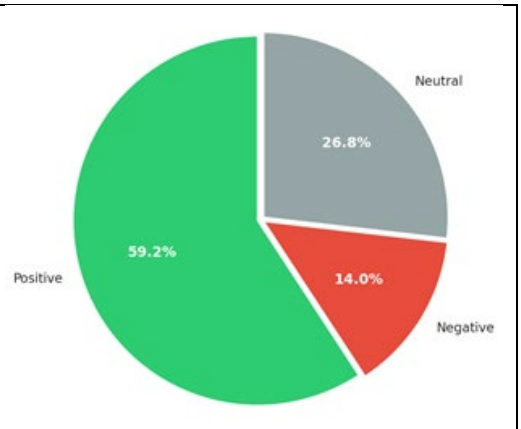
During pre-processing, 20,977 comments and replies were excluded from the analysis because they consisted of five or fewer characters, contained only emojis or abbreviations, or included profanity. Subsequently, stop words, punctuation marks, and other non-informative textual elements were removed. Descriptive statistics of the final sample are presented in Table 1.

Table 1: Descriptive Statistics of the Sample



Description	Statistics
Timespan	2022-2025
Number of	
Posts	4,546
Text block — comment	*93,839*
Text block — reply	*40,325*
Total comment and reply	*134,164*
Grand Total	138,710

2.2 Tools for Sentiment Analysis



The sentiment analysis was performed in Python 3.14.3 using the Turkish BERT model (Yildirim, 2024). The BERT models provide an accuracy and positive outcomes for text classification in sentiment analysis (Chiorrini et al., 2021). The analysis environment incorporated widely used libraries, including pandas for data handling, transformers and torch for sentiment classification, and matplotlib and seaborn for data visualization. Additionally, the wordcloud library was used for lexical visualization, while the analysis outputs were exported to Microsoft Excel format using openpyxl.

3. Results

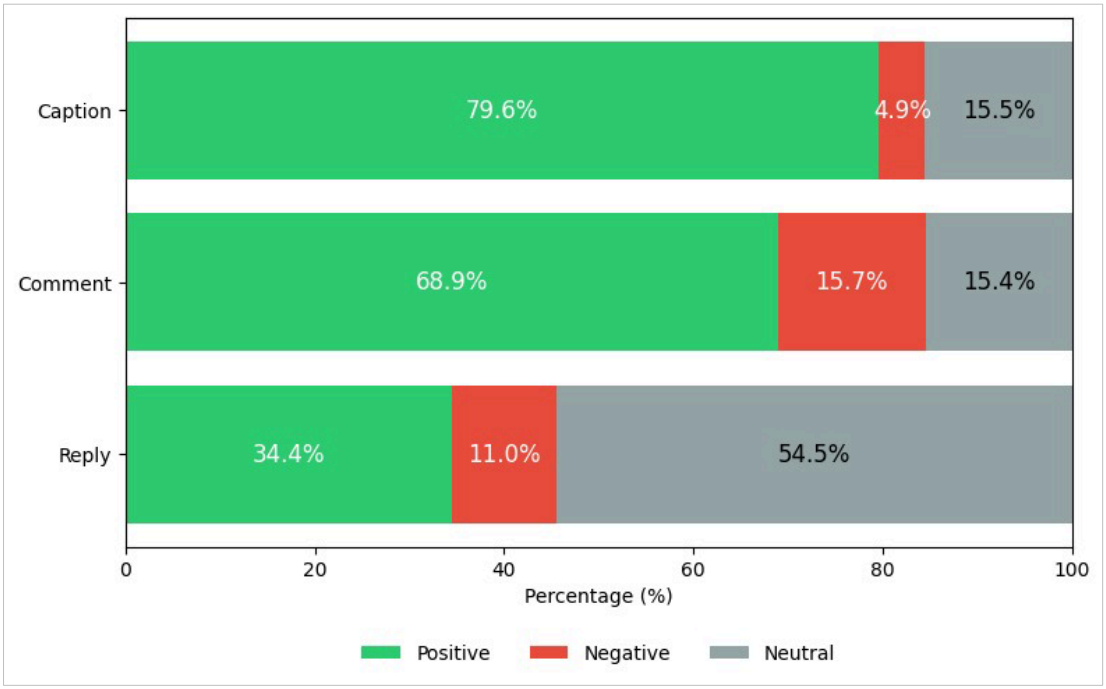
To examine public attitudes toward ChatGPT in Türkiye through sentiment analysis of Instagram user-generated content shared between 2022 and 2025, we used the Turkish BERT model (Yildirim, 2024). Figure 4 presents the sentiment analysis results, categorized as positive, negative, and neutral. The results are reported using both frequency counts and percentage distributions.

(a) Frequency of Sentiment Analysis

(b) Pie Distribution of Sentiment Analysis

Figure 4: The Frequency of Pie Distribution of Sentiment Analysis

Figure 5 presents the sentiment distribution across three sources—captions, comments, and replies—using a 100% stacked horizontal bar chart to illustrate the relative proportions of positive, negative, and neutral sentiments within each category.



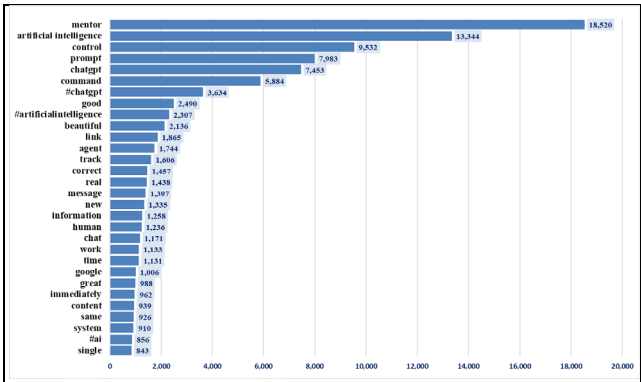


Figure 5: The Results of Sentiment Analysis by Source

Figure 5 shows that primary content (captions) is predominantly positive. As user interaction becomes more direct, moving from general comments to specific replies, the percentage of neutral sentiment increases, whereas the percentage of positive sentiment decreases. Although replies exhibit a lower percentage of positive sentiment than captions, they also show a lower percentage of negative sentiment than comments.

Figure 6 presents a linguistic analysis of the dataset through two visualizations: a horizontal bar chart displaying the frequencies of the 30 most frequent terms and a word cloud illustrating their relative prominence.

(a) The Frequency of Leading 30 Terms

(b) The Word Cloud of Top 100 Terms

Figure 6: The Frequency of the Leading 30 Terms of The Word Cloud Top 100 Terms

The combination of these two visualizations indicates that the analysed content is strongly centered on artificial intelligence interaction and mentorship. Notably, the term "mentor" is by far the most frequently occurring word in the dataset, appearing 18,520 times (Figure 6(a)). This substantial frequency suggests that Turkish Instagram users predominantly perceive and engage with ChatGPT as a mentor, educational assistant, or advisor, rather than merely as a conventional chatbot. Terms such as "control" (9,532), "prompt" (7,983), and "command" (5,884) frequently appear in the dataset, reflecting a strong emphasis on active AI management and user interaction (Figure 6(a)). Their high frequency indicates that discussions are primarily concerned with the practical aspects of using AI, particularly how to guide its behaviour and control its outputs. As expected, core domain-specific terms, including "artificial intelligence" (13,344), "chatgpt" (7,453), and the hashtags "#chatgpt" (3,634) and "#artificialintelligence" (2,307) are also highly prominent, confirming that the dataset is closely aligned with the intended research focus. Furthermore, the frequent occurrence of positive adjectives such as "good" (2,490), "beautiful" (2,136), and "great" (988) provides additional linguistic evidence supporting the predominantly positive sentiment identified in the previous analysis. Finally, terms including "agent" (1,744), "message" (1,397), "information" (1,258), and "human" (1,236) highlight the conversational and information-driven nature of these interactions, suggesting that users frequently discuss the interface between human queries and AI-generated responses.

Figure 7 provides a detailed breakdown of the 30 most frequent terms in the dataset, showing their proportional distribution across three sources: captions, comments, and replies.

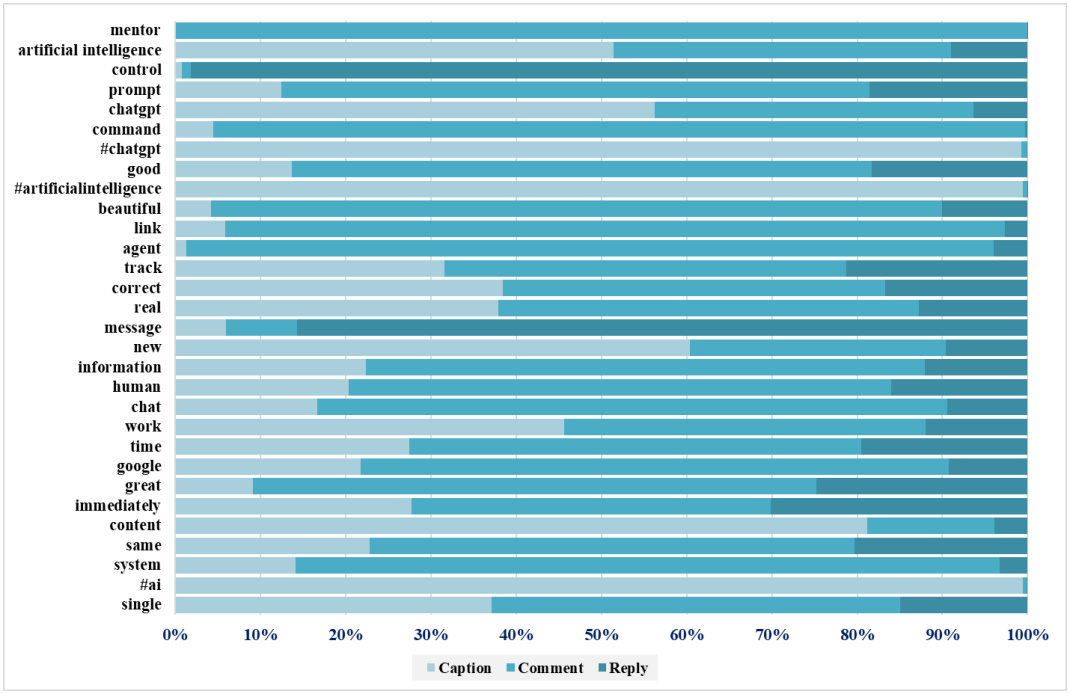

Figure 7: Leading 30 Terms Stacked Bars by Source

Figure 7 suggests a functional division in how these terms are used across different interaction types. Captions primarily serve to label and categorize content. Hashtags such as "#chatgpt", "#artificialintelligence", and "#ai" are found almost exclusively in captions. Likewise, core terms such as "chatgpt" and "artificial intelligence" are most prevalent in this category, indicating that captions primarily define the subject matter of posts. Comments function as the primary space for user-driven instructions, feedback, and mentorship. Notably, "mentor"—the most frequently occurring term in the entire dataset—appears almost exclusively in comments. Other instructional terms, such as "command" and "prompt", together with evaluative words like "good", also occur predominantly in this category, reflecting users' engagement in providing guidance, requesting assistance, and assessing AI-generated content. Replies, in contrast, are characterized by more direct, task-oriented interactions. The term "control" appears almost exclusively in replies, suggesting that this communication layer is used for monitoring, refining, or managing ongoing interactions. Similarly, terms associated with direct communication, such as "message", are disproportionately represented in replies, highlighting their role in facilitating focused follow-up exchanges between users.

Figure 8 visualizes the most frequently occurring terms in Instagram comments classified as expressing positive sentiment. The most striking feature of the word cloud is the overwhelming prominence of the term mentor, which stands out alongside key terms such as "artificial intelligence", "chatgpt", "prompt", "command", "link", and "beautiful". This pattern suggests that positive interactions are strongly associated with mentorship-related discourse, as well as discussions of AI tools, instructional guidance, resource sharing, and favourable evaluations.

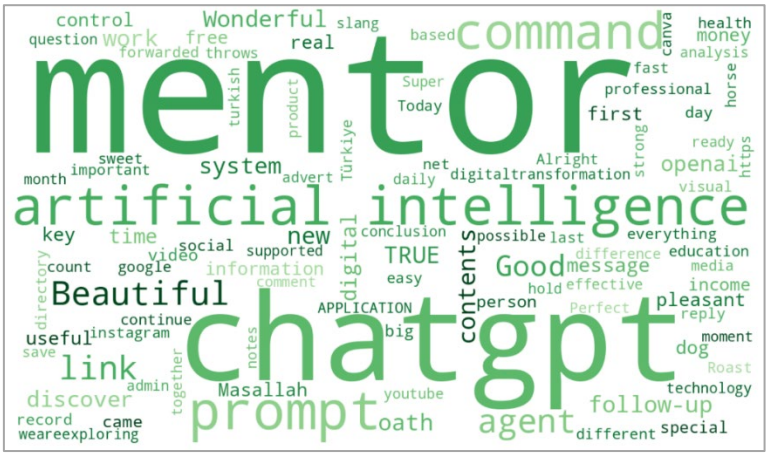

Figure 8: Word Cloud-Positive Sentiment

Figure 9 presents a visual synthesis of the most frequently occurring terms in Instagram comments classified as expressing negative sentiment. The word cloud reveals that "artificial intelligence", "chatgpt", "information", "person", "time", "wrong", and "lie" are among the most prominent terms. The co-occurrence of evaluative terms such as "wrong" and "lie" suggests that negative comments frequently center on concerns about the accuracy, reliability, and trustworthiness of AI-generated information.

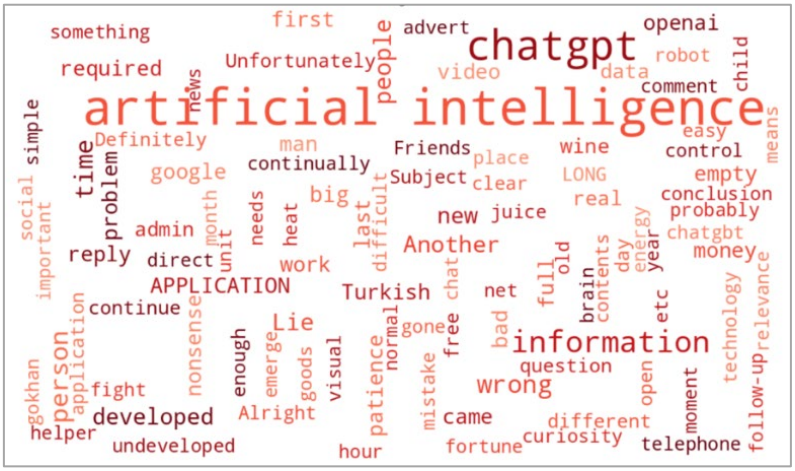

Figure 9: Word Cloud-Negative Sentiment

4. Discussion and Conclusion

The sentiment analysis of Instagram captions, comments, and replies shared between 2022 to 2025 shows that the Turkish public's relationship with generative AI, particularly ChatGPT, has expanded significantly within Türkiye's digital environment. Using a fine-tuned Turkish BERT model, this study provides a detailed view of public sentiment, language use, and interaction dynamics across Instagram content.

The results indicate that positive sentiment substantially outweighs negative sentiment, with 86% of the analysed content classified as either positive or neutral. These findings are consistent with the Stanford Artificial Intelligence Index Report (Stanford HAI, 2025), which shows that Turkish respondents have a more favourable view of AI products and services than the global average and rank above many countries in Europe and North America in terms of perceived benefits of AI. The report also indicates that levels of excitement about AI in Turkey are relatively high, while concerns remain moderate, placing Turkey among the countries where enthusiasm for AI is comparable to or exceeds concerns about its potential risks.

The prominence of words such as "mentor", "prompt", and "command" in the positive sentiment category suggests that users tend to perceive AI as a supportive, interactive, and knowledge-enhancing technology. The prominence of "mentor" aligns with recent research indicating that generative AI is increasingly viewed as a learning companion and cognitive assistant capable of facilitating problem-solving and personalized guidance (Kasneci et al., 2023). The frequent occurrence of "prompt" and "command" further highlights the collaborative nature of human–AI interaction, emphasizing users' awareness that the quality and usefulness of AI-generated outputs depend on effective instructions and iterative engagement. Rather than passively consuming information, users appear to actively shape AI responses through prompting practices, reflecting the growing importance of prompt literacy in the use of generative AI technologies (Dwivedi et al., 2023). Collectively, these findings suggest that Turkish Instagram users increasingly view ChatGPT and artificial intelligence as interactive partners that support knowledge acquisition, creativity, and everyday problem-solving rather than as static technological tools. The presence of "beautiful" among the most frequently used words suggests that Turkish Instagram users' positive attitudes toward ChatGPT encompass both emotional-aesthetic and functional-utilitarian dimensions. This finding indicates that the acceptance of artificial intelligence is shaped not only by performance expectations but also by users' satisfaction and feelings of admiration arising from their experiences with the technology. A rather unique and local finding within the positive cluster is the explicit appearance of the cultural term "Masallah" (Maşallah). In Turkish culture, "Maşallah" is an expression of admiration and praise used when witnessing something extraordinarily successful or impressive. Its presence in the positive sentiment dataset is highly indicative of Turkish cultural integration. This shows that users are translating their appreciation for the latest global technology into a traditional, local language to express genuine admiration and approval.

The dominance of the words such as "wrong" and "lie" within the negative sentiment category suggests that Turkish Instagram users' concerns about ChatGPT are primarily related to the accuracy, reliability, and trustworthiness of AI-generated information. The frequent appearance of "information" further indicates that users often associate negative experiences with misinformation, factual errors, or misleading responses. In addition, the presence of "person" and "time" may reflect concerns about the impact of AI on human roles and the time required to verify generated content. Together, these findings suggest that negative perceptions of ChatGPT are driven less by the technology itself and more by concerns regarding information quality, trust, and the broader implications of AI use in everyday life. These concerns are consistent with a growing body of research highlighting the limitations of large language models, particularly their tendency to generate inaccurate or fabricated information, commonly referred to as AI hallucinations (Ji et al., 2023), and the broader challenges these systems pose for trust, transparency, and information reliability. Users' concerns regarding verification and accuracy may also reflect the additional cognitive and temporal effort required to assess AI-generated outputs before relying on them in everyday contexts.

At the same time, positive sentiment should not be interpreted as unconditional acceptance. The coexistence of trust-related concerns alongside predominantly favourable attitudes suggests that Turkish users may simultaneously appreciate the benefits of generative AI while remaining cautious about its limitations, accuracy, and potential societal implications.

Finally, these findings indicate that public engagement with ChatGPT in Türkiye is characterized by active use, practical orientation, and predominantly positive sentiment. In addition to its empirical findings, this study contributes to the emerging literature on public perceptions of generative AI by extending research beyond English-language and Twitter/X datasets. By focusing on Instagram and Turkish-language discourse, it

demonstrates how cultural and platform-specific contexts shape the ways users interpret, evaluate, and integrate AI technologies into everyday communication practices. More broadly, the findings suggest that Türkiye is not merely adopting AI technologies but is actively domesticating them through local cultural meanings, linguistic practices, and everyday digital interactions.

This study has several limitations. First, the dataset is restricted to Instagram, a platform predominantly used by younger and more digitally engaged individuals. Consequently, the findings may not fully represent attitudes across the broader Turkish population. Second, Instagram's self-presentational nature may contribute to a more positive expression of attitudes than would be observed on other platforms. Third, although the fine-tuned Turkish BERT model achieved strong classification performance, automated sentiment analysis may not fully capture sarcasm, irony, humour, or context-dependent meanings that frequently occur in social media communication. Consequently, some nuances of user sentiment may remain undetected despite the robustness of the classification approach. Future research may extend this work through cross-platform analyses, longitudinal studies, and comparative investigations of public attitudes toward different generative AI systems across cultural contexts.

Interpersonal Relationships in Entrepreneurial Team Research: a Meta-Analysis Using Advanced Computational Methods

Mikhail Bogach
Faculty of Social Sciences, University of Helsinki, Finland

mikhail.bogach@helsinki.fi

Abstract: This study examines how interpersonal relationships are positioned within entrepreneurial team (ET) research, focusing on how relational themes such as trust, conflict, cohesion, diversity, and collaboration are distributed across dominant research streams. Moving beyond conventional literature reviews and performance-centred perspectives, the study provides a systematic, data-driven mapping of relational orientations in ET scholarship. Using three complementary text analysis techniques, namely topic modelling, term network analysis, and large language model (LLM)-assisted text extraction, the study examines 916 abstracts of peer-reviewed articles, book chapters, and conference papers published between 1995 and 2025. This integrated approach enables multi-level analysis of a large corpus and the identification of latent research streams derived from the substantive focus of each study, followed by an examination of their term networks. Findings show that although nearly half of the publications address internal team functioning, relational constructs remain concentrated within a relatively isolated subset of research on team processes and team properties. In contrast, outward-looking research on investment, strategic growth, and international entrepreneurship largely omits explicit relational perspectives. Conflict, resilience, team reflexivity, team formation, team dynamics, transactive memory systems, and trust emerge as prominent relational constructs but are often isolated from ecosystem-level inquiry. Notably, ecosystem actors such as incubators and universities typically appear as contextual background rather than as influential agents shaping intra-team dynamics, suggesting a disconnect between ecosystem discourse and relational team mechanisms across multiple theoretical and empirical contexts. The study contributes to human-centred entrepreneurship research by offering a high-resolution analysis of relational concepts in ET scholarship. It clarifies how interpersonal relationships are presented in ET studies and identifies blind spots, particularly the limited integration of relational themes into ecosystem-level research. It also highlights opportunities to better integrate entrepreneurial ecosystem stakeholders, including academia, support organisations, policymakers, and industry actors, to strengthen collaboration, trust-building, and the development of resilient startup teams.

Keywords: Entrepreneurial Teams, Interpersonal Relationships, Relational Orientation, Human-centred Entrepreneurship, Meta-analysis

1. Introduction

Interpersonal relationships are a key mechanism through which entrepreneurial team (ET) members build trust, cohesion, mutual support, collaboration, knowledge exchange, and other attitudes and attributes that contribute to both venture performance and the team's internal climate (Anderson and West, 1998; Francis and Sandberg, 2000; Love *et al.*, 2021). This internal climate, in turn, underpins the team's long-term success, which can carry over to other ventures, and subsequent team formations (Patzelt, Preller and Breugst, 2021).

Although interpersonal relationships are a crucial element of team functioning, the ET research field lacks a systematic mapping of studies related to interpersonal relationships. Such mapping facilitates an understanding of how relational themes and concepts are positioned within ET scholarship in relation to other topics, enabling the identification of both research gaps and studies that can be drawn upon. Additionally, it offers a lens for connecting new research to the broader development of the field by relating and juxtaposing arguments with those of other scholars.

This study addresses this need by mapping the themes and concepts related to interpersonal relationships in existing research on entrepreneurial teams (ETs). Using machine learning and natural language processing techniques, including topic modelling (Grootendorst, 2022) and text network analysis (Van Eck and Waltman, 2007), supported by LLM-assisted text extraction (Foisy *et al.*, 2025), and applied to a corpus of 916 abstracts from peer-reviewed papers published over the past three decades, the study identifies thematic clusters and semantic patterns that naturally emerge from how researchers describe and frame their work.

While conventional ET research prioritises performance as the primary outcome of team functioning, this study shifts focus to intra-team relational aspects, thereby suggesting an alternative research lens for a more human-centred investigation of ETs. In addition to examining relational orientations in ET scholarship, it contributes to a broader understanding of the field by providing a detailed breakdown of research streams, which helped locate relational concepts in this study and may guide future research aiming to deepen and expand ET knowledge in other areas.

2. Analytical Framework

This study focuses on relational orientations in ET scholarship, understood as analytical perspectives that foreground interpersonal relationships, socio-emotional processes, and socially embedded interactions within entrepreneurial teams. Researchers address relational aspects through diverse frameworks, including 'interpersonal relationships', 'social capital', and 'kin ties' (e.g. Klotz *et al.*, 2014; Lazar *et al.*, 2020). Although these frameworks emphasize different aspects of relational phenomena, such as relational structures, relational qualities, and interaction dynamics, they converge in treating relational aspects as important elements for understanding and developing teams, thereby supporting a more human-centred view of entrepreneurial teams.

Because relational orientations are dispersed across many studies, rarely appear as a central focus, and described using varying terminology, they are difficult to identify systematically across large scholarly corpora. To address this challenge, this study adopts elements of a qualitative meta-analytical approach (Timulak, 2009), supported by computational methodologies, to aggregate key concepts and explore thematic patterns and commonalities across studies. This differs from conventional bibliometric studies, which typically map authors, citation patterns, thematic trends, and dominant journals or institutions, and from literature reviews, which usually examine a smaller set of carefully selected publications in depth. Instead, the present analysis develops theoretical arguments at a higher level of abstraction while drawing on a large corpus of primary research. By combining a large dataset with a focused research question, it addresses a widely recognised yet underexplored area of team processes (Jones *et al.*, 2019; Horvatinovic, Mikic and Dabić, 2023; Zayadin *et al.*, 2023).

Performance-oriented entrepreneurial research largely defines ET success through venture survival, business goal achievement, and financial performance. An earlier bibliometric study has already pointed out the dominance of performance orientation in entrepreneurial scholarship (Wales *et al.*, 2021). At the level of intra-team research, scholars have long established the term ‘task orientation’ (e.g. Forsyth, 1983; McGrath, 1984), which translates performance orientation from the higher venture level to the level of intra-team relationships. In contrast, scholars also recognise ‘relational orientation’ within teams and highlight the task–relationship dichotomy (e.g. Vanderheyden, Lommelen and Cools, 2010; Zhou, Vredenburgh and Rogoff, 2015). ‘Relational orientation’ generally refers to socio-emotional aspects of team processes, including of interpersonal relationships, affective ties, team cohesion, and interpersonal alignment, as well as the overall socio-emotional climate within a team (Vanderheyden, Lommelen and Cools, 2010). This tension between dominant performance-centred perspectives and more relational, human-centred perspectives motivates the present study.

This study identifies relational orientation through scholars’ use of relational terms, defined here as terms signalling bidirectional and relational aspects of team-member interactions. By contrast, some concepts may imply bidirectional interaction without reflecting relational aspects; such terms are not considered relational. Non-relational terms, in turn, do not signal bidirectionality at all.

3. Methods and Data

This meta-analysis uses a data-driven approach on a large dataset to identify patterns in how scholars use constructs belonging to a relatively narrow analytical perspective within a broader domain of scholarship. It aims to track relational orientations across three structural levels of the scholarship: macro - across the whole corpus; meso - within a collection of documents belonging to a distinct thematic topic within the corpus; and micro - at the level of how specific concepts co-occur and relate to other concepts across multiple documents within a selected thematic topic.

The corpus consists of peer-reviewed abstracts that inherently contain key information on each study. Unlike many literature reviews and bibliometric studies, the selection criteria included not only journal articles but also book chapters and conference papers. The inclusion of a wider range of publication types ensured broader coverage of peer-reviewed materials that better reflect research on ETs, and allowed the assembly of a corpus of sufficient size for the chosen computational methods.

Abstracts of peer-reviewed articles, book chapters, and conference papers published between 1995 and 2025, written in English, and at the final stage of publication were downloaded from the Scopus database on 24 February 2026. The following search query was used to identify matches in publication titles, abstracts, or keywords:

("entrepreneurial team" OR "new venture team*" OR "startup team*" OR "start-up team*" OR "cofounding team" OR "founding team*" OR "founder team*")*

The search criteria also excluded publications that do not belong to the disciplines of business, management and accounting; economics, econometrics and finance; social sciences; decision sciences; or psychology. The search yielded 955 publications, of which 34 were missing abstracts and 5 were duplicates; these were excluded from the analysis, resulting in 916 abstracts selected for analysis.

While the further use of several computational approaches may seem complex, it was justified by the distinct purpose each served in enabling the level of detail required for the investigation and in linking macro-, meso-, and micro-levels of the ET scholarship corpus structure. An LLM was first used to pre-process each document in order to maximise natural clustering and reduce noise in furthers analyses. Building on this, topic modelling allowed to identify latent thematic topics across the corpus, producing a high-level view on the structure of the ET scholarship. Term network analysis was applied to 'zoom in' into each of these topics identifying terms clusters and relations between terms that would otherwise remain unseen.

The analytical procedure consisted of four sequential steps, each building on the results of the previous step: (1) verbatim extraction of the substantive focus of each study from their abstracts using Mistral-Small-3.2 LLM, released in June 2025 and featuring improved reasoning capabilities (Mistral AI, 2025);(2) identification of latent topics using BERTopic (Grootendorst, 2022);(3) construction of term networks using VOSviewer (Van Eck and Waltman, 2007) for each identified topic separately; and (4) interpretation of results using data derived from both topic modelling and term network analysis, supported by close reading of selected documents.

Verbatim extraction of the substantive focus of each study was a necessary step to reduce noise in subsequent topic modelling and term network analysis, while ensuring that the original use of terms by scholars remained intact. For each abstract, the LLM was prompted to extract text segments that define the core conceptual content of the study, omitting the research scaffolding, which may include non-substantive elements such as contextual background, procedural narrative, contributions of the research, and other forms of text that connect the study to the research field rather than describe its essence.

In order to identify thematic topics within the corpus, we applied BERTopic, an unsupervised topic modelling technique that clusters documents based on semantic patterns in the text (Grootendorst, 2022). BERTopic has also been shown to outperform other topic modelling techniques in terms of topic coherence when applied to short texts similar in length to the abstract excerpts used in this study (McInnes and Healy, 2017; Groot, Aliannejadi and Haas, 2022). The granularity of clustering was adjusted using the UMAP dimensionality reduction model and the min_cluster_size parameter, which were configured to produce a number of topics aligned with the size and complexity of the corpus, i.e. 10 to 15 topics.

Further, for each of the 14 topics identified with BERTopic, we generated a term co-occurrence network. For this, we employed VOSviewer software, which applies natural language processing algorithms to generate noun-phrase co-occurrence networks (Van Eck and Waltman, 2007). Fourteen subsets of documents, one network per topic, were processed using VOSviewer's default clustering settings, resulting in 14 term networks. Each network was configured to include noun-phrases that occur in at least three documents and are thus considered to have significant presence in the corpus. Co-occurrences within individual documents were excluded, as the analysis focused on cross-document co-occurrence patterns.

Finally, analysis of topic representations computed by BERTopic, term networks generated with VOSviewer, and close reading of selected documents were used to interpret the content of the generated topics and to examine the distribution and occurrence of relational concepts across the corpus.

4. Results

The findings include a high-level mapping of the ET research field based on the interpretation of 14 distinct topics identified using BERTopic (see Table 1), and a more detailed analysis of relational constructs using term network analysis conducted separately for each identified topic.

Table 1: Topics identified using BERTopic

	Topic Name	Docs N	Weight	Top 10 representative terms
T1	Team composition and internal dynamics	167	18%	conflict, diversity, passion, resilience, team performance, leadership, entrepreneurial teams, cognitive, decision, influence
T2	New venture team development factors	125	14%	founding teams, ventures, founders, entrepreneurial teams, behaviors, venture teams, strategy, entrepreneurial team, new ventures, new venture teams
T3	Strategic growth and venture performance	95	10%	founding team, growth, venture, firms, ventures, founders, startup, ceo, new ventures, effect
T4	Strategic capitals: financial, social, and human	66	7%	capital, social capital, entrepreneurial, investors, venture, funding, impact, role, founders, founding team
T5	Gender diversity in teams	50	5%	women, entrepreneurs, gender diversity, social, ventures, equity, women entrepreneurs, role, founding teams, female entrepreneurs
T6	Startup formation and development	94	10%	digital, entrepreneurial, startups, freelancers, development, entrepreneurs, start ups, factors, key, innovation
T7	Entrepreneurship in educational settings	65	7%	students, entrepreneurial, entrepreneurship, development, entrepreneurial teams, study, competencies, factors, results, entrepreneurs
T8	Venture growth factors	48	5%	growth, knowledge, entrepreneurial, ntbfs, human capital, organizational, venture, strategic, capabilities, factors
T9	Venture capitalists and investments	58	6%	vcs, investment, startup, venture capitalists, entrepreneurial, evaluation, risk, decision making, based, venture capital
T10	Academic entrepreneurship and spin offs	26	3%	spin offs, university spin, academic spin, usos, university spin offs, parent universities, academic spin offs, founding team, internationalization, entrepreneurial
T11	International and immigrant entrepreneurship	31	3%	immigrant, experience, founding team, entrepreneurial, new ventures, firm, international responsiveness, esg performance, strategic orientation, foreign
T12	Team composition and venture performance	36	4%	diversity, new, venture, team composition, founding team, environmental, team diversity, hybrids, survival, led hybrids
T13	Startup ecosystem actors	23	3%	business angels, entrepreneurs, startups, accelerator, investors, ai, academic, failures, bas, funding
T14	Family-based entrepreneurship	32	3%	family, entrepreneurs, ownership, family ties, contributions, family non family, family co, family co founders, team members, relative

The 14 identified topics were thematically grouped into four higher-level research streams, reflecting dominant orientations in ET scholarship (see Figure 1). These streams cover key directions in how scholars address fundamental questions about ETs: what they are, how they grow and develop, where they operate, and what their external relations are.

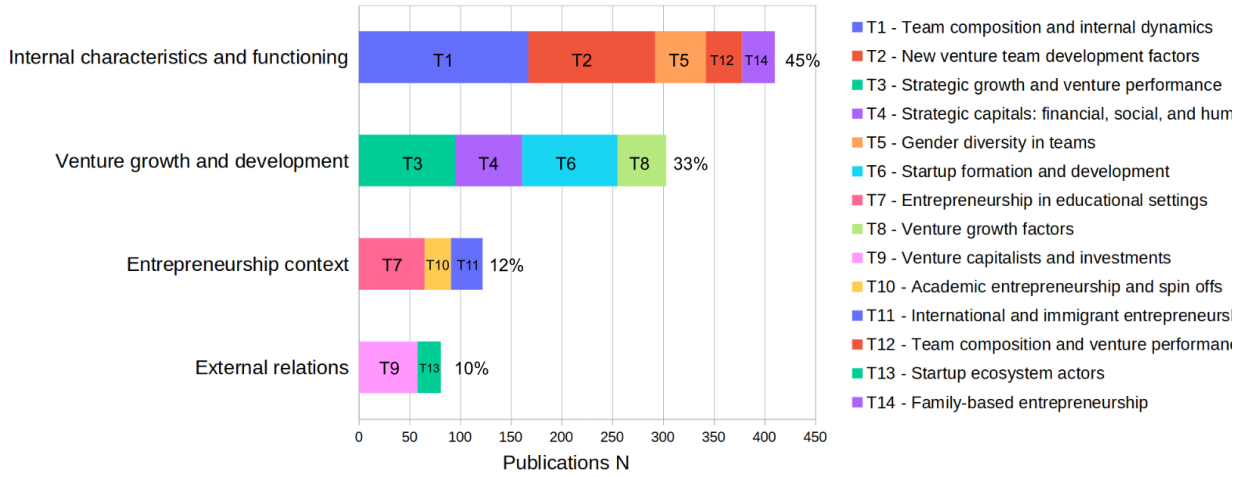

Figure 1: Identified topics grouped into high-level research streams.

The largest research stream, comprising close to half of the corpus, focuses on teams' internal characteristics and functioning. This stream includes topics such as team composition and internal dynamics, factors of a new venture development, gender diversity in teams, team composition and venture performance, and family-based entrepreneurship. These themes represent the main strands of intra-team-oriented ET scholarship, which often address relational aspects of team functioning.

A research stream focusing on venture growth and development accounts for over a third of the corpus. This stream includes topics covering both strategic and operational dimensions that are critical for ventures. The strategic dimension involves venture orientation in terms of growth and performance, and capital orientation, where financial, social and human capital are the most prominent. The operational dimension consists of topics on startup formation and development, and factors of a venture growth.

Entrepreneurship contexts are prominent in a research stream that accounts for 12% of the corpus and includes three quite distinct topics: entrepreneurship in educational settings, academic entrepreneurship and spin-offs, and international and immigrant entrepreneurship.

The smallest research stream comprises 10% of the corpus and focuses on ETs' relations with external actors. Two topics within this stream cover relations with venture capitalists and investment, and with broader entrepreneurial ecosystem actors.

Collectively, these four streams cover three levels of ET research from Entrepreneurial Ecosystem (EE) structural perspective: the stream on ET internal characteristics and functioning addresses the micro level; venture growth and development covers the organisational meso level; and the streams on entrepreneurship context and external relations reflect the broader EE level. This distribution suggests that scholars are almost equally concerned with intra-team characteristics and processes as with aspects extending beyond ETs' internal functioning. Nevertheless, the prominence of the topic of team composition and internal dynamics underscores that an intra-team orientation remains central, and relational aspects are emerging as an important focus of many investigations.

While topic modelling enabled the identification of latent thematic topics in the corpus, term network analysis provided a more granular view within each topic. Only terms occurring in at least three documents were included in the networks, and relational terms constitute a subset of all identified terms. Before proceeding to the results of a deeper analysis of relational concepts in the corpus, it is worth noting that in 10 out of 14 topics, "performance" appears as a highly central term, reflecting a conventional instrumental perspective on ETs. Two more topics are dominated by the slightly more inclusive term "success". The two remaining topics, in which neither "performance" nor "success" are salient, cover themes related to startup ecosystem actors and family-based entrepreneurship. In light of this performance-oriented dominance, the examination of relational orientations becomes even more valuable, as it represents an alternative and underexplored analytical perspective.

Relational terms mostly appear in topics related to team composition, internal dynamics, and new venture team development factors. Family-based entrepreneurship revolves around "family ties", an inherently relational concept, though it does not specify the relational orientations involved. Such a relatively isolated concentration of relational terms suggests that intra-team relational concepts remain largely invisible in outward-looking topics that do not explicitly address internal team functioning. This may be attributed to the conventional tendency of meso- and macro-level research streams to approach ET issues through economic, structural, and institutional lenses. This pattern may also reflect methodological constraints, whereby both macro-level and meso-level studies tend to treat intra-team relational aspects as implicit background conditions rather than as measured variables.

To better understand how relational concepts are positioned within the two topics in which these concepts are most prominent, it is useful to examine term co-occurrence networks generated for each topic based on the documents they contain. Figure 2 presents a term network for the 'Team composition and internal dynamics' topic. While the size of each node in the network reflects the frequency of term co-occurrences across documents, the term scores shown in the top-right corner, derived from the c-TF-IDF algorithm used in BERTopic, indicate the representativeness of the top 10 terms in the topic, enabling an assessment of their significance. The most prominent relational terms are underlined to facilitate their identification within the network.

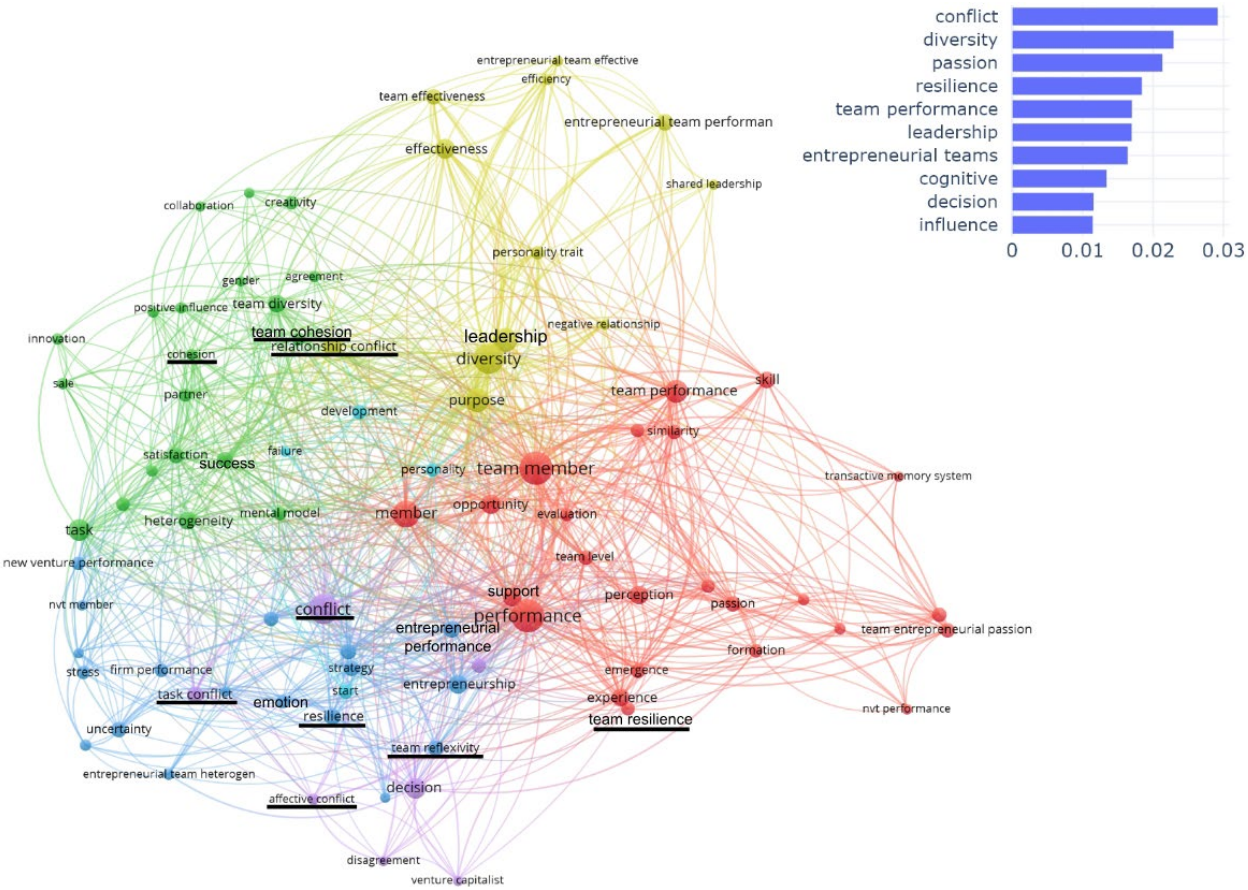

Figure 2: Term network of 'Team composition and internal dynamics' topic with top 10 representative terms scores.

'Conflict' emerges as the most prominent relational term and is largely concentrated within the 'Team composition and internal dynamics' topic. This topic also often mentions task conflict and affective conflict, as researchers tend to distinguish between these two types within the broader concept of team conflict. The results of this study suggest that task conflict appears to be more prevalent in ET scholarship, as it co-occurs with terms from five of the six network clusters and appears in twice as many documents as 'affective conflict'. The second most prominent term within this topic, 'resilience', appears to balance this emphasis on critical issues and instead reflects a desirable state sought in ETs, one that results from intra-team relational processes. This term appears in two clusters that are bridged by another relational concept, 'team reflexivity', suggesting that these concepts are of significant importance to one another.

Figure 3 demonstrates a term network for the topic 'New venture team development factors'. This topic is the second largest in the corpus and also ranks second in terms of the presence of relational terms. Interestingly, with the exception of 'team cohesiveness', the relational terms in this topic do not overlap with those from the previous topic.

The prevalent relational concepts in this topic primarily relate to entrepreneurial team formation, transactive memory systems, and trust, signalling the relational mechanisms through which ETs develop. 'Entrepreneurial team formation' appears as the most frequently occurring relational concept in this topic and is connected to 'team dynamics' through 'trust'. Both 'entrepreneurial team formation' and 'team dynamics' are conceptually close, although they focus on different stages of ET development: the former is more concerned with the early stage, while the latter relates to subsequent stages, where team cohesiveness naturally emerges as an important variable.

'Trust' also connects 'entrepreneurial team formation' and 'team dynamics' with 'transactive memory systems', which are not directly linked, suggesting the central role of trust across all three concepts. 'Transactive memory systems' are also noteworthy in that they belong to the same cluster as 'trust', within which 'performance' and 'development' are central. This points to a performance- or instrumentally oriented focus in the research domain, where 'transactive memory systems' and 'trust' are considered important.

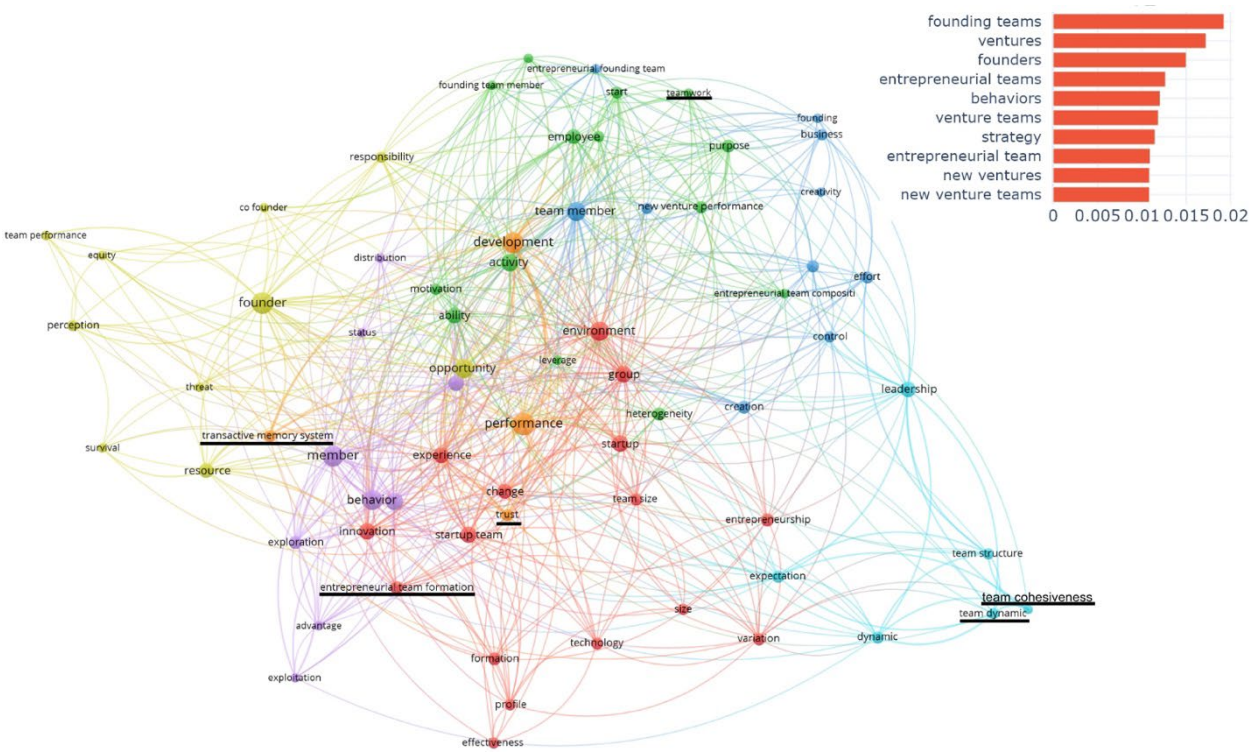

Figure 3: Term network of 'New venture team development factors' topic with top 10 representative terms scores.

5. Discussion

Although this study focuses on exploring how relational orientation is reflected in ET scholarship, we were also able to perform a high-level mapping of the entire corpus of 916 ET research publications. This mapping was necessary to situate relational concepts appropriately in relation to other research themes. Using topic modelling, we identified 14 topics and grouped them into four broader research streams, each reflecting a distinct orientation within ET scholarship.

Through topic modelling, we revealed latent themes that collectively reflect both an internal orientation, focusing on properties and dynamics within teams, and an external orientation, exploring how teams relate to their ventures, interact with their environments, and engage with broader contexts. This finding partially aligns with previous reviews of startup team literature, which identify three major foci in this domain: finance, strategy, and group dynamics (Knight, Greer and De Jong, 2020). Seven out of 14 topics (finance - T6, T9; strategy - T3, T4; group dynamics - T1, T2, T12) identified in our analysis roughly correspond to these focal areas. However, our study provides additional granularity by distinguishing seven more thematic topics. It also extends insights from previous studies by revealing an additional, specialised stream that captures contextual factors influencing entrepreneurial team activities. This observation resonates with Lazar et al. (2020), who similarly identify contextual factors as a distinct research stream within the field. Our study further advances this perspective by distinguishing entrepreneurship in educational settings, academic entrepreneurship, and international and immigrant entrepreneurship as separate topics within this stream.

While previous literature reviews describe gender as one of three dimensions of surface-level diversity, alongside age and ethnicity (Schoss, Brettel and Mauer, 2021), our analysis shows that research on gender diversity constitutes a distinct thematic cluster. This suggests that gender diversity has received more focused attention than other team diversity attributes, indicating its particular salience in current ET research discourse.

Most importantly for the focus of this study, through term network analysis that enabled detailed examination of identified topics, we were able to demonstrate that relational constructs in ET research are prominent in only two topics that differ significantly from one another. One topic highlights 'conflict' and 'resilience', bridged by 'team reflexivity', and the other - 'entrepreneurial team formation', 'team dynamics', and 'transactive memory systems' - all bridged by 'trust'. Furthermore, identified relational terms were not found to co-occur saliently

with terms referring to EE actors, even though ET relationships with these actors occupy a distinct topic. This disconnect suggests that founders are largely left alone in addressing the challenges of building cohesive and resilient teams.

This isolation of EE actors from relational constructs aligns with a broader ecosystem-level blind spot, where ET remain largely unseen within EE studies (Roundy, 2025). Consequently, the development of internal relational capacities within ETs is frequently overlooked in the EE context. While EE scholars increasingly recognize entrepreneurship as a collective achievement (Stam and Van De Ven, 2021), the prevailing literature continues to focus primarily on individual entrepreneurs as the central nodes of the ecosystem (e.g., Alvedalen and Boschma, 2017; Stam and Van De Ven, 2021). Extending this analytical focus to encompass ETs and their specific relational needs would contribute to the design of more effective, tailored forms of relational support (Mason and Brown, 2014). Furthermore, given the inherently interdependent nature of the EE, internal team relationships should not be viewed as isolated, private assets; rather, they represent a vital element of the larger ecosystem's cultural and social dimensions (Spigel, 2017).

6. Conclusions

While the approach of this meta-analysis has certain limitations related to its ability to detect only very explicit relational concepts that frequently appear in documents, and its inability to detect unique yet important relational concepts for the research field, it nevertheless provides a relatively comprehensive overview of relational orientation within the ET scholarship, offering detailed evidence of how relational concepts relate to each other and to other terms, and how they cluster within the corpus. This detailed view of the scholarship opens avenues for further exploration that could build on the results of this study to provide a deeper understanding not only of how relational concepts are positioned, but also of the types of research associated with relational orientation in ET research, and how these types address the needs of practitioners, thus facilitating the identification of research gaps and bringing the value of research results closer to EE stakeholders. Alongside deeper exploration of relational orientations, it would also be useful for future research to examine the positioning of performance-oriented analytical perspectives to better understand what constitutes their prevalence, and potentially to reframe the identified performance-oriented pillars so as to orient them more towards people involved in ET formation and development, thereby contributing to the research field with a strengthened human-centred analytical perspective.

Abstract: Research on social enterprises in the Finnish context remains scarce, especially regarding large, foundation-based welfare actors. This study examines how foundation-based social enterprises in Finland articulate and operationalise social responsibility within the Nordic welfare-state context. Social enterprises in Finland operate within a distinctive Nordic welfare framework, where their primary purpose is to generate social value while maintaining economic viability. Despite their growing relevance in addressing societal needs, Finnish examples have received little attention in the international literature. Thus, this study contributes to addressing this gab. Specifically, the study presents and discusses the concept of social enterprise as defined in the Finnish context while focusing on its legal and operational characteristics. Drawing on publicly available organisational communications and a qualitative, interpretive analysis, we analyse three prominent influential Finnish foundation-based social enterprises selected for their scale, longevity and social impact. Each case is described in detail, covering their origins, mission, core activities, and the social challenges they aim to address. The findings show how foundation ownership supports the institutionalisation of social responsibility through long-term governance arrangements that limit profit distribution and routinise reinvestment for community benefit, while also revealing variation in size, sectoral focus, and sustainability strategies within the Finnish model. The analysis focuses on their operation model and how social responsibility becomes institutionalised over time. Therefore, rather than aiming to represent all social enterprises in Finland, this study offers an in-depth examination of specific cases. By situating these cases in the Nordic welfare-state setting, the article contributes to discussions on social entrepreneurship, hybrid welfare arrangements, and the evolving division of responsibility between public institutions and foundation-based actors.

Keywords: Foundations, Societal Enterprise, Finland, Social Entrepreneurship, Nordic Welfare Model, Qualitative Analysis, Case Study

1. Introduction

While social entrepreneurship has gained growing attention, research into foundation-based social enterprises in Nordic welfare-states, particularly in Finland, remains limited. The existing literature often focuses on small, grassroots enterprises or market-oriented models, overlooking large and historically embedded welfare actors. This study addresses this gap by analysing Finnish foundation-based social enterprises and their role in institutionalising social responsibility within the Nordic welfare-state context. In Finland, foundation-based organisations have historically played an important role in delivering social welfare alongside public authorities. This paper explores how such organisations can be understood as social enterprises and how they enact long-term social responsibility within the Nordic welfare-state context.

European research highlights that social enterprises are embedded in distinct national and regional ecosystems shaped by welfare regimes, institutional arrangements, and historical evolution, rather than operating as a uniform organisational model across countries (Borzaga et al., 2020). The research question of the study is: "How do foundation-based social enterprises in Finland publicly articulate and operationalise social responsibility within the Nordic welfare-state context?" The study also examines how long-term social responsibility is represented in the public documentation of Finnish foundation-based social enterprises. From an institutional perspective, social enterprises take different organisational forms and societal roles depending on national welfare systems, legal frameworks, and historical conditions, highlighting the importance of context-sensitive analysis (Kerlin, 2013).

2. Literature Review

A social enterprise can be defined as any organisation that produces goods or services and institutionalises a social mission through governance and resource allocation mechanisms (Defourny et al. 2021). While this encompasses different legal forms of organisations, such as non-profit foundations, the role of foundations has been relatively little studied in the social enterprise literature. Social entrepreneurship scholars have long emphasised how different types of social enterprises could be understood based on their contexts (Defourny et

al., 2021). To understand heterogeneity, different typologies have been proposed. For example, in their model of different types of nonprofit social enterprises, Defourny et al. (2021) highlighted the existence of large, institutionalised organisations which act as crucial societal foundations since they deliver mission-centric services and often mix philanthropy, public services, and market income.

In Western Europe, social enterprises are commonly understood as organisations that combine economic activity with a primary social purpose, operating at the intersection of market, state, and civil society logics rather than fitting neatly into a single sector (Defourny & Nyssens, 2021). From a welfare-regime perspective, social enterprises take different organisational forms and societal roles depending on national welfare regimes, legal frameworks, and historical development paths, highlighting the importance of context-sensitive analysis (Kerlin, 2013). In Finland, social enterprises are embedded in a distinctive Nordic welfare-state context in which societal responsibility has traditionally been associated with public institutions and collective governance arrangements. It has been argued that the Nordic welfare-state tradition shapes how social enterprises operate in this context and social entrepreneurship is seen as politically and institutionally flexible—functioning both through the logic of privatisation and effectiveness—and as a collaborative innovation mechanism (Nordic Council of Ministers, 2015). Historically, foundational and other social enterprises play an influential role in welfare-state development (Hulgård & Andersen, 2015). Based on these perspectives, it can be inferred that neither welfare-state models nor social enterprises are ongoing processes. Organisations can reinforce the welfare state, undermine it, or reshape it (Mair & Rathert, 2025).

In this context, social enterprises do not primarily emerge as market-based alternatives to public services, but rather as complementary organisational forms that seek to generate societal value through economically viable business activity (Linna, 2017; Kostilainen & Nieminen, 2023). Central to the Finnish understanding of social enterprise is the prioritisation of social purpose over profit maximisation, combined with an expectation of financial sustainability and long-term operational continuity (Brusila-Meltovaara, 2024). This aligns with earlier analyses of Finnish social entrepreneurship, which highlight the role of socially oriented organisations as complementary actors within the welfare state rather than as market-driven alternatives (Linna, 2017).

Furthermore, in Finland, a social enterprise is not defined as a separate legal form but as a purpose driven mode of organising economic activity. Social enterprises may operate as foundations, cooperatives, associations, or limited liability companies, with the unifying feature being the prioritisation of societal benefit over profit maximisation. A key expectation is that the majority of economic surplus is reinvested to advance the organisation's social mission rather than distributed to owners (Yhteiskunnallisten yritysten työryhmä, 2021; Kostilainen & Nieminen, 2023). Consequently, the distinguishing features of Finnish social enterprises lie primarily in their mission orientation, governance structures, and use of profits rather than in formal the organisational status.

Finnish social enterprises are typically embedded in the Nordic welfare-state context, where economic activity is closely intertwined with public responsibility and social policy objectives. Rather than emerging primarily as market substitutes for public services, social enterprises in Finland often complement and extend welfare-state functions by addressing social needs through business based models. They are characterised by a clear societal mission, the reinvestment of surpluses into social objectives, and strong alignment with principles of universality, inclusion, and long-term social responsibility. Finnish social enterprises operate across diverse legal forms and institutionalise social responsibility through governance structures prioritising societal impact over profit (European Commission 2023). A central theoretical concept in the Finnish context is the institutionalisation of social responsibility. Social responsibility is not treated as an auxiliary activity or a form of corporate social responsibility (CSR), but as an integral element of organisational purpose, governance, and long-term decision-making. Therefore, social enterprises are expected to demonstrate societal impact, operate transparently, and engage responsibly with stakeholders, which reinforces their legitimacy and accountability in the absence of a distinct legal status (Yhteiskunnallisten yritysten työryhmä, 2021).

Finnish social enterprises frequently emerge in areas closely linked to welfare-state responsibilities, such as social and healthcare services, employment integration, and community well-being, etc. (Anoschkin & Kainulainen 2023). Rather than positioning themselves in opposition to public systems, these organisations often respond to gaps, pressures, or transformation needs within the welfare state. This positioning places social enterprises at the intersection of public responsibility and market-based activity, where economic viability is necessary but subordinated to societal purpose (Kostilainen & Nieminen, 2023). Foundation-based social enterprises constitute a particularly illustrative form of this institutional logic. Foundation ownership can function as a governance mechanism that safeguards societal objectives across organisational changes over

time. By separating ownership from profit-seeking interests, foundations enable social enterprises to embed their social mission structurally into governance and strategy, thereby reinforcing long-term commitment to societal goals (Kostilainen & Nieminen, 2023). This aligns closely with welfare-state principles emphasising equality, inclusion, and collective benefit.

Foundations not only operate within welfare-state arrangements but also actively participate in redefining the boundaries between public, private, and third-sector responsibilities. Hence, this study contextualises the foundations' operation with the welfare model. Understanding the evolution of the Finnish welfare state requires moving beyond viewing it as a coherent or ideologically driven project and instead, recognising it as a historically contingent outcome of negotiated compromises between diverse societal actors. As shown by Kettunen (2001), welfare institutions in Finland emerged through the interaction of agrarian interests, labour movements, employer organisations, and a strong state apparatus, rather than being shaped solely by social democratic agendas. Early emphasis on universal, citizenship-based benefits reflected the influence of rural constituencies, while later developments incorporated income-related protections aligned with wage work, producing a hybrid model. Crucially, the state and its expert institutions played a central mediating role, translating conflicting interests into policy solutions framed as matters of national economic necessity. The consolidation of corporatist practices, particularly through income policy agreements and "social packages" negotiated between the government, unions, and employers, further embedded welfare development within a system of coordinated adjustment. From a foundation perspective, this evolution highlights that social welfare arrangements are built on layered and competing logics, also including economic pragmatism. Welfare model principles are continuously institutionalised and negotiated through contested understandings and the reality of responding to societal needs. (Kettunen, 2001).

Within this context, foundations may not explicitly identify as social enterprises, yet they occupy a central position in the social entrepreneurship ecosystem. Through their control over financial and symbolic resources, foundations act as influential intermediaries that enable, shape, and constrain social entrepreneurial activity. Their funding decisions, strategic priorities, and definitions of societal problems contribute to structuring the field itself, determining which initiatives gain visibility and support. At the same time, their role reflects broader welfare-state dynamics, where responsibilities for social provision are distributed across public, private, and third-sector actors. From this perspective, foundations are best understood not as isolated organisational forms, but as embedded and agentic actors that both respond to and actively shape the evolving configurations of social welfare and social entrepreneurship. In the context of Finland's updated social entrepreneurship strategy (Yhteiskunnallisten yritysten työryhmä, 2025), where employment, inclusion, and ecosystem-building are emphasised, foundations operate as intermediaries that both enable and steer social entrepreneurial activity. Their role reflects the broader Finnish welfare model, where responsibility for social outcomes is shared between public, private, and third-sector actors, and where institutional collaboration is central to addressing complex social challenges (Fellman et al., 2022). Comparative research has further highlighted that social enterprises across Europe represent diverse organisational models shaped by national institutional configurations, with large and long-established organisations comprising a recognised but still under-researched group (Defourny et al., 2021).

3. Methodology

This study employs a qualitative case-study design and an interpretive (hermeneutic) approach to examining how foundation-based social enterprises in Finland publicly articulate and operationalise social responsibility in the Nordic welfare-state context (Järvinen et al., 2020). The analysis is based exclusively on publicly available organisational documents and communications; no interviews were conducted.

3.1 Data and Case Selection

The empirical material comprises publicly available documents produced by the three case organisations (Linnanmäki/Children's Day Foundation, the Deaconess Foundation/Diakonissalaitos Group, and the A-Clinic Foundation/A-Clinic Ltd). The dataset includes organisational webpages and other public communications such as annual reports, press releases, strategies and "about us" materials, and publicly available descriptions of services, governance, and profit-use principles. The cases were selected purposively to represent influential and historically embedded Finnish foundation-owned welfare actors operating in different sectors, enabling an in-depth and context-sensitive comparison.

3.2 Analytical Approach and Procedure

The analysis follows an iterative hermeneutic process (Järvinen et al., 2020). First, the materials of each organisation were read holistically to establish how the organisation frames its mission, societal role, and relationship to the welfare-state context. Second, the documents were subjected to closer readings to identify recurring expressions, implicit assumptions, and concrete organisational mechanisms related to social responsibility (e.g., statements about mission primacy, governance and ownership arrangements, reinvestment/profit-use logic, partnership narratives, and sustainability practices). Third, these observations were clustered into interpretive themes within each case. Finally, themes were compared between cases to identify similarities and differences in how social responsibility is articulated and institutionalised through foundation ownership in Finland.

3.3 Trustworthiness and Limitations

To enhance trustworthiness, the analysis applied the same reading logic to the three cases. The emerging interpretations were compared against the full set of materials and the Nordic welfare-state context. Given the interpretive nature of the approach, the researcher's role in constructing the themes is acknowledged. The main limitations are that the study relies on public, self-representational materials, which may emphasise selected narratives; thus, the findings should be read as a contextually situated and plausible interpretation. Future research could triangulate these insights with interviews and additional internal or third-party data sources.

4. Case Studies

In Finland, prominent examples of foundation-based social enterprises include Linnanmäki, owned by the Children's Day Foundation, the Diakonissalaitos Group owned by the Deaconess Foundation (Diakonissalaitos, Finland) and the A-Clinic Foundation's (A-Klinikkasäätiö) health service operation. They all combine commercial activity with a clear, non-profit distributing social mission (Table 1).

Table 1: Foundation based social enterprises

Organisation / Brand	Owning Foundation	Main Field of Activity	Business Model
Linnanmäki Amusement Park	Children's Day Foundation	Leisure & tourism	Commercial amusement park
Diakonissalaitos Group	Deaconess Foundation	Social & health services, education	Foundation-owned service enterprises
A-Clinic Ltd	A-Clinic Foundation	Health care (substance abuse & mental health)	Foundation-owned service company

Although these foundation-based social enterprises operate in different sectors, they collectively showcase how foundation ownership facilitates the institutionalisation of social responsibility through sustained economic activity. Table 1 highlights the role of foundation-based ownership in aligning operational models with broader societal objectives over time, while also revealing variation in the sectoral focus and organisational scope. These examples provide a context-sensitive basis for analysing how social enterprises operate at the intersection of public responsibility and market-based activity in Finland.

4.1 Case: Linnanmäki Amusement Park

The Children's Day Foundation and its Linnanmäki Amusement Park represent a long-standing and large-scale example of a foundation-based social enterprise embedded in the Finnish welfare-state context. The amusement park was established in 1950 by six Finnish child-welfare organisations with the explicit purpose of generating funding for child-welfare work through commercial activity. In 1957, ownership and governance were formalised through the establishment of the Children's Day Foundation (Lasten Päivän Säätiö), which continues to own and operate Linnanmäki today (Children's Day Foundation, n.d.). Linnanmäki Amusement Park is noted as an example of how long-term purpose-driven ownership can be translated into a visitor-oriented commercial experience, while maintaining a clear societal mission (Storyland Studios, 2024).

Linnanmäki operates as a fully commercial amusement park in the centre of Helsinki, Finland, offering different services, retail activities, and partnerships. Entry to the park will be free until the summer of 2026. Its business

model is based on economic self-, it does not sufficiency and long-term viability; however distribute profits to private owners. Instead, all annual surpluses are donated by the Children's Day Foundation to Finnish child-welfare organisations and projects. According to the foundation, cumulative donations to child-welfare work exceed EUR 130 million, demonstrating the scale and continuity of its societal impact (Children's Day Foundation, n.d.). The foundations that founded the common foundation are still active in the governance model to this date. The impact is channelled through the founding organisations. The chair of the board expresses the partnership-based thinking in his statement: "It is wonderful to see how our grants support the work of our founding organisations and, through them, make a difference in the lives of children and young people. I would like to thank our key stakeholders, who make this long-term work in support of child welfare possible," (Parasta Lapsille, 2024). The statement constructs a relational and mediated understanding of impact, where value is created through a chain of actors and sustained through long-term collaboration. At the same time, it reinforces a harmonious and depoliticised view of welfare provision, emphasising shared responsibility. Public communication of the park ignores the structural welfare issues, focusing instead on the Amusement Park and funding news for children's welfare foundations. Table 1 highlights the role of foundation-based ownership in aligning operational models with broader societal objectives over time, while also revealing variation in sectoral focus and organisational scope. These examples provide a context-sensitive basis for analysing how social enterprises operate at the intersection of public responsibility and market-based activity in Finland.

While foundations do not publicly discuss the welfare-state, their model reflects the early stages of Finland's welfare-state formation, when public provision was still evolving. The profits were and still are used for contributing to the welfare of society. As funding grew, the Children's Day Foundation became integral to a dense welfare ecosystem, having significant social influence by providing resources to develop ideas, competencies, and support for children's welfare. (Korppi-Tommola, 2012). The foundation emphasises work for children's wellbeing, enabled by many partnerships.

4.2 Case: Deaconess Foundation

The Deaconess Foundation is best understood as a hybrid welfare organisation/social foundation group combining service provision. Founded in 1867, it represents a long-standing example of a foundation-based social enterprise. Additionally, it predates the modern Finnish welfare-state and has historically operated at the margins and intersections of public responsibility, civil society, and faith-based social action. It has evolved into a diverse social foundation group, blending extensive services in healthcare, education, and employment integration with advocacy and societal development. Operating through foundation-owned service entities, it takes a quasi-public welfare role and functions as a parallel welfare provider alongside the state, while remaining structurally independent from public administration (Deaconess Foundation, 2024).

The Deaconess Foundation can be considered as part of Finland's "distributed welfare-state" evolution. It represents a hybrid welfare actor that operates at the intersection of state-led welfare governance, social enterprise logic, and foundation-based value orientation. It is embedded within its contemporary transformation, where responsibility for social inclusion is distributed across public, private, and third-sector actors. In this sense, the organisation not only delivers services but also participates in the interpretation of social problems and the production of normative understandings of inclusion, employability, and human dignity (Deaconess Foundation, 2024; Fellman et al., 2022).

Moreover, it operates across sectoral boundaries within the Finnish welfare system while remaining anchored in a strong normative value base. Its foundation structure enables the utilisation of both public funding and internally accumulated resources, which supports long-term social investment and development work. This, in turn, enables the organisation to address emerging social needs while ensuring continuity in its mission and governance. Rather than functioning as a short-term project actor, the Deaconess Foundation exemplifies a stable welfare institution. In this role, it helps maintain social cohesion and address welfare gaps as public systems are increasingly supported by third-sector and hybrid actors (Deaconess Foundation, 2024; Fellman et al., 2022).

4.3 Case: A-Clinic Foundation

The A-Clinic Foundation is one of Finland's most established institutions in the field of substance abuse and addiction treatment and has played a significant role in the development of Finnish welfare services since the 1950s. Established in the 1950s, the A-Clinic Foundation is one of Finland's most established institutions in substance abuse and addiction treatment. It operates as a foundation-based owner and development

organisation overseeing its wholly owned service company, A-Clinic Ltd, which is responsible for the delivery of substance abuse and addiction treatment services. Following an organisational restructuring in 2018, the service provision was transferred to A-Clinic Ltd, while the foundation continues to focus on long-term research, development, and societal advocacy. The services are mainly provided through publicly funded contracts with wellbeing services counties and the City of Helsinki, with any economic surpluses reinvested to support the foundation's mission of advancing Finnish substance abuse and mental health initiatives. This organisational arrangement in 2018 exemplifies a foundation-based welfare model where economic activity, public responsibility, and societal mission are structurally intertwined without profit-distribution objectives, positioning the A-Clinic Foundation as a parallel welfare actor within the Finnish welfare-state (A-Kilinikkasäätiö, n.d.).

The A-Clinic Foundation represents a prominent example of a foundation-based social enterprise operating in the core areas of the Finnish welfare-state, particularly in substance abuse treatment, mental health services, and social rehabilitation. Since its foundation, it has played a central role in developing and delivering addiction treatment services in Finland, closely aligned with public health and social policy objectives. Through its wholly owned service company, A-Clinic Ltd, the foundation combines professional health-service provision with a strong societal mission focused on treatment, prevention, and recovery. Operating primarily through publicly funded service contracts, A-Clinic Ltd functions in a quasi-public role while remaining institutionally independent from the state, reflecting the long tradition of collaboration between foundations and public authorities in Finnish welfare provision (A-Klinikkasäätiö, n.d.). Addiction treatment in Finland is strongly regulated and embedded in public welfare responsibilities, where ethical considerations, patient rights, and the limits of compulsory care are actively debated within the medical profession (Levola et al., 2023).

5. Discussion

Lindberg & Kostilainen (2021) highlight the importance of context when applying institutional models across countries, a point that is also relevant when considering the development of social enterprise ecosystems. The findings support this argument of the contextual embeddedness of social enterprises by showing that Finnish foundation-based social enterprises are historically embedded welfare actors that have influenced welfare development. The cases examined indicate that the societal purpose is anchored in foundation ownership and long-term reinvestment, positioning them closer to nonprofit social enterprises than to market-substituting models of social entrepreneurship (Defourny et al., 2021). They initially filled service gaps that were not provided by the welfare-state and brought to existence social welfare-related operations that were later considered as self-evident parts of the welfare model ecosystem. This reflects the Nordic welfare-state tradition, where foundations operate as parallel or quasi-public welfare providers complementing state responsibilities within a distributed welfare system (Kettunen, 2001). Our study contributes to understanding the co-evolution of foundation-based social enterprises in the context of Nordic welfare-state, viewing these as complex and mutually enforcing social processes. Recent Finnish discussion on social enterprise emphasises their role not only as complementary welfare actors but also as contributors to broader eco-social transitions, linking social inclusion, sustainability, and participation (Brusila-Meltovaara & Katisko, 2024).

The cases also illustrate that the institutionalisation of social responsibility is enacted through a combination of public articulation and operational mechanisms that create continuity beyond individual leadership or short-term projects. While the organisations communicate their societal missions through narratives of partnership, inclusion, and welfare contribution, their ability to sustain these claims rests on foundation-based governance that limits profit distribution and routinises reinvestment into socially valued aims. From an organisational perspective, such foundation-based social enterprises can be understood as hybrid organisations that combine elements of market-based activity and welfare-oriented logics, operating across sectoral boundaries while pursuing both a societal purpose and economic sustainability (Doherty et al., 2014; Ebrahim et al., 2014). At the same time, the cases point to a key tension in the Finnish context: as the foundations increasingly operate through market-facing service companies and publicly funded service contracts awarded through competitive tendering, social responsibility becomes partly shaped by normal requirements based on market related demands i.e. accountability requirements, efficiency and profitability, as well as reputational considerations. This suggests that foundation ownership can support the stability of a long-term societal purpose. However, responsibility is shaped at the intersection of welfare-state expectations and market-oriented operating conditions.

Finally, beyond the insights that can be yielded by examining the organisations individually, further analytical insights can be revealed when comparing them. Specifically, while all three organisations share a foundation-

based ownership structure and a commitment to reinvestment, they differ in how social responsibility is operationalised depending on their institutional positioning. Linnanmäki Amusement Park represents a commercially oriented redistributive model, where societal impact is generated indirectly through profit-making and subsequent allocation to welfare causes. In contrast, the Deaconess Foundation exemplifies an integrated welfare provision model, combining service delivery, advocacy, and long-term social investment, while the A-Clinic Foundation reflects a contract-based, quasi-public model embedded in publicly funded service systems. This variation suggests that hybridity in foundation-based social enterprises is not uniform but takes different configurations (e.g., redistributive, integrated welfare provision, contract-based quasi-public) shaped by the degree of market exposure and proximity to public welfare structures. Simultaneously, across all cases, the institutionalisation of social responsibility is stabilised through foundation governance mechanisms, particularly non-distribution constraints and reinvestment logics, which anchor a long-term societal purpose while allowing operational flexibility within changing welfare and market conditions. These findings indicate that foundations act as differentiated, co-evolving contributors to welfare-state transformation, with ownership aligning economic activity to the social purpose and market exposure shaping how that responsibility is carried out.

6. Conclusion

This study examined successful Finnish foundation-based social enterprises in the Nordic welfare-state context using publicly available organisational communications and a qualitative interpretive analysis. The small number of cases and the reliance on public materials limit its generalisability; however, the approach enables context-sensitive insight into how societal purpose is articulated and stabilised over time.

The findings highlight foundation ownership as a durable governance mechanism through which social responsibility is institutionalised: profits are not distributed to private owners but are reinvested to support welfare-oriented missions, and decision-making is anchored in long-term societal objectives. Across the cases, foundations function as quasi-public welfare actors that complement public responsibility while operating through economically viable service models. At the same time, the cases illustrate diversity in sectoral positioning and operating logics, suggesting that "foundation-based social enterprise" in Finland covers multiple hybrid configurations rather than a single organisational template.

Overall, the study suggests that foundation-based social enterprises can sustain long-term societal purpose within a Nordic welfare-state setting by embedding social responsibility in ownership, governance, and profit-use rules. Future research could extend the analysis with a larger set of cases, triangulate public materials with interviews, and compare how similar foundation-owned models operate across Nordic countries.

Abstract: Background: Health apps cover many areas and functions and are easily available. However, massive use of personal data has security and privacy risks. Although there is the widespread idea that privacy is important for app users, their efforts to protect their personal data are usually low or none. Evidence from online services show that privacy protection is still an issue, and many app developers fail on the disclosure of a privacy policy, even if it is mandatory. This is evident for health apps also, despite the sensitivity of personal health data. Entrepreneurs must choose an adequate monetization model for their health app business, including privacy concerns. Objectives: We intend to explain how the availability of the privacy policy of a health app and how the decision of an app to explicitly inform users on the use of personal data for micro-segmentation relates with diverse revenue sources, treating those variables as business strategic variables. Methods: We performed a cross-sectional study of health apps available in Portugal. We use logit and probit regression models to establish cause-effect relations between variables. Results: If a health app is downloaded for free or if it includes in-app purchases, it will be more probable to have a privacy policy and to explicitly inform users on the use of personal data. However, the inclusion of ads within the app is not relevant. We conclude that the disclosure of privacy policies and the use of personal data cannot be disconnected from the business model of the app.

Keywords: Privacy Policy, Micro-segmentation, Personal Data, Health Apps, Monetization Models

1. Introduction

Information technologies are seen as powerful tools to help overcome the challenges posed to health systems. Nowadays, health apps cover many areas and functions and are easily available. However, the massive use of information, especially personal data, has security and privacy risks. Regulators try to overcome those risks by preparing rules to ensure that privacy policies are disclosed, and consumers know and agree with the use of their personal data.

In this paper, we intend to explain how the availability of the privacy policy of an app relates with other revenue sources, treating the disclosure of the privacy policy as a business strategic variable. Also, we intend to explain why users are or are not explicitly informed of the use of personal data for micro-segmentation. To achieve this, first we present and describe data; and, secondly, we perform regression analysis.

We contribute to the existing literature not only by studying the behavior of apps on privacy policy disclosure and use of personal data practices but also by explaining the absence of a privacy policy or the lack of accuracy and transparency regarding the provision of information on the use of personal data as a conscious decision taken to conceal the business model of the app. And this should concern developers, users, and regulators in a sector where personal data is particularly sensitive.

2. Theoretical Framework

Although there is the widespread idea that the privacy of personal data is important for app users, the efforts they make to protect their personal data are usually low and often none. This is the so called “privacy paradox”: what online users think about privacy protection is not what they do to protect privacy, in fact. Another piece of evidence is that online users can disclose personal data if, in return, they can benefit from it. This is the so called “privacy calculus”, that Zhu et al. (2021) showed that is presented in mHealth apps.

Empirical analysis shows contradictious results on how consumers respond to data and privacy protection. Aydin and Silahtaroglu (2021) found that mentioning the privacy policy in the description of the app is important to explain higher scores from users but not to explain downloads of the app. In a previous study, on three European countries, only in the Netherlands data protection increased the willingness to pay for the health app. But, in all

three countries, data protection increased the likelihood of downloading the app (Lupiáñez-Villanueva et al., 2020).

The disclosure of privacy policies is mandatory whenever companies collect, manage, and use personal information from users. Nonetheless, evidence from online services, and specifically from apps, show that privacy protection is still an issue, and many app developers fail on the disclosure of a privacy policy. Moreover, even when the privacy policy is disclosed, many times it does not comply with regulation, or it is not suited to the functions of the app itself. This is a reality common to all categories of apps (Alamri et al., 2022; Story et al., 2018), and health apps are no exception. Sunyaev et al. (2015) showed that only 30.5% of 600 mHealth apps have a privacy policy. Papageorgiou et al. (2018) showed that 15% of 20 free health apps, with at least 100,000 downloads, in 2016, did not have a privacy policy available. O'Loughlin et al. (2019) indicated that only 49% of 116 apps, searched using the term "depression", disclose the privacy policy. The study of Fan et al. (2020) reveals that 23.7% of 796 health apps do not provide a complete privacy policy. Alfawzan et al. (2022) showed that, of the 23 of the most popular women's mHealth apps, 16 (70%) have a privacy policy. The study of Iwaya et al. (2023) revealed significant privacy and security of personal data issues, for mental health apps, aggravated by the sharing of data with third parties, such as advertisers.

Despite the variety of figures, studies showed that there is a significative number of health apps in all samples with no privacy policy available. Evidence corroborates that there is an issue on privacy policies availability, in health apps. The next step is to understand how app developers make the decision to disclose or not a privacy policy and how they decide how accurate the privacy policy should be.

In fact, the use of personal data is a business strategic variable that cannot be dissociated from other business variables, but it is not clear if users see it that way. Tang et al. (2022) conducted a study with users of mobile apps to investigate how user-visible aspects of the app impact perceptions of privacy threat. They concluded that users interpret the presence of advertising as a signal that an app poses a privacy threat (users believe that apps with ads tend to collect more data and are less trustworthy). They also tested if users perceived differences between free apps and paid apps concerning privacy threats, and they concluded that payment for download has not a significant effect. Users seem to see advertising as a signal of data collection, but they do not see payment for download as a way to buy privacy.

The use of personal data can be an important part of a monetization model of an app. In fact, for many apps, the price charged for download (if any) is not the main source of revenue. Apps can also get revenue from advertisement and/or in-app purchases. When combining ads and in-app purchases with the collection and use of personal data for micro-segmentation, the revenues are potentiated, and personal data becomes a relevant economic input. Personal data can additionally be sold to third parties, either for micro-segmentation or for other purposes (Cecere et al., 2022; Polykalas and Prezerakos, 2019). However, contrary to the other sources of revenue, collecting and sharing data for revenue is only perceived by users if it is explicitly presented, and the proper way to communicate the use of personal data is in a privacy policy.

3. Data and Methodology

3.1 Sample

We performed a cross-sectional study of health apps available in Portugal. For this study, a sample of health apps was collected on July 11, 2021. The inclusion criteria were mobile apps for Android or iOS systems, available on Google Play Store or Apple App Store platforms, in Portugal, and listed in the Top Free and Top Paid rankings, for categories 'Health & Fitness' and 'Medical Care/Medicine'.

The initial sample of health apps resulted in a set of 2133 apps, some of which were disregarded based on the following exclusion criteria: apps focused on Coronavirus 2019 (COVID-19), given that these are the consequence of an exceptional context; apps with an approach focused solely on exercise or well-being, such as training apps, yoga, meditation, relaxing melodies, among others, since these do not fall within the meaning of mHealth; and apps that are a mere tool to support other activity (and not a service/product by itself).

Following the application of the above criteria, the final sample of the study comprises 1121 health apps from the two major platforms operating in Portugal: Apple App Store and Google Play Store. The variables collected in the dataset are presented in table 1.

Table 1: Variables description

Variables	Description
Dependent variables	
privacy	Dummy variable that specifies if the privacy policy is available (if not = 0; if so = 1)
inform	Dummy variable that specifies if users are explicitly informed about the use of personal data for micro-segmentation purposes (if not = 0; if so = 1)
Independent Variables	
type	Dummy variable that identifies the typology of the app (Free = 0; Paid = 1)
iap	Dummy variable that specifies whether the app has in-app purchases options (if not = 0; if so =1)
ads	Dummy variable that specifies whether the app has ads (if not = 0; if so =1)
remuneration	Dummy variable that identifies if the app remunerates the users (if not = 0; if so = 1)
platform	Dummy variable that identifies the platform where the app is marketed (Google Play Store = 0; Apple App Store = 1)
category	Dummy variable that specifies the category in which the app is classified ("Health and Fitness" = 0; "Medical Care/Medicine" = 1)

3.2 Statistical Analysis

Table 2 presents a statistical description of the dataset. Concerning the disclosure of privacy policies, table 2 presents two sub-samples: the sub-sample of apps without privacy policy available (*privacy*=0) and the sub-sample of apps with privacy policy available (*privacy*=1), that is, where users know, before download, how their personal data will be used by the app, and they can make an informed choice about the implications of using that app. On the full sample, 71.63% of the health apps disclose their privacy policy. Additionally, table 2 presents another two sub-samples: the sub-sample of apps that explicitly inform users about the use of personal data for micro-segmentation (*inform*=1) and the sub-sample of apps that do not explicitly disclose that information (*inform*=0).

The variable *inform* is zero for all the apps without privacy policy. However, the most surprising result is that even when apps disclose the privacy policy, only 68.00% of those explicitly inform about the use of personal data for micro-segmentation.

Our sample has 64.94% of health apps classified as "Medical Care/Medicine" and the remaining 35.06% are apps of "Health and Fitness" (variable *category*). The sub-sample of apps without privacy policy and the sub-sample of apps that "do not inform" have higher percentages of "Medical Care/Medicine" apps.

The health apps are available on the two major platforms operating in Portugal: 40.95% on Apple App Store and 59.05% on Google Play Store. The distribution is similar on the sub-samples.

We consider three alternative sources of revenue: (1) to charge or not a price for download (*type*); (2) to have in-app purchases available on the app (*iap*); or (3) to advertise in the app (*ads*). The most common source of revenue is the price of download (38.54% of the health apps are paid). However, regarding the sub-samples in table 2, there are major differences. For apps without privacy policy, there is a higher percentage of paid apps than that of the full sample. For apps with privacy policy, only 33.13% are paid. Also, for apps that "inform users" only 29.30% are paid.

The second source of revenue is the possibility of in-app purchases (20.79% of all apps). Regarding the sub-samples, the percentage of apps with in-app purchases on the group of apps without privacy policy available is less than half than in the other group, and the difference is even bigger between the sub-sample of apps that "inform" and apps that "do not inform".

The third source of revenue is including advertisements. We have 18.29% of apps with in-app ads, and the prevalence is similar between sub-samples.

Finally, we have only 1.16% of apps that remunerate the users of the app. Our data does not have information on the reasons for remunerating users. It can be done to guarantee a significative number of users and/or their engagement (that may guarantee advertising revenues) or to pay for personal data.

Table 2: Descriptive statistics.

Variables	Full sample (N=1121)	Privacy Policy		Information about the use of personal data for micro-segmentation	
		No (N=318)	Yes (N=803)	No (N=575)	Yes (N=546)
privacy =1	71.63%	------	-----	44.70%	100.00%
inform = 1	48.71%	0.00%	68.00%	------	-----
type = 1	38.54%	52.20%	33.13%	47.30%	29.30%
iap = 1	20.79%	11.64%	24.41%	12.70%	29.30%
ads =1	18.29%	15.41%	19.43%	15.48%	21.25%
remuneration =1	1.16%	0.31%	1.49%	0.17%	2.20%
platform =1	40.95%	41.19%	40.85%	41.73%	40.11%
category =1	64.94%	72.33%	62.02%	68.17%	61.54%

Finally, we have only 1.16% of apps that remunerate the users of the app. Our data does not have information on the reasons for remunerating users. It can be done to guarantee a significative number of users and/or their engagement (that may guarantee advertising revenues) or to pay for personal data.

3.3 Regression Analysis

We analyze the factors that influence the likelihood of disclosure of privacy policy and the likelihood to inform about the use of personal data for micro-segmentation. According to Gujarati and Porter (2011), both the dependent variables privacy and inform qualify as qualitative dummy variables and, therefore, qualitative response regression models are applied. Qualitative response regression models, or probability models, aim to find the probability p of something happening. The logit model and the probit model are widely used probability models, in econometrics, because they ensure that the probability is between 0 and 1 and that the relationship between the dependent variable and the independent variable is not linear, that is, the probability does not vary linearly with the explanatory factor (Gujarati and Porter, 2011).

Both models are quite similar, and their results are easily comparable. The selection of the most appropriate model is based on the criterion of the highest log likelihood or, in the specific case of this research, on the smallest log likelihood in absolute terms, since we are facing models with negative values of log likelihood (Cameron and Trivedi, 2008).

4. Results and Discussion

4.1 Dependent Variable Privacy

Results for the dependent variable *privacy* are presented in table 3. Results are similar on both regression models. However, considering the log likelihood value of the logit and probit models, table 3 shows that the most appropriate probability model is the probit, whose log likelihood is -638.2008, that is, the highest value.

First, *category* is a statistically significant variable. Being in the “Medical Care/Medicine” category decreases the probability of having privacy policy available by 7.4 percentage points. This result is in line with Alamri et al. (2022). Although, previous studies could not prove the effect of those categories on the disclosure of privacy policies (Story et al., 2018; Sunyaev et al., 2015). Indeed, there are some doubts about the accuracy of the classification within categories that have such close subjects, and a content analysis may be necessary to link the contents of the apps with the probability of having a privacy policy. To this study, this variable is mainly important as a control variable.

The choice of platform to market the app, that is Google Play Store or Apple App Store, does not have a significant effect on the probability of having a privacy policy available. The irrelevance of the platform to explain the disclosure of privacy policies is consistent with previous evidence if we cross results of Alamri et al. (2022), for Apple App Store, and Zimmeck et al. (2019), for Google Play Store. Both studies show similar proportions between apps with or without privacy policy.

Table 3: Estimation results – coefficients and marginal effects (dependent variable privacy)

Variables	Probit Model		Logit Model

Note: N = 1121; ** Significant with p-value <0.05; *** Significant with p-value <0.01

We consider three alternative sources of revenue (charge a price, advertise, and have in-app purchases) and a fourth business strategy (remunerate the users). We have two of those variables significant to explain the disclosure of privacy policy.

An app being paid decreases the probability of having a privacy policy available by 15.26 percentage points. We may argue that paid apps' business model does not involve the use, collection and share of substantial personal data and, therefore, the lesser care with the availability of a privacy policy. However, there is ambiguous evidence that paid apps harvest less data than free apps (Han et al., 2019; Kollnig, 2021; Laperdrix et al., 2022).

The presence of ads and the possibility of in-app purchases are two sources of revenue that can be potentiated by customization, using personal data. Therefore, the focus on the use of personal data and its security and privacy issues should be higher. However, the variables *ads* and *iap* have different impact on our dependent variable. On one side, having ads does not significantly influence the availability of privacy policies; while on the other side, having in-app purchases increases the probability of having privacy policy available by 13.06 percentage points. This result is in accordance with Kollnig (2021), that showed that apps, relying on in-app purchases as a revenue source, harvest personal data and, therefore, may be more aware of the need of a privacy policy to maintain user's confidence. Story, et al. (2018) showed that more than 65% of apps with in-app purchases have a link to its privacy policy; and that was the interactive element that contributed more to have a privacy policy available.

Finally, to remunerate users has a positive but not statistically significant effect on the availability of privacy policy. The positive signal is expected since apps mainly remunerate users for their personal data and, thus, privacy and security aspects should be taken care. The absence of statistical significance is, probably, due to the small number of apps on our sample remunerating users (13 from 1121 apps). In fact, despite the use of personal data as a monetization way for many apps, many app developers do not feel the need to pay for data because they can get that data for free, either because of the lack of regulation or supervision, or the lack of control by users.

4.2 Dependent Variable Inform

As for the dependent variable *inform*, estimation results are exhibited in table 4. Results are similar for both regression models, but we will analyze the results of the probit model, whose log likelihood is -734.83821, that is, the highest value.

Table 4: Estimation results – coefficients and marginal effects (dependent variable inform)

Variables	Probit Model		Logit Model	
	Coefficients (Standard Errors)	Marginal Effects (Standard Errors)	Coefficients (Standard Errors)	Marginal Effects (Standard Errors)
category	-0.1044	-0.0416	-0.1653	-0.0413
	(0.0812)	(0.0324)	(0.1314)	(0.0328)
platform	0.0418	0.0167	0.0667	0.0167
	(0.0832)	(0.0332)	(0.1345)	(0.0336)
type	-0.3921 ***	-0.1550 ***	-0.6305 ***	-0.1559 ***
	(0.0870)	(0.0339)	(0.1405)	(0.0340)
ads	-0.0960	-0.0382	-0.1508	-0.0376
	(0.1119)	(0.0445)	(0.1814)	(0.0451)
iap	0.5754 ***	0.2242 ***	0.9291 ***	0.2253 ***
	(0.1011)	(0.0374)	(0.1653)	(0.0375)
remuneration	1.3280 **	0.4176 ***	2.3011**	0.4199 ***
	(0.5259)	(0.0928)	(1.0490)	(0.0928)
constant	0.0574		0.0909	
	(0.08511)		(0.1612)	
Log likelihood	-734.83821		-734.88165	
LR Chi^2 (6)	83.61 ***		83.52 ***	

Note: N = 1121; ** Significant with p-value <0.05; *** Significant with p-value <0.01

Some of the variables that explained the disclosure of a privacy policy have a similar effect on the decision to explicitly inform about the use of personal data for micro-segmentation. To be paid decreases the probability of informing about the use of personal data for micro-segmentation by 15.50 percentage points (the effect was -15.26 percentage points on the probability of *privacy* = 1). This result corroborates that if an app is paid for download the users will be less informed about the use of personal data, despite the disclosure or not of the privacy policy.

For apps with in-app purchases, the probability of an app to disclose the privacy policy is 13.06 percentage points higher and the probability of an app to inform about the use of personal data for micro-segmentation is 22.42 percentage points higher. Regression analysis shows that users of apps with in-app purchases are better informed about how the app uses their personal data, either because of higher probability of availability of privacy policy, and because privacy policies are more accurate and informative about the use of personal data for micro-segmentation. It seems that app developers which include in-app purchases are keener to adequately inform users. However, they do not have the same behavior concerning advertising. The existence of ads is not significant to explain the probability of explicitly informing users about the use of personal data for micro-segmentation. We may argue that, in the presence of ads, users expect that data is collected and used (Tang et al., 2022), and may adequate their choices and use of the app. Nonetheless, that does not substitute full disclosure for a well-informed decision.

Being in the "Medical Care/Medicine" category decreases the probability of having privacy policy available by 7.4 percentage points. However, the variable *category* is not significant to explain the probability of informing users about the use of personal data for micro-segmentation. Combining the availability of privacy policies and the accuracy of those policies, we conclude that there is no significant difference between how users are informed about the use of personal data for micro-segmentation.

Finally, remuneration of app users has a positive impact of 41.76 percentage points on the probability of informing about the use of personal data for micro-segmentation. The variable *remuneration* has no statistically significant impact on the disclosure of the privacy policy, but privacy policies are more accurate for the few apps that remunerate users, causing that positive impact on the variable *inform*. Therefore, apps that remunerate users disclose more information about the business model and what the roles of app owners and users are. Acknowledging that personal data is used and actively informing the benefits/remuneration that this may bring

to users can be a viable business strategy, based on the idea of the 'privacy calculus' (users are willing to share data in exchange for a gain). The benefit does not have to be exclusively monetary. Another type of benefits can be valued: the possibility of accessing social comparison mechanisms (comparing your personal data with the average of the group) can be an important factor for choosing a health app (Joeckel et al., 2021); or the possibility of participating in the creation or development of the app itself as it happens in digital games (El Afi and Ouiddad, 2021).

5. Conclusions and Policy Implications

There are many studies that describe the behavior of apps on privacy issues and use of personal data, however most of them lack to explain that behavior. Our work contributes to the comprehension of why some health apps do not have a privacy policy available and/or do not fully disclose on the use of personal data. We focused on business factors to explain the lack of privacy policies or accurate information in a sector where personal data is so sensitive.

We found that the pricing strategy and the presence of in-app-purchases are important to explain both the disclosure of a privacy policy and the information about the use of personal data for micro-segmentation. However, we did not find a significant effect on the presence of ads. Apps that remunerate users are more probable to explicitly inform users on the use of personal data for micro-segmentation purposes.

Our work tries to link privacy policies and their 'quality/accuracy' with the 'monetization of privacy capital'. However, precisely because many developers do not disclose detailed and reliable privacy policies, it is difficult to study this new monetization mechanism and its real weight and importance in many business models. However, evidence is enough to alert entrepreneurs that they should not ignore personal data as a strategic business variable.

Abstract: This paper examines how small and medium-sized enterprises (SMEs) generate value and innovation through digital transformation, focusing on the interplay between strategic orientation and digital capability development. While digital transformation is widely recognized as a strategic imperative, existing studies remain largely centered on large firms or linear technology adoption models. This means the ongoing, adaptive, and resource-limited experiences of SMEs have received less attention. Drawing on qualitative data from in-depth interviews with five SME leaders in Switzerland, this study investigates how SMEs frame digital value, develop enabling capabilities, and translate constrained resources into innovation outcomes. The study identifies four empirical themes: strategic framing of digital value, capabilities as catalysts, co-creation and network innovation, and resource constraints and strategic trade-offs. These themes show that SME digital transformation is not simply a process of adopting digital tools, but an adaptive journey in which strategic intent, technological integration, managerial learning, and external collaboration are continuously aligned. Building on these themes, this research proposes the Digital Synergy Loop—a conceptual framework capturing the iterative alignment of strategy and capability as the foundation for digital value creation. The framework comprises five interconnected stages: strategic intent and direction, capability development, digital synergy formation, value creation and innovation outcomes, and strategic refinement and feedback. By integrating the Resource-Based View, Dynamic Capabilities Theory, and effectuation logic, the study contributes to SME digital transformation literature by explaining how firms mobilize existing resources, build capabilities iteratively, and use stakeholder relationships to compensate for internal constraints. It therefore reframes digitalization as a strategic, relational, and feedback-driven capability process rather than merely a one-off technological investment. Practically, the findings suggest that SMEs should approach digital transformation through focused strategic intent, incremental capability building, co-creation with partners, and reflective feedback mechanisms. The study also offers policy implications, highlighting the need for adaptive capability-building support rather than technology subsidies alone.

Keywords: Digital Capabilities; Digital Transformation; Value Creation; SMEs; Innovation

1. Introduction

In an increasingly digitalized economy, small and medium-sized enterprises (SMEs) face both significant opportunities and constraints in pursuing digital transformation. While digitalization is now a strategic imperative for competitiveness and growth, SMEs must navigate this process with limited financial, technological, and human resources. This study examines how resource-constrained SMEs enact digital transformation, focusing on strategy, capability development, and innovation outcomes. Three research questions guide the inquiry: (1) How do SMEs strategize for digital value creation under resource constraints? (2) Which technological, managerial, and relational capabilities enable digital synergies? and (3) How do the interactions between strategy and capabilities drive innovation?

Despite growing interest in digital transformation, the literature remains largely centred on large firms, leaving SME-specific dynamics underexplored. Existing perspectives tend to frame digital transformation either as a technology adoption problem (Vial, 2019) or as a linear capability maturity process (Warner and Wäger, 2019). These approaches overlook the iterative and feedback-driven nature of SME transformation, where strategy and capabilities co-evolve under constraint. To address this gap, this study proposes the Digital Synergy Loop, a conceptual framework that characterizes SME digital transformation as a non-linear, recursive process grounded in the co-alignment of strategic intent and organizational capabilities. This framework extends Resource-Based View (RBV) and Dynamic Capabilities Theory (DCT) by incorporating the adaptive, means-driven logic of resource-constrained firms, and integrates strategy, capabilities, and innovation into a unified model.

Recent disruptions, particularly the COVID-19 pandemic, alongside the broader trajectory of the Fourth Industrial Revolution, have accelerated digital adoption and heightened the need for agility and resilience (Gavrila and de Lucas Ancillo, 2021; Niewöhner et al, 2020). In this context, digital transformation has evolved from an efficiency-oriented activity to a key driver of long-term value creation (Yang and Cui, 2022; Wang, Cao

and Wang, 2022). For SMEs, digital transformation is not merely a matter of technology adoption, but a strategic, practice-based process of mobilizing constrained resources, developing capabilities, and aligning digital initiatives with entrepreneurial objectives. This perspective highlights digital transformation as an ongoing, adaptive journey shaped by continuous learning and strategic reconfiguration.

2. Literature Review

2.1 Digital Transformation, Strategic Orientation, and Dynamic Capabilities

Digital transformation has become a critical strategic imperative, reshaping firm competitiveness and innovation capabilities (Vial, 2019; Peng and Tao, 2022). For SMEs, adopting digital technologies enhances operational efficiency, customer engagement, and market accessibility (Li et al, 2023; Konopik et al, 2021). Unlike large firms, SMEs often pursue digital transformation in incremental and adaptive ways, reflecting their size, flexibility, and contextual embeddedness (Chen and Liu, 2022). Transformation must therefore be analyzed in terms of both strategic intent and organizational capabilities, not technology adoption alone (Vial, 2019; Schiuma et al, 2024).

Strategic orientation reflects the firm's foundational philosophy guiding long-term competitive positioning (Wiklund and Shepherd, 2003). In SMEs, digital strategy tends to be emergent and adaptive, driven by founder vision and ecosystem opportunities (Liang and Li, 2022; Sahi, Gupta and Cheng, 2020). The Resource-Based View (RBV) posits that sustainable competitive advantage derives from valuable, rare, inimitable, and non-substitutable (VRIN) resources (Barney, 1991). In SMEs, these often include specialized knowledge, founder expertise, and customer relationships (Arsawan et al, 2020). Dynamic Capabilities Theory (DCT) extends the RBV by focusing on the firm's ability to integrate, build, and reconfigure competences to address rapidly changing environments (Teece, Pisano and Shuen, 1997; Teece, 2007)—making it especially apt for analyzing SME digital transformation.

2.2 Co-Creation, Network Innovation and Resource Constraints

In digital environments, value creation is increasingly distributed and collaborative. The shift from value chains to value networks is well-documented in service-dominant logic (Vargo and Lusch, 2004) and open innovation (Chesbrough, Vanhaverbeke and West, 2006). Digital transformation empowers SMEs to transition from passive users of digital tools to proactive participants in innovation ecosystems (Benitez, Ayala and Frank, 2020), enabling product, process, and business model innovation (Radicic and Petković, 2023). Effectuation theory (Sarasvathy, 2001) offers a complementary lens: SMEs innovate through means-oriented, trust-based, iterative partnerships rather than centralized R&D (Pundziene and Geryba, 2024).

SMEs often face significant resource constraints—limited finance, specialized expertise, and infrastructure—influencing digital investment decisions (Ruiz-Palomo, Fernández-Gámez and León-Gómez, 2022; Yao and Yang, 2022). However, these constraints can catalyze innovation by compelling firms to make strategic trade-offs and pursue selective digitalization (Yao and Yang, 2022). Incremental change, adaptive prioritization, and the effectual logic of affordable loss—investing only what can be risked without jeopardizing core operations—are key strategies (Sambamurthy, Bharadwaj and Grover, 2003; Sarasvathy, 2001).

2.3 Toward the Digital Synergy Loop

Traditional linear models of digital maturity fail to capture the iterative, recursive nature of digital transformation in SMEs (Warner and Wäger, 2019; Priyono, Moin and Putri, 2020). Building on these critiques and on the recognition that SME strategic learning unfolds through cycles of action, feedback, and adaptation (Sarasvathy, 2001; Baker and Nelson, 2005), this study introduces the Digital Synergy Loop—an integrative framework capturing how SMEs iteratively align strategic intent and capabilities through continuous experimentation, feedback, and refinement (Barragan et al, 2024).

3. Methodology

This study adopts a qualitative exploratory research design to investigate how SMEs strategize for digital value creation and develop innovation-enabling capabilities. Qualitative methods are suited to uncovering underlying mechanisms and interpretive meanings through rich, empirical insights from practitioners' lived experiences (Creswell and Poth, 2016; Eisenhardt, 1989). More specifically, this study employs a multiple case study design following the principles of Yin (2018), who emphasizes case study methodology for investigating contemporary

phenomena within their real-life context, and Stake (1995), who highlights the importance of thick description and naturalistic generalization in qualitative case inquiry. The case study approach is appropriate for this study because the research questions are explanatory in nature ("how" questions) and address a complex, context-bound phenomenon, SME digital transformation, that cannot be adequately captured through survey instruments alone (Yin, 2018).

In-depth, semi-structured interviews were selected as the primary data collection method. This approach allows for detailed, context-specific insights while maintaining thematic consistency across cases and sufficient flexibility to explore emergent issues (Kvale and Brinkmann, 2009). A purposive sampling strategy was employed to recruit SME leaders in Switzerland with substantial experience in digital transformation (Creswell and Poth, 2016). Switzerland offers a pertinent setting due to its strong SME sector and innovation-driven environment. The final sample comprised five senior leaders, including founders, managing directors, and operations managers, across diverse sectors (Table 1).

A sample of five cases is consistent with established norms for qualitative case study research: Yin (2018) recommends between four and six cases for replication logic in multiple case designs, while Eisenhardt (1989) notes that four to ten cases are typically sufficient to achieve theoretical saturation. The cases were purposively selected to maximize variation across sector, firm age, and size, enabling cross-case comparison and analytical generalization (Stake, 1995). Firms varied in size (10–250 employees) and age, ranging from legacy companies established in the late 19th century to post-2015 start-ups, enabling comparative insights into how firm maturity, leadership, and sectoral context shape digital transformation trajectories.

Table 1: Participant and Firm Demographic Profiles

No.	Role	Industry	Employees	Founded	Code
1	Managing Director	Luxury Goods / Jewellery Manufacturing	30–40	1923	D.K
2	Operating Manager	Telecommunications Equipment	200–220	2018	T.K
3	Company Founder	Digital Marketing / Web Services	10–15	2018	K.B.
4	Company Founder	Hardware / Security & Access Solutions	100–110	1952	A.S.
5	Company Founder	Textiles / Natural Fibres	50–60	1892	M.C

Primary data were collected over three months through semi-structured interviews lasting 45–60 minutes, conducted face-to-face or online. All interviews were audio-recorded with consent, transcribed verbatim, and anonymized. The interview protocol covered four themes: (1) digital strategy formulation, (2) capability development, (3) innovation practices, and (4) ecosystem engagement. Data were analyzed thematically using Braun and Clarke's (2012) six-phase framework, with NVivo supporting systematic coding. To enhance validity, coding was peer-reviewed and reflective memos captured analytical decisions (Bringer, Johnston and Brackenridge, 2004).

4. Findings

Thematic analysis yielded five core themes capturing how SMEs engage with digital transformation. Table 2 provides an overview; subsequent sections discuss each theme in relation to existing theory.

Table 2: Thematic Analysis Summary

Theme	Description	Illustrative Quotations
1. Strategic Framing of Digital Value	Aligning digitalisation with long-term goals such as quality, transparency, and sustainability	"The goal was always to create more clarity..." — AS; "We were really trying to change..." — DK

Theme	Description	Illustrative Quotations
2. Capabilities as Catalysts of Digital Synergy	Developing digital capabilities to enhance effectiveness, operational efficiency, and adaptability	"MES software tracks material consumption..." — TK; "Our machines collect more and more data..." — MC
3. Co-Creation and Network Innovation	Collaborating and co-creating with clients and partners in digitally enabled product/service development	"Customers can directly comment via Markup.io..." — KB; "We need several partnerships..." — AS
4. Resource Constraints and Strategic Trade-Offs	Managing limitations through phased digitalisation and pragmatic decision-making	"It took us seven years..." — AS; "ERP for all at once—don't do it..." — TK
5. The Digital Synergy Loop (Emergent Framework)	An emergent loop of strategic alignment, capability development, adaptation, and innovation	"Change never ends..." — MC; "Prepare in advance..." — TK; "We became the industry standard..." — DK

4.1 Theme 1: Strategic Framing of Digital Value

Participants consistently emphasized aligning digital initiatives with broader strategic goals. Digitalisation was driven not by novelty or efficiency alone, but by a value-oriented logic focused on clarity, traceability, and long-term adaptability:

> "The goal was always to create more clarity in each process... mistakes were made less... data is entered only one time instead of several times." — AS

> "We are B2B... the ultimate driver is the end consumer. We were trying to change that even if it upset current clients." — DK

This reflects a shift from technology-push to strategy-pull digitalisation, aligning with the RBV (Barney, 1991), which asserts that competitive advantage arises when digital tools are embedded within firm-specific competencies (Parida et al, 2016; Li et al, 2023). Strategic framing serves as the foundational input for the Digital Synergy Loop, initiating the journey by defining the purpose and scope of digital initiatives.

4.2 Theme 2: Capabilities as Catalysts of Digital Synergy

SMEs that succeeded with digitalisation developed the right internal capabilities—digital literacy, leadership with a digital mindset, and agile experimentation—enabling integration of systems (ERP, MES, CRM) across operations:

> "The MES software tracks material consumption and gives feedback to the ERP... this gives better quality and financial control." — TK

> "Our machines collect more and more data about production and quality... customers receive yarn produced according to their specific needs." — MC

This aligns with Dynamic Capabilities Theory (Teece, 2007), where sensing, seizing, and reconfiguring capabilities are essential for sustaining innovation. Digital systems created organizational transparency facilitating internal consistency and downstream customer visibility—a form of digital maturity contributing to operational agility and the basis of digital synergies (Chanias and Hess, 2016).

4.3 Theme 3: Co-Creation and Network Innovation

SMEs leveraged co-creation with customers, suppliers, and technology partners to generate innovation, especially where internal R&D was limited:

> "With Markup.io, customers can comment directly on the website interface. This improved the user experience and saved time." — KB

> "We need partners... not just one. One direction is too risky. We develop in several directions." — AS

This supports open innovation (Chesbrough, Vanhaverbeke and West, 2006) and digitally enabled value co-creation (Ramaswamy and Ozcan, 2016). The iterative, trust-based nature of these partnerships reflects effectuation theory (Sarasvathy, 2001)—particularly means orientation and pre-commitments—enabling SMEs to co-develop ideas and share uncertainty despite resource constraints. Co-creative practices represent the outward extension of the Digital Synergy Loop, leveraging external networks to accelerate innovation cycles.

4.4 Theme 4: Resource Constraints and Strategic Trade-Offs

All SMEs faced resource constraints in capital, expertise, and infrastructure, necessitating strategic trade-offs. Rather than halting digitalisation, firms responded with selective, phased approaches:

> "It took us seven years to slowly implement digitalisation... older employees found it very difficult." — AS

> "We implemented ERP everywhere at once—do not do this. Start with one module like finance." — TK

Challenges related to change management, employee buy-in, and data governance were salient. Firms applied effectual logic—prioritizing initiatives based on affordable loss and available capabilities (Sarasvathy, 2001)—and demonstrated the "digitally enabled organisational agility" of Sambamurthy, Bharadwaj and Grover (2003). Navigating constraints through strategic trade-offs illustrates the iterative feedback and recalibration inherent in the Digital Synergy Loop.

4.5 The Digital Synergy Loop: A Framework for SME Digital Transformation

Drawing on the four empirical themes, this study proposes the **Digital Synergy Loop**—a dynamic, iterative framework capturing how strategic intent, organisational capabilities, and digital value creation are continuously re-aligned through internal feedback learning. The loop comprises five interconnected stages (Figure 1):

- **Stage 1—Strategic Intent and Direction:** SMEs articulate a strategic vision aligned with business goals and stakeholder demands, framing the scope of digital initiatives (Barney, 1991).
- **Stage 2—Capability Development:** SMEs develop technical (ERP, MES, analytics), organisational (change management, process integration), and relational (partnerships, supplier engagement) capabilities, often path-dependent and means-driven (Teece, 2007; Sarasvathy, 2008).
- **Stage 3—Digital Synergy Formation:** Combinatory value emerges from coordinating people, processes, and digital technologies. SMEs transition from digital implementation to digital integration, gaining organisational coherence and innovation readiness.
- **Stage 4—Value Creation and Innovation Outcomes:** Digital synergy yields measurable gains (cost savings, process efficiency) and intangible outcomes (enhanced customer experience, faster innovation cycles, brand legitimacy). This validates strategic assumptions and reflects value co-creation logic (Vargo and Lusch, 2004; Chesbrough, Vanhaverbeke and West, 2006).
- **Stage 5—Strategic Refinement and Feedback:** Feedback from digital outcomes is analysed, lessons codified, and strategic direction updated. This reflective capacity enables continuous adaptation—consistent with effectual reasoning where goals evolve in response to stakeholder input and unfolding opportunities (Sarasvathy, 2001, 2008).

Figure 1: The Digital Synergy Loop

Note: The Digital Synergy Loop depicts five iteratively connected stages—Strategic Intent and Direction, Capability Development, Digital Synergy Formation, Value Creation and Innovation Outcomes, and Strategic Refinement and Feedback—through which SMEs continuously re-align strategy and capabilities. Arrows indicate the cyclical, feedback-driven nature of the process. Grounded in RBV (Barney, 1991), DCT (Teece, 2007), and Effectuation Theory (Sarasvathy, 2001, 2008).

5. Discussion

The findings presented above reveal a coherent and empirically grounded picture of how SMEs strategize and develop capabilities for digital transformation. This section discusses those findings in relation to existing theory, differentiating between confirmatory contributions—where findings reinforce established knowledge—and novel contributions—where findings extend, challenge, or reframe prior understanding.

5.1 Confirmatory Contributions

Several findings are consistent with established theory. The centrality of strategic alignment in driving digital value (Theme 1) confirms prior work positioning digital strategy as a prerequisite for transformation success (Bharadwaj et al, 2013; Vial, 2019). The role of dynamic capabilities in enabling sensing, seizing, and reconfiguration (Theme 2) aligns with Teece (2007), reinforcing the applicability of DCT to SME contexts. The use of ecosystem partnerships to compensate for internal resource deficits (Theme 3) is consistent with open innovation theory (Chesbrough, Vanhaverbeke and West, 2006) and also reflects effectual reasoning, specifically the logic of building opportunities through stakeholder commitments rather than relying solely on internally controlled resources (Sarasvathy, 2001, 2008). The phased, selective digitalization approach under resource constraints (Theme 4) corroborates findings by Yao and Yang (2022) and Priyono, Moin and Putri (2020), who document incremental digitalization as the dominant SME pattern.

5.2 Novel Contributions

Several contributions go beyond confirmation to extend, integrate, and theorize anew. First, while RBV and DCT are well-established individually, this study shows how they can be meaningfully connected with effectual reasoning in the context of SME digital transformation. Rather than treating resources, capabilities, and entrepreneurial action as separate perspectives, the findings suggest that SMEs often transform digitally through

a combined logic: they mobilize existing resources, develop capabilities iteratively, and use stakeholder relationships to compensate for internal constraints. Second, the Digital Synergy Loop (Theme 5) is a novel theoretical contribution: unlike linear digital maturity models (Warner and Wäger, 2019), it theorizes transformation as a recursive, iterative loop where strategic intent and capability development are continuously co-aligned through feedback cycles. This cyclical architecture remains underdeveloped in existing SME digital transformation frameworks. Third, the study introduces the concept of "digital synergy formation"—the stage at which coordinated people, processes, and technologies produce combinatory organizational value—as a theoretically distinct and empirically meaningful construct that bridges capability development and innovation outcomes. Together, these novel insights provide a richer, more nuanced account of how SME digital transformation unfolds in practice, and lay the groundwork for future quantitative validation.

5.3 Analytical Propositions

Drawing on the empirical themes and the Digital Synergy Loop framework, three analytical propositions are advanced for future theoretical and empirical elaboration:

- **Proposition 1 (Strategic Alignment):** SMEs that establish explicit strategic intent as the initiating condition of their digital transformation journey will exhibit higher levels of digital synergy formation and sustainable innovation outcomes than those adopting a purely technology-driven approach.
- **Proposition 2 (Capability Iteration):** The iterative cycling between capability development and strategic refinement, as operationalized in the Digital Synergy Loop, positively moderates the relationship between resource constraints and innovation performance in SMEs.
- **Proposition 3 (Network Co-Creation):** SMEs that actively engage in digitally enabled co-creation networks will demonstrate accelerated innovation cycles, as stakeholder commitments and collaborative ecosystems substitute for the internal R&D capacity constraints characteristic of smaller firms.

6. Conclusions and Implications

This study advances theory, practice, and policy in SME digital transformation through the Digital Synergy Loop. It reconceptualises digitalisation as a recursive, adaptive process rather than a linear progression. Theoretically, it makes three contributions: (1) it bridges strategic framing and capability development as co-evolving elements, enriching the RBV (Barney, 1991); (2) it extends DCT by illustrating how SMEs engage in sensing, seizing, and reconfiguring through iterative experimentation; and (3) it challenges linear digital maturity models, positioning transformation as a non-linear loop involving reflection, recalibration, and reimplementation.

For practitioners, four actionable pathways emerge: (1) initiating digital transformation through clear strategic intent rather than technology-centric approaches; (2) adopting incremental capability development to mitigate risk; (3) actively engaging in co-creation with customers and partners; and (4) cultivating organisational reflexivity—the capacity for continuous learning and adaptation based on feedback.

From a policy perspective, interventions should extend beyond subsidized technology acquisition to develop modular, adaptive capability-building programs tailored to SME contexts. Policies fostering ecosystem collaboration and safe experimentation—through innovation sandboxes or phased implementation support—better align with the iterative, feedback-driven nature of SME digital journeys.

7. Limitations and Future Research

This research draws from a small, context-specific sample of Swiss SME leaders, making findings non-generalizable but analytically valuable. Future research should quantitatively validate the Digital Synergy Loop across broader SME populations and diverse sectors. Comparative and longitudinal designs are particularly valuable for examining how the loop evolves over time and how leadership styles, organisational culture, and sectoral dynamics influence the digital transformation process. Exploring the interplay between digital transformation pathways and specific innovation outcomes (e.g., radical vs. incremental) also warrants attention.

Circular Migration and Entrepreneurship in the Western Balkans: From Brain Drain to Innovation Potential

Eldisa Cirogu
Independent Researcher, Tirana, Albania

eldisa.cirogu@commercey.co

Abstract: This paper examines how circular migration can support entrepreneurship and innovation in the Western Balkans, using Albania as the principal analytical reference point. Migration in the region is usually framed as brain drain, yet that framing captures only one side of the relationship between mobility and development. Migrants and returnees may also accumulate skills, savings, market knowledge, work discipline, and transnational networks that can be mobilized for new venture creation, small-firm upgrading, and international market access. The paper argues that entrepreneurship is the critical mediating mechanism between migration and development: mobility-generated assets only become productive when they are translated into business formation, SME upgrading, innovation adoption, and export-oriented activity. The study is conceptual and exploratory. It draws on academic literature on brain circulation, transnational entrepreneurship, return migration, and entrepreneurial ecosystems, and combines this with desk-based analysis of recent official data and policy material from Albania. The empirical context is important. Recent official evidence indicates that Albania has around 1.6 million citizens abroad, that 37 percent of Albanian households include a current or returned migrant, that 108,503 Albanians returned over the previous 12 years including 25,595 in 2023, and that personal remittances equaled 8.4 percent of GDP in 2024. At the same time, only 23.8 percent of individuals report basic or above-basic digital skills, even though roughly 95 percent of public services are available online. The paper's main finding is that circular migration clearly generates entrepreneurial resources, but these resources are only partially converted into innovation and growth because migration policy, SME support, digital capability, and export promotion remain weakly aligned. The paper contributes by integrating migration studies with ecosystem thinking, by grounding the discussion in stronger official evidence, and by proposing a concise conceptual framework through which entrepreneurship mediates the relationship between circular migration and development.

Keywords: Circular Migration; Entrepreneurship; Return Migration; Entrepreneurial Ecosystems; Albania; Western Balkans

1. Introduction

Migration has shaped the social and economic transformation of the Western Balkans for more than three decades. In Albania, large-scale emigration since the early 1990s has affected labor supply, demographic structure, household welfare, and the country's ties to regional and global markets. Recent official evidence confirms that migration remains a structural feature of Albania's development path rather than a temporary episode. The Albania Household Migration Survey 2024 estimates that 1.6 million Albanians live abroad, while more than one in three Albanian households includes a current or returned migrant (World Bank, 2025a). INSTAT (2025) also reports that net migration remained negative in 2024, indicating that outward mobility pressures continue.

The dominant interpretation of these dynamics has long been brain drain. That concern is not misplaced. Persistent emigration can remove skilled labor, intensify demographic aging, and weaken the domestic supply of capabilities needed for growth. Yet a purely loss-based reading is analytically incomplete. Migrants do not only leave; many also return, circulate, remit, invest, advise, and sustain business and family ties across borders. Migration therefore creates not only demographic pressure but also a flow of resources that may retain developmental value for the country of origin.

This paper asks: how can circular migration be used more effectively to promote entrepreneurship and innovation in the Western Balkans? Its central argument is that entrepreneurship is the key mediating mechanism between migration and development. Skills, savings, and transnational contacts only become development assets when they are transformed into new firms, upgraded SMEs, innovation adoption, and market expansion. That transformation depends not only on migrants themselves, but also on the quality of the entrepreneurial ecosystem into which they return or with which they remain connected.

The paper contributes in three ways. First, it connects the migration literature with work on entrepreneurial ecosystems and transnational entrepreneurship. Second, it grounds the discussion in recent official evidence from Albania, which serves as a useful reference case because it combines high outward mobility, significant return migration, strong remittance flows, and still-fragmented competitiveness support. Third, it proposes a concise conceptual framework showing how circular migration can produce entrepreneurial value under some ecosystem conditions but remain underused under others.

2. Literature and Analytical Framework

Classical migration theory treated labor mobility largely as a response to wage differentials and household risk diversification. Stark (1991) emphasized that migration decisions are often embedded in family strategies rather than made by isolated individuals, while Portes (1998) showed that social capital and migrant networks influence both migration opportunities and outcomes. Within this earlier literature, the emigration of skilled workers from smaller and poorer economies was often interpreted as a developmental loss.

Later work complicated that view. Saxenian (2005) introduced the idea of brain circulation to show that migrants may contribute to development through repeated mobility, investment, and cross-border knowledge transfer rather than only through permanent return. Vertovec (2007) similarly emphasized that migrants can remain embedded in more than one economic and social space at once. These perspectives are important because they shift analysis from one-way exit toward circulation, transaction, and recombination across borders.

This literature intersects with research on entrepreneurship. Drori, Honig and Wright (2009) conceptualize transnational entrepreneurship as venture creation that draws on opportunities, resources, and networks spanning more than one country. Wahba and Zenou (2012) show that migration can increase the likelihood of entrepreneurship because it enables savings accumulation and human-capital formation, although time abroad may also weaken some forms of home-country social capital. Filatotchev et al. (2009) further argue that returnee entrepreneurship can improve the export orientation and performance of firms in emerging-market contexts by transferring international knowledge into domestic business practices.

However, migrant resources alone do not explain entrepreneurial outcomes. For that, the entrepreneurial ecosystems literature is especially useful. Stam (2015) defines entrepreneurial ecosystems as interdependent actors and factors coordinated in ways that enable productive entrepreneurship in a territory. Spigel (2017) adds that ecosystems are relational structures composed of material, social, and cultural elements that reproduce entrepreneurial activity over time. This perspective is especially relevant in transition economies, where finance, digital capability, market access, institutional support, and policy coherence determine whether external knowledge can actually be absorbed.

The main theoretical gap in the Western Balkans literature lies in the weak integration of these fields. Migration is often treated as a demographic or labor-market problem, while entrepreneurship is approached mainly through SME or innovation policy. What remains underdeveloped is an explanation of how migration-generated resources are converted into enterprise creation, upgrading, and internationalization. This paper addresses that gap by proposing a framework in which circular migration generates entrepreneurial resources, entrepreneurship mediates their productive use, and ecosystem conditions determine whether the result is brain circulation or continued underuse of migration-linked assets.

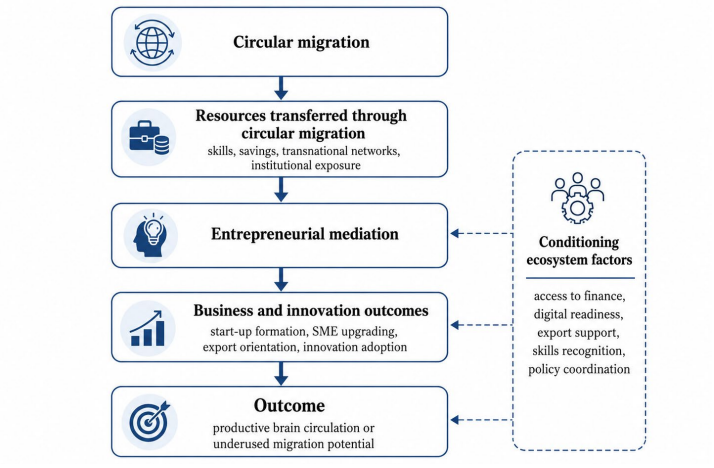

Figure 1: Conceptual framework

3. Methodology and Scope

This paper is a conceptual and exploratory study. It does not present original interview material or primary survey fieldwork and does not claim to test causal relationships through empirical modeling. Instead, it integrates three sources of evidence: academic literature on migration, return migration, transnational

entrepreneurship, and entrepreneurial ecosystems; policy and institutional documents relevant to Albania and the Western Balkans; and recent official secondary data from the World Bank, INSTAT, and OECD.

The analytical strategy proceeded in three steps. First, the literature was reviewed to identify the mechanisms most commonly used to explain how migration may affect entrepreneurship and development. Second, recent official data were used to establish the scope and profile of Albanian migration, return migration, remittances, digital readiness, and SME-support conditions. Third, these materials were synthesized into four analytical categories: migration-generated resources, entrepreneurial mediation mechanisms, ecosystem enablers, and structural constraints.

This framing is important because the original manuscript described interviews with practitioners without providing the empirical detail needed for an interview-based academic paper. Recasting the paper as desk-based conceptual analysis resolves that inconsistency and aligns the method with the evidence actually used. It also better reflects the paper's purpose, which is not to claim causal proof, but to clarify the conceptual and policy mechanisms through which circular migration may support entrepreneurship.

The scope is therefore bounded. Albania is treated as the principal reference case, while claims about the wider Western Balkans are inferential rather than statistically comparative. The paper also does not assume that all return migration generates innovation or that all migrant entrepreneurship is growth-oriented. Rather, it identifies the conditions under which migration-linked assets are more likely to be translated into productive entrepreneurship instead of subsistence-level self-employment.

4. Albania as the Reference Case

Table 1: Selected indicators for Albania's migration-development context

Indicator	Latest Evidence	Relevance to the Argument
Albanians Living Abroad	1.6 million	Large external stock of human and social capital
Households with a Current or Returned Migrant	37%	Migration has economy-wide relevance
Return Migration	108,503 returnees in the previous 12 years, including 25,595 in 2023	Return is quantitatively significant
Net migration	-28,836 in 2024	Out-migration pressures remain strong
Personal Remittances	8.4% of GDP in 2024	Migration remains macroeconomically important
Recipient-household Income From Remittances	41% of total household income among recipient households	Financial flows are substantial but household-centered
Individuals With Basic or Above-Basic Digital Skills	23.8%	Weak digital readiness constrains upgrading
Public Services Online	about 95%	State digitalization has advanced
SMEs in Active Enterprises	99.8%	SME support quality is critical to development outcomes

Source: compiled from World Bank (2025a), INSTAT (2025), World Bank Data (2025), and OECD (2024).

Albania is a particularly useful case for examining the migration-entrepreneurship relationship because multiple migration dynamics coexist. The country combines large-scale emigration, meaningful return flows, strong

remittance dependence, and a visible but still incomplete policy interest in diaspora and return migration. According to the World Bank (2025a), 37 percent of Albanian households include a current or returned migrant. The same source reports 108,503 returnees over the previous 12 years, including 25,595 in 2023 alone. These figures show that return is not marginal; it is a significant component of Albania's mobility profile.

Migration is also highly differentiated. Different corridors appear to generate different forms of human-capital accumulation. The World Bank (2025a) shows that migrants to the United States and Germany are considerably more likely to have tertiary education than migrants to Greece, indicating that some mobility channels may produce stronger entrepreneurial potential than others. The same report notes that more than one quarter of current migrants with tertiary degrees completed that education abroad, which suggests that migration itself can become a mechanism of human-capital accumulation rather than merely one of labor extraction.

Financial links are equally important. The World Bank (2025a) finds that approximately half of migrant households received remittances in the year before the survey and that these transfers accounted for 41 percent of total income among recipient households. Yet the same report also shows that remittance use remains heavily consumption-oriented: 90 percent of households use remittances for food and daily necessities, while productive investments such as business expansion or agricultural inputs remain below 2 percent. This is analytically significant because it shows that migration generates resources, but not automatically entrepreneurial outcomes.

Finally, Albania reveals a revealing tension between state digitalization and firm capability. OECD (2024) reports that about 95 percent of all public services are available online, while only 23.8 percent of individuals report basic or above-basic digital skills. In other words, the public sector's digital transition has advanced faster than the productive capabilities of many citizens and firms. That matters because migration-linked entrepreneurship often depends on digital tools for cross-border coordination, market discovery, and service delivery.

5. Findings

The analysis yields three main findings. First, circular migration clearly enlarges the resource base from which entrepreneurship can emerge. Second, entrepreneurial reintegration exists, but often remains small-scale. Third, the principal bottleneck is ecosystemic rather than motivational.

The first finding is that migration generates multiple entrepreneurial assets. These include savings, remittances, work experience, foreign-language ability, organizational routines, and transnational contacts. Such assets can help returnees or diaspora-linked actors identify market gaps, adopt international standards, and connect local production to foreign demand. The World Bank (2025a) reinforces this argument by showing that migration is associated with both financial accumulation and human-capital accumulation, including education achieved abroad and work experience that later yields wage returns in Albania.

The second finding is that entrepreneurial reintegration is visible but fragile. Returnees are not economically passive. World Bank (2025a) reports that returnees have higher employment rates than non-migrants and that self-employment has become increasingly visible across return cohorts. Self-employment among returnees rose from 7 percent among those returning in 2000–2004 to 29 percent among recent cohorts, peaking at 34 percent among those returning in 2010–2014. However, most of this entrepreneurship is not employer-based. Among self-employed returnees, 91–93 percent operate without paid employees, while only a small minority report being employers with paid employees. This matters because it indicates that returnee entrepreneurship often exists, but usually does not scale into broader job creation or innovation-intensive growth.

The third finding is that the main barrier lies in the ecosystem. Albania has made visible progress in digital government, in the legal framework for e-business, and in the formal architecture of export promotion and SME support. Yet implementation capacity remains weak. OECD (2024) reports that AIDA's export-promotion services remain centered primarily on capacity building, with limited targeted assistance for SMEs, despite SMEs accounting for 99.8 percent of active enterprises. The same report notes that staff allocated to export-promotion activities increased only from three in 2018 to four in 2022, while the export-promotion budget relative to total exports declined over the same period. Support exists, but it is too thin to systematically convert mobility-linked assets into scaled market participation.

The same pattern appears in digitalization. OECD (2024) documents progress in e-signatures, e-business rules, and SME digitalization programs, but also shows that many initiatives remain donor-funded, limited in scale, or weakly monitored for impact. This is important because migrant and returnee entrepreneurs often rely on digital

tools to sustain transnational coordination, online sales, and market access. When firm-level digital capability remains weak, the value of transnational experience is harder to monetize.

Table 2: Mechanisms, barriers, and implications

Dimension	Development Mechanism	Main Barrier	Policy Implication
Human Capital	Skills, managerial routines, and quality standards learned abroad	Weak reintegration and skills-matching systems	Link return support to entrepreneurship support and sector needs
Financial Capital	Savings and remittances can fund firms and upgrading	Consumption bias and weak channeling into enterprise finance	Create returnee- and diaspora-oriented seed instruments
Transnational Networks	Access to suppliers, customers, and trust networks abroad	Low export readiness and weak brokerage institutions	Build diaspora mentoring and export-linkage programs
Digital Capability	Lower coordination costs and easier cross-border service delivery	Low digital skills and limited SME digital support	Pair e-government progress with SME digitalization support
Institutional Coordination	Better alignment can turn mobility into productive brain circulation	Fragmented migration, SME, and innovation policy	Create integrated mobility-enterprise policy instruments

Source: author's synthesis.

Overall, the findings point to a systemic disconnect between three elements: the capabilities of migrants and returnees, the absorptive capacity of domestic SMEs, and the demands of international markets. When these elements do not align, migration-based assets remain underused. Migration still supports household welfare and social resilience, but its effects on innovation, formal job creation, and export upgrading remain weaker than they could be.

6. Discussion

The central contribution of this paper is to reposition entrepreneurship as the mechanism that links circular migration to development outcomes. This matters because many policy discussions still separate migration from enterprise development. Migration is treated as a labor-market or demographic issue; entrepreneurship is treated as an SME policy issue. The evidence reviewed here suggests that this separation is misleading. In high-mobility societies such as Albania, migration changes the composition of local entrepreneurial resources, not only the demographic profile of the labor force.

The findings also speak directly to the entrepreneurial ecosystems literature. Migrants and returnees may possess valuable assets, but ecosystem quality determines whether those assets produce productive entrepreneurship. A returnee with sector experience, language skills, and business contacts may still fail to build a growth-oriented firm if credit is unavailable, export support is generic, digital support is weak, and navigating institutions is costly. Conversely, the same returnee may become a valuable bridge between local firms and foreign markets if the ecosystem offers targeted support and brokerage.

The Albanian case suggests that current policy is strongest in recognition and weakest in coordination. Official discourse increasingly acknowledges diaspora engagement, SME competitiveness, digitalization, and internationalization as priorities. Yet the instruments connecting those fields remain weak. Migration policy is not fully integrated with entrepreneurship support; digital public services are more advanced than firm-level digital capability; and export promotion remains under-resourced relative to the structure of the Albanian economy. A more coherent strategy would link return migration, diaspora engagement, SME upgrading, digital capability, and export readiness rather than treating them as separate policy silos.

This interpretation has implications beyond Albania. Other Western Balkan economies also combine high outward mobility, fragmented ecosystems, and competitiveness agendas that remain unevenly implemented. Using entrepreneurship as the analytical bridge between mobility and development may therefore help explain why migration produces widely different economic outcomes across the region. It also suggests a clear agenda for future research: more comparative work on returnee firms, diaspora brokerage, and sector-specific ecosystems that can translate mobility into innovation rather than only compensating for loss.

7. Conclusion

This paper has argued that circular migration should be understood not only as a demographic or labor-market phenomenon, but also as a potential source of entrepreneurial renewal. Using Albania as the main reference case, it has shown that migration generates a meaningful stock of skills, savings, and transnational links, while return migration creates openings for reintegration through enterprise activity. However, those openings do not automatically produce innovation or broad-based development.

The key reason is ecosystem weakness. Entrepreneurship can mediate migration's developmental effects only where the surrounding ecosystem is able to translate migrant resources into start-up formation, SME upgrading, export orientation, and innovation adoption. In Albania, that translation remains partial because digital readiness, targeted export support, institutional capacity, and policy coordination are still limited. Circular migration therefore contains real innovation potential, but much of it remains underused.

The broader implication is that policy should move beyond the simple opposition between brain drain and return. A more useful approach is to ask how mobility-generated assets can be retained, circulated, and scaled through entrepreneurship. That means linking migration governance with SME policy, digital capability building, innovation support, and market internationalization. Such integration would not eliminate the costs of emigration, but it would improve the chances that mobility contributes to resilience, capability, and innovation in the Western Balkans.

Abstract: Innovation has become a critical driver of competitiveness in traditional manufacturing industries, yet its role remains insufficiently understood in mature industrial clusters. This study examines how structured innovation practices influence firm performance and contribute to broader transformation dynamics in the textile and clothing sector of Portugal´s Vale do Ave region. Adopting a qualitative multiple case study approach, the research draws on semi-structured interviews with senior managers from five firms at different levels of innovation maturity. Through the Innovation Scoring framework, it analyses how innovation is organised, embedded, and managed across firms. The findings reveal significant heterogeneity. Firms with institutionalized and strategically aligned innovation demonstrate stronger capabilities in integrating innovation with strategy, fostering supportive organisational cultures, and engaging in external collaboration. These capabilities enhance adaptability and lead to superior performance. In contrast, less mature firms rely on reactive, ad hoc practices and struggle to structure innovation and assess its impact. The study shows that innovation maturity appears to mediate the relationship between innovation practices and performance, conceptualizing it as an operational expression of dynamic capabilities. It also highlights the importance of multidimensional innovation measurement and offers relevant implications for managers and policymakers aiming to strengthen competitiveness in traditional industries.

Keywords: Innovation Management, Industrial Clusters, Regional Innovation, Traditional Manufacturing, Textile Industry

1. Introduction

In a volatile, competitive, and knowledge-intensive global economy, innovation has become a critical driver of firm competitiveness, adaptability, and long-term performance (OECD, 2005; Teece, 2025; Çil, 2026). It extends beyond product and technological novelty to a dynamic organisational capability enabling firms to sense opportunities and reconfigure resources (Teece, 2025), thereby sustaining value creation and competitive advantage (Bessant & Tidd, 2016; Statar et al., 2026). This is particularly relevant in traditional manufacturing sectors, such as textiles and apparel, where globalization, digitalization, and shifting consumer expectations demand continuous upgrading. Even in low- and medium-technology industries, innovation increasingly encompasses products, processes, design, and business models (Glock, 2025; Rosa et al., 2025; O'Brien, 2026), often unfolding through iterative, experience-based, and institutionally embedded processes that support internationalization (Han, et al., 2026).

Contemporary perspectives frame innovation as a systemic and collaborative process involving multiple actors within open innovation ecosystems (Nambisan et al., 2019; Chesbrough, 2024; Nan & Huang, 2025). Firms embedded in such ecosystems benefit from enhanced knowledge flows, reduced uncertainty, and accelerated innovation outcomes (Autio et al., 2018). However, innovation's multidimensional nature, namely spanning tangible outputs and intangible capabilities, renders its measurement complex (Adams et al., 2016; Hidayat & Pok, 2025), often exceeding traditional indicators such as R&D expenditure or patents (Taherdoost, 2024). This has led to the emergence of more comprehensive approaches, including innovation maturity models, which assess capabilities, processes, and organisational conditions (Adams et al., 2016; Hidayat & Pok, 2025).

Among these, the Innovation Scoring framework developed by COTEC Portugal (2023) provides a multidimensional assessment of firms' innovation across strategy, organisation, processes, and impact, forming the analytical basis of this study. Focusing on the textile and clothing cluster of Vale do Ave, a historically significant, export-oriented industrial region facing intensified global pressures, the research examines how innovation practices and maturity levels relate to firm performance. While prior literature confirms a positive innovation–performance link (Rajapathirana & Hui, 2018; Henao-García & Cardona Montoya, 2024), empirical evidence in traditional sectors remains limited, particularly regarding structured maturity frameworks.

This study addresses this gap by analysing firms' innovation strategies, assessing their maturity, and exploring their relationship with business performance. It contributes by advancing empirical understanding of innovation in low-technology contexts, applying a multidimensional maturity perspective, and offering managerial and policy insights on institutionalizing and systematizing innovation management.

2. Literature Review

2.1 Innovation as a Strategic and Dynamic Capability

The concept of innovation has a long history as a primary engine of growth and competitiveness (Schumpeter, 1934; Hamdouna & Khmelyarchuk, 2025). It has moved from a conceptualization of technological change and product innovation to a more sophisticated conceptualization that accounts for the organisational processes, business models and strategic renewal (OECD, 2005; Bessant & Tidd, 2016). More recently, innovation in the context of dynamic capabilities, in which the firm integrates, builds and reconfigures internal and external capabilities in response to rapidly changing situations, is used in this context (Teece, 2025; Zhou et al., 2026). From this perspective, innovation must be viewed not merely as output but as an ongoing process that sustains adaptation, renewal and long-term success of organisations. Especially in turbulent and competitive markets, where firms must sense the chance, take advantage of it, and reconfigure their resource base, such a perspective is relevant (Al-Husain et al., 2025), as emphasised in the literature, organisations that have developed a robust innovation capability can maintain a competitive advantage and counter uncertainty as a result of their organisational structures and capabilities. Consistent with this view, innovation is also strongly associated with organisational learning processes, knowledge creation, and new competencies (Migdadi, 2022; Alhidayatullah, 2025). These features reinforce the view that innovation is a systemic and multidimensional phenomenon embedded within the firm's strategic and operational activities.

2.2 Innovation in Traditional and Low-tech Industries

While innovation is often associated with high-technology enterprises, a growing amount of literature indicates its role in traditional and low-tech industries (e.g., textiles and clothing) (Spithoven & Van Criekingen, 2026; Wani, 2026). In such sectors, innovation is less science-based and more practice-driven with reliance on incremental improvements, design, process optimization, and close interaction with customers and suppliers (Piana & Brustolin, 2023). Instead of radical technological breakthroughs, firms innovate by recombining existing knowledge and iteratively improving products and processes. Such innovation is often embedded within organisational routines and tacit knowledge, so it is less apparent but also important for competitiveness (O'Brien, 2026). That is, traditional industries need more complex analytic approaches than traditional proxies that signify innovation, like R&D funding or patents. Also, regional industrial clusters, like the Vale do Ave, play a critical role in supporting innovation in these sectors. It is because these clusters enable the exchange of knowledge, collaboration, and specialization that a society learns and that it forms collective skills and competes (Kowalski, 2022). As discussed above for the textile and clothing industry, innovation is critical to compete across the globe, cater for changing consumer preferences, and address growing concerns for sustainability (Todeschini et al, 2017). In fact, this industry relies on continuous innovation to sustain its market share and longevity.

2.3 Open Innovation and Innovation Ecosystems

The old view of innovation as internally driven had gradually been exchanged for the new idea of open innovation and how external knowledge flows and collaborative networks are implicated (Chesbrough, 2024). From that view, firms innovate not just through internal research and development (R&D) activities but also by engaging with knowledge from the external environment, such as relationships with customers, suppliers, universities, and research institutions. This transition indicates the increasing complexity of innovation and the need for the use of multiple capacities and assets (Chesbrough, 2024). This concept is directly tied to innovation ecosystems, which are the linked actors, institutions, and relationships that complement and amplify innovation (Autio et al., 2018; Nambisan et al., 2019; Peçanha & Ferreira, 2025). In these ecosystems, value creation can be traced through interactions and complementarities between several actors. Indeed, firms located in strong innovation ecosystems appear to have the potential to become more innovative, less uncertain, and faster at commercializing innovation (Sewenet et al., 2026). This is especially important for SMEs and companies in traditional industries where they typically do not possess in-house capabilities and rely heavily on cooperation from external collaboration. Within the case of the textile sector in Vale do Ave, the presence of industrial networks, technological centers, and institutional support mechanisms serves to support that collaborative

innovation processes play an important role, as proposed in the paper through an exploration of external partners.

2.4 Measuring Innovation: Challenges and Multidimensional Approaches

And it remains difficult to quantify innovation as it is intangible, complex, and non-linear by nature, despite its importance (Gault, 2018; Alhidayatullah, 2025). Traditional indicators, like R&D budgets and patent numbers, can yield a limited understanding of innovation ventures and neglect organisational, strategic, or process elements (Taherdoost, 2024). As discussed in the literature, innovation is a composite that encompasses outputs, processes, capabilities, and contextual variables, forcing us to develop more holistic and multidimensional measurement frameworks (Alhidayatullah, 2025). This, in turn, has prompted the emergence of alternative methodological approaches which concentrate on the qualitative domain including organisational culture, learning, and knowledge management. In this way, the paper highlights the challenges of measuring innovation especially because it is qualitative and multifaceted, and single indicator capable of fully capturing it. With these challenges in mind, innovation maturity models have come to the fore as a way for measuring organisations' innovation capabilities. Such models enable organisations to assess their development in several areas of development, identify gaps, and enable improvement as a continuous process.

2.5 Innovation Maturity and the Innovation Scoring Model

The concepts of innovation maturity models are useful frameworks for providing a structured understanding of how firms create and manage innovation. These models build upon these factors to reflect a full breadth of knowledge encompassing innovation capabilities and performance across various measures: strategy, organisation, processes, and outcomes. For instance, the Innovation Scoring model by COTEC Portugal allows businesses to evaluate how mature they are in their innovation process using a multi-dimensional analysis (COTEC Portugal, 2023). The model incorporates strategic alignment, organisational structures, knowledge management, and the impact of innovation activities as parts of innovation management. The model serves as both a diagnostic and benchmarking tool, and in the paper, it is developed to measure the Innovation Score for industry practitioners to find the strengths, weaknesses, and possibilities for improving the innovation processes. Notably, this method is consistent with the innovation measurement literature as it does not consider that innovation performance can be measured by a single indicator but rather needs to be explored across multiple organisational dimensions (Alhidayatullah, 2025). In addition, the idea of innovation maturity is related to the differentiation between institutionalized innovation (i.e., innovation that is firmly entrenched in strategy and processes) and ad hoc innovation, which is more reactive and disorganised (Abreu, 2024). The paper illustrates the difference, indicating that firms with more institutionalized innovation practices experience better performance results.

3. Methodology

3.1 Research Design

This research adopts a qualitative exploratory research design to study the complex and situation-specific issues, such as innovation practices and their association with business performance (Yin, 2018). The qualitative method is commonly employed in innovation research because it can provide a nuanced picture of organisational processes, managerial views, and situational dimensions that are sometimes a challenge to retrieve with quantitative measures (Lê & Schmid, 2022). Consistent with this view, the objective of the current research is to investigate how innovation is structured, perceived, and implemented within firms, not to test certain hypotheses. The study adopts a multiple case study design and examines companies from the textile and clothing sector based in the Vale do Ave sub-region. Case studies are especially suitable for considering contemporary phenomena within their real-life context, where the boundaries between a phenomenon and a context are unclear (Yin, 2018). Data were collected through semi-structured interviews conducted using a pre-structured questionnaire. This questionnaire script was divided into five sections: i) Strategy (environmental analysis, strategic planning and innovation culture); ii) Organisation (innovation structure, human capital and skills); iii) RDI processes (generation and management of innovation projects); iv) Enablers (external cooperation, funding and knowledge management); and v) Impact (market and sustainability).

3.2 Sample and Data Collection

The empirical analysis is based on a multiple case study design involving five firms operating in the textile and clothing sector in the Vale do Ave sub-region. The firms were selected using a purposive sampling strategy (Obilor, 2023), based on their relevance within the industry, their level of internationalization, and their engagement with innovation practices. This approach enables the identification of information-rich cases and allows for meaningful comparison across different organisational contexts.

For confidentiality and analytical consistency, the firms are anonymized and referred to as A1, A2, A3, A4, and A5 throughout the study. These firms correspond to well-established companies in the Portuguese textile sector and represent different profiles in terms of size, organisational structure, and innovation maturity.

A1 and A2 are large, internationally oriented firms with long industrial trajectories and strong technological capabilities. A3 and A4 are medium-sized companies characterized by high technical specialization and a strong focus on incremental and process-based innovation. A5 represents a smaller firm oriented towards product differentiation and niche markets, illustrating the diversity of organisational structures and innovation strategies within the cluster

Interview data were analysed using qualitative content analysis.

The interviews were conducted online between September and November 2025, and information on the interviewees is summarized in Table 1.

Table 1: Firms and Interviewee's function on company

Firm	Interviewee's Function on Company
A1	Process Engineer – Head of R&D
A2	Head of R&D – Technical Management and Materials Sub-division
A3	Administrator
A4	Product Manager, in the research and development team.
A5	Head of Department

Source: own elaboration

4. Results

4.1 Innovation as a Strategic Driver of Competitiveness

The findings consistently indicate that innovation is perceived as a central strategic driver of competitiveness, growth, and differentiation across all firms.

This perception emerges clearly from the interviews, where firms emphasise the necessity of innovation in a highly competitive and globalized market:

"Innovation is essential to maintain competitiveness in the textile sector" (A1)
"Without innovation, it becomes very difficult to keep up with market and customer demands" (A2)
"Innovation allows us to grow and differentiate from competitors" (A3)

These insights confirm that innovation is not viewed merely as a reactive mechanism, but as a proactive strategic tool, supporting growth, differentiation, and internationalization, as also identified in the paper findings

4.2 Heterogeneity in Innovation Maturity: Institutionalized *vs ad hoc* Innovation

A key result is the existence of two distinct patterns of innovation:

4.2.1 Institutionalized Innovation

Firms with higher innovation maturity demonstrate structured and strategic approaches:

> "Innovation is integrated into the company's strategy" (A1)
>
> "There is clear planning and monitoring of innovation activities" (A2)

"Innovation is not occasional; it is part of how we operate" (A3)

4.2.2 Ad hoc Innovation

Less mature firms rely on reactive and unstructured approaches:

"Innovation often arises as a response to market demands" (A4)

"There is not always a structured plan for innovation" (A5)

"We innovate, when necessary, not as part of a long-term strategy" (A4)

The research confirms that firms with lower innovation maturity tend to respond to external pressures without prior planning or anticipation.

Furthermore, firms with institutionalized innovation achieve superior results in:

- Operational Efficiency
- Value Creation
- Adaptability.

4.3 Organisational Culture and Leadership as Enablers of Innovation

The findings highlight that innovation is strongly shaped by organisational culture and leadership commitment.

Firms with higher maturity consistently report:

"Leadership plays a key role in promoting innovation" (A1)

"Innovation is embedded in our organisational culture" (A2)

"Employees are encouraged to contribute ideas and improvements" (A3)

In contrast, firms with lower maturity face internal barriers:

"It is still difficult to involve the whole organisation in innovation processes" (A4)

"Innovation is not yet fully integrated across departments" (A5)

The study supports this distinction, showing that firms such as A1 and A2 exhibit strong leadership involvement, structured processes, and innovation-oriented cultures.

4.4 Collaboration and External Relationships

The results reveal that innovation is supported by external collaboration, although its level of formalization varies.

Firms report engaging with multiple external actors:

"We collaborate with partners and suppliers to develop new solutions" (A2)

"Customer relationships are fundamental for innovation" (A3)

"External knowledge plays an important role in our innovation processes" (A1)

However, collaboration is not always strategically structured:

"Collaboration exists, but it is not always formalized or managed strategically" (A4)

The paper also highlights the importance of interorganisational cooperation and knowledge exchange, particularly in more mature firms

4.5 Challenges in Measuring Innovation

A highly consistent finding across all firms concerns the difficulty in measuring innovation outcomes.

Firms emphasise the intangible and long-term nature of innovation:

"It is difficult to measure the real impact of innovation activities" (A4)

"Innovation results are not immediate" (A2)

"We often struggle to quantify innovation outcomes" (A5)

This challenge is explicitly identified in the paper, which highlights the difficulty of measuring innovation due to its intangible and multidimensional nature

5. Discussion

5.1 Innovation Maturity as a Manifestation of Dynamic Capabilities

The distinction between institutionalized and ad hoc innovation reflects differences in firms' dynamic capabilities (Teece, 2025).

Firms with higher innovation maturity demonstrate:

"Innovation is integrated into strategy and daily operations" (A1)

"We continuously adapt our processes to market changes" (A2)

These characteristics reflect the ability to:

- Sense Opportunities
- Seize Them
- Reconfigure Resources

By contrast, firms with ad hoc innovation lack these capabilities:

"Innovation is mostly driven by external pressure rather than internal planning" (A4)

Key contribution: Innovation maturity can be understood as an operational manifestation of dynamic capabilities in traditional industries.

5.2 Innovation in Traditional Industries: Beyond R&D

The findings reinforce that innovation in the textile sector is primarily:

- Incremental
- Process-oriented
- Experience-based

"Innovation often comes from continuous improvements in processes" (A2)

"Small improvements make a big difference over time" (A3)

This aligns with Spithoven and Van Criekingen (2026), who argue that innovation in low-tech industries is often embedded in routines rather than driven by radical technological change.

Insight: Innovation in traditional industries is less visible but equally strategic.

5.3 Open Innovation: a Partial Transition

The importance of external collaboration reflects a shift toward open innovation (Chesbrough, 2024).

"Innovation depends a lot on collaboration with external partners" (A1)

"Customers and suppliers play a key role in innovation" (A2)

However, the data also reveals limitations:

"These collaborations are not always managed in a structured way" (A4)

Interpretation: Firms are transitioning toward open innovation, although many remain in an intermediate stage of maturity.

5.4 Organizational Culture as a Determinant of Innovation

The findings strongly support the role of organisational culture as a key enabler of innovation (Dobni, 2008).

"Innovation depends heavily on how the organisation is structured internally" (A3)

"Without employee involvement, innovation becomes very difficult" (A5)

Key insight: Innovation is not only a capability; it is a cultural condition.

5.5 Measuring Innovation: Bridging the Gap

The empirical evidence confirms the limitations of traditional innovation metrics:

"Innovation is difficult to measure in objective terms" (A4)

This supports the literature (Alhidayatullah, 2025), which highlights the multidimensional nature of innovation.

In this context, the Innovation Scoring model emerges as a relevant contribution, providing:

- a structured assessment framework
- multidimensional evaluation
- support for decision-making

5.6 Innovation Maturity as a Mediator of Performance

The findings refine the relationship between innovation and firm performance.

Rather than suggesting a direct relationship, the results indicate that performance outcomes depend on the degree to which innovation is structured, strategically aligned, and embedded within organisational processes.

Firms with higher levels of innovation maturity demonstrate more institutionalized innovation practices, stronger strategic alignment, and better integration of innovation into daily operations. These characteristics contribute to greater adaptability, operational efficiency, and value creation, leading to superior performance outcomes.

By contrast, firms with less mature innovation systems tend to rely on reactive and ad hoc approaches, limiting their ability to anticipate market changes, systematically manage innovation activities, and evaluate their impact.

These findings suggest that innovation maturity plays an important mediating role between innovation practices and business performance. In this sense, innovation maturity can be understood as a mechanism through which innovation capabilities are transformed into sustained organisational outcomes.

6. Conclusion

This study analysed the relationship between innovation practices and business performance in firms operating in the textile and clothing sector of the Vale do Ave region, using the Innovation Scoring model as an analytical framework.

The findings demonstrate that innovation is widely perceived as a strategic driver of competitiveness, supporting firms not only in maintaining market position, but also in fostering growth, differentiation, and internationalization. However, the study also shows that innovation alone does not automatically lead to superior performance. More importantly, firm performance appears to depend on how innovation is structured, managed, and integrated into organisational strategy and daily operations.

A central contribution of the study lies in the distinction identified between institutionalized and ad hoc innovation practices. Firms with more mature and structured innovation systems, embedded in strategic planning, organisational culture, and operational processes, demonstrate greater adaptability, stronger value creation, and higher operational efficiency. In contrast, firms relying on reactive and less formalized innovation approaches face greater difficulties in anticipating market changes and evaluating innovation outcomes.

The findings also highlight the importance of organisational culture, leadership commitment, and external collaboration as critical enablers of innovation. In addition, the study reinforces the challenges associated with measuring innovation due to its intangible and multidimensional nature, supporting the relevance of holistic frameworks such as the Innovation Scoring model.

From a theoretical perspective, the research suggests that innovation maturity can be understood as an operational manifestation of dynamic capabilities in traditional industries. The results further indicate that

innovation maturity may act as a mediating mechanism between innovation practices and business performance.

Overall, the study contributes to the understanding of innovation management in traditional manufacturing sectors and highlights the importance of structured innovation practices for strengthening competitiveness in industrial clusters. Future research may extend these findings through quantitative approaches, comparative sector analyses, or longitudinal studies exploring the evolution of innovation maturity over time.

Abstract: Entrepreneurship education in higher education is increasingly expected to demonstrate not only student engagement but also credible evidence of competence development through pedagogical approaches that connect theory, action and reflection. However, empirical research remains limited regarding how specific experiential practices – particularly market validation – contribute to competence development and how such learning can be meaningfully assessed. This paper examines the educational value of a market validation activity implemented within a course unit in Entrepreneurship and Digital Innovation at a Portuguese higher education institution. The course is structured as an integrated learning pathway through which students progress from opportunity identification and idea presentation to prototype development, market validation and business model design. The study aims to analyse how market validation contributes to the development of entrepreneurial competences and to explore its potential as an authentic assessment mechanism. A mixed-methods case study design was adopted, combining quantitative, qualitative and performance-based evidence. The study was conducted within an Entrepreneurship and Digital Innovation course involving 72 undergraduate students. Data sources included a questionnaire completed by 37 students, two focus groups involving 14 students, and the analysis of market validation reports, prototypes and business model proposals as performance-based evidence of entrepreneurial competence development. The findings show that market validation supports entrepreneurial attitudes, knowledge and skills, particularly responsibility, collaboration, feedback use and evidence-based decision-making. Direct interaction with potential users, exposure to uncertainty and reflection on customer feedback emerged as key learning mechanisms. The study shows that market validation can function both as an experiential learning strategy and as an authentic assessment tool, providing observable evidence of entrepreneurial competence development.

Keywords: Entrepreneurship Education; Entrepreneurial Competences; Market Validation

1. Introduction

Entrepreneurship is widely recognised as a key driver of economic growth, innovation and social transformation. In knowledge-based economies, higher education institutions are increasingly expected to play a central role in fostering entrepreneurial mindsets and equipping students with the competences required to navigate uncertain and dynamic environments (Nabi et al., 2017; Sutter et al., 2019). As a result, entrepreneurship education has evolved significantly over recent decades, shifting from a focus on business plans and theoretical knowledge towards more experiential, student-centred and practice-oriented approaches (Fayolle & Gailly, 2015; Bell & Bell, 2020).

This evolution reflects a growing consensus that entrepreneurial competences – such as opportunity recognition, problem-solving, creativity and decision-making – are more effectively developed through active engagement in real-world challenges rather than through passive learning methods (Cui et al., 2021; Wu et al., 2022). In this context, experiential learning approaches, inspired by Kolb's (1984) experiential learning theory, have gained prominence in entrepreneurship education, emphasising the importance of concrete experience, reflection and iterative learning processes (Kolb, 1984; Pittaway & Edwards, 2012; Bell & Bell, 2020). These approaches not only enhance knowledge acquisition but also promote behavioural and attitudinal change, which are essential for developing an entrepreneurial mindset.

Despite these advances, the literature still highlights significant limitations in understanding the impact of specific pedagogical practices on the development of entrepreneurial competences and how this impact can be robustly assessed (Nabi et al., 2017; Bernadó & Bratzke, 2024). In particular, the operationalisation and assessment of entrepreneurial competences remain challenging, despite recent contributions based on frameworks such as EntreComp and more sophisticated measurement instruments (Lin et al., 2024; Almeida et al., 2026). In this context, there is a clear need for studies that examine concrete pedagogical practices and their effects on learning outcomes.

One such practice is market validation, understood as the process of testing ideas with real users and incorporating their feedback into an iterative development process. Although this practice is widely used in entrepreneurship, particularly in approaches such as Lean Startup, its systematic integration as a pedagogical strategy in higher education remains underexplored (Lackéus, 2020). Furthermore, its potential as both an experiential learning mechanism and an authentic assessment tool still lacks consistent empirical evidence.

Previous research analysed the impact of an international entrepreneurship education programme on students' competences, attitudes and skills, highlighting the importance of experiential, collaborative and multicultural learning environments (Costa et al., 2024). These findings are consistent with earlier studies demonstrating that entrepreneurship education plays a key role in developing entrepreneurial competences and intentions (Costa & Mares, 2016; Mares et al., 2017), as well as competences relevant to complex and dynamic contexts (Liu et al., 2025).

Building on these contributions, the present study extends this line of research by focusing specifically on the pedagogical role of market validation within a course unit in entrepreneurship and digital innovation. The course is structured as an integrated experiential learning pathway, in which students progress through different stages of the entrepreneurial process, including opportunity identification, idea development, prototyping, market validation and business model design. This approach aligns with the increasing need for higher education institutions to become more entrepreneurial and innovation-oriented (Belitski, 2024).

Within this framework, market validation plays a central role, as it requires students to interact directly with potential users, gather and interpret feedback and iteratively refine their value propositions. This process not only reflects real entrepreneurial practice but also provides a rich context for developing entrepreneurial competences and implementing authentic, performance-based assessment practices (Pittaway & Edwards, 2012).

Accordingly, the aim of this study is to examine how a market validation activity, implemented within a broader experiential learning pathway, contributes to the development of entrepreneurial competences in higher education. More specifically, the study seeks to understand the educational value of market validation as an experiential learning strategy and to explore how competence development can be assessed through the triangulation of students' perceptions, qualitative reflections and performance-based outputs, such as market validation reports, prototypes and business model proposals. To address these objectives, the study adopts a mixed-methods case study design that combines quantitative, qualitative and performance-based evidence to provide a comprehensive understanding of entrepreneurial learning outcomes (Timans et al., 2019).

To achieve this aim, the study addresses the following research questions:

> **RQ1:** How do students perceive the contribution of a market validation activity to the development of entrepreneurial attitudes, knowledge and skills?
>
> **RQ2:** Which entrepreneurial competences are most strongly developed through participation in a market validation activity?
>
> **RQ3:** How do students describe the learning processes generated through direct interaction with potential users and the feedback obtained during market validation?
>
> **RQ4:** What evidence of entrepreneurial competence development can be identified through students' performance-based outputs produced during the market validation process?

These research questions guided the design of the study and informed the collection and analysis of quantitative, qualitative and performance-based evidence. By addressing these questions, the study seeks to advance understanding of how market validation can support entrepreneurial competence development and authentic assessment within higher education contexts.

By focusing on a specific experiential practice and its role within a structured pedagogical design, this paper contributes to the entrepreneurship education literature in three main ways. First, it provides empirical evidence regarding the educational value of market validation as a mechanism for entrepreneurial competence development. Second, it contributes to the growing discussion on authentic assessment by demonstrating how performance-based outputs can provide observable evidence of competence demonstration beyond self-reported perceptions. Third, it advances understanding of the learning processes associated with market validation by integrating quantitative, qualitative and performance-based evidence within a triangulated

research design. Taken together, these contributions offer insights that may support the design and assessment of entrepreneurship education programmes in higher education.

2. Literature Review

2.1 Entrepreneurship Education and Competence Development

Entrepreneurship education has increasingly moved from approaches focused on entrepreneurial intention and venture creation towards broader perspectives centred on competence development. Recent literature emphasises that entrepreneurial competences include opportunity identification, creativity, initiative, collaboration, problem-solving and the ability to transform ideas into value (Costa & Mares, 2016; Mares et al., 2017; Nabi et al., 2016; Cui et al., 2021; Bernadó & Bratzke, 2024).

In this context, active learning methodologies assume particular importance. Challenge-based learning, project-based learning, simulations, interaction with real users and prototype development allow students to engage more closely with entrepreneurial practice, fostering more meaningful learning. Recent literature highlights that entrepreneurship education benefits from experiential, theoretically grounded and student-centred pedagogical approaches (Kakouris et al., 2023). Additionally, studies on educational technologies in entrepreneurship indicate that digital tools, simulations and interactive environments can support the development of entrepreneurial competences, particularly in terms of initiative, motivation, financial literacy and decision-making capacity (Hammoda, 2024).

Thus, entrepreneurship education should be conceived as an integrated pedagogical process that connects intention, competence and action. This perspective is particularly relevant in higher education, where students are expected not only to understand entrepreneurial concepts but also to apply them in real or simulated situations. Recent studies also highlight the need for longitudinal and robust methodologies to assess the impact of entrepreneurship education on competences and intentions over time (Almeida et al., 2026).

2.2 Experiential Learning and Market Validation

Experiential learning is central to entrepreneurship education because it prioritises action, experimentation and reflection. Inspired by Kolb's model, this approach argues that knowledge is constructed through cycles of experience, reflection, conceptualisation and experimentation. In entrepreneurship education, such approaches allow students to engage with real problems, interact with stakeholders and develop competences such as initiative, creativity and adaptability (Lackéus, 2020; Bell & Bell, 2020).

Despite its practical relevance, the literature indicates that market validation remains underexplored as a structured pedagogical strategy in higher education. Most studies focus on broader experiential learning approaches without examining in depth the specific role of practices such as market testing in knowledge construction and competence development (Lackéus, 2020). This gap is particularly significant given the growing importance of pedagogical approaches oriented towards value creation and real-world problem-solving.

Therefore, integrating market validation into the teaching and learning process may constitute an effective mechanism for fostering entrepreneurial competences, as it requires students not only to generate ideas but also to confront them with reality. This process supports the development of competences such as critical analysis, stakeholder communication, feedback interpretation and adaptability, which are especially relevant in contexts of uncertainty and innovation.

2.3 Authentic Assessment in Entrepreneurship Education

Experiential entrepreneurship education also requires assessment methods capable of capturing complex competences. Traditional tests are often insufficient, while authentic assessment evaluates tasks that reflect real-world entrepreneurial practice, such as prototypes, pitches, business models and market validation reports (Gulikers et al., 2004; Pittaway & Edwards, 2012).

Furthermore, authentic assessment is frequently associated with continuous and iterative feedback processes, which play a crucial role in learning development. Throughout the entrepreneurial process, students are exposed to multiple sources of feedback – from lecturers, peers and users – which contributes to the progressive improvement of their proposals and to the development of reflective and critical competences.

However, the implementation of authentic assessment practices presents significant challenges, particularly in terms of defining clear criteria, ensuring consistency in evaluation and aligning learning objectives with performance evidence. Recent literature highlights the need to develop more structured and systematic approaches to assessing entrepreneurial competences, integrating multiple sources of evidence and enhancing methodological rigour (Bernadó & Bratzke, 2024; Lin et al., 2024).

In this sense, the integration of experiential learning and authentic assessment is particularly relevant in entrepreneurship education, as it enables not only the promotion of competence development but also a more effective evaluation of learning outcomes. The use of practices such as market validation, as a central component of the pedagogical process, provides a unique opportunity to connect these two dimensions, representing a valuable contribution to both research and practice in this field.

Despite the growing interest in experiential entrepreneurship education, limited research has examined market validation as a specific pedagogical strategy and even fewer studies have explored its potential as a mechanism for authentic assessment. This study seeks to address these gaps by examining how market validation contributes to entrepreneurial competence development and how such competences can be evidenced through performance-based outputs.

3. Methodology

3.1 Research Design

This study adopted a mixed-methods case study design aimed at examining the contribution of a market validation activity to entrepreneurial competence development. The research combined three complementary sources of evidence: (1) students' self-reported perceptions collected through a questionnaire, (2) qualitative reflections gathered through focus groups, and (3) performance-based artefacts produced throughout the entrepreneurial process. The triangulation of these data sources enabled a more comprehensive assessment of learning outcomes than reliance on a single method.

The study was conducted within the Entrepreneurship and Digital Innovation course offered at a Portuguese higher education institution. The course follows an experiential learning approach in which students progress through opportunity identification, idea development, prototyping, market validation and business model design.

3.2 Pedagogical Context

The study focused on a market validation activity entitled "Startup Pop-up Day", during which student teams left the classroom environment and interacted directly with potential users in order to test assumptions regarding the identified problem, proposed solution and value proposition.

Students conducted interviews and informal conversations with potential customers, collected feedback and subsequently used the information gathered to refine their prototypes and business models. The activity was designed to expose students to authentic entrepreneurial situations, requiring them to engage with uncertainty, interpret evidence and make informed decisions.

3.3 Participants and Data Collection

The study was conducted within the Entrepreneurship and Digital Innovation course during the 2025/2026 academic year, in which 72 undergraduate students were enrolled. Participation in the research was voluntary and anonymous.

Quantitative data were collected through an online questionnaire administered after the completion of the Startup Pop-up Day market validation activity. A total of 37 students responded to the questionnaire, which assessed four dimensions: entrepreneurial attitudes, entrepreneurial knowledge, entrepreneurial skills and evaluation of the pedagogical experience. Responses were measured using a five-point Likert scale.

To complement the quantitative findings, qualitative data were collected through two focus groups involving 14 students. The discussions explored students' experiences during the market validation process, critical learning moments and perceptions regarding the role of customer feedback in the development and refinement of their business ideas.

In addition, market validation reports, prototypes and business model proposals produced by the student teams were analysed as performance-based artefacts. These outputs provided complementary evidence of entrepreneurial competence development and supported the triangulation of findings across different data sources.

3.4 Data Analysis

Questionnaire data were analysed using descriptive statistics, including means and standard deviations, while the internal consistency of the questionnaire dimensions was assessed through Cronbach's alpha coefficients.

Focus group data were transcribed and analysed using thematic analysis (Braun & Clarke, 2006, 2021). The analysis generated four main themes: customer interaction and exposure to real users, learning beyond the comfort zone, feedback-driven refinement of solutions, and entrepreneurial competence development.

Student artefacts were examined through qualitative content analysis to identify evidence of opportunity recognition, stakeholder engagement, feedback interpretation and evidence-based decision-making.

Findings from the three data sources were subsequently triangulated to strengthen the credibility and robustness of the results.

3.5 Ethical Considerations

Participation was voluntary and all responses were collected anonymously. Students were informed about the objectives of the study and the use of the data for research purposes. No personally identifiable information was collected.

4. Results

4.1 Quantitative Findings

A total of 37 students completed the questionnaire following participation in the Startup Pop-up Day market validation activity. Internal consistency analysis revealed high reliability across all questionnaire dimensions, with Cronbach's alpha values ranging from 0.895 to 0.912.

Table 1 presents the overall results for the four dimensions assessed.

Table 1: Summary of quantitative results

Dimension	Mean	SD
Entrepreneurial Attitudes	4.37	0.79
Entrepreneurial Knowledge	4.30	0.73
Entrepreneurial Skills	4.16	0.83
Pedagogical Experience	4.31	0.73

4.1.1 Entrepreneurial Attitudes

Students reported highly positive perceptions regarding the entrepreneurial attitudes developed and applied during the activity. The overall mean for this dimension was 4.37 (SD = 0.79), indicating a strong level of agreement.

The highest-rated items were respect for the opinions of colleagues and participants (M = 4.59; SD = 0.63), responsibility in completing the tasks of the activity (M = 4.57; SD = 0.59), constructive collaboration with the team (M = 4.57; SD = 0.68), and active involvement in project development (M = 4.54; SD = 0.60).

These results suggest that the market validation activity was particularly effective in promoting responsibility, collaboration, active participation and respect for others. The lowest-rated item in this dimension was feeling comfortable in dealing with uncertainty (M = 3.81; SD = 0.98), suggesting that uncertainty remained a relevant challenge for some students, despite the generally positive results.

4.1.2 Entrepreneurial Knowledge

The entrepreneurial knowledge dimension also revealed positive results, with an overall mean of 4.30 (SD = 0.73). Students perceived the activity as contributing to their understanding of several key aspects of the entrepreneurial process.

The highest-rated item was understanding the importance of user feedback (M = 4.49; SD = 0.68). Students also reported a better understanding of the different stages of the entrepreneurial process (M = 4.35; SD = 0.71), the importance of evidence in decision-making (M = 4.35; SD = 0.67), and the relevance of the value proposition (M = 4.32; SD = 0.77).

These results indicate that the activity helped students connect entrepreneurial concepts with practical action, particularly by reinforcing the role of feedback, evidence and market validation in the development of business ideas.

4.1.3 Entrepreneurial Skills

The entrepreneurial skills dimension obtained an overall mean of 4.16 (SD = 0.83). Although this was the lowest of the four dimensions, the results remain clearly positive.

The highest-rated items were the ability to deal adequately with divergent opinions (M = 4.30; SD = 0.65), the ability to find solutions to difficulties that emerged during the activity (M = 4.24; SD = 0.71), the ability to critically analyse the feedback received (M = 4.24; SD = 0.75), problem-solving skills (M = 4.22; SD = 0.74), and decision-making based on collected information (M = 4.22; SD = 0.70).

The lowest-rated items were oral communication skills (M = 3.97; SD = 1.03) and the ability to clearly explain the value proposition of the business idea (M = 3.92; SD = 0.82). These findings suggest that, although the activity contributed positively to skill development, communication and value proposition articulation may require additional pedagogical support in future implementations.

4.1.4 Evaluation of the Pedagogical Experience

The evaluation of the pedagogical experience was also highly positive, with an overall mean of 4.31 (SD = 0.73). Students considered the activity challenging (M = 4.41; SD = 0.68), valued the interaction with potential customers as important for learning (M = 4.38; SD = 0.71), and recognised that the feedback collected helped improve the solution developed (M = 4.38; SD = 0.67).

The item “the activity allowed me to learn through practice” also received a high score (M = 4.35; SD = 0.67), reinforcing the experiential nature of the pedagogical approach. The lowest-rated item in this dimension was motivation (M = 4.08; SD = 0.78), although the score remains positive.

Overall, these findings suggest that the market validation activity was perceived as an authentic and valuable learning experience, capable of connecting classroom-based learning with real entrepreneurial practice.

4.2 Focus Group Findings

The thematic analysis of the two focus groups generated four main themes related to entrepreneurial learning through market validation.

4.2.1 Customer Interaction and Exposure to Real Users

Students highlighted direct interaction with potential users as one of the most valuable aspects of the activity. Customer engagement enabled participants to better understand user needs and challenge assumptions regarding the relevance of their proposed solutions.

> “Until that moment, our idea only made sense within our group. Talking to potential users allowed us to understand whether the problem was actually relevant for other people.”

4.2.2 Learning Beyond the Comfort Zone

Participants described the activity as challenging due to the need to approach unfamiliar individuals and operate in uncertain situations. Despite initial discomfort, students reported increased confidence and adaptability throughout the process.

> "At the beginning, I was afraid of approaching people and asking questions, but after the first few conversations I became much more confident."

4.2.3 Feedback-Driven Refinement of Solutions

Students reported that the feedback collected during the market validation activity frequently challenged their initial assumptions and encouraged them to reconsider aspects of their proposed solutions.

One participant noted:

> "We realised that some features we considered important were not valued by potential users, while other aspects that we had overlooked turned out to be much more relevant."

Participants frequently described feedback as a mechanism for validating assumptions and improving the value proposition. This finding reinforces the role of market validation as an evidence-based process rather than an exercise focused solely on confirming pre-existing ideas.

4.2.4 Development of Entrepreneurial Competences

Students perceived the activity as contributing to the development of several entrepreneurial competences, particularly communication, creativity and teamwork.

Regarding communication skills, one participant commented:

> "The activity helped me learn how to explain an idea clearly and adapt my message depending on who I was talking to."

Students also highlighted the importance of teamwork throughout the activity.

As another participant explained:

> "We had to work together, divide responsibilities and discuss how to interpret the feedback. The activity strengthened our ability to collaborate as a team."

Finally, creativity emerged as an important outcome, particularly when students were required to adapt and refine their ideas based on customer feedback.

Overall, the qualitative findings support and enrich the quantitative results, suggesting that the market validation activity contributed not only to the acquisition of entrepreneurial knowledge but also to the development of entrepreneurial behaviours and competences through authentic interaction with potential users.

4.3 Evidence from Market Validation Reports

To complement the data collected through the student questionnaire and focus group, a qualitative content analysis was conducted on the market validation reports produced by the student teams during the Startup Pop-up Day activity. Within the logic of a case study design, these reports were treated as performance-based artefacts that provide evidence of competence demonstration in authentic learning contexts.

The analysis sought to identify recurring patterns in how students approached market validation, interacted with potential users, interpreted feedback and transformed evidence into decisions. Following an inductive coding process, four main categories emerged from the data: (1) opportunity recognition, (2) stakeholder interaction, (3) feedback interpretation and learning, and (4) iteration and evidence-based decision-making.

4.3.1 Opportunity Recognition

The first category concerns students' ability to identify, articulate and validate relevant problems experienced by potential users. Across the reports, students demonstrated a strong focus on recognising practical challenges affecting everyday life, particularly in university contexts. The validated problems frequently related to convenience, access to information, time management, service accessibility, trust and wellbeing.

The findings suggest that students were able to move beyond idea generation and engage in systematic problem exploration. Rather than assuming the existence of a market need, most teams sought evidence from potential users to confirm whether the identified problem was perceived as relevant. This process reflects the

development of opportunity recognition competences, which are considered central within contemporary entrepreneurship competence frameworks (Bernadó & Bratzke, 2024).

The analysis also revealed differences in the depth of problem validation. While some teams focused primarily on confirming the existence of a problem, others explored its causes, consequences and contextual factors, demonstrating a more sophisticated understanding of user needs and market dynamics.

4.3.2 Stakeholder Interaction

A second category emerging from the analysis relates to students' interaction with stakeholders during the validation process. All teams engaged directly with potential users through conversations, demonstrations, surveys, interviews or prototype presentations. This interaction required students to communicate their value propositions, answer questions, manage objections and adapt their discourse to different audiences.

The reports indicate that market validation created opportunities for authentic engagement with external stakeholders, exposing students to perspectives that challenged their initial assumptions. Students were required to leave the classroom environment and confront real users, which increased the realism of the learning experience and contributed to the development of communication, networking and relationship-building competences.

The diversity of interaction strategies observed across the reports suggests that students developed practical skills associated with entrepreneurial communication and stakeholder engagement, both of which are essential components of entrepreneurial competence.

4.3.3 Feedback Interpretation and Learning

The third category concerns students' capacity to interpret feedback and extract meaningful learning from the validation process. The reports show that most teams collected both quantitative and qualitative data, including survey responses, user comments, objections and suggestions.

However, differences emerged in the sophistication of data interpretation. Some teams primarily reported descriptive results, focusing on percentages and levels of interest. Others demonstrated greater analytical depth by identifying patterns, interpreting user concerns and exploring the implications of the feedback received.

Particularly relevant was the identification of recurring themes across projects, such as concerns regarding trust, usability, pricing, convenience and operational feasibility. These findings suggest that students were able to recognise critical adoption factors and understand how user perceptions influence the viability of entrepreneurial solutions.

Overall, the reports provide evidence that market validation functioned not only as a mechanism for gathering information but also as a learning process through which students developed critical thinking and evidence interpretation skills.

4.3.4 Iteration and Evidence-Based Decision-Making

The fourth category refers to the extent to which students used validation evidence to refine their ideas and make informed decisions. This category emerged as one of the strongest indicators of entrepreneurial learning.

Many reports described modifications resulting directly from user feedback, including adjustments to pricing models, the introduction of new features, interface redesign, simplification of user journeys and changes in communication strategies. These adaptations indicate that students were not merely collecting feedback but actively using it to improve their value propositions.

The findings suggest that market validation encouraged iterative thinking and fostered an evidence-based approach to decision-making. Rather than defending their original ideas, students were frequently required to reconsider assumptions and adapt their solutions according to market signals.

From an educational perspective, this process reflects the principles of experiential learning and Lean Startup methodologies, in which learning occurs through cycles of experimentation, feedback and refinement. The ability to translate market evidence into actionable decisions represents one of the clearest demonstrations of entrepreneurial competence identified in the analysis.

5. Discussion

This study examined how market validation contributes to entrepreneurial competence development in higher education. By combining students' perceptions, qualitative reflections and performance-based outputs, the findings support its value as both a learning strategy and an assessment mechanism.

5.1 Market Validation as Experiential Learning

The findings reinforce the importance of experiential learning approaches in entrepreneurship education. By engaging directly with potential users, students moved beyond theoretical discussions and were required to test assumptions, collect evidence and reflect on real-world feedback. This process is consistent with experiential learning theory (Kolb, 1984), which emphasises learning through concrete experience, reflection and experimentation.

The qualitative findings suggest that customer interaction played a particularly important role in the learning process. Students frequently reported that engagement with potential users challenged their assumptions and encouraged them to reconsider aspects of their proposed solutions. These findings support previous studies highlighting the value of stakeholder interaction and value-creation activities within entrepreneurship education (Lackéus, 2020; Bell & Bell, 2020).

Furthermore, exposure to uncertainty emerged as an important learning mechanism. Approaching unfamiliar individuals, receiving critical feedback and adapting ideas to market realities required students to operate outside their comfort zones. Such experiences are recognised as essential elements of entrepreneurial learning because they promote adaptability, initiative and resilience (Kakouris et al., 2023).

5.2 Development of Entrepreneurial Competences

The results indicate that market validation contributes to the development of several entrepreneurial competences. Students reported gains in responsibility, collaboration, feedback utilisation and evidence-based decision-making, while the qualitative findings highlighted improvements in communication, teamwork and problem-solving.

These competences align closely with contemporary entrepreneurial competence frameworks, which emphasise not only knowledge acquisition but also the development of attitudes and behaviours that support entrepreneurial action (Bernadó & Bratzke, 2024). The findings therefore suggest that market validation activities can provide meaningful opportunities for students to develop entrepreneurial competences through authentic engagement with real-world challenges.

Particularly noteworthy is the emphasis placed on customer feedback as a basis for decision-making. Rather than defending their initial ideas, students were encouraged to interpret evidence, question assumptions and refine their solutions. This process reflects contemporary entrepreneurial approaches centred on experimentation, customer discovery and iterative learning (Blank, 2013; Lackéus, 2020).

5.3 Market Validation as Authentic Assessment

A further contribution of this study concerns the role of market validation as an authentic assessment strategy. While entrepreneurship education research frequently relies on self-reported measures, this study incorporated performance-based evidence derived from market validation reports, prototypes and business model proposals.

The analysis of these artefacts provided observable evidence of opportunity recognition, stakeholder engagement, feedback interpretation and evidence-based decision-making. These findings support authentic assessment approaches that advocate the use of real-world tasks and performance-based outputs to evaluate competence development (Gulikers et al., 2004; Pittaway & Edwards, 2012).

Taken together, the findings suggest that market validation can operate simultaneously as a learning activity and as an assessment mechanism. By requiring students to engage with real users, collect evidence and refine solutions, the activity created opportunities for entrepreneurial competence development while generating meaningful evidence of learning outcomes.

6. Conclusions

This study examined the contribution of a market validation activity to entrepreneurial competence development in higher education. Using a mixed-methods case study design, it combined questionnaire data, focus group discussions and performance-based outputs. The findings show that market validation supports entrepreneurial attitudes, knowledge and skills by promoting responsibility, collaboration, feedback use, evidence-based decision-making and interaction with real users.

The study contributes to entrepreneurship education by showing that market validation can function both as an experiential learning activity and as an authentic assessment mechanism. Market validation reports, prototypes and business model proposals provided observable evidence of opportunity recognition, stakeholder engagement, feedback interpretation and iterative decision-making.

From a practical perspective, the results suggest that customer validation activities can be integrated into entrepreneurship curricula to connect classroom learning with real entrepreneurial practice. However, as this is a single case study based on one course unit and short-term evidence, future research should examine similar approaches across different institutions and assess their longer-term effects on entrepreneurial competence development.

Ethics Declaration

This research did not require formal ethical clearance as it did not involve any vulnerable populations or sensitive topics. All participants provided informed consent prior to their participation in the study.

AI Declaration

Artificial Intelligence tools were used for language editing and proofreading only. The intellectual content, analysis, and conclusions remain entirely the product of the authors' original work, and AI was not used to generate substantive ideas or interpret empirical findings.

Abstract: Higher education institutions are under growing pressure to design pedagogical approaches that help early-stage researchers develop more than methodological knowledge alone. They also need to build collaboration, communication and project development skills. Responding to this challenge, this paper examines an international blended intensive programme for Master's and PhD students, as well as other early-stage researchers, focused on research development and co-creation in the social sciences. The programme was proposed and hosted by the Polytechnic Institute of Setúbal, Portugal, and developed in collaboration with the Politehnica University of Timisoara, Romania, Fulda University of Applied Sciences, Germany, and the University of Foggia, Italy, within an international partnership framework. The programme combines online sessions and a physical mobility week built around expert-led workshops, tutor matching, collaborative project work and research proposal presentations. Its activities address literature review, scientific collaboration, researcher profiling, communication, dialogue with reviewers, quantitative research insights and proposal development. Together, these elements offer participants a structured and supportive environment in which research training is closely connected with peer learning, co-creation and international academic exchange. The study adopts a case study approach to explore the pedagogical value of this format as an innovation in higher education. Particular attention is given to how the programme integrates blended learning, collaborative knowledge production and milestone-based research development. Rather than treating research training as an individual and isolated process, the programme creates a shared learning space where participants develop their research ideas through expert guidance, peer interaction and international dialogue. The findings show that this pedagogical design supports the development of research competences, scientific communication, collaborative learning and academic confidence, positioning BIPs as meaningful formats for linking research training with active participation, internationalisation and output-oriented learning.

Keywords: Research Training; Early-Stage Researchers; Blended Intensive Programme; Co-Creation; Higher Education; International Collaboration

1. Introduction

Higher education institutions are increasingly being asked to reconsider how they prepare early-stage researchers for complex academic and professional environments. Research training can no longer be limited to methodological instruction or to the individual production of a dissertation, thesis or research project. Master's students, PhD students and other early-stage researchers are expected to develop a broader set of competences, including methodological awareness, scientific communication, collaboration, reflexivity and the ability to turn emerging research ideas into structured academic outputs (Mantai & Marrone, 2022; Ashonibare, 2023).

Recent debates on doctoral and early-stage researcher development underline the importance of transversal skills, research identity, communication and participation in academic communities (Mantai & Marrone, 2022; Mydin et al., 2021). Research training therefore requires pedagogical formats that move beyond formal instruction in research methods and create structured opportunities for dialogue, feedback, peer interaction and progressive output development.

Previous work shows that collaborative and output-oriented learning environments can support academic development. More recent work presents co-creation as a structured process of interaction, participation and collaborative value creation, rather than as a generic form of cooperation (Costa et al., 2025). In higher education, co-creation positions learners as active participants in knowledge development, supporting engagement, partnership, collaborative curriculum development and more inclusive learning processes (Godbold et al., 2022; Omland et al., 2025). In research training, this approach is particularly meaningful because research questions, theoretical frameworks, methodological choices and scientific outputs are often refined through dialogue, critique, revision and feedback.

Blended learning also plays a central role in contemporary pedagogical innovation. Recent studies show that blended formats can support flexibility, engagement and learning continuity when online and face-to-face

components are intentionally integrated into a coherent pedagogical design (Bruggeman et al., 2021; Theelen & van Breukelen, 2022). This is especially relevant for research training because different stages of the research process - preparation, literature review, methodological discussion, feedback, presentation and proposal refinement - can be distributed across online and physical learning environments.

Within the European higher education context, BIPs have emerged as a specific form of blended mobility that combines online collaboration with short-term physical mobility. O'Dowd and Werner (2024) describe BIPs as short, intensive programmes that use innovative approaches to learning and teaching, including online cooperation, and identify both benefits and challenges related to blended mobility, collaboration, international learning and organisational complexity. Despite the growing use of BIPs, their specific contribution to research training remains underexplored. Existing studies have mainly examined BIPs in relation to blended mobility, internationalisation, intercultural learning and programme organisation, while giving less attention to how they can support early-stage researchers in developing research competences, scientific communication, collaborative practices and confidence in academic work (O'Dowd & Werner, 2024; Frank & Hogendoorn-Schweighofer, 2026).

This paper addresses that gap by analysing an international BIP designed to support research development and co-creation among Master's students, PhD students and other early-stage researchers. The programme was hosted by the Polytechnic Institute of Setúbal and developed in collaboration with the Politehnica University of Timisoara, Fulda University of Applied Sciences and the University of Foggia. It combined online sessions with a physical mobility week and included expert-led workshops, tutor matching, peer interaction, collaborative project work and research proposal presentations.

The central research question guiding this study is: How can blended intensive programmes support co-creation and research training among early-stage researchers in higher education? To answer this question, the paper adopts a case study approach and examines the programme's pedagogical design, learning activities and perceived value. The study has three objectives: first, to describe the pedagogical design and implementation of the BIP as a model for blended research training; second, to analyse how the programme supports the development of research competences, scientific communication and collaborative learning; and third, to discuss the potential of BIPs as transferable formats for pedagogical innovation in research education.

2. Literature Review

2.1 Research Training in Higher Education

Research training in higher education has traditionally been associated with the acquisition of methodological knowledge, the development of disciplinary expertise and the production of individual academic outputs, such as dissertations, theses or research papers. However, recent transformations in doctoral and research education suggest that this understanding is no longer sufficient. Doctoral education is increasingly expected to respond to multiple purposes, including researcher development, knowledge production, preparation for diverse career pathways and contribution to wider academic, professional and societal contexts (Alves et al., 2025; Taylor, 2023).

This broader understanding of research training has important implications for early-stage researchers. Master's students, PhD students and other early-stage researchers are expected to develop not only technical and methodological competences, but also transversal skills such as communication, collaboration, adaptability, autonomy, critical thinking and the ability to engage with academic and non-academic audiences. Mantai and Marrone (2022) show that the skills and attributes expected of PhD candidates extend beyond disciplinary knowledge and include a wide range of transferable competences. Research training must therefore create pedagogical conditions that support both methodological development and the wider formation of researchers.

This perspective also points to the importance of output-oriented learning in research education. The development of research proposals, literature reviews, presentations and preliminary research designs can function as milestones through which early-stage researchers gradually transform initial ideas into more coherent academic projects. These milestones provide structure, make progress visible and create opportunities for formative feedback. In this sense, research training should not be seen only as the transmission of methodological content, but as a process through which participants learn by developing, presenting, revising and communicating research outputs.

2.2 Co-Creation and Collaborative Learning

Co-creation has become increasingly relevant in higher education as a pedagogical approach that emphasises participation, shared responsibility and collaborative knowledge development. Rather than positioning learners as passive recipients of content, co-creation involves students and participants as active contributors to learning processes, curriculum development and knowledge production. Recent literature highlights that co-creation can support more inclusive, dialogical and participatory forms of higher education, particularly when it is grounded in meaningful interaction between students, teachers and other academic actors (Godbold et al., 2022; Lubicz-Nawrocka, 2023; Omland et al., 2025).

In research training, co-creation is particularly relevant because research ideas develop through iterative and dialogical processes. Early-stage researchers need opportunities to formulate research problems, test conceptual arguments, discuss methodological options and refine academic outputs through interaction with others. From this perspective, co-creation can support not only knowledge development, but also academic confidence, ownership of research ideas and the ability to participate in scholarly dialogue. This is especially important in programmes designed to support proposal development, where participants are expected to move progressively from initial ideas to more structured research outputs.

In collaborative learning environments, participants learn with and from one another through discussion, shared problem-solving, feedback and collective reflection. For early-stage researchers, this interaction can help make research ideas visible, open them to critique and improve their coherence. Peer dialogue may also support the clarification of theoretical frameworks, methodological choices and research contributions, particularly when participants come from different academic, disciplinary or institutional contexts.

Dialogue, and even productive disagreement, also matters in co-creation. Godbold et al. (2022) show that conflict can play a constructive role in curriculum co-creation when it is managed through partnership and dialogue. This is important for research training because the development of research proposals often involves questioning assumptions, confronting alternative perspectives and revising initial ideas. In this sense, collaborative learning does not imply simple consensus, but rather a structured process of negotiation, critique and shared development.

Lubicz-Nawrocka (2023) further emphasises that curriculum co-creation involves moving beyond a separation between teachers and students towards a more relational understanding of learning. This perspective is relevant to research education because it highlights the importance of shared participation and mutual contribution. In a research training context, tutors, peers and participants contribute in different ways, but all play a role in shaping the development of research ideas, questions and outputs.

Previous work on international pedagogical projects also supports this understanding of co-creation as a structured and output-oriented process (Costa et al., 2022). More recent work also frames co-creation as a process linked to interaction, engagement and collaborative value creation, reinforcing the idea that co-creation depends on active participation and meaningful exchange (Costa et al., 2025).

In the BIP analysed in this paper, co-creation and collaborative learning are central pedagogical principles rather than complementary activities. They are operationalised through tutor matching, peer interaction, collaborative project work, international dialogue and research proposal presentations. These activities create opportunities for participants to test ideas, receive feedback, revise their proposals and engage with different academic perspectives. As a result, co-creation supports the transformation of initial research ideas into more developed and communicable academic outputs.

2.3 Blended Learning in International Higher Education

Recent developments in digital technologies in higher education are strongly linked to the increase of hybrid pedagogical models and the growth of diverse forms of student and staff mobility. It is widely recognised that the COVID-19 pandemic accelerated these developments and highlighted the potential for online work and collaboration, enabling new forms of learning and international experiences (Ashraf et al., 2021; O'Dowd & Werner, 2024; Dang et al., 2026).

In this context, blended learning and Blended Intensive Programmes (BIPs) have emerged as central elements, particularly within the Erasmus+ 2021–2027 framework (European Commission, 2021). Within this framework, higher education institutions (HEIs) can design, offer, and apply for funding for BIPs, which are short, intensive programmes combining physical and virtual mobility components. These programmes are intended to promote

pedagogical innovation and student-centered active learning within an international and interdisciplinary collaborative environment. A BIP must involve at least three HEIs from three different countries, include a compulsory but flexible virtual component, and incorporate a physical phase lasting between 5 and 30 days. Additionally, the programme should award a minimum of 3 ECTS (European Commission, 2022).

The integration of international activities into the curriculum is widely recognized as an important and distinct factor for HEI (Leask, 2015; Clarke & Kirby, 2022; Li et al., 2024), and BIPs may play a key role in curriculum internationalisation (Hildebrandt et al., 2025), which remains a framework under consolidation. For example, O'Dowd and Werner (2024) found that some HEIs were unable to recognise ECTS credits for BIPs and that only a limited number were beginning to integrate these programmes formally into their curricula.

If blended learning can foster pedagogical innovation and promote cooperative, active, and student-centered learning, the findings of O'Dowd and Werner (2024) indicate that BIP activities are mainly based on experiential learning, group work, interactive workshops, or project-based approaches focused on specific topics. These typically involve multicultural teams working on real-world challenges, representing the most common implementation model. Additionally, some BIPs focus on intercultural competence and global citizenship, while others are more discipline-specific, particularly in applied and technical fields (Carthy, 2022).

As a summary, BIPs represent a significant innovation at the intersection of blended learning and internationalisation. They contribute to more flexible, inclusive, and curriculum-integrated models of international education. Nonetheless, little evidence is provided regarding BIPs oriented towards research activities or the development of scientific literacy, suggesting an area for further development in higher education.

3. Methodology

3.1 Research Design

This study adopts a qualitative case study approach to analyse the pedagogical design and implementation of an international Blended Intensive Programme (BIP) aimed at supporting research training and co-creation among early-stage researchers. A case study design is appropriate for examining a contemporary educational phenomenon in depth and within its real-life context, particularly when the aim is to understand processes, practices and meanings rather than to produce statistical generalisation (Yin, 2018; Creswell & Poth, 2024).

The BIP is treated as a bounded case, defined by a specific programme, a specific group of participants, a defined pedagogical structure and an international partnership involving four higher education institutions. This approach is aligned with the exploratory nature of the research question: How can blended intensive programmes support co-creation and research training among early-stage researchers in higher education?

3.2 Programme Context

The case analysed in this paper is an international BIP hosted by the Polytechnic Institute of Setúbal, Portugal, and developed in collaboration with the Politehnica University of Timisoara, Romania, Fulda University of Applied Sciences, Germany, and the University of Foggia, Italy. The programme was designed for Master's students, PhD students and other early-stage researchers interested in developing research projects in the social sciences.

The BIP combined online sessions with a physical mobility week. Its pedagogical structure included expert-led workshops, tutor matching, collaborative project work, peer interaction and research proposal presentations. Activities focused on literature review, scientific collaboration, researcher profiling, scientific communication, dialogue with reviewers, quantitative research insights and proposal development. This structure reflects the programme's aim of connecting research training with co-creation, academic dialogue and international exchange.

3.3 Data Collection

Data were collected from multiple sources in order to capture both the design and the perceived pedagogical value of the programme. These sources included programme documentation, observation of learning activities, participant feedback and the outputs produced during the BIP. Multiple sources provide a richer understanding of the phenomenon (Yin, 2018; Creswell & Poth, 2024). Programme documentation was used to analyse the

intended pedagogical design, including the structure of the BIP, the sequence of activities and the learning objectives. Observation focused on workshops, tutor matching, collaborative work, peer interaction and proposal presentations. Participant feedback provided insight into perceptions of research competence development, scientific communication, collaboration and confidence. The outputs produced by participants, particularly research ideas, proposal drafts and final presentations, were analysed as evidence of the programme's milestone-based and output-oriented design.

3.4 Data Analysis

Data were analysed using a qualitative descriptive approach supported by thematic analysis. Thematic analysis is appropriate for identifying, analysing and interpreting patterns of meaning across qualitative data (Braun & Clarke, 2022). The analysis involved familiarisation with the data, identification of initial codes, grouping of codes into broader themes and interpretation of these themes in relation to the research question.

The analytical dimensions were informed by the objectives of the study and included research competence development, scientific communication, collaborative and international learning, co-creation dynamics, tutor guidance and milestone-based research development. These dimensions were used to organise the findings and discussion.

4. The Blended Intensive Programme: Design and Implementation

4.1 Pedagogical Design

The Blended Intensive Programme analysed in this study was designed as a structured research training experience for Master's students, PhD students and other early-stage researchers. Its main pedagogical purpose was to create a supportive environment in which participants could develop research ideas, engage in academic dialogue and progressively transform initial research interests into more structured research proposals.

The programme followed a blended structure, combining online sessions with a physical mobility week. This design allowed research development to be organised as a gradual process rather than as a single intensive event. The online component supported preparation, initial orientation and early interaction among participants and tutors. The physical mobility week then created the conditions for more intensive academic exchange, collaborative work, feedback and presentation of research proposals.

The pedagogical design was based on four interconnected principles. First, research training was understood as a developmental process that requires the progressive refinement of ideas and outputs. Second, learning was organised around active participation, encouraging participants to discuss, present, question and revise their research work. Third, co-creation was embedded in the programme through peer interaction, tutor matching and collaborative project development. Fourth, the international nature of the BIP was used to expose participants to different academic perspectives, institutional contexts and research cultures.

Its structure connected blended learning, co-creation, international academic exchange and output-oriented learning. This is consistent with the abstract, which describes the programme as combining online sessions with a physical mobility week structured around expert-led workshops, tutor matching, collaborative project work and research proposal presentations.

4.2 Learning Activities

The programme included a sequence of learning activities designed to support different stages of research development. These activities focused on literature review, scientific collaboration, researcher profiling, scientific communication, dialogue with reviewers, quantitative research insights and proposal development.

The literature review activities helped participants position their research ideas within existing academic debates. Through these activities, participants were encouraged to identify relevant literature, clarify conceptual frameworks and strengthen the theoretical grounding of their research proposals. This was important for early-stage researchers, who often need support in moving from broad research interests to more focused and academically situated research questions.

Research profiling activities helped participants reflect on their identity and research interests, clarify their academic objectives and communicate their work more effectively in an international context.

Scientific communication was another central dimension of the programme. Participants were invited to present and discuss their research ideas, receive feedback and refine their ability to communicate academic arguments. Activities related to dialogue with reviewers further strengthened this dimension by familiarising participants with academic critique, revision processes and expectations associated with scientific publication and peer review.

Finally, collaborative project work and proposal presentations functioned as key integrative activities. They allowed participants to apply what they had learned, receive feedback from tutors and peers, and present more developed versions of their research proposals. These activities made the output-oriented nature of the programme visible, as participants were expected to progress from initial ideas towards more structured academic outputs.

4.3 Co-Creation Dynamics

Co-creation was embedded in the BIP through the way participants, tutors and peers interacted throughout the programme. Rather than positioning participants as passive recipients of content, the programme encouraged them to actively develop, discuss and refine their research ideas. This was achieved through tutor matching, peer interaction, collaborative project work and proposal presentations.

Tutor matching played an important role in supporting individual and group research development. By connecting participants with academic staff, the programme created opportunities for targeted guidance and formative feedback. Tutors helped participants clarify research questions, strengthen theoretical and methodological choices and improve the coherence of their proposals.

Peer interaction also contributed to the co-creation process. Participants were encouraged to share their ideas, discuss challenges and compare perspectives with colleagues from different academic and institutional backgrounds. This interaction helped create a collaborative learning environment in which participants could learn not only from experts, but also from one another.

The international composition of the programme further strengthened these dynamics. Because the BIP involved partner institutions from Portugal, Romania, Germany and Italy, participants were exposed to different academic traditions, research cultures and ways of approaching scientific work. This international dialogue supported broader reflection on research problems and helped participants situate their work in a wider academic context.

Co-creation therefore emerged as a practical and pedagogical process. It was not limited to group work, but was expressed through the joint development of ideas, the exchange of feedback, the negotiation of perspectives and the progressive refinement of research outputs. In this sense, the BIP created a shared learning space in which research training was closely connected to collaboration and academic dialogue.

4.4 Milestone-Based Research Development

A central feature of the programme was its milestone-based structure, which enabled participants to move progressively from initial research ideas to more developed proposals through moments of reflection, feedback and revision. Early activities, such as literature review and research profiling, supported conceptual clarification and helped participants define their research interests and project focus. Subsequent sessions on quantitative research, scientific communication and dialogue with reviewers strengthened methodological awareness and prepared participants for proposal discussion. Collaborative project work allowed participants to test ideas, receive feedback and revise their proposals with peers and tutors. The final research proposal presentations made progress visible and connected research training, co-creation and academic communication.

5. Findings/Discussion

The discussion below draws on multiple sources of information collected for this study, namely programme documentation, observation of learning activities, participant feedback and the outputs produced during the BIP. As outlined in the methodology, using these different sources made it possible to capture not only the intended design of the programme, but also its perceived pedagogical value and the academic products that emerged from it.

5.1 Development of Research Competences

The programme documentation shows that the BIP was designed as a structured research training pathway, combining online sessions, a physical mobility week, expert-led workshops, tutor matching, collaborative work, peer interaction and proposal presentations. This structure, built around literature review, scientific collaboration, researcher profiling, scientific communication, dialogue with reviewers, quantitative research input and proposal development, suggests a clear pedagogical intention to support the gradual development of research competences.

The observation of learning activities reinforces this interpretation, as it suggests that proposal development was not treated as a final or isolated task, but as a staged process supported by interaction, feedback and revision. In this sense, the programme appears to have supported participants in shaping research topics, clarifying research questions and organising their academic work in a more systematic way. The outputs produced during the BIP, particularly research ideas, proposal drafts and final presentations, provide further evidence of this milestone-based and progressive approach.

Proposal writing therefore emerges as one of the central competences developed through the programme. The combination of tutor matching, collaborative work, interim feedback and final presentation suggests that research proposals were built through successive stages of refinement. This reading is strengthened by the publication produced from the programme, whose editorial explicitly states that the published papers were developed within the Connected Minds – Research and Co-Creation Exchange context and were supported by tutors and trainers through a process of review and improvement.

Critical thinking also seems to have been encouraged by the way the programme structured research work. The pedagogical documentation and the observation of activities suggest that participants were asked to question assumptions, discuss alternatives, justify theoretical and methodological choices, and revise their projects.

A similar pattern can be seen in relation to methodological awareness. The programme documentation explicitly refers to activities focused on literature review, quantitative research input and proposal development, while the observation of activities suggests that these aspects were addressed in direct connection with participants' own projects. Rather than engaging with methods in the abstract, participants worked through methodological issues in relation to their own emerging research, which is likely to have strengthened both understanding and applicability.

5.2 Scientific Communication and Confidence

The observation of activities shows that the programme included regular moments in which participants presented and discussed their research ideas, particularly through proposal presentations and interactions with tutors and peers. These moments appear to have supported the development of presentation skills, as participants were required to organise arguments, communicate research aims and position their work before an academic audience. Scientific communication was therefore treated as an integral part of research training rather than as an additional skill.

In terms of academic dialogue, both the programme documentation and the observation of activities suggest that the BIP moved away from a traditional lecture-based model. Tutor matching, peer interaction, collaborative work and activities focused on dialogue with reviewers brought participants closer to real academic practices, in which ideas are defended, negotiated, revised and strengthened through exchange. This seems particularly valuable because it allowed participants to experience forms of communication that are central to academic life.

Confidence building appears to have grown out of this combination of expert guidance, active participation and peer support. The participant feedback provides indications that the environment created by the programme helped reduce insecurity and strengthened confidence in presenting and discussing research ideas. This reading is reinforced by the outputs produced during the programme and the subsequent publication, which suggest that participants were able to turn early-stage ideas into academic outputs that were both communicable and publishable.

5.3 Collaborative and International Learning

The programme documentation makes clear that collaborative and international learning were not peripheral features of the BIP, but central principles of its pedagogical design. The programme was explicitly organised around co-creation, peer interaction, tutor guidance, collaborative work and international dialogue across

partner institutions. The article itself also frames these elements as core pedagogical principles rather than complementary activities.

Peer learning emerges particularly strongly from both the observation of activities and the interpretation of the outputs produced during the BIP. Participants seem to have benefited from opportunities to test ideas, receive feedback, compare approaches and improve their projects through interaction with others. In this sense, academic development was not confined to individual work, but distributed across a shared process of discussion and co-creation.

International academic exchange is another strong dimension of the programme. The case documentation shows that the BIP was developed by the Polytechnic Institute of Setúbal in collaboration with the Politehnica University of Timisoara, Fulda University of Applied Sciences and the University of Foggia. The editorial of the publication produced from the programme confirms this collaborative network and states that the published papers emerged from the Connected Minds context, involving participants and tutors from several institutions. This publication reinforces the idea that the BIP was more than a mobility experience; it created an international framework for collaborative knowledge production.

5.4 Pedagogical Value of the BIP Format

The evidence also highlights the pedagogical value of the BIP format as a model for research training. In terms of flexibility, the programme documentation and the editorial of the publication show that the BIP combined online sessions with a physical mobility week and follow-up sessions afterwards. This made it possible to distribute research development over time, creating space for preparation, immersion, feedback and revision, which appears particularly valuable in early-stage research training. The editorial explicitly refers to an initial online session and follow-up sessions with supervisors aimed at supporting the improvement of the final papers.

Active participation is especially visible through the observation of activities and the nature of the outputs produced. The programme required participants to do more than listen: they were expected to discuss, present, revise and develop outputs throughout the process. This distinguishes the BIP from more traditional research training formats that rely mainly on lectures or individual supervision.

The analysis of the outputs produced during the programme suggests that participants worked on their own research ideas and were able to see those ideas evolve through successive stages.

5.5 Challenges and Limitations

Despite these contributions, the findings should be interpreted with caution. This is a single case study, based on one programme, one group of participants and a specific partnership, so the conclusions cannot be broadly generalised. The qualitative evidence provides a rich understanding of the BIP, but does not allow strong causal claims or longitudinal assessment of its impact. Moreover, the success and transferability of the model depend on pedagogical design, tutor engagement, alignment between activities and outputs, and institutional conditions. The subsequent publication indicates academic productivity, but does not demonstrate longer-term effects on participants' research trajectories or collaborations.

6. Conclusions

Drawing on the analysis of programme documentation, observation of learning activities, participant feedback and the outputs produced during the BIP, this study suggests that Connected Minds – Research and Co-Creation Exchange offered a meaningful pedagogical format for supporting early-stage researchers in higher education. Bringing these sources together made it possible to understand the programme not simply as a blended mobility initiative, but as a structured learning environment that supported the development of research competences, scientific communication, collaborative learning and international academic exchange.

The programme documentation shows that the BIP was designed with a clear pedagogical purpose, combining online sessions, a physical mobility week, expert-led workshops, tutor matching, collaborative work and proposal presentations. The observation of learning activities suggests that this structure encouraged active participation, academic dialogue and the gradual development of research ideas. In turn, participant feedback points to the value of the programme in strengthening confidence, scientific communication and the experience of learning through co-creation. Finally, the outputs produced during the programme, together with the subsequent publication of papers in a special issue of the Scientific Bulletin of Politehnica University of Timisoara,

reinforce the view that the BIP generated concrete academic results rather than simply short-term learning experiences.

The case analysed here suggests that BIPs can offer a promising format for connecting blended learning, internationalisation and output-oriented learning in advanced research training. Much of the programme's value seems to lie in the way it brings together expert guidance, peer learning, clear developmental milestones and exposure to different academic cultures.

At the same time, these conclusions need to be read considering the study's limitations. As a single case study, based on qualitative sources and a specific programme context, the findings cannot be generalised automatically. In addition, although the publication of papers is an important indicator of academic output, there is still no longitudinal evidence showing the longer-term impact of the programme on participants' future research trajectories, publication practices or the continuation of the international collaborations established during the BIP.

Even so, the Connected Minds case suggests that Blended Intensive Programmes can offer a relevant pedagogical response to some of the current challenges of advanced research training in higher education. Future studies could usefully explore the medium- and long-term effects of these programmes, compare different models of blended research training, and look more closely at the role of tutoring, interdisciplinarity and internationalisation in the development of research competences in higher education.

Ethics Declaration

This research did not require formal ethical clearance as it did not involve any vulnerable populations or sensitive topics. All participants provided informed consent prior to their participation in the study.

AI Declaration

Artificial Intelligence tools were used for language editing and proofreading only. The intellectual content, analysis, and conclusions remain entirely the product of the authors' original work, and AI was not used to generate substantive ideas or interpret empirical findings.

Measuring Emotional and Rational Drivers in Retail Customer Journeys Beyond Surveys

Tamás Darázs
University of St. Cyril and Methodius, Trnava, Slovakia

tamas.darazs@ucm.sk

Abstract: This paper argues that customer journey, brand, and innovation-related decisions in retail should not rely only on self-reported data and questionnaire analytics, especially when evaluating the emotional and rational drivers of consumer behaviour. In practice, surveys remain a major source of evidence for assessing communication effectiveness, touchpoint quality, packaging evaluation, and brand performance. However, self-reports often capture declared preferences and post hoc rationalisations rather than the processes that shape attention, arousal, and affect during exposure. As a result, retailers may optimise communication, touchpoints, and product or packaging presentation on incomplete evidence. The paper proposes a dual-layer framework for measuring retail customer journeys that captures both declarative and process-sensitive components of consumer response. The first layer covers explicit evaluations, including attribute importance, trust, preferences, and purchase intentions. The second layer captures implicit signals, including visual attention patterns, physiological arousal, and affective responses during exposure to retail stimuli. The framework integrates both layers across key journey stages and links them to communication design, touchpoint prioritisation, brand consistency management, and the evaluation of retail changes across touchpoints. Methodologically, the paper is conceptual and practice-oriented, supported by a secondary cross-study synthesis of proprietary neurolab studies conducted in a university research setting. The included studies span multiple retail contexts, including advertising, online retail environments, packaging presentation, and product experience. They are not treated as one pooled empirical dataset. Instead, they reveal a recurring managerial risk: decisions based only on questionnaire results would have supported different recommendations than decisions informed by combined explicit and implicit evidence. Across the included studies, the dual-layer approach identifies hidden friction points, underestimated brand effects, failures of perceptual access, and mismatches between declared choice logic and experienced response. The paper contributes a framework for measuring emotional and rational drivers beyond surveys, a perspective on implicit signals as decision-relevant evidence in retail customer journey analysis, and practical guidance for combining declarative and biometric data across touchpoints. It also highlights how such evidence can support the evaluation of retail changes, redesign decisions, and selected innovation-related actions. The paper concludes with implications for practice and directions for further validation.

Keywords: Customer Journey Measurement; Retail Innovation; Brand Management; Implicit Consumer Response; Packaging Innovation; Touchpoint Design

1. Introduction

Retail managers make brand and customer journey decisions across multiple touchpoints, including advertising, online retail environments, packaging, and product experience. Customer journey research shows that customer experience emerges across sequences of interactions, channels, and contexts rather than at a single moment (Lemon and Verhoef, 2016). This creates a core measurement challenge: retail decisions should be guided not only by what consumers say they value, but also by what they actually process and respond to during browsing, comparison, exposure, and choice.

In practice, retail decision-making often relies on questionnaire-based customer feedback and brand health indicators, including widely used metrics such as Net Promoter Score (Baehre et al., 2022). These measures are scalable and easy to track, but they may be insufficient when managerial choices depend on the interplay of rational and emotional drivers, especially in situations involving redesign, validation, or rollout decisions. Verbal reports can reflect declared preferences and post hoc rationalisations rather than direct access to the processes shaping attention and affective response during exposure (Nisbett and Wilson, 1977). This does not invalidate self-reports, but highlights their limits when firms assess whether a communication concept, packaging solution, or product-related change is genuinely working.

Consumer neuroscience and psychophysiology suggest that implicit measures can complement traditional marketing research when interpreted carefully and used in a decision-relevant way (Plassmann et al., 2015). Neurophysiological measures can also add explanatory value beyond standard pretest approaches in forecasting advertising effectiveness (Venkatraman et al., 2015). However, such methods are often applied to isolated stimuli or narrow contexts rather than integrated into a retail customer journey framework that links measurement to touchpoints, managerial action, and the validation of retail innovations.

This paper addresses that gap by advancing a dual-layer measurement approach for retail customer journeys, combining an explicit layer of self-reports, preferences, perceived attribute importance, trust, and intentions

with an implicit layer capturing visual attention, physiological arousal, and expressive affect. It draws on a secondary cross-study synthesis of proprietary, previously unpublished neurolab studies conducted in retail contexts, spanning retail advertising (Retailer A), online retail communication (E-retailer A versus Brand B), packaging and shelf-level presentation (Product C), and product experience in innovation assessment (Product D). Rather than treating these as separate case reports, the analysis identifies recurring mismatches between declared and process-sensitive responses that could lead to different recommendations if managers relied on questionnaires alone. Across cases, these mismatches are relevant to communication redesign, digital touchpoint optimisation, packaging innovation, and product innovation assessment.

The paper contributes at the intersection of retail customer journey management, brand management, and innovation decision-making by offering a transferable conceptual framework for dual-layer measurement across retail touchpoints, a methodologically explicit approach to synthesising heterogeneous lab studies through pattern matching and analytic generalisation, and practical guidance for decisions in which emotional and rational drivers jointly shape behaviour. In this sense, the framework can also be understood as a measurement innovation that supports better validation of retail changes before broader implementation.

To structure the argument, the paper addresses three research questions. RQ1 asks at which retail touchpoints survey-based evidence is most vulnerable to misguiding redesign or innovation-related decisions. RQ2 asks what recurring divergences emerge between declarative evaluations and process-sensitive indicators across retail contexts. RQ3 asks how a dual-layer measurement approach can improve validation, trial, and rollout decisions across the retail customer journey.

2. Background

Retail brand management unfolds across sequences of touchpoints rather than isolated moments. Customer experience research frames this explicitly: experience emerges across interactions, channels, and contexts over time, which makes journey thinking a natural lens for retail decision-making (Lemon and Verhoef, 2016). At the same time, the customer experience field has expanded rapidly and become conceptually fragmented, with different traditions emphasising different operationalisations (Becker and Jaakkola, 2020). In practice, firms therefore rely on measurement approaches that are scalable and comparable across units and time, most often questionnaire-based customer feedback metrics and brand health indicators. Net Promoter Score is one prominent example of such a metric and has increasingly been used as a broader brand performance indicator rather than only a transaction-level loyalty measure (Baehre et al., 2022). More broadly, customer feedback metrics are used to monitor firm performance over time (Agag et al., 2023). A similar declarative logic dominates academic customer experience measurement, including survey-based syntheses and scales developed for services, omnichannel environments, and physical retail contexts (Bueno et al., 2019; Gahler et al., 2023; Rahman et al., 2022; Klaus and Maklan, 2012; Klaus and Maklan, 2013; Bustamante and Rubio, 2017). For retail management, however, the key question is where such measures become too coarse, especially when decisions depend on what consumers actually attend to, process, and feel during exposure.

This issue is particularly relevant because retail touchpoints routinely combine rational information with affective and heuristic cues. Dual-process accounts describe behaviour as shaped by an interaction between reflective and impulsive processes, while persuasion theory similarly distinguishes between effortful evaluation of arguments and cue-based processing (Strack and Deutsch, 2004; Petty and Cacioppo, 1986). In consumer contexts, affect and cognition may conflict, and situational conditions can alter which influence dominates behaviour (Shiv and Fedorikhin, 1999). For measurement, this means that self-reports remain useful, but they do not necessarily provide full access to the processes that shaped behaviour during exposure. Verbal reports may reflect post hoc rationalisations and limited introspective access to the actual mental mechanisms involved (Nisbett and Wilson, 1977), while reliance on one dominant method raises the risk of common method bias (Podsakoff et al., 2003). In retail settings, these limitations support a dual-layer approach that combines declarative evidence with process-sensitive measures.

Consumer neuroscience and psychophysiology provide such complementary tools, provided they are interpreted cautiously and in a decision-relevant way (Plassmann et al., 2015). Evidence suggests that neurophysiological methods can add incremental value beyond traditional pretest measures when forecasting advertising effectiveness (Venkatraman et al., 2015). Within the present framework, three classes of implicit indicators are especially relevant. First, eye-tracking captures what information is actually sampled during evaluation; attention is not adequately represented in many standard choice models and is therefore a useful diagnostic variable in its own right (Orquin and Mueller Loose, 2013). Packaging research further shows that

attention is strongly shaped by the visual ecology of packaging, including salience, size, and position, which helps explain why consumers may overlook information they later claim to value (Orquin et al., 2020). Second, electrodermal activity provides an index of sympathetic activation rather than valence and is therefore useful for detecting the intensity of arousal when interpreted carefully (Boucsein, 2012; Benedek and Kaernbach, 2010). Third, automated facial coding offers a nonverbal indicator of expressive response patterns; prior work shows that it can predict self-reported emotion as well as advertisement and brand effects in video commercial contexts (Höfling and Alpers, 2023), and that facial expressions can be linked to advertising effectiveness in amusing persuasive stimuli (Lewinski et al., 2014). Taken together, these measures support a principled triangulation in which attention indicates what is processed, EDA indicates activation, and facial coding indicates expressive reaction patterns.

Although each of these strands is well established, they are often applied separately rather than integrated into a decision-focused retail customer journey framework. Customer journey research provides the broad touchpoint perspective (Lemon and Verhoef, 2016), while customer experience research continues to expand survey-based operationalisations across heterogeneous contexts (Becker and Jaakkola, 2020; Gahler et al., 2023; Rahman et al., 2022). In parallel, consumer neuroscience and psychophysiology show that implicit methods can add predictive and diagnostic value beyond self-report in relevant marketing settings (Plassmann et al., 2015; Venkatraman et al., 2015). What remains underdeveloped in practice-oriented academic work is a clear mapping of where, across retail touchpoints, a dual-layer approach is most useful and which combinations of explicit and implicit measures are most decision-relevant for understanding emotional and rational drivers in customer journey decision-making.

3. Methods

This paper uses a secondary cross-study synthesis of four proprietary, previously unpublished studies conducted in retail-relevant contexts. The purpose was not to pool the datasets into one statistical model, but to identify recurring decision structures in cases where declarative evaluations and process-sensitive indicators could support different managerial conclusions. Following pattern matching and analytic generalisation, the analysis searched for transferable decision logic across studies that differed in stimulus type but shared a common practical problem: reconciling what consumers say with how they respond during exposure in retail decision-making (Eisenhardt, 1989; Yin, 2014).

Table 1: Overview of included source studies

Study	Retail Touchpoint	Data Basis	Sample Profile	Role in Synthesis
A	Online retail communication	Two video advertisements; trust/evaluation plus EDA/GSR and facial coding	Student neurolab sample, approximately 15–30 participants	Declared trust versus affective response during exposure
B	Retail advertising	Grocery retail advertisement; survey evaluation plus facial coding over time	Student neurolab sample, approximately 15–30 participants	Narrative dynamics and segment-level response differences
C	Packaging and shelf-level presentation	Wine labels; post-exposure evaluation plus eye-tracking	Student neurolab sample, approximately 15–30 participants	Early visual access to premium and differentiating cues
D	Product experience and innovation assessment	Product tasting; purchase choice, openness to alternatives, and facial coding	Large questionnaire dataset (N = 1,742), complemented by several neurolab samples ranging from 12 to 30 participants	Familiar choice versus positive response to novelty

The participant samples were not intended to be statistically representative of the general consumer population. Most studies used predominantly student neurolab samples to compare within-study divergences between declared evaluations and process-sensitive responses under controlled exposure conditions. Study D differed because its explicit dataset was substantially larger. The synthesis therefore supports analytic, not statistical, generalisation: it identifies decision-relevant patterns across retail touchpoints, but does not estimate their prevalence in the wider consumer population.

The source studies used the measurement infrastructure available in the Neurolab FMK UCM in Trnava, including eye-tracking, electrodermal activity/galvanic skin response, electroencephalography, and automated

facial coding through FaceReader. At the cross-study level, only harmonisable indicators were interpreted: questionnaire-based evaluations such as trust, stated preference, purchase intention, perceived quality or value, and openness to alternatives; and implicit indicators of visual attention, physiological arousal, and expressive affect. Eye-tracking captured information sampling through dwell time, time-to-first-fixation, fixation counts, and revisits (Orquin and Mueller Loose, 2013). EDA/GSR was interpreted as arousal rather than valence, with attention to activation frequency and intensity (Benedek and Kaernbach, 2010; Boucsein, 2012). Facial coding was treated as an indicator of expressive response patterns rather than direct access to inner emotional states (Lewinski et al., 2014; Höfling and Alpers, 2023). EEG formed part of the broader infrastructure, but was not used as a harmonised cross-case indicator because comparable outputs were not available across all studies. Implicit indicators were therefore triangulated with the explicit layer rather than interpreted as standalone evidence (Jick, 1979; Podsakoff et al., 2003; Plassmann et al., 2015).

Studies were included if they addressed a retail-relevant decision context, contained at least one explicit outcome, contained at least one implicit measure, and allowed a meaningful comparison between declarative and process-sensitive evidence in relation to a retail recommendation, redesign decision, or innovation-related action. Because the studies differed in stimuli, sample structure, and measurement configuration, raw data were not pooled. The analytical procedure consisted of three steps: summarising explicit and implicit outcomes within each study; identifying cases in which the two layers could plausibly support different retail actions; and conducting cross-study pattern matching aimed at analytic generalisation rather than pooled statistical estimation (Eisenhardt, 1989; Yin, 2014).

All included studies were conducted with informed consent, voluntary participation, and anonymisation of participants and brands or organisations within the institutional ethical framework of the University of Ss. Cyril and Methodius in Trnava. The present paper reports an anonymised secondary synthesis of proprietary neurolab datasets.

This approach has limitations. Heterogeneity in stimuli, samples, and measurement setup prevents pooled effect estimation and population-level causal claims. Harmonisation improves comparability across cases, but reduces study-specific detail. Finally, implicit measures remain interpretively bounded: EDA/GSR reflects arousal rather than valence, facial coding reflects expressive dynamics rather than direct inner states, and EEG was not used as a harmonised cross-study indicator.

4. Findings

This section reports the results as a decision-focused synthesis across retail touchpoints. Drawing on proprietary neurolab studies with student participants from the Neurolab FMK UCM in Trnava, it contrasts explicit measures (questionnaires and stated choices) with process-sensitive indicators recorded during exposure (eye-tracking, electrodermal activity, and automated facial coding) in order to identify recurring divergences relevant to retail customer journey, brand management, and the evaluation of retail changes across touchpoints.

4.1 Pattern A: a Trusted Brand can Elicit a Negative Affective Profile During Exposure

In an online retail communication context, students viewed two video advertisements and evaluated them via questionnaires, while EDA/GSR and facial coding were recorded in the Neurolab FMK UCM in Trnava. Explicitly, the less-known brand was rated as less trustworthy. Implicitly, however, the pattern reversed: the known brand showed a markedly negative expressive profile, while the less-known brand elicited more positive affect and higher physiological activation frequency. The less-known brand produced higher GSR activation frequency (mean 6.06 vs 2.56), dominant joy (64.3%), and low disgust (5.4%), whereas the known brand showed high disgust (35.1%), contempt (24.4%), and anger (22.9%). For retail decision-making, this suggests that declared trust and affective acceptance during exposure should be treated separately. A brand may remain trusted at the declarative level while the communication execution itself functions as an early warning signal for weaker touchpoint performance.

4.2 Pattern B: Segments can Process the Same Advertising Narrative Differently Even When Surveys Show Little Difference

A grocery retail advertisement (Retailer A) was evaluated in a student sample, with analysis focused on emotional trajectories over time and gender differences in implicit expressive dynamics. The trajectories suggested different narrative responses: for women, valence increased with story development, fell in quieter

segments, and neutralised towards the end; for men, the pattern showed an early uplift, a neutral plateau, later increases tied to action moments, and a drop around the product reveal, suggesting lower relevance or weaker involvement. The retail implication is that even when survey summaries look similar, the same narrative may work differently across segments. This matters for pacing, message placement, and the timing of product-related cues, especially when communication is being adjusted or re-used across audiences.

4.3 Pattern C: Premium Meaning Cannot Work if the Design is not Processed Early in Visual Scanning

In an eye-tracking task approximating shelf-like scanning, students viewed wine labels to assess how quickly they attracted attention and how strongly they were processed. Attention was strongly asymmetric. One label entered processing very quickly (time-to-first-fixation 354.2 ms), showed the highest sustained processing (dwell count 7.3), and captured the largest dwell time share (25.1%). Another entered substantially later (time-to-first-fixation 2800.1 ms) and received a lower dwell time share (19.9%). These results show that labels differ not only in post-exposure evaluation, but in whether they enter early visual sampling at all. In retail terms, premium signalling has an access condition: if the design is visually late, the premium cue may never be meaningfully processed in the comparison stage.

4.4 Pattern D: a Consumer can Choose the "Safe" Familiar Option Even When Novelty Produces a More Positive Experience Signal

In a tasting context, respondents evaluated multiple product variants through explicit measures of purchase choice and openness to alternatives, alongside implicit expressive responses during tasting. Explicitly, the classic familiar option remained the conservative purchase choice. At the same time, openness to alternatives was substantial: 67% said they would also buy another sample, and 60% most wanted to buy one of the non-classic flavours. Implicitly, a novel variant generated the strongest positive experience signal: joy and mean emotional valence were highest for sample 4, while the classic sample 2 showed the lowest joy and the highest surprise, interpreted as a recognition effect. Survey-only logic might suggest that novelty is unlikely to succeed. However, the dual-layer evidence points instead to the need for trial pathways, such as sampling, limited editions, or seasonal variants, rather than expecting a novel option to displace the familiar one in a single choice moment.

4.5 Synthesis: What These Patterns Mean for Retail Customer Journey Decisions

Across touchpoints, the synthesis shows that survey-only evidence can misdirect retail decisions when process-sensitive responses diverge from declared evaluations.

Table 2: Cross-study decision patterns

Pattern	Touchpoint	Survey-only Risk	Dual-layer Implication
A	Online retail communication	Trust may hide negative exposure response	Separate brand trust from execution performance
B	Retail advertising	Final ratings may hide narrative and segment dynamics	Test pacing and cue timing
C	Packaging/shelf presentation	Premium meaning may be assumed post hoc	Validate early visual access to cues
D	Product experience	Familiar choice may suppress novelty potential	Use trial pathways before rejecting innovation

Together, the patterns show that dual-layer measurement reduces the risk of optimising the wrong element at the wrong touchpoint.

5. Discussion

The main contribution of this paper is not to argue that consumers are simply "irrational", but to show that different retail touchpoints create different managerial risks when they are evaluated through survey-based evidence alone. Customer journey research has consistently shown that customer experience emerges across sequences of interactions rather than at a single isolated moment, while more recent omnichannel work has stressed the need for comparable measurement across interaction contexts and journey stages (Lemon and Verhoef, 2016; Gahler et al., 2023; Rahman et al., 2022). From this perspective, the value of dual-layer

measurement lies not only in enriching interpretation, but in helping managers evaluate whether a given touchpoint is performing as intended within the journey and whether selected retail changes or innovations are being assessed on sufficiently complete evidence.

For advertising and online retail communication, the findings suggest that managers should distinguish between accumulated brand reassurance and touchpoint-level performance. Pattern A shows that a better-known brand can remain more trusted in declarative evaluation while simultaneously generating a weaker or more negative process profile during exposure. Pattern B similarly indicates that segment differences may emerge less in final questionnaire summaries and more in how a narrative is processed while the message unfolds. In retail terms, communication touchpoints should not be assessed only by stated liking, trust, or preference, but also by whether they sustain constructive processing and support progression to the next stage of the journey (Baxendale et al., 2015). This is especially relevant when managers evaluate whether an existing communication execution should be retained, adjusted, or adapted for different audiences.

For packaging and shelf-level presentation, the findings point to a different retail problem. Pattern C suggests that premium meaning cannot work if the relevant cue is not processed early enough to enter the consumer's comparison process. Packaging research shows that consumer attention is shaped by the visual ecology of the package, including salience, size, and positional characteristics (Orquin et al., 2020). In managerial terms, it is therefore not enough that respondents later say that a package looks premium; the premium cue must also become visually accessible under realistic competitive viewing conditions. In this sense, dual-layer evidence can improve the evaluation of packaging changes and packaging-related innovation by showing whether the intended cue is merely appreciated post hoc, or actually enters the decision process at the right moment.

For product experience and innovation-related evaluation, Pattern D suggests that immediate declared choice and positive experienced response should not be treated as identical indicators of retail success. A familiar option may remain the safer stated purchase choice, while a novel alternative may generate a more favourable experiential profile. From a customer journey perspective, this suggests that some innovations may be more suitable for low-risk trial, repertoire expansion, or staged adoption than for immediate substitution of the familiar option (Lemon and Verhoef, 2016). The managerial implication is not that novelty should automatically replace familiarity, but that dual-layer evidence can help distinguish between rejection, curiosity, and trial-readiness when evaluating product-related innovation.

In relation to the research questions, the paper offers three concise answers. For RQ1, survey-based evidence appears most vulnerable at touchpoints where in-process exposure matters for the managerial decision, especially communication, packaging, and product experience. For RQ2, the recurring structure is not simply a generic gap between what consumers say and what they "really feel", but a repeated divergence between declarative evaluation and process-sensitive indicators that would support different retail actions. For RQ3, the practical implication is that dual-layer measurement helps managers assign the right success criterion to the right touchpoint: trust-related indicators for reassurance problems, attention-related indicators for visibility problems, and combined process evidence for friction, acceptance, or trial-readiness problems. In this way, the approach supports not only customer journey analysis, but also the evaluation of retail changes and selected innovation-related decisions before broader implementation.

Overall, the value of the dual-layer approach lies less in psychological depth for its own sake and more in better retail judgement. It helps managers decide which touchpoint should be redesigned, what role that touchpoint is expected to fulfil in the journey, and which type of evidence is actually relevant for that managerial decision. Under this interpretation, the main weakness of survey-only measurement is not merely that it undercaptures emotion, but that it can direct optimisation towards the wrong retail lever, including in cases where firms assess communication changes, packaging redesign, or product-related innovation.

6. Conclusion

This paper has argued that the main weakness of survey-based retail decision-making is not that surveys are wrong, but that they are often incomplete at touchpoints where behaviour is shaped during exposure rather than only after it. Across advertising, online retail communication, packaging, and product experience, the secondary synthesis of proprietary studies from the Neurolab FMK UCM in Trnava revealed a recurring pattern: explicit evaluations and implicit responses may support different managerial conclusions. The contribution of the paper therefore lies in addressing a practical gap between customer journey research, customer experience measurement, and implicit consumer research. Rather than treating these streams separately, the paper proposes a dual-layer framework that links them to retail touchpoints and decision-making across the journey.

Its core message is simple: better retail decisions require not only asking consumers what they think, but also understanding what they attend to, react to, and carry forward across the journey. At the same time, this perspective can also support the evaluation of retail changes, redesign decisions, and selected innovation-related actions before broader implementation.

Abstract: This empirical paper introduces the "Socio-environmental Canvas," a novel strategic framework and practical instrument for policymakers, investors and socio-environmental entrepreneurs, designed to address the persistent "purpose-benefit paradox" in sustainable entrepreneurship. While traditional business design tools, such as the Business Model Canvas (BMC), are adept at maximizing direct financial returns, they frequently fail to capture the multidimensional value and systemic complexity inherent in socio-environmental ventures. These initiatives often generate significant positive impacts—including ecological restoration, social cohesion, and public health improvements—that remain "invisible" within conventional accounting frameworks, leading to structural underfunding and market marginalization. This research makes a distinct theoretical contribution by expanding current business model design theory, specifically addressing the gap in how externalized social and environmental benefits are captured. The framework explicitly integrates and quantifies "non-appropriable profitability"—the tangible economic benefits society obtains indirectly from a venture's operations—using a counterfactual cost-avoidance methodology. This approach allows ventures to demonstrate their role as strategic "cost-saving centers" for public and private stakeholders. To validate this theoretical contribution, the paper presents an empirical case study of "Abono de Mar" in Uruguay, a circular economy venture transforming monthly fish waste into high-quality compost. This case-based evidence demonstrates the tool's practical utility by quantifying an annual non-appropriable social return of USD 100,423. The methodology critically contrasts the Socio-environmental Canvas with the Triple Layered Business Model Canvas (TLBMC), identifying that while the TLBMC focuses on internal organizational sustainability layers, the Socio-environmental Canvas uniquely maps external "non-appropriable" value. By transforming diffuse social impacts into credible financial arguments, the framework provides a credible financial narrative for institutional capital that empowers entrepreneurs to secure institutional investment and provides policymakers with an empirical basis for data-driven, equitable public policies. This shift allows ventures to be re-framed as strategic 'cost-saving centers,' where governments can justify fiscal incentives and procurement preferences based on concrete avoided costs, effectively bridging the purpose-benefit paradox. Ultimately, this research offers a practical strategic instrument for investors and policymakers and a robust instrument for purpose-driven organizations to prevent common long-term strategic planning and operational blind spots, ensuring that their full contribution to public wealth is both visible and actionable.

Keywords: Socio-Environmental Entrepreneurship, Non-Appropriable Profitability, Alternative Business Models

1. Introduction

In the contemporary global landscape, socio-environmental ventures have emerged as critical actors in addressing systemic ecological and social crises. However, these initiatives operate within an environment characterized by deep-seated structural barriers that go far beyond standard business challenges. Socio-environmental entrepreneurs face an "uphill battle" from the outset: they frequently carry a "sustainability premium"—higher operational costs derived from responsible environmental sourcing and fair labor practices—which directly pressures their profit margins.

Unlike traditional innovation, these ventures encounter a double burden: they must navigate the inherent risks of pioneering new processes or products, yet they do so with tighter margins and historically more restricted access to capital (Ashoka and Schwab Foundation, 2020; GEM, 2020; Austin et al., 2006; Santos, 2012; Dacin et al., 2011; Cohen and Winn, 2007).

Furthermore, the support ecosystem often remains underdeveloped. These entrepreneurs face a lack of specific international policy frameworks to promote their growth and often contend with cultural mismatches between the dominant logic of traditional entrepreneurship and their mission-driven approach. Even when they successfully secure capital, the nature of this funding often imposes additional operational burden; unlike traditional investors who prioritize financial ROI, social investors frequently demand rigorous, additional reporting, metrics, and dissemination efforts that divert scarce resources away from core productivity.

When these entrepreneurs move to the design phase, they rely on conventional business design tools, such as Osterwalder's Business Model Canvas (BMC) (Osterwalder and Pigneur, 2011). These tools were primarily conceived for maximizing direct financial profitability. Because the BMC focuses on internal financial capture, it

fails to represent the multifaceted value these ventures generate, such as avoided public costs or ecological restoration. This omission renders their "invisible value" or "non-appropriable profitability" effectively nonexistent in the eyes of investors and policymakers. This methodological gap exacerbates the "purpose-benefit paradox," systematically undervaluing high-impact ventures and hindering their long-term viability (Dees, 1998).

2. Literature Review

Traditional business model design tools generally operate under a 'business case' logic—the assumption that social and environmental value must align with, or result from, direct financial performance (Margolis and Walsh, 2003; Hahn and Figge, 2011). However, contemporary academic literature critiques this view, noting that it often establishes a "primacy of financial outcomes" at the firm level, which systematically ignores the wider societal benefits that ventures generate (Bansal, 2002; Hahn et al., 2018).

Instead of treating social and environmental goals as trade-offs to be "resolved," a paradox perspective is gaining traction in management literature. This framework defines sustainability as the navigation of persistent, interdependent tensions between economic, social, and environmental goals (Smith and Lewis, 2011; Van der Byl and Slawinski, 2015). This paradox is particularly acute in social entrepreneurship. Here, the tension between mission and profit is not a temporary misalignment but a structural characteristic (Smith and Besharov, 2019; Cherrier et al., 2018). Unlike traditional innovation, these ventures face a heightened risk of "mission drift" if they prioritize financial viability exclusively. Conversely, they face operational failure if they fail to capture their wider socio-environmental value (Scott and Teasdale, 2012).

The persistent "sustainability implementation gap"—the discrepancy between corporate sustainability commitments and actual ecological contributions—remains a primary concern in contemporary management research. Navigating these paradoxes is often obstructed by sector-specific regulatory and institutional lock-ins, requiring systemic governance beyond the scope of individual firms.

While models like the Triple Layered Business Model Canvas (TLBMC) (Joyce and Paquin, 2016) have pioneered structural approaches to internalizing organizational sustainability, their primary focus remains firm-centric. This approach aligns economic, social, and environmental dimensions within the organizational boundary. While effective for internal impact management, it may overlook the systemic external value that socio-environmental ventures generate for the public sphere.

The Socio-environmental Canvas extends this discourse by pivoting from an internal alignment logic to an external-facing "cost-avoidance" paradigm. By explicitly quantifying "non-appropriable profitability," the framework moves beyond mere impact description. It offers an empirical mechanism that translates externalities into actionable financial narratives for institutional stakeholders.

3. The Socio-Environmental Canvas Framework

3.1 Theoretical Foundations

The Socio-environmental Canvas framework offers a strategic architecture for purpose-driven ventures to visualize and internalize both visible and invisible generated value. While traditional business models generally operate within a single commercial dimension—focused solely on addressing the needs of paying customers—socio-environmental ventures require a more sophisticated structural design.

This framework postulates that a sustainable venture’s viability is fundamentally rooted in the integration of a Purpose or Vocation alongside its primary commercial engine, and also that this dimension implies a different and specific Proposal Value that requires specific key resources and activities that may be considered and visualized. While these two foundational pillars are essential for all socio-environmental ventures, the framework remains modular; entrepreneurs can activate additional strategic dimensions according to their specific impact model, operational design, and stage of maturity, to understand and better measure its generated total value.

The table below summarizes all potential dimensions identified by the Socio-environmental Canvas as drivers of value propositions, and consequently, the specific, independent key activities and metrics that should be visualized and calculated when designing, evaluating, and monitoring a socio-environmental venture in its entirety.

Table 1: Dimensions of the Socio-environmental Canvas

Dimension	Value Proposition	Key Activities	Metrics
Purpose/Vocation	Impact	Monitoring, LCAs, transparency	Footprint, waste avoided
Economic Sustainability 1st Floor	Direct utility	Production, logistics, sales	Sales volume, margins
Economic Sustainability 2nd Floor	Impact ROI	Impact reporting, materials	SROI, retention rates
Non-appropriable Benefits	Public cost-savings	Data collection, counterfactuals	Quantified public savings
Non-financial Operational Sustainability	Endogenous leverage	Community design, volunteer mgmt	Volunteer hours, monetary equiv.

Source: Own elaboration

Thus, the value proposition and the operational and economic sustainability of this type of venture are broken down into two foundational dimensions and three additional modular dimensions, which may or may not apply in each specific case depending on the profile of the socio-environmental venture being analyzed and its specific operational and financial structure.

1. *Purpose or Vocation:* The core mission driving strategic decisions. The Value Proposition here is the measurable socio-environmental impact. It is not merely a statement of intent; the venture must substantiate its differential contribution. Key Activities/Resources: monitoring systems, life-cycle assessments, impact transparency mechanisms. Possible metrics: Environmental footprint reduction, social KPIs, tonnes of waste avoided, etc.
2. *Economic Sustainability (1st Floor):* The commercial engine. The Value Proposition is the product or service's direct utility to paying customers. Key Activities/Resources: Standard operational production, logistics, and sales activities required to maintain commercial margins. Possible metrics: Sales volume, profit margins, and unit economics, etc.
3. *Economic Sustainability (2nd Floor):* The social investor layer. The Value Proposition is the 'Impact ROI' offered to benefactors or sponsors. These agents do not purchase a commodity but invest in a mission. Key Activities/Resources: Specialized impact reporting, creation of 'investor-facing' dissemination materials that are distinct from core operations, etc.. Possible metrics: Social Return on Investment (SROI), sponsor retention rates, and data compliance benchmarks, additional costs regarding this dimension, etc.
4. *Non-appropriable Benefits / Positive Externalities:* This dimension captures the systemic value provided to beneficiaries or users who do not pay for the venture service but derive direct or indirect utility from the venture's output. The Value Proposition is twofold: it is the specific benefit (solution) delivered to these free users and the broader societal cost-saving (e.g., avoided public health costs, improved air quality, or waste management savings). Key Activities/Resources: Profiling and segmenting these beneficiaries, data collection to quantify the impact of the solution on their well-being, counterfactual analysis, and strategies to articulate the venture as a 'cost-saving center' to transform beneficiaries into key allies. Possible metrics: Quantified public savings, social externalities in monetary terms, and reach within the beneficiary segment, etc.
5. *Non-financial Operational Sustainability:* This dimension addresses the mobilization of non-monetary capital, which is foundational for the sector, as nearly 75% of social projects rely on volunteer contributions, particularly during their initial execution phases (Ashoka and Schwab Foundation, 2020). This dimension fulfills a dual strategic role. First, it articulates a specific value proposition for volunteers and in-kind donors, addressing intrinsic motivations such as ethical alignment and professional growth. Second, it quantifies the venture's 'endogenous investment' capacity, effectively mapping the hidden leverage created by these contributions. By assigning economic value to volunteer time and in-kind resources—assets that would otherwise represent substantial operational costs—this dimension shifts the perspective from viewing contributions as mere data to positioning them as essential financial leverage. Key Activities/Resources: Community engagement design, volunteer management, and tracking mechanisms for in-kind contributions. Possible metrics: Volunteer hours, retention rates, and the monetary equivalent of leveraged endogenous investment.

4. Methodology and Case Study Validation: Abono de Mar

The case of "Abono de Mar" in La Paloma, Uruguay, serves as a primary empirical validation of the Socio-environmental Canvas framework. The venture arose following a systemic collapse of the local fishing industry, specifically the closure of three fishmeal factories due to competitive pressures from soy and obsolete technology. This created an immediate environmental crisis: the accumulation of 50 tons of fish waste monthly, leading to severe issues such as toxic leachates, disease vectors, and malodorous emissions.

The problem fell into a governance vacuum: it was a municipal responsibility by default, yet the private sector lacked an operational model to resolve it. "Abono de Mar" emerged as a strategic response, evolving from initial consultancy efforts into an operational circular economy venture. This real-world progression provided the ideal conditions to test the fourth dimension of the Canvas: "Non-appropriable Benefits / Positive Externalities."

Table 2: Overview of Stakeholder Impacts

Stakeholder Groups	Impact Description
Municipal Government	Direct optimization of the public budget through reduced waste transport logistics and tipping fees at landfill sites.
Local Community & Regional Economy	Enhancement of regional economic resilience via internal labor retention and procurement from local micro-enterprises.
Fishers managing their waste	Cost savings from waste transportation to landfills or outsourced waste management services.

Source: Own elaboration

The quantification provided in Table 3 utilizes the Cost-Avoidance Method (Simplified SROI), based on operational data from the Municipality of La Paloma (2026). Calculations leverage local market rates (exchange rate: 42 LCU/USD) for logistics, verified against municipal waste management budget reports, and local wage benchmarks for job impact. By applying the framework, we move beyond simple business analysis and utilize a 'Simplified SROI' (Social Return on Investment) approach, specifically employing a Cost-Avoidance Method. This methodology quantifies the annual economic burden that the State, the community, and other private actors would incur if the enterprise were to cease operations. The analysis aggregates logistics, disposal costs, and regional economic resilience, revealing that the venture functions not merely as a commercial entity, but as a

critical municipal 'cost-saving center.' The valuation demonstrates that the venture generates USD 100,423 in annual non-appropriable social return, with a 5-year projected avoided cost of USD 502,115.

Table 3: Detailed Annual Cost-Avoidance Matrix

Category	Annual Cost (USD)
Transport/Transfer Logistics	17,280
Landfill Management Cost	30,000
Local Job and Service Impact	53,143
Total Annual Non-Appropriable Social Return	**100,423**

Source: Own elaboration based on Simplified SROI framework applied to Abono de Mar (2026).

Data sources. The figures presented in Table 2 were constructed from a combination of official benchmarks and internal operational records. Transport costs are based on 2025 price references from the Uruguayan Ministry of Transport and Public Works (MTOP), while landfill management costs are informed by the economic model for small-scale operations presented in the IDB Technical Note (Roda & Pigola, 2021). These data points are complemented by primary operational information—including waste volumes, personnel salaries, and specific operational overheads—provided by the partners of 'Abono de Mar'.

Calculation logic:

- Transport/Transfer Logistics (USD 17,280/year): Calculated based on 50 tons/month waste transfer to a landfill, 60 km distance, 120 annual trips, and a transport cost of USD 2.4 per kilometer (based on 2025 MTOP operating references for C12-type heavy cargo vehicles).
- Landfill Management Cost (USD 30,000/year): Derived from an operational cost of USD 50/ton, calculated for an annual volume of 600 tons (based on IDB Technical Note, Roda & Pigola, 2021).
- Local Job and Service Impact (USD 53,143/year): Quantifies regional economic loss from the cessation of waste processing, including three direct local jobs and essential outsourced services, aggregated from regional average wages and typical service billings.

While Table 2 provides the conceptual scope of stakeholder impacts, Table 3 offers the empirical quantification of these externalities through the Cost-Avoidance Method.

Methodological limitations. As a simplified, single-case application, this Cost-Avoidance Method does not incorporate stakeholder deadweight, attribution, or displacement adjustments typical of full SROI protocols (Nicholls et al., 2012). Figures should therefore be interpreted as directional evidence of non-appropriable value.

The quantification of non-appropriable social return follows a Cost-Avoidance Method, a simplified variant of Social Return on Investment (SROI) analysis that estimates the economic burden the local community would face in a counterfactual scenario where 'Abono de Mar' ceased operations. Unlike a full SROI analysis—which requires stakeholder-weighted valuation and deadweight/attribution adjustments—this simplified approach focuses exclusively on directly observable avoided costs.

This annual quantification provides the empirical basis to move beyond philanthropic perceptions and establish the venture as essential public infrastructure. By revealing an annual non-appropriable return of USD 100,423, the venture creates a compelling macroeconomic justification for public subsidies, procurement preferences, and preferential regional zoning.

5. Discussion and Implications

The Socio-environmental Canvas functions as a practical strategic instrument for investors and policymakers. By translating diffuse social impacts into quantifiable data, the framework provides a credible financial narrative for institutional capital. This shift allows ventures to be re-framed as strategic 'cost-saving centers,' where governments can justify fiscal incentives and procurement preferences based on concrete avoided costs, effectively bridging the purpose-benefit paradox.

Internally, the canvas improves the entrepreneur's capacity for long-term strategic planning. By explicitly mapping all key resources—including 'invisible subsidies' like volunteer work—it prevents common operational blind spots. This visibility allows organizations to plan for professionalization and financial independence as a

deliberate strategic move, while treating beneficiaries as distinct segments with unique value propositions. Ultimately, whereas the TLBMC successfully maps internal sustainability, the Socio-environmental Canvas provides the critical missing link between social impact and institutional finance, transforming ventures from fragile philanthropic entities into resilient, data-driven cost-saving infrastructure.

6. Conclusion

The Socio-environmental Canvas serves as an interesting strategic framework in business modeling for purpose-driven organizations. By integrating non-appropriable profitability and non-financial operational sustainability alongside core commercial operations, the framework provides a robust solution to the 'purpose-benefit paradox.' It empowers ventures to escape structural underfunding, turning invisible wealth into tangible institutional support, while simultaneously acting as an internal roadmap for sustainable organizational growth.

This framework effectively guides ventures through the complex evolution from an initial reliance on informal, non-monetary contributions toward a resilient, professionalized structure. By enhancing the entrepreneur's capacity for strategic planning, resource management, and narrative alignment, the Socio-environmental Canvas transforms diffuse impact into a credible asset. It is not merely a design sheet, but a comprehensive instrument to catalyze a shift toward a more equitable, efficient, and sustainable economic landscape.

7. Limitations and Future Research

This study presents a foundational case study of the Socio-environmental Canvas. While the Abono de Mar case demonstrates significant non-appropriable value, its singular nature limits broad generalization. Future research should prioritize multi-case validation across diverse sectors and geographies to test the framework's scalability and its applicability in different regulatory environments.

Ethics Declaration

This research was conducted in accordance with institutional ethical standards; specific clearance was not required as it utilizes conceptual modeling and public case data.

AI Declaration

AI tools were used for language refinement, English syntax correction, and structural formatting to adhere to ECIE 2026 standards. All analytical content, data processing, and the theoretical framework development were performed exclusively by the author.

Social Capital and Entrepreneurial-Specific Knowledge as Key Drivers of Innovation

Ronald Jean Degen
ANEGEPE, São Paulo, Brazil

Abstract: Innovation in startups is frequently attributed to technological novelty or access to financial capital. However, Contemporary Entrepreneurship Research Increasingly Recognizes Innovation As A Knowledge-Based And Socially Embedded Process. This Article Examines How Entrepreneurial-Specific Knowledge And Social Capital Jointly Shape Innovation Outcomes In Startups And Explores The Implications Of These Mechanisms For Brazilian Public Policy And University-Based Entrepreneurial Ecosystems. Building On The Knowledge-Based View Of The Firm, Social Capital Theory, And The Knowledge Recombination Perspective, Innovation Is Conceptualized As The Outcome Of Interactions Between Tacit And Explicit Knowledge Mediated By Trust-Based Networks. Methodologically, The Study Adopts A Qualitative, Theory-Driven Multiple-Case Approach Based On Secondary Data From Twelve Brazilian Startups. A Structured Coding Protocol Was Used To Classify Entrepreneurial Knowledge (Tacit, Explicit, Or Mixed) And Forms Of Social Capital (Relational, Institutional, And Market-Based), Thereby Enhancing Analytical Transparency And Rigor. The Findings Show That Startup Innovation Rarely Emerges From Isolated Technological Invention. Instead, It Results From The Recombination Of Entrepreneurial-Specific Knowledge Accumulated Through Professional Experience, Academic Training, And Sectoral Immersion, Combined With Social Capital Embedded In Networks Of Customers, Partners, Universities, Investors, And Regulators. The Study Extends Prior Research By Showing That Innovation Outcomes Depend On The Alignment Between Knowledge Type And Network Structure. The Article Contributes To Theory By Refining The Concept Of Entrepreneurial-Specific Knowledge As A Dynamic Capability And To Practice By Advocating A Shift In Innovation Policy From *Finance-First* To *Capability-And-Network-First* Approaches.

Keywords: Social Capital; Entrepreneurial-Specific Knowledge; Innovation; University-Based Entrepreneurial Ecosystems; Finance-First; Capability-And-Network-First

1. Introduction

Innovation is a central mechanism through which startups create value and achieve competitive advantage (Shane & Venkataraman, 2000). Unlike established firms, startups typically operate under conditions of high uncertainty, limited resources, and weak legitimacy. Under these constraints, innovation depends less on proprietary technologies and more on founders' prior knowledge and their ability to mobilize social relationships that provide access to complementary resources (Grant, 1996; Nahapiet & Ghoshal, 1998).

Entrepreneurship research increasingly conceptualizes innovation as a knowledge-based and socially embedded process (Galunic & Rodan, 1998; Shane, 2000). Entrepreneurs identify opportunities by recombining experiential, technical, and market knowledge accumulated through education, professional trajectories, and repeated interaction with external actors. These processes are mediated by social capital—networks of trust, shared norms, and relational proximity that facilitate knowledge exchange and coordination (Adler & Kwon, 2002).

Despite this theoretical advancement, innovation policies in many emerging economies, including Brazil, remain disproportionately focused on financial instruments and infrastructure. This article argues that such approaches are incomplete unless they explicitly address how entrepreneurial knowledge and social capital are formed, recombined, and scaled, particularly within university-based entrepreneurial ecosystems.

2. Theoretical Background

2.1 Innovation as a Knowledge-Based Outcome

From the knowledge-based view of the firm, innovation results from creating, recombining, and applying knowledge (Grant, 1996). It rarely stems from isolated invention; rather, it emerges through novel combinations of existing knowledge elements (Schumpeter, 1934; Galunic & Rodan, 1998). This recombination logic is particularly relevant for startups, which typically lack the resources for large-scale R&D but excel at creatively integrating dispersed knowledge.

Recent research emphasizes that innovation depends not only on knowledge diversity but also on the capability to integrate and recombine knowledge effectively (Xiao, Makhija, & Karim, 2022).

2.2 Entrepreneurial-Specific Knowledge

Entrepreneurial-specific knowledge refers to the idiosyncratic set of cognitive frameworks, experiential insights, and domain expertise accumulated by entrepreneurs through education, industry experience, and entrepreneurial activity (Shane, 2000). This knowledge shapes opportunity recognition, problem framing, and the development of innovative solutions.

Contemporary research extends this concept by incorporating entrepreneurial cognition, emphasizing that entrepreneurs interpret information through mental models and heuristics shaped by prior experience (Baron, 2006). These cognitive schemas influence how opportunities are perceived and acted upon.

From a human capital perspective, entrepreneurial-specific knowledge reflects both general and domain-specific human capital (Becker, 1993; Marvel, Davis, & Sproul, 2016). Domain knowledge is particularly important for innovation because it helps entrepreneurs identify inefficiencies and unmet needs within specific industries.

Moreover, entrepreneurial-specific knowledge can be understood as a dynamic capability (Teece, 2014). Entrepreneurs continuously sense opportunities, seize them, and reconfigure resources, relying on accumulated knowledge to make decisions under uncertainty.

A key characteristic of this knowledge is its predominantly tacit nature. Tacit knowledge is experiential, context-dependent, and difficult to codify (Polanyi, 1966; Nonaka, 1994). Innovation often arises from the interaction between tacit and explicit knowledge through iterative learning processes (Autio et al., 2014).

Entrepreneurial learning is also inherently social. Entrepreneurs develop and refine knowledge through interaction with customers, partners, and mentors (Cope, 2005).

Thus, entrepreneurial-specific knowledge is best understood as a dynamic, socially embedded capability that combines cognition, experience, and learning processes to enable innovation under uncertainty.

2.3 Social Capital and Innovation

Social capital encompasses the actual and potential resources embedded in networks of relationships (Nahapiet & Ghoshal, 1998). It facilitates innovation by enabling access to external knowledge, fostering trust, and reducing coordination costs (Tsai & Ghoshal, 1998; Adler & Kwon, 2002).

Different configurations of social capital produce distinct innovation outcomes. Dense, trust-based networks support the transfer of tacit knowledge, whereas bridging and institutional networks facilitate access to diverse and codified knowledge (Stam, 2015).

3. Methodology

3.1 Research Design

This study adopts a qualitative, theory-driven multiple-case research design to support analytical generalization (Yin, 2018).

3.2 Data Source and Sample Selection

The empirical material was collected from the Startups section of *Revista PEGN*, focusing on startups featured in 2022. Twelve cases (startups) were selected based on the richness of available qualitative information and the clarity with which innovation and network relationships were described.

3.3 Analytical Procedure and Coding Strategy

To enhance methodological rigor, the study employed a structured, multi-stage coding procedure:

Stage 1: Case profiling: Each startup was summarized using a standardized template capturing founders' backgrounds, innovation characteristics, and salient network relationships.

Stage 2: Open coding: Case narratives were coded inductively to identify themes related to entrepreneurial knowledge sources and social relationships.

Stage 3: Theory-driven categorization: Codes were consolidated into theoretically informed categories:

Entrepreneurial knowledge:

- Tacit
- Explicit
- Mixed

Social capital:

- Relational
- Institutional
- Market-based

Classification was conducted at the case level based on the dominant entrepreneurial knowledge type and the primary mechanism of value creation. Cross-validation across sources for each case was used to enhance analytical consistency.

4. Findings

Table 1: Entrepreneurial-specific knowledge, social capital, and innovation in selected startups

Startup	Sector	Year Founded	Entrepreneurial-Specific Knowledge	Dominant Social Capital	Core Innovation
Spotx	Logistics	2020	Industrial logistics experience	Client and partner networks	Real-time delivery tracking
Galena	Edtech/Fintech	2020	Education and finance expertise	Employers and investors	Income Share Agreement
Bombordo	Marketplace	2021	Nautical tourism knowledge	Trust with asset owners	Boat rental platform
Gringo	Mobility	2020	Regulatory and bureaucratic expertise	Institutional partnerships	Vehicle management app
Dolado	B2B Commerce	2020	Small retail operations	Merchant relationships	B2B marketplace
CondoConta	Fintech	2020	Banking and financial services	Property manager networks	Digital condominium bank
AkinTec	Fintech	2019	Informal finance and retail knowledge	Community networks	Retail-based banking
Ambi Real Food	Biotech/Foodtech	2021	Academic and scientific research	University and lab ties	Cultivated meat
Agrolend	Agrifintech	2020	Agribusiness finance	Farmer networks	Rural credit platform
Compra Rápida	SaaS/E-commerce	2021	Conversion optimization	Platform partnerships	One-click checkout
Lubs	Consumer Goods	2020	Consumer behavior insights	Influencer communities	Sustainable sexual wellness
Liqi	Fintech/Blockchain	2021	Capital markets and blockchain	Investor–regulator ties	Asset tokenization

Note: Developed by the author based on secondary qualitative data from *Revista PEGN* and startups' official websites.

Table 2: Startups grouped by predominant type of entrepreneurial knowledge

Predominant Knowledge Type	Startups	Typical Innovation Characteristics	Policy-Relevant Implications
Tacit knowledge	Spotx; Bombordo; Gringo; Dolado; AkinTec; Lubs	Rapid iteration, strong problem–solution fit, reliance on trust	Policies should emphasize mentoring, networks, and experiential learning
Explicit knowledge	Ambi Real Food; CondoConta; Compra Rápida; Liqi	Technological or regulatory complexity, slower diffusion	Policies should strengthen market access and regulatory bridges
Mixed (tacit + explicit)	Galena; Agrolend	Higher scalability, institutional integration	Support university–industry interfaces and hybrid programs

Note: Tacit knowledge is experiential and difficult to codify, whereas explicit knowledge is formalized and transferable (Nonaka, 1994).

Overall, the findings indicate that innovation emerges from the interaction between entrepreneurial-specific knowledge and social capital.

- Startups grounded primarily in tacit knowledge rely on dense, trust-based networks and engage in rapid experimentation.
- Startups grounded primarily in explicit knowledge depend on institutional ties but often face diffusion challenges.
- Startups combining tacit and explicit knowledge tend to exhibit greater scalability.

5. Discussion

The findings indicate that startup innovation emerges from the *co-evolution of entrepreneurial-specific knowledge and social capital*. Startups relying predominantly on tacit knowledge draw on dense, trust-based networks to test assumptions and accelerate learning. By contrast, startups grounded mainly in explicit scientific or technical knowledge benefit from institutional ties but often face diffusion challenges when relational embeddedness is weaker.

Importantly, the most robust innovation outcomes appear when tacit and explicit knowledge are recombined under conditions of strong social capital. This finding highlights the role of *entrepreneurial ecosystems* as knowledge-orchestration mechanisms rather than merely funding channels.

5.1 Confirmation of Existing Theory

The findings align with work showing that innovation is driven by knowledge recombination (Galunic & Rodan, 1998) and facilitated by social capital (Nahapiet & Ghoshal, 1998).

5.2 Extension of Theory

This study extends prior research by showing that:

- Innovation outcomes depend on the alignment between knowledge type and network structure.
- Entrepreneurial-specific knowledge can function as a dynamic capability that enables opportunity recognition and resource reconfiguration under uncertainty.
- Mixed (tacit + explicit) knowledge configurations tend to enhance scalability by supporting both experimentation and diffusion.

5.3 Challenging Existing Assumptions

More broadly, the findings call into question *finance-first* assumptions in innovation policy by indicating that knowledge development and network formation are equally critical for innovation.

6. Implications for Brazilian Public Policy

The results suggest that Brazilian innovation policy should shift from a *finance-first* approach to a *capability-and-network-first* strategy. Accordingly, institutions such as BNDES, FINEP, SEBRAE, SENAI, and state development agencies should prioritize programs that deliberately build entrepreneurial capabilities and social capital.

Potential policy instruments include:

- Funding ecosystem intermediaries (accelerators, incubators, and Technology Transfer Offices (TTOs)) as network builders
- Expanding regulatory experimentation mechanisms (e.g., sandboxes) to reduce uncertainty and accelerate diffusion
- Adopting place-based strategies aligned with regional industrial strengths

7. Implications for Brazilian University-Based Entrepreneurial Ecosystems

Brazilian universities play a leading role in forming entrepreneurial knowledge but must strengthen their *third mission* by deepening engagement with startups and regional innovation systems. Key actions within university-based entrepreneurial ecosystems include:

- Revising promotion and tenure criteria to recognize entrepreneurial engagement
- Embedding experienced entrepreneurs as instructors, mentors, and advisors
- Professionalizing technology transfer beyond patenting
- Creating venture studios and living labs that connect students, researchers, firms, and government

Within university-based entrepreneurial ecosystems, universities should function as *boundary-spanning platforms* that recombine knowledge across institutional domains, consistent with the Triple Helix framework (Etzkowitz & Leydesdorff, 2000).

8. Limitations and Future Research

This study relies on secondary qualitative data, which may reflect editorial bias and limit causal inference. The modest sample size and single-country focus also constrain generalizability. Future research should draw on primary data, adopt longitudinal designs, and conduct cross-country comparisons. It should also examine how governance arrangements shape the orchestration of social capital within entrepreneurial ecosystems, including university-based entrepreneurial ecosystems.

Ethics Declaration

This study is based exclusively on secondary data derived from publicly-available sources, including journalistic case reports and information published on the official websites of the startups analyzed. No primary data were collected, and the study involved no direct interaction with human participants. Accordingly, the research did not require interviews, surveys, experiments, or any other procedures that would typically warrant ethical review. Given the nature of the data and methods used, ethical clearance from an institutional review board (IRB) or equivalent ethics committee was not required.

The author confirms that the research was conducted in accordance with accepted principles of academic integrity and transparency, including the responsible use of publicly available information.

AI Declaration

The author declares that *artificial intelligence (AI) tools were used to support writing and research tasks* during the preparation of this manuscript. Specifically, AI was used to (a) improve academic language, structure, and clarity; (b) help organize arguments and integrate theoretical perspectives; and (c) support the synthesis of publicly available information and academic literature identified by the author.

The AI tool did not generate original empirical data, conduct independent analysis, or make autonomous interpretive or normative decisions. All theoretical framing, methodological choices, data selection, interpretation of findings, policy recommendations, and final editorial decisions are the sole responsibility of the author.

The author reviewed and edited all AI-assisted content to ensure accuracy, coherence, originality, and compliance with academic standards, including appropriate citation and attribution of sources.

Abstract: The global fashion industry has undergone rapid transformation in recent decades, driven by the expansion of fast fashion and the increasing adoption of digital technologies. While fast fashion has enhanced accessibility and affordability, it has also raised significant environmental concerns, prompting growing interest in sustainable consumption practices. In this context, digital second-hand platforms have emerged as an important mechanism for promoting circular economy principles by extending product lifecycles and reducing waste. This study examines the factors influencing purchase intention in digital C2C second-hand fashion platforms, with a specific focus on users in the Lithuanian market. The research investigates the role of perceived value, trust, perceived security, and usage motivations in shaping purchase intention. A quantitative research design was employed, with data collected through an online questionnaire distributed to 105 users with experience using second-hand fashion platforms. The findings reveal that perceived value is the strongest predictor of purchase intention, followed by usage motivations and trust, all of which have a positive and statistically significant effect. In contrast, perceived security does not have a significant direct impact on purchase intention, suggesting that it functions as a baseline requirement rather than a key driver of behaviour. The study contributes to the literature by providing empirical evidence from a relatively underexplored context and highlights the importance of perceptual and motivational factors in digital second-hand consumption. Practical implications suggest that platform managers should prioritise enhancing perceived value and user motivations to strengthen user engagement and purchasing behaviour.

Keywords: Sustainable Fashion; Second-hand Platforms; Purchase Intention; Perceived Value; Consumer Behaviour; C2C E-commerce

1. Introduction

The global fashion industry has experienced substantial growth over the past decades, driven largely by the rise of fast fashion. This model has enabled companies to produce and distribute low-cost clothing at unprecedented speed, encouraging frequent consumption and short product life cycles. While this has increased accessibility and affordability for consumers, it has also generated significant environmental and social challenges. The fashion industry is responsible for approximately 8–10% of global carbon emissions and consumes vast quantities of water and raw materials (Niinimäki et al., 2020). Additionally, the widespread use of synthetic fibres such as polyester contributes to long-term environmental degradation.

In response to these challenges, the concept of sustainable fashion has gained increasing attention among both consumers and researchers. One of the most prominent manifestations of sustainable consumption in the fashion sector is the growing popularity of second-hand clothing. By extending the lifecycle of garments, second-hand markets contribute to reducing waste, lowering resource consumption, and supporting circular economy principles (Persson and Hinton, 2023; Sandin and Peters, 2018).

The rapid development of digital technologies has played a crucial role in facilitating the growth of second-hand fashion. Digital platforms enable peer-to-peer (C2C) transactions, allowing users to buy and sell pre-owned items efficiently and conveniently. Among these platforms, Vinted has emerged as one of the leading marketplaces in Europe, particularly in the Baltic region. The platform not only supports economic transactions but also promotes sustainable consumption practices by encouraging reuse and recycling. Previous studies have shown that digital platforms and technology-enabled environments increasingly influence users' decision-making processes, online purchase behaviour, and behavioural intentions across different sectors (Deirmentzoglou et al., 2025; Mischin et al., 2025).

In Lithuania, second-hand fashion has evolved into a mainstream consumption pattern. Recent data indicate that a significant proportion of consumers regularly engage in second-hand purchasing, reflecting both economic considerations and increasing environmental awareness. At the same time, the high level of digital literacy

among younger generations, particularly Generation Z, has facilitated the adoption of mobile applications such as Vinted.

Despite the growing importance of digital second-hand platforms, the academic literature remains relatively fragmented. Much of the existing research focuses on macro-level issues such as sustainability, circular economy frameworks, or business models (e.g. Fletcher and Tham, 2019). However, there is a notable lack of studies examining the micro-level behavioural mechanisms that influence consumer decision-making in digital second-hand environments.

Specifically, limited attention has been given to the role of psychological and perceptual factors such as perceived value, trust, perceived security, and user motivations. Moreover, there is a scarcity of empirical research conducted within specific national contexts, such as Lithuania, despite its relevance as a leading market for second-hand platforms. This study aims to address these gaps by examining the factors that influence purchase intention in digital second-hand fashion platforms such as Vinted. By focusing on users of second-hand applications, the research seeks to provide both theoretical and practical insights into sustainable consumption behaviour in digital environments.

2. Literature Review

Purchase intention is a central concept in consumer behaviour and refers to the likelihood that a consumer will engage in a future purchase. In e-commerce research, it is widely used as a predictor of actual purchasing behaviour (Pavlou, 2003). In digital marketplaces, purchase intention is not shaped only by price or product characteristics, but also by perceived value, trust, perceived security, and user motivations (Gefen et al., 2003). This is particularly important in C2C fashion platforms, where consumers cannot physically inspect products before purchase. In such environments, online reviews, ratings, platform credibility, and electronic word-of-mouth help reduce perceived risk and support purchasing decisions (Chevalier and Mayzlin, 2003; Park and Lee, 2009). In this study, purchase intention is the dependent variable through which the effect of the other constructs is examined.

Perceived value is one of the most important factors in understanding consumer behaviour in online markets. It refers to the consumer's overall assessment of the benefits received compared with the costs involved in using a product, service, or platform (Mishra et al., 2023). In C2C second-hand platforms, perceived value is multidimensional. It includes economic benefits, such as lower prices, but also emotional, social, and environmental benefits, such as the satisfaction of participating in sustainable consumption (Guiot & Roux, 2010). In the context of sustainable consumption, perceived environmental benefits and green-related consumer perceptions have been shown to significantly influence consumers' purchase propensity and behavioural intentions (Apostolopoulos et al., 2025).

Previous research suggests that perceived value can strengthen purchase intention in digital environments (Wu and Huang, 2023). In second-hand fashion, users may value the opportunity to find unique products, reduce waste, save money, and contribute to circular consumption practices (Hamari et al., 2016; Palomo-Domínguez et al., 2023). Therefore, perceived value is expected to play a key role in shaping users' intention to purchase through second-hand applications such as Vinted.

H1: Perceived value from using second-hand applications has significant effect on purchase intention.

Trust is another critical factor in e-commerce, especially in C2C platforms where transactions take place between individual users and involve greater uncertainty. Since consumers cannot physically interact with sellers or products, they rely on indicators such as platform reputation, seller ratings, service quality, transparency, and information reliability (Falahat et al., 2019). Trust helps reduce perceived risk and increases confidence in online purchasing decisions. Previous studies show that consumers with higher levels of trust are more willing to make purchases and to continue using digital platforms. In the case of Vinted, trust is particularly important because users must rely on the platform's mechanisms, seller evaluations, and product descriptions when purchasing second-hand items.

H2: Trust in second-hand digital platforms has a significant effect on purchase intention.

Perceived security refers to the extent to which users believe that online transactions and personal information are protected from risks such as fraud, data misuse, or unauthorised access (Pavlou, 2003). In online shopping environments, security is closely linked to trust and is often considered a necessary condition for platform adoption. Studies show that secure payment systems, privacy protection, and effective transaction mechanisms

reduce perceived risk and support positive attitudes toward online purchasing (Kim et al., 2008). In C2C second-hand platforms, perceived security is especially relevant because users may face uncertainty regarding payment safety, seller reliability, and product condition. Therefore, security is expected to influence purchase intention by creating a safer and more reliable transaction environment.

H3: Perceived security when using second-hand applications has a positive effect on purchase intention.

Usage motivations also play an important role in shaping consumer behaviour in digital second-hand platforms. In the literature, motivations for second-hand consumption are commonly classified as economic, functional, hedonic, social, and environmental. Economic motivations include saving money and finding better prices, while functional motivations relate to convenience and ease of use (Guiot & Roux, 2010; Hamari et al., 2016). Given that Vinted is widely used by digitally active consumers, these motivations are expected to positively influence purchase intention.

H4: Usage motivations for second-hand applications have a positive effect on purchase intention.

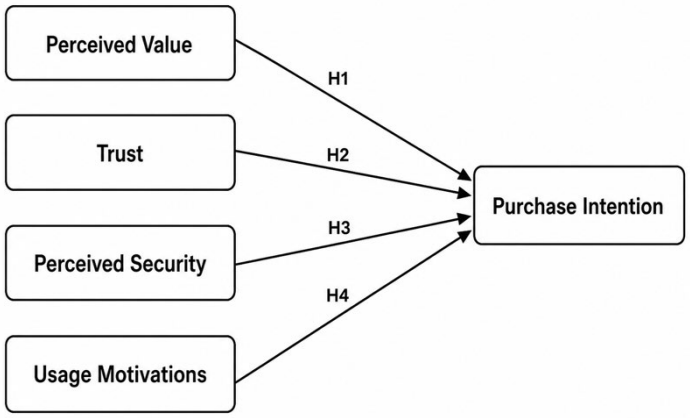

Figure 1: Conceptual framework

3. Methodology

This study adopts a quantitative research design to examine the factors influencing consumer behaviour in digital second-hand fashion platforms, with a specific focus on the Vinted application in Lithuania. The primary objective is to investigate how perceived value, trust, perceived security, and usage motivations affect users' purchase intention, which is widely recognised as a key predictor of repeat purchasing behaviour and long-term user loyalty. Accordingly, the central research question guiding this study is: *What factors influence users' purchase intention on digital second-hand fashion platforms?*

Data were collected through an online questionnaire, which was designed and distributed using Google Forms. The questionnaire targeted individuals residing in Lithuania who have experience using the Vinted platform, ensuring that the responses accurately reflect the perceptions and behaviours of the relevant population. To achieve an adequate and relevant sample, the questionnaire was disseminated through multiple channels, including social media platforms such as Facebook and Instagram, particularly within groups related to second-hand fashion and Vinted users. In addition, participants were encouraged to share the survey within their personal networks, and a snowball sampling technique was employed to facilitate access to a specific and otherwise difficult-to-reach target group.

The questionnaire consisted of closed-ended questions measured using a five-point Likert scale (1 = strongly disagree, 5 = strongly agree), allowing for the quantification of participants' attitudes and perceptions. It was structured into two main parts. The first part collected demographic information, including gender, age, and place of residence, ensuring the geographical relevance of the sample. The second part focused on measuring the core constructs of the study: perceived value, trust, perceived security, usage motivations, and purchase intention. Each construct was operationalised through multiple items (typically three to four statements per variable) to enhance measurement accuracy and reliability.

The measurement scales were adapted from previously validated instruments in the literature to ensure both reliability and validity. Specifically, the constructs of trust, perceived security, and purchase intention were based on the work of Quintus et al. (2024), while perceived value and usage motivations were measured using scales

derived from Mishra et al. (2023), which focus on consumer behaviour in sustainable and second-hand fashion contexts. The use of established measurement scales ensures consistency with prior research and strengthens the robustness of the findings. Furthermore, the reliability of the constructs was assessed using Cronbach's alpha, with the results reported in the statistical analysis section.

The choice of Lithuania as the research context is particularly relevant for several reasons. Vinted was founded in Lithuania and continues to maintain its headquarters in Vilnius, making the country one of its primary markets. The platform has achieved significant penetration in the local market and is widely recognised as Lithuania's first technology "unicorn". Moreover, the high level of digital adoption among Lithuanian consumers, particularly younger generations, supports the widespread use of mobile applications for online shopping (Statista, 2024). At the same time, existing research on second-hand fashion and digital C2C marketplaces within specific national contexts remains limited, with most studies focusing on Western European markets. By examining consumer behaviour in Lithuania, this study addresses an important research gap and contributes to a more context-specific understanding of digital second-hand consumption.

4. Findings

This section presents the empirical findings of the study. The analysis first provides a brief overview of the sample and the descriptive results, followed by the reliability analysis, correlation analysis, and regression model, which represents the main statistical analysis of the study.

The final sample consisted of 105 respondents residing in Lithuania. The sample was predominantly female (76.2%), while 23.8% were male. Most participants belonged to the 25–34 age group (52.4%), followed by the 18–24 age group (41%), indicating that the sample mainly reflects younger users of digital second-hand platforms. Regarding education, 45.7% held an undergraduate degree, 28.6% held a postgraduate degree, and 25.7% had completed secondary education. In terms of employment, 47.6% were employed full-time, while the rest were students, part-time employees, self-employed, or currently unemployed. All respondents were either Lithuanian or residing in Lithuania, while the majority reported experience with the Vinted platform.

The descriptive results indicate generally positive perceptions of Vinted across the main constructs. Respondents perceived the platform as valuable, particularly in relation to environmental and emotional benefits. Trust levels were also positive, especially regarding seller ratings and the reliability of platform information. Perceived security was evaluated favourably, with respondents expressing confidence in privacy protection and transaction safety. Usage motivations were mainly driven by economic benefits, ease of use, and the opportunity to discover unique products, while social influence appeared less important. Finally, respondents showed strong purchase intention, particularly regarding the likelihood of using Vinted again for future second-hand fashion purchases.

Before testing the proposed relationships, reliability and validity assessments were conducted for all main constructs of the study. Internal consistency was evaluated using Cronbach's alpha, indicating acceptable levels across the variables. Convergent validity was examined through Average Variance Extracted (AVE), confirming that the constructs adequately capture the underlying concepts they are intended to measure. In addition, Composite Reliability (CR) further supported the overall reliability of the measurement model. Taken together, these results suggest that the constructs exhibit satisfactory reliability and validity, justifying their use in the subsequent correlation and regression analyses.

A Spearman correlation analysis was then conducted to examine the relationships between the independent variables and purchase intention. Spearman's rho was selected because the variables were measured using Likert-type scales and the analysis did not require the assumption of normal distribution. The results show that all four independent variables were positively and significantly correlated with purchase intention. Perceived value had the strongest correlation with purchase intention ($\rho = 0.589$, $p < 0.001$), followed by usage motivations ($\rho = 0.517$, $p < 0.001$). Perceived security and trust also showed positive and significant correlations, although of lower strength ($\rho = 0.385$, $p < 0.001$ and $\rho = 0.340$, $p < 0.001$, respectively).

Table 1: Correlation matrix

Variable	Purchase Intention
Perceived Value	0.589***
Usage Motivations	0.517***
Perceived Security	0.385***
Trust	0.340***

*Note: Spearman's rho. *** p < 0.001.*

The main analysis of the study was conducted through regression analysis, with purchase intention as the dependent variable and perceived value, trust, perceived security, and usage motivations as independent variables. The results indicate that perceived value is the strongest predictor of purchase intention (β = 0.423, p = 0.001). This suggests that users who perceive greater value in using Vinted are more likely to express stronger intentions to purchase through the platform.

Usage motivations also had a statistically significant positive effect on purchase intention (β = 0.285, p = 0.018). This finding indicates that economic, functional, and hedonic motivations play an important role in encouraging users to continue purchasing through Vinted. Trust was also found to have a positive and statistically significant effect (β = 0.228, p = 0.036), although its predictive power was weaker compared to perceived value and motivations.

In contrast, perceived security did not have a statistically significant effect on purchase intention (β = 0.019, p = 0.833). Although users generally evaluated the platform as secure, this result suggests that perceived security does not directly explain purchase intention when other variables are considered. Security may therefore operate more as a basic requirement for platform use rather than as a direct driver of purchasing behaviour.

Table 2: Regression analysis predicting purchase intention

Predictor	Estimate	SE	t	p
Intercept	0.1626	0.5103	0.319	0.751
Usage Motivations	0.2845	0.1181	2.408	0.018
Perceived Value	0.4230	0.1288	3.283	0.001
Perceived Security	0.0190	0.0899	0.211	0.833
Trust	0.2278	0.1072	2.125	0.036

Overall, the findings support H1, H2, and H4, as perceived value, trust, and usage motivations were found to positively influence purchase intention. However, H3 is not supported, as perceived security did not have a statistically significant direct effect. Additional regression analysis showed that demographic characteristics, including gender, age, education, and employment status, did not significantly predict purchase intention. Therefore, purchase intention appears to be shaped primarily by perceptual and behavioural factors rather than demographic characteristics.

5. Discussion

The findings of this study provide important insights into consumer behaviour within digital second-hand fashion platforms, particularly in relation to the factors influencing purchase intention among Vinted users in Lithuania. Overall, the results indicate that users exhibit a positive attitude toward the platform and are more likely to engage in purchasing behaviour when they perceive that the platform delivers meaningful value and aligns with their personal needs and motivations.

Most notably, perceived value emerged as the strongest predictor of purchase intention, supporting H1. This finding suggests that users are more inclined to make purchases when they believe that the platform offers clear benefits, such as economic savings, ease of use, and an overall positive shopping experience. The importance of perceived value is well documented in the literature, as it integrates functional, emotional, and social dimensions of consumption (Mishra et al., 2023). In the context of second-hand fashion, prior studies have also highlighted

the significance of economic, environmental, and experiential value in shaping consumer decisions (Guiot & Roux, 2010; Farrant et al., 2010). The present findings are therefore consistent with existing research, reinforcing the argument that value perception is a central driver of behaviour in digital marketplaces.

In addition, usage motivations were found to have a positive and statistically significant effect on purchase intention, supporting H4. This result highlights the importance of both utilitarian and hedonic drivers in shaping user behaviour. Participants who reported stronger motivations, such as the desire to find unique products, save money, or engage in more sustainable consumption, were more likely to express higher purchase intention. This finding aligns with previous studies, which emphasise the role of economic, functional, and environmental motivations in second-hand consumption (Hamari et al., 2016; Guiot & Roux, 2010).

Trust was also found to have a positive but comparatively weaker effect on purchase intention, partially supporting H2. This suggests that while trust remains an important factor in online environments, its role may be less dominant when other variables, such as perceived value and motivations, are considered simultaneously. This finding aligns with more recent perspectives suggesting that trust often functions as a baseline condition rather than a primary differentiator in well-established digital platforms. When users already perceive a platform as generally reliable, trust becomes less decisive in driving purchase intention, and other factors, particularly value and personal motivations, become more influential in shaping behaviour.

In contrast, perceived security did not have a statistically significant direct effect on purchase intention, leading to the rejection of H3. Although users generally evaluated the platform as secure, this result suggests that security does not directly influence purchasing decisions when other factors are taken into account. This finding can be interpreted in light of the evolving nature of digital environments, where security is increasingly perceived as a standard feature rather than a competitive advantage.

6. Conclusion

This study examined the factors influencing purchase intention in digital C2C second-hand fashion platforms, focusing on the Vinted application in the Lithuanian market. Specifically, it explored the role of perceived value, trust, perceived security, and usage motivations in shaping users' purchase intention. Primary data were collected through a structured questionnaire and analysed using statistical techniques, including correlation and regression analysis.

The findings indicate that perceived value, usage motivations, and trust are positively associated with purchase intention, with perceived value emerging as the strongest predictor. This highlights the importance of the overall benefits users derive from the platform, including economic advantages, ease of use, and a positive shopping experience. Usage motivations also play a significant role, suggesting that economic, functional, and experiential drivers encourage users to engage in purchasing behaviour. Trust demonstrates a positive but weaker effect, indicating that while it remains important, it is not the primary determinant when other factors are considered. In contrast, perceived security and demographic characteristics were not found to have a statistically significant direct impact on purchase intention, suggesting that these factors function more as baseline conditions rather than active drivers of behaviour.

From a theoretical perspective, the study contributes to the literature on e-commerce and C2C second-hand platforms by providing empirical evidence from a relatively underexplored context. The findings reinforce the central role of perceptual and motivational factors in shaping consumer behaviour, while also suggesting that trust and security may operate as necessary conditions in more mature digital environments rather than as key differentiators.

From a practical standpoint, the results offer useful implications for platform managers and practitioners. Enhancing perceived value through competitive pricing, improved user experience, and high-quality information appears crucial for increasing purchase intention. At the same time, strengthening user motivations by promoting the economic, environmental, and experiential benefits of second-hand consumption can further support platform engagement. Although trust and security were not the strongest predictors, they remain essential for maintaining a positive user experience.

Despite its contributions, the study has certain limitations. It focuses on a single national context, which may limit the generalisability of the findings. The use of self-reported data may introduce response bias, and the quantitative approach does not allow for in-depth exploration of user experiences. Additionally, the study examines purchase intention rather than actual behaviour, which represents a common limitation in consumer research. Future research could extend this work through cross-country comparisons, the use of qualitative

methods, or the inclusion of additional variables such as social influence, information quality, or environmental awareness, in order to provide a more comprehensive understanding of consumer behaviour in digital second-hand platforms.

Ethics Declaration

The study was conducted in accordance with the Declaration of Helsinki, and approved by the Institutional Review Board of Neapolis University Pafos (protocol number 54/2025). This paper is based on the Master's thesis of Maria Ioanna Marmoutzaki, completed at Neapolis University Pafos, with contributions from the co-authors in supervision, analysis, and manuscript preparation. In its current form, the study has not been published elsewhere.

AI Declaration

During the preparation of this manuscript, the authors employed ChatGPT 5.2 (OpenAI) solely to assist with language refinement and improvement of readability. The authors have reviewed and edited the output and take full responsibility for the content of this publication.

Abstract: This study examines how GenAI-native startups enter and position themselves in knowledge-intensive professional services and how their emergence reconfigures disruption dynamics. It adopts a qualitative-dominant multi-method design combining a dataset of 177 consulting-oriented GenAI startups with three semi-structured key-informant interviews. Three patterns emerge. First, startup formation accelerates after foundation models become widely accessible through APIs and cloud infrastructure, suggesting that GenAI operates as enabling infrastructure for a category of entrants rather than as a proprietary innovation owned by individual firms. Second, the evidence does not indicate displacement of incumbents. Startups occupy an intermediate position between consultancies and generalist AI providers, differentiating through domain expertise and deployment-ready applications while depending on upstream model suppliers that are also latent competitors. Third, the three cases combine recurring software revenues with enterprise agreements and usage-dependent infrastructure costs, producing heterogeneous commercial responses, including performance-based pricing in one case. The study qualifies Big Bang Disruption for knowledge-intensive professional services: its supply-side conditions hold, whereas near-zero marginal costs and immediate adoption do not. It also specifies the properties and boundary conditions of a triadic competitive configuration. The findings inform startup positioning above the model layer, coopetitive incumbent responses, and investment in a capital-concentrated market.

Keywords: Generative AI, GenAI Startups, Business Consulting, Big Bang Disruption

1. Introduction

Generative artificial intelligence (GenAI) is reshaping the boundaries of knowledge-intensive work, extending automation beyond structured and codifiable tasks to synthesis, interpretation, and content generation. Business consulting represents a paradigmatic case: an industry historically reliant on human capital, institutional knowledge, and client relationships, and therefore resistant to prior forms of automation (Kubr, 2002). Recent estimates place the potential annual contribution of generative AI to the global economy between $2.6 and $4.4 trillion, with professional services among the most exposed domains (McKinsey & Company, 2023). Consulting firms are already integrating AI-enabled workflows to improve efficiency and redesign service delivery, and the conditions for competitive disruption in the industry are now in place.

A central feature of this transformation is the entry of a new class of market participants. GenAI-native startups are translating advances in large language models into targeted applications for specific consulting activities, entering a market long dominated by incumbent firms such as the Big Four and global strategy consultancies. At the same time they operate under competitive pressure from large AI infrastructure providers, including OpenAI, Google, and Anthropic, whose general-purpose models increasingly overlap with specialised solutions. The result is a triadic competitive structure in which new entrants sit between incumbent service firms and generalist GenAI providers.

Existing literature addresses these dynamics only partially, and from three directions. Research on GenAI and the future of work documents the exposure of knowledge-intensive professions to automation (Eloundou et al., 2023; Brynjolfsson et al., 2023), but at the macro level of aggregate employment rather than firm-level competition. Disruption research explains how technological discontinuities enable entrants to challenge incumbents (Christensen, 1997; Downes & Nunes, 2013), yet has been applied largely to product markets. Work on consulting characterises the pyramid delivery model and its knowledge economics (Hansen et al., 1999; Kubr, 2002) without addressing entrants whose core capability is externally supplied. What is not known is therefore specific: how GenAI-native startups position themselves within professional service markets, which consulting activities they target, and how their value propositions differ from both incumbent firms and generalist AI providers. This matters theoretically, because disruption frameworks derived from product markets may not

hold where expertise and trust govern exchange, and practically, because incumbents, entrants and investors are committing resources under competing assumptions about how this market will consolidate.

The study is guided by the following research question: "How do GenAI-native startups enter and position themselves within knowledge-intensive professional service markets, and how does their emergence reconfigure traditional disruption dynamics?" It addresses this question through an exploratory qualitative investigation combining descriptive analysis of an original dataset of 177 GenAI startups with semi-structured founder interviews. The findings indicate that these firms are not displacing consulting incumbents but are instead occupying an intermediate position between them and generalist AI infrastructure providers, entering as the enabling infrastructure becomes available and adapting their commercial models to the variable costs it imposes. Theoretically, the study modifies Big Bang Disruption for knowledge-intensive professional services, where its supply-side conditions hold but its cost and adoption assumptions do not, and specifies the properties and boundary conditions of a triadic competitive structure. Practically, the results inform startup positioning beyond the model layer, incumbent responses that are more coopetitive than competitive, and investment in a market of high capital concentration.

2. Literature Review

2.1 Generative Artificial Intelligence

Artificial intelligence initially relied on rule-based systems and statistical classifiers requiring explicit human logic. Deep learning shifted this by learning hierarchical representations from data (LeCun et al., 2015), while Transformer architecture (Vaswani et al., 2017) replaced sequential processing with self-attention, enabling large-scale training of models such as BERT (Devlin et al., 2019), the GPT family and multimodal systems with cross-domain capabilities. Generative artificial intelligence (GenAI) refers to models that generate meaningful content, including text, images, code and audio, from patterns learned during training (Feuerriegel et al., 2024). Unlike earlier systems focused on classification or retrieval, GenAI synthesises outputs from open-ended prompts and operates across tasks without task-specific redesign. Three properties are central here. Generativity enables knowledge-intensive tasks such as drafting analytical reports and strategic scenarios. Accessibility through APIs and cloud infrastructure lowers technical and financial barriers to AI-enabled applications. Scalability allows one model to support heterogeneous applications at marginal deployment costs approaching zero (Feuerriegel et al., 2024). Together, these properties extend automation into unstructured knowledge work involving synthesis and interpretation (Eloundou et al., 2023; Brynjolfsson et al., 2023), where business consulting creates value.

2.2 Big Bang Disruption and the Competitive Implications of GenAI

Disruption has been central to innovation management since Christensen (1997) showed how entrants can displace incumbents by targeting underserved segments with cheaper, initially inferior solutions that gradually improve and redefine the market. Downes and Nunes (2014), however, identify a distinct class of innovation that escapes this gradual logic. Big Bang Disruption (BBD) describes innovations entering markets with better performance, lower cost and immediate mass-market scalability, collapsing sequential diffusion stages and rendering incumbent advantages obsolete before defensive repositioning is possible.

At first sight, GenAI approximates the three BBD conditions, particularly on the supply side. First, unencumbered development: standardised AI infrastructure and API-based delivery reduce the cost and complexity of developing AI-enabled applications (Feuerriegel et al., 2024). Second, undisciplined strategy: from their initial public releases, generative models demonstrated cross-domain capabilities and performed competitively with specialised professionals in tasks from legal analysis to financial reporting without domain-specific redesign (Eloundou et al., 2023). Third, unconstrained growth: ChatGPT reached 100 million users within two months, the fastest adoption rate recorded for a consumer technology, followed by rapid enterprise adoption (Reuters, 2023).

Unlike Christensen's model, where incumbents retain time to respond because entrants initially underperform, BBD compresses or eliminates this window by competing immediately on performance and cost. This matters in knowledge-intensive industries, where incumbency rests on accumulated human capital rather than physical assets and language models can partly replicate work previously requiring substantial organisational resources.

2.3 Business Consulting: Incumbent Models and the Impact of GenAI

Business consulting is a paradigmatic form of knowledge-intensive work (Kubr, 2002). Incumbents have historically relied on three foundations: human capital organised through hierarchical delivery models, long-term client relationships and brand reputation. Their pyramid structure combines junior analysts handling data collection and analysis with senior professionals providing strategic judgment and client management. Growth therefore requires proportional expansion of human resources, while marginal costs remain tied to labour. Profitability depends on high billing rates and stable utilisation, a model long protected by the difficulty of codifying and automating consulting knowledge (Hansen et al., 1999). GenAI challenges this structure by making information-intensive tasks such as document analysis, regulatory review and market research partially automatable, while also supporting content and insight generation with narrowing quality gaps relative to human work (Eloundou et al., 2023).

US labour-market evidence indicates slower junior hiring alongside rising demand for senior professionals able to orchestrate AI-augmented workflows (Hosseini Maasoum and Lichtinger, 2025). GenAI therefore compresses the labour required to produce inputs for strategic judgment without replacing human expertise. Its impact concentrates on human-capital delivery, while client relationships and reputation remain less exposed. Incumbents consequently face both efficiency gains in junior work and erosion of the resource base on which traditional consulting models depend.

2.4 Literature Gap

Each of the three literatures reviewed above leaves this problem unaddressed, and their separation is itself part of the difficulty. Research on AI and the future of knowledge work establishes that generative models perform tasks previously considered resistant to automation, with measurable labour-market implications (Eloundou et al., 2023; Brynjolfsson et al., 2023; Hosseini Maasoum & Lichtinger, 2025), but treats exposure at the level of occupations rather than of the firms supplying the technology. The disruption literature provides frameworks for how discontinuities enable entrants to challenge incumbents, yet empirical applications to knowledge-intensive professional services remain limited, and GenAI-native startups have not been examined as a distinct category of entrant. Work on consulting models incumbent delivery economics but predates the arrival of competitors whose core capability is externally supplied.

This gap is consequential because these startups do not confront a single incumbent category. They must differentiate simultaneously from consulting firms offering human-intensive expertise and from generalist AI providers offering powerful but domain-agnostic models, a triadic configuration that remains underexplored in disruption research. The present study addresses that gap empirically, grounding the application of Big Bang Disruption in a knowledge-intensive professional service market.
More specifically, existing disruption models do not explain how entrants compete when the enabling technology is controlled by upstream providers that simultaneously act as suppliers and potential downstream competitors.

3. Methodology

This study adopts an exploratory, qualitative-dominant multi-method design (Yin, 1984; Lin, 1998) comprising two sequential phases: descriptive mapping of GenAI-based consulting startups and semi-structured interviews with three key informants. This design reflects the research question's dual requirements: breadth and comparability to map the market, and depth to interpret the strategic logics underlying observed patterns. The study is exploratory because this nascent segment lacks established constructs, performance baselines and comparable conditions. A large-scale survey would therefore presuppose categories still being identified, while quantitative performance analysis would be premature for predominantly early-stage, privately held firms without standardised public financial data.

Crunchbase was selected as the primary source because of its coverage of technology startups and use in entrepreneurship research. Its self-reported descriptive and sector classifications were treated as provisional and cross-checked against company websites, while financial fields were treated as verified. The advanced-search query combined five criteria: founding year from 2015 onwards; active status; classification under Artificial Intelligence or Generative AI; assignment to Management Consulting, Consulting, Compliance or Data Governance; and keyword-based exclusion of adjacent domains such as AR/VR/XR, advertising technology and

Web3. It returned over 3,000 firms, illustrating both the scale of AI entrepreneurship and the limitations of self-reported categories.

Refinement occurred in two stages. First, GPT-4.1 and Gemini 2.5 Pro, with web-search capability, screened candidates in batches of about 200 by comparing company descriptions with live websites and producing provisional classifications. These outputs informed but did not determine selection: every candidate was manually verified through company websites and other public sources. Manual review also resolved boundary cases, retaining firms whose core offering applied generative AI to a consulting domain and excluding those where AI was merely nominal or the entity was not a genuine startup; no duplicates were found. Inclusion required generative AI as a core offering component, primarily SaaS or cloud-based delivery, and consulting-related functionality. Deep-tech venture-capital portfolios, including Y Combinator, Sequoia Capital, Founders Fund and Italian and international early-stage investors, were also screened for overlooked firms. The final dataset contains 177 startups across Operations Consulting (88), Strategy Consulting (37), Compliance (35) and Data Protection (17). Section 4 reports the analysed dimensions; cumulative concentration ratios assessed funding concentration among the 96 funded firms.

The second phase comprised three semi-structured interviews with startup representatives selected as key informants because of their knowledge of strategic direction, business models and technological architecture. Purposive selection maximised variation in geography (two Italy-based, one US-based), specialisation (legal-tech compliance, strategy and deep-tech operations) and company stage rather than representativeness. The interviews therefore provide interpretive depth rather than generalisable estimates. The protocol covered five domains derived from the research question and census findings: founding rationale, business model and go-to-market strategy, technological architecture and model dependencies, perceived effects of GenAI on consulting, and growth and competitive outlook. All interviews were audio-recorded and transcribed.

Analysis followed a framework-based thematic approach. The five common domains formed the initial coding frame, allowing transcript segments to be assigned consistently despite non-linear conversations, while coding remained open to inductive themes, notably pricing, model dependency and relationships with incumbents and general-purpose AI providers. The two sources were integrated through triangulation, comparing interview themes with corresponding census dimensions so that qualitative evidence could interpret observed structural patterns, including the relationship between software-based distribution and interviewees' accounts of pricing and cost dynamics.

4. Findings

4.1 Market Structure and Geographic Concentration

Startup formation tracks the availability of enabling infrastructure rather than preceding it. Entry is sparse before 2015, shows isolated peaks in 2016 and 2020, then accelerates continuously from 2022 to a maximum of 37 firms in 2024, the window following the mass-market release of GPT-3.5/4 and Gemini; Geographically the sample concentrates in a few hubs, with a pronounced lead for the United States.

Table 1:Geographic distribution of the identified startups

Country	Firms (n=177)	Share
United States	62	35.0%
European Union	38	21.5%
United Kingdom	20	11.3%
Canada	9	5.1%
India	7	4.0%
Australia	4	2.3%
Other	37	20.9%
Total	**177**	**100%**

Italy is the largest single EU country (10 firms), included in the EU aggregate.

Capital, however, behaves differently. Among the 96 funded firms it is sharply concentrated: the eleven largest raised 80.9% of all capital ($4.55B of $5.62B), and the top twenty account for 92.3% ($5.19B). The skew is also

national: within that top tier US firms hold roughly three quarters of the capital and UK firms a further 13.4%, while continental EU firms, numerically comparable across the full sample, hold under 6%. This asymmetry maps onto the growth trajectories reported in the interviews. The US strategy startup operated in a deeper, more risk-tolerant capital market, whereas both Italian firms described slower capitalisation; the deep-tech founder singled out the difficulty of raising for deep tech in Italy relative to France or the UK.

4.2 Competitive Positioning Between Incumbents and AI Providers

The funded subset (96 of 177 firms) underpins every metric that requires financial or go-to-market data, and the tables below state their base explicitly. By volume the sample tilts toward operations consulting, but capital intensity inverts the ranking: operations attracts the largest absolute capital through sheer firm count, while strategy consulting commands the highest average funding per firm.

Table 2: Cluster composition and reported funding

Cluster	Firms (n=177)	Share	Funded (n=96)	Total capital	Avg / firm
Operations Consulting	88	49.7%	41	$3.01B	$34.3M
Strategy Consulting	37	20.9%	18	$1.55B	$41.9M
Compliance	35	19.8%	23	$0.98B	$27.9M
Data Protection	17	9.6%	14	$0.08B	$4.7M
Total	**177**	**100%**	**96**	**$5.62B**	

The 177-to-96 transition is itself informative: the regulated clusters convert a far larger share of their firms into funded status (compliance 23 of 35, data protection 14 of 17) than operations (41 of 88), indicating that investor selectivity concentrates on regulated niches even where absolute capital is smaller.

Beyond cluster, the funded firms share a recognisable solution and go-to-market profile.

Table 3: Industry orientation and solution architecture of the funded subset

Dimension	Category	Firms	Share
Industry orientation	Cross-industry	69	71.9%
	Single-industry	27	28.1%
Solution architecture	Vertical (task-specialised)	49	51%
	Horizontal (cross-functional)	47	49%

Table 4: Acquisition-channel occurrences in the funded subset

Dimension	Category	Count	Share
Acquisition channel*	Direct sales	84	41.6%
	Digital / SaaS	49	24.3%
	Consulting-mediated	35	17.3%
	System integrators	34	16.8%

* Non-exclusive: a firm may appear under several categories.

Table 5: Main industries served by the funded subset

Industry served (n=96)*	Firms
Finance	47
Healthcare	23
Manufacturing	20
Retail	19
IT	17
Technology	16

* Non-exclusive; cross-industry firms serve several sectors, so counts exceed 96.

The balance shifts by cluster: operations and data protection skew horizontal and cross-industry, whereas compliance skews vertical and concentrates on the legal function, consistent with task-specific regulatory tools. Direct enterprise sales leads in every cluster, and finance in all but strategy, where retail leads.

Two features recur across all three interviews. The first is a reputation barrier: as young firms in a market built on long-term relationships, all three initially struggled to gain traction against incumbents. This surfaced as long sales cycles and caution toward startup vendors for the Italian legal-tech firm, the need to prove solidity and ROI as young graduates for the US strategy startup, and a perception of instability relative to established consultancies and hyperscalers for the deep-tech platform. The second is that each framed competition as two-sided rather than against a single rival, locating itself at an intermediate application layer between incumbent consultancies and generalist model providers. The Italian deep-tech CEO put it sharply: "Our competitor is not Deloitte, but Microsoft: they sell the bricks, we sell the house already built." The strategy startup's CTO held that rivalry with large AI providers is only partially relevant, since those firms optimise horizontally for breadth rather than domain depth, and contrasted a value-based, win-win model against incumbents' time-based billing. The legal-tech firm described a market polarised between generic LLMs carrying hallucination risk in regulated domains and static legal databases lacking interactivity, occupying the middle ground through a curated regulatory corpus.

This intermediate position can be summarised as a triadic structure that bilateral disruption models do not fully capture.

Table 6: Triadic competitive configuration

	Incumbent Consultancies	Generalist AI Providers	Genai-Native Startups
Core offering	Human expertise, institutional knowledge, client relationships	General-purpose models optimised for breadth	Domain-specialised applications on third-party models
Distinctive asset	Brand, delivery capacity, client trust	Model capability and infrastructure	Curated proprietary corpus, vertical workflows
Exposed weakness	High time-based cost, slower AI adoption	Breadth over depth, hallucination in regulated tasks, not deployment-ready	Dependence on external model providers
Relation to startups	Coopetitive: rival and distribution channel	Supplier and latent competitor	n/a

4.3 Commercial Configurations and Technological Dependencies

SaaS distribution predominates, but the token-based cost of inference conflicts with fixed subscription logic, a tension all three founders identified as a constraint on sustainability. Each resolves it differently, and none locates its defensibility in the model layer.

Table 7: Commercial configurations and technological dependencies of the three cases

Startup	Pricing Structure	Models and Infrastructure
Italian legal-tech	Tiered fixed-fee for professionals plus enterprise agreements	Multi-provider; RAG over an internally built regulatory corpus
US strategy consulting	Flat SaaS for SMEs; performance-based for enterprise, at 1-2% of incremental value, calibrated over an initial 8-week period	Multi-provider; multi-agent architecture with human validation by former consultants
Italian deep-tech	Annual contracts from 25 users, approx. €200,000/year, with modular skill components	Multi-provider and retrained open-source models; serving-agnostic

None of the three trains a proprietary foundation model, and all integrate several providers explicitly to avoid single-vendor dependency. Differentiation rests instead on a curated regulatory corpus, an orchestration layer with human validation, and ready-to-use vertical applications respectively, all located above the model layer.

4.4 Startups and Incumbent Consulting Firms

The evidence suggests a coopetitive rather than purely adversarial relationship with incumbents. Consulting firms may compete with GenAI-native startups by integrating similar technologies into their own delivery models, but they also operate as users, partners, and routes to market. Consulting-mediated relationships account for 17.3% of the channel occurrences coded in the funded subset. This pattern also appears in two interviews: the legal-tech platform reaches professionals and law firms through a combination of product-led and relationship-based channels, while the deep-tech platform positions consultants as users capable of configuring modular AI components for client-specific tasks.

5. Discussion

The evidence points to three interlocking patterns. Entry into GenAI consulting tracks the availability of transformer-based infrastructure rather than preceding it, forming a market at speed rather than displacing incumbents within it. The resulting firms position themselves between established consultancies and generalist AI providers, differentiating along both fronts at once. And their commercial architecture, predominantly SaaS, sits in tension with a token-based cost structure, producing the hybrid and performance-based adaptations observed in the interviews. Read together, these patterns qualify the disruption frameworks through which such entry is usually interpreted.

5.1 Theoretical Implications

The first contribution specifies how the GenAI context extends the Big Bang Disruption. The original BBD formulation largely assumes that the disruptive offering is controlled by the market entrant (Downes & Nunes, 2014). Here the innovation originates upstream: none of the interviewed firms trains a proprietary foundation model, and all integrate several external providers. Disruption is therefore a market-formation event rather than a firm-level one, lowering barriers for an entire category of entrants simultaneously rather than advantaging any single firm, as the founding-year distribution indicates. This has a consequence BBD does not anticipate. Because the same infrastructure reaches incumbents on equal commercial terms, incumbents are not technologically excluded; what constrains their response is a pyramid delivery model whose profitability depends on leveraged junior labour and stable utilisation (Hansen et al., 1999; Kubr, 2002). The compressed adjustment window BBD attributes to technological lag is here produced by revenue architecture.

The evidence also qualifies BBD's condition of unconstrained growth, which precludes marginal costs approaching zero. Token-based inference imposes a variable cost floor that rises with usage, and the pricing adaptations documented above are responses to it. A second attenuation operates on the demand side: adoption in professional services is gated by institutional credibility rather than product quality, as the reputation barrier reported by all three founders and the dominance of direct enterprise sales both indicate. The pattern is therefore one of asymmetric diffusion, in which BBD's supply-side conditions hold while its demand-side prediction does not. Entry is immediate and categorical; adoption remains incremental and trust-mediated. This reconciles a market formed at Big Bang speed with incumbents that have not been displaced.

The second contribution concerns a triadic configuration absent from traditional entrant-incumbent models, which do not explicitly theorise an upstream provider that both enables entry and can expand into the entrant's application layer (Christensen, 1997). Three properties distinguish it. Dual-role dependency: the AI provider is at once critical supplier and latent competitor, so rivalry runs vertically as well as horizontally. Asymmetric mobility: providers can extend downstream into domain applications at low incremental cost, whereas entrants cannot move upstream, and the multi-provider integration adopted by all three firms is best read as supplier diversification substituting for unavailable vertical integration. Two-front differentiation: value must be established against incumbents on cost and delivery terms and against providers on deployment-readiness and curated domain data, the distinction captured in the founder's contrast between selling bricks and selling the house already built. Together these produce a value-capture squeeze between an upstream cost floor and a price ceiling anchored by incumbent alternatives, which makes business model innovation a condition of survival rather than an accompaniment to positioning.

The configuration is bounded. It should be expected where upstream capability is concentrated, the entrant does not own it, the domain requires knowledge that general models do not encode, and regulatory or trust requirements sustain a defensible application layer. Where these weaken, the structure should revert toward bilateral competition: if upstream capability commoditises into a utility with abundant substitutes, if providers

absorb the application layer, or if domain corpora become publicly available. On this reasoning the regulated clusters, where proprietary and continuously updated corpora are hardest to substitute, should prove the most durable. These are propositions for testing rather than established results.

5.2 Practical Implications

For founders, the asymmetric mobility described above implies that defensible advantage cannot reside in the model layer, which is accessible to all entrants on equal terms. It depends instead on assets built around it: proprietary datasets, domain expertise, and integration into client workflows, which is where the interviewed firms locate their differentiation.

For incumbents, the relationship with GenAI entrants is more accurately coopetitive than competitive. The constraint they face is not access to the technology but the delivery economics of their current model, and the consulting-mediated sales channel observed in the dataset indicates that entrants also depend on them for distribution. Integrating AI-native solutions can therefore capture efficiency gains while preserving the trusted-advisor role that generative AI does not replace (Kubr, 2002).

For investors, the concentration of capital documented here, and its geographic skew toward the United States, indicates that ecosystem conditions continue to shape trajectories in AI-enabled sectors independently of firm-level positioning.

5.3 Limitations and Future Research

Three limitations qualify these findings. First, the dataset relies primarily on Crunchbase, which combines verified financial records with self-reported descriptive fields, so classification inconsistencies are possible and firms without public funding records may be underrepresented.

Second, the evidence base is supply-side by design: founders offer the most direct view of entry and positioning, and of the coopetitive dynamics at the interface with clients and incumbents, but the perspectives of clients, incumbent firms, and practising consultants fall outside its scope. Characterising the broader market impact of GenAI on consulting, as distinct from the entry of the startups driving it, would require a design incorporating those viewpoints.

Third, three interviews provide interpretive depth on the census patterns rather than generalisable estimates, and the boundary conditions proposed above are derived analytically rather than tested. Future research could examine them through larger interview samples, longitudinal tracking of startup trajectories, or comparison across national innovation ecosystems as both the technology and the market mature.

6. Conclusion

This study asked how GenAI-native startups enter and position themselves within knowledge-intensive professional service markets, and how their emergence reconfigures disruption dynamics. Drawing on an exploratory design combining a census of 177 startups with three founder interviews, it offers supply-side evidence on the competitive dynamics of AI-enabled consulting markets.

Entry is enabled by external infrastructure rather than by proprietary innovation, lowering barriers for entire categories of entrants at once (Eloundou et al., 2023; Feuerriegel et al., 2024). Rather than displacing incumbents, these firms occupy an intermediate position between consultancies and generalist AI providers, differentiating against both. Their commercial models are constrained by the same infrastructure that enables them, as token-based costs sit uneasily with recurring SaaS revenue and drive hybrid and performance-based adaptations.

Two contributions follow. First, the study modifies Big Bang Disruption for knowledge-intensive professional services: entry follows the framework's supply-side logic, but token-based costs and trust-mediated adoption qualify its predictions of unconstrained growth and immediate diffusion. Second, it specifies a triadic competitive structure, and the conditions under which it holds, in which startups differentiate simultaneously from incumbent service providers and from technology infrastructure firms.

Whether that structure persists depends on conditions this study identifies but cannot test: whether upstream capability commoditises, whether providers absorb the application layer, and whether domain corpora remain proprietary. Tracking these boundaries as the market consolidates is the natural extension of this work.

Ethics Declaration

This study draws on anonymised qualitative data from voluntary semi-structured interviews with informed startup representatives. Formal ethical approval was not required under the institutional guidelines and national regulations applicable at the time of data collection. Nevertheless, the research followed established ethical standards for studies involving human participants.

AI Declaration

Artificial intelligence tools were used under human supervision for preliminary screening and language editing. GPT-4.1 and Gemini 2.5 Pro supported the provisional classification of publicly available company information, while all inclusion and exclusion decisions were manually verified against company websites and other sources. The authors retain full responsibility for all methodological, analytical, and interpretive decisions.

Abstract: Artificial intelligence (AI) is currently exhibiting rapid changes in shaping and enhancing the entrepreneurial landscape, including the startup ecosystem. While prior research has addressed innovative financial startup systems such as AI-based credit scoring and AI for financial fraud detection, the current understanding of AI's optimal role in startup evaluation remains fragmented. This study addresses the need to critically assess how AI is actually reshaping a part of the startup ecosystem, namely startup investors such as angel investors, venture-capitals, corporate venture capital, governments, financial advisors, and private equities. This systematic literature review with bibliometric analysis examines the landscape of AI applications in startup investment decision-making across articles published over the past decade in Scopus-indexed journals. Using PRISMA systematic literature review protocols and VOSviewer, 623 articles were considered, and 67 were fully reviewed that were related to artificial intelligence, investment, and startups. We identify three phases in the implementation of AI in this area: methodological sophistication, relational learning, and generative AI. Our review also revealed several research gaps pertaining to its application or usage in several different levels of the startup investment stage. This study offers practical guidelines for practitioners and a theoretical foundation for subsequent research on AI. This research contributes to the entrepreneurship, technology management, and financial management literature by mapping evidence and identifying promising research directions for developing AI frameworks within the startup ecosystem. This study also implies that while investors should attempt AI-driven instruments for decision-making, final human calibration and evaluation should still be done to provide sound alignment with startup investors' financial or investment decisions. As such, the findings provide emphasis on responsible AI adoption within the startup ecosystem.

Keywords: Artificial Intelligence, Entrepreneurship, Investment Decision, Startup Valuation, Venture Capital

1. Introduction

The development of the Industrial Revolution 4.0, which refers to the current trend of automation and data exchange in manufacturing technologies, has positioned startups as new drivers of innovation and economic growth (OECD, 2024). Appropriate investment in potential startups can not only facilitate technological independence and the creation of engineering talents but is also strategic in supporting government objectives, including job creation, increased productivity, innovation, and exports (Mulyawan, Aldianto and Dhewanto, 2023; Wei et al, 2025). However, experts have long described financing these types of new ventures as risky. In fact, according to the Startup Genome Project (2021), 90% of global startups fail within the first 3 to 5 years and one of the main determinants of startup failure is the lack of adequate financial resources from investors, which would enable startup founders to pursue entrepreneurial endeavours (Martielli et al, 2024). These results were obtained from 111 post-mortem analyses of startups. Therefore, understanding the factors that determine investor valuation of a company is a priority for startup development (Nursaadah & Faturohman, 2022).

The startup investment process itself is often faced with high complexity, such as high market uncertainty, information asymmetry, and reliance on subjective assessments of the founding team and untested business models (Azka & Faturohman, 2020; Beyhan et al, 2024; Topaler & Khan, 2025). Moreover, traditional investment decisions frequently depend on investors' intuition, which can lead to missed opportunities or heightened failure risk (Colombo, 2021). To address this issue, alternatives are needed to improve assessment accuracy.

An emerging technology that can potentially leverage decision-making pertaining to startup investment or financing is artificial intelligence (AI). In fact, Ferrati and Muffatto (2021) show that more and more investment companies, including Kleiner Perkins, EQT Ventures, Correlation Ventures, and SignalFire, are using data-driven methods that combine algorithms with human judgement. However, while venture capital (VC) companies are using AI more and more, little research exists to undermine these phenomena (Xu et al 2023).

The focus of this study is to provide a systematic literature review on how AI can be used to help make choices on startup investments and funding. As such, the study is organised around four research questions, which are:

RQ1: How has AI transformed startup investment decision-making?

RQ2: What investment criteria are identified as most critical across the empirical literature, and how do they vary across startup life-cycle stages?

RQ3: At which stages of the investment process does AI intervention offer the greatest marginal benefit?

By addressing these enquiries, this study aims to bridge the gap between theoretical understandings of artificial intelligence and practical, real-world deployment in venture capitals and other stakeholders. We contribute to the discourse on artificial intelligence by synthesising fragmented empirical findings on AI deployment in startup investment decision-making. Ultimately, this work hopes to provide insights for both practitioners seeking to optimise their investment decisions and scholars in the fields of business and management and artificial intelligence.

2. Methodology

2.1 Review Approach

The systematic literature review (SLR) approach is used in this study because it can "ensure transparency, replicability, and methodological rigour in synthesising the research body" (Pandey and Mohan, 2024). We followed the PRISMA 2020 protocol (Page et al, 2021) for SLR with four distinct stages, as shown in Figure 1, and used VOSViewer to identify relations within the network of papers.

2.1.1 Identification

The search was conducted using the Scopus and Springer databases. The terms 'startup', 'investment', 'financing', and 'artificial intelligence' were combined to create a search approach that was intended to find records related to the research scope and research questions. The final search string is as below:

("invest" OR "investor" OR "investment" OR "venture capital" OR "fund*" OR "valuation") AND ("artificial intelligence" OR "AI" OR "Predictive Analytics" OR "Natural Language Processing" OR "Large Language Models") AND ("startup*" OR "start-up" OR "start up")

Table 1 shows the number of articles that were reduced using several inclusion criteria such as years, publication type, language, and filtered keywords. The final number of papers that were identified from both databases was 623 papers.

Table 1: Search Results Criteria in Databases

Inclusion Criteria	Scopus Database	Springer Database
Search Fields: title, abstract, and keywords	17,959	16,463
Years: 2021-2026	14,738	10,759
Publication Type: Journal Article	10,099	2,071
Language: English	9,896	2,066
Field: Business, management, accounting; economics, econometrics, finance.	4,141	797
Filtered Keywords: artificial intelligence, startup	581	54

2.1.2 Screening

Each unique source was then assessed against pre-specified inclusion and exclusion criteria. Articles were included if they explicitly investigated the use of AI, ML, LLMs or related techniques in connection with startup or entrepreneurial-firm investment, financing, valuation, screening, recommendation or success prediction. Meanwhile, articles were excluded if they addressed AI in entrepreneurship without any link to investment or financing, covered general financing without a startup focus, or addressed startup financing or investment but without AI. The final number of studies included in this SLR is 67.

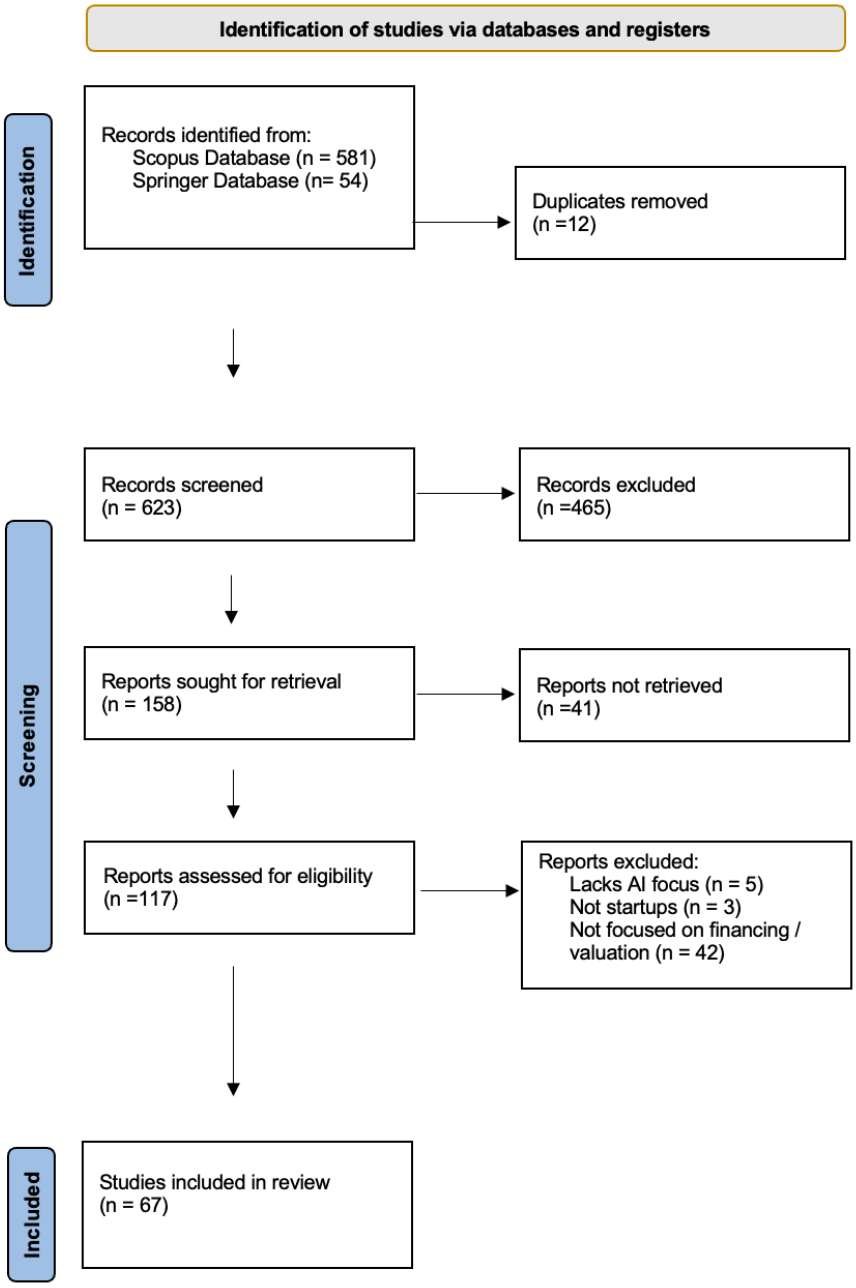

Figure 1: PRISMA results

3. Bibliometric Results

After results of articles were pooled, a bibliometric analysis was generated. First, through VOSviewer, a keyword co-occurrence network was generated to map the intellectual structure of the reviewed literature. As can be seen in Figure 2, the visualisation reveals two distinct but highly interconnected thematic clusters. The first cluster (red) encapsulates the broader startup ecosystem, characterised by strong linkages between "artificial intelligence" (the most prominent node), "entrepreneurship", "startups", and "innovation". The second cluster (green) delineates the specific operational mechanics of venture funding, highlighting the triad of "investments", "decision-making", and "machine learning". The central positioning of the artificial intelligence node illustrates its role as a pivotal bridge, demonstrating how broad entrepreneurial innovations are increasingly underpinned by specific, data-driven methodologies (such as machine learning) used to optimise investment decision-making processes.

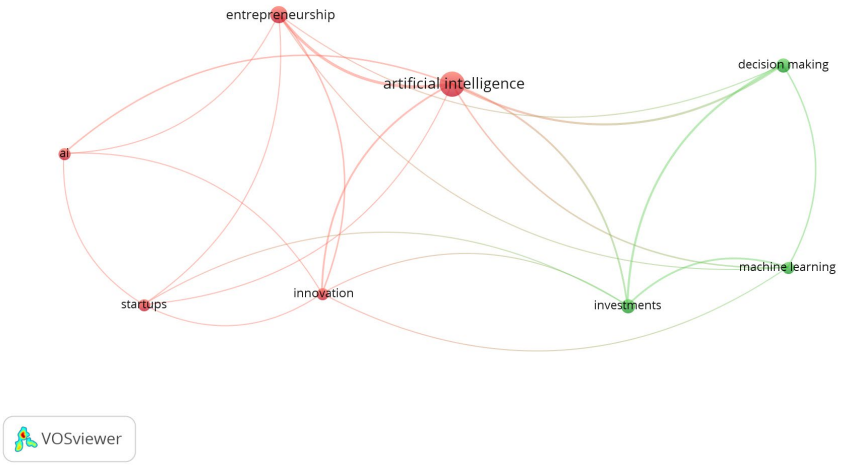

Figure 2: Co-occurence results

Next, after reviewing metadata from the included studies, we were able to track the most outlets used for publishing research relevant to this field and topic. Table 2 has identified journals with the most citations. The relatively modest citation metrics observed across these publications largely reflect the nascent and highly specialised niche of artificial intelligence applications in startup financing. Because the integration of algorithmic decision-making into venture capital is a rapidly emerging frontier, the academic discourse remains in its developmental infancy and has not yet had the longitudinal runway required to accumulate the massive citation volumes typical of more mature management disciplines.

Table 2: Top Journals Based on Citations

Source	Citations
International Journal of Entrepreneurial Behaviour and Research	67
Foundations and Trends in Entrepreneurship	33
Journal of Innovation and Knowledge	10
Journal of Technology Transfer	7

Finally, several respectable publications with the most citations were also discovered, as can be shown in Table 3. An examination of these works indicates that artificial intelligence is radically altering entrepreneurship across numerous levels of analysis, from macro-environmental policy to micro-level venture operations. At the ecosystem level, Hannigan (2022) demonstrates that AI, coupled with advanced text analytics like topic modelling, can uniquely capture both the cultural and material infrastructures of emerging entrepreneurial networks, thereby equipping policymakers with richer data for economic intervention. Within the corporation, AI's disruption is most pronounced in strategic decision-making (SDM). Csaszar (2024) gives solid evidence that existing big language models can analyse and produce corporate plans at a skill level comparable to seasoned investors and entrepreneurs. This cognitive augmentation extends directly into the venture conception and product development phases. Schiavone (2023) illustrates through multiple case studies how AI interventions forge new organisational processes and reduce resource costs during venture creation, while Raneri (2023) successfully operationalises this by embedding AI predictive algorithms directly into the Lean startup "build-measure-learn" loop to forecast product desirability under high uncertainty. However, despite these deep multi-level implications, the quick explosion of interest has resulted in a highly fragmented corpus of knowledge.

4. Thematic Analysis and Discussion

4.1 RQ1: How has AI Transformed Startup Investment Decision-Making?

Several researchers have recorded the transformation of startup investment, from human-based decision-making to integrating algorithmic insight, but none have recorded the whole replacement of the human agent in decision-making. For example, Ferrati and Muffatto (2021) recorded the early shift and found seven common research goals that machine learning works on: predicting a company's exit event, predicting future funding events, predicting the next milestones, predicting investor–company relationships, making investment recommendations, predicting valuations, and classifying firms by industry. They show that random forest has generally been the most consistently effective algorithm for classification problems, with three studies achieving accuracy, recall and AUCs above 90% on the exit-prediction task. Crucially, they frame ML (machine learning) as a decision-support layer; the final commitment of capital should remain with the practitioner because predictions are not decisions.

In all, we found that AI transformation has happened in three phases. The first phase is methodological sophistication. Zhang et al (2023) develop an integrated differential-evolution and adaptive-moment-estimation neural network (Adam-ENN) tailored to early-stage valuation, outperforming least squares, ridge regression, deep neural networks and random forest on both R^2 and root-mean-squared error. Blanquet et al (2025) benchmark eight algorithms (decision trees, random forest, XGBoost, support vector machines, neural networks, ridge regression, k-nearest neighbours and C5.0) and report a Mean Absolute Percentage Error of roughly 34.9%, a thirty per cent improvement over industry benchmarks. They explicitly reject deep learning for the small-sample, high-dimensional VC context and prefer Local Interpretable Model-agnostic Explanations (LIME) to SHapley Additive exPlanations (SHAP) because deal-by-deal evaluation aligns with localised explanations.

The second phase is relational learning. Xu et al (2023) develop a venture-capital knowledge graph from CrunchBase and OriginsInfo, capturing 107,507 entities and over 376,000 relations among VCs, startups, founders, employees, educational institutions, ethnic origins, cities and industries. Combining graph embeddings (using TransD) with meta-path counts, their SocioLink framework significantly outperforms four state-of-the-art benchmarks. Relational learning thus introduces a fundamentally new modality of information – the social and structural ties of investors and founders – that transactional models cannot capture.

The third phase is generative AI, which refers to artificial intelligence systems that can create content, such as text, images, or music, based on input data. For instance, Csaszar et al (2024) show that LLM scores of 138 startup-competition business plans correlate at 0.52 with the average of 250 professional investors, with intraclass reliability between LLM and VC ratings (0.51) actually exceeding inter-rater reliability among individual VCs (0.25). Ramoglou et al (2026) also argued, drawing on a Wittgensteinian language-centred view, that mastery of relevant 'language games' may itself constitute the kind of competence required for entrepreneurial narrative work. Together these papers suggest that AI now contributes not only predictive analytics but also evaluative judgement – albeit imperfect, biased and bounded judgement, as discussed under RQ4.

Apart from the deal-screening room, AI has also changed the way institutions finance deals. Antoniuk and Ivens (2026), interviewing twenty-three professionals across eighteen German entrepreneurship infrastructure organisations (EIOs), find that generative AI is automating document creation, customer queries and market analytics, while shifting expert roles toward higher-value strategic-consulting tasks. Trawnih et al (2025) demonstrate that AI, together with firm capabilities, explains 57.2% of the variance in supply chain finance outcomes for 349 Jordanian startups, with blockchain and trust playing partial mediation and moderation roles, respectively. The transformation is therefore both vertical (within investor workflows) and horizontal (across the institutions that channel capital to startups).

4.2 RQ2: Investment Criteria Across Life-Cycle Stages

Across the literature, investment criteria converge on five groups: team and human capital; founder and investor networks (social capital); technology and intellectual property; financial and operational signals; and market and traction signals. Their relative weight varies systematically across life-cycle stages.

4.2.1 Team and Human Capital

Almost every empirical paper in our sample assigns team a leading role. The ten-dimension rubric of Csaszar et al (2024) places the team at the top of the list, alongside the execution plan, financials, writing quality, innovation, market opportunity, competitive advantage, product, investment potential and viability. Carrera et al (2025) treat team characteristics as one of five Quality 4.0-aligned criteria. In their case study, the most important criterion is innovation and technology (weight 0.33), followed by team (0.22) illustrating that the weighting of team relative to technology depends on context but rarely vanishes.

4.2.2 Networks and Social Capital

Zhang et al (2023) report that the single most important predictor of early-stage valuation is the number of VC investors in the funding syndicate, with VC investors' social capital playing a substantial secondary role. Xu et al (2023) find that the most informative SocioLink meta-paths are employment-affiliation overlap between VC and startup employees, ethnic connection and the industry relatedness of the VC's prior investees. Networks therefore matter both directly (more co-investors signal quality) and indirectly (proximity drives matching).

4.2.3 Technology, IP and Innovation

Blanquet et al (2025) identify the Total Cost of Ownership and the Value Added Intellectual Capital coefficient as particularly informative for early-stage technology firms. However, Zhang et al (2023) report a striking counter-finding: patent counts convey little useful signal in early-stage entrepreneurial-firm valuation, contradicting a long tradition that treats patents as quality proxies. Carrera et al (2025), by contrast, weight 'patents and market potential' jointly at 0.20. The literature thus disagrees on the marginal value of formal IP, with the disagreement plausibly explained by sectoral and stage differences.

4.2.4 Financial and Operational Signals

Blanquet et al (2025) report that 37 of 54 statistically significant predictors are financial metrics, contributing the largest cumulative variance-importance score and validating the centrality of financial performance to valuation. However, they also stress that non-financial categories particularly team and management show statistically significant influence, supporting a hybrid valuation strategy that integrates traditional financial data with intellectual-capital and cost-structure indicators.

4.2.5 Market and Traction Signals

Siddik (2026) demonstrates that funding-stage signals themselves operate as quality cues. Analysing 561 generative-AI startups with two-stage least squares and method-of-moments quantile regression, the study shows that angel and seed funding are essential for early formation but are associated with lower total funding amounts, whereas Series A, B and C investments significantly increase total funding. Team size, investor diversity and LinkedIn engagement all amplify funding success implying that signals visible to AI scrapers are themselves valuation-relevant features.

Life-cycle stage also can shift the weights. At pre-seed and seed, with little financial history, signals about team, network and digital footprint dominate (Zhang et al 2023; Xu et al 2023). At Series A, technological proof and intellectual capital metrics like the Value Added Intellectual Capital coefficient gain weight (Blanquet et al 2025). At Series B and beyond, financial performance metrics dominate and traction signals such as prior funding stage become dispositive (Siddik 2026). The empirical message is that no single criterion is universally critical what matters most depends on where the firm sits on its development trajectory.

4.3 RQ3: Stages of Greatest Benefit From AI

The investment process can usefully be broken down into deal sourcing, screening, due diligence, valuation, deal structuring, post-investment monitoring and exit decisions. The literature suggests that AI's marginal benefit is largest at the upstream stages and reduces as the decision moves toward final commitment.

4.3.1 Deal Sourcing and Screening

This is where the evidence is strongest. Ferrati and Muffatto (2021) note that filtering large funnels of opportunities is precisely where ML models excel, citing several studies achieving over 90% accuracy on exit prediction. SocioLink (Xu et al 2023) delivers measurable uplift over four state-of-the-art benchmarks for matching VCs with startups, with relational features explaining most of the gain. Csaszar et al (2024) demonstrate that LLMs can score business plans rapidly and consistently, with strong correlation to professional investor scores making them a natural triage layer when an accelerator faces hundreds of applications it cannot fully review by hand.

4.3.2 Due Diligence and Valuation

Zhang et al (2023) show that ML can produce comprehensive valuations for early-stage firms that traditional methods cannot value at all, but emphasise the importance of partial-dependence analysis to surface non-linear relationships. Blanquet et al (2025) report a thirty-percent reduction in valuation error but explicitly require LIME-based local explanations because deal-by-deal scrutiny is the norm. Trawnih et al (2025) demonstrate that AI improves credit evaluation in supply chain finance contexts, particularly for startups underserved by traditional banks suggesting that AI's due-diligence value is highest where conventional data infrastructure is thinnest.

4.3.3 Pitch Evaluation and Pitch Refinement

Two findings deserve emphasis. First, AI evaluations of pitches correlate with realised fundraising outcomes more tightly than evaluations from a benchmark sample of human investors (Kleinert and Urbig 2026). Second, AI-rewritten pitches are themselves rated higher by human evaluators by 0.14 standard deviations on average and the uplift is largest for plans previously rejected by accelerators (Csaszar et al 2024). This suggests a striking dual benefit: AI helps investors triage pitches and helps founders craft them, with potentially democratising effects for entrepreneurs without privileged networks (Ramoglou et al 2026).

4.3.4 Final Commitment Under Uncertainty

This is where AI's marginal benefit narrows. Kleinert and Urbig (2026) warn that LLMs may struggle in genuinely novel situations where future possibilities are neither analysable nor predictable using statistical reasoning. Their finding that LLM survival predictions collapse for unseen ventures is a powerful caution. Sycophancy, anchoring and herding biases compound the problem. Carrera et al (2025) note that even sophisticated LCJ-based methodologies require tempering with expert judgement when comparing very heterogeneous startups. Ferrati and Muffatto (2021) echo the foundational point: predictions are not decisions, and the final go/no-go remains a human responsibility.

4.3.5 Post-Investment Monitoring and Exit

Recent research does not touch much on this stage, but Ferrati and Muffatto (2021) and Blanquet et al (2025) both flag continuous valuation and recalibration as an emerging frontier. Antoniuk and Ivens (2026) also note that stakeholders see analogous opportunities for AI-supported portfolio personalisation. Marginal benefits at this stage therefore appear real but are less established empirically than benefits upstream.

In short, AI's marginal benefit is greatest where the volume of candidates is large, the data signals are noisy but plentiful, and final stakes are not yet committed. Aziz et al (2026) synthesizes the implication: AI amplifies entrepreneurs' and investors' intellectual capital, but its responsible use requires explicit ethical frameworks addressing bias, transparency and data privacy, especially in resource-constrained contexts.

5. Conclusion

This review on the use artificial intelligence in startup investment or financing finds a research field in its early years. Through rigorous SLR methods, we found that (RQ1) classical machine learning and generative AI have changed how startup funding decisions are made by adding predictive, relational, and evaluative layers to a process that used to be dominated by intuition. Nevertheless, at the point of commitment, human judgement is still used. When it comes to investing, the most important factors (RQ2) are team and human capital, networks and social capital, technology and intellectual property (IP), financial signals and market signals. The importance of these factors changes regularly between the seed, Series A, and later stages of a business's life. AI evaluations

and investor tastes are not the same. The marginal benefit (RQ3) is strongest during deal sourcing, screening, and pitch evaluation. It is moderate during due diligence and valuation, and it is lowest during final commitment when there is real uncertainty

Several implications are apparent. First, for investors, AI is best viewed as a sophisticated decision-support layer rather than a replacement for human judgement; the most rigorous studies in the bulk of literature consistently report augmentation rather than substitution. Second, for entrepreneurs, the same tools that empower investors also empower founders LLMs can polish pitches, simulate investor feedback and democratise access to high-quality strategic advice (Csaszar et al 2024; Ramoglou et al 2026). Third, for policymakers and infrastructure providers, opportunities include extending financing access through AI-blockchain supply chain finance (Trawnih et al 2025) and AI-augmented EIOs (Antoniuk and Ivens 2026); obligations include enforcing transparency, auditing for bias and protecting data privacy (Aziz et al 2026).

The bulk of literature also shows clear gaps. Most ML works use Crunchbase or single-region samples, leaving generalisability open. LLM evaluations have been tested primarily on equity-crowdfunding pitches and accelerator competitions rather than professional VC pipelines. Interpretability methods are improving but rarely linked back to investor decision-quality results. Ethical frameworks stay largely aspirational. Finally, the field has yet to grapple seriously with the systemic and reflexive effects of mass AI adoption: if every VC uses similar models learned on similar data, will deal flow homogenise, valuations correlate and tail risks concentrate? These questions point to a rich agenda for further work bridging entrepreneurial finance, AI methodology and the political economy of invention. In sum, AI is reshaping startup investment and financing choices, but the most robust evidence in the literature argues for a hybrid future in which algorithmic insight is married to, not divorced from, human knowledge.

Abstract: This article examines the determinants and intensity of science-business collaboration from the perspective of enterprises in Poland. The study addresses a gap in the literature by distinguishing between two analytically different dimensions of cooperation with scientific institutions: the probability that a company engages in collaboration and the intensity of collaboration measured by the number of cooperation forms used by the company. The empirical analysis is based on survey data from 433 enterprises, of which 104 declared at least one form of cooperation with universities or research institutions. The study combines descriptive analysis with two regression approaches. First, a binary logistic regression model is used to identify the factors associated with the occurrence of collaboration. Second, a Poisson regression model is applied to explain variation in the number of collaboration forms declared by companies. The results show that science-business collaboration is strongly differentiated by company characteristics. Medium-sized and large enterprises are significantly more likely to collaborate than small companies, and they also engage in a broader range of cooperation forms. Innovation activity also plays a central role: both product and process innovation increase the likelihood of collaboration, while process innovation in particular is associated with higher collaboration intensity. Among the institutional variables, the perceived competence of university staff emerges as a consistent positive predictor in both models, while access to research infrastructure is especially important for explaining broader collaboration portfolios. The descriptive findings additionally show that collaboration is concentrated among production and service companies and among enterprises with longer market experience. Taken together, the findings indicate that science-business collaboration remains selective and uneven. Cooperation depends not only on companies' internal capacities and innovation orientation, but also on the practical attractiveness of academic partners and the availability of usable institutional resources. The article argues that policies aimed at strengthening university-industry relations should therefore combine support for companies' absorptive and innovation capabilities with efforts to improve the credibility, competence, and infrastructure accessibility of scientific institutions. By separating the occurrence of collaboration from its breadth, the study contributes to a more nuanced understanding of how enterprise-level and institutional factors shape university-industry interaction.

Keywords: Science-Business Collaboration; Innovation; Enterprises

1. Introduction

Science-business collaboration has become an important topic in debates on innovation, competitiveness, and the societal role of universities. In knowledge-based economies, companies increasingly rely on external sources of expertise, while universities are expected not only to produce scientific knowledge, but also to contribute more directly to socio-economic development. As a result, collaboration between scientific institutions and enterprises is now widely treated as a key mechanism supporting knowledge transfer, innovation activity, and the diffusion of research results.

Despite this growing importance, science-business collaboration remains uneven in scope and effectiveness. Some companies engage actively in cooperation with universities and research institutes, whereas others remain outside such relationships or perceive substantial barriers to participation. This makes it important to identify not only the determinants of collaboration itself, but also the factors shaping its intensity. Against this background, the present study examines science-business collaboration from the perspective of enterprises and focuses on the determinants and breadth of cooperation.

2. Theoretical Background

Science-business collaboration has long been recognized as an important mechanism for knowledge transfer, innovation diffusion, and the commercialization of research results. In the literature, this relationship is discussed through several related concepts, including university-industry collaboration, academic engagement, technology transfer, and commercialization. A major contribution of more recent studies has been to distinguish between narrowly understood commercialization activities, such as patenting and licensing, and broader forms

of academic engagement, including joint research, consulting, training, student placements, and other collaborative interactions between universities and companies (Perkmann et al., 2013; Ankrah and AL-Tabbaa, 2015). This distinction is particularly important because many university-business linkages develop outside formal commercialization channels and are embedded in broader relational and organizational processes.

A substantial stream of research has focused on the determinants of university-industry collaboration. Reviews of the field show that collaboration is typically shaped by a combination of company-level capabilities, university characteristics, and institutional conditions. On the side of companies, absorptive capacity, prior innovation activity, organizational resources, and strategic orientation toward external knowledge are consistently identified as important drivers of cooperation. On the side of universities, the competence of academic staff, the relevance of research expertise, and the availability of usable infrastructure increase the attractiveness of scientific institutions as collaboration partners. Broader environmental and institutional factors, such as public support, incentives, and intermediary structures, also influence whether and how such partnerships emerge (Perkmann et al., 2013; Ankrah and AL-Tabbaa, 2015; Rybnicek and Königsgruber, 2019).

Another major strand of the literature concerns barriers to collaboration. Prior studies show that cooperation between science and business is often constrained by differences in goals, time horizons, organizational culture, and expectations regarding outcomes. Administrative complexity, legal uncertainty, intellectual property concerns, and high transaction costs can further weaken cooperation incentives (Bruneel et al., 2010). demonstrated that many barriers are relational and experiential rather than purely technical, and that previous collaboration experience can reduce some of these constraints over time. More recent contributions also emphasize that barriers vary across stages of collaboration, suggesting that initiation, implementation, and continuation of cooperation may depend on different organizational and institutional conditions (O'Dwyer et al., 2023).

The literature also highlights that successful collaboration depends not only on the presence of resources, but also on the quality of coordination and alliance management. Studies on university-industry relations increasingly stress the importance of trust, communication quality, mutual understanding, and the ability to manage collaborative interfaces. In this view, science-business cooperation is not merely a transactional exchange but a relational process that requires organizational capabilities on both sides. This perspective is especially relevant in studies showing that universities and companies often differ not only in objectives but also in operating logics, which makes intermediary mechanisms and brokerage functions particularly important (Rybnicek and Köonigsgruber, 2019; Leischnig and Geigenműller, 2020)

In parallel, the role of intermediaries such as technology transfer offices, science parks, liaison units, and other brokerage institutions has become more visible in the literature. These actors are expected to reduce coordination costs, facilitate contact formation, support intellectual property management, and improve the translation of academic knowledge into forms usable by companies. Recent reviews suggest that intermediary institutions matter especially where direct collaboration channels are weak, fragmented, or poorly institutionalized . (Friedman and Silberman, 2003; Arroyabe et al., 2025) This strand of research is particularly relevant for analyses that connect enterprise-level collaboration behavior with broader institutional mechanisms supporting knowledge transfer.

The literature also suggests that collaboration should be analyzed as a multidimensional phenomenon. Existing studies often focus either on whether collaboration occurs, on specific channels of knowledge transfer, or on the effects of selected policy instruments. Fewer studies examine, within a single empirical framework, the likelihood of collaboration, the breadth or intensity of collaboration, and the preferences of companies regarding how collaboration should be improved. Yet these dimensions are analytically distinct. The factors that influence entry into collaboration may differ from those that shape the number of collaboration forms, and both may differ from the factors associated with companies' support for specific institutional reforms. This gap provides a strong justification for a multi-model empirical strategy.

The Polish context adds an important institutional layer to this discussion. Research on Poland points to a persistent gap between the formal ambition to build a knowledge-based economy and the practical capacity of universities and companies to cooperate effectively. Analyses of Polish innovation policy suggest that a strong policy emphasis on innovation and commercialization does not automatically generate effective knowledge transfer, especially when institutional incentives, organizational cultures, and channels of interaction remain weak or misaligned (Karpińska, 2020). In this sense, the Polish case is particularly useful for examining not only whether companies collaborate with science, but also which constraints remain most salient and which reforms are perceived as most needed.

At the same time, studies on the entrepreneurial university in Poland show that collaboration with business is increasingly treated as part of the third mission of higher education. Polish contributions emphasize the growing importance of practical cooperation channels, external engagement, and support structures intended to connect universities with their socio-economic environment. However, this literature also indicates that institutional solutions remain unevenly developed and that cooperation often depends on the initiative and capacity of particular units rather than on fully mature systemic arrangements (Bukowska-Piestrzyńska, 2024; Szarek, 2023). This makes Poland a relevant setting for studying the interaction between company-level determinants of collaboration and institutional mechanisms intended to support it.

Against this background, the present study contributes to the literature in two ways. First, it examines science-business collaboration from the perspective of enterprises rather than focusing exclusively on universities or technology transfer offices. Second, it distinguishes between the probability of collaboration and the intensity of collaboration, thereby addressing both the extensive and intensive margins of university-industry interaction. In doing so, the article brings together themes that are often studied separately in the existing literature: determinants and breadth of cooperation.

3. Methodology

The empirical analysis was designed to capture two complementary dimensions of science-business collaboration at the enterprise level: the probability of collaboration and the intensity of collaboration. The models were estimated on survey data from 433 enterprises.

The explanatory variables were selected directly from the enterprise questionnaire. Company characteristics were based on the background questions identifying sector, company size, and company tenure. In the empirical files these variables were coded as sector dummies for production and commerce (with services as the reference category), size dummies for medium and large companies (with small companies as the reference category), and tenure dummies for short and medium company age (with long-established companies as the reference category). Innovation variables were derived from question on the types of innovation introduced during the previous two years, from which product innovation ($InnProd_i$) and process innovation ($InnProc_i$) were selected. The dependent variable in Model 1 was constructed from the block of questions on forms of cooperation with universities and research institutions, coded as a binary indicator equal to 1 if a company declared at least one cooperation form and 0 otherwise. The dependent variable in Model 2 was constructed from the same block as a count of declared cooperation forms. Institutional predictors were selected from question, which asked respondents to assess the importance of specific cooperation-related conditions. From that block the analysis retained access to modern technologies ($Tech_i$), access to research infrastructure ($Infra_i$), competence of university staff ($Staff_i$), opportunities for joint RD projects ($JointRD_i$), opportunities for joint training ($JointTrain_i$), and access to RD funding ($Fund_i$). These variables were included because they correspond directly to the theoretical mechanisms emphasized in the literature on university-industry collaboration.

Model 1 examined whether an enterprise collaborated with scientific institutions at all. The dependent variable was a binary indicator of collaboration, denoted by $Y_i^{(1)}$, coded as 1 if company declared at least one form of cooperation and 0 otherwise. Because the outcome was dichotomous, a binary logistic regression model was estimated:

$$logit\left(P\left(Y_i^{(1)}=1\right)\right) = \beta_1 D_i^{prod} + \beta_2 D_i^{comm} + \beta_3 D_i^{med} + \beta_4 D_i^{big} + \beta_5 D_i^{short} + \beta_6 D_i^{semi} + \beta_7 InnProd_i + \beta_8 InnProc_i + \beta_9 Tech_i + \beta_{10} Infra_i + \beta_{11} Staff_i + \beta_{12} JointRD_i + \beta_{13} JointTrain_i + \beta_{147} Fund_i$$

Here, D_i^{prod} and D_i^{comm} are sector dummies (services as the reference category), D_i^{med} and D_i^{big} are company-size dummies (small companies as the reference category), and D_i^{short} and D_i^{semi} capture shorter tenure categories. Product innovation is denoted by I$nnProd_i$, process innovation by $InnProc_i$, access to modern technologies by $Tech_i$, access to research infrastructure by $Infra_i$, competence of university staff by $Staff_i$, opportunities for $JointRD_i$ by , joint training opportunities by $JointTrain_i$, and perceived access to RD funding by $Fund_i$.

Model 2 extended the analysis from the occurrence of collaboration to its breadth. The dependent variable, denoted by $Y_i^{(2)}$, was the number of forms of cooperation declared by each enterprise. Since the outcome had a count structure, count-data models were considered. The general specification was:

$$\log\left(E\left[Y_i^{(2)}\right]\right) = \beta_0 + \sum_{k=1}^{K} \beta_k X_{ki}$$

Both Poisson and negative binomial models were estimated. The Poisson specification was retained because it achieved a slightly better fit, the Pearson dispersion statistic was close to 1, and the overdispersion parameter in the negative binomial model was not statistically significant.

The empirical analysis was guided by the following hypotheses. **H1:** larger enterprises are more likely to collaborate with scientific institutions than small companies. **H2:** product and process innovation increase both the likelihood and the intensity of collaboration. **H3:** higher perceived competence of university staff increases the probability and breadth of collaboration.

4. Results

Before discussing the regression models, it is useful to present the descriptive profile of the surveyed companies and their collaboration patterns. The study covered 433 enterprises, of which 104 declared at least one form of cooperation with universities. As shown in Table 1, the most frequently reported form of cooperation was the organization of internships and placements for students and doctoral candidates, followed by training and workshops for employees. Joint research projects and scientific or technological consulting were less frequent, while technology transfer, licensing, joint publications, and conference presentations were relatively rare.

Table 1: Forms of collaboration declared by enterprises

Form of Collaboration	Number of Companies	Share of Collaborating Companies
Internships and student placements	47	45,19%
Training and workshops for employees	33	31,73
Joint research projects	30	28,85
Scientific and technological consulting	28	26,92
Technology transfer and licensing	14	13,46
Joint publications and conference presentations	2	1,92

Notes: Percentages refer to the 104 enterprises that declared at least one form of collaboration.

Source: own work.

The descriptive breakdown also shows clear differences in collaboration rates across company types. As reported in Table2 , production and service enterprises clearly dominated among collaborating companies, whereas commercial companies were much less represented. Collaboration was also more frequent among medium-sized and large companies than among small companies (Table3). In addition, cooperation was concentrated among companies with longer market experience; companies in the short-tenure category did not report collaboration, while most collaborating companies belonged to the longest-tenure group (Table 4).

Table 2: Collaboration by sector

Sector	Share Among Collaborating Companies	Collaboration Rate Within Sector
Production companies	49.04%	34.93%
Commerce companies	5.77%	10.17%
Service companies	45.19%	20.61%

Notes: The first percentage indicates the share of a sector among companies declaring collaboration; the second indicates the percentage of companies within a given sector that reported collaboration.

Source: own work.

Table 3: Collaboration by company size

Sector	Share Among Collaborating Companies	Collaboration Rate Within Size Class
Smal	36.54%	14.50%
Medium	30.77%	30.48%
Large	32.69%	51.52%

Notes: The first percentage indicates the share of a size class among companies declaring collaboration; the second indicates the percentage of companies within a given size class that reported collaboration.

Source: own work.

Table 4: Collaboration by company size

Sector	Share Among Collaborating Companies	Collaboration Rate Within Tenure Class
Short tenure (up to 5 years)	0.00%	0.00%
Medium tenure (5–10 years)	12.50%	17.81%
Long tenure (over 15 years)	87.50%	25.71%

Notes: The first percentage indicates the share of a tenure class among companies declaring collaboration; the second indicates the percentage of companies within a given tenure class that reported collaboration.

Source: own work.

Model 1 shows that the probability of collaboration with scientific institutions is shaped mainly by company size, innovation activity, and perceived competence of academic staff. The model is statistically significant as a whole, with McFadden's pseudo-R^2 = 0,286. As shown in Table 5, medium-sized enterprises are about 2.45 times more likely to collaborate than small companies, while large companies have about 4.93 times higher odds of collaboration. Product and process innovation both increase the likelihood of cooperation, and the competence of university staff remains the only significant institutional driver once the full set of controls is introduced. At the same time, enterprises operating in commerce are significantly less likely to collaborate than companies in the reference category. The corrected coding of company tenure makes the coefficient for short-tenure companies numerically unstable because all six companies in that category report no collaboration.

The reduced estimated equation for Model 1, including only statistically significant predictors, is:

$$\log\left(\frac{P(Y_i^{(1)}=1)}{1-P(Y_i^{(1)}=1)}\right) = -6.785 - 1.219D_i^{comm} + 0.897D_i^{med} + 1.594D_i^{big} + 0.803InnProd_i + 1.029InnProc_i + 0.722Staff_i$$

Model 2 shifts attention to collaboration intensity, measured as the number of collaboration forms. The dependent variable has a mean of 0.36, a large share of zeros, and a variance-to-mean ratio of 1.51. The Poisson model outperforms the negative binomial alternative. As shown in Table 6 , medium-sized companies display about 1.93 times as many expected forms of cooperation as small companies, while large companies display about 3.12 times as many. Product innovation increases the expected number of collaboration forms by about 83%, and process innovation more than doubles it. Better assessments of university staff competence and access to research infrastructure also increase the breadth of collaboration. By contrast, access to modern technologies has a negative net effect, suggesting that companies already perceiving strong technological access may rely less on a broader portfolio of cooperation channels. As in Model 1, the corrected coding of short tenure leads to an unstable estimate because all six short-tenure companies report zero cooperation forms.

The reduced estimated equation for Model 2, including statistically significant and marginally significant predictors, is:

$$\begin{aligned}\log\left(E[Y_i^{(2)}]\right) = &-4.209 - 0.660D_i^{comm} + 0.659D_i^{med} + 1.137D_i^{big} \\ &+ 0.603InnProd_i + 0.808InnProc_i - 0.560Tech_i \\ &+ 0.392Infra_i + 0.503Staff_i.\end{aligned}$$

5. Discussion

Taken together, the two models provide a coherent picture of science-business collaboration as a process shaped by both company-level capacity and institutional conditions.

Model 1 shows that the transition from non-collaboration to collaboration depends primarily on organizational capacity and innovation orientation. Larger companies are substantially more likely to collaborate with scientific institutions than small companies, and the same is true of companies introducing product and process innovations. This is consistent with the view that collaboration requires not only willingness, but also absorptive capacity, strategic openness, and organizational readiness (Perkmann et al., 2013; Ankrah and AL-Tabbaa, 2015). The significance of university staff competence further suggests that companies enter collaboration when they perceive academic partners as credible, useful, and professionally competent, which aligns with prior findings on the role of university-side capabilities in attracting external partners.

Model 2 demonstrates that these same factors also shape the intensity of collaboration. Larger and innovation-active enterprises not only collaborate more often, but also do so through a broader range of interaction forms. This suggests that collaboration is cumulative: companies with stronger internal capabilities are better positioned to sustain more diversified links with the science sector. The significance of research infrastructure and staff competence reinforces the view that broad collaboration depends on visible and usable institutional resources, not merely on formal opportunities for contact.

From a broader perspective, the results suggest that collaboration should not be treated as a single outcome. The probability of collaboration and the breadth of collaboration are analytically distinct, although both are strongly shaped by company capacity and innovation orientation. This distinction helps explain why some companies do not collaborate at all, whereas others develop a more diversified portfolio of university links. At the same time, the descriptive evidence indicates that collaboration remains concentrated in selected company categories, especially among larger, production-oriented, and longer-established enterprises. This pattern is consistent with the Polish literature emphasizing uneven institutionalization of university-industry cooperation and the selective character of knowledge-transfer relationships.

Overall, the combined evidence from Models 1-2 supports the conclusion that science-business collaboration remains uneven and selective. Larger and innovation-active companies are more likely to collaborate and to do so more intensively. Broad collaboration is also reinforced by favorable assessments of institutional resources, especially staff competence and access to infrastructure. These findings suggest that strengthening science-business relations requires support mechanisms that both expand companies' absorptive and innovation capacities and improve the practical attractiveness of academic partners.

6. Conclusion

This study examined science-business collaboration by distinguishing between the probability of collaboration and the intensity of collaboration. The findings show that collaboration is more likely and more intensive among larger and innovation-active companies. The results also indicate that the competence of university staff and

access to research infrastructure matter for building broader cooperation portfolios, while descriptive evidence confirms that collaboration remains concentrated in selected types of enterprises.

The results suggest that effective support for science-business relations should combine company-targeted measures with improvements in the institutional environment in which universities and enterprises interact. More generally, the study indicates that improving collaboration requires attention not only to company capabilities, but also to the practical usefulness, accessibility, and credibility of academic partners. Questions related to preferred directions for improving cooperation were not examined in depth in this article and may constitute a separate subject for further research in a subsequent study.

Abstract: This study aims to validate the climate for creativity in Saudi Arabian architectural and engineering (A&E) firms using factors of climate by Ekvall, Amabile, and Woodman's theories of creativity climate. According to Saudi Vision 2030, A&E companies' creative thinking and innovation are important for achieving sustainable development since they encourage resource conservation, resilient urban growth, and green design. Promoting innovation results in socially, economically, and environmentally sound practices. The study methodology used a quantitative survey approach to analyse the data. Fourteen hypotheses were tested, and the study sample included 460 participants from different categories of owners, managers, and employees from Saudi and international firms. The findings of the investigation on A&E firms operating in Saudi Arabia showed that Debate (80%) and Challenges (80%) are the most significant factors that serve creativity and innovation in A&E firms. While (79%) is recorded for technological knowledge, freedom recorded (76%), management strategies (76%), and organizational culture (68%). Conflict resolution (59%) ranked lowest, indicating a need for improvement in this area. The findings align with global creativity models adapting them to Saudi Arabia's context. This study presents the Innovation in Saudi A&E Firms (CISAEF) model, a measurable framework that helps to improve innovation environment. The practical implications introduce the importance of improving the culture of debate and employee empowerment in the light of Saudi Vision 2030.

Keywords: Creativity Climate; Innovation Management; Architectural and Engineering Firms; Saudi Arabia; Quantitative Survey; Organizational Culture.

1. Introduction

Creativity and innovation are critical for Saudi Architecture and Engineering (A&E) firms, which function as creative problem solvers for society (Alexander, 1993). Managers must have an organizational vision and possess the necessary skills to engender a creative environment, guaranteeing high-quality creative outcomes. Despite the extensive research on organizational creativity, empirical studies specifically examining creativity climate in A&E firms within the Saudi Arabian context remain limited. Salvatierra et al. (2019) discuss that, unlike those of other actors, the performance and practices of architects' offices are difficult to characterize, and there have been few studies on these issues. While Saudi firms strive to meet Vision 2030 goals, many lack the internal creative consultancy needed to overcome existing challenges. The innovation climate is important in determining innovation-related outcomes (Steele and Murray, 2004). Improving creativity in A&E firms is a major factor in bringing professional practices into line with the sustainability goals of Vision 2030, which specifically highlights sustainability in urban and architectural development. This research project aims to find the necessary professional working suitable climate or environment for A&E firms, especially in Saudi, for them to achieve a conducive environment for innovation and creativity when working. Even though sustainability is receiving more attention globally, little is known about how Saudi A&E companies' creativity and innovation can support sustainable development. The study primarily aims to measure the creative climate of A&E firms' performance in the Kingdom of Saudi Arabia that guides employees to be more creative and enhances their creative outputs. The findings should help the managers of these firms initiate a suitable creative climate. The study was conducted during the global pandemic (Covid-19), which affected the objectives, continuity, and performance of Architecture and Engineering offices and firms in Saudi Arabia (Al-Youbi et al., 2020, Crosbie, 2020). The pandemic increased the need to search for innovative and creative ways to keep A&E firms continuing their work.

2. Theoretical Framework

The research hypotheses are reflected in the study model based on the theories of Amabile, Woodman, and Ekvall, figure 1. The study uses Ekvall's theory, Amabile (Amabile, 1988), and Woodman's model of the creativity climate as tools to optimize of A&E firms in Saudi. Integrating these three frameworks enables a multi-level

analysis: Ekvall's dimensions capture the organizational climate, Amabile's componential model addresses individual and managerial factors, and Woodman's interactionist perspective accounts for group-level dynamics. Together, they provide a more comprehensive lens than any single framework alone. Some of these authors emphasize that architects should have these behaviours when they manage these firms (MAASHER, 2013). Ekvall's creativity climate theory relies on three aspects: resources, climate, and their effect on various elements. Resources include the people, buildings, machinery, etc., that must be present to encourage people's creativity (Ekvall, 1996). Creating a creative climate requires understanding challenges, freedom, liveliness, and conflicts in the working environment. Risk-taking, leadership, and communication are also essential factors influencing creativity (Ekvall, 1996). Furthermore, the framework of Ekvall's creative climate can be applied to sustainability-oriented innovation since elements like challenge, debate, and freedom foster an atmosphere in which businesses not only produce original ideas but also incorporate sustainability concerns into their architectural design. According to Ekvall, there are ten dimensions to evaluate and measure creativity within an organization, including freedom, openness and trust, conflicts, debates and discussions, absurdity and humour, risk-taking factors, supportive ideas, dynamism, challenges, and ideological state (Afsar and Badir, 2017). Amabile's componential theory proposes that organizational motivation to innovate, management practices, and resources are essential in supporting creativity (Amabile, 1988). The model underlying Amabile KEYS articulates these factors in detail. Since intrinsic motivation and creativity-relevant skills are essential for creating environmentally conscious designs and solutions within A&E firms, Amabile's model also serves as a foundation for sustainability-oriented innovation. Woodman et al. (1993) suggested an interactionist model of creativity as the result of a person's actions in a specific situation shaped by contextual and social forces. According to Woodman's model, group dynamics and organizational culture can have an impact on creative outputs. When these dynamics are focused on sustainability, they can encourage shared accountability for environmentally friendly building and design methods. The conceptual model in figure 2 shows a fundamental link between the criteria that provide an environment for creativity and the firm's strategic management, and how these strategies affect personal competencies. The research's outcomes and findings concerning creativity and innovation in A&E firms are affected by various elements, including the internal work environment, leadership, individual motivation, rewards, internal relations, management education, and organizational culture to adopt new ideas and practices (Alsharef et al., 2021, Isaksen, 2017).

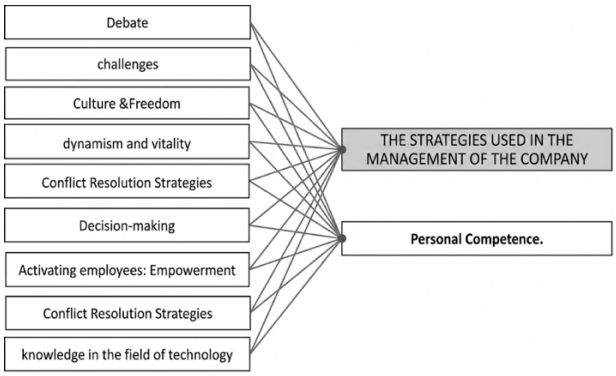

Figure 1: Study Hypothesis concept, Diagram showing the research hypothesis linking creative climate factors to innovation outcomes in Saudi A&E firms, with implications for sustainability.

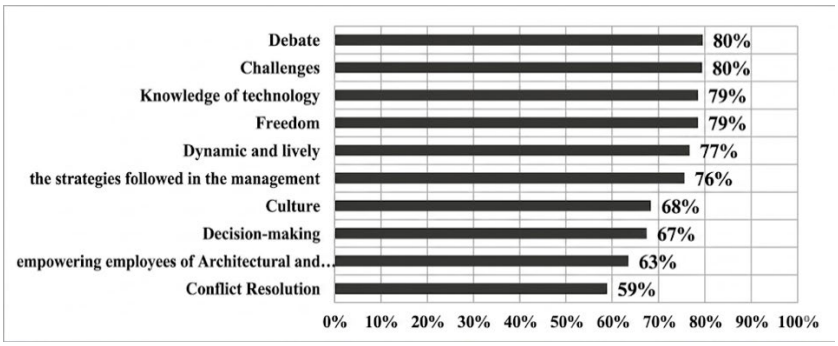

Figure 2: Conceptual model illustrating the relationship between creative climate dimensions and firm performance, supporting sustainable practices in A&E firms.

3. Materials and Methods

According to Engineers (2018), the number of registered engineers was approximately 186,630, with 2,856 offices, table 1. In 2021, the number of registered engineers rose to approximately 192,809, with 3,280 offices excluding expired licenses (Engineers, 2021), table 2. The planning stages included formulating the general objective of the questionnaire to measure factors necessary for developing A&E firms in Saudi Arabia and creating a creative and innovative environment. The distribution of A&E firms in the kingdom focused on the data received from the Directory of Engineering and Consulting Firm and Offices 2019 (Saudieng, 2019), indicating that the total number of A&E firms in Saudi Arabia was 2345 principal consultant A&E firms and 514 engineering subsidiary offices. The sample included 460 participants selected from managers, specialized staff (designers), and firm owners. A non-probability convenience sampling approach was adopted. The questionnaire was distributed to as many firms as possible using the official directory, and participation was entirely voluntary. Initial deductive research involving a literature review generated questionnaire questions addressing employees' opinions on factors affecting creativity. The survey used a 5-point Likert scale. The questions were also judged and drafted by several experts, academics, and practitioners in architecture and engineering. They were tested, developed and subsequently published (Kangari, 1995, Creswell and Creswell, 2017). Data were collected from 27 January 2021 to 8 March 2021, and 2,859 questionnaires were distributed by email with a cover letter explaining the survey purpose. Among the 935 questionnaires collected, 475 were incomplete. Accordingly, 460 questionnaires were valid for this study, and others were discarded. The response rate of approximately 16% (460/2,859) is acknowledged as a limitation; Although the response rate may increase the possibility of self-selection bias, the inclusion of respondents from different organizational roles and firms across Saudi Arabia provides a reasonably broad representation of the target population. a non-response bias check was conducted by comparing early versus late respondents on key demographic variables, revealing no significant differences. Efficiency, adaptability, and management strategies are just a few of the factors that have obvious sustainability implications, even though the questionnaire did not measure sustainability directly. In line with the objectives of sustainable development, these dimensions demonstrate long-term viability and ethical management techniques. It follows that encouraging a creative environment in A&E companies not only boosts innovation but also subtly promotes sustainable results.

Table 1: Number of engineering consultants and classifications in the Saudi Council 2018 (Engineers, 2018)

Licenses by Category (Classification)	Number	Licenses by Category (Classification)	Number
Engineering Consulting Office	1,489	Soil and Concrete Laboratory	37
Specialized Engineer's Office	485	Soil and Foundation Laboratory	22
Engineer's Support Office	298	Architectural Drawing Office	7
Professional Engineering Firm	156	Facility Control Office	3
Foreign Firms	140	Interior Design Office	17
Mixed Professional Firms	99	Concrete and Materials Inspection Office	6
Office of Engineering Safety	95	Architectural Monitoring Office	2
Total			2,856

Table 2: Number of engineering consultants and classifications in the Saudi Council (Engineers, 2021)

Licenses by Category (Classification)	Valid License	License Almost Expired	Initial License	Expired License	Total
Engineering office	2186	84	701	2519	5490
Engineering Consulting Office	1708	59	409	1807	3983

Professional Engineering firm	214	10	42	227	493
Foreign firm	29		14		43

4. Results

4.1 Characterization of the Primary Data

The survey had 460 respondents, most of whom were young professionals with an average age of 42.64 years. The gender distribution was 93% male and 7% female. Participants represented 23 nationalities, with the largest group being Saudi (58%), followed by Egyptian (20%) and Sudanese (4%). The sample also showed high educational diversity. In job roles, 35% were employees, 38% were firm owners/partners, and 27% were executive directors or department heads. Average experience was 13.5 years (SD = 10.5). Firm nationality was predominantly Saudi (87%). Most A&E firms were headquartered in Riyadh, Makkah, and Jeddah, with 96% based in Saudi Arabia. 98% of participants worked within the Kingdom. A detailed demographic breakdown of the participants is presented in Table 3.

Table 3: Biography characterization

Age	20–25	6%	**Experience Years**	0–5	23%	**Education**	Secondary / Diploma	3%	**Firm Nationality**	Saudi	87%
	26–30	11%		6–10	28%		Bachelor	59%		Egyptian	2.90%
	31–35	17%		11–15	17%		Master	31%		American	1.90%
	36–40	16%		16–20	11%		PhD	7%		Other	8.20%
	41–45	14%		21–24	6%						
	46–50	7%		25–30	5%						
	51–55	9%		30+	10%						
	56–60	9%									
	60+	11%									
Job Title	Firm Owner	35%	**Gender**	Male	93%	**Workplace**	Makkah	28%	**HQ Location**	Inside KSA	95%
	Employer/ Partner	28%		Female	7%		Riyadh	21.70%		Outside KSA	5%
	Executive Director	10%	**Nationality**	Saudi	58%		Jeddah	20.20%			
	Department Head	12%		Non-Saudi	42%		Other	26.50%			
	Other	15%					Outside KSA	3.50%			

4.2 Measures and Scale Validation

To evaluate internal consistency (reliability), Cronbach's alpha was used (Cronbach, 1951). All questionnaire axes showed acceptable reliability levels, mostly above 0.70, except the 6th and 7th axes. Deleting Item 3 in axis 6 improved reliability from 0.449 to 0.709. Axis 7 was better when split into culture and freedom components, table 4. Construct validity was ensured through literature review and factor analysis. Items were developed based on Amabile, Woodman, and other foundational studies. Content and construct validity were confirmed. Future revisions should supplement Cronbach's alpha with Composite Reliability (CR) and Average Variance Extracted (AVE) to establish convergent validity, and report a Confirmatory Factor Analysis (CFA) for each construct.

Table 4: The Values of the 'Alpha–Cronbach' Parameter for Each Main Study Axis, Included in the Study Questionnaire

The axis	Number of Questions	Cronbach's Alpha	Cronbach's Alpha if Item Deleted	Cronbach's Alpha if Item Divided	The Number of Questions for the Divided Axis
The second axis	5	0.733			
The third axis	4	0.861			

The axis	Number of Questions	Cronbach's Alpha	Cronbach's Alpha if Item Deleted	Cronbach's Alpha if Item Divided	The Number of Questions for the Divided Axis
The fourth axis	6	0.867			
The fifth axis	6	0.880			
The sixth axis	3	0.449	0.709		
The seventh axis	5	0.580		2	0.838
				3	0.656
The eighth axis	4	0.766	0.782		
The ninth axis	2	0.815			
The tenth axis	5	0.819			

4.3 Descriptive Analysis of Questionnaire Axes

Descriptive statistics (frequency, percentage, mode, median) were analysed. The average importance score across the 10 axes was 72%. The most important axes were Debate (80%), Challenge (80%), Knowledge of Technology (79%), Freedom (79%), Strategies for Management (76%), and so on, with Conflict Resolution (59%) being the lowest, figure 3.

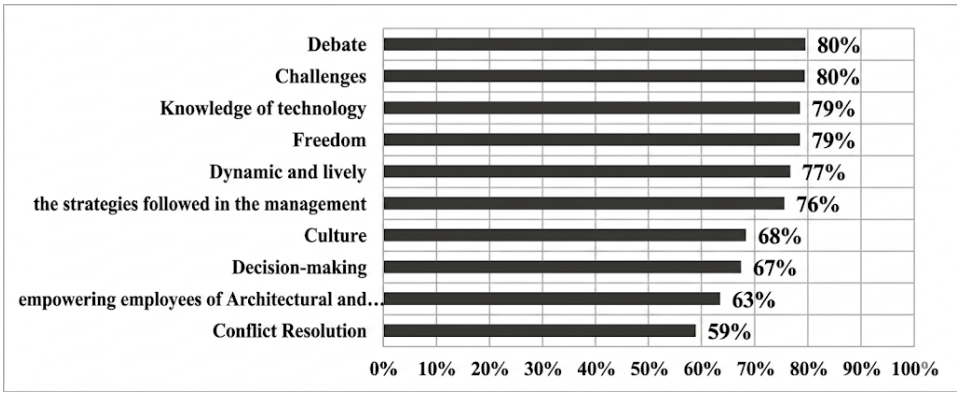

Figure 3: Bar chart showing the general importance of the study axes in shaping creative climate, highlighting their relevance for innovation and sustainability.

The graphical columns showing the relative importance of the major dimensions evaluated in this study are shown in Figures 4 through 13. The respondents' assessments of the different elements influencing the creative environment in A&E firms are shown in these figures. Figure 4 highlights the significance of the tactics used by businesses, while Figure 5 emphasizes the role of debate. The significance of challenges and dynamism are illustrated in Figures 6 and 7, respectively. Figure 8 presents conflict resolution, while Figures 9 and 10 present culture and freedom. Figure 13 demonstrates the value of motivating and empowering staff members, while Figures 11 and 12 highlight the importance of technological expertise and decision-making, respectively.

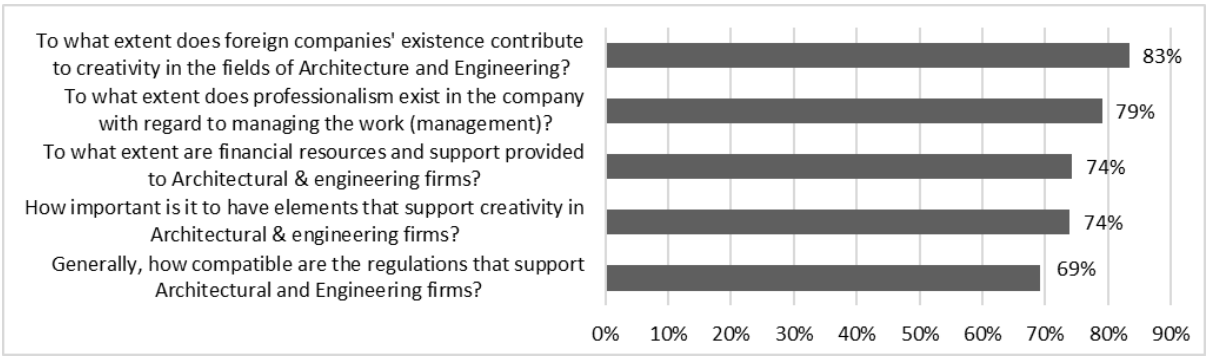

Figure 4: Strategies Followed Graphical columns showing the importance of the elements of the second axis, with implications for sustainability.

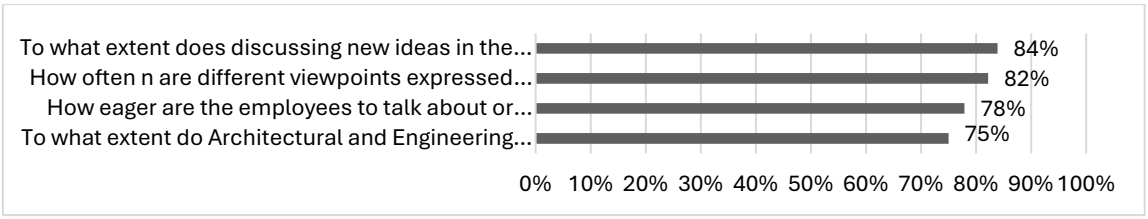

Figure 5: Debate Graphical columns showing the importance of the elements of the third axis, contributing to sustainable decision-making.

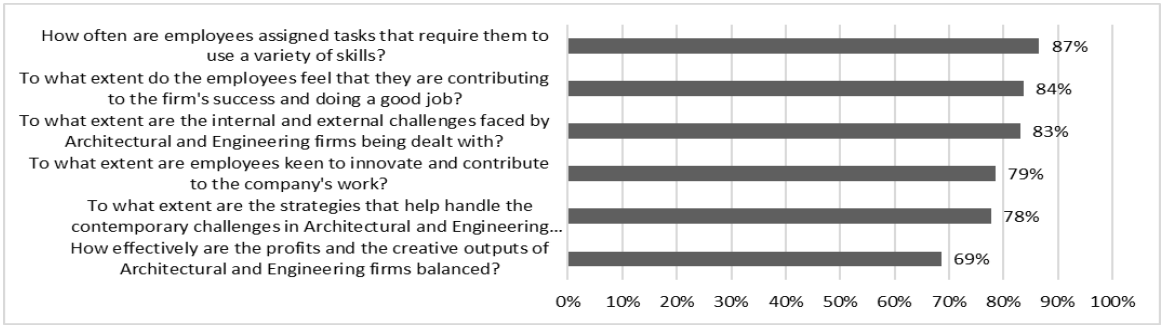

Figure 6: Challenges Graphical columns showing the importance of the elements of the fourth axis, which drive innovation and sustainability adaptation.

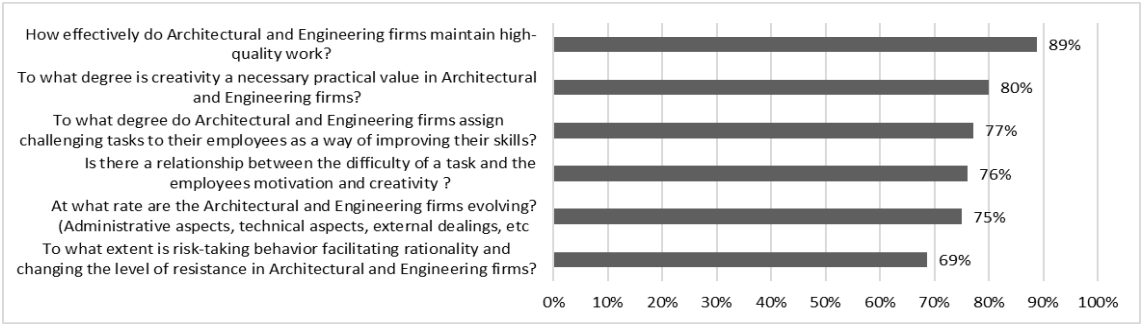

Figure 7: Dynamic and lively Graphical columns showing the importance of the elements of the fifth axis, which foster adaptability and sustainable growth.

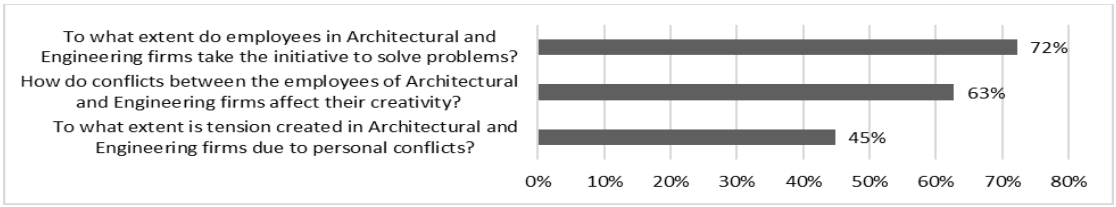

Figure 8: Conflict Resolution Graphical columns showing the importance of the elements of the Sixth axis, supporting collaboration and sustainable organizational practices.

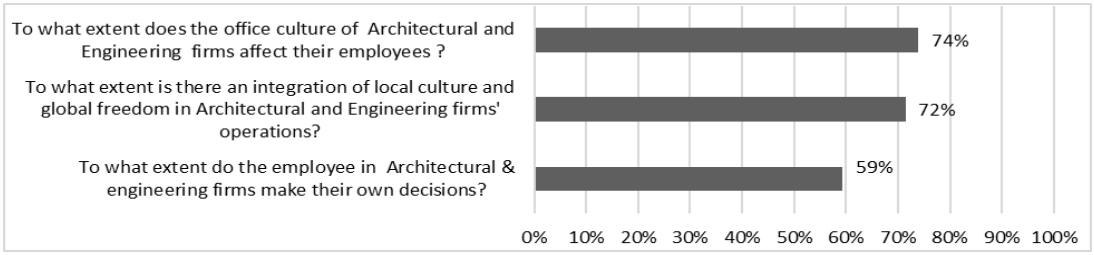

Figure 9: Culture Graphical columns showing the importance of the elements of the Seventh axis, embedding creativity and sustainability values in A&E firms.

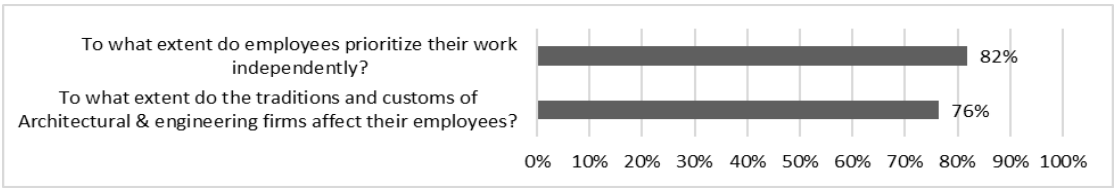

Figure 10: Freedom Graphical columns showing the importance of the elements of the eighth axis, enabling innovation and sustainable problem-solving.

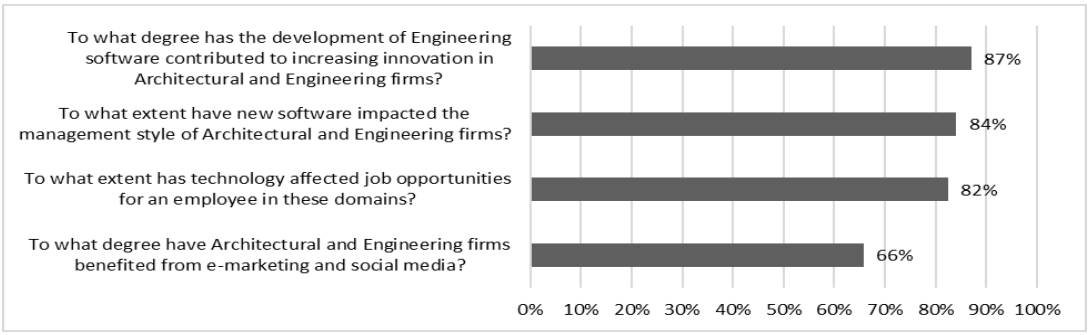

Figure 11: Knowledge of technology Graphical columns showing the importance of the elements of the ninth axis, essential for developing sustainable design and engineering solutions.

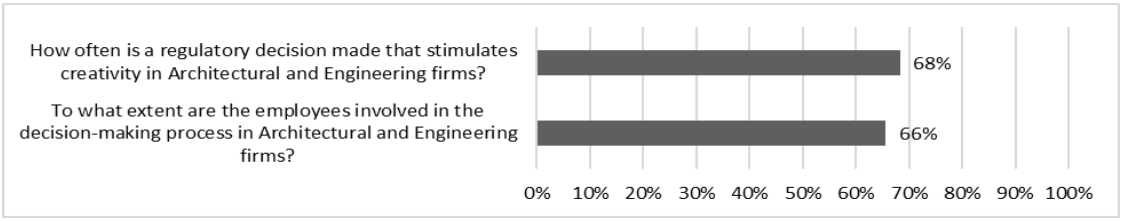

Figure 12: Decision-making Graphical columns showing the importance of the elements of the tenth axis, contributing to responsible and sustainable management practices.

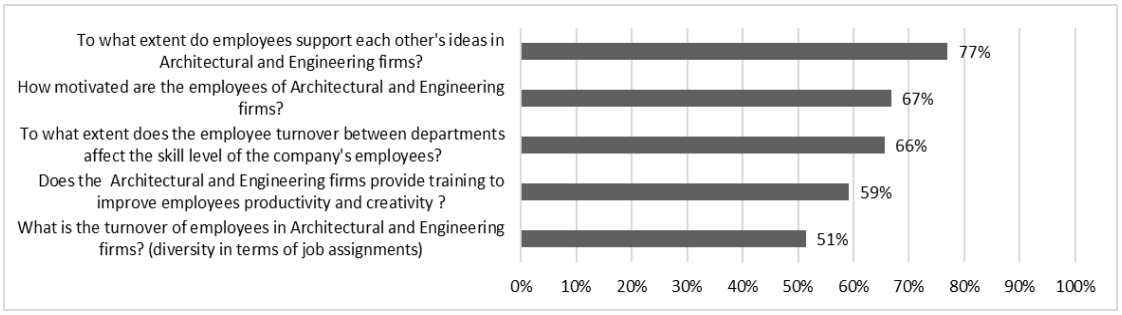

Figure 13: Energizing or empowering Graphical columns showing the importance of the elements of the eleventh axis, which strengthens creativity and promotes sustainable practices.

5. Discussion and Conclusion

The literature strongly supports the role of creativity and innovation in A&E firms (Cropley, 2016; Emmitt, 1999). This study confirms those findings in the Saudi context. Participants showed strong awareness of creativity's importance in performance, problem-solving, and strategic innovation. In addition to showing the innovative environment of Saudi A&E companies, the ranked factors also suggest possible directions for sustainable practices. For instance, technological expertise can encourage the use of eco-friendly solutions, and organizational culture may promote sustainability principles. In the same way, freedom and decision-making allow businesses to implement long-term plans that strike a balance between creativity and effective utilization of resources. These results imply that in A&E firms, a creative environment can promote sustainability and innovation at the same time. The discussion should be reorganized to systematically address each of the 14

stated hypotheses, specifying which were supported and which were not, and grounding each finding in prior literature. Currently the discussion presents general observations rather than hypothesis-specific analysis. The analysis showed that Debate, Challenge, and Technological Knowledge are the most valued factors. Interestingly, Conflict Resolution ranked lowest, suggesting a gap in this area that firms may need to address. These findings align with the studies of Steele & Murray (2004) on innovation climates. The developed model, CISAEF, illustrates how creative climate factors (as proposed by Ekvall, Amabile, and Woodman) relate directly to strategic management and personal competencies in Saudi firms. This model helps Saudi A&E firms assess their own creativity levels and highlights areas for improvement. The developed CISAEF conceptual model, illustrated in Figure 14, integrates the creative climate factors with strategic management and personal competencies in Saudi A&E firms. The overall ranking and interpretation of the creativity climate factors are summarised in Table 5.

Table 5: A creative environment and innovations in A&E professional firms ordered according to importance

No.	Climate Factors	Interpretation	Importance
1	Debate	Encouraging diverse viewpoints and idea-sharing to foster competitiveness.	80%
2	Challenges	Utilizing skills to overcome internal and external risks successfully.	80%
3	Knowledge of Technology	Adoption of software that evolves management styles and innovation.	79%
4	Freedom	The level of employee autonomy in decision-making and task prioritization.	79%
5	Dynamic And Lively	An eventful environment that reduces resistance and evolves technical aspects.	77%
6	The strategies Followed for the management	Strategic support for financial and professional creativity standards.	76%
7	Culture	Social perceptions and habits influencing independent employee action.	68%
8	Decision-Making	Regulatory processes that include and stimulate employee creativity.	67%
9	Energizing or Empowering Employees.	Motivating staff through diverse assignments and targeted training.	63%
10	Conflict Resolution	Eliminating personal tensions to protect and maintain creative output.	59%

Flexibility, remote work, and international collaboration (especially post-COVID) also emerged as relevant factors. Firms embracing joint ventures (JVs) and digital platforms demonstrated more resilience. Finally, this study calls for leadership in fostering a creative professional culture aligned with Islamic values and Vision 2030 (Iqbal, 2020). Future studies could compare local and global A&E firm practices and apply this model in longitudinal or case-based settings.

Ethics Declaration

This study used an anonymous, voluntary questionnaire with no collection of private or sensitive data. The affiliated organization does not have a formal IRB; ethical oversight is provided through its internal research

framework, publicly available online (Omraniyoun, 2025). Given the non-clinical, low-risk nature of the study, formal ethical approval was not required. The research followed internationally accepted ethical principles, including confidentiality, voluntary participation, and participant wellbeing. Participants were informed of the study purpose, their right to withdraw, and data confidentiality. Completion of the questionnaire was considered as informed consent.

AI Declaration

The authors confirm that the research, analysis, and writing of this manuscript were carried out independently by the authors without the use of Ai tools.

Navigating Entrepreneurial Stress: How Egyptian Female Entrepreneurs Build and Sustain Resilience

Hadia Fakhreldin, Dalia Mounir and Rania Miniesy
The British University in Egypt, Cairo, Egypt

RMiniesy@bue.edu.eg

Abstract: Women's entrepreneurship in Egypt unfolds amid patriarchal norms, macroeconomic instability, and resource scarcity that generate stress and shape both entry into entrepreneurship and the resilience women develop in response. Drawing on in-depth semi-structured interviews with thirteen Egyptian women entrepreneurs across diverse sectors, marital statuses, and socioeconomic positions, this study develops a process model of how stress is converted, through structural coping, into self-actualisation outcomes. Hybrid deductive–inductive thematic analysis integrates the ART of Resilience Framework (Acknowledgment, Reframing, Tailoring) with Self-Competition Theory, which specifies the internally benchmarked logic against which outcomes are evaluated. The analysis identifies five interacting stressors — societal, economic, emotional, identity-rupture, and resource — and shows that resilience operates through building durable coping infrastructure rather than episodic strategy selection. The outcomes participants value most are notably non-financial and relationally embedded: identity, freedom, impact on other women, and confidence. This stress–resilience–outcomes relationship is reciprocal and moderated by marital and child-rearing status and socioeconomic class. The study offers a culturally specific, process-based account of female entrepreneurial resilience and refines both frameworks for MENA contexts.

Keywords: Women Entrepreneurship, Stress, Resilience, Self-actualization, Egypt

1. Introduction

Women's entrepreneurship in Egypt unfolds within a distinctive set of structural conditions. Female labour-force participation in Egypt remains among the lowest in the world - around 18% compared with a global average of approximately 50% - despite substantial gains in women's educational attainment (World Bank, 2025). Women's early-stage entrepreneurial activity (TEA) sits well below regional and global averages: Egypt's female TEA rate is approximately 2.6% — roughly a third of the male rate (7.6%) and a quarter of the global women's average of 10.4% (Global Entrepreneurship Monitor, 2025).Those who do build ventures operate in an economy marked by currency devaluation, inflation, and opaque licensing, while simultaneously navigating patriarchal norms that position them as primary caregivers and, in some cases, require the approval of a husband or male family member as a precondition for commercial activity. The resulting stress compounds across societal, economic, emotional, and resource dimensions, and falls especially heavily on women whose class position limits their access to coping resources. For a significant subset, stress does not merely accompany the entrepreneurial journey, it generates it. A divorce, a health issue, or a midlife crisis forces a reconstruction of identity, and the venture becomes the vehicle through which that reconstruction takes place. Stress, for many of these women, is not only what they absorb and try to cope with but what makes them entrepreneurs in the first place.

This study examines how Egyptian women entrepreneurs experience stress, how they cope with it, what resilience mechanisms they develop, and what outcomes they value. The female-entrepreneurship literature has documented structural barriers and work–family conflict in patriarchal societies; the resilience literature has articulated mechanisms through which these difficulties are processed and overcome. What remains underdeveloped is a process model linking the female entrepreneurship literature with the resilience body of knowledge; particularly in the MENA region where the socioeconomic class shapes the resources available for resilience. The paper develops a model on the basis of in-depth interviews with thirteen Egyptian women entrepreneurs, integrating the ART of Resilience Framework with Self-Competition Theory to trace how stress gets converted into self-actualisation outcomes.

2. Literature Review

2.1 Stress, Coping, and Resilience in Entrepreneurship

Entrepreneurship is characterised as a high-stress activity due to persistent uncertainty, role overload, financial precarity, and personal exposure (Rauch et al., 2018; Stephan, 2018). Ahmed et al. (2022) identified work

characteristics, family–work conflict, business difficulties, and personal life events as the principal antecedents of entrepreneurial stress and concluded that experiencing stress is a precondition for building resilience.

Resilience is conceptualised in two main ways: as a stable trait (Bullough et al., 2014) and, more recently, as a dynamic process in which capabilities are developed as stocks of resources for adaptation over time (Pangallo et al., 2015; Ahmed et al., 2022). The dynamic view draws on Lazarus and Folkman's (1984) distinction between problem-focused and emotion-focused coping and aligns with conservation of resources (COR) theory (Hobfoll, 2001), which frames stressor–coping interaction as reciprocal cycles of resource loss and gain (De Clercq et al., 2022). Stress and resilience are thus reciprocally related: stress drives resilience-building, and resilience enables the absorption of subsequent stressors. Ahmed et al. (2022), Omorede (2020), and Byrne (2021) all note that the mechanisms by which stress is converted into resilience in culturally specific contexts remain underexplored, particularly in resource-constrained settings.

2.2 Female Entrepreneurship, Work–family Conflict, and Gendered Role Expectations

Women entrepreneurs face structurally different conditions from male counterparts (Brush, 1992; Jennings and Brush, 2013). Work–family conflict (WFC), defined by Greenhaus and Beutell (1985) as inter-role conflict between work and family demands, is particularly significant for women, where cultural caregiving expectations intersect with business demands to produce a compound burden (Jennings and McDougald, 2007; Welsh and Kaciak, 2019). De Clercq et al. (2022) showed that work-related emotional exhaustion mediates the link between WFC and reduced firm performance, intensified in culturally traditional environments. Cheraghi et al. (2023) reported a similar dynamic during COVID-19.

Beyond WFC, women entrepreneurs report lower access to finance, mentorship, and networks (Brush et al., 2018; Tlaiss and McAdam, 2022); greater scrutiny in mixed-gender settings and assumptions of lesser competence (Marlow and Patton, 2005); higher rates of imposter fears that constrain growth ambitions (Ladge et al., 2019; Chadwick and Dawson, 2024); and gatekeeping by husbands and male family members (Welsh et al., 2017; De Clercq et al., 2022). Family enrichment, defined as the positive transfer of resources between family and business, can compensate for these effects (Welsh and Kaciak, 2019).

2.3 Women Entrepreneurs in MENA and Egypt

Despite gains in education, female labour-force participation in MENA remains the lowest in the world at around 21% (International Labour Organization, 2017; Fathi, 2017). The dominant explanation is not religion but a configuration of patriarchal norms, restrictive legal frameworks, and limited supporting infrastructure (Assaad et al., 2018; Constant, 2022). Recurring patterns in the literature on Arab women entrepreneurs include necessity-driven entry, spouse and family approval as a condition for activity, faith- and community-based coping, and disproportionate exposure to macroeconomic shocks (Borham et al., 2023; Tlaiss and McAdam, 2022).

2.4 Theoretical Framework

The ART of Resilience Framework (Farchi and Peled-Avram, 2025) integrates cognitive, emotional, social, and physiological mechanisms of resilience into three components: Acknowledgment of available coping resources, Reframing of stressors as challenges (drawing on cognitive-reappraisal theory; Gross, 2015), and Tailoring of responses to situational demands. Self-Competition Theory (Khalil, 1997) explains why high-performing entrepreneurs continue to take risks after financial security: entrepreneurial drive is internally benchmarked against one's prior performance, consistent with self-actualisation (Maslow, 1954) and self-determination theory's emphasis on autonomy, competence, and intrinsic motivation (Deci and Ryan, 2000). The two frameworks are complementary: ART specifies coping mechanisms; Self-Competition Theory specifies the motivational logic against which outcomes are evaluated.

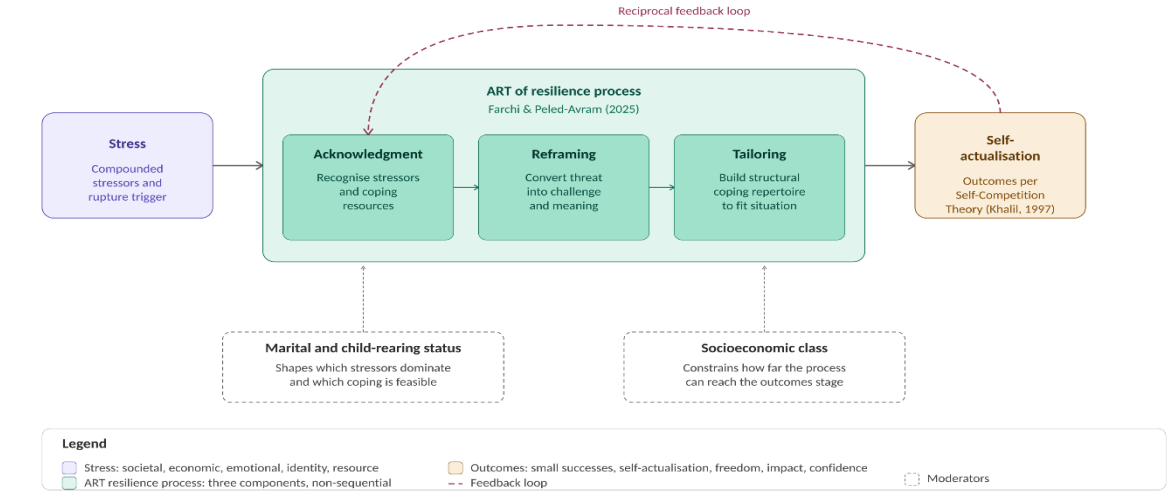

Figure 1

2.5 Research Gap

Four gaps remain. First, no process model articulates how stress is converted into resilience and entrepreneurial outcomes for women in patriarchal settings. Second, WFC and family support have been treated as separate variables rather than complementary constructs interacting through reciprocal feedback. Third, empirical work on Egyptian women entrepreneurs focuses on barriers rather than psychological processes. Fourth, ART and Self-Competition Theory have not been previously integrated. The present study addresses these gaps through a process model grounded in interviews with thirteen Egyptian women entrepreneurs.

3. Methodology

This study adopts a qualitative interpretive design to examine how Egyptian women entrepreneurs experience stress and develop resilience that results in positive outcomes. A qualitative approach is appropriate because the study seeks to understand a process within a culturally specific context, and the theoretical lenses adopted require attention to participants' meanings and lived experiences (Patton, 2015; Braun and Clarke, 2006). This is consistent with comparable studies of women entrepreneurs in similar cultural contexts (Borham et al., 2023; Tlaiss and McAdam, 2022).

Participants were recruited through purposive sampling (Patton, 2015), with inclusion criteria requiring participants to be Egyptian women who were founders or co-founders of an active venture. Maximum-variation sampling guided recruitment across age, sector, business stage, marital status, and family situation. Thirteen complete interviews informed the analysis, with participants ranging from 23 to 60 years old and operating in sectors including technology, wellness, design, marketing, beauty services, handicrafts, content production, and NGO work. Marital and family status varied across single, married, divorced, single-mother, and blended-family configurations. The sample size is consistent with established saturation findings (Guest et al., 2006; Hennink et al., 2017) and with comparable published studies (Borham et al., 2023; Tlaiss and McAdam, 2022). Saturation was monitored throughout, with final interviews adding no new themes.

Data were collected through semi-structured in-depth interviews of 45 to 70 minutes, conducted in a mix of Arabic and English. Interviews were audio-recorded with informed consent and transcribed and compared with the transcription of Read AI. Anonymity was preserved; participants are referred to by numerical identifiers, with identifying information redacted.

Transcripts were analysed using hybrid deductive–inductive thematic analysis (Fereday and Muir-Cochrane, 2006), which combines a priori theoretical coding (Crabtree and Miller, 1999) with data-driven inductive coding (Boyatzis, 1998). The approach is appropriate because the research questions are anchored in two theoretical frameworks while the cultural specificity of the data required openness to emergent themes. Coding followed Braun and Clarke's (2006) six-phase procedure: familiarisation, initial coding, theme generation, theme review, theme definition, and reporting. NVivo was used throughout to manage codes, organise extracts, and maintain an audit trail (Bazeley and Jackson, 2013; Jackson and Bazeley, 2019). Emergent themes — including identity-

rupture as an antecedent of entrepreneurial entry, the moderating role of marital and class status, and authenticity as a bridge between resilience and self-actualisation — surfaced through the inductive layer.

Trustworthiness was ensured through Lincoln and Guba's (1985) four criteria (Nowell et al., 2017): credibility through prolonged engagement, verbatim extracts, and peer debriefing; transferability through thick description; dependability through an NVivo audit trail; and confirmability through reflexive memos and separation of inductive and deductive coding layers. All participants provided written informed consent.

4. Findings and Discussion

4.1 Stress: the Compounded Stressor Configuration

The stress experienced by Egyptian women entrepreneurs is a configuration of five interacting types — societal, economic, emotional, identity-rupture, and resource — that operate simultaneously. This extends Ahmed et al.'s (2022) account of entrepreneurial stress by specifying the configuration that obtains for women entrepreneurs in a patriarchal economic context.

Societal and gendered role expectations were the most pervasive stressor (11 of 13 participants), manifesting in three sub-forms. First, participants reported being assumed less competent in mixed-gender professional rooms. One woman described "the audacity" of male peers who "automatically assume of course that they know better"; another one reported clients questioning her work "not out of inquiry … out of mocking". The credibility deficit Marlow and Patton (2005) and Brush et al. (2018) documented operates here not only with clients and suppliers but also with subordinates: this same entrepreneur notes that male carpenters working under her direction become uncomfortable taking instructions from a younger woman, requiring indirect leadership strategies her male peers do not deploy. The cognitive load of this credibility-management work itself is a stressor the literature has rarely operationalised. Imposter fears (Ladge et al., 2019) emerge here because of repeated credibility-deficit experiences rather than an inherent trait. Second, the compound burden of multiple gendered roles. P13 contrasted male and female role configurations: "Men usually have maybe two roles … We have several: the wife, the mom, the working woman, the sister, the daughter, the nurse, the cook, the healer." One of the participants reported three medically confirmed stress-related conditions within four months — gallbladder attack, swollen colon, inflamed womb — in a period with no acute work problems. This supports De Clercq et al.'s (2022) finding that emotional exhaustion mediates the link between WFC and firm performance and shows the "never-ending spiral" operating through physical as well as cognitive processes. Interventions targeting only the work side of the conflict are therefore likely to be inadequate. Third, the structural barrier of husbands and male family members as gatekeepers. The NGO team supporting a handicrafts initiative reported husbands swearing oaths of divorce to prevent attendance, and described how women "want to work, earn money, and help their children, but their husbands are often a barrier". Among upper-middle-class participants, the same dynamic operates more subtly through the necessity of partnering with a husband who can attend male-dominated meetings: "There has to be a man in a certain position … there are people who don't move unless there is a male present." Both versions are present in the data; they differ in visibility and in the resources available to absorb them, grounding the moderator analysis below. These accounts confirm Welsh et al.'s (2017), and Constant's (2022) findings on patriarchal gatekeeping in MENA contexts.

Economic instability appears across most transcripts: currency devaluation ("we feel like drowning"), inflation, opaque licensing, and exclusion from bazaars priced beyond individual reach, which align with Borham et al. (2023) identifying shortage of access to finance as a serious obstacle for women entrepreneurs. Two observations follow: the macroeconomic stressor is entangled with the gendered-role stressor (formalisation is burdensome, but informal status constrains market access in gendered ways), and it acts as a multiplier on all other stressors, consistent with Hobfoll's (2001) Conservation of Resources (COR) logic.

Emotional exhaustion is named explicitly by several participants in terms including imposter syndrome, collapse at peak workload, and nervous-system burnout. This gives empirical form to Stephan's (2018) review of entrepreneurs' mental health and confirms Ladge et al.'s (2019) account of imposter fears.

Identity-rupture as an acute stressor is the most important emergent finding and was not anticipated by the researchers. Five participants identify a discrete personal disagreement in a life event with a family member, a divorce, a 2013 health event, a midlife reckoning at 39, as the moment that led them onto their entrepreneurial path. One described turning 39 with the recognition that her life had been only "between job and home … I didn't know anything else at all. This pattern departs from the opportunity-driven model of entrepreneurial

entry in which the founder rationally identifies a market gap and assembles resources. Drawing on Korhonen et al. (2020) and Ibarra and Deshpande's (2007) model of identity transitions, the data suggest a pattern in which an identity crisis is being resolved through the venture, which functions as a vehicle for processing and integrating an unresolved life event. Literature has acknowledged life events as contextual factors but rarely positioned them as primary antecedents. Jennings and McDougald (2007) touched on this when identifying coping with family issues as triggers for new venture creation but did not articulate it as a pattern. The contribution here is to fold the rupture trigger explicitly into the Stress stage: for the women in this sample, stress is not merely an antecedent of resilience but of entrepreneurship itself.

Resource gaps — financial, knowledge, and network — recur across the sample and interact reciprocally with all other stressor types, intensifying imposter fears, WFC, and the credibility deficit (Brush et al., 2018; Marlow and Patton, 2005). In Egypt the formal ecosystem is itself fragile (bazaar pricing, informal–formal regulatory tension, limited venture capital), compounding the basic asymmetry.

4.2 The ART of Resilience Process

The resilience mechanisms map onto the three components of the ART Framework (Farchi and Peled-Avram, 2025) with refinements.

Acknowledgment is not a single moment, it is rather a process established through therapy, peer-founder conversations, mentor relationships, and culturally specific spiritual activities. Therapy is named explicitly by upper-middle-class participants: “Therapy a hundred percent; when you feel that things are too hard to handle, talk to someone; talking to someone really helps you deflate that balloon.” One participant described her Acknowledgment journey as confronting demons “created by you and your own family”, with explicit recognition of cultural barriers that made the process slow. This supports Farchi and Peled-Avram's (2025) emphasis on Acknowledgment as acceptance-based coping that reduces distress by preventing emotional suppression. Lower-income women, lacking access to therapy, rely on spiritual framings: “It's God's way of patting you on the shoulder.” This spiritual framing is a culturally specific extension that the original framework, grounded in a secular cognitive-behavioural register, does not anticipate; it functions as Acknowledgment by allowing the participant to name the stressor and identify a resource available to her.

Reframing is supported through the rollercoaster/waves metaphor, the reframing of adversity as growth and transformation, and the spiritual framing of problems as part of a larger plan with better consequences (Gross, 2015). The cognitive mechanism is universal but the narrative content is culturally inflected — a refinement that the original framework does not specify.

Tailoring in the Egyptian data is the active building of durable coping infrastructure, not flexible episodic selection. Five sub-components are visible: support systems, therapy, identity-and-boundary work, strategic pivoting, and faith and spirituality. Family-as-team configurations recur — one participant's daughter manages her social media; another brought her husband in as co-founder after observing that her existing strategy lacked structure — operating as what Welsh and Kaciak (2019) call family enrichment. The family is not a passive recipient of business spillover but is actively constructed as part of the entrepreneur's coping repertoire. Peer-founder networks (periodic meetings of female founders) align with Brush et al. (2018) and function as structural infrastructure, kept active through deliberate recurring engagements rather than reactive activation. Identity work is illustrated by the participant who terminated a $5m investor relationship “when I started to feel that we are not on the same level when it comes to values” — showing that Tailoring and outcomes are not strictly separated; the same action can function as both. Strategic pivoting is visible in the participant who reframed her business “around freedom, not money”, supporting the COR argument (Hobfoll, 2001; De Clercq et al., 2022) that resilient entrepreneurs convert resource loss into resource redirection through adaptive reconfiguration of purpose. Faith functions as ongoing infrastructure rather than episodic intervention.

The substantive refinement is that Tailoring operates as continuous infrastructure-building rather than episodic selection from a repertoire, with implications for intervention design: programmes should help women build coping infrastructure (peer-founder groups, family integration, mentor relationships, financial buffers) rather than train them in flexible coping selection alone.

4.3 Self-actualisation Outcomes

The data overwhelmingly support Khalil's (1997) Self-Competition Theory: outcomes are non-financial and benchmarked internally. Five sub-categories emerge.

Identity realisation: participants describe finding capacities they did not know they had. One described entrepreneurship as "something inside of me … looking back, it has always been the same exact dream or vision". This reinforces Deci and Ryan's (2000) emphasis on intrinsic motivation, autonomy, and competence.

Small successes: concrete moments (first sales, awards, international clients) accumulate into forward motion fuelling resilience for the next setback, consistent with Ahmed et al.'s (2022) account of dynamic capability-building.

Freedom redefined as the goal: participants explicitly reframe entrepreneurship's purpose away from financial growth — "it used to be a money-making business, but now it's more of a freedom-based business". This is direct empirical support for Khalil's (1997) proposition that successful founders pursue internal benchmarks.

Impact and contribution to other women: many participants frame their business as serving women even when products are gender-neutral ("My main goal is to employ 90% female workers"). This adds a relational dimension to Self-Competition Theory consistent with Deci and Ryan's (2000) emphasis on relatedness.

Confidence and voice: participants describe a hardened voice — the willingness to terminate contracts, refund clients, and walk away from misaligned investors. This supports Ahmed et al.'s (2022) account of resilience as active mitigation of stress.

4.4 Reciprocal Feedback Loop

The stress–resilience–outcomes relationship is reciprocal, not linear. Outcomes feedback through three mechanisms: strengthening of Acknowledgment capacity (Hobfoll, 2001; De Clercq et al., 2022); enrichment of the Reframing repertoire (cognitive reappraisals accumulate into durable resources rather than discrete acts — refining Gross, 2015); and maturation of the Tailoring repertoire. A fourth element is the generation of new self-competition demands: participants progressively move to more demanding ventures, supporting Ahmed et al.'s (2022) call for theorising the dynamic interaction of stress and resilience over time.

4.5 Moderators: Marital Status and Socioeconomic Class

Marital and child-rearing status changes the form of every stage, not merely the intensity of stress. Unmarried-childless participants describe stress in cognitive-emotional terms; married-with-children participants describe it in role-overload terms. Tailoring strategies differ in kind, not just intensity. Unmarried-childless participants build identity-anchor work to ground themselves against professional pressures. Married-with-children participants build family-as-team architectures to convert competing demands into shared resources. This aligns with De Clercq et al.'s (2022) account of work-family conflict in traditional environments and with the broader literature establishing women's structural distinctiveness in entrepreneurship (Brush, 1992; Jennings and Brush, 2013; Welsh and Kaciak, 2019)."

Socioeconomic class constrains how far the outcomes stage can be reached without external scaffolding. For upper-middle-class participants the full sequence runs. For lower-income participants the framework is stuck at the Stress stage: therapy is unavailable, peer-founder networks are inaccessible, and bazaar pricing excludes them from formal exhibition. Reaching outcomes requires structural enabling the entrepreneur cannot provide alone — NGO support, husband engagement, accessible exhibition spaces, formalisation pathways. The ART Framework needs adjustment for contexts where resource access varies systematically by class (Constant, 2022; Borham et al., 2023).

5. Conclusion

First, stress is a configuration of five interacting types with reciprocal feedback both across and within types, extending Ahmed et al. (2022) for the MENA context. Second, resilience maps onto the ART framework with two refinements: Reframing is heavily inflected by faith and family narratives, and Tailoring operates as continuous coping infrastructure-building. Third, the things participants value most about their entrepreneurial outcomes are not money but identity, freedom, impact on other women, and confidence. This is consistent with the Self-Competition Theory, which argues that entrepreneurs are motivated by an internal drive to outperform themselves rather than by external financial rewards. The Egyptian data add an important refinement: the "self" these women are competing against includes doing better for their families, their employees, and other women, not only for themselves. Fourth, the stress–resilience–outcomes relationship is reciprocal and moderated by

marital status and socioeconomic class; the class moderator is particularly consequential, indicating that the framework's universalist construction needs qualification. A summary of conclusions is in the table (1) below.

Table 1:

Main Conclusion	Theoretical Implication	Practical Implication
Stress is a configuration of five interacting types with reciprocal feedback	Extends Ahmed et al. (2022) to the MENA context	Interventions must address the whole configuration, not the work side alone
Resilience maps onto ART with two refinements (faith/family-inflected Reframing; infrastructure-building Tailoring)	ART Framework (Farchi & Peled-Avram, 2025) extended for culturally specific reappraisal and durable coping infrastructure	Programmes should help women build coping infrastructure (peer-founder networks, family integration, mentors, financial buffers)
Outcomes valued are non-financial: identity, freedom, impact on other women, confidence	Relational extension of Self-Competition Theory (Khalil, 1997) — a self-in-relation	Mental-health support normalised and made accessible as a routine resource
The relationship is reciprocal and moderated by marital status and class	Both frameworks' universalism must be qualified where resource access varies by class	Programme designers must distinguish upper-middle-class from lower-income beneficiaries

5.1 Theoretical Implications

Three theoretical refinements follow. First, the ART Framework (Farchi and Peled-Avram, 2025) requires extension to accommodate faith- and family-based reappraisal as a culturally specific variant of Reframing, and the building of durable coping infrastructure as the dominant mode of Tailoring in resource-constrained contexts. Second, Self-Competition Theory (Khalil, 1997) requires a relational extension: the self against which Egyptian women compete is a self-in-relation, with internal benchmarks incorporating identity, freedom, impact, and confidence. Third, both frameworks' universalism must be qualified for contexts where resource access varies by class; the analysis shows the process can be arrested at the Stress stage for resource-constrained women.

5.2 Practical Implications

Three practical recommendations follow. First, intervention programmes should help women build durable coping infrastructure — peer-founder networks, family integration, mentor relationships, financial buffers — rather than train them in episodic coping selection. Second, programme designers must distinguish upper-middle-class from lower-income beneficiaries. Mentorship circles and mental-health awareness will not reach women facing basic resource scarcity and gatekeeper husbands; for them, NGO-mediated employment, accessible exhibition spaces, formalisation pathways, and male-family engagement strategies are more consequential. Third, mental health support should be normalised and made accessible as a routine resource including through workplace and community-based delivery.

Ethics Declaration

Interviewees signed a declaration that they participated in the interviews willingly with no conflict of interest. Names are anonymous and not mentioned anywhere in the manuscript. There was no need for ethical approvals of any entity.

AI Declaration

The authors used Claude, an AI assistant, in the preparation of this manuscript. Claude was used to: (i) shorten and condense authors' drafted sections of the literature review, methodology, and findings and discussion to check language and meet word length requirements; (ii) draft initial versions of the introduction and recommendations section, based on outcomes of the discussion section; (iii) convert in-text citations and the reference list from APA to Harvard style; and (iv) assist with document formatting in the required template. All empirical material (interview data, coding, thematic analysis, theoretical integration, and analytical conclusions)

was developed by the authors. All AI-generated text was reviewed, edited and is in its current form and content the responsibility of the authors.

Abstract: Entrepreneurship education increasingly emphasizes experiential and transformative learning approaches; however, little research has yet examined how experience design may intentionally foster inner development and meaningful relational connections. This exploratory case study presents a Learnfestival as a format designed for collaboration to support social entrepreneurship in Germany and especially Saxony-Anhalt. The guiding research question is how experience design can foster meaningful connections between practicing social entrepreneurs, while impacting the inner dimensions that lead to sustainable change and collaboration. The pedagogical design integrates two complementary frameworks. The Inner Development Goals (IDG) framework provided the competence lens, emphasizing capacities such as self-awareness, critical thinking, empathy, collaboration, and responsible action. On the other hand, an Experience Design Model structured the emotional and spatial learning journey. The Learnfestival was conceived as a half-day lived experience of social entrepreneurship rather than a traditional academic conference. Each phase intentionally activated relational and reflective capacities: a "Tunnel of Challenges" installation raised emotional awareness of sustainability issues; multisensory engagement spaces fostered presence; small "home groups" supported belonging; collaborative exhibition formats encouraged dialogue and collaboration; and structured reflection moments enabled sense-making. Results from a prior Collaborative Online International Learning (COIL) program involving participants from Germany and Tanzania were presented as a focal element within the open, exploratory agenda. Approximately 70 participants, including social entrepreneurs, startups, civic initiatives, and students with entrepreneurial aspirations attended the event. The Learnfestival was evaluated through a structured participant feedback survey combining Likert-scale items and open-ended qualitative responses. Data analysis indicates high perceived engagement and meaningful interaction between participants, who emphasized the experiential and participatory character of the format as enabling authentic exchange beyond conventional networking settings. This study contributes to entrepreneurship education by operationalizing inner development through experience design and proposing the Learnfestival as a transferable set of design principles for connecting academic and entrepreneurial ecosystems. It suggests that intentionally designed emotional and spatial learning journeys may strengthen relational competencies essential for sustainable and social entrepreneurship.

Keywords: Social Entrepreneurship Education**,** Experiential Education, Inner Development Goals, Intersectoral Learning, Experience Design, Embodied Learning

1. Introduction

Social entrepreneurship (SE) has been identified as a driving force and possible solution for many of today's problems (Lytvynchuk, 2023), addressing complex societal challenges that neither governmental agencies nor conventional market forces can solve alone. Consequently, the teaching and learning of SE, social entrepreneurship education (SEE), is becoming an integral component of both formal and informal higher education (Kickul et al., 2018), with some institutions extending it into secondary education contexts and many offers in professional or continuing education.

A fundamental question in SEE is whether this complex set of skills can be taught, and if so, how. A contradiction emerges in as much as that a field, entrepreneurship, driven by innovation and disruption, yet continues to be taught predominantly through conventional, and established pedagogical approaches. Approaches, that. are often rooted in traditional business disciplines and originate from the global north. However, addressing the most pressing global challenges requires moving beyond the knowledge systems that contributed to them.

Therefore, there is a clear need for more interdisciplinary, participatory, and experiential approaches that incorporate diverse perspectives in SEE (Thomsen, Muurlink and Best, 2019). Prior research suggests that experiential learning opportunities between students and third sector organizations foster the knowledge

acquisition about SE by providing opportunities to engage with social complexities that are impossible to replicate in a classroom setting (Thomsen, Muurlink and Best, 2019).

A growing body of literature portrays the United Nations' Sustainable Development Goals (SDGs) as a globally shared framework for communicating societal and environmental challenges, likewise the SDGs are seen as a map for the efforts of humans in initiatives and organizations across for-profit, social innovation, and social enterprise sectors.

However, contributing to achieving the SDGs requires not only external action but also parallel attention to humans' inner development. The Inner Development Goals (IDG) framework has recently emerged as a complementary perspective, emphasizing the development of humans' individual capacities necessary to drive sustainable change. The underlying assumption is that inner conditions shape how individuals move from awareness to connection and ultimately to action (Robles, 2024).

The Inner Development Goals (IDGs) are a research-based framework and have been constructed internationally and across disciplines (Robles, 2024). The framework seeks to identify the skills, qualities, and capacities required for sustainable transformation. It is structured into five interrelated dimensions—Being, Thinking, Relating, Collaborating, and Acting—comprising a set of 25 core skills (see Figure 1).

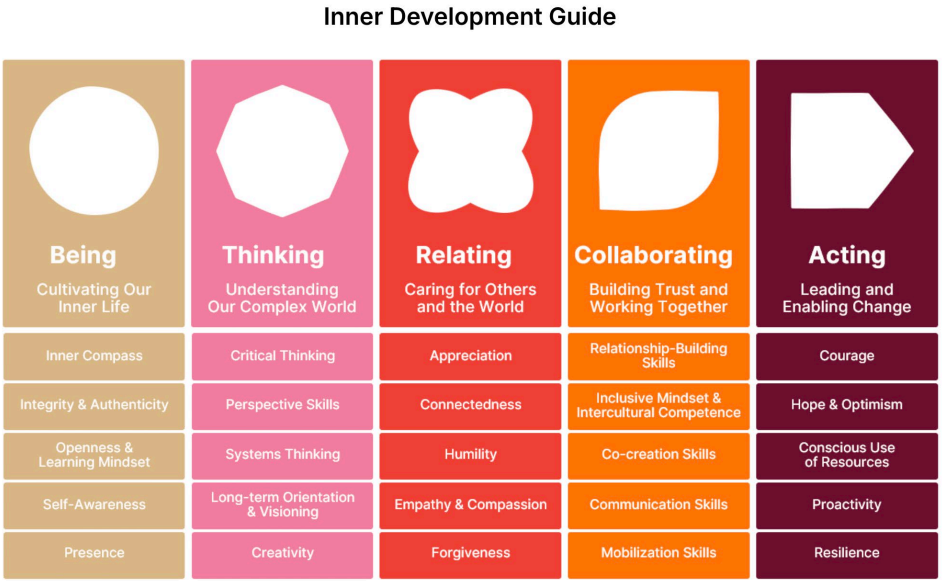

Figure 1: The Inner Development Goals (IDG, 2026)

An increasing body of literature explores the application of the IDG framework across disciplines, including sustainability and entrepreneurship education. Within SEE, the IDGs can be understood as a meta-framework for inner capacities, influencing cognitive framing, emotional orientation, value prioritization, and identity formation, which in turn shape entrepreneurial strategies and innovation processes (Kumar and Suthar, 2026).

However, as research shows, while some universities are recognizing the value of nurturing entrepreneurial mindsets, thus making progress in promoting the IDG dimensions of "Thinking," "Collaborating," and "Acting" through innovative entrepreneurship programs (Shtaltovna *et al.*, 2024), there remains a deficiency in activities related to the other IDG dimensions namely "Being" and "Relating," which would imply cultivating other inner skills and developing an ethical and holistic educational approach that includes intellectual, emotional and practical aspects (Nordén, 2024). This shows a gap in SEE, where personal and relational skills development remains under-emphasized (Robles, 2024). This is especially true of skills that are harder to grasp and less common in formal training and education, such as development of empathy, inner compass, presence, etc.; they are not merely "soft" skills, but central to resilience, frustration tolerance and stress management which in turn impact healthy entrepreneurial success (Wu *et al.*, 2019).

To address this gap, this study draws on experience design as a complementary pedagogical approach. Experience design focuses on deliberately shaping learning environments to influence not only what participants know, but also how they feel, think, and act. In particular, the 5E Experience Design Model developed by the Kaospilots provides a structured framework for designing emotional and spatial learning journeys (Sontag,

2018). This model is well suited to this context since it can situate the learning process not only at a cognitive level but also include aspects of embodied and affective learning (Wu *et al.*, 2019) The model emphasizes the intentional design of meaningful outcomes and guides the development of experiences across five phases: excitement, entry, engagement, exit, and extension.

Achieving the SDGs is a global challenge as the SDGs have been formulated by the UN as a global body with the aim to actually re-adjust developments that had historically been the reasons for the formulation of the SDGs. Thus, in order to provide a global and inclusive approach to leaving knowledge systems that have previously contributed to the creation of current global challenges, in the following there is an attempt to provide fresh insights on how to inclusively embrace contradictions in SEE through experiential learning, that is, by mobilizing the IDG framework for sustainable transformation towards achieving the SDGs.

The study adopts a design-based research approach, which involves iterative cycles of design, implementation, and reflection in real-world contexts as well as pragmatic choice of methods (Anderson and Shattuck, 2012). Within this framework, the research question guiding this study is: *how can experience design foster meaningful connections among practicing social entrepreneurs and individuals interested in the common good, while simultaneously influencing inner dimensions that support sustainable change*?

1.1 Description of the Case Study: the Learnfestival Design and Objectives

A group of stakeholders from academia, social entrepreneurship, and regional networks was convened to co-design an in-person event aimed at fostering collaboration among social entrepreneurs, startups and organizations in Saxony-Anhalt, Germany. The group met regularly to define the learning objectives and format of the event.

The intended meaningful outcomes of the experience were defined as community, beauty, harmony, and accomplishment. The central objective was to create a space in which the IDGs could be experienced in practice rather than communicated solely through theoretical instruction. In response to a perceived declining official engagement with sustainability topics in the German context (Thurau, 2025), the event aimed to foster a sense of connection, empowerment, and agency among participants.

The main theme of the festival, “A whole new world” was co-created and guided the design elements and the tone of communication with all stakeholders. The core idea behind it was to imagine a whole new world, one that is regenerative and participative, aiming to create bridges across the world. Bridges, metaphorically, are needed to solve the most urgent problems with appreciation for different cultural lenses and personal knowledge.

The event was designed as a half-day experience hosted in a former monastery, chosen to create an atmosphere combining historical depth with reflective space. The design intentionally addressed all IDG dimensions by incorporating activities that supported Being (arrival and presence), Relating (connection and dialogue), and Acting (collaboration and experimentation), alongside more traditional cognitive elements (like talks and presentations). A prior Collaborative Online International Learning (COIL) program involving participants from Germany and Tanzania was integrated into the event as a focal element. This component included presentations of six collaborative projects and represented the most structured part of the program. The remaining agenda was intentionally open, allowing for self-directed exploration and emergent interactions.

Thematic areas of the event included waste prevention, circular economy, and sustainability education. Participants included local initiatives, social entrepreneurs, startups, civic organizations, and students interested in starting a social business.

The experience design of the event was guided by the 5E Model, a practitioner framework, developed by Kaospiloten (Sontag, 2018). We followed the five phases of the 5E model during event planning, each step was guided by the question of how participants should feel at different stages of the event:

(I) Excitement: The initial phase aimed to foster curiosity and openness. Participants were invited without detailed information about the event format, emphasizing participation over passive attendance. A pre-event survey was distributed to gather information on participants’ motivations, interests, and expectations.

(II) Entry: At the entry stage, participants were welcomed and provided with a “scan card”. The card contained questions to guide the reflection process of each participant, as well as a map of the experience (see Figures 2 and 3). To introduce a sense of urgency regarding environmental challenges, participants passed through a “Tunnel of Challenges” installation. Rather than relying on conventional imagery of environmental degradation,

the installation featured large-scale artworks by Swaantje Güntzel, a German artist well known for her ecological activism, accompanied by carefully curated instrumental music to create an emotionally reflective atmosphere.

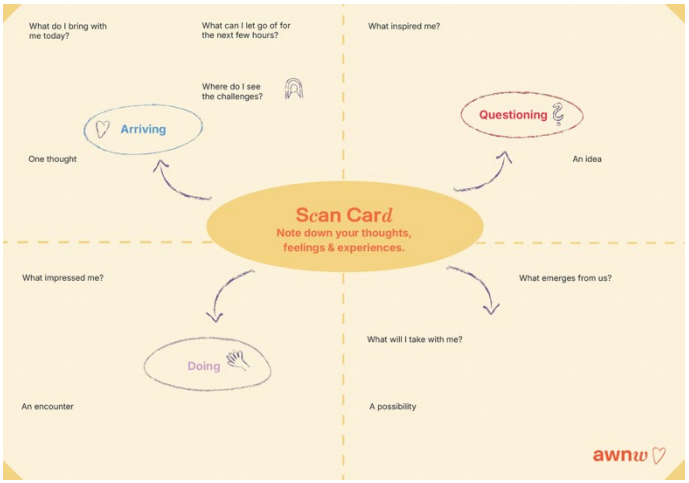

Figure 2: Scan card to guide the self-directed learning experience

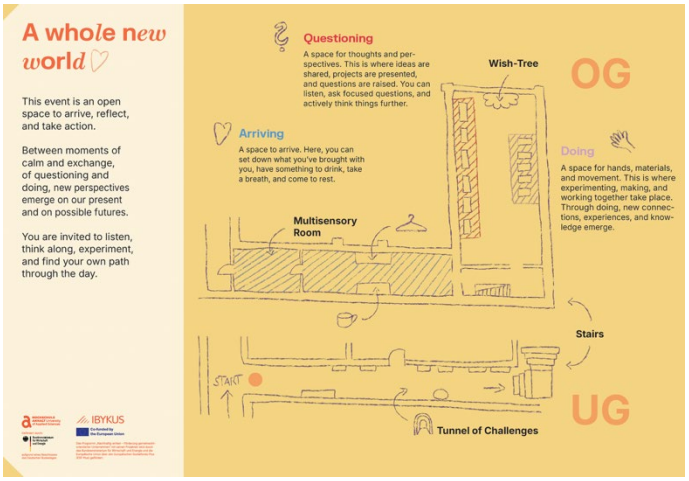

Figure 3: Map of the experience and broad objectives

(III) Engagement: The engagement phase aimed to foster inspiration and connection. Participants were organized into small "home groups," which served as recurring spaces for reflection and exchange. They engaged in discussions about their aspirations for the future and participated in various co-laboratory ("co-lab") spaces and exhibitions.

Activities included hands-on experiences such as creating sustainable products, exploring reforestation initiatives, and engaging with sensory installations. To support the Being dimension, a multisensory room was designed to promote self-awareness and presence (Finck et al., 2023).

(IV) Exit: The exit phase aimed to leave participants with a sense of hope and cultural appreciation. This phase included some reflections about the day followed by intercultural activities such as shared food experiences and a fashion show, creating a gradual transition out of the event.

(V) Extension: At the event, participants were invited to take home a "wish card" created by another participant as a symbolic reminder of the experience. In the longer extension phase, participants received two follow-up communications: the first one including a graphic recording of the event, one week after the event, and the second one was sent out one month after the event together with the feedback survey, and a short film documenting key moments.

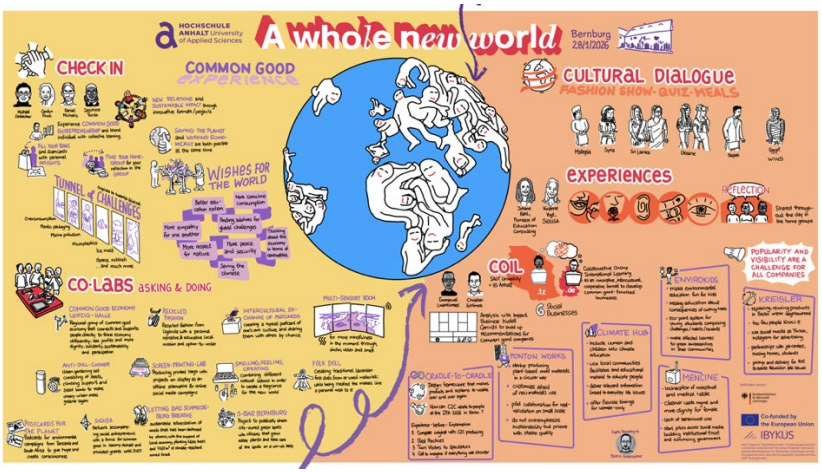

Figure 4: Graphic recording by Markus Querengässer

2. Methods

Approximately 70 participants attended the event. The evaluation was conducted during the extension phase through a structured participant feedback survey.

The anonymous survey included seven self-constructed Likert-scale items (1–5) assessing overall satisfaction, perceived learning, sense of community, and long-lasting impact, as well as open-ended questions exploring participants' experiences, highlights, and suggestions for improvement for future iterations in terms of design based research (Anderson and Shattuck, 2012). The survey was administered via LimeSurvey.

Quantitative data were analyzed using Jamovi (version 2.6.45). Qualitative responses were analyzed using inductive thematic analysis. AI-assisted tools were used to support the coding process; however, all interpretations and thematic categorizations were reviewed and validated by the authors.

It should be noted that the survey was distributed one month after the event, which may have contributed to the relatively low response rate of 18.57% (n = 11). While this limits the statistical representativity of the quantitative findings, it is consistent with typical response rates observed in post-event evaluations of non-mandatory educational activities and the downward trend observed in general in response rates (Baruch and Holtom, 2008). Given the exploratory and design-based nature of this study, the primary analytical value lies in the richness of the qualitative responses and in the identification of patterns relevant to an iterative design improvement, rather than in generalization. Findings should therefore be interpreted as indicative rather than conclusive.

3. Results

The survey yielded a response rate of 18.57%, resulting in a total of 11 completed and valid datasets.

Overall satisfaction with the event was high (M = 4.09, SD = 1.04). Participants rated the format particularly positively (M = 4.55, SD = 0.82), with respondents indicating that it was more personal and intensive than traditional conference formats. The sense of community received the lowest mean score (M = 3.09, SD = 1.45), accompanied by the highest standard deviation, suggesting heterogeneous experiences among participants. See Table 1 for all dimensions evaluated.

Table 1: Dimensions of satisfaction and perceived impact (Likert scale 1–5)

Dimension	Mean (M)	SD
Overall satisfaction	4.09	1.04
Personal & intensive format	4.55	0.82
Sense of community	3.09	1.45
Lasting resonance	3.64	1.21
Cultural diversity	4.91	0.30

Dimension	Mean (M)	SD
Broadened perspective	3.73	1.35
New impulses for action	4.00	1.05

All respondents indicated that they had established new relevant contacts, which contradicts the comparatively lower rating for sense of community. Furthermore, all reported remaining in contact with at least one participant after the event, and several noted that concrete ideas or collaborations had emerged. This suggests that, although the subjective perception of "community" varied, functional networking outcomes were consistently achieved.

3.1 Qualitative Findings: Personal Highlights

The inductive thematic analysis of the open answers to the question regarding their personal highlights of the event resulted in six overarching themes:

First, participants frequently emphasized the *aesthetic and sensory design* of the event as a key highlight. Elements such as the relaxation space, music, and visual documentation contributed to an immersive atmosphere.

Second, the *interactive* character of the format emerged as a central theme. Participants highlighted the value of actively engaging with content through hands-on and co-creative elements, rather than passively consuming information.

Third, *interpersonal exchange* was consistently identified as a core component of the experience.

Both structured and informal dialogue spaces enabled meaningful interactions.

Fourth, several responses pointed to the emotional and inspirational impact of the event. Participants described the experience as meaningful and motivating, suggesting that it fostered motivation, reflection, and a sense of purpose.

Fifth, *networking and collaboration outcomes* were highlighted, indicating that the event not only facilitated exchange but also led to tangible results such as partnerships and project development. Finally, participants emphasized the *diversity of contributions and collective engagement,* particularly in relation to sustainability topics.

Across responses, participants' highlights reflect a holistic learning experience characterized by the integration of sensory, social, and cognitive dimensions. The findings suggest that the interplay between experiential design and relational interaction was central to participants' positive perceptions. Rather than isolated elements, it was the combination of participation, dialogue, and emotional engagement that shaped the overall experience (see Table 2 for a summary of the key elements).

Table 2: Summary of qualitative themes emerging

Theme	Description	Representative Elements
Experiential & Sensory Engagement	Emotional and embodied experience design	Music, multisensory room, visual art
Interactive Learning	Active participation and co-creation	Co-Labs, interactive stands
Social Interaction	Dialogue and relational exchange	Conversations, group discussions
Inspiration & Impact	Emotional and motivational effects	Inspiration, meaningful experience
Networking Outcomes	Concrete collaborations	Partnerships, project connections
Diversity & Engagement	Collective action and plurality	COIL projects, cultural elements

3.2 Qualitative Findings: What to Keep for Next Iterations, What to Rethink

Participants were further asked which elements of the Learnfestival should be maintained and which should be adapted or reconsidered. An inductive thematic analysis again identified six overarching themes, reflecting both strong appreciation and constructive critique.

3.2.1 Experiential and Interactive Highlights

Participants consistently emphasized hands-on, participatory elements as central to their positive experience. These included interactive stands, co-creation formats (e.g., co-labs and group discussions), informal exchange spaces (e.g., table conversations and relaxation areas), and creative elements such as live graphic recording.

3.2.2 Cultural Expression and Diversity

Respondents highlighted the cultural performances (e.g., fashion show) and diverse project presentations. These elements were perceived as authentic, engaging, and identity-affirming, reinforcing the high quantitative rating for cultural diversity.

3.2.3 Value of Informal Exchange

Many responses stressed the importance of open dialogue formats and peer-to-peer exchange. Participants particularly valued the accessibility and openness of interactions during the event.

3.2.4 Structural Tensions and Time Constraints

A recurring critique concerned time pressure and over-programming. Participants reported insufficient time for exploration and reflection and expressed a desire for fewer scheduled activities. The need for more "breathing time" between sessions was mentioned repeatedly.

3.2.5 Inclusion and Representation

One participant pointed to a lack of direct voice from certain international partners (e.g., Tanzanian collaborators in COIL Projects), which could suggest that while diversity was visible, perceived equity in representation could be improved, particularly in formal program elements.

3.2.6 Mixed Evaluation of Small-Group Formats

Responses regarding small-group interactions were mixed. While some participants appreciated these formats, others reported limited personal benefit and expressed a preference for more open formats such as exhibitions and co-lab spaces. The flexible structure of these groups was perceived both as a strength and as a source of disorganization.

The analysis of the resulting themes within the IDG framework showed that interestingly, the IDG Being and Relating dimensions, which are the most underrepresented dimensions in conventional SEE training and activities (Robles, 2024) received the most distinctive design attention and generated the strongest qualitative responses among the participants. Table 3 provides an overview of how the qualitative themes identified align with the five IDG dimensions.

Table 3: IDG Dimensions, activities and corresponding qualitative theme

IDG Dimension	IDG Skills Activated	Corresponding Learnfestival Element	Qualitative Theme
Being	Presence, self-awareness, inner compass	Multisensory room, Tunnel of Challenges, arrival rituals	Experiential & Sensory Engagement
Thinking	Critical thinking, sense-making, perspective-broadening	COIL project presentations, co-lab spaces	Interactive Learning; Diversity & Engagement
Relating	Empathy, appreciation, connectedness	Home groups, intercultural activities, fashion show	Social Interaction; Cultural Expression
Collaborating	Communication, co-creation, inclusive mindset	Co-labs, group discussions, exhibition formats	Interactive Learning; Networking Outcomes
Acting	Courage, creativity, optimism, sustained engagement	Wish cards, follow-up communications, concrete project outcomes	Inspiration & Impact; Networking Outcomes

4. Discussion

The findings indicate a strong alignment between participants' experiences and the intended experiential and relational design principles of the Learnfestival. At the same time, they reveal several tensions inherent to the

design of large, open, participatory learning environments. In particular, regarding the balance between openness and structure, inclusivity and representation, and immediacy versus long-term impact.

Participation levels were satisfactory; however, the relatively low representation of social entrepreneurs and startups, as well as the limited survey response rate, constrain the generalizability of the findings.

Despite these limitations, our results suggest that the experiential design successfully fostered engagement, interaction, and meaningful exchange. In particular, multisensory and participatory elements appear to have supported emotional engagement and presence, aligning with research on the importance of embodied and affective learning even in digital settings (Wu *et al.*, 2019).

Notably, the findings indicate that learning processes were not solely content-driven but emerged through relational interaction. This supports previous research emphasizing the role of collaboration, empathy, and shared experience in social entrepreneurship education (Pischetola and Martins, 2024).

4.1 Strengths of the Format

Participants highlighted the value of interactive and participatory formats, particularly the co-laboratory spaces. These findings align with the typology proposed by Motta and Galina (2023), which suggests that experiential learning formats can help to demystify the process of (social) enterprise creation and enhance motivation.

For practitioners, the opportunity to engage creatively and collaboratively represented a departure from more conventional formats such as startup pitches or fairs. The possibility of “doing” rather than merely listening emerged as a key strength of the Learnfestival format.

The results further indicate that multisensory design elements facilitated emotional engagement and presence, supporting the argument that learning environments benefit from integrating embodied and affective dimensions (Wu *et al.*, 2019).

Interestingly, participants’ responses reflected dimensions of the Inner Development Goals, even though these were deliberately not explicitly presented as part of the program. This suggests that the design could implicitly support inner development processes.

Finally, all respondents reported establishing at least one meaningful new connection that persisted beyond the event. This reinforces the importance of relational learning processes and aligns with findings by Pischetola and Martins (2024), who emphasize the role of empathy, collaboration, and togetherness in learning outcomes.

4.2 Areas for Improvement

Future iterations should explore alternative formats such as shorter events, hybrid models, or targeted engagement strategies in order to better accommodate the needs of entrepreneurial participants.

Participants also expressed a desire for more unstructured time. Although the event was deliberately designed to be open and flexible, it was still perceived as relatively dense. This suggests that creating truly open learning spaces requires not only reduced programming of agendas but also careful expectation management of participants and stakeholders alike.

Facilitating large-scale open formats presents an additional challenge. It requires facilitators to adopt a less directive role and to support emergent processes without over-structuring them. This calls for further reflection and preparation in future implementations.

Limitations and future research

The main limitations of this study include the small sample size and low survey response rate, as well as the heterogeneous composition of the participant group These factors restrict the generalizability of the findings. However, and in turn, as a single event design-based study, validities and generalizability are always lower due to its situated instantiation.

Additionally, the evaluation relied on retrospective self-report data collected one month after the event. While this approach captures lasting impressions, it may be affected by recall bias.

Future research should consider incorporating real-time or longitudinal data collection methods to better capture learning processes and outcomes. Furthermore, exploring alternative formats and contexts could provide deeper insights into the scalability and transferability of the Learnfestival model.

Acknowledgements

This project is part of the funding line “Nachhaltig wirken – Förderung gemeinwohlorientierter Unternehmen” and was funded by the Federal Ministry for Economical Affairs and Energy, Germany Grant Number 2025000321, together with funds from the European Union (ESF Plus). Furthermore, the authors also thank the Kaospilot training team and the participants of the Experience Design training (November 2025) for their contributions and inspiration. Special thanks are extended to all members of the Learnfestival planing and organizing committees for their support.

Ethics Declaration

Participants were informed about the purpose of the study, and all data were collected anonymously. Formal ethical approval was not required according to institutional guidelines.

AI Declaration

AI tools were used to support literature exploration, qualitative data analysis, and language editing. All outputs were critically reviewed and validated by the authors, who retain full responsibility for the content of the manuscript.

Technical and Economic Gaps in Freight Diesel-to-Natural Gas Transition – A Conceptual Analysis

Lennon de Almeida Freire, Savio Figueira Corrêa and Sérgio Evangelista Silva
Universidade Federal de Ouro Preto (UFOP), MG, Brasil

lennon.freire@aluno.ufop.edu.br
saviofcorrea@ufop.edu.br
sergio.silva@ufop.edu.br

Abstract: Heavy-duty road freight transport plays a central role in contemporary logistical systems but remains heavily dependent on diesel, making it a primary driver of atmospheric emissions, intensive fossil fuel consumption, and exposure to energy cost volatility. Given this scenario, the transition to alternative energy technologies has been widely discussed in academic literature, particularly within the contexts of sustainability, innovation, and organisational competitiveness. Among these alternatives, natural gas-based technologies—such as Compressed Natural Gas (CNG) and Liquefied Natural Gas (LNG)—have received significant attention for their potential to serve as transitional solutions in the short and medium term. Despite the growing volume of studies on the subject, existing literature addresses the energy transition in road freight transport in a fragmented way. Technical research focuses on engine performance, energy efficiency, and emissions, while economic studies focus on financial indicators such as Total Cost of Ownership (TCO) and payback periods. Meanwhile, organisational and behavioural approaches analyse institutional factors and technology acceptance. These strands progress largely in isolation, with limited integration between technical and economic issues, which restricts effective decision-making support within organisational and corporate environments. In this context, this article aims to critically examine the fragmentation of scientific literature regarding the transition from diesel to alternative energy technologies in heavy-duty road freight transport, and to propose a conceptual framework integrating technical and economic feasibility. The study adopts a theoretical-analytical approach based on critical synthesis of the literature, thereby addressing a gap in the integration of techno-economic dimensions in existing research. The article organises the technical, economic, and decisional dimensions involved in the energy transition, repositioning the debate beyond isolated environmental assessments. In doing so, it establishes a clear conceptual foundation for the development of integrated performance evaluation models and for future empirical investigations aimed at supporting strategic decision-making in the road freight transport sector. This approach contributes to bridging the gap between technical performance and economic decision-making in energy transition studies. The proposed framework is particularly relevant for fleet managers, logistics operators, and policymakers operating in contexts characterised by infrastructure constraints, regulatory uncertainty, and cost sensitivity.

Keywords: Energy Transition, Green Innovation, Economic Feasibility, Performance Assessment, Freight Transport

1. Introduction

Road freight transport occupies a pivotal position within contemporary logistics systems, particularly in countries characterised by large territories and a pronounced reliance on this mode for the movement of goods. Despite its economic and operational significance, the sector remains deeply anchored to diesel as its primary energy source. This dependency casts a long environmental shadow, placing road freight among the leading contributors to atmospheric emissions, a reality acknowledged across the literature as a defining feature of freight transport systems in diverse national contexts (Cantillo et al., 2022; Zhao et al., 2021).

However, when considered collectively, a structural limitation emerges. Within this landscape, the transition towards alternative energy technologies has steadily emerged as a strategic focal point in both academic discourse and managerial practice, where sustainability, innovation, and logistical performance increasingly intersect. The literature on green logistics and sustainable supply chain management suggests that the adoption of environmentally oriented practices can yield tangible gains in organisational performance, operational efficiency, and competitive positioning—particularly when such practices are woven into the broader fabric of business strategy (Martinsen & Huge-Brodin, 2014; Wang & Hu, 2021).

Among the alternatives to diesel explored in the literature, natural gas-based technologies—most notably compressed natural gas (CNG) and liquefied natural gas (LNG)—have attracted considerable attention for their potential to strike a delicate balance between technical performance, economic viability, and environmental impact mitigation. Experimental studies indicate that heavy-duty engines operating on natural gas, including dual-fuel configurations, can achieve levels of torque, power, and energy efficiency that closely mirror those of conventional diesel engines across a range of operating conditions. Such findings lend weight to the argument for their technical feasibility in freight transport applications (Karczewski & Wieczorek, 2021; Karczewski & Szamrej, 2023).

From an economic standpoint, a growing body of research has turned to total cost of ownership (TCO) and life-cycle costing approaches as lenses through which alternative energy technologies may be comparatively assessed. Empirical evidence suggests that, under certain operational conditions, natural gas-powered vehicles may offer economic advantages over their diesel counterparts, driven primarily by lower fuel costs and a more predictable maintenance profile (Zhao et al., 2021; Zhang et al., 2024). These insights reinforce the view that natural gas may serve as a transitional technology in the short to medium term, particularly in contexts where infrastructure availability and route characteristics are conducive to its deployment.

Despite the accumulation of relevant technical and economic evidence, the body of literature addressing energy transition in heavy-duty road freight transport remains markedly fragmented. Technical studies tend to concentrate on engine performance, fuel consumption, and emissions, while economic analyses predominantly privilege financial indicators such as TCO and payback periods (Katreddi et al., 2023; Karczewski & Szamrej, 2023). In parallel, behaviour-oriented research explores perceptual factors and institutional barriers, often without establishing explicit connections to vehicle performance metrics or to the tangible economic outcomes of freight operations (Cantillo et al., 2022).

As a result, a significant gap becomes apparent in relation to the critical and integrated assessment of techno-economic feasibility within this transition. In light of this, the present study sets out to critically examine the fragmentation of existing approaches in the literature and to argue for the need for an integrated analytical framework capable of capturing the interplay between technical and economic dimensions in the transition from diesel to alternative energy technologies in heavy-duty road freight transport. By adopting a theoretical-analytical approach based on critical literature synthesis, the study contributes to addressing the lack of integration between technical and economic dimensions, offering a structured conceptual basis to support organizational decision-making, particularly for fleet managers, logistics operators, and policymakers operating in contexts of infrastructure and regulatory uncertainty.

2. Evidence of the Research Gap

Building on the previous discussion, the scientific literature addressing the energy transition in heavy-duty road freight transport has expanded markedly, reflecting the mounting regulatory, environmental, and economic pressures placed upon a sector still firmly reliant on diesel as its primary energy source. However, despite the breadth of studies available, existing contributions appear dispersed and unevenly articulated, with notable advances achieved within specific dimensions, yet only limited integration across technical, economic, and decision-making aspects. It is precisely this analytical fragmentation that lies at the heart of the research gap examined in this article.

2.1 Fragmentation of Approaches in the Literature on Energy Transition

Building on this perspective, a cross-cutting examination of the existing body of research reveals that the transition from diesel to alternative energy technologies in heavy-duty transport is approached through multiple, largely isolated perspectives. As a result, the capacity to support complex technological decision-making within the operational context of heavy-duty road freight transport remains constrained (Karczewski & Wieczorek, 2021; Katreddi et al., 2023).

2.2 Predominance of Isolated Technical Analyses

A substantial portion of the literature is devoted to the technical evaluation of alternatives to diesel, with a primary focus on engine performance, energy consumption, and atmospheric emissions. Assessments conducted under real or representative driving cycles further reinforce the technical feasibility of LNG and CNG for medium- and long-distance applications (Zhao et al., 2021). However, these studies often remain anchored in specific technical or environmental metrics (Zhao et al., 2021; Katreddi et al., 2023).

2.3 A Narrow and Decontextualised Economic Focus

In parallel with technical analyses, a considerable body of research approaches the energy transition through an economic lens, employing indicators such as total cost of ownership (TCO), life-cycle cost, and payback period (Katreddi et al., 2023; Cantillo et al., 2022). Recurring findings suggest that natural gas-powered vehicles may offer economic advantages over diesel, particularly due to lower fuel costs and, in some cases, reduced maintenance expenses (Zhao et al., 2021; Zhang et al., 2024). However, these analyses often neglect operational

variability (Katreddi et al., 2023; Karczewski & Szamrej, 2023). As a result, economic analyses often fail to engage meaningfully with the technical outcomes observed under real operating conditions, which, in turn, constrains their effectiveness in informing sound technological transition decisions (Karczewski & Szamrej, 2023).

2.4 Environmental Assessments Disconnected From Decision-Making Logic

Another important strand of the literature focuses on the environmental evaluation of alternatives to diesel, with particular emphasis on studies grounded in Life Cycle Assessment (LCA) and Well-to-Wheel (WTW) approaches. These works provide relevant evidence regarding the reduction of greenhouse gas emissions and local pollutants associated with the use of natural gas in heavy-duty vehicles. However, more recent studies, such as that of Karczewski & Szamrej (2023), indicate that the environmental benefits of natural gas may involve meaningful trade-offs, including increased emissions of methane and secondary aerosols under certain operational conditions. This challenges simplified environmental assessments based solely on CO_2 or aggregated Global Warming Potential (GWP). However, these assessments are rarely integrated with economic analyses or with the decision-making logic of firms.

2.5 Behavioural and Organisational Studies Without Techno-Economic Integration

The literature also encompasses studies aimed at understanding the behavioural and organisational factors that shape the adoption of sustainable technologies in transport. These works highlight institutional barriers, risk perception, infrastructure availability, and stakeholder expectations as central elements in the decision-making process (Cantillo et al., 2022). These approaches often lack integration with technical and economic evidence (Martinsen & Huge-Brodin, 2014; Khan et al., 2019). Empirical evidence suggests, however, that organisational acceptance of alternative technologies is strongly conditioned by perceived profitability, operational reliability, and actual costs—factors that call for a rigorous integration of technical and economic analyses (Pfoser, 2022).

2.6 Limitations of Existing Frameworks and Multicriteria Approaches

In an effort to bring together multiple dimensions of sustainability, some studies propose conceptual frameworks and multicriteria methods for the evaluation of energy technologies. Approaches grounded in AHP, DEMATEL, EDAS, and structures derived from the triple bottom line seek to consider technical, economic, and environmental criteria simultaneously (Alonso-Villar et al., 2022). However, when applied to the specific context of heavy-duty road freight transport, such frameworks reveal notable limitations. These frameworks often lack applicability to real operational contexts. (Alonso-Villar et al., 2022). As a result, these approaches often provide only limited support for decision-making in real-world energy transition contexts.

2.7 Critical Synthesis of the Research Gap

An integrated reading of the literature reveals that, although there have been meaningful advances in the technical, economic, environmental, and organisational assessment of energy transition in heavy-duty road freight transport, these strands of progress remain largely disconnected from one another. The principal limitation of existing frameworks lies in their inherently generic character, which often overlooks critical sector-specific features, such as the high sensitivity to torque and the dependence on route-specific infrastructure. The absence of an analytical framework capable of critically and pragmatically integrating techno-economic feasibility under such real-world conditions constrains both the advancement of scientific knowledge and the effective support of organisational decision-making (Khan et al., 2019; Alonso-Villar et al., 2022). This gap underscores the need for a conceptual effort aimed at articulating these dimensions, thereby establishing the foundations for the development of evaluation models specifically tailored to the performance of energy transition in heavy-duty freight transport.

3. Conceptual Framing of the Research

The critical analysis of the literature presented in the previous section clearly highlights the fragmentation of existing approaches and makes it clear that the energy transition in heavy-duty road freight transport cannot be adequately understood through isolated approaches. Within this context, it becomes necessary to establish a conceptual framing capable of organising, in an integrated manner, the core dimensions involved in assessing the feasibility of replacing diesel with alternative energy technologies. This framing rests on the understanding that the energy transition constitutes a matter of technological and organisational performance, rather than merely an issue of environmental compliance.

3.1 Energy Transition as a Problem of Organisational Performance

Studies in the field of green logistics and sustainable innovation suggest that the adoption of environmentally oriented technologies should be examined through the lens of organisational performance, considering their effects on operational efficiency, competitiveness, and value creation (Martinsen & Huge-Brodin, 2014; Wang & Hu, 2021). In this sense, and in response to the fragmentation identified, the energy transition in heavy-duty road freight transport entails long-term strategic decisions, characterised by substantial investments, a strong dependence on physical assets, and direct impacts on the cost structure of operations.

The literature further indicates that technologies such as CNG and LNG may be understood as incremental transition solutions, whose adoption depends less on their isolated environmental potential and more on their ability to enhance—or at the very least sustain—the operational and economic performance of logistics systems (Pfoser, 2022).

3.2 The Dimension of Technical Feasibility in Heavy-Duty Road Freight Transport

Technical feasibility stands as one of the foundational pillars of this framework, defined by the capacity of an alternative technology to withstand and sustain the demanding operational requirements of heavy-duty freight transport. This dimension extends beyond isolated thermodynamic efficiency, encompassing critical parameters such as torque delivery at low engine speeds, power stability on inclines, and mechanical robustness in the face of load variability (Karczewski & Wieczorek, 2021; Karczewski & Szamrej, 2023).

Beyond these force-related parameters, operational range emerges as a decisive factor, particularly in the case of LNG, whose performance under real driving cycles demonstrates compatibility with medium- and long-distance routes (Zhao et al., 2021; Balazadeh et al., 2024).

In this light, the concept of technical feasibility proposed here brings together the reliability of the powertrain and its geographical and operational adaptability. Within this framing, a technology is only deemed technically viable when it demonstrates the capacity to maintain the required level of performance under real-world conditions of use, while minimising the risks of unavailability or accelerated asset degradation (Karczewski & Szamrej, 2023; Balazadeh et al., 2024).

3.3 The Dimension of Economic Feasibility and Decision Rationality

Economic feasibility constitutes the second pillar of this framework and is often the determining factor in shaping the scale of energy transition within commercial fleets. Yet, the perspective advanced here moves beyond a static view of costs, embracing instead the rationality of decision-making under conditions of uncertainty and operational variability (Katreddi et al., 2023; Cantillo et al., 2022).

From this standpoint, Total Cost of Ownership (TCO) is treated as a dynamic variable, sensitive not only to fluctuations in fuel prices but, more fundamentally, to the technology's actual technical performance in the field. Economic feasibility is validated when reductions in direct operating costs are sufficient to offset the capital premium associated with acquiring natural gas-powered vehicles within a time horizon deemed acceptable by the organisation (Zhao et al., 2021; Zhang et al., 2024).

Economic feasibility also depends on cost predictability and perceived risk. Evidence suggests that cost predictability can be as decisive for managers as the absolute magnitude of the savings achieved (Katreddi et al., 2023). In this sense, economic feasibility is defined here as the capacity of the alternative technology to sustain business profitability, mitigate the risks of obsolescence, and preserve the competitiveness of logistics operations in relation to diesel (Karczewski & Szamrej, 2023; Zhang et al., 2024).

3.4 Interdependence Between Technical and Economic Feasibility

A central feature of the proposed conceptual framework lies in the interdependence between the technical and economic dimensions. Evidence drawn from both technical and economic studies indicates that variations in technical performance exert a direct influence on operational costs, particularly those associated with maintenance, energy consumption, and vehicle reliability (Karczewski & Szamrej, 2023; Zhang et al., 2024). Conversely, economic constraints may limit the adoption of technically viable solutions, especially when high initial investments or infrastructure-related costs exceed the financial capacity and capital availability of transport operators (Issa et al., 2024; Pfoser, 2022). This bidirectional relationship underscores the inadequacy

of assessments that treat technical and economic dimensions in isolation, as the performance of one variable inevitably shapes and conditions the outcomes of the other.

3.5 Decision-Making Context and the Integration of Dimensions

The decision-making context forms the final frame within which technical and economic feasibility is interpreted and acted upon by organisations. This dimension acknowledges that the energy transition does not unfold within a purely technical vacuum; rather, it is shaped by institutional pressures, infrastructure availability, and perceptions of strategic risk (Cantillo et al., 2022; Alonso-Villar et al., 2022).

Within this setting, the context operates as a filter of feasibility: regulatory uncertainties or gaps in refuelling infrastructure may render technically sound and economically attractive projects unviable (Khan et al., 2019). The rationale underpinning this framework therefore suggests that the transition to alternative fuels in heavy-duty transport requires a convergence between the technical capacity for implementation, the financial sustainability of the investment, and the contextual viability of the operation (Martinsen & Huge-Brodin, 2014). Seen through this integrated lens, the fleet manager no longer evaluates isolated components but instead oversees the performance of the transition as a long-term strategic asset.

3.6 Synthesis of the Proposed Conceptual Framework

The synthesis of the conceptual framework presented here advances the view that energy transition in heavy-duty road freight transport should be assessed as a system of integrated performance, rather than as a sequence of isolated decisions. This model departs from the fragmented approaches found in the literature by establishing that the real viability of the transition emerges only from a balanced intersection of three critical dimensions: the technical capacity for implementation, the economic rationality of the investment, and alignment with the decision-making context (Karczewski & Wieczorek, 2021; Katreddi et al., 2023; Pfoser, 2022).

The framework integrates technical, economic, and contextual dimensions into a unified analytical perspective (Karczewski & Szamrej, 2023; Zhang et al., 2024). In this sense, the proposed model operates as an analytical instrument for both managers and researchers, offering a coherent foundation for scenario simulation and for supporting strategic decisions aimed at sustaining the competitive performance of logistics operations (Martinsen & Huge-Brodin, 2014; Alonso-Villar et al., 2022).

3.7 Schematic Representation of the Conceptual Framework

As a synthesis of the theoretical discussion presented, Figure 1 illustrates the structure of the proposed conceptual framework. The visual model highlights the central intersection of the three dimensions—Technical Feasibility, Economic Feasibility, and Decision-Making Context—as the point at which the real performance of the energy transition takes shape.

This integration enables a systemic analysis that moves beyond the fragmentation identified in the literature, offering a coherent basis for scenario simulation and for supporting strategic decision-making in heavy-duty road freight transport.

4. Methodology

4.1 Nature of the Study and Analytical Logic

This study is characterised as conceptual in nature, guided by a theoretical-analytical approach aimed at critically organising the existing literature on energy transition in heavy-duty road freight transport. Unlike empirical investigations, this work does not seek to test hypotheses or validate models through primary data; rather, it endeavours to structure and integrate dispersed contributions within the literature, with the purpose of revealing gaps and proposing a more coherent analytical framing.

This methodological choice is justified by the fragmented nature of the existing literature, which requires critical synthesis rather than empirical validation at this stage. The analytical logic adopted is grounded in the critical synthesis of studies that address, in isolation, the technical, economic, and organisational dimensions of energy transition. From this examination, the study identifies recurring patterns of fragmentation and limitations inherent in purely technical or financial models, weaving these insights into the construction of a conceptual framework oriented towards assessing transition performance through an integrated and systemic perspective.

In this sense, the methodology enables the articulation of dispersed evidence into a structured analytical model, supporting both theoretical advancement and future empirical applications.

4.2 Delimitation of the Analytical Dimensions

The conceptual framework proposed in this study is structured around the articulation of three central dimensions: technical feasibility, economic feasibility, and the decision-making context.

- The technical dimension refers to the capacity of alternative technologies to meet the real demands of logistics operations, including torque, power, reliability, and adaptability to different operating conditions (Karczewski & Szamrej, 2023).
- The economic dimension encompasses the analysis of the costs associated with the adoption and operation of these technologies, considering not only Total Cost of Ownership (TCO), but also cost predictability and exposure to financial risk (Zhang et al., 2024).
- The decision-making context includes factors such as infrastructure availability, regulatory conditions, and the perception of risk among the stakeholders involved (Khan et al., 2019).

These dimensions are treated as interdependent, as technical performance directly shapes operational cash flows, while the conditions of the decision-making context act as the final filter determining the feasibility of technological adoption. This delimitation ensures analytical focus while preserving the systemic nature of the energy transition problem.

4.3 Scope

This study focuses on the conceptual analysis of energy transition in heavy-duty road freight transport, with particular emphasis on the shift from diesel-based technologies to natural gas solutions, including compressed natural gas (CNG) and liquefied natural gas (LNG). These technologies are considered due to their relative maturity and recurrent presence in the literature as transitional alternatives for long-distance operations.

The scope of the proposed framework is deliberately centred on the integration of technical and economic dimensions, as these are identified as the most critical and yet insufficiently articulated aspects in existing studies. Environmental and organisational factors are incorporated as contextual elements that influence the decision-making environment, without constituting the primary analytical focus. This scope reflects the intention to develop a practically applicable framework, particularly relevant for operational and strategic decision-making contexts in freight transport.

5. Research Logic and Proposed Objectives

5.1 Logical Structuring of the Research

The analysis developed demonstrates that the transition to alternative energy technologies in road freight transport is essential for logistical sustainability (Martinsen & Huge-Brodin, 2014; Pfoser, 2022). However, the

logic underpinning this research rests on the recognition that isolated assessments fall short of capturing the complexity of this process, thereby revealing the need for an integrated analytical perspective. As technical performance directly shapes operational costs, and economic conditions, in turn, determine the feasibility of technological adoption (Karczewski & Szamrej, 2023; Zhang et al., 2024), there emerges a clear need for a coherent structure capable of articulating these dimensions within the decision-making context, so as to provide a consistent foundation for organisational decision-making (Cantillo et al., 2022; Khan et al., 2019). This research logic therefore bridges the gap identified in the literature by explicitly linking technical performance and economic feasibility within a unified analytical perspective.

5.2 Scope Delimitation of the Research

This study focuses on heavy-duty road freight transport, a domain in which energy consumption and cost sensitivity are particularly critical. The analysis is directed towards the transition from diesel-based technologies to solutions grounded in natural gas (CNG and LNG), identified in the literature as mature transitional alternatives.

The scope is deliberately centred on the technical and economic dimensions, as these represent the most critical and least integrated aspects within existing approaches. Environmental and organisational factors are incorporated as contextual variables that shape the decision-making environment, allowing the framework to maintain its focus on operational performance without overlooking the institutional and regulatory pressures that characterise the sector (Issa et al., 2024; Khan et al., 2019).

5.3 General Objective of the Article

In light of the gaps identified, this article aims to propose and describe a conceptual framework for the integrated assessment of the technical and economic feasibility of energy transition in heavy-duty road freight transport. This objective reflects the need to support decision-making processes in contexts characterised by operational complexity and uncertainty.

To achieve this objective, the study:

- Examines how the literature addresses technical performance and economic viability in a dissociated manner;
- Identifies the limitations of these approaches when detached from real-world operational contexts;
- Proposes a conceptual structure (figure 1) that brings these dimensions together under a perspective oriented towards organisational performance and strategic decision support.

To support the achievement of this objective and the application of the proposed framework, the following section outlines the methodological perspective and analytical logic underpinning the construction and future operationalisation of this study.

6. Conclusions and implications

6.1 Theoretical and Conceptual Contributions

This article set out to establish a conceptual foundation for a more integrated assessment of the technical and economic feasibility of energy transition. Its primary contribution lies in the critical organisation of this fragmented field and in the proposal of a conceptual framework (Figure 1) that brings together the technical, economic, and decision-making dimensions. By explicitly addressing the lack of integration identified in the literature, the study advances the understanding of energy transition as a problem of integrated performance rather than isolated evaluation. By reframing the transition as a problem of technological-organisational performance, the study offers an analytical perspective more closely aligned with the real operational conditions encountered in heavy-duty freight transport.

6.2 Managerial and Public Policy Implications

From a managerial perspective, the framework contributes to a more structured understanding of the trade-offs involved in the adoption of new technologies. Within the realm of public policy, the findings suggest that incentives for transition should extend beyond vehicle subsidies, placing equal emphasis on regulatory stability and the expansion of refuelling infrastructure, both of which form part of the critical decision-making context

identified. This highlights the need for coordinated policy approaches that consider the interdependence between technological performance, economic viability, and contextual conditions. Policies grounded in partial analyses risk generating distortions, as they overlook the fact that the economic viability of transport operators is intrinsically tied to the availability of this supporting contextual network.

6.3 Research Agenda

The findings of this study point to the need for further advances in investigations capable of empirically operationalising the proposed conceptual framework. Future research should prioritise validation through real-world applications, particularly using fleet-level data and operational case studies. Future research may explore the application of this framework in real-world operational contexts, including analyses based on fleet data, case studies, and quantitative modelling approaches that integrate technical performance and economic feasibility.

In addition, there is scope for the development of analytical models capable of capturing the interdependence between technical, economic, and contextual variables, thereby contributing to a more robust assessment of energy transition performance. Comparative studies across different transition technologies, as well as investigations into the impacts of specific operational conditions, may also deepen the understanding of the phenomenon.

Despite its contributions, this study presents limitations inherent to its conceptual nature. The proposed framework is not empirically validated and does not incorporate quantitative indicators of cost or emissions at this stage. Furthermore, the analysis is primarily centred on natural gas-based technologies, reflecting their maturity in the literature rather than an exhaustive comparison across all possible alternatives. These limitations reinforce the need for future empirical studies aimed at validating and operationalising the proposed framework under real-world conditions.

Ethics Declaration

The authors declare that this research is an original theoretical and conceptual work. The study did not involve experimentation with human or animal subjects. The research was conducted in compliance with ethical standards of academic integrity. The authors further declare that there are no conflicts of interest or financial relationships that could have influenced the work reported in this article.

AI Declaration

The authors declare that artificial intelligence (AI) tools were used as support in the preparation of this manuscript. AI was applied specifically to assist with translation, language refinement, logical structuring of the text, and grammatical correction, aimed at ensuring the clarity and academic rigour required for an international publication. It is emphasised that the theoretical conception, critical literature analysis, and the proposal of the original conceptual framework were performed entirely by the human authors, who take full responsibility for the content and final integrity of this article.

Abstract: Drawing upon the Theory of Planned Behavior (TPB), this study explores the main antecedents of entrepreneurial intention and the desire to start a new business among Tourism students during the COVID-19 pandemic. The research is based on data collected from 152 finalist students from Portuguese higher education institutions (HEIs) using a self-report questionnaire. Partial least squares structural equation modeling (PLS-SEM) was employed to assess the measurement and structural model. The results reveal that fear and anxiety related to COVID-19 do not significantly influence either entrepreneurial intention (βs = -0.100; p = 0.133) or the desire to start a new business (βs = 0.066; p = 0.177). Conversely, opportunity recognition (βs = 0.471; p < 0.001) and perceived entrepreneurial education (βs = 0.284; p < 0.05) positively influence entrepreneurial intention. Furthermore, entrepreneurial intention (βs = 0.446; p < 0.001) and anticipatory emotions (βs = 0.204; p < 0.05) significantly enhance the desire to start a new business. Surprisingly, TPB antecedents – attitude, subjective norms, and perceived behavioural control – do not show statistically significant effects on this outcome. The findings also indicate that entrepreneurial intention fully mediates the relationships between opportunity recognition (βs = 0.210; p < 0.01) and perceived entrepreneurial education (βs = 0.127; p < 0.05) with the desire to start a new business. This study extends entrepreneurship research in crisis contexts by highlighting the central role of entrepreneurial intention as a mediating mechanism and by evidencing the limited explanatory power of traditional TPB antecedents in shaping students' entrepreneurial behavior during periods of uncertainty. The findings also suggest the coexistence of distinct crisis-response logics – "*acting*" vs. "*wait-and-see*" – influencing entrepreneurial outcomes.

Keywords: Entrepreneurial Intention; TPB; Entrepreneurship Education; Desire to Start a new Business; Global Crisis.

1. Introduction

The COVID-19 pandemic reshaped the global landscape, creating economic, political, and sociocultural challenges. The business sector was severely affected, as firms suspended operations and adopted new strategies to ensure survival and continuity (Kryeziu *et al*., 2022).

The tourism sector was among the most affected, given its reliance on physical presence. Cultural, conference, and sporting events were cancelled or moved online. In 2020, the hotel industry, airlines, and destinations experienced sharp revenue declines (Donthu and Gustafsson, 2020).

The pandemic also constrained new venture creation. Uncertainty and investment risk reduced entrepreneurs' willingness to start businesses (Liñan and Jaén, 2022). Fear, anxiety, and uncertainty further impaired managerial decision-making (Wang *et al*., 2020).

Sneader and Singhal (2020) argue that tourism will recover more slowly than other sectors but will ultimately adapt and reinvent itself. Recognizing business opportunities remains critical in this process. Individuals' ability to identify opportunities becomes especially salient in crises, which can create favourable conditions for new ventures (Hassan *et al*., 2020).

Opportunity recognition supports entrepreneurial behavior, but other factors also shape entrepreneurial intention, including prior entrepreneurship training. Research shows that personal characteristics and psychological factors influence both entrepreneurial intention and the entrepreneurial process (Ferreira *et al*., 2012).

Building on strategic management literature, we conceptualize students' crisis responses as entrepreneurial intention – flexible and adaptive actions in response to adversity. Entrepreneurial intention operates as a

resilience mechanism that helps potential entrepreneurs manage environmental change. It reflects deliberate decisions and actions that finalist students, as future strategic leaders, take regarding their business trajectories.

Drawing on the Theory of Planned Behavior (TPB), we explore the antecedents of entrepreneurial intention and the desire to start a business among Tourism students during the COVID-19 pandemic. We use a quantitative approach based on validated questionnaires collected from 152 finalist students in Portuguese higher education. We apply partial least squares structural equation modelling (PLS-SEM) to estimate the structural model.

Our findings show that opportunity recognition and perceived entrepreneurial education strengthen entrepreneurial intention, which in turn increases the desire to start a new business, together with anticipatory emotions. In contrast, COVID-19-related fear and anxiety and traditional TPB antecedents do not significantly affect this outcome. Additionally, entrepreneurial intention mediates the effects of opportunity recognition and perceived entrepreneurial education on the desire to start a business.

2. Theoretical Background

Pandemic scenarios such as the one we are experiencing with COVID-19 can cause fear and anxiety in the population (Lee *et al*., 2020). In a study on mental health in the COVID-19 pandemic, Schäfer *et al.* (2020), concluded that some participants suffered from psychopathological symptoms after isolation.

Previous studies have already shown that the entrepreneurial process is negatively affected by uncertainty and risk scenarios (e.g., Ahorsu *et al*., 2020; Lin, 2020). The fear created by environments of uncertainty will negatively interfere with business performance, consequently destroying the individual's motivation for entrepreneurial initiatives (Ahorsu *et al*., 2020). According to Lin (2020), contact with individuals who tested positive for COVID-19 is one of the main sources of fear.

The pandemic had an impact on different actors, from managers, entrepreneurs, business owners or employees who often became unable to make rational decisions due to the fear generated (Wang *et al*., 2020). Fabeil *et al.* (2020), in their study, concluded that a significant number of micro-entrepreneurs felt confused about the decisions to be taken in order to be able to carry out their business ideas. The fear of COVID-19 and the anxiety caused by it has a negative impact on the creation of start-ups (Soomro *et al*., 2021). On an economic level, the COVID-19 pandemic has caused several consequences, which may have consequences for entrepreneurship and the creation of new businesses. This economic situation created a fear effect on entrepreneurs about creating new businesses (Liñan and Jaén, 2022).

With regard specifically to university students, the study by Mahmud *et al.* (2021) conducted with university students shows that the pandemic has caused fear and anxiety in people regarding their professional future. Fear and anxiety are negatively linked to various intentions that will result in an action (Loan *et al*., 2021). According to Seah (2021), the entrepreneurial intention of university students became stronger when the restriction measures were lifted during the COVID-19 pandemic, thus showing that this has an impact on the entrepreneurial intention. Based on these findings, the following hypotheses were formulated:

- Hypothesis 1: Fear and anxiety related to COVID-19 are negatively associated with entrepreneurial intention.
- Hypothesis 2: Fear and anxiety related to COVID-19 are negatively associated with the desire to start a business.

The recognition of opportunities, which has already been extensively studied, can be seen as an essential factor for the development of the entrepreneurial process (Ozgen and Baron, 2007). According to Puni *et al.* (2018), information/knowledge of individuals (education) and recognition of opportunities have an impact on entrepreneurial intention. Finding the right information plays an extremely important role in an individual's ability to identify opportunities. For an individual to get involved in an entrepreneurial activity, most of the time he only makes that decision if he sees that it has some potential and that it is a viable path (Krueger *et al*., 2000).

In the process of identifying opportunities, the entrepreneur thinks hard about his idea and always tries to find ways to develop and improve the idea (Schmitt *et al*., 2018). With this, individuals who find it easier to identify an opportunity will be more willing to start an entrepreneurial activity (Santos *et al*., 2018). Thus, there are several studies that relate recognition of business opportunities with entrepreneurial intention (e.g., Hassan *et al*., 2020; Loan *et al*., 2021). As the analyzed literature suggests, the recognition of opportunities plays a vital role in the entrepreneurial intention and, therefore, the following hypothesis was proposed:

- Hypothesis 3: Recognition of business opportunities is positively associated with entrepreneurial intention.

The decision to create a new business can be influenced by their personal experiences throughout life, such as educational experiences, which in turn can influence their beliefs and attitudes and consequently influence entrepreneurial intention (Castro and Zermeño (2020). Entrepreneurial education is defined by Fayolle *et al.* (2006), as any pedagogical program or education process for entrepreneurial attitudes or skills.

Teaching entrepreneurship is of great importance because it can provide students with an understanding of how a business works, how a company is structured, and how it relates to other segments of the economy and society. However, entrepreneurship education should focus more on business management and risk creation or should it focus more on developing students' personal attributes as entrepreneurs (Cheung, 2008).

Teaching entrepreneurship is not easy, nor does it come from a specific discipline, which sometimes makes it difficult to clarify the subjects to be taught. The programs are interdisciplinary, involving the transmission of knowledge in different areas (Cheung, 2008). Fayolle and Gailly (2015), in their study on the impact of entrepreneurial education on entrepreneurial attitude and intention, concluded that the positive effects of entrepreneurship programs have more impact on students who have had weak entrepreneurial exposure than on students who have already had exposure to stronger entrepreneurship.

According to Castro and Zermeño (2020), factors such as resilience, attitude towards the crisis, business characteristics, entrepreneur characteristics, relationships with other institutions, strategic management and human and social capital must be considered in resilience training programs as well as universities. Training and education in the area of entrepreneurship should be developed from an early age in the teaching of students. Training and education policies must be rethought so that there is management training that will stimulate students' entrepreneurial skills and thus encourage entrepreneurship from an early age, more specifically from basic education (Santos *et al*., 2018).

The university as a whole also plays an important role in teaching entrepreneurship. Varblane and Mets (2010), consider that the teaching of entrepreneurship is very dependent on the existence of an entrepreneurial spirit at the university and the creation of an entrepreneurial environment around the university. The commitment of institutions to create an entrepreneurial environment can be implemented through their communication and through different activities, such as entrepreneurship programs or support mechanisms for this (Gubik, 2021). Based on this understanding, the following hypotheses were postulated:

- Hypothesis 4: The perception of entrepreneurial education is positively associated with entrepreneurial intention.
- Hypothesis 5: The perception of entrepreneurial education is positively associated with the desire to start a business.

Over the last few years, entrepreneurial intention has proved to be a consolidated area, however its relationships with new emerging themes need further study. For Bird (1988), entrepreneurial intention is a state of mind that directs an individual's attention to an object with a view to a goal. Esfandiar *et al.* (2019) describe entrepreneurial intention as a conscious, deliberate, and planned state of mind that precedes action and directs direct attention to certain behaviours, such as starting a business.

The intention is essential in an individual's decision to create a company (Liñán and Chen 2009). Following the path of entrepreneurship on the part of the individual is a conscious and voluntary decision (Krueger *et al*., 2000). According to Ajzen (1991), actions performed by human beings are preceded and controlled by intentions, and following this idea, the term “intention” is defined by the author as the will that an individual has to perform or adopt a certain behaviour (Ajzen, 1991). This reasoning leads to the formulation of the following hypothesis:

- Hypothesis 6: Entrepreneurial intention is positively associated with the desire to start a business.

In this study, the Theory of Planned Behaviour (TPB) developed by Ajzen (1991) was adopted. According to this model, an individual’s intention to perform a given behaviour is the result of a cognitive process shaped by the interaction of three key factors, which in this context are expected to influence entrepreneurial intention.

The first factor is attitude towards the behaviour, which refers to the individual’s evaluation of whether becoming an entrepreneur is favourable or unfavourable. Thus, it reflects the extent to which the individual perceives the creation of a business as advantageous or disadvantageous (Ajzen, 1991).

The second factor is subjective norms, which capture the perceived social pressure exerted by significant others such as family, friends, and teachers. This dimension reflects the degree to which the individual feels encouraged or discouraged by these referents to engage in entrepreneurial behaviour (Ajzen, 1991).

The third factor is perceived behavioural control, which refers to the individual's perception of their own ability to perform the behaviours required to create a business. In other words, it reflects the perceived ease or difficulty of becoming an entrepreneur (Liñán and Chen, 2009).

Building on the TPB, Perugini and Bagozzi (2001) proposed the model of Goal-Directed Behaviour, which suggests that desires are the proximal antecedents of intentions, and that the traditional TPB construct operate indirectly through desires. According to Perugini and Bagozzi (2001), desire is defined as a motivational state in which reasons for action are transformed into a personal willingness to perform a given behaviour. The stronger the desire, the greater the likelihood of intention formation.

This model was later extended with the inclusion of two additional construct: desirability of the goals and feasibility of the goal, both considered central in explaining behavioural decision-making. Desirability refers to the extent to which an individual wishes to achieve a specific outcome, whereas feasibility refers to the perceived ease or difficulty of achieving that outcome (Perugini and Bagozzi, 2001).

According to Ajzen (1991), intention to perform behaviour can be influenced by several factors, including needs, desires, values, and beliefs. Similarly, Bagozzi (1992) argues that the three TPB components – attitude, subjective norms and perceived behavioural control – affect intentions indirectly through desires. Based on this theoretical framework, the following hypotheses were proposed:

- Hypothesis 7: Attitude towards behaviour is positively associated with the desire to start a business.
- Hypothesis 8: Subjective norms are positively associated with the desire to start a business.
- Hypothesis 9: Perceived behavioural control is positively associated with the desire to start a business.

When it comes to predicting and understanding human behaviour, we must also consider the role of emotions. The feelings that an individual experiences can help to predict the behaviour that he will adopt in the future. According to Baumgartner *et al.* (2008), there is a greater variety of anticipatory emotions since these are a specific subset of all discrete emotions that an individual may experience related to the occurrence or not of a future event.

According to Loewenstein and Lerner (2003), anticipated emotions play a significant role in the decision-making process. These authors argue that anticipatory emotions are real feelings experienced in the present in relation to the possible occurrence or non-occurrence of future events. In this sense, and considering that the present study aims to explore how tourism students feel about starting a business and how they perceive and recognize opportunities in the context of a global crises (i.e., COVID-19 pandemic), the following hypothesis was presented:

- Hypothesis 10: Positive anticipatory emotions are positively associated with the desire to start a business.

3. Methodology

3.1 Data Collection and Sample

Data were collected through an online structured questionnaire using the key informant technique. The sampling frame comprised public and private higher education institutions (HEIs) in Portugal. An email link to the survey was sent to all the identified HEIs. The data collection process took place between March and June 2022. At the end of data collection, we obtained 152 valid answers from final-year Bachelor's and Master's students in Tourism.

Since our model simultaneously assumes a series of interrelated relationships, we apply partial least squares structural equation modelling (PLS-SEM) rather than often-used multiple regression, which is restricted to examining a single relationship at a time (Hair *et al*., 2019). The estimation method has low requirements for data distribution and sample size compared to covariance-based structural equation modelling (CB-SEM) (Hair *et al*., 2019). SmartPLS 3.3.9 software was used for the empirical analysis.

3.2 Variables

All the constructs were measured through multi-item scales that were previously validated in the literature. The respondents were asked to evaluate the extent to their agreement with a specific statement on a 7-point Likert scale (ranging from 1 = "Strongly disagree" to 7 = "Strongly agree"). *Fear and anxiety related to COVID-19* was measured by using a 4-item scale adapted from Lee *et al*. (2020). *Opportunity recognition* was operationalized through a 5-item scale from Ozgen and Barron (2007). Four items adapted from Liñán and Chen (2009) were used to capture the students' perception of *entrepreneurial education*. *Entrepreneurial intention* represents the effort of an individual to become entrepreneur measured through a 6-item scale of Liñán and Chen (2009). The three constructs related to the TPB were also measured based on the scales developed by Liñán and Chen (2009). Specifically, the 5-item scale of *attitude* reflects the degree to which an individual holds a positive (or negative) assessment about the possibility to become an entrepreneur. *Subjective norms*, assessed through a 3-item scale, represent the perceived social pressure toward the adoption of an entrepreneurial behaviour. A 6-item scale for *perceived behavioural control* comprises the pros and cons of becoming an entrepreneur. *Anticipatory emotions* were measured using a 3-item scale adapted from Baumgartner et al. (2008). To measure the *desire to start a new business* after graduation, we employed a 2-item scale proposed by Perugini and Conner (2000).

4. Results

4.1 Measurement Model

The measurement model assessment indicated that all required criteria were satisfactorily met (Table 1). A detailed analysis revealed that all constructs exhibited composite reliability (CR) and Cronbach's alpha (CA) values above the recommended threshold of 0.70 (Hair *et al.*, 2019), confirming adequate internal consistency and reliability of the measurement scales. In addition, all average variance extracted (AVE) values exceeded the recommended cut-off of 0.50 (Fornell and Larcker, 1981), providing evidence of convergent validity.

Table 1: Convergent validity and internal consistency reliability

Constructs	AVE	CR	CA
Attitude (AT)	0.763	0.941	0.921
Perceived behavioural control (CCP)	0.737	0.944	0.929
Desire to start a new business (DCE)	0.914	0.955	0.906
Anticipatory emotions (EAP)	0.896	0.963	0.942
Perceived entrepreneurial education (EE)	0.806	0.943	0.920
Entrepreneurial intention (IE)	0.863	0.974	0.968
Fear and anxiety related to COVID-19 (MAC)	0.750	0.923	0.897
Subjective norms (NS)	0.870	0.952	0.925
Opportunity recognition (RON)	0.784	0.948	0.931

To validate the discriminant validity, the heterotrait-monotrait ratio of correlations (HTMT) should be below 0.85, following the threshold suggested by Henseler *et al*. (2015), and the square root of the AVE for each construct should be greater than the correlation involving the constructs based on the criterion introduced by Fornell and Larcker (1981). Table 2 shows that the discriminant validity via Fornell-Larcker's criterion was reliable, and the values of HTMT were in line with the necessary requirements (Henseler *et al.*, 2015).

Table 2: Discriminant validity

The italic numbers on the diagonal are the square root of AVE. Off-diagonal values are correlations among constructs.

4.2 Structural Model

The structural model was assessed by considering the path coefficients and their significance levels. The path significance was evaluated based on p-values calculated after executing a bootstrap analysis with 5,000 subsamples to validate the results. Figure 1 summarizes the structural model obtained through PLS-SEM analysis. The quality of the structural model was firstly evaluated using the coefficient of determination (R^2) and the effect sizes (f^2), which complement the R^2 assessment, by considering the relative impact of an independent variable on the dependent one through the changes in R^2 values (Cohen, 1988). According to Cohen (1988), the f^2 effect sizes can be classified as follows: $f^2 \geq 0.35$ (high), $0.15 \leq f^2 < 0.35$ (medium), $0.02 \leq f^2 < 0.15$ (small), and $f^2 < 0.02$ (negligible). Overall, our f^2 effect sizes are mostly classified as medium, small, or negligible. Moreover, the evaluation analysis revealed minimum collinearity in each set of predictors, as all the variance inflation factor (VIF) values were below the threshold of 5 with an average value of 2.463 (Hair *et al.*, 2019).

Table 3 summarizes the direct relationships and their significance. In a first instance, the fear and anxiety related to COVID-19 does not affect neither entrepreneurial intention (H1: $\beta s = -0.100$; $p = 0.133$) nor the desire to start a new business (H2: $\beta s = 0.066$; $p = 0.177$); thus, H1 and H2 are not supported. H3 predicts a positive relationship between opportunity recognition and entrepreneurial intention; the results reveal their positive relationship (H3: $\beta s = 0.471$; $p < 0.001$), supporting H3. The relationship between perceived entrepreneurial education and entrepreneurial intention is predicted in H4, which is also supported (H4: $\beta s = 0.284$; $p < 0.05$). Surprisingly, the relationship between perceived entrepreneurial education and the desire to start a new business is not statistically significant (H5: $\beta s = -0.053$; $p = 0.240$); therefore, H5 is not supported.

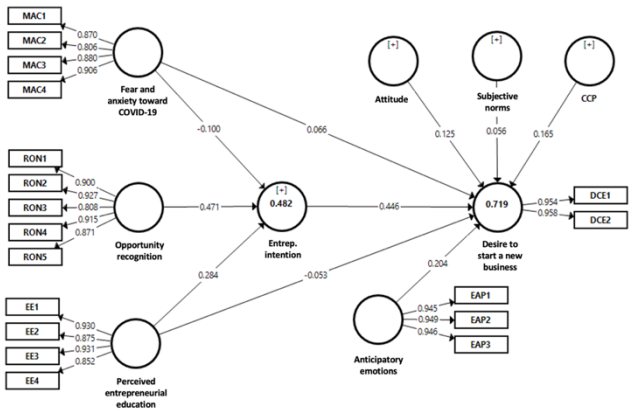

Figure 1: Empirical results of the research model

On the other hand, H6 predicts a positive relationship between entrepreneurial intention and the desire to start a new business (H6: βs = 0.446; p < 0.001), receiving support from the results. Interestingly, none of the variables predicted by the TPB as influencing factors of the desire to start a new business, revealed a statistically significant effect on the target outcome. More specifically, neither attitude (H7: βs = 0.125; p = 0.169), nor subjective norms (H8: βs = 0.056; p = 0.245), nor perceived behavioural control (H9: βs = 0.165; p = 0.054) influence the desire to start a new business after students' graduation; thus, H7, H8, and H9 are not supported by the results. Finally, H10 predicts a positive relationship between anticipatory emotions and the desire to start a new business; the findings reveal their positive relationship (H10: βs = 0.204; p < 0.05), providing support to H10.

Table 3: Direct effects

Relationship	Std Beta	Std Error	t-value	p-value	95% CI LL	95% CI UL	f^2	VIF
MAC → IE	-0.100	0.090	1.111	0.133	-0.241	0.047	0.019	1.011

CI, bias-corrected confidence intervals; LL, lower limit; UL, upper limit; f^2, effect size; VIF, variation inflation factor. Path coefficients significant at p-values: $^{(+)}$ p < 0.050; *** p < 0.001.

A summary of the mediation analysis is presented in Table 4. The empirical evidence shows that the model is purely mediated for the relationships of opportunity recognition and perceived entrepreneurial education with the desire to start a new business after students' graduation. This happens because the direct relationships between those latent variables are not statistically significant (p-values are below the 5% significance level), but the specific indirect relationships are statistically significant: opportunity recognition → entrepreneurial intention → desire to start a new business (βs = 0.210; p < 0.01), and perceived entrepreneurial education → entrepreneurial intention → desire to start a new business (βs = 0.127; p < 0.05).

Table 4: Specific indirect effects

Relationship	Std Beta	Std Error	t-value	p-value	95% CI LL	95% CI UL
MAC → IE → DCE	-0.044	0.040	1.101	0.136	-0.109	0.020
RON→ IE → DCE	0.210	0.080	2.611*	0.005	0.081	0.345
EE → IE → DCE	0.127	0.068	1.850$^{(+)}$	0.032	0.029	0.247

CI, bias-corrected confidence intervals; LL, lower limit; UL, upper limit. Path coefficients significant at p-values: $^{(+)}$ p < 0.050; * p < 0.010.

5. Conclusion

The results show that perceived entrepreneurial education and opportunity recognition positively drive students' entrepreneurial intention. Anticipatory emotions and entrepreneurial intention, in turn, increase the desire to start a new business. Mediation analysis indicates that perceived entrepreneurial education and opportunity recognition affect this desire only through entrepreneurial intention.

These findings align our study with prior literature. Perceived entrepreneurial education shapes entrepreneurial intention, suggesting that exposure to entrepreneurship programmes fosters students' willingness to become entrepreneurs, consistent with Fayolle *et al*. (2006). We also find that anticipatory emotions – confidence, hope, and optimism – strengthen the desire to start a business after graduation. This result aligns with Ortony *et al.* (1988), who show that individuals experience real emotions when anticipating future events.

Our study makes two contributions. First, we extend crisis-focused entrepreneurship research, which links crisis responses to firm survival and performance, by identifying entrepreneurial intention and the desire to start a business as key micro-level outcomes. Our findings suggest that a "wait-and-see" approach may benefit students planning to start a business after graduation. Second, unlike recent economic crises (e.g., 2008), the COVID-19 pandemic posed severe health risks and disrupted social interaction. Similar crises (e.g., the Spanish Flu, 1918-1920) have occurred and will likely recur. Thus, although context-specific, our findings offer important contributions to future crises and warrant practitioners' attention.

During the development of the study, some limitations were identified. First, its cross-sectional design limits temporal analysis. Future research should collect data during and after crisis periods. Second, we surveyed only final-year Tourism students, which narrows generalizability and confines conclusions to this group. Future studies should replicate the analysis across other HEIs in Portugal and internationally to enhance comparability and generalization. Researchers should also explore additional factors shaping higher education students' entrepreneurial intention.

When Generative AI Builds or Undermines Entrepreneurial Capability

Abstract: Generative AI (GenAI) is rapidly becoming foundational cognitive infrastructure for entrepreneurship. Yet a critical question remains: why does GenAI enhance entrepreneurial capability for some while quietly eroding it for others? Responding to the ETP Special Issue's call to move beyond main-effect accounts, this study advances a human-GenAI cognitive engagement framework that explains when GenAI functions as a competence-development rather than a competence-erosion tool. Drawing on goal orientation theory and entrepreneurial cognition, we demonstrate that GenAI's effects depend on the joint configuration of entrepreneurs' initial competence and motivational orientation, revealing a paradoxical downside of GenAI-enabled efficiency largely overlooked in entrepreneurship research.

1. Introduction

The transformative potential of generative AI (GenAI) in entrepreneurship has sparked intense scholarly debate, with perspectives ranging from universal productivity enhancer to threat to human skill development (Chalmers et al., 2021; Obschonka & Audretsch, 2020; Shepherd & Majchrzak, 2022). Yet as Obschonka et al. (2024) observe, the field lacks theoretical frameworks explaining why some individuals flourish with GenAI while others experience developmental stagnation. Recent work suggests the very convenience of AI tools may undermine the cognitive development they purport to support (Larson et al., 2024). We address this gap by introducing the individual-GenAI cognitive engagement model, integrating goal orientation theory with entrepreneurial cognition to explain heterogeneous developmental outcomes among nascent entrepreneurs (VandeWalle, 1997). Central to our approach is that GenAI's developmental impact cannot be understood through simple main effects (Otis et al., 2024). Meaningful insight emerges only when considering the triple interaction of initial competence levels, GenAI use, and goal orientation, reflecting that GenAI effects are filtered through both cognitive resources and motivational systems entrepreneurs bring to the human-AI interface (Vanneste & Puranam, 2025). Our research question is: *How do initial entrepreneurial competencies and motivational goal orientations interact to determine developmental outcomes of GenAI reliance?* Our empirical results reveal three distinct configurations. First, GenAI functions as a *force multiplier* for entrepreneurs, combining high baseline Individual Entrepreneurial Orientation (IndEO) with a learning goal orientation: these individuals leverage GenAI for genuine skill development rather than task completion. Second, GenAI triggers *competence erosion* for prove-oriented entrepreneurs with high baseline competencies, who use GenAI as a shortcut that bypasses the effortful practice of sustaining their skills. Third, GenAI plays a *paradoxical dual role* for avoidance-oriented entrepreneurs: serving as a safety net that enables engagement for those with low baseline competencies, yet functioning as a barrier to growth for those with high baselines who use it defensively. Together, these findings establish that GenAI's impact on entrepreneurial development is fundamentally contingent on the alignment between starting competence and underlying motivational orientation.

2. Theoretical Framework

Entrepreneurial action under uncertainty requires sophisticated metacognitive processes, the capacity to monitor, evaluate, and regulate one's own thinking. GenAI tools fundamentally alter this landscape by serving as external cognitive resources that can augment, supplement, or supplant internal cognitive processes (Choudhary et al., 2023; Lévesque et al., 2022). Entrepreneurial competence development, including creative self-efficacy, perspective-taking, and entrepreneurial orientation, requires deliberate practice and effortful engagement (Frese & Gielnik, 2023; Bandura, 1997). When GenAI circumvents effortful processing, it may produce short-term productivity gains at the cost of long-term skill acquisition (Sweller, 1988). This tension is particularly salient for entrepreneurship, where opportunity recognition depends on domain expertise developed through experiential learning (Corbett, 2005; 2007; Garbuio & Lin, 2021). We propose that goal

orientation, an individual's dispositional approach to achievement situations (VandeWalle, 1997), serves as the governing mechanism determining engagement depth at the entrepreneur-GenAI interface. Goal orientation theory distinguishes learning goal orientation (focused on mastery), prove goal orientation (focused on demonstrating competence), and avoidance goal orientation (focused on avoiding negative judgments). These orientations interact with GenAI use and baseline competence to produce distinct developmental trajectories.

2.1 The Force Multiplier Configuration (Learning Orientation)

Learning-oriented individuals approach GenAI with intrinsic motivation to develop competence. For these entrepreneurs, GenAI serves as a coach expanding the possibility space for exploration and providing rich feedback for iterative improvement. The mechanism operates through enhanced metacognitive engagement: learning-oriented entrepreneurs are more likely to critically evaluate GenAI outputs, compare them against their own reasoning, iterate on prompts to deepen understanding, and integrate GenAI-generated insights into existing knowledge structures (Chalmers et al., 2021; Csaszar et al., 2024). This aligns with research on entrepreneurial mindset development emphasizing that growth occurs through cycles of experimentation, reflection, and adaptation (Lynch & Corbett, 2023). We theorize this force multiplier effect is most pronounced among entrepreneurs with higher baseline competencies. Individuals with high IndEO (Clark et al., 2024; Wales et al., 2023) possess the proactive disposition, risk tolerance, and innovative mindset necessary to leverage GenAI for genuine exploration. When combined with a learning orientation, these entrepreneurs use GenAI not merely to complete tasks but to push the boundaries of their understanding, treating GenAI outputs as starting points for deeper inquiry.

> **H1:** GenAI use is associated with enhanced competence for nascent entrepreneurs with high baseline competencies and high learning orientation.

2.2 The Erosion Configuration (Prove Orientation)

Prove-oriented individuals may approach GenAI with extrinsic motivation to demonstrate competence and achieve positive outcomes efficiently. For these nascent entrepreneurs, GenAI represents an efficiency tool that can generate high-quality outputs without requiring effortful cognitive processing that might expose competence gaps. The mechanism operates through cognitive offloading: prove-oriented entrepreneurs are more likely to accept GenAI outputs at face value, minimize iteration that might reveal uncertainty, and prioritize outcome quality over learning process (Lindebaum & Fleming, 2024). This represents a form of "algorithmic management" of one's own learning, where technology shapes behavior in ways that may undermine genuine development (Butler & Spoelstra, 2025). Critically, such offloading disrupts feedback loops necessary for skill development. When entrepreneurs outsource cognitive labor to GenAI without engaging in deep processing, they bypass productive struggles that drive learning. We theorize this detrimental effect is most pronounced among entrepreneurs with higher baseline competencies. High-competence, prove-oriented individuals have the most to "protect" reputationally and may use GenAI most extensively to maintain performance advantage without typical effort. The very entrepreneurs who appear most capable become most vulnerable to skill degradation because GenAI provides a seductive alternative to continued effortful practice (Lindebaum, 2024).

> **H2:** GenAI use is associated with diminished competence specifically for nascent entrepreneurs with high baseline competence and high prove orientation.

2.3 The Safety Net/Barrier Configuration (Avoidance Orientation)

Avoidance-oriented individuals are primarily motivated to avoid negative judgments about competence (VandeWalle, 1997). Unlike prove-oriented individuals who seek positive evaluations, avoidance-oriented entrepreneurs focus on *not appearing incompetent*, leading them to withdraw from situations that might expose skill deficits (Elliot & Church, 1997). We theorize GenAI plays a dual, paradoxical role for these entrepreneurs, functioning as either a safety net enabling engagement or a barrier deepening withdrawal, depending on baseline competence level. For avoidance-oriented entrepreneurs with *low* baseline competencies, GenAI may serve as a psychological safety net. These individuals need developmental experiences but withdraw from challenging situations that would foster growth (Crosina et al., 2024). GenAI resolves this dilemma by providing low-stakes exploration, entrepreneurs can rehearse ideas or explore perspectives without social exposure. The technology creates psychological distance from failure: shortcomings can be attributed to the tool rather than personal inadequacy (Glikson & Woolley, 2020). Conversely, for avoidance-oriented entrepreneurs with *high* baseline competencies, GenAI may function as a barrier. These individuals have developed competencies

through prior effort but remain focused on avoiding exposure of limitations. GenAI offers an attractive escape: defensively outsourcing cognitive work to preserve reputation while avoiding growth-inducing struggle.

> **H3a:** GenAI use is associated with *enhanced* competence development for nascent entrepreneurs with *low* baseline competence and high avoidance orientation (safety net effect).
>
> **H3b:** GenAI use is associated with *diminished* competence development for nascent entrepreneurs with *high* baseline competence and high avoidance orientation (barrier effect).

3. Method

We employed a quasi-experimental pre-post design with non-equivalent control groups, comparing nascent entrepreneurs in which GenAI was integrated into entrepreneurial tasks (treatment) with those without GenAI use (control). The sample (N=201) consists of nascent entrepreneurs from a university context engaged in early-stage venture creation. This context also allows us to examine whether standard entrepreneurship training remains effective in an AI-enabled environment (Oosterbeek et al., 2010).

3.1 Measures

Our pre-test and post-test measures include creative self-efficacy (Tierney & Farmer, 2004), entrepreneurial self-efficacy, perspective-taking and empathetic concern (Davis, 1983), and Individual Entrepreneurial Orientation (Clark et al., 2024). During the pre-test survey, we used established scales to determine individual goal orientation, categorizing participants into learning, prove, and avoidance orientations (VandeWalle, 1997). GenAI use is a binary measure taking one if nascent entrepreneurs were in the cohort that allowed and encouraged GenAI use for completing early-stage venture creation activities (brainstorming, business model, MVP) and zero otherwise.

4. Results

Table 2 presents descriptive statistics and correlations for all study variables. Table 3 presents regression results testing the three-way interaction between baseline competencies, GenAI use, and learning orientation. The hypothesized force multiplier effect received significant support for Individual Entrepreneurial Orientation (IndEO). The three-way interaction term (GenAI × Learning Orient × IndEO pre-test) was positive and significant ($\beta = 0.347$, $p < .05$), indicating GenAI use enhances IndEO development specifically for entrepreneurs combining high baseline entrepreneurial orientation with high learning orientation. For entrepreneurs with high learning orientation and high baseline IndEO, GenAI use produces an upward trajectory in post-test IndEO scores. In contrast, entrepreneurs with high baseline IndEO but low learning orientation show a negative slope when using GenAI, suggesting that without a learning mindset, even initially capable entrepreneurs may experience competence stagnation, confirming that learning orientation fundamentally alters whether GenAI serves as a developmental accelerator or impediment. H2 received strong support across multiple competency domains. For creative self-efficacy, the three-way interaction (GenAI × Prove Orient × Creative SE pre-test) was negative and highly significant ($\beta = -0.246$, $p < .01$), indicating GenAI use significantly erodes creative self-efficacy for entrepreneurs who start with high creative confidence but harbor a prove orientation. The erosion effect extended to perspective-taking ability. The three-way interaction (GenAI × Prove Orient × Perspective pre-test) was negative and significant ($\beta = -0.224$, $p < .01$). Table 5 presents results testing safety net (H3a) and barrier (H3b) effects. For perspective-taking, the three-way interaction was negative and marginally significant ($\beta = -0.165$, $p < .10$), suggesting a barrier effect where GenAI impedes perspective-taking development for high-baseline, avoidance-oriented entrepreneurs. This domain-specific duality supports our proposition that avoidance orientation's effects depend on whether competency requires interpersonal risk-taking (safety net) versus authentic emotional engagement (barrier).

5. Contributions and Discussion

5.1 Theoretical Contribution 1: Configuration-Contingent View of AI's Role

This study introduces a novel human-GenAI cognitive engagement framework considering a three-way interaction between an entrepreneur's baseline competence, GenAI usage, and goal orientation. Our framework specifies conditions under which GenAI use leads to capability growth versus decline, rather than assuming uniform effects. This integrative model bridges goal orientation theory with entrepreneurial cognition, offering a configuration-contingent view of technology's role in entrepreneurial development.

5.2 Theoretical Contribution 2: The "Dark Side" of Cognitive Offloading

Our research demonstrates a trade-off suggesting GenAI's ability to turbocharge task completion can lead entrepreneurs to skip the struggle and practice needed for deep learning, resulting in competence stagnation over time. By articulating this efficiency-learning paradox, we align with and extend emerging discussions in management education warning against overreliance on assistive technologies. This provides theoretical explanation for why faster is not always better in skill development.

5.3 Theoretical Contribution 3: Baseline Competence as Counterintuitive Boundary Condition

Our research underscores initial skill level as a crucial and counterintuitive boundary condition. GenAI most enhances capability when high initial competence pairs with learning orientation, creating a "force multiplier" effect. Conversely, nascent entrepreneurs with high competence but prove-oriented mindset experience the greatest skill erosion, a paradox where those appearing most capable are actually most vulnerable to cognitive offloading. This challenges assumptions that high-skill individuals might be immune to AI's developmental drawbacks. Our study suggests that having entrepreneurs use GenAI tools in a vacuum is insufficient and can be detrimental; mentors, coaches, and educators must impart the "how" of deep engagement to ensure entrepreneurs use tools successfully. This study informs "GenAI-savvy" training to prioritize learning orientation over performance-validation to prevent nascent entrepreneurs from using GenAI as a crutch and experience skill degradation.

Emergent Strategy and Innovation in Entrepreneurship: A Complex Adaptive Systems Perspective

Ghayur Ahmad
College of Business Administration, Prince Mohammad Bin Fahd University, Al Khobar, Saudi Arabia

gahmad@pmu.edu.sa

Abstract: Entrepreneurship research increasingly recognises that opportunities, strategies and innovations develop in settings where technologies, institutions and stakeholder relationships change together. Yet the relevant literatures often locate explanation at different levels: opportunity research privileges entrepreneurial judgement, ecosystem research emphasises interdependence, and strategic entrepreneurship concentrates on the mobilisation of resources. This conceptual paper connects these levels through a complex adaptive systems perspective. It asks how entrepreneurs translate distributed environmental change into coordinated action and innovation without assuming either complete foresight or purely spontaneous adaptation. The framework was developed through a theory-integration approach that compares the causal roles assigned to variation, interaction, feedback and selection across complexity, opportunity and strategic entrepreneurship research. It distinguishes five constructs: environmental complexity and disequilibrium, opportunity emergence, adaptive entrepreneurial capability, adaptive self-organisation, and innovation outcomes. Three propositions specify the mechanism. Environmental disequilibrium makes opportunities more likely to emerge when change creates interpretable gaps in existing arrangements; adaptive entrepreneurial capability strengthens the conversion of those possibilities into self-organised action; and emergent strategy carries the effect of such action into innovation while performance feedback reshapes later interpretation and capability. The contribution is a process model that joins individual judgement to collective reconfiguration and treats innovation as both an outcome and a source of subsequent adaptation. The framework also identifies boundary conditions—resource slack, network accessibility and feedback quality—that can interrupt the proposed sequence. The paper concludes with an empirical agenda using longitudinal, multilevel and process-sensitive designs.

Keywords: Complex Adaptive Systems; Entrepreneurial Opportunity; Adaptive Entrepreneurial Capability; Self-Organisation; Emergent Strategy; Innovation

1. Introduction

Entrepreneurial action rarely unfolds against a stable background. A new platform changes access to customers; a regulatory decision alters the value of existing assets; a supplier failure exposes a neglected capability; or a local network recombines knowledge that was previously separate. These events do more than add uncertainty. They change the relationships through which an entrepreneurial problem is understood. Consequently, the relevant unit of analysis is not only an alert individual or a resource-seeking firm, but an evolving configuration of actors, rules, technologies and feedback. Complex adaptive systems (CAS) theory offers language for this configuration because it explains how local interactions can produce system-level patterns that no participant designed in advance (McKelvey 2004; Roundy, Bradshaw and Brockman 2018).

Existing entrepreneurship theories illuminate important parts of this process but leave their connection under-specified. Opportunity research asks whether opportunities are discovered, created or enacted through judgement (Alvarez and Barney 2007; Davidsson, Recker and von Briel 2020). Effectuation explains how entrepreneurs proceed when prediction is unreliable (Sarasvathy 2001), while bricolage shows how resource constraints can prompt novel recombination (Baker and Nelson 2005). Entrepreneurial ecosystem research shifts attention to interdependent actors and contextual conditions (Stam and van de Ven 2021; Wurth, Stam and Spigel 2022). Strategic entrepreneurship, in turn, links opportunity seeking with advantage seeking (Ireland, Hitt and Sirmon 2003). The conceptual problem is not a shortage of explanations. It is that individual judgement, collective reorganisation and innovation outcomes are often presented as adjacent ideas rather than as stages in a testable causal process.

This gap remains despite earlier efforts to bring complexity science into strategic entrepreneurship. Schindehutte and Morris (2009), for example, use complexity to recast opportunity space, micro-macro interaction and entrepreneurial dynamics, while Spigel and Harrison (2018) explain ecosystems as processes that accumulate and circulate resources over time. Those accounts establish that entrepreneurial outcomes are path dependent and systemically produced. They are less specific, however, about the intervening sequence through which an environmental disturbance becomes an opportunity interpretation, how that interpretation recruits distributed action, and how action is selected into a strategic pattern. The present paper does not claim

that CAS is new to entrepreneurship; its contribution is to tighten that causal chain and make its cross-level transitions empirically examinable.

This paper addresses that problem through the question: how does environmental disequilibrium become coordinated entrepreneurial action and, eventually, innovation? The answer developed here is deliberately conditional. Change does not automatically reveal an opportunity, networks do not automatically self-organise, and flexible strategy does not necessarily generate a valuable innovation. Translation between these states depends on an adaptive entrepreneurial capability: the capacity to interpret weak and conflicting signals, mobilise distributed resources, run bounded experiments and revise commitments in response to credible feedback. This formulation treats capability as learned and relational rather than as innate talent.

The proposed framework makes three contributions. First, it positions opportunity emergence between environmental change and action, thereby avoiding the claim that complexity itself is productive. Second, it supplies a micro-to-meso mechanism: entrepreneurial judgement matters because it helps participants coordinate local adaptations without requiring central control. Third, it models innovation outcomes recursively. Market response, technical performance and stakeholder acceptance feed back into later interpretations and routines; an outcome in one episode becomes an input to the next. These contributions refine a CAS account of entrepreneurship and create propositions suitable for multilevel empirical testing.

2. Theoretical Background

A CAS consists of heterogeneous agents whose actions are interdependent, whose interactions are often nonlinear, and whose local adjustments can generate emergent order. Applied to entrepreneurship, the perspective changes the question from how a venture executes a predetermined plan to how entrepreneurial arrangements remain viable while the problem, available resources and relevant partners are themselves moving. McKelvey (2004) describes this terrain as one in which entrepreneurial order develops near the boundary between rigid stability and unstructured turbulence. The practical implication is not that more complexity is always beneficial. Excessive coupling, rapid feedback or opaque dependencies can make learning difficult and amplify failure.

Entrepreneurial ecosystems are a visible meso-level expression of these dynamics. Their actors—entrepreneurs, investors, universities, support organisations, incumbent firms and public agencies—possess different goals and resources, yet their repeated interactions create shared expectations and pathways for resource flow. Ecosystem performance therefore cannot be reduced to a checklist of elements. It depends on how elements combine and whether participants can access them (Stam and van de Ven 2021). A CAS interpretation explains why similar policy inputs can generate different outcomes across places and why small interventions may occasionally trigger disproportionate change (Roundy, Bradshaw and Brockman 2018). Recent ecosystem research likewise calls for closer attention to causal mechanisms and policy processes, not merely descriptive inventories (Hess et al. 2025).

A process view also changes how ecosystem resources are understood. Culture, finance, knowledge and support services have effects through relationships that make them available to particular ventures, not simply through their presence in a region (Spigel 2017). Successful and unsuccessful ventures can themselves replenish or deplete these resources by producing experienced employees, investor knowledge, legitimacy and caution (Spigel and Harrison 2018). Small local actions may consequently be amplified into wider change when they attract complementary responses, as complexity-based research on organisational emergence demonstrates (Plowman et al. 2007). The reverse is equally possible: a promising initiative can stall when complementary actors do not respond or when prior commitments lock the system into an inferior path.

Opportunity emergence is the first translation problem. The discovery view locates opportunities in changes that exist independently of a particular entrepreneur, whereas the creation view emphasises iterative action through which an opportunity takes form (Alvarez and Barney 2007). External-enablement research helps bridge the two by distinguishing an environmental change from the venture outcomes it may enable (Davidsson, Recker and von Briel 2020). From this perspective, disequilibrium supplies variation and unsettles existing arrangements, but an opportunity emerges only when actors connect those changes to a plausible user problem, means of delivery and route to value capture. This is an interpretive and relational accomplishment, not a simple act of detection.

Opportunity interpretation is constrained by cognition as well as context. Entrepreneurs compare the relational structure of a new technology or market with patterns they already understand; evidence from verbal-protocol

research shows that these structural alignments affect which possibilities are recognised (Grégoire, Barr and Shepherd 2010). Prior knowledge can therefore improve interpretation while simultaneously narrowing attention. Moreover, uncertainty changes as action proceeds. What begins as uncertainty about whether demand exists may become uncertainty about stakeholder response, execution or appropriation. Treating judgement as repeated reassessment, rather than a single choice, captures these transitions (Packard, Clark and Klein 2017) and explains why an early opportunity frame should remain provisional.

That interpretation normally develops over time. Dimov (2007) warns against attributing an opportunity to a single person and moment of insight; ideas acquire coherence through interaction, evaluation and revision. Digital technologies extend this process by making artefacts editable and participation less tightly tied to location, but they also multiply dependencies and accelerate imitation (Autio et al. 2018). Resilience in digitally advanced entrepreneurship therefore rests partly on the capacity to combine technological options with organisational and network adaptation (Audretsch et al. 2024). In CAS terms, opportunity emergence is a provisional pattern that stabilises enough to guide action while remaining open to revision.

Digital settings make this provisionality especially visible. Digital artefacts are editable, distributable and readily combined, so the boundaries of both the venture and its product may continue to shift after market entry (Nambisan 2017). Openness and generativity invite contributions from users, complementors and platform owners, creating agency that spans organisational and geographic boundaries (Nambisan, Wright and Feldman 2019). These affordances widen the opportunity space but also create dependencies: changes to an interface, ranking algorithm or access rule can invalidate a previously viable configuration. Digital complexity is therefore not simply faster environmental change; it is a redistribution of who can alter the entrepreneurial arrangement and who controls consequential feedback.

The second translation problem concerns agency. This paper defines adaptive entrepreneurial capability as a learned capacity distributed across an entrepreneur and collaborators. It contains four connected activities: sense changing relationships; frame a tractable problem; mobilise people and resources across organisational boundaries; and update commitments after experiments. The definition draws on dynamic-capability reasoning, which treats sensing, seizing and reconfiguration as mechanisms for coping with environmental change (Teece 2007), but narrows the focus to entrepreneurial episodes in which both goals and means remain partly indeterminate.

Two established logics clarify how the capability operates. Effectuation limits exposure by beginning with available means and negotiated commitments rather than a forecast treated as fact (Sarasvathy 2001). Bricolage recombines resources that others may regard as inadequate or unrelated (Baker and Nelson 2005). Neither logic is equivalent to improvisation without discipline. Both require selection: actors decide which signals deserve attention, which partners can be trusted and which experiments justify further commitment. Adaptive entrepreneurial capability is therefore visible in the quality and speed of revision, not in constant change for its own sake.

The capability must also balance exploration with exploitation. Exploration preserves variation by testing unfamiliar partners, technologies and problem frames; exploitation stabilises the routines needed to deliver and learn from a selected configuration. March (1991) shows why adaptive systems can over-invest in exploitation: its returns are nearer and easier to attribute than the returns to exploration. For entrepreneurial ventures, the opposite imbalance is also hazardous. Endless experimentation can consume scarce attention without producing commitments that others can rely upon. Adaptive capability therefore concerns the timing of closure as much as openness—the ability to preserve alternatives while evidence is weak and to concentrate resources when a pattern becomes sufficiently credible.

3. Conceptual Development and Framework

The framework was developed through theory integration rather than a claim to systematic review. The analysis began with a focal explanatory problem—the passage from environmental change to innovation—and compared how CAS, opportunity, effectuation, bricolage, dynamic-capability and strategic-entrepreneurship research assign causal roles to four recurring processes: variation, interaction, feedback and selection. Concepts were retained when they identified a distinct state or mechanism in that passage. Overlapping labels were consolidated, and causal order was revised until each link could be expressed as an observable proposition. This procedure does not establish exhaustive coverage of the literature; its purpose is analytical coherence and testable synthesis.

Three criteria governed the integration. Construct distinctiveness required each concept to explain something not captured by the neighbouring construct; level consistency required the framework to identify whether evidence concerned an actor, team, network, venture or environment; and temporal order required a plausible account of what changes before another state can follow. The criteria exposed two problems in a simple complexity-to-innovation argument. It conflates environmental variation with opportunity, and it treats self-organisation as an outcome rather than a mechanism that still requires strategic selection. Separating these roles responds to the call by Schindehutte and Morris (2009) for complexity-based strategic entrepreneurship while avoiding complexity terminology that cannot be operationalised.

The resulting model separates context, emergent state, capability, organising process and outcome. Environmental complexity and disequilibrium describe the initiating conditions. Opportunity emergence is an evolving interpretation of a possible value-creating configuration. Adaptive entrepreneurial capability is the mechanism that helps actors move from interpretation to coordinated experimentation. Adaptive self-organisation captures the relational process through which roles, resources and routines are rearranged. Emergent strategy is the temporary pattern that becomes visible across those actions, rather than a plan fully specified beforehand (Mintzberg and Waters 1985). Innovation outcomes are changes in products, services, processes or business models that users and other stakeholders can evaluate.

Distributed agency is central to the move between these constructs. Technology entrepreneurship frequently advances through the accumulated inputs of users, engineers, investors, regulators and producers rather than through the actions of a heroic founder (Garud and Karnøe 2003). The focal entrepreneur nevertheless remains consequential because framing, convening and commitment decisions influence which distributed inputs become connected. The framework therefore avoids two extremes: it does not reduce innovation to an individual trait, and it does not portray emergence as agency-free. Adaptive entrepreneurial capability is the bridge because it concerns how situated actors make the system's distributed knowledge actionable.

Table 1: Construct definitions and observable evidence

Construct	Definition in the Framework	Illustrative Evidence
Environmental complexity and disequilibrium	Interdependent technological, market or institutional changes that disturb established relationships.	Rule changes, new interfaces, supply disruptions, shifting actor dependencies.
Opportunity emergence	A provisional, shared interpretation that connects environmental change to a feasible configuration for creating and capturing value.	Changing problem frames, stakeholder validation, convergence around a use case.
Adaptive entrepreneurial capability	A learned capacity to sense, frame, mobilise and update under partial knowledge.	Cross-domain scanning, bounded experiments, staged commitments, revision after evidence.
Adaptive self-organisation	Decentralised reconfiguration of roles, resources and routines around a provisional opportunity.	New collaborations, role changes, resource recombination, locally initiated coordination.
Emergent strategy and innovation outcomes	A coherent pattern formed through repeated action and the externally evaluated changes it produces.	Consistent investment direction; adoption, reliability, revenue logic and stakeholder acceptance.

Figure 1 represents a sequence without implying a one-way or deterministic path. Capability is placed beneath the central transition because it operates through interpretation and coordination rather than as another environmental stage. The dashed arrows make feedback explicit: realised outcomes change what actors notice, whom they trust and which routines they repeat.

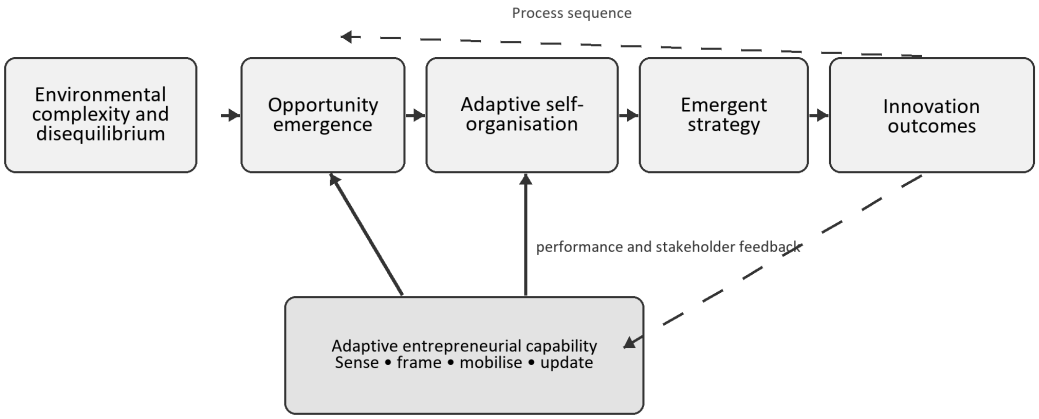

Figure 1: Complex adaptive entrepreneurship as a recursive multilevel process

4. Propositions

Environmental change enlarges the range of possible entrepreneurial responses, but only some variation becomes meaningful. A regulatory discontinuity may open access to a market while simultaneously increasing compliance costs; a digital interface may lower coordination costs but expose a venture to platform dependence. Opportunity emergence thus requires an interpretable gap between existing arrangements and a feasible alternative. Moderate disequilibrium can make such gaps visible by weakening established assumptions. At very high levels, however, rapid and contradictory signals may prevent a stable interpretation. The proposed positive relationship is therefore most plausible where actors have enough time, knowledge diversity and feedback access to distinguish a persistent change from noise.

4.1 Proposition 1

Environmental complexity and disequilibrium increase the likelihood of opportunity emergence when changes create interpretable gaps in existing market, technological or institutional arrangements.

An opportunity interpretation does not coordinate resources by itself. Participants must translate a tentative account of value into roles, experiments and commitments. Adaptive entrepreneurial capability supports that translation by linking sensemaking to mobilisation. Its sensing component compares signals across customers, technologies and institutions; its framing component identifies a problem that can be tested; its mobilisation component recruits complementary knowledge and assets; and its updating component withdraws or deepens commitments as evidence accumulates. These activities create minimum coordination without freezing the configuration too early. The effect should weaken when gatekeepers block network access, resources are indivisible, or power asymmetry prevents partners from revising roles.

4.2 Proposition 2

Adaptive entrepreneurial capability strengthens the conversion of an emergent opportunity into adaptive self-organisation by enabling distributed actors to coordinate experiments, resources and provisional roles.

Self-organisation can generate many local adaptations without producing an innovation. A recognisable strategic pattern is needed to select and connect those adaptations. Emergent strategy performs this mediating role when repeated actions produce a coherent direction that stakeholders can support, even though that direction was not designed completely in advance. The pattern channels investment, makes interdependencies legible and permits unsuccessful variations to be abandoned. Innovation outcomes then provide feedback through adoption, technical reliability, unit economics and stakeholder response. Feedback is useful only when it is timely and difficult to manipulate; delayed or politically filtered measures can reinforce an inferior path. The model is recursive because credible results reshape both subsequent opportunity interpretation and the routines that constitute capability.

4.3 Proposition 3

Emergent strategy mediates the relationship between adaptive self-organisation and innovation outcomes, and feedback from those outcomes subsequently reshapes opportunity interpretation and adaptive entrepreneurial capability.

Table 2: Proposition summary and empirical implications

Proposition	Relationship	Empirical Indicators and Boundary Conditions
P1	Disequilibrium → opportunity emergence	Timing of external changes and problem frames; moderation by knowledge diversity, interpretability and signal velocity.
P2	Opportunity emergence × adaptive capability → self-organisation	Partner recruitment, experiments, role/resource reconfiguration; constraints from gatekeeping, indivisibility and power asymmetry.
P3	Self-organisation → emergent strategy → innovation; recursive outcome feedback	Stable action patterns, adoption and technical/economic results; moderation by timeliness, credibility and openness of feedback.

5. Discussion and Theoretical Contributions

The framework clarifies what a complexity account adds to entrepreneurship research. CAS is sometimes used as a broad metaphor for turbulence. Here it performs a narrower explanatory task: it connects dispersed variation and local interaction to an emergent pattern, while specifying the selection mechanisms that keep emergence from becoming an all-purpose label. Opportunity emergence selects a provisional interpretation from environmental variation; adaptive capability selects and coordinates experiments; emergent strategy selects a pattern from repeated action; and stakeholder feedback selects which innovations persist.

This sequence joins levels of analysis that are usually separated. Environmental complexity is a system condition, interpretation and judgement are individual or team activities, self-organisation occurs in a network, and innovation is evaluated at venture and market levels. Treating these as a process prevents a common category error: inferring an individual capability directly from a successful ecosystem, or attributing an ecosystem outcome to one entrepreneur. The proposed capability is a microfoundation, but its exercise depends on accessible relationships and institutional permission.

The framework also qualifies strategic entrepreneurship. Opportunity seeking and advantage seeking need not occur as separate managerial tasks. Under disequilibrium, they can be coupled through experiments that simultaneously reveal demand and assemble difficult-to-copy relationships. This extends the integration proposed by Ireland, Hitt and Sirmon (2003) by showing how a strategic pattern can emerge before reliable forecasts or stable resource positions exist. It also complements effectuation and bricolage: those logics describe action under constraint, whereas the present model specifies how their repeated use can become collective organisation and an observable strategy.

A further contribution concerns the relationship between local adaptation and strategic coherence. Complexity accounts rightly show that small deviations can accumulate into radical change (Plowman et al. 2007), but accumulation alone does not explain why a pattern becomes economically or socially valuable. The concept of emergent strategy supplies that missing selection layer. It allows strategy to be recognised retrospectively in a stream of commitments while retaining a forward-looking role for entrepreneurial judgement. This is particularly important in distributed settings, where participants may coordinate around a direction before they agree on a complete plan.

Finally, the feedback loop distinguishes adaptation from flexibility. A venture that changes frequently may be reacting to noise, managerial fashion or the preferences of its most powerful partner. Adaptation requires a correspondence between revision and informative feedback. This distinction introduces an evaluative criterion into CAS-based entrepreneurship: the capacity to preserve useful variation while discontinuing arrangements that no longer support stakeholder value.

6. Practical Implications and Future Research

For entrepreneurs, the model recommends managing a portfolio of bounded experiments rather than treating adaptability as continuous strategic reversal. Each experiment should identify the assumption being tested, the actors whose commitment is needed, the affordable exposure and the evidence that would justify continuation. A short opportunity log can record how regulatory, customer and technological signals alter the working interpretation. Network maps can reveal where access to knowledge or assets depends on a single gatekeeper. These practices make feedback traceable and reduce retrospective stories that portray every change as intentional.

Support organisations and policymakers should pay similar attention to connections rather than counts. Adding incubators, funds or training programmes will have limited effect if entrepreneurs cannot reach specialised knowledge, early customers or complementary infrastructure. Interventions can instead shorten feedback cycles through regulatory sandboxes, shared testbeds, procurement trials and brokerage across otherwise disconnected groups. Because CAS responses are path dependent, programmes should be evaluated for who gains access, what new interactions occur and whether unsuccessful arrangements can be revised without excessive loss.

Empirical work should test the sequence rather than correlate broad perceptions of turbulence with innovation. Longitudinal case studies can use event histories to trace an external change, competing opportunity interpretations, partner commitments, strategic pivots and subsequent feedback. Comparative cases would reveal boundary conditions such as slack, network closure and institutional rigidity. A second stage could develop measures of adaptive entrepreneurial capability around sensing, framing, mobilisation and updating, then test cross-level mediation with repeated surveys and archival indicators. Digital trace data—version histories, platform interactions or experiment logs—may capture self-organisation more accurately than single-respondent retrospective scales.

Three cautions should guide that programme. First, opportunity emergence and recognition should not be measured as the same event; the former is an evolving relational pattern. Second, innovation quality needs external indicators such as adoption, reliability or willingness to pay, not novelty alone. Third, researchers should test rival explanations. Prior experience, market power or resource slack may account for both apparently adaptive behaviour and superior outcomes. Designs using process tracing, lagged measures and matched comparisons can help separate these effects.

The framework has limits that future work should preserve rather than assume away. It is designed for episodes marked by interdependence and consequential feedback; it may add little where tasks are separable, outcomes are immediately observable or a dominant actor can specify the entire arrangement. It also does not predict that decentralisation is always efficient. Self-organisation can reproduce exclusion, diffuse accountability or amplify misinformation, particularly in platform-mediated settings. Finally, the propositions describe a recurrent process, not a universal life-cycle sequence. Ventures may enter at different points, revisit earlier interpretations or terminate after any failed transition. Comparative tests across digital, place-based and regulated contexts would establish where the framework travels and where more centralised explanations are superior.

7. Conclusion

Complexity matters to entrepreneurship because it changes relationships, not simply because it raises uncertainty. The framework developed in this paper explains how those changes can move through opportunity emergence, adaptive entrepreneurial capability, self-organisation and emergent strategy to innovation outcomes. Its central claim is modest but consequential: environmental variation becomes productive only through mechanisms that interpret, coordinate and select.

By distinguishing these mechanisms, the paper replaces a direct complexity-to-innovation claim with a multilevel, recursive process. It also identifies conditions under which the process may fail, including inaccessible networks, indivisible resources, power asymmetry and poor feedback. The next step is empirical: follow entrepreneurial episodes through time and examine whether specific patterns of sensing, mobilisation and revision explain why some interdependent actors create a viable innovation while others remain active but uncoordinated.

Abstract: This study examines how entrepreneurship promotion within universities influences organizational-level innovation capability. Innovation capability is defined as an institution's capacity to foster innovation through the effective use of knowledge, resources, and collaboration, resulting in outcomes such as new products, processes, systems, research outputs, and innovative teaching methods (Lawson & Samson, 2001; Bartoloni et al., 2021). Rather than focusing on individual or team-level innovation, the study investigates how university staff perceive their institution's overall ability to innovate. The study is grounded in the entrepreneurial university framework, which highlights universities' evolving role as active contributors to innovation, economic development, and societal change (Clark, 1998; Etzkowitz, 2003). Building on prior research on organizational innovation capability (Lawson & Samson, 2001; Hero et al., 2017), this study addresses calls for a deeper understanding of its determinants in higher education contexts (Mendoza-Silva, 2021). Empirically, the study focuses on two organizational drivers of innovation capability: perceived management support for entrepreneurship and institutional support for student entrepreneurship. These dimensions reflect both strategic leadership and the entrepreneurial culture embedded in university structures and practices. Data were collected from two Finnish universities of applied sciences between November 2024 and January 2025, yielding responses from 134 staff members, including teaching and RDI personnel across disciplines. Organizational-level innovation capability, management support, and support for student entrepreneurship were measured using validated multi-item scales. Linear regression analysis was conducted, with the university included as a control variable. The results show that the model explains 56.2% of the variance in perceived innovation capability. Both management support for entrepreneurship and support for student entrepreneurship are positively and significantly associated with organizational-level innovation capability, with management support emerging as the strongest predictor. The control variable indicates some institutional differences, while the overall pattern of relationships is consistent across both universities. The findings contribute to research on entrepreneurial universities by demonstrating that innovation capability is embedded in organizational leadership and culture rather than solely in individual initiatives. Practically, the study highlights the importance of integrating entrepreneurship into institutional strategies and support structures to enhance universities' long-term competitiveness, relevance, and societal impact.

Keywords: Innovation Capability, Entrepreneurship Promotion, Management Support

1. Introduction

Universities of applied sciences (UAS) play a key role in regional innovation ecosystems by acting as interfaces between education, research, and industry, thereby fostering collaboration, entrepreneurship, and competitiveness. This role requires staff to possess strong innovation capabilities and entrepreneurial expertise in both education and R&D activities (Virolainen et al., 2024; Hämäläinen et al., 2022; Audretsch and Belitski, 2023). In addition, UAS have a specific responsibility to enhance students' entrepreneurial readiness and innovation capability, which further emphasizes the importance of entrepreneurial competence among educators (Kayyali, 2023; Hämäläinen et al., 2022; Seikkula-Leino and Salomaa, 2020). These expectations highlight the central role of innovation capability (IC), understood as the ability of individuals and organizations to generate and utilize knowledge and resources for innovation (Hero et al., 2017; Lawson and Samson, 2001).

This study is situated within the literature on entrepreneurial universities, which conceptualizes higher education institutions as active contributors to innovation, economic development, and societal change (Etzkowitz and Zhou, 2022). Entrepreneurial universities are characterized by strategic leadership, organizational flexibility, and a culture that supports innovation and entrepreneurship among staff and students (Audretsch and Belitski, 2023; Guerrero et al., 2022; Etzkowitz and Zhou, 2022). However, despite growing research on innovation capability in higher education (Mendoza-Silva, 2021; Schaap et al., 2025; Albulushi, 2024), studies focusing specifically on UAS remain limited.

Addressing this gap, the present study examines how entrepreneurship promotion influences organizational-level innovation capability in UAS. In particular, it focuses on two key factors: perceived management support

for entrepreneurship and institutional support for student entrepreneurship. By analyzing staff perceptions in two Finnish UAS, the study aims to provide insights into how strategic leadership and organizational culture contribute to strengthening innovation capability and, ultimately, institutional competitiveness and societal impact.

2. Theoretical Framework

This study draws on the concept of entrepreneurial universities, which emphasizes the evolving role of higher education institutions as active contributors to innovation, economic development, and societal change (Etzkowitz, 2003; Clark, 1998). In this perspective, universities are no longer seen solely as producers of knowledge but as dynamic actors that engage in entrepreneurial and innovation activities—both internally and in collaboration with external stakeholders. Though organizational innovation capability has been studied from various perspectives, including personal and team abilities to innovate and the utilization of knowledge and resources (Hero et al., 2017; Lawson and Samson, 2001), yet owing to the multifaceted nature of innovation capability, its development in university context requires a deeper understanding of its determinants (Mendoza-Silva, 2021).

The entrepreneurial university framework provides a relevant theoretical lens for understanding how universities can build innovation capability not only through individual or team efforts but also through organization-wide values, structures, and strategies. This approach also recognizes that promoting entrepreneurship is itself an innovation in the context of higher education—requiring internal adoption, cultural change, and strategic prioritization. Key features of an entrepreneurial university include strategic leadership, organizational flexibility, a supportive culture for innovation, and an institutional commitment to fostering entrepreneurship among staff and students. These elements align closely with the present study's focus on how management support and institutional culture contribute to innovation capability at the organizational level. By assessing staff perceptions of leadership's role in promoting entrepreneurship and the institution's support for student entrepreneurship, this study examines how internal drivers of entrepreneurial orientation relate to broader innovation outcomes.

2.1 Innovation Capability and Related Concepts

In research literature, concepts such as innovation, innovation capability, innovation readiness, innovation capacity, and innovation potential have been defined in various ways and are sometimes used interchangeably. Defining innovation capability and its related concepts must begin with an exploration of innovation itself. Innovations can be understood broadly, encompassing product, service, process, operational, system, and social innovations (Mathias et al., 2024). A key aspect of innovation involves creativity and novelty, but ideas alone are insufficient; innovation requires the successful implementation of a creative idea and its practical usefulness (Quintane et al., 2011). Innovation does not always imply radical change but can also be incremental (Zhang, 2022), highlighting its continuous and context-dependent nature. This characterization emphasizes the importance of innovation capability, referring to an organization's or team's ability to transform knowledge, skills, and ideas into new products, processes, and practices (Hero et al., 2017; Mendoza-Silva, 2021). It includes creativity, problem-solving, collaboration, and technical expertise, and is shaped by internal and external factors such as structures, culture, leadership, resources, and networks (Mendoza-Silva, 2021).

A related concept is innovation readiness, which refers to an individual's ability to recognize opportunities, take calculated risks, and engage in creative thinking and problem-solving (Ovbiagbonhia et al., 2019). Innovation capacity, in turn, describes a firm's ability to innovate efficiently and competitively, combining both resources and capabilities (Pierre and Fernandez, 2018). Thus, it can be seen as a broader concept than innovation capability. Another related concept is innovation potential, which refers to the factors enabling an organization's ability to innovate, such as leadership, structures, collaboration, culture, and individual competence (Saunila and Ukko, 2012). This concept has also been applied at regional and national levels (Gladevich, 2023; Lomachynska and Podgorna, 2018).

In this study, we focus on innovation capability to identify key internal factors influencing innovation at the organizational level in universities of applied sciences. While innovation capability has been widely studied, prior research has often focused more on its outcomes than its underlying drivers (Samson et al., 2017). Previous studies show that innovation capability in higher education is built across multiple levels, requiring both individual competencies and organizational support. For example, Schaap et al. (2025) highlight the role of

interactions between individual, network, and organizational levels, while Albulushi (2024) emphasizes the importance of organizational culture and management in sustaining innovation capability..

2.2 Importance of Organization Culture

Organizational culture is a key factor that guides individuals' behavior, thinking, and experiences within an organization. It is formed by shared values, beliefs, and expectations that define what is considered socially acceptable and legitimate behavior (Hayton et al., 2002; Schein, 1984). Organizational culture provides meaning and context, influencing how members of the organization consciously and unconsciously think and make decisions. Thus, organizational culture functions as a collective programming of thought, which is transferred to new members through learning (Schein, 1984).

In a higher education environment, the operational culture affects how teaching staff and students adopt entrepreneurial practices. An organizational culture that promotes entrepreneurship (entrepreneurial culture, EC) encourages staff to be creative, take risks and responsibility, initiate new projects, engage in continuous learning, and learn from mistakes (Hayton and Cacciotti, 2013; Wong, 2014). Such a culture creates the conditions for individuals to behave innovatively and entrepreneurially.

Engzell et al. (2024) and Valka et al. (2020) point out that teachers often operate between different institutional logics, where traditional academic logic meets an organization-level logic that emphasizes entrepreneurship. Organizational structures and processes influence how initiatives that promote entrepreneurship and innovation are implemented. A low degree of formality and management's trust in staff promote entrepreneurship, whereas high formality and hierarchy may limit the organization's ability to act flexibly and innovatively (Valka et al., 2020). Teachers and other professionals working in innovative higher education institutions are more likely to take calculated risks and engage in creative activities (Albulushi, 2024). Therefore, the organizational culture forms the foundation for organization members' innovativeness and the promotion of entrepreneurship.

Furthermore, the organizational culture of a higher education institution has been found to directly influence how students perceive entrepreneurship as an opportunity and how likely they are to engage in entrepreneurial activities. Hero et al. (2017) emphasize that cultural and collaborative factors in the learning environment are central to the development of students' entrepreneurial competencies, supporting the idea that the organizational culture impacts not only staff but also students. For example, Liu and Peng's (2025) study shows that students' entrepreneurial intentions are positively influenced by their attitudes, beliefs, and experiences of environmental support. Particularly, students' identification with their own academic department ("departmental identification") strengthens these relationships, highlighting the importance of cultural support from the academic community in promoting entrepreneurship.

Joensuu-Salo et al. (2020) have exproled the relationship between university teachers' innovativeness and risk-taking ability and their use of entrepreneurship teaching methods. The results showed that teachers' innovativeness, including risk-taking abilities, positively influence how actively they foster students' entrepreneurial skills, such as uncertainty tolerance, creativity, responsibility, and anticipation. In addition, as the study of Hämäläinen et al. (2023) indicates, a teacher's own background and entrepreneurial mindset influence how entrepreneurship-promoting activities are carried out in a university of applied sciences. Some teachers have entrepreneurial experience or other specific expertise related to entrepreneurship, which can be a significant asset to the work community in promoting entrepreneurship. Teachers who have been entrepreneurs themselves tend to be somewhat more active promoters of entrepreneurship within their work environment (Hämäläinen et al. 2023). These findings align with the suggestions of Gibb (2012) who higlights that fostering a culture of entrepreneurship within higher education institutions involves cultivating a dynamic, opportunity-oriented organizational environment that supports experimentation and adaptability, thereby enhancing institutional innovation capability.

Hence, we propose the following hypothesis:

> **H1:** An entrepreneurship-supportive organizational culture is positively associated with organizational-level innovation capability.

2.3 The Importance of Management Support in Promoting Entrepreneurship and Innovation Capability

The Ministry of Education and Culture (2017) has published the Entrepreneurship Guidelines for Education with the aim of guiding the promotion of entrepreneurship and entrepreneurial education measures nationally, including within universities of applied sciences. Additionally, the Universities of Applied Sciences Act (351/2003) obligates higher education institutions to cooperate with business and other working life sectors. To fulfill these obligations, entrepreneurship promotion can be institutionally supported through various regulatory systems such as shared strategies, regulations, and objectives (Hämäläinen et al., 2018; Lahikainen et al. 2018). However, even if entrepreneurship is included in the guiding documents of a higher education institution, the goals and objectives of entrepreneurship education are not always clear to teachers (Heinonen and Hytti 2010).

Moreover, teachers' willingness and capability to promote entrepreneurship do not depend solely on the institution's strategies and guidelines but also on other forms of institutional and leadership support. Such support can manifest in the provision of resources such as information, facilities, funding, opportunities for collaboration, personnel, teaching materials, and exemplifying desired behavior (Montecinos et al., 2015; Ruskovaara, Hämäläinen and Pihkala 2016). These elements help staff perform their duties in the desired and productive manner (Yang and Yu 2022; Hardie et al., 2022; Guerrero and Urbano 2012).

The strategy and leadership practices of a higher education institution have been shown to directly influence teachers' attitudes toward entrepreneurship education (Hämäläinen et al. 2022). In other words, when a teacher perceives that the institution's strategies and management practises support the promotion of entrepreneurship, their own attitudes toward entrepreneurship education tend to be more positive. Since the institution's strategies and management support influence both teachers and the organization as well as how entrepreneurship is promoted, they also strengthen the organization's innovation capability.

Hence, we propose the following hypothesis:

> **H2:** Perceived management support for promoting entrepreneurship is positively associated with organizational-level innovation capability.

3. Data and Method

3.1 Data Collection

The data for this study were collected from two universities of applied sciences from Finland (hereafter UAS A and UAS B) between November 2024 and January 2025. The survey invitation was distributed to the entire staff of both institutions, followed by a reminder two weeks later. A total of 74 staff members from UAS A and 60 from UAS B responded, yielding 134 participants overall. The sample included both teaching staff and research, development, and innovation (RDI) personnel from a range of disciplinary fields.

At UAS A, 55% of respondents reported teaching responsibilities, compared to 43% at UAS B; the remaining respondents in both institutions represented RDI personnel. Women constituted 72% of respondents at UAS A and 53% at UAS B. Differences also emerged in disciplinary backgrounds: in UAS A, the largest share of respondents came from social sciences, business, and administration (41%), whereas in UAS B, most respondents represented engineering and transport (45%).

This study examined staff perceptions of organizational-level innovation capability and its relationship to two key predictors: (1) perceived management support for promoting entrepreneurship, and (2) an entrepreneurship-supportive organizational culture, particularly in relation to student entrepreneurship.

3.2 Measures and Analytical Strategy

Organizational Innovation Capability. Innovation capability was measured with six items adapted from Hurtado-Palomino et al. (2022) and modified for the higher education context. Respondents rated each item on a seven-point Likert scale (1 = strongly disagree, 7 = strongly agree). The construct demonstrated strong reliability (AVE = .70, CR = .93, factor loadings .79–.87; see Table 1).

Entrepreneurship-Supportive Organizational Culture. This construct was measured with three items adapted from Bergmann et al. (2018), focusing on the extent to which the institution fosters student entrepreneurship. Reliability was excellent (AVE = .88, CR = .96, factor loadings .91–.97; see Table 1).

Management Support for Promoting Entrepreneurship. Perceived management support was assessed with three items derived from a previously validated survey for UAS teachers (Joensuu-Salo et al., 2023). Respondents evaluated institutional strategies, top management, and their immediate supervisor with respect to entrepreneurship promotion. Reliability was high (AVE = .80, CR = .92, factor loadings .84–.98; see Table 1).

Table 1: Measurement items, factor loadings, AVE, and CR

Construct & Item	Factor Loading	AVE	CR
Organizational Innovation Capability		.70	.93
Our institution effectively uses information from multiple sources to improve operations.	.855		
Our institution quickly adapts to changes in the operating environment in developing its activities.	.873		
Employees are encouraged to generate new ideas.	.826		
Our institution actively makes use of new ideas from stakeholders.	.827		
Collaboration across different fields of education works well in our institution.	.789		
Internal practices for open knowledge sharing between teams are developed in our institution.	.852		
Entrepreneurship-Supportive Organizational Culture		.88	.96
Our institution's culture encourages students to develop new business ideas.	.940		
Our institution's culture supports students in becoming entrepreneurs.	.968		
Our institution's culture encourages participation in entrepreneurship-related activities.	.908		
Management Support for Promoting Entrepreneurship		.80	.92
Our institution's strategies support the promotion of entrepreneurship in my work.	.851		
The top management of our institution supports the promotion of entrepreneurship in my work.	.978		
My immediate supervisor supports the promotion of entrepreneurship in my work.	.844		
Note. AVE = Average Variance Extracted; CR = Composite Reliability			

The university of applied sciences (UAS A vs. UAS B) was included as a control variable. Linear regression analysis was employed, and all assumptions were met: residuals followed a normal distribution, no significant autocorrelation was detected, variance of errors was approximately constant (homoscedasticity), and multicollinearity remained at an acceptable level (VIFs 1.3–1.4) (Hilbe, 2009; Menard, 2010). Scatterplots suggested linear relationships between the predictors and the outcome, while diagnostic tests (e.g., Shapiro–Wilk, Durbin–Watson, Cook's distance) confirmed the robustness of the model.

4. Results

The regression model explained a substantial proportion of the variance in organizational innovation capability (adjusted $R^2 = .562$). The overall model was statistically significant, $F = 57.77$, $p < .001$ (see Table 3).

Both focal predictors were positively and significantly associated with organizational innovation capability. Management support for entrepreneurship emerged as a strong predictor ($\beta = .375$, $p < .001$), indicating that staff who perceived greater support for entrepreneurship promotion from institutional strategies, top management, and supervisors also rated their institution as more innovative. Similarly, an entrepreneurship-supportive organizational culture was significantly related to higher levels of innovation capability ($\beta = .328$, $p < .001$), underscoring the role of organizational culture in fostering innovation.

The control variable (institution) was also statistically significant ($\beta = .182$, $p < .01$), suggesting modest differences between UAS A and UAS B, with staff at UAS A evaluating innovation capability slightly more favorably. Importantly, however, the effects of leadership support and culture were consistent across both institutions.

Taken together, the findings provide strong support for both hypotheses. An entrepreneurship-supportive organizational culture H1) and perceived management support for promoting entrepreneurship (H2) were robustly linked to organizational innovation capability in UAS.

Table 3: Regression results predicting organizational innovation capability

Predictor	B (SE)	β	p
Constant	0.315 (0,331)		-
Institution (control)	0.517 (0,196)	0.182	<.01
Entrepreneurship-supportive organizational culture	0.336 (0,079	0.328	<.001
Management support for entrepreneurship promotion	0.322 (0,069)	0.375	<.001
Adjusted R^2	0.562		
F	57.770		<.001

5. Discussion and Conclusions

The aim of this study was to examine the impact of entrepreneurship-supportive organizational culture and perceived management support for promoting entrepreneurship on the innovation capability of universities of applied sciences. The results demonstrate that both entrepreneurship-supportive organizational culture and perceived management support play a significant role. This aligns with Schaap et al. (2025), who argue that innovation capability in higher education is built through interactions at individual, network, and organizational levels, with management as a key resource. The findings reinforce that management support, particularly in promoting entrepreneurship, is critical for fostering innovation capability. They are also consistent with Albulushi (2024), showing that innovation is shaped by both individual and organizational factors. Notably, an entrepreneurial culture fosters creativity, risk-taking, and continuous learning, which are closely tied to innovation (Hayton and Cacciotti, 2013).

Developing innovation capability in higher education requires a holistic understanding of internal organizational factors such as management and culture. Innovation capability does not emerge solely from structures or resources but from a constellation of factors (Ocampo et al., 2022; Pan et al., 2024). The findings highlight two key levers: first, top management commitment and clear entrepreneurship strategies, reflected in communication, actions, and supervisory support; and second, support for student entrepreneurship, which contributes to organizational innovation capability by reinforcing an entrepreneurial climate.

The results support the view that innovative organizations require both “hard” (resources, strategies, management commitment) and “soft” (culture, climate) support. Although the institutional control variable had a smaller effect, differences between institutions were modest, suggesting that innovation capability exists in both and can be strengthened, particularly through management support and entrepreneurial culture.

It is important to note that the study captures individual perceptions rather than objective measures of innovation capability. These perceptions may vary within institutions and across subcultures, influenced by management and supervisory support, as well as the encouragement of student entrepreneurship. Nevertheless, the findings suggest that broadly fostering entrepreneurship among staff and students is crucial for strengthening institutional innovation capability.

The study has limitations. Data was collected from only two universities of applied sciences in one country, limiting generalizability. In addition, reliance on self-reported data may introduce bias. Future research could combine quantitative and qualitative approaches to provide a more comprehensive understanding of innovation capability and its drivers.

In conclusion, the findings highlight the importance of mechanisms that enable innovation, such as management development, cross-functional collaboration, and entrepreneurship-supportive practices. By investing in an innovation-friendly culture and strengthening management capacity, higher education institutions can enhance their competitiveness, support regional innovation, and increase their societal impact.

Abstract: Entrepreneurial ecosystems have received renewed interest in recent years. Initially developed by Moore (1990s) and later popularized by Isenberg (2010, 2011), the entrepreneurship ecosystem approach provides a unique but dynamic framework for studying entrepreneurship development. As noted by Stam (2015), ecosystems offer a more holistic and imbedded approach to entrepreneurship development and as such, policy makers and academics alike have been keen to apply this framework in policy development, support structures and funding strategies. The question of how to ignite an ecosystem that recognises the changing needs of entrepreneurs has been considered in recent years, particularly in terms of women entrepreneurship, ensuring the infrastructure is in place to support women in business (Hernandez, 2022). However, the emergence of Generation Y and subsequently Gen Z has reignited the debate on entrepreneurship and ecosystems. As this new generation of young, technologically and social media savvy entrepreneurs have emerged, their particular generational trait and motivations, have forced policy makers to look at what changes need to be made, or facilities employed to support them in their entrepreneurial journeys? There is no doubt that this new generation represents a potentially un(der)tapped source of economic growth, vital for future economic growth and sustainability. However, understanding how we can better align supports to this new cohort and reflect the business environment in which they typically operate is still an emerging area. Furthermore, earlier research indicates a '*disconnect*' between support agencies and this new generational group which impacts on them accessing enterprise supports (Hamouda et al., 2020). The study seeks to draw on new insights into these entrepreneurial sub-groups and discuss the implications for the development of dynamic (lean) entrepreneurial ecosystems that better support their entrepreneurial endeavors. The paper closes with a number of recommendations regarding emerging areas of research that will address the disconnect between these entrepreneurs and existing policy frameworks.

Keywords: Female Entrepreneurs, Entrepreneurial Ecosystems, Gen Y and Gen Z, Entrepreneurship, Ecosystems and Policy

1. Introduction

Entrepreneurship has been widely recognized as critical for economic growth and employment, both nationally and internationally (GEM 2024; OECD 2023a). As far back as the 1930s, with the work of Schumpeter (1934), the case for encouraging entrepreneurship and the role entrepreneurs play as innovators delivering economic and social development is now firmly established within the business and economic literature. Despite the wealth of literature in this area, challenges exist in how policymakers translate entrepreneurship policy into practice. Continued evidence of disparity in entrepreneurial rates across countries, and within genders and socio-economic groups have continued to shape and challenge policy advisers and researchers alike. In the area of gender for example, the so called 'gender gap' has identified fundamental weaknesses in the entrepreneurial system, for women in accessing networks, societal expectations and access to funding options (McAdam et al., 2017; Brush et al., 2019; Cullen 2020).

In an attempt to reconcile these challenges, academic scholars and policymakers have shifted their focus towards an entrepreneurial ecosystem approach. First proposed by Isenberg (2010) and Stam (2015), researchers have sought to reframe the debate by exploring the role and impact of the entrepreneurial ecosystem on entrepreneurial activity. Conceptually rich, this approach has proved insightful in several ways. Firstly, it served to highlight the interconnected and mutually impacting elements that make up the entrepreneurial environment. Secondly, it shifts the emphasis to the entrepreneur as a central player, rather than the business and positions the entrepreneur as an actor in impacting and developing the ecosystem in which they operate. Writing on the subject, Stam (2015) argues that the entrepreneurial ecosystem approach firmly places the entrepreneur as a central player "in the creation of the system" and in "keeping the system healthy" (p.1761).

It is within this debate that a new cohort of entrepreneurs, namely Gen Y and Gen Z have emerged, re-igniting the debate on entrepreneurial ecosystems. These young, digitally native entrepreneurs, with a strong focus on sustainability, typically operate in high-growth, technology-driven ventures. They thrive in ecosystems offering robust, tech-enabled support, often prioritizing self-actualization and social impact alongside profit. These new

cohorts are challenging our traditional view of entrepreneur. There is also new evidence to suggest that entrepreneurial rates among these new groups, Gen Y and Gen Z, are set to rise over the coming years.

In the context of the above, this study seeks to draw on new insights into these entrepreneurial sub-groups and examine the implications for the development of dynamic entrepreneurial ecosystems. The paper seeks to examine the characteristics, challenges, and motivations of these new and significant groups and how the entrepreneurial ecosystem can better support them, through policy and support agencies. The paper closes with a reflection on the findings from preliminary research and presents key implications for further research to work on addressing the current disconnect between existing enterprise supports and the changing needs of this new cohort of female entrepreneurs.

2. Entrepreneurial Ecosystems

The entrepreneurship ecosystem framework has become increasingly topical among researchers and policymakers in recent years in entrepreneurship development. While the framework is relatively new, the work dates back to the 1990s with the work of Markusen 1996 and Krugman 1991 and Moore (1993). However, Isenberg (2010, 2011) is largely credited with popularising the term and establishing the framework as key to understanding and influencing entrepreneurial behaviour. At the core, the framework suggests that the interaction of various interdependent organisations and players (such as Policy, Markets, Finance, Supports, Culture, and Human Capital), play a critical role in influencing entrepreneurial behaviour by providing the necessary resources (human, financial and professional) required for an entrepreneur to start and grow their business (Manolova et al., 2017; Isenberg 2010, 2011; Mason & Brown, 2014). The framework in its original development identified six key components, in an 'entrepreneurial ecosystem': policy, markets, finance, human capital, supports and culture.

The value of the entrepreneurship ecosystem framework is widely documented (Stam, 2015; 2017; Spiegel, 2015; 2017) and has served to provide a powerful lens for investigating the factors shaping entrepreneurial activity at regional and national levels. The framework emphasizes a more holistic approach to entrepreneurship and stresses the interconnectedness of key components within the system. This research has also highlighted the critical role of enterprise policy (mainly supports) and access to finance as key components in promoting entrepreneurship, According to Mazzarol (2014), enterprise policy and access to finance are the first and potentially the most important component of an entrepreneurial ecosystem. It also recognizes the central role of the entrepreneur in shaping the ecosystem. For example, the entrepreneurship ecosystem approach has provided key insights into understanding the gender gap in entrepreneurship (Brush et al., 2018) and Hechavarría & Ingram, 2019). Indeed, as noted by Acs and Virgill (2010), in order to address the potential marginalisation of certain groups, the development of a conducive entrepreneurship eco system is paramount. It is within this context that research into a new cohort of entrepreneurs, namely Gen Y and Gen Z has emerged in the debate on entrepreneurial ecosystems. These young, digitally native entrepreneurs, with a strong focus on sustainability, typically operate in high tech sectors and are challenging the traditional view of entrepreneurship. This has led to a growing debate on the development and implementation of relevant and appropriate enterprise support policies that are aligned with the needs of the entrepreneurs, namely creating an ecosystem that is region specific and, therefore, reflective of the entrepreneurs in that region.

3. Gen Y: The Rise of the Millennials

Much has been written on the emergence of Gen Y. Defined as those born between 1980 and 2000, this distinct group, also known as Millennials, E-generation, Echo Boomers or Millennipreneurs is now a growing topic of debate (BNP Paribas Global Entrepreneur Report, 2017 and Liu, Zuh, Serapio and Cavusgil, 2019). The rise of millennials as a distinct group has led to a growing number of studies examining the motivations and aspirations of this cohort and suggests that millennials convey characteristics and motivations not typically associated with entrepreneurs and that their interaction with enterprise supports is similarly challenging. While an exhaustive review of Gen Y is outside the scope of this paper, the research outlined below draws on key insights that are particularly relevant to the discussion, namely in terms of value creation, accessing supports and how this new cohort is evolving in an entrepreneurial context.

There is growing evidence that the traditional value-based assumptions of profit and growth are not equally shared with Gen Y entrepreneurs. According to Parkinson (2017), millennials have a greater focus on the environment and social impact than previous generations (D'Andria and Gabarret, 2017), (Nielsen, 2015). Indeed, a major report by BNP Paribas Global Entrepreneur Report (2017) suggests Gen Y have a pronounced

personal drive to make a difference and be different. This social agenda is markedly different from that traditionally attributed to entrepreneurship.

In the area of engagement with enterprise supports, the research suggests a disengagement with traditional information channels and support agencies. As technologically savvy individuals (Pountain and Robin, 2000 as cited in Ferguson, 2011), they rely on the use of technology instantly (Behrens, 2009; Cahill and Sedrak, 2012) with an expectation for immediate answers and instant feedback. This has led to claims that Gen Y entrepreneurs can be perceived as difficult and challenging to deal with (Levenson, 2010), being considered over-confident and overly concerned with their own interests. Indeed, initial preliminary research by the authors on Gen Y female entrepreneurs based on 92 GenY female entrepreneurs in Ireland and representatives of 3 enterprise support agencies concurs with the above findings. The results suggest a number of important themes.

Profile of Gen Y Female Entrepreneur Respondents surveyed:

- Aged between 31-36 years
- Highly educated to degree and master's level
- Young businesses (less than 2 years old)
- Operate as for-profit businesses
- Sample was drawn from a broad range of sectors, personal services, professional services, administration and information and communications

3.1 Theme 1 - Value Creation

What this research collectively indicates is that their motivation towards value creation is centered on sustainability, social and environmental impact Indicating a move towards a more comprehensive value creation model of entrepreneurship (Tapscott, 2000; Aguiree et al; D'andria and Gabarret, 2017). The desire to make an impact on the world and wanting to have a social impact are also key motivators for this group, which the wider literature has already highlighted with millennials having a strong environmental and societal focus (D'andria and Gabarret, 2017). This suggests that unlike many of their male counterparts, female entrepreneurs do not view entrepreneurship solely as an economic endeavour, but that their motivation is intertwined with personal, social and, in some cases, wider community goals (Buttner and Moore, 1997; Carter et al., 2007; Robinson, 2001; Marlow and Carter, 2004).

3.2 Theme 2 - Freedom and Autonomy

The study showed that they are more interested in autonomy, and the flexibility and freedom that entrepreneurship offers, as opposed to the traditional perspective driven by money. They seek to think for themselves, act independently and carry out assigned work on a mobile basis with flexible working hours, striving for work-life balance.

3.3 Theme 3 – Change in Confidence and Entrepreneurial Mind-set

Gen Y female entrepreneurs do not feel pressured to conform to what is 'normal', nor was gender considered a challenge. Furthermore, they did not experience pressure from family and friends nor was age seen as a barrier. Interestingly, work life balance does not feature as a significant challenge for this group. While fear of failure and pressure to succeed were identified as a challenge, results suggests that they are quite different from previous generations in terms of both confidence and mind-set. Furthermore, they convey core entrepreneurial traits of being open-minded, creative and have a strong need for independence, indicating this generation shows clear traits associated with entrepreneurship (Bansal, 2017; Koloba, 2017).

3.4 Theme 4 - Experience of Accessing Enterprise Supports

While research has long recognised the challenges facing female entrepreneurs (Brush, 1997; Brush, 2000; Carter, 2000; Shaw, 2001; Marlow, 2002; Brush et al., 2004), this study indicates that Gen Y female entrepreneurs continue to face challenges in the area of accessing finance and supports with the most significant challenges being generating an income for themselves and financing their business. Other, related challenges were not being seen as credible and access to start-up training and education. Surprisingly, two thirds did not access any supports in the start-up or development of their business. Given the proliferation of female enterprise in Ireland, this is surprising. The question is why is this generation of entrepreneurs not being reached as well as a possible disconnect between demand (entrepreneurs' needs) and supply (current training provision)?

4. Supply Side Perspective

From a supply side perspective, in-depth Interviews were held with three female representatives from different enterprise support organisations revealed a surge of *New Generation of Female Entrepreneurs th*at illustrates new emerging skillset and characteristics. While it was suggested that they are highly educated and technologically savvy, this is perceived to have a negative impact. According to the representatives:

'… they are often bombarded with the next thing... 'background noise as in, social media platforms and information coming at them from every angle'... …"It is hard for them to focus on something and see it through, there are so many different distractions".

They also suggest that as a result they can often lack focus and are more concerned with speed and an instant response rather than having to work to achieve results. It is suggested there is an emerging difference in motivations and attitudes towards entrepreneurship, with their motivations of entrepreneurship being more individualistic in nature. As one representative noted that*, 'When Gen Y is looking for a career and jobs, they are not asking what I can do for the job or business, they are asking what the job can do for me.'* It is suggested that they may not have the same attitude to risk aversion as previous generations of female entrepreneurs which contrasts with prior research by Wilson, Kickul, and Marlino (2007) that found that female entrepreneurs are often less confident or less willing to engage in risky business ventures, which impacts their entrepreneurial intentions.

Gen Y female entrepreneurs are seen by support agencies as more of a challenge than an opportunity. Certainly, prior research has alluded to the challenges of working with these entrepreneurs: ranging from difficulties around a sense of entitlement (Deal et al., 2010); being viewed as more demanding than previous generations (Levenson, 2010); and with a strong focus on their own interests (Myers and Sadaghiani, 2010).

5. Enter Gen Z – the New Digital Natives

In the last decades, there has been a gradual transition from Gen Y to a new cohort Gen Z. While there are several opinions and no precise dates for when Gen Z started, often referred to as "Post-Millennials" (Stewart, 2020), researchers postulate that Gen Z was born between 1997 and 2012 (Dimock, 2019). It is predicted that by 2034 they will be the largest generational cohort equal to 8 million (Millennials, Gen Z, 2019).

Gen Z is typically referred to as "digital natives" due to their high reliance on digital media and online literature (Feher, 2019; Francis and Hoefel, 2018) and commonly referred to as "digital nomads" (Fromm and Read, 2018), and "the most application friendly and website-savvy generation" (Ayuni, 2019, p. 169). Gen Z had very distinct and notable characteristics that is reshaping the world of work. Numerous studies (Redmond, 2026; Young, 2018; Ratajczak, 2020; Barhate, 2022) and a major report by Forbes (2025) suggest that Gen Z are reshaping the traditional workplace that is driving changes in management styles, work environments and organisational values. This is also impacting the field of entrepreneurship with evidence suggesting that Gen Z are becoming one of the most entrepreneurial generations to date (Forbes, 2024). A 2020 survey from the US reported that 62% of Gen Zs indicated that they plan to start or potentially start their own business. Research by Wakefield Research (2024) puts the number even higher at 84% of Gen Zers who want to own their own company. Moreover, they have very specific expectations; they prefer simplicity, want to be safe, want to escape reality, have high expectations, and care about experience (Tunsakul, 2020). They do not value teamwork, favouring working independently (Iorgulescu, 2016). It is suggested that they seem to be quite confident, seeking money and status, coined by social media (Törőcsik et al., 2014).

6. Implications for Entrepreneurship and the Ecosystem

There is no doubt that both Gen Y and Gen Z have enormous potential for entrepreneurial development and success (Rinaldi and Herlina, 2022). Gen Z are driven by a strong desire for independence, social impact, and technological innovation. They tend to leverage digital tools and social media to create and scale businesses rapidly. Moreover, their approach to entrepreneurship is more inclusive and collaborative, often focusing on sustainable and ethical business practices. Moreover, they have the potential of potentially redefining entrepreneurship towards a more social agenda and with strong corporate social responsibility (CSR) ambitions (Dabija et al., 2019).

Moreover, their risk-taking abilities differ dramatically (Rinaldi and Herlina, 2022). Gen Z is more willing to take risks as learning opportunities (Carolin et al., 2024), they are more daring than Gen Y (Rinaldi and Herlina, 2022).

Gen Y's business strategies are more stable and sustainable, while Gen Z's approach is more dynamic, flexible, and adaptable to changing market conditions (Carolin et al., 2024). It is proposed that Gen Z will use social media to promote their business, as they are great communicators and digital natives who could rise to become pioneer modern-day entrepreneurs who might surpass GenY, even though they work less hard, but smart (Hidayat,2024). Furthermore, Gen Z's redefinition of entrepreneurship will likely lead to significant changes in the future of work, emphasizing flexibility, digital integration, and value-driven business (Rinaldi and Herlina, 2022). This then leads to the question of what are the implications of this research for entrepreneurship ecosystems? To better address this question, two key themes have begun to emerge:

6.1 Theme 1: Growing Disconnect between Policy and Practice

As outlined above, the entrepreneurial ecosystem framework has provided a unique insight in driving forward the entre agenda. However, while the framework has offered key insights, the rise of these new cohorts of entre – namely Gen Y and Z, we are seeing the evolution of a new type of entrepreneur that is presenting characteristics and traits outside the traditional perspective. There is now substantial evidence to indicate that these entrepreneurs have a different value system and are not engaging with local enterprise supports at the levels expected or associated with traditional entrepreneurs. This disconnect is also leading to a growing negative perception of enterprise support agencies towards these groups.

6.2 Theme2: Need for Further Research into Gen Z Entrepreneurs

There is a growing body of research which suggests that there are now fundamental shifts generationally in entrepreneurs which have implications for our understanding of and use of ecosystems. A significant proportion of entrepreneurs belong to a new generation of relatively young, technologically and social media savvy entrepreneurs and their particular generational trait and motivations, have forced policy makers to look at what changes need to be made, or facilities employed to support them in their entrepreneurial journeys? In fact, this research suggests that in a number of key areas there is a growing disconnect between the ecosystem created in large part, by the characteristics, motivation and traits of these new groups of entrepreneurs. Building on these insights, this evidence highlights the need for future research to examine how various generational groups are engaging with enterprise supports. in particularly how digital and other internationally designed and delivery supports can be adapted for these groups.

7. Concluding Statement

The research has highlighted a number of areas where Gen Y and increasingly Gen Z are experiencing a disconnect in terms of existing entrepreneurship structures and approaches. For example, their attitudes and traits are challenging our traditional view of what motivates an entrepreneur and what an entrepreneur is. Moreover, research also suggest that this group have different view of enterprise. The fact that so few access the abundant support that is offered suggests that beyond the familiar 'sticking point' of finance, the supports and culture are weak in the current system. Additionally, these weaknesses are not (yet) taken up through policy to try to reframe or rectify the missing elements for these entrepreneurs. Finally, the '*disconnect*' between support agencies and this generational group is identified through the negative views the support agency person have towards the entrepreneurs in terms of over-confidence, and a reluctance to take up advice, support and training.

Policy and access to finance are recognised as two critical components of the entre eco system. As such the role of policy and support agencies is to create a favourable entrepreneurial ecosystem to promote and support entrepreneurial engagement. Given that Gen Y potentially represents an un(der)tapped source of economic growth and vital for future economic growth and sustainability, it is imperative that we better align supports and training for this generation and reflect the business environment in which they typically operate. This paper represents a first attempt to open the debate on Gen Y, Gen Z and entrepreneurial ecosystems. The authors recognise that this may be challenging but that such discussion is necessary in order to ensure a more equitable match between the entrepreneurs and the ecosystem in which they operate.

Abstract: Innovation is widely recognized as a key driver of economic growth, competitiveness and societal development. However, innovation does not emerge only from isolated organizational activities, but from the interaction of heterogeneous actors embedded in national innovation systems. While innovation management literature has traditionally emphasized organizational strategies, processes and capabilities, related streams on open innovation, innovation networks and network governance show that innovation also depends on interorganizational collaboration and systemic coordination. This paper brings these perspectives together by introducing the Trilevel Innovation Management Framework for National Innovation Systems. The framework conceptualizes innovation management as a multi-level capability operating at three mutually connected levels: the micro level of units and organizations, the meso level of networks and collaborative structures and the macro level of national innovation systems. It argues that innovation management can act as a catalyst for national innovation system performance when it aligns organizational capability building, interorganizational collaboration and system-level governance. The framework is illustrated through the case of the SENAI Innovation Institutes in Brazil, a national network of applied R&D institutes to strengthen the connection between scientific knowledge and industrial application. The case demonstrates how systematic planning, implementation and evaluation supported the development of individual institutes, collaboration within regional and national innovation ecosystems and measurable macroeconomic impact. The paper contributes to innovation management and national innovation system research by offering an integrated perspective on how management practices at different levels can jointly strengthen innovation system performance.

Keywords: Innovation Management, National Innovation System, Research and Technology Organizations, Technology Audit, SENAI, Industry 4.0, Knowledge Transfer, Systemic Catalyst

1. Introduction

Innovation is a central driver of economic growth, competitiveness and societal development. However, innovation does not emerge only from isolated organizational activities. It is shaped by the interaction of different actors, including companies, universities, research institutions, research and technology organizations and government agencies. The concept of the national innovation system provides a useful perspective for understanding these interactions and the institutional conditions under which knowledge is generated, diffused and applied (Freeman 1987; Lundvall 2010; Edquist 1997).

At the same time, innovation needs to be managed. Organizations require strategies, processes, resources and capabilities to transform ideas into new products, services, processes or technologies. Innovation management literature has developed a broad understanding of these organizational tasks, while related streams on open innovation, innovation networks and network governance show that innovation also depends on collaboration across organizational boundaries (Chesbrough 2003; Tidd and Bessant 2020; Hauschildt et al. 2023; Cap 2020). However, the organizational, interorganizational and systemic perspectives on innovation management are often discussed separately.

This paper addresses the gap through a conceptual synthesis of NIS, innovation management and network governance literature. It develops the TIMF and uses the SENAI Innovation Institutes as an illustrative case. The case draws on previously published action research, technology audits and impact assessments (Kohl et al. 2020; Hecklau 2024; Schubert et al. 2025). Its purpose is to examine whether the proposed micro-, meso- and macro-level logic can be identified in a large-scale innovation-system intervention. The paper therefore provides an analytically grounded framework and initial case-based illustration, while broader validation across contexts remains necessary.

2. Conceptual Background

2.1 Actors and Structures in Innovation Systems

The concept of the national innovation system emphasizes that innovation is shaped by the interaction of multiple actors embedded in institutional, economic and political contexts. Freeman 1987 defines a national innovation system as the network of public and private institutions whose activities and interactions initiate, import, modify and diffuse new technologies. Later contributions further developed this perspective by highlighting interactive learning, institutional arrangements and systemic interdependencies as central elements of innovation performance (Lundvall 2010; Edquist 1997; Patel and Pavitt 1994; Sharif 2006).

A national innovation system typically includes companies, universities, research institutions, research and technology organizations, government agencies, funding bodies and intermediary organizations. These actors perform complementary functions. Companies translate knowledge into market-oriented products, services and processes. Universities and research institutions generate scientific knowledge and educate skilled personnel. Government actors provide policy direction, funding mechanisms and regulatory frameworks. RTOs occupy a hybrid position because they operate between science and industry and support the transfer of research results into application-oriented solutions (European Research Advisory Board 2005; Arnold et al. 2010; EARTO 2015; Hecklau 2024).

The interaction between these actor groups is often described through the Triple Helix model. This model conceptualizes innovation as the result of dynamic relationships between science, industry and government. It also highlights the importance of hybrid organizations that emerge at the interfaces of these spheres and support knowledge transfer, collaboration and technology diffusion (Etzkowitz and Leydesdorff 1995; Etzkowitz and Leydesdorff 2000; Ranga and Etzkowitz 2013). From this perspective, innovation systems are not only defined by the presence of actors, but also by the quality of their interactions. This is particularly important for applied research and technology transfer, where the connection between scientific knowledge and industrial demand is central.

2.2 Innovation Management

Innovation management refers to the systematic planning, steering and implementation of activities that transform ideas into innovations. It includes the development of innovation strategies, the generation and selection of ideas, the management of R&D and technology portfolios, the implementation of innovation projects and the measurement of innovation performance (Goffin and Mitchell 2016; Tidd and Bessant 2020; Hauschildt et al. 2023). In this understanding, innovation management is not limited to creativity or invention. It concerns the organizational capabilities and processes required to turn knowledge into value-creating outcomes.

Classical innovation management literature has a strong organizational focus. It examines how firms and other organizations structure their innovation processes, allocate resources, manage uncertainty, balance exploration and exploitation and bring new products, services or processes into application. For technology-oriented organizations, innovation management is closely related to technology management because technological capabilities, infrastructure, competencies and portfolios determine an organization’s ability to develop and apply new technological solutions (Schuh and Klappert 2011; Hecklau 2024).

However, innovation management is not confined to single organizations. Open innovation research emphasizes that organizations increasingly use external knowledge sources and collaborate with partners to develop innovations (Chesbrough 2003). Research on innovation networks and network governance further shows that innovation often depends on interorganizational relationships, coordination mechanisms and the management of collaboration (Dhanaraj and Parkhe 2006; Provan and Kenis 2008; Cap 2020; Cap et al. 2019). Cap 2020 explicitly connects innovation management and network management by arguing that innovation frequently emerges through collaboration among several actors and that the management of innovation networks combines elements of both fields.

If innovation depends on the interaction of heterogeneous actors, innovation management must be considered not only within organizations, but also between organizations and at the system level. The following framework builds on this understanding and conceptualizes innovation management as a multi-level capability that links organizational capability building, interorganizational collaboration and systemic governance.

3. A Trilevel Framework for Innovation Management of National Innovation Systems

The TIMF does not propose a new taxonomy of innovation-system actors. NIS and Triple Helix approaches primarily explain system composition, institutional relationships and interactions among science, industry and government, while network-governance research focuses on coordination between autonomous organizations. The TIMF adds a management perspective by translating these analytical domains into three connected levels of intervention: organizational capability building, management of collaborative structures and system-level governance. Its contribution is therefore not the identification of micro, meso and macro structures as such, but the integration of management activities and bidirectional feedback across them. Detailed analyses of NIS actors and the position of RTOs are provided in previous research – see Hecklau et al. 2020 and Hecklau 2024.

The framework distinguishes three mutually connected levels of innovation management. At the micro level, innovation management strengthens the capabilities of individual actors, such as firms, RTOs, universities, research institutes or public agencies. At the meso level, innovation management structures collaboration, knowledge transfer and joint value creation between actors. At the macro level, innovation management supports the strategic governance, monitoring and continuous development of the innovation system. The framework therefore extends the classical organizational understanding of innovation management toward a systemic perspective. It suggests that innovation management can act as a catalyst for NIS performance when it aligns organizational capabilities, interorganizational collaboration and system-level governance.

The TIMF is conceptually grounded in NIS, innovation management and innovation network literature. Its three-level structure is also reflected in the management approach used in the development of the SENAI Innovation Institutes in Brazil, where network-level strategies, standards and guiding principles had to be connected with management models, methods and evaluation tools for individual institutes (Kohl et al. 2020). The SENAI case is used in the following section as case evidence illustrating how innovation management can operate across micro, meso and macro levels.

3.1 Micro Level: Units and Organizations

At the micro level, innovation management refers to the internal practices through which individual NIS actors systematically generate, select, develop and implement innovations. This level forms the operational foundation of the NIS. Even well designed innovation policies or network structures cannot create sustainable impact if the actors that are expected to implement them lack the capabilities, resources and management systems required for innovation. Organizational innovation management therefore includes R&D strategy formulation, technology and project portfolio management, competence development, business model planning, innovation process design and performance measurement (Goffin and Mitchell 2016; Tidd and Bessant 2020; Hauschildt et al. 2023). This perspective is also consistent with the understanding that innovation management comprises the systematic planning, steering and control of processes that transform ideas into innovations (Müller-Prothmann and Dörr 2019; Cap 2020).

The importance of this level differs across NIS actors. Companies, universities, public agencies and RTOs use innovation management according to their specific missions, incentive structures and roles within the innovation system. RTOs occupy a particularly important position because they operate at the interface between scientific knowledge generation and industrial application. Their systemic contribution depends on technological capabilities, research infrastructure, qualified personnel, market orientation and cooperation with external partners (European Research Advisory Board 2005; Mazzoleni and Nelson 2007; Arnold et al. 2010; EARTO 2015; Hecklau 2024).

Within the TIMF, organizational innovation management is not an end in itself. It is the basis for enabling individual actors to contribute effectively to interorganizational and systemic innovation processes. This is particularly important because innovation increasingly emerges through collaboration among several actors, especially when knowledge is complex, interdisciplinary and distributed across organizations (Powell et al. 1996; Cap 2020; Cap et al. 2019). Innovation management and network management are therefore closely related, since innovation frequently depends on collaboration among multiple participants (Cap 2020). From the perspective of the TIMF, capable units and organizations are thus the necessary starting point for productive collaboration at the meso level and for system-wide impact at the macro level.

3.2 Meso Level: Networks and Collaborative Structures

At the meso level, innovation management refers to the practices through which multiple NIS actors are connected, coordinated and enabled to create value jointly. While the micro level focuses on individual units and organizations, the meso level addresses collaborative structures such as clusters, science and technology parks, thematic networks, RTO networks, public-private partnerships and other forms of interorganizational collaboration. Innovation management at this level is therefore closely related to network management, open innovation and the governance of interorganizational innovation processes (Chesbrough 2003; Dhanaraj and Parkhe 2006; Provan and Kenis 2008; Cap 2020; Cap et al. 2019).

In the TIMF, meso-level innovation management is understood as the deliberate design, coordination and development of collaborative structures that enable knowledge exchange, joint R&D, technology transfer and diffusion. It includes the selection and integration of relevant actors, shared objectives, governance structures, coordination mechanisms, collaboration management, performance evaluation and improvement measures (Cap 2020; Cap et al. 2019). This reflects the network perspective that innovation is not only managed through internal organizational processes, but also through the design and steering of relationships between actors.

For RTOs, the meso level is particularly relevant because their systemic role is inherently interorganizational. RTOs operate at the interface between science and industry and contribute to the NIS by translating research results into application-oriented solutions, supporting firms in technological development and connecting different parts of the innovation ecosystem. Their innovation performance therefore depends not only on internal technological maturity, but also on the quality and intensity of cooperation with companies, universities, public agencies, start-ups, intermediaries and other research organizations (Hecklau 2024).

Meso-level innovation management requires a different governance logic than micro-level innovation management. Networks are characterized by distributed authority, partial autonomy of actors and the need to balance cooperation and individual interests. Therefore, network governance is not simply an extension of organizational management. It requires coordination mechanisms that support alignment, trust, knowledge mobility and stability without fully replacing actor autonomy (Dhanaraj and Parkhe 2006; Provan and Kenis 2008; Cap 2020). Within the TIMF, networks and collaborative structures form the connective layer between capable individual actors and system-level innovation performance.

3.3 Macro Level: National Innovation Systems

At the macro level, innovation management refers to the practices through which the overall direction, governance and continuous development of a national innovation system are supported. While the micro level focuses on units and organizations and the meso level on networks and collaborative structures, the macro level addresses the innovation system as a whole. National innovation systems consist of interacting institutions and actors from science, industry, government and intermediary organizations whose activities influence the generation, diffusion and application of knowledge (Freeman 1987; Lundvall 2010; Edquist 1997; Patel and Pavitt 1994; Sharif 2006). Innovation management at this level therefore cannot be reduced to the management of individual innovation activities. It concerns the strategic alignment of actors, the design of enabling framework conditions and the creation of mechanisms that allow the system to learn from its performance over time.

From the perspective of the TIMF, macro-level innovation management is required because neither strong organizations nor well-designed networks automatically lead to national innovation performance. Individual capabilities and collaborative structures need to be embedded in a coherent system architecture. This includes clear roles for key actors, appropriate funding mechanisms, strategic priorities, performance indicators and mechanisms for continuous learning. RTOs need to understand and improve their technological maturity in order to fulfil their role as bridges between basic research and industry. (Hecklau 2024) Furthermore, innovation networks need structured management, evaluation and improvement mechanisms in order to make collaboration productive. (Cap 2020) At the macro level, these organizational and network-oriented perspectives are integrated into a broader system view. The central question becomes how national structures can enable, coordinate and scale innovation activities across actors and networks.

Within the TIMF, national innovation systems form the level at which organizational capabilities and interorganizational collaboration are translated into system-wide direction, coherence and impact. Macro-level innovation management provides the strategic frame that enables micro-level actors and meso-level networks to contribute to national innovation performance. At the same time, it depends on feedback from these lower levels, because system-wide strategies can only be effective if they are grounded in the actual capabilities, needs

and development trajectories of the actors involved. The catalyst effect of innovation management is therefore not created by macro-level governance alone. It emerges when national strategies, network structures and organizational capabilities are aligned through continuous learning and evidence-based improvement.

3.4 Interaction Between the Three TIMF Levels

The three levels of the TIMF should not be understood as isolated layers of innovation management. Rather, they describe mutually dependent perspectives on how innovation capabilities, collaborative structures and system-level governance interact within national innovation systems. The micro level provides the organizational capabilities required for innovation. The meso level connects these capabilities through networks and collaborative structures. The macro level provides the strategic and institutional frame in which organizations and networks operate. The contribution of the TIMF therefore lies not only in distinguishing these levels, but also in explaining how they reinforce each other.

The interaction from the micro to the meso level is primarily based on the ability of individual actors to participate effectively in collaborative innovation processes. Organizations with clear innovation strategies, structured R&D processes, qualified personnel, technological capabilities and routines for performance measurement are better able to absorb and use external knowledge. This corresponds to the concept of absorptive capacity, which describes the ability of organizations to recognize the value of external knowledge, assimilate it and apply it commercially (Cohen and Levinthal 1990). From the perspective of the TIMF, organizational innovation management therefore strengthens the quality of the individual actors that participate in networks. Well-managed organizations are more capable of contributing knowledge, engaging in joint projects and benefiting from cooperation with other NIS actors (Goffin and Mitchell 2016; Tidd and Bessant 2020; Hauschildt et al. 2023).

The interaction from the meso to the macro level is created through the aggregation and diffusion of collaborative innovation activities. Networks, clusters, science and technology parks, RTO networks and other collaborative structures can connect complementary actors and reduce barriers to knowledge transfer. Innovation network literature shows that such structures require active management, including the selection of actors, the definition of shared objectives, coordination mechanisms, governance structures and the evaluation of collaboration (Dhanaraj and Parkhe 2006; Provan and Kenis 2008; Cap 2020; Cap et al. 2019). In this sense, meso-level innovation management transforms organizational capabilities into collective innovation capacity. When collaborative structures function effectively, knowledge and technologies can circulate more widely across the innovation system and contribute to broader economic and societal outcomes.

The interaction from the macro level back to the micro and meso levels is based on strategic orientation, institutional learning and feedback. National innovation systems require policies, funding mechanisms, institutional roles and performance indicators that provide direction and create enabling conditions for innovation (Freeman 1987; Lundvall 2010; Edquist 1997; Sharif 2006). However, macro-level governance can only be effective if it is informed by the actual capabilities of organizations and the performance of collaborative structures. Methodologies, like evaluation approaches, benchmarking and impact assessments are therefore central elements of systemic innovation management. They allow decision-makers to identify strengths and weaknesses in the innovation system and to translate these insights into targeted measures for organizational development, network improvement and policy adaptation.

The catalyst effect of innovation management emerges from this interaction between the three levels. Innovation management strengthens national innovation systems when it builds capable organizations, enables productive collaboration and supports evidence-based system governance. The TIMF therefore conceptualizes innovation management as a multi-level capability. It operates within organizations, between organizations and at the level of the innovation system as a whole. Its main function is to align these levels so that organizational capabilities can be connected through collaborative structures and translated into system-wide innovation performance.

4. Illustrative Case: The SENAI Innovation Institutes as Multi-Level Evidence

The SENAI Innovation Institutes provide a suitable case for illustrating the TIMF because their establishment addressed innovation management challenges at all three levels of the framework. The case is particularly relevant because Brazil combines a large industrial base with persistent structural challenges in connecting scientific knowledge to industrial application. Although Brazil has important research universities and a sizeable

economy, its innovation system has historically faced limitations in applied, industry-oriented R&D, technology transfer and the availability of non-university research organizations serving industrial needs (Kohl et al. 2020; Kohl et al. 2025). In the Global Innovation Index 2025, Brazil ranks 52nd among 139 economies, which indicates both progress and remaining potential for strengthening its national innovation system (WIPO 2025).

Against this background, the National Confederation of Industry (CNI, Portuguese: Confederação Nacional da Indústria), as the umbrella organization representing Brazilian industry, initiated the creation of a national network of applied R&D institutes. SENAI, the National Service for Industrial Training (Portuguese: Serviço Nacional de Aprendizagem Industrial), is part of the CNI system and traditionally responsible for industrial education and vocational training. It took over the implementation of this initiative and, from 2012 onward, established the SENAI Innovation Institutes as a new applied R&D network designed to strengthen the connection between scientific knowledge and industrial application. By 2024, 27 institutes were operational across Brazil, employing approximately 1,500 researchers and covering technology fields relevant to industrial development. (Kohl et al. 2020; Kohl et al. 2025)

At the micro level, the case shows how individual RTOs can be developed through systematic planning, implementation and evaluation. The planning and implementation of the institutes included business planning, strategic action planning, management methods, competence development and performance monitoring (Kohl et al. 2020). One example of micro-level evaluation is the technology audit method developed for assessing the technological maturity of RTOs. This method evaluates dimensions such as technology base, products and services and cooperation, thereby linking internal capabilities with the broader systemic role of RTOs (Hecklau 2024). The technology audits conducted in the SENAI network provide one possible measurement approach for observing the development of individual institutes over time. They should not be interpreted as the only evidence of institute development, but as an example of how organizational innovation management can be assessed and improved systematically.

At the meso level, the SENAI case demonstrates the importance of collaborative structures for transforming organizational capabilities into innovation system effects. The institutes were designed to interact with industry, universities, start-ups and other partners in regional, national and technological environments. They also formed part of a national institute network in which collaboration between institutes and technology fields had to be coordinated. This corresponds to the understanding that innovation management and network management overlap when knowledge, resources and capabilities are distributed across organizations (Cap 2020; Cap et al. 2019).

At the macro level, the SENAI case illustrates how innovation management can contribute to the development of a national innovation system. The establishment of the institute network was a strategic intervention aimed at closing a structural gap between research and industrial application. It created a national applied R&D infrastructure and introduced common principles, planning routines and evaluation mechanisms across a distributed network (Kohl et al. 2020). The macro-level relevance of this intervention is also reflected in the economic impact assessment of the SENAI Innovation Institutes. Based on a difference-in-differences approach the causal economic effects of the staggered foundation of the institutes on regional GDP development could be estimated. The network of SENAI innovation institutes contributed 0.66 percent to Brazil's GDP and supported approximately 3,350 R&D and innovation projects with a total value of nearly 2.5 billion BRL between 2012 and 2024. This impact assessment provides evidence that the network did not only create organizational and collaborative capacities, but also contributed to measurable economic effects at the system level. (Schubert et al. 2025, Kohl et al. 2025)

The case also identifies important boundary conditions. Standardized models and indicators supported coordination, but they could not capture all local particularities and had to be complemented by on-site discussion. Moreover, transforming an organization rooted in vocational training into an applied R&D provider required continuing changes in supporting functions such as human resources, finance, legal affairs and procurement (Kohl et al. 2020). The TIMF should therefore not be interpreted as an automatic causal mechanism. Its catalyst effect depends on context-sensitive implementation, sustained organizational adaptation and feedback across the three levels.

5. Conclusion

The central conclusion of this paper is that innovation management should not be treated as a purely organizational discipline when the objective is to strengthen national innovation systems. Organizational

innovation management remains essential, but it is only one part of the broader mechanism through which innovation systems become effective. The TIMF shows that innovation management gains systemic relevance when it connects three functions that are often considered separately: developing capable actors, enabling productive collaboration between them and creating governance mechanisms that provide direction, evaluation and learning at the system level.

This shifts the focus from isolated management practices to the interaction between levels. A strong organization contributes more to a national innovation system when it is embedded in effective networks. A well-designed network creates more value when its actors have sufficient capabilities. A national strategy becomes more effective when it is connected to the actual development needs and performance data of organizations and networks. The decisive factor is therefore not only the quality of innovation management at each individual level, but the alignment between the levels.

The SENAI Innovation Institutes illustrate this logic. Their establishment was not only the creation of individual institutes, but the development of a coordinated applied R&D infrastructure for Brazil. The reported economic impact of the network indicates that systematic capability building, network coordination and system-level governance can lead to measurable effects beyond the organizations themselves.

For policy and management practice, the implication is clear. Strengthening a national innovation system requires more than funding research or establishing new institutions. Countries and regions that aim to improve innovation performance should therefore not only ask which actors are missing, but also how existing and new actors are managed, connected and continuously improved across levels. Future research should apply the TIMF to other national contexts, actor constellations and sectoral innovation systems.

Ethics Declaration

This research did not involve human participants, personal data, medical data or experimental procedures requiring ethical approval. The paper is based on literature analysis, previously published research and publicly available or institutionally approved case evidence. Therefore, no formal ethical clearance was required.

AI Declaration

AI-based tools were used to support proofreading and English language refinement, including spelling, grammar and wording corrections. This was done because the authors are not native English speakers. The authors reviewed the final manuscript and take full responsibility for its accuracy, originality and integrity.

Understanding Sustainable Travel Choices through the Value-Belief-Norm Theory: Implications for Tourism SMEs

Jonna Kielenniva, Sanna Joensuu-Salo and Elina Järvinen
Seinäjoki University of Applied Sciences, Seinäjoki, Finland

sanna.joensuu-salo@seamk.fi
elina.jarvinen@seamk.fi

Abstract: This study examines how travelers' sustainability-related values influence responsible tourism choices. The objective of this study is to investigate how the perceived importance of sustainability predicts tourists' responsible travel choices and to provide insights for tourism entrepreneurs and SMEs on how to respond to travelers' value-driven preferences. The research builds on the Value-Belief-Norm (VBN) theory (Stern et al, 1999). The study explores how sustainability values shape responsible travel behavior in the context of domestic tourism in Finland. The data were collected through the South Ostrobothnia Tourist Survey 2024, conducted by Seinäjoki University of Applied Sciences and the University of Helsinki Ruralia Institute. The final sample includes 526 respondents. Two dimensions of sustainability importance, environmental and socio-cultural, were measured using validated multi-item scales, and logistic regression analyses were used to assess their relationships with responsible travel choices. The results show that environmental sustainability has a stronger positive association with responsible travel choices (Exp(B)=1.70, p<.001) than socio-cultural sustainability (Exp(B)=1.49, p=.003). This indicates that while tourists value both dimensions, environmental aspects are more visible and therefore more influential in their decision-making. However, the significance of the socio-cultural dimension suggests untapped potential: tourists may not yet recognize its importance, but businesses can enhance its impact through clearer communication about local employment, cultural heritage, and community collaboration. The study extends the VBN framework to a broader sustainability context and contributes to the entrepreneurship and tourism literature by offering actionable insights for tourism SMEs. Strengthening the visibility of socio-cultural sustainability can help firms differentiate their services, communicate authentic local value, and align business strategies with travelers' evolving ethical expectations.

Keywords: Sustainable Tourism, Environmental Sustainability, Socio-cultural Sustainability, Value-Belief-Norm Theory, Tourism SMEs

1. Introduction

The objective of this study is to investigate how the perceived importance of sustainability predicts tourists' responsible travel choices and to provide insights for tourism entrepreneurs and SMEs on how to respond to travelers' value-driven preferences. By identifying which sustainability dimensions most strongly influence travel decisions, the research offers guidance on how companies can design and communicate their services more effectively.

The theoretical foundation of this research is based on the Value-Belief-Norm (VBN) theory (Stern et al, 1999), which provides a framework for understanding how personal values and moral norms influence individuals' environmentally responsible behavior. In the context of sustainable tourism, the VBN theory helps to explain why some travelers consider sustainability aspects when making travel-related decisions. It suggests that individuals' fundamental values, such as altruistic or biospheric values, shape their beliefs about environmental and social consequences and their perceived personal responsibility to act. When these beliefs are activated, they foster moral obligations that guide behavior consistent with sustainability principles. Applying this framework enables the present study to investigate how travelers' sustainability-related values affect their choices of responsible tourism services from both environmental and socio-cultural perspectives.

According to UN Tourism (n.d.), sustainable tourism comprises environmental, economic, and socio-cultural dimensions, and its principles are applicable across all forms of tourism and all types of tourist destinations. Achieving sustainability in tourism development requires establishing and a suitable balance among these dimensions to ensure long-term sustainability. The environmental dimension emphasizes the optimal use of environmental resources, with the aim of maintaining essential ecological processes and supporting the conservation of natural heritage and biodiversity. The socio-cultural dimension underscores the importance of respecting the authenticity of host communities, conserve both built and living cultural heritage, and traditional values, and contribute to inter-cultural understanding and tolerance. The economic dimension focuses on securing viable and equitable long-term operating conditions for all stakeholders, ensuring that the benefits of tourism are distributed fairly. Sustainable tourism development also extends to tourists themselves, aiming to

enhance their awareness of sustainability issues and to encourage the adoption of responsible tourism practices. Furthermore, sustainable tourism seeks to maintain high levels of tourist satisfaction and to provide meaningful and enriching experiences.

Data from the South Ostrobothnia Tourist Survey 2024 (n = 526), conducted in Finland, were analyzed using logistic regression analysis to examine how the importance of environmental and socio-cultural sustainability influences responsible travel choices.

This research makes several contributions. First, it extends VBN theory in the tourism context by incorporating a social dimension into the framework. Sustainable tourism research has predominantly focused on environmental aspects while socially sustainable tourism has received considerably less attention (Baena and Cerviño, 2024). This study addresses this gap by responding to the need for concrete actions that enable tourism SMEs to make their socially responsible practices more visible to tourists.

2. Theoretical Framework

2.1 Value-Belief-Norm Theory

The Value-Belief-Norm (VBN) theory, developed by Stern et al (1999), offers a comprehensive framework for understanding how individual values and moral norms shape in particular pro-environmental behavior. The theory posits a causal chain in which values influence beliefs, which in turn activate personal norms that ultimately guide behavior.

When individuals recognize that their personal values are under threat and believe they can take meaningful action to protect those values, a sense of moral obligation to act is activated. This personal norm motivates behaviors aligned with those values. In this way, VBN theory links internal cognitive and moral processes to observable behavioral outcomes. Individuals who share the values of the environmental movement typically experience a moral responsibility to act; however, the specific behaviors adopted, such as environmentally friendly consumption, are also influenced by factors beyond the personal domain (Stern et al, 1999).

In this study, the VBN framework is applied to explore how travelers' sustainability-related values and beliefs translate into responsible tourism behavior. More specifically, it examines whether the perceived importance of environmental and socio-cultural sustainability affects tourists' likelihood of selecting responsible tourism services. Following the logic of the VBN theory, travelers who place greater importance on sustainability-related values are expected to experience stronger moral obligations, which in turn increase the probability of choosing sustainable and responsible travel options. In this study, the VBN framework is used as a theoretical lens to explain sustainability-related travel choices, rather than to test the full value–belief–norm causal chain.

2.2 Sustainable Tourism Research

Research on sustainable tourism has primarily focused on environmental aspects (Li et al, 2024), while also addressing socio-cultural dimensions such as the preservation of cultural heritage (Geçikli et al, 2024). However, the integration of these perspectives has received comparatively little attention. Furthermore, there is a notable lack of studies conducted in Finland, particularly in regions where Finnish travelers are the main visitors. Further research is needed to understand tourists' sustainability behavior, particularly how their sustainability-related values influence their choices of responsible tourism services.

Aziz et al (2025) found that tourists' environmentally responsible behavior is shaped by green destination brand equity, which includes green destination awareness, green destination image, green destination quality, and green destination loyalty. Gomes and Lopez (2023) state that access to information on a destination's sustainability positively influences the adoption of sustainable travel habits and steers traveler behavior toward more sustainable practices.

Su et al (2017) found that customers perceived positive emotions strengthen customer–company identification, which together partially mediate the link between perceived corporate social responsibility and green consumer behavior. Furthermore the results showed that positive emotions and customer–company identification are partly associated with sustainable consumption behavior.

Previous studies examining the VBN theory in the context of tourism sustainability have mainly focused on environmental perspectives (Li et al, 2024; Thuy et al, 2025; Alashiq and Aljuhmani, 2025), such as tourists' intentions to visit green hotels (Waris et al, 2024) and tourists' behavioral intentions (Yan and Chai, 2021). Recent

research has expanded this view by incorporating cultural, informational, and social dimensions. Thuy et al (2025) emphasized the role of Vietnam's collectivist culture, showing that cultural norms amplify the normative consequences of sustainable behavior and highlight rational, normative, and contextual drivers.

Waris et al (2024) demonstrated that egoistic values most strongly influence pro-environmental beliefs which, together with information publicity, shape personal norms and intentions to visit green hotels. Similarly, Alashiq and Aljuhmani (2025) examined social engagement as a norm-driven outcome, showing that tourism sustainability fosters social participation through environmental knowledge and destination image as key mediators. Yan and Chai (2021) reported that environmental concern and perceived influence positively affect behavioral intentions, while price has a negative effect. Fauzi et al (2024) identified subjective norms and perceived behavioral control as the main drivers of intentions to stay at green hotels, whereas green trust and personal norms showed no significant effect. To support industry development, further research is needed to understand tourist consumption behavior and assess the effectiveness of sustainability actions.

2.3 Sustainable Tourism in Finland

The Region of South Ostrobothnia is located in Western Finland with a population of 195 000 residents. Tourism in South Ostrobothnia is predominantly rural tourism. A characteristic feature is that tourism typically functions as a supplementary source of income, and the sector is largely characterized by its seasonal nature. The region's visitor base is composed almost exclusively of domestic tourists. Compared to Finland's most known travel destinations, such as Lapland and Helsinki, the tourism sector in South Ostrobothnia has not developed to the same level of professionalisation, and significantly fewer resources are allocated to tourism. Although tourism in the region relies primarily on domestic visitors, South Ostrobothnia holds considerable growth potential in international markets as well. The region is known for its high-quality family tourism attractions and diverse events. South Ostrobothnia is home to two Geoparks with UNESCO status, and its cultural offering is rich, with Alvar Aalto's architecture standing out as the most internationally recognised element.

In Finland, the promotion of sustainability within the tourism sector is guided by national strategies and policy documents that steer the development of the industry. Finland's Tourism Strategy and measures for 2025–2028 defines a set of measures aimed at establishing Finland as the most sustainably growing tourism destination in the Nordic region by 2028 and the tourism industry should demonstrate strong competence and capability in sustainability management (Kyyrä, 2025). According to the Finland's Food Tourism Strategy for 2024–2028 strategy, a key strategic priority is advancing responsible business practices in the food tourism sector by systematically integrating sustainability across operations, resource use, and communication (Laamanen et al, 2024).

Finland's official tourism promotion organization Visit Finland's task is to promote Finland as an interesting destination for international tourists. Visit Finland enhances the attractiveness of Finnish tourism through several thematic focus areas, including nature, culture, wellness, education, and food tourism, with sustainability systematically integrated across all themes (Visit Finland, n.d.-a). The strategic objective is to position Finland as a leading destination for sustainable tourism and as the first choice for the conscious traveller (Visit Finland, 2025). To support this objective, Visit Finland has developed the Sustainable Travel Finland programme in line with international standards to promote sustainability in tourism and support the sector's long-term viability. Upon meeting the programme criteria, enterprises and destinations are awarded the Sustainable Travel Finland label, which serves as a communication tool to signal comprehensive sustainable practices to tourists (Visit Finland, n.d.-b).

Halminen and García-Rosell (2022) noted that programs such as the Sustainable Travel Finland process, which help firms implement sustainability measures, are essential for supporting tourism companies in adopting sustainability practices, as each firm follows a unique learning path and must continuously develop its sustainability efforts. Sorakunnas et al (2024) examined Visit Finland's Sustainable Travel Finland program and its potential to enhance the Finnish tourism industry's resilience in terms of sustainability. Through the program, the Finnish tourism industry receives support and proactive guidance in responding to the demands of sustainability.

3. Data and Method

3.1 Data Collection

The data for the South Ostrobothnia Tourist Survey 2024 were collected by Seinäjoki University of Applied Sciences in collaboration with the University of Helsinki Ruralia Institute in Finland. Data collection was conducted in two phases using the same structured questionnaire. In the first phase, data were gathered from tourists through face-to-face interviews and self-administered questionnaires distributed by local tourism companies. This phase focused on collecting background information, including demographic variables, travel destination, purpose and duration of the trip, and the respondents' relationship with the destination area. A total of 1,374 responses were obtained in this phase. In the second phase, a follow-up survey was conducted after the trip to capture tourists' experiences, service use, and the perceived importance of sustainability when choosing tourism destinations. A total of 680 respondents participated in the follow-up survey; however, only 526 respondents provided complete answers to the items related to all study variables, and these responses constitute the dataset used in the present analysis.

In this study, we investigate the extent to which the perceived importance of sustainability influences travelers' responsible travel choices. Table 1 summarizes the demographic characteristics of the respondents. A majority were women (75%), while 25% were men. With respect to age distribution, 3% were younger than 25 years, 13% were between 25 and 34 years, 34% were 35–49 years, 29% were 50–64 years, and 22% were 65 years or older.

Table 1: Demographics of the respondents.

Gender	**N (%)**
Woman	395 (75%)
Man	131 (25%)
Age	**N (%)**
Under 25 years	13 (2,5%)
25 – 34 years	66 (12,5%)
35 – 49 years	180 (34,2%)
50 – 64 years	152 (28,9%)
65 years or older	115 (21,9%)

3.2 Variables and Reliability

Variables, items, and factor loadings, along with Average Variance Extracted (AVE) and Composite Reliability (CR) values, are presented in Table 2. Dependent variable was responsible travel choice, and it was measured with the question: *"How much did responsible tourism services influence your decision to take your trip to South Ostrobothnia?".* The dependent variable captures whether responsible tourism services influenced the travel decision and therefore reflects a self-reported responsible travel choice. Responses were given on a five-point scale (1 = did not influence at all, 5 = influenced decisively). For further analysis, the variable was dichotomized: responses 1–2 were coded as 0 (indicating no influence), and responses 3–5 as 1 (indicating influence).

The independent variable, sustainability importance as a value, was measured from two dimensions, environmental and socio-cultural, drawing on the framework developed by Li et al (2022). Respondents were asked to rate the importance of various sustainability aspects when travelling on a five-point Likert scale ranging from 1 (= not important at all) to 5 (= very important).

The four items measuring environmental sustainability importance loaded onto a single factor, with loadings ranging from 0.753 to 0.936. The factor demonstrated good internal consistency (CR = 0.91) and acceptable convergent validity (AVE = 0.72). Socio-cultural sustainability importance was measured with five items, which also formed a single factor. Factor loadings ranged from 0.677 to 0.769, with good internal consistency (CR = 0.81) and acceptable convergent validity (AVE = 0.65).

Table 2: Variables, items, factor loadings, average variance extracted and composite reliability.

Variable and Items	Factor Loadings	AVE	CR
Environmental Sustainability Importance			
The tourism service is environmentally friendly	.821	.72	.91
The tourism company uses renewable energy sources in its operations	.936		
The tourism company has measures in place to reduce water consumption	.875		
The tourism company or area is certified, meaning it has, for example, an eco-label	.753		
Socio-cultural Sustainability Importance			
The tourism company employs local people	.677	.65	.81
The tourism company informs its customers about nature and local culture	.702		
Visitors have the opportunity to eat local food at businesses in the destination	.743		
The tourism company plans its operations together with local residents	.769		
The destination offers opportunities to experience local culture and traditional landscapes	.706		

Control variables included age (continuous) and gender (coded one for male and zero for female).

Binary logistic regression was used to examine whether sustainability-related attitudes predict the likelihood that respondents selected their trip based on responsible tourism services. The dependent variable was dichotomous (0 = no, 1 = yes), and the predictors included gender, age, and perceived importance of socio-cultural and environmental sustainability.

The assumptions for logistic regression were evaluated and found to be generally satisfied. The outcome variable was binary, observations were independent, and predictors were appropriately coded as continuous or dummy variables. Linearity in the logit for continuous predictors was assumed based on theoretical justification and preparatory diagnostics (Hilbe, 2009; Menard, 2010). To assess multicollinearity, variance inflation factors (VIFs) were calculated for each predictor.

The values indicate that multicollinearity is not a concern for the gender variable (VIF=1.41), and only moderately elevated for age (VIF=8.50). However, the two sustainability dimensions show very high VIFs, reflecting a strong intercorrelation ($r \approx .88$). This is expected as these variables reflect different dimensions of sustainability. However, this level of collinearity inflates the standard errors of the regression coefficients and complicates interpretation when both dimensions are included in the same model.

To address this issue, two separate logistic regression models were estimated: one with environmental sustainability as the sole predictor, and another with socio-cultural sustainability alone. This approach allowed clearer assessment of each dimension's individual contribution to responsible tourism choices, while avoiding the interpretive limitations caused by multicollinearity.

4. Results

Two separate binary logistic regression models were estimated to assess the relationship between sustainability attitudes and the likelihood that respondents selected their trip based on responsible tourism services. Each model included age, gender, and one sustainability dimension (either environmental or socio-cultural importance). A total of 526 cases were included in both analyses.

4.1 Responsible Travel Choice and Environmental Sustainability

The first model included age, gender, and the perceived importance of environmental sustainability. The model was statistically significant overall ($\chi^2(3) = 25.551$, $p < .001$), indicating that the predictors collectively improved the fit compared to the intercept-only model. The explanatory power of the model was modest, with Cox & Snell $R^2 = 0.047$ and Nagelkerke $R^2 = 0.071$.

Table 3: Model for responsible travel choice; independent variable the importance of environmental sustainability.

Variables in the Equation						
	B	S.E.	Wald	df	Sig.	Exp(B)
Age	.012	.007	2.843	1	.092	1.012
Gender	.229	.252	.829	1	.363	1.258
Importance of environmental sustainability	.531	.122	19.049	1	<.001	1.700
Constant	-3.586	.558	41.306	1	<.001	.028

Among the predictors, only environmental sustainability reached statistical significance. The coefficient for environmental importance was B = 0.531 (SE = 0.122), with a Wald statistic of 19.049 and $p < .001$. The corresponding odds ratio (Exp(B) = 1.700) indicates that for each one-unit increase in perceived environmental sustainability importance, the odds of selecting a trip based on responsible tourism increased by approximately 70%.

Age exhibited a positive but non-significant association with responsible travel choices (B = 0.012, SE = 0.007, p = .092), suggesting that older respondents tended to be somewhat more likely to make responsible decisions. Gender did not emerge as a significant predictor (B = 0.229, SE = 0.252, p = .363).

4.2 Responsible Travel Choice and Socio-cultural Sustainability

The second model included age, gender, and the perceived importance of socio-cultural sustainability. This model was also statistically significant ($\chi^2(3) = 14.290$, p = .003), though its explanatory power was slightly lower than the first model (Cox & Snell $R^2 = 0.027$; Nagelkerke $R^2 = 0.040$).

Table 4: Model for responsible travel choice; independent variable the importance of socio-cultural sustainability.

Variables in the Equation						
	B	S.E.	Wald	df	Sig.	Exp(B)
Age	.015	.007	4.278	1	.039	1.015
Gender	.071	.245	.084	1	.771	1.074
Importance of socio-cultural sustainability	.401	.136	8.751	1	.003	1.493
Constant	-3.357	.628	28.534	1	<.001	.035

In this model, socio-cultural sustainability was a statistically significant predictor of responsible travel choices. The coefficient for socio-cultural importance was B = 0.401 (SE = 0.136), with a Wald statistic of 8.751 and p = .003. The corresponding odds ratio (Exp(B) = 1.493) indicates that for each one-unit increase in perceived socio-cultural sustainability importance, the odds of selecting a trip based on responsible tourism increased by approximately 49%.

Age was also a significant predictor in this model (B = 0.015, SE = 0.007, p = .039), with an odds ratio of Exp(B) = 1.015, suggesting a small but statistically significant increase in the likelihood of responsible choices with age. Gender remained non-significant (B = 0.071, SE = 0.245, p = .771).

4.3 Classification Accuracy

In both models, the classification tables showed that the fitted equations predicted only the “no” category (i.e., that responsibility was not a selection criterion). As a result, the models correctly classified 100% of the “no” responses and 0% of the “yes” responses, yielding an overall classification accuracy of 75.7%. This outcome reflects the imbalance in the dependent variable, as only about 24% (N = 128) of respondents reported that they had chosen their trip based on responsible tourism services. Such imbalance naturally limits the discriminative power of the predictors in their current form.

Although the logistic regression models were statistically significant, their overall explanatory power was modest, and they failed to correctly classify any respondents who reported choosing their trip based on responsible tourism. This limitation highlights a common challenge in behavioral research; the gap between expressed attitudes and actual behavior.

Despite this, the models still provide meaningful insights. The results suggest that environmental sustainability shows a stronger and more consistent association with responsible travel choices than socio-cultural sustainability. This may reflect the fact that environmental actions and credentials are more visible and easier for travellers to recognize and act upon through eco-labels, green certifications, or marketing messages. In contrast, socio-cultural sustainability may be perceived as more abstract or less directly connected to the consumer experience, making it harder to translate into concrete decisions.

The inability of the models to accurately classify behaviour does not invalidate the findings. Instead, it underscores the complexity of consumer decision-making. Attitudes alone are not sufficient to predict behaviour; other factors such as price, convenience, habits, social norms, and the availability of clear information likely play significant roles. This suggests that sustainability communication must go beyond raising awareness—it must also make responsible choices easy, visible, and actionable.

5. Discussion and Conclusions

This study examined how travelers' sustainability-related values influence responsible tourism choices, drawing on the VBN theory (Stern et al, 1999) as the main theoretical framework. The findings are discussed in relation to the VBN framework and prior research on sustainable tourism behavior.

The results provide partial support for the VBN theory, which suggests that individual values and beliefs shape moral norms that guide pro-environmental behavior. In line with this framework, a higher perceived importance of environmental sustainability increased the likelihood of choosing responsible tourism services. However, the modest explanatory power of the models and the relatively small proportion of respondents (24%) reporting such choices indicate that sustainability-related values do not automatically translate into behavior. This reflects the well-documented attitude–behavior gap (Ajzen and Fishbein, 1977), suggesting that VBN alone does not fully explain responsible tourism choices. Contextual factors such as price sensitivity, availability, and the visibility of sustainability practices also play a significant role. Overall, the findings point to a partial alignment between values and behavior, particularly with regard to environmental sustainability, and highlight the importance of effective sustainability communication by tourism providers. Nevertheless, other factors, most notably price, may outweigh sustainability considerations in travel decision-making, especially when travelers place limited value on environmental or socio-cultural sustainability.

Importantly, the results extend the application of the VBN framework by demonstrating that socio-cultural sustainability also plays a significant, albeit weaker, role in shaping responsible travel choices. This suggests that moral responsibility may be driven not only by biospheric and altruistic values but also by cultural and community-related considerations. Integrating these dimensions into the VBN framework could enrich our understanding of how diverse sustainability values influence consumer behavior in tourism.

The findings of this study are consistent with previous research, confirming that open information about destinations' green actions shapes intentions to visit green hotels (Waris et al, 2024). Accordingly, when destinations actively share information about their green activities, travelers are more likely to choose sustainable destinations. In addition, this study indicates that other factors may have a stronger influence than sustainability values on destination choice, which is consistent with the findings of Yan and Chai (2022).

As a practical implication of this study, it can be noted that environmental sustainability actions may be more easily understood by travelers, whereas socially sustainable actions can be less clear. Sustainability communication often focuses primarily on environmental values, such as recycling and energy consumption. This suggests that tourism SMEs should pay greater attention to the visibility of their socially responsible actions, enabling travelers to make decisions also based on social sustainability considerations. The sustainability-related actions that travelers value are often everyday practices that companies already implement in their operations, but do not communicate openly enough to travelers. Companies should communicate responsibility from different perspectives.

In general, travelers are interested in local culture, people, and ways of life. Responsibility can be communicated more broadly by explaining, for example, what kind of cooperation the company has with local residents and communities. Companies can also highlight whether they employ local people and use local products and service

providers. It is equally important to communicate the region's culture and traditions and to incorporate them into product development and service design. Communication should also explain why certain actions are important and why specific sustainability choices have been made. In sustainability communication, it is essential to consider the entire customer journey, from travel planning to post-trip marketing.

This study has some limitations. The data were collected in a single country and included only Finnish travelers. Therefore, future research should examine whether the results can be replicated in other countries and contexts. Despite these limitations, the study provides insights into sustainable tourism research within the VBN context and contributes to a better understanding of socially responsible tourism research.

Reassessing MSME Classification Thresholds in the Philippines: Evidence of Structural Finance Misalignment from Sectoral Cluster Analysis

rgvaldez@pup.edu.ph

Abstract: Micro, small, and medium enterprises (MSMEs) in the Philippines are classified primarily using static, asset-based thresholds established by law. Despite their policy centrality, these thresholds have remained unchanged whilst the enterprise landscape has undergone substantial growth and structural change. This paper uses the Asian Development Bank's Asia SME Monitor (ASM) 2025 dataset for the Philippines to empirically reassess the adequacy of the current MSME classification framework. Using national data on enterprise counts, employment, and bank lending across seven sectors for 2019–2024, the paper undertakes a multi-dimensional assessment: it constructs sector-level profiles combining MSME population shares, employment shares, and loan shares; applies k-means++ clustering to identify structural finance archetypes; and examines temporal trends in access to finance. Cluster analysis consistently reveals three sector profiles: a mass-market sector (wholesale and retail trade) with broadly proportional enterprise, employment, and loan shares; a labour-intense but chronically underfinanced sector (other services); and a group of sectors with disproportionately high loan shares relative to their MSME population. Critically, MSME loans as a share of total bank lending declined from 6.1% in 2019 to 3.9% in 2024, even as MSME count grew by 24.2%. Geographic concentration is severe: 83.8% of MSME loans were extended in Metro Manila, where only 17.8% of MSMEs are located. These structural misalignments support a reframing of MSME policy beyond uniform size thresholds toward sector-informed, risk-differentiated support frameworks.

Keywords: MSME Classification, Enterprise Size Thresholds, Sectoral Finance Structure, Asia SME Monitor, Cluster Analysis, Philippines

1. Introduction

Micro, small, and medium enterprises (MSMEs) play a central role in economic development, particularly in emerging economies where they account for most firms and a substantial share of employment (Ayyagari et al., 2007; Beck et al., 2005). In the Philippines, MSMEs have consistently represented more than 99% of registered enterprises over the 2019–2024 period and accounted for over two-thirds of total employment by 2024 (Asia Small and Medium-Sized Enterprise Monitor 2025, 2025; Department of Trade and Industry, 2025). Governments design policies, regulatory frameworks, and financial programmes specifically for MSMEs, and the classification of firms into size categories is the foundational mechanism through which these interventions are targeted.

In the Philippines, MSME classification is established by the Magna Carta for MSMEs (Republic Act 9501), which defines categories based on total asset size exclusive of land. These legal thresholds have remained fixed since 2003 (Micro Small and Medium Enterprise Development Council, 2003). Yet the enterprise population has grown substantially, and bank lending patterns have shifted markedly. The MSME loan share of total bank credit fell from 6.1% in 2019 to 3.9% in 2024, whilst MSME count grew by 24.2% over the same period. This divergence raises a fundamental question: do current classification thresholds remain adequate for targeting policy support, or has the structure of the MSME sector outpaced the administrative categories used to define it?

This paper addresses these questions using the ADB's ASM 2025 dataset for the Philippines. The analysis applies k-means++ cluster analysis to sector-level data spanning 2019–2024 and examines whether structural patterns in enterprise distribution, employment, and finance align with the current classification framework. Beyond answering the research questions, this study makes three distinct contributions. First, it provides the first systematic, empirically grounded evaluation of Philippine MSME classification thresholds using six years of nationally representative longitudinal data that spans the COVID-19 disruption and recovery period. Second, it introduces a multi-dimensional sectoral profiling approach that integrates enterprise counts, employment shares, and finance access – dimensions that existing policy instruments treat separately and that no prior study of the Philippine MSME sector has combined into a single analytical framework. Third, the study generates actionable evidence for immediate policy application: the cluster-based archetypes can directly inform the redesign of Bangko Sentral ng Pilipinas (BSP) mandatory lending quotas, DTI enterprise development targeting,

and PHILGUARANTEE portfolio allocation, without requiring legislative amendment of Republic Act 9501. The study addresses the following research questions:

- Do existing thresholds correspond to observable patterns in enterprise distribution and employment?
- Can data-driven clustering identify natural sector archetypes that differ from administrative categories?
- What implications do structural finance misalignments hold for MSME policy design?

2. Review of Literature

2.1 Economic implications of Size Thresholds

Firm size classifications underpin a wide range of economic policies: credit allocation programmes, tax incentives, regulatory exemptions, and business development initiatives. The selection of classification thresholds can therefore significantly affect the distribution of policy benefits (Beck et al., 2005). Research has also documented that size-based thresholds may induce 'bunching' behaviour, where firms strategically constrain growth to remain within advantageous categories (Garicano et al., 2016). More broadly, firm size affects productivity, employment growth, innovation, and access to finance, underscoring the importance of accurate size categorisation in policy design (Haltiwanger et al., 2013).

2.2 Legal Definitions of MSMEs in the Philippines

Philippine MSME classification is governed by Republic Act 9501, which defines enterprises based on total asset size exclusive of land (Republic Act 9501, 2008). Micro enterprises are those with assets not exceeding Philippine peso (PHP) 3 million; small enterprises have assets between PHP 3,000,001 and PHP 15 million; medium enterprises between PHP 15,000,001 and PHP 100 million. Employment counts serve as a supplementary but non-binding indicator: micro enterprises typically employ 1–9 workers, small enterprises 10–99, and medium enterprises 100–199 (Micro Small and Medium Enterprise Development Council, 2003). These thresholds determine eligibility for government support programmes and bank lending mandates under Republic Act 9501.

Critically, no formal review of these thresholds has been undertaken despite substantial changes in the price level, factor costs, and the enterprise landscape since the current limits were set in 2003. Given general price level increases over two decades, a fixed PHP 3 million micro enterprise ceiling represents a substantially lower real asset threshold today than when it was legislated, raising the possibility that many enterprises are miscategorised under current law.

2.3 International Comparison

MSME definitions vary substantially across countries, reflecting differing institutional objectives and economic structures. The European Union employs a multidimensional definition combining employment, annual turnover, and balance-sheet size, setting the SME ceiling at 250 employees and EUR 50 million in turnover or EUR 43 million in balance-sheet total (European Union, 2022). The OECD uses an employment benchmark of 250 employees for cross-country comparability whilst acknowledging that national definitions diverge (OECD SME and Entrepreneurship Outlook 2019, 2019). Within ASEAN, definitional heterogeneity is pronounced: some member states rely on employment, others on assets or turnover, and several apply multiple criteria simultaneously (The ASEAN Secretariat, 2025). This international variation underscores that classification thresholds are not technical constructs but institutional choices, and that the Philippine asset-based, single-dimension approach is an outlier among comparable economies.

2.4 Issues with Static Classification Thresholds

Static thresholds raise several conceptual and practical difficulties. First, even without recalibrating for inflation, the ASM data show that MSME counts grew from 995,745 in 2019 to 1,236,908 in 2024, suggesting that fixed asset ceilings may now be capturing a wider share of the enterprise population than originally intended. Second, different sectors exhibit markedly different capital intensity and risk profiles, making a single threshold ill-suited for cross-sectoral application. Third, and most critically, static thresholds do not account for the uneven access to formal finance that characterises the Philippine MSME sector, where MSME loans to total bank lending declined

from 6.1% in 2019 to 3.9% in 2024 despite MSME growth, and MSME non-performing loan (NPL) ratios consistently exceeded overall bank NPL ratios by more than three-to-one throughout this period. These structural patterns provide the empirical basis for examining whether the current classification framework adequately captures meaningful differences in firm structure and policy need.

2.5 Critical Gaps in the Existing Literature

Despite the breadth of the literature surveyed, three critical gaps remain. First, studies on MSME classification thresholds have predominantly adopted a cross-country comparative lens (Ayyagari et al., 2007; OECD, 2019), rarely examining the empirical adequacy of thresholds within a single developing economy over time. The OECD and EU definitional frameworks, whilst multidimensional, were designed for data-rich institutional environments; their direct applicability to the Philippines – where firm registries are incomplete, asset valuations are often informal, and sectoral coverage of national statistics is uneven – cannot be assumed. Second, the Philippine MSME literature remains largely descriptive, cataloguing enterprise counts and employment shares (Department of Trade and Industry, 2025) without testing whether the boundaries of the classification system correspond to structurally distinct groupings in terms of finance access. Beck et al. (2005) and Haltiwanger et al. (2013) demonstrate that firm-size effects on growth and employment are real, but neither evaluates whether the administrative categories through which policy operates are well-calibrated to the economy they purport to describe. Third, no existing study has systematically combined temporal trend analysis with sectoral clustering to evaluate whether the three-tier Philippine MSME classification reflects durable structural differences – or merely administrative convenience. This paper addresses all three gaps by treating the classification framework itself as the object of empirical scrutiny.

3. Methodology

For each sector s, the paper constructs a three-dimensional structural profile using the ASM 2025 data for 2024 (the most recent year with full sectoral coverage): (1) Ms – MSME share by sector (% of total MSMEs); (2) Es – MSME employment share by sector (% of total MSME employees); and (3) Ls – MSME loan share by sector (% of total MSME loans outstanding). Trend data for 2019–2024 are used to assess structural stability and contextualise the finance gap.

Because the three indicators differ in scale and dispersion, z-score standardisation is applied: $z_{is} = (x_{is} - \mu_i) / \sigma_i$, where $i \in \{M, E, L\}$. Following standardisation, k-means++ initialisation is used with $k = 3$ to identify structurally distinct sector groupings. Assignment is based on minimising squared Euclidean distance: $d^2(x_s, \mu_k) = \Sigma_j(x_{sj} - \mu_{kj})^2$. The choice of $k = 3$ is motivated by the three-category logic of the existing classification framework (micro, small, medium), providing a direct comparator for the sectoral analysis. Given the seven-sector dataset, clustering provides an exploratory structural typology rather than a statistically definitive segmentation.

4. Empirical Results

4.1 MSME Landscape Trends, 2019–2024

Table 1 and Figure 1 present the evolution of the Philippine MSME sector over 2019–2024. MSME count grew from 995,745 to 1,236,908, a 24.2% increase, with the recovery from COVID-19-related contraction in 2020 producing sharp growth in 2021 and especially 2023. Micro enterprises consistently account for 90–91% of MSMEs. MSME employment grew from 5.5 million to 6.3 million and its share of total employment rose from 62.4% to 66.6%, reflecting the sector's expanding role in the labour market.

Table 1: MSME Landscape Trends, Philippines 2019–2024

Indicator	2019	2020	2021	2022	2023	2024
Total MSMEs ('000)	995.7	953.0	1,076.3	1,105.1	1,241.8	1,236.9
MSME share of total (%)	99.5	99.5	99.6	99.6	99.6	99.6
MSME employment ('000)	5,511	5,381	5,462	5,608	6,364	6,252
MSME employment share (%)	62.4	62.7	64.7	65.1	66.8	66.6
MSME loans / total loans (%)	6.06	4.93	4.57	4.29	4.06	3.90

Indicator	2019	2020	2021	2022	2023	2024
MSME NPL ratio (%)	5.49	9.85	11.20	9.32	10.30	9.60
Overall bank NPL ratio (%)	2.04	3.63	3.97	3.16	3.20	3.27

Source: Asia Small and Medium-Sized Enterprise Monitor 2025 (2025); Bangko Sentral ng Pilipinas.

Table 1 confirms two simultaneous and seemingly contradictory trends. On one hand, the number of MSMEs and their share of total employment have both grown consistently since 2021, recovering strongly from the COVID-19 contraction of 2020. On the other hand, MSME loans as a share of total bank credit have fallen in every year of the period, and MSME NPL ratios have remained persistently above the overall bank average. Figure 1 below illustrates these employment and enterprise growth trends, while Figure 2 in the following section documents the corresponding deterioration in finance access.

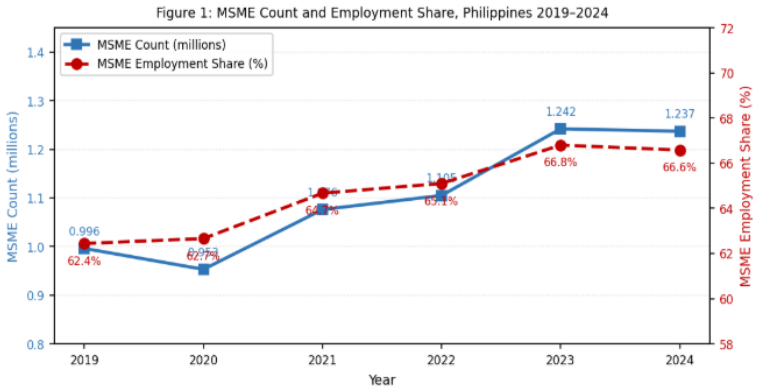

Figure 1: MSME Count and Employment Share, Philippines 2019–2024. Source: ASM 2025.

4.2 The MSME Finance Gap

Figure 2 illustrates a persistent and widening finance gap. Despite MSME count growing by 24.2% between 2019 and 2024, MSME loans as a share of total bank credit fell from 6.1% to 3.9%, well below the nominal 8% mandatory lending ceiling for micro and small enterprises under Republic Act 9501. Bank compliance with this mandatory allocation has declined continuously, from 2.8% in 2019 to 1.9% in 2024 for micro and small enterprises, and from 4.3% to 2.9% for medium enterprises. Simultaneously, MSME NPL ratios remained persistently above the overall bank NPL ratio, exceeding it by more than three times throughout the period. This risk differential partially explains lender reluctance but also signals that current classification-based lending mandates do not sufficiently differentiate risk profiles across sectors.

Geographic concentration compounds these structural pressures. In 2024, 83.8% of MSME loans outstanding were recorded in the National Capital Region (NCR), even though only 17.8% of MSMEs are headquartered there. This mismatch between firm distribution and financial resource allocation suggests that finance-based policy instruments are not reaching the bulk of MSME activity concentrated outside Metro Manila.

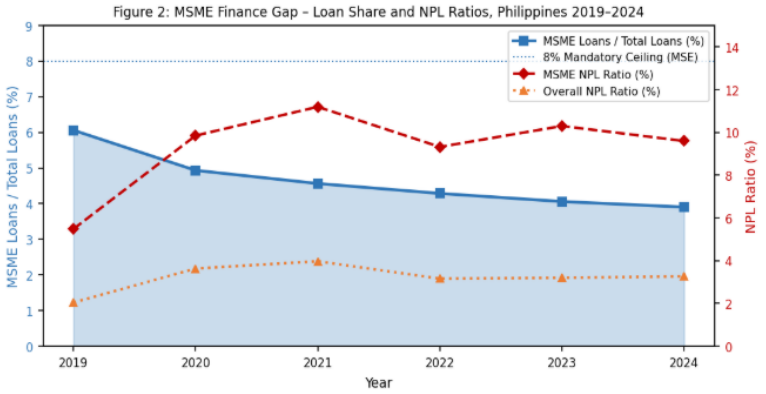

Figure 2: MSME Finance Gap – Loan Share and NPL Ratios, Philippines 2019–2024. Source: ASM 2025; Bangko Sentral ng Pilipinas.

4.3 Sectoral Profile and Cluster Analysis

Table 2 presents the 2024 sectoral data used for clustering. Using 2024 ASM 2025 data, the profile for each sector is the triple (Ms, Es, Ls). Wholesale and retail trade dominates both enterprise population (48.7%) and employment (37.9%) and receives 40.9% of MSME loans – a broadly proportional relationship. By contrast, other services accounts for 36.5% of MSMEs and 39.9% of employment but receives only 6.0% of loans, a severe structural underfinancing. The 'others' category (which includes real estate, financial services, and accommodation) accounts for just 0.3% of MSMEs but attracts 23.0% of MSME loans, indicating a concentration of credit in relatively capital-intensive sub-sectors.

Table 2: Sectoral MSME Profiles, Philippines 2024

Sector	Ms (%)	Es (%)	Ls (%)	Cluster
Agriculture	0.8	1.9	7.3	C1
Manufacturing	11.3	12.9	9.1	C1
Transportation & comm.	2.0	4.5	5.8	C1
Construction	0.5	1.7	7.9	C1
Wholesale & retail trade	48.7	37.9	40.9	C2
Other services	36.5	39.9	6.0	C3
Others	0.3	1.3	23.0	C1
Total	**100**	**100**	**100**	—

Source: Asia Small and Medium-Sized Enterprise Monitor 2025 (2025).

Following z-score standardisation, k-means++ with k = 3 is applied to the standardised triple (Mz, Ez, Lz). The algorithm assigns sectors to three clusters: Cluster 1 (C1): agriculture, manufacturing, transportation and communication, construction, others; Cluster 2 (C2): wholesale and retail trade; Cluster 3 (C3): other services.

The cluster assignments are identical to those obtained from the 2023 data in the prior version of this analysis, confirming that the structural finance archetypes are stable across time and not artefacts of a single year. This temporal stability strengthens the substantive finding: the three structural profiles represent persistent features of the Philippine MSME economy, not transient fluctuations.

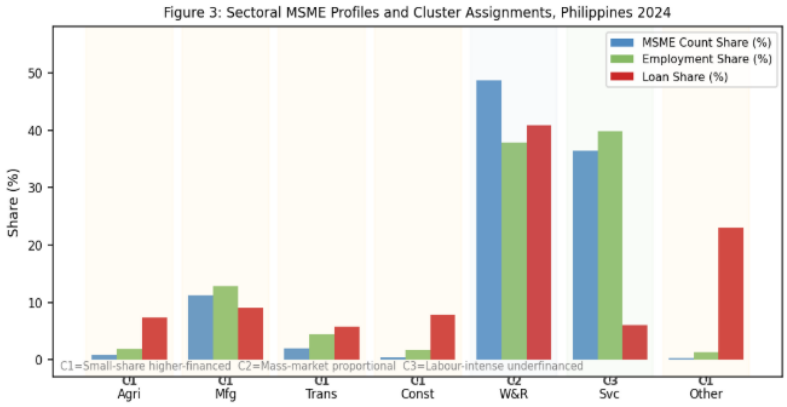

Figure 3: Sectoral MSME Profiles and Cluster Assignments, Philippines 2024. Source: ASM 2025.

Cluster 1 sectors host a small share of MSMEs and employment but attract disproportionately high loan shares per enterprise, suggesting either higher capital intensity or the concentration of borrowing in fewer but larger MSMEs within these sectors. Cluster 2 (wholesale and retail trade) exhibits a broadly proportional relationship between enterprise population, employment, and finance access. Cluster 3 (other services) is the most economically important sector by employment but receives a loan share far below its enterprise and employment weights, indicating a structural underfinancing that persists regardless of overall credit conditions.

5. Discussion and Limitations

This study evaluates whether existing MSME classification thresholds in the Philippines correspond to observable patterns in enterprise distribution, employment, and financial participation. The findings point to three interlocking structural misalignments that the current framework fails to address.

First, the current one-dimensional, asset-based classification does not distinguish between sectors with fundamentally different relationships to formal finance. Cluster 3 sectors (primarily other services, which accounts for 36.5% of MSMEs and 39.9% of employment) are chronically underfinanced, with an MSME loan share of only 6.0%. Treating these enterprises in the same policy category as Cluster 1 sectors, which receive loans far exceeding their population shares, may result in poorly designed lending mandates and support programmes that fail to reach the firms with the greatest need.

Second, the declining MSME loan share (6.1% in 2019 to 3.9% in 2024) signals a structural deterioration in MSME finance access during a period of MSME growth. If the classification system cannot signal which sectors and enterprise types face the most acute credit constraints, policy instruments such as mandatory MSME lending quotas cannot be designed effectively. The declining compliance ratios across all bank types confirm that existing mandates are insufficiently differentiated to drive meaningful resource allocation to underserved segments.

Third, the geographic concentration of MSME lending in the NCR (83.8% in 2024 versus 17.8% of MSME count) suggests that finance-access patterns are driven partly by the location and risk-pricing practices of lenders rather than by the size or sector of enterprises as defined under RA 9501. A more nuanced classification system incorporating sector and geographic dimensions could provide a stronger basis for targeted interventions.

These findings collectively support a move toward sector-informed, multidimensional classification that considers the structural finance characteristics of enterprise clusters. This does not necessarily require legislative reform of RA 9501 in the immediate term, but it does suggest that ancillary policy instruments – such as risk-differentiated guarantee programmes, sector-specific lending windows, and regional financial inclusion targets – should be calibrated against empirically identified structural profiles rather than uniform size thresholds.

Several limitations must be acknowledged. The analysis relies on aggregate, sector-level data rather than firm-level microdata. Future research using establishment-level datasets could test whether the identified archetypes hold at the level of individual enterprises. The cluster count ($k = 3$) is chosen for conceptual alignment with the existing classification, but alternative specifications may yield different groupings. Finally, the analysis is descriptive and does not establish causal mechanisms linking classification design to finance outcomes.

6. Conclusion and Directions for Future Research

This paper provides an empirically grounded assessment of MSME classification thresholds in the Philippines using ADB ASM 2025 data for 2019–2024. The key findings are: MSME count grew by 24.2% whilst MSME loans as a share of total bank credit fell from 6.1% to 3.9%; MSME NPL ratios persistently exceeded overall bank NPL ratios by more than three times; 83.8% of MSME loans are concentrated in the NCR despite only 17.8% of MSMEs being located there; and cluster analysis identifies three stable structural finance archetypes that cut across the current administrative size categories.

Taken together, these findings indicate that the current one-dimensional, asset-based classification framework is insufficient for targeting MSME policy support effectively. The paper advocates for a sector-informed, multi-dimensional approach to MSME classification and proposes that mandatory lending quotas and credit guarantee programmes be redesigned to reflect empirically observed structural finance profiles rather than administratively fixed thresholds.

Confronted with the prior literature, the findings of this study both confirm and diverge from established positions. The results align with Beck et al. (2005), who argued that access to formal finance is the primary binding constraint on MSME growth in developing economies; the Philippine data demonstrate precisely that constraint, with the MSME loan share of total bank credit declining persistently despite enterprise growth. The findings also extend the theoretical argument of Garicano et al. (2016) on size-threshold distortions: whilst they showed that static thresholds in France distort firm-level incentives to grow, the present study shows that in the Philippine context the thresholds also fail to reflect the structural heterogeneity of finance access across sectors – a dimension not captured in the European literature. At the same time, the present results diverge from more optimistic regional assessments of MSME financial inclusion in Southeast Asia (Financing SMEs and Entrepreneurs 2020, 2020). Headline MSME growth in the Philippines masks a structural deterioration in credit

access, particularly for the other services sector, which accounts for nearly 40% of MSME employment yet receives only 6% of MSME loans outstanding. This divergence is not contradictory but contextual: aggregate regional trends do not capture within-country sectoral asymmetries of the kind that this study documents.

The authors interpret the persistence of three distinct structural finance archetypes across the full 2019–2024 period – spanning a global pandemic, a sharp contraction, and a recovery – as evidence that the misalignment between the existing classification framework and the economic reality of Philippine MSMEs is not a transient or data-specific artefact but a durable structural condition. This distinction matters critically for policy design: if the misalignment were cyclical, incremental adjustments to lending quotas might suffice. The evidence strongly supports the alternative interpretation, however: that the misalignment is structural and that it requires a more fundamental redesign of classification-linked policy instruments. The authors further note that the stability of the cluster assignments across time strengthens confidence in the methodology; the three archetypes are not artefacts of a single cross-section but reflect persistent sectoral characteristics that any reform effort must directly address.

The practical advantages of adopting a cluster-informed policy framework are both concrete and immediately actionable. At the regulatory level, the BSP could redesign mandatory MSME lending quotas by sector rather than by asset-based firm size tier, redirecting credit incentives toward the chronically underfinanced other services cluster without requiring legislative amendment of Republic Act 9501 – a reform achievable through administrative circular. Development finance institutions such as PHILGUARANTEE could calibrate guarantee fees and portfolio coverage limits to sector-specific NPL risk profiles rather than applying uniform rates across all MSME categories. The DTI could use the sector archetypes to prioritise business development services, matching grants, and capacity-building programmes for the most underfinanced enterprise groups, improving resource efficiency in the implementation of the Philippine MSME Development Plan. More broadly, the analytical framework developed in this study – combining longitudinal trend analysis, sectoral profiling, and k-means++ clustering – is replicable across other ADB member economies using ASM data, offering a methodological template for comparative MSME policy evaluation across the Asia-Pacific region.

Future research should: extend the analysis to firm-level microdata to examine within-cluster heterogeneity; explore alternative clustering methods (e.g., Gaussian mixture models, hierarchical clustering) to assess robustness; incorporate additional dimensions such as productivity, digital adoption, and export orientation; and conduct comparative analyses across ASEAN economies using harmonised ASM datasets to assess whether the identified archetypes are Philippines-specific or regionally generalisable.

Ethics Declaration

This study uses publicly available, aggregated secondary data from the Asian Development Bank's Asia SME Monitor 2025 and official government and international agency sources. The data do not contain personal identifiable information and do not involve human participants, confidential records, or sensitive individual-level data. The research was conducted in accordance with applicable ethical standards for research integrity, including accurate reporting of data, transparency in methodological procedures, and proper citation of all data sources.

AI Declaration

The authors acknowledge the use of artificial intelligence tools, including large language models, to assist in the drafting, editing, and formatting of this manuscript. All substantive intellectual contributions, including research design, data analysis, interpretation of results, and final content decisions, were performed and verified by the authors. The authors assume full responsibility for the accuracy, originality, and integrity of the work. No AI tools were used to generate or manipulate empirical data, statistical results, or research findings.

Abstract: Entrepreneurial intentions are critical precursors to entrepreneurial action, yet the psychological and social mechanisms that underpin intention formation remain underexplored, particularly in integrated empirical models. Drawing on a nationally representative sample from the Global Entrepreneurship Monitor (GEM) Adult Population Survey from Finland, this study examines how entrepreneurial self-efficacy mediates the effects of gender and exposure to entrepreneurial role models on entrepreneurial intentions. Entrepreneurial self-efficacy refers to individuals' beliefs in their ability to successfully perform the tasks required to start and run a business. The analysis focuses on individuals aged 18–64 who were not currently engaged in entrepreneurial activity (n = 1,264). We apply structural equation modeling as a path-analytic framework to estimate direct and indirect relationships among gender, role model exposure, self-efficacy, and entrepreneurial intentions. Given the dichotomous nature of the variables, the results are interpreted as associations rather than causal effects. Indirect effects are assessed using bootstrapped confidence intervals. The results indicate a very good model fit (CFI > .98, RMSEA < .04), suggesting that the hypothesised relationships are well supported by the data. Entrepreneurial self-efficacy emerges as the strongest predictor of entrepreneurial intentions among the variables included in the model and mediates part of the effects of both gender and role model exposure. Individuals with higher self-efficacy report stronger entrepreneurial intentions, and this confidence partly explains why men and those with entrepreneurial contacts exhibit higher intentions. At the same time, both gender and role model exposure retain significant direct effects, indicating that social context influences entrepreneurial intentions beyond individual beliefs alone. These findings highlight the importance of integrating psychological and social determinants in models of entrepreneurial intention formation. By examining mediation mechanisms within a single empirical framework, the study provides a more nuanced understanding of how gender and social exposure shape entrepreneurial intentions and offers implications for entrepreneurship education and policy.

Keywords: Entrepreneurial Intentions, Self-Efficacy, Gender, Role Models, Entrepreneurship, Mediation

1. Introduction

Entrepreneurial intentions are widely regarded as key antecedents of entrepreneurial behaviour and new venture creation. Intention-based approaches have therefore become central in entrepreneurship research. A major theoretical foundation for this work is Ajzen's (1991) Theory of Planned Behavior, which conceptualises intentions as the most immediate predictors of planned behaviour. In the entrepreneurship domain, this perspective has been further developed by Krueger, Reilly and Carsrud (2000), who demonstrate that intention-based models provide a robust framework for understanding entrepreneurial action.

A substantial body of research has identified both individual and contextual antecedents of entrepreneurial intentions. Among individual-level factors, entrepreneurial self-efficacy has received sustained attention. Rooted in Bandura's (1997) theory of self-efficacy, the construct refers to individuals' beliefs in their capability to perform entrepreneurial tasks (Chen, Greene and Crick, 1998). Empirical research has consistently shown that self-efficacy is strongly associated with entrepreneurial intentions (Zhao, Seibert and Hills, 2005; Newman et al, 2019). At the same time, entrepreneurial intentions are shaped by social context. Exposure to entrepreneurial role models has been found to influence both the perceived desirability and feasibility of entrepreneurship (Nowiński and Haddoud, 2019), while gender differences in entrepreneurial intentions and self-efficacy have been widely documented (Wilson, Kickul and Marlino, 2007; Haus et al, 2013).

In addition to these cross-sectional findings, longitudinal research suggests that entrepreneurial intentions are relatively stable over time and are meaningfully linked to subsequent entrepreneurial behaviour. For example, Joensuu-Salo, Viljamaa and Varamäki (2020) show that entrepreneurial intentions measured during higher

education predict entrepreneurial behaviour several years later. Their findings also highlight the importance of psychological and contextual factors, including perceived behavioural control and gender, in shaping the development of entrepreneurial intentions over time.

Despite these advances, prior research has often examined psychological and social determinants separately. While self-efficacy, role models, and gender have each been linked to entrepreneurial intentions, less attention has been paid to how these factors operate together. In particular, there is a need for research that examines the mechanisms through which social and demographic factors influence entrepreneurial intentions. Existing evidence suggests that self-efficacy may play a central role in this process, but its mediating function has not been sufficiently examined in integrated empirical models (Newman et al, 2019). This highlights the need and relevance of the present study, as prior research has largely examined psychological and social determinants of entrepreneurial intentions in isolation, leaving their combined and mediating mechanisms insufficiently understood.

The present study addresses this gap by examining how entrepreneurial self-efficacy mediates the relationships between gender, exposure to entrepreneurial role models, and entrepreneurial intentions. The objective is to analyse both direct and indirect relationships among these variables within a single empirical framework using data from the Global Entrepreneurship Monitor Adult Population Survey from Finland and structural equation modelling. In doing so, the study contributes to the literature by integrating psychological and social perspectives and by providing new evidence on the mechanisms linking gender and social exposure to entrepreneurial intentions.

2. Theoretical Framework and Literature Review

2.1 Entrepreneurial Intentions and Self-Efficacy

Entrepreneurial self-efficacy refers to an individual's belief in their capability to successfully perform the tasks required in a specific domain (Bandura, 1997). In the context of entrepreneurship, it reflects individuals' confidence in their ability to identify opportunities, mobilise resources, and manage a business (Chen, Greene and Crick, 1998). As such, entrepreneurial self-efficacy is closely aligned with the concept of perceived behavioural control in intention-based models, which has been identified as a key determinant of entrepreneurial intentions (Ajzen, 1991).

A growing body of research provides consistent evidence that entrepreneurial self-efficacy is positively associated with entrepreneurial intentions. Earlier empirical work has shown that self-efficacy directly predicts entrepreneurial intentions and mediates the effects of other antecedents (Zhao, Seibert and Hills, 2005). More recent research has reinforced this relationship. In a comprehensive review, Newman et al (2019) conclude that entrepreneurial self-efficacy is among the most robust predictors of entrepreneurial intentions across different contexts. Similarly, Schmutzler, Andonova and Diaz-Serrano (2019) find that self-efficacy plays a central role in shaping entrepreneurial intentions, particularly in environments characterised by uncertainty. More recent empirical studies continue to report a significant positive relationship between self-efficacy and entrepreneurial intentions, even when controlling for other psychological and contextual variables (Nowiński and Haddoud, 2019).

These findings are also consistent with research emphasising the importance of perceived capability in entrepreneurial intention formation. For example, Joensuu et al (2013) show that perceived behavioural control is positively associated with entrepreneurial intentions, supporting the broader view that individuals are more likely to form entrepreneurial intentions when they believe they possess the necessary skills and capabilities.

Overall, the literature suggests that individuals who perceive themselves as capable of performing entrepreneurial tasks are more likely to develop intentions to engage in entrepreneurship. Entrepreneurial self-efficacy thus represents a central mechanism linking individual perceptions of capability to entrepreneurial intentions, and we propose the following hypothesis:

H1: Entrepreneurial self-efficacy is positively associated with entrepreneurial intentions.

2.2 Entrepreneurial Role Models

Entrepreneurial role models are individuals whose example makes entrepreneurship more visible, understandable, and accessible. In entrepreneurship research, role models typically include family members,

friends, or other close contacts engaged in entrepreneurship (Abbasianchavari and Moritz, 2021). Role models can strengthen intentions by reducing uncertainty and by increasing the perceived attractiveness and attainability of entrepreneurship. Studies have shown that entrepreneurial role models in one's close social environment, particularly within the family, are associated with stronger entrepreneurial intentions (Chlosta et al, 2012; Laspita et al, 2012; Nowiński and Haddoud, 2019). Thus, we hypothesize:

H2: Exposure to entrepreneurial role models is positively associated with entrepreneurial intentions.

Role models may also influence entrepreneurial intentions indirectly through entrepreneurial self-efficacy. Prior work shows that exposure to entrepreneurial role models can support the development of self-efficacy (Laviolette, Radu Lefebvre and Brunel, 2012), but also that for individuals with higher self-efficacy, the influence of knowing entrepreneurs is lower (Schmutzler, Andonova and Diaz-Serrano, 2019). Nowiński and Haddoud (2019) show that the effect of role models on entrepreneurial intentions operates partly through entrepreneurial self-efficacy. Indeed, it seems reasonable that the opportunity to observe entrepreneurial activity in one's immediate environment can strengthen the belief that entrepreneurial tasks are manageable and that success in entrepreneurship is achievable. Thus, role models may contribute to individuals' confidence in their own entrepreneurial capability, i.e., entrepreneurial self-efficacy. Based on this reasoning, we hypothesize:

H3: Exposure to entrepreneurial role models is positively associated with entrepreneurial self-efficacy.

2.3 Gender Gap in Entrepreneurship

Intentions are the best predictor of any planned behaviour, such as entrepreneurship (Krueger, Reilly and Carsrud, 2000). An individual's intention to start a business is influenced by perceptions of the advantages and disadvantages regarding it (Douglas and Shepherd, 2000). Gender gap has been widely studied in entrepreneurship research, which repeatedly finds that women are less likely than men to have entrepreneurial intentions or to start businesses (Caliendo et al, 2015; Björk et al, 2022; Saarela et al, 2024; Shinnar, Giacomin and Janssen, 2012). Recently, this phenomenon has reduced only slowly, if at all (Henry et al, 2022; Saarela et al, 2024). Thus, we hypothesize:

H4: Gender is associated with entrepreneurial intentions, such that men are more likely than women to report entrepreneurial intentions.

The more a person believes that she/he is capable of successfully running a business, the more likely she/he is to consider entrepreneurship (Brush et al, 2017; Chen, Greene and Crick, 1998). Entrepreneurial self-efficacy, an individual's confidence in possessing the necessary skills to successfully create and run a business, has been shown to play a key role in shaping interest in pursuing an entrepreneurial career (Wilson, Kickul and Marlino, 2007; Wilson et al, 2009). However, preliminary evidence indicates that women tend to exhibit lower levels of entrepreneurial self-efficacy than men (Björk et al, 2022; Wilson, Kickul and Marlino, 2007). The research focusing on gender differences in self-efficacy led to our fifth set of hypotheses:

H5: Gender is associated with entrepreneurial self-efficacy, such that men report higher self-efficacy than women.

In addition to the direct relationships, entrepreneurial self-efficacy is expected to function as a key mediating mechanism linking social and demographic factors to entrepreneurial intentions. Prior research suggests that exposure to entrepreneurial role models can enhance individuals' confidence in their own entrepreneurial capabilities by providing information, inspiration, and learning opportunities (Nowiński and Haddoud, 2019). At the same time, entrepreneurial self-efficacy has been shown to be a strong predictor of entrepreneurial intentions (Zhao, Seibert and Hills, 2005; Newman et al, 2019). Taken together, these findings indicate that role models may influence entrepreneurial intentions not only directly but also indirectly through increased self-efficacy.

Similarly, gender differences in entrepreneurial intentions have been partly attributed to differences in perceived capabilities. Earlier studies show that women tend to report lower entrepreneurial self-efficacy than men, which in turn is associated with lower entrepreneurial intentions (Wilson, Kickul and Marlino, 2007; Haus et al, 2013). This suggests that self-efficacy may act as an explanatory mechanism through which gender influences entrepreneurial intentions.

Based on this reasoning, we propose the following mediation hypotheses:

H6: Entrepreneurial self-efficacy mediates the relationship between exposure to entrepreneurial role models and entrepreneurial intentions.

H7: Entrepreneurial self-efficacy mediates the relationship between gender and entrepreneurial intentions.

Figure 1 presents the hypothesized relationships of the study.

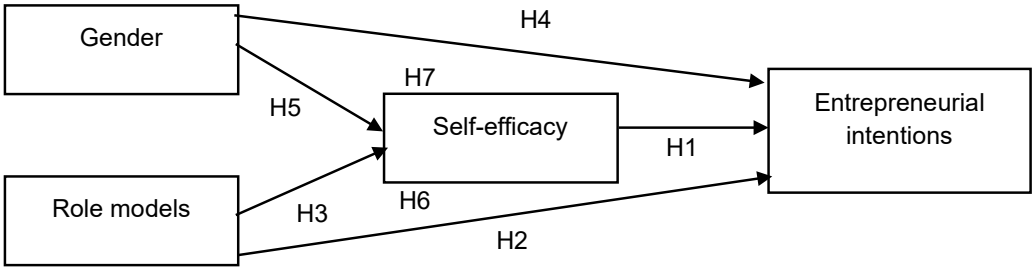

Figure 1: Conceptual model of the study.

3. Data and Method

3.1 Data Collection

This study uses individual-level data from the Global Entrepreneurship Monitor (GEM) Adult Population Survey (APS) for Finland. GEM is an internationally harmonised survey that provides comprehensive data on entrepreneurial attitudes, perceptions, and intentions among the adult population. The analysis focuses on respondents aged 18–64 who were not currently engaged in entrepreneurial activity, ensuring that entrepreneurial intentions reflect prospective rather than ongoing entrepreneurial behaviour.

After excluding cases with missing values on the variables of interest, the final analytical sample consisted of 1,264 respondents. This sample size is well-suited for structural equation modeling and allows for reliable estimation of both direct and indirect effects. The sample consisted of 54% women and 46% men. Respondents ranged in age from 18 to 64 years, with a mean age of 43. In terms of social exposure to entrepreneurship, 47% of the respondents reported personally knowing at least one entrepreneur. In addition, 7% of the respondents indicated an intention to start a business within the next three years.

3.2 Measures and Analytical Strategy

This study employs a cross-sectional research design using individual-level survey data and structural equation modelling (SEM) as the analytical approach. The chosen design is appropriate for the objectives of this study, as it enables the simultaneous examination of direct and indirect relationships between psychological and social variables and allows for testing mediation effects within a single analytical framework.

The variable was treated as an observed endogenous outcome. Entrepreneurial self-efficacy was measured using a dichotomous indicator capturing respondents perceived knowledge, skills, and experience required to start a business (yes or no). This measure reflects perceived entrepreneurial capability and has been widely used in GEM-based entrepreneurship research as a proxy for entrepreneurial self-efficacy. Role model exposure was operationalised as whether respondents personally know at least one entrepreneur (yes or no), capturing social exposure to entrepreneurship in respondents' immediate environment. Gender was included as a binary exogenous variable distinguishing men and women.

Although the variables used in the analysis are dichotomous, structural equation modeling (SEM) was employed as a path-analytic framework to estimate the system of relationships simultaneously, including both direct and indirect effects. Given the categorical nature of the indicators, the estimated relationships should be interpreted as associations rather than causal effects. To mitigate potential violations of normality assumptions associated with binary variables, indirect effects were assessed using bias-corrected bootstrap confidence intervals based on 5,000 resamples. In addition, the use of SEM in this context allows for a coherent estimation of mediation effects and provides a parsimonious representation of the hypothesised relationships.

Gender and role model exposure were allowed to covary, reflecting their potential association in the population. Model fit was evaluated using multiple indices, including the chi-square statistics, the Comparative Fit Index

(CFI), and the Root Mean Square Error of Approximation (RMSEA), following conventional guidelines. Although the model does not include latent constructs, these indices provide a useful assessment of how well the specified path model reproduces the observed relationships in the data.

4. Results

4.1 Model Fit

The structural equation model demonstrated excellent fit to the data. The chi-square statistic was non-significant ($\chi^2(1) = 2.53$, $p = .112$), indicating no meaningful discrepancy between the observed and model-implied covariance matrices. Additional fit indices further supported the adequacy of the model (CFI = .986; RMSEA = .035). These results suggest that the hypothesised mediation structure provides a satisfactory representation of the underlying relationships.

4.2 Structural Relationships

As hypothesised, entrepreneurial self-efficacy emerged as a strong and statistically significant predictor of entrepreneurial intentions ($\beta = .199$, $p < .001$). Both social and demographic factors were significantly associated with self-efficacy. Respondents who personally knew an entrepreneur reported higher levels of entrepreneurial self-efficacy ($\beta = .146$, $p < .001$). Gender was also significantly related to self-efficacy, with men reporting slightly higher perceived entrepreneurial capability than women ($\beta = .062$, $p = .025$).

In addition to their indirect effects, both gender and role model exposure exhibited direct effects on entrepreneurial intentions. Knowing an entrepreneur increased entrepreneurial intentions directly ($\beta = .105$, $p < .001$), while gender also remained a significant predictor ($\beta = .068$, $p = .012$). These findings indicate that social context and gender influence entrepreneurial intentions both through psychological confidence and through additional mechanisms beyond self-efficacy. Table 1 presents the results of the direct effects.

Table 1: Results of direct effects

Path	β	p
Role model → Self-efficacy	.146	<.001
Gender → Self-efficacy	.062	.025
Self-efficacy → Entrepreneurial intentions	.199	<.001
Role model → Entrepreneurial intentions	.105	<.001
Gender → Entrepreneurial intentions	.068	.012
Note: *Model fit:* $\chi^2(1) = 2.53$, $p = .112$; RMSEA = .035; CFI = .986.		

Bootstrap analyses confirmed the presence of statistically significant indirect effects. Role model exposure influenced entrepreneurial intentions indirectly via self-efficacy (standardized indirect effect = .014, 95% CI [.008, .025], $p < .001$). A smaller but significant indirect effect was also observed for gender (standardized indirect effect = .006, 95% CI [.001, .013], $p = .020$). Because the direct effects of gender and role model exposure remained significant, the results indicate partial mediation rather than full mediation. Table 2 presents the indirect effects.

Table 2: Indirect effects (bootstrap, bias-corrected 95% CI)

Indirect Path	Estimate	Lower CI	Upper CI	p
Role model → Self-efficacy → Intentions	.014	.008	.025	<.001
Gender → Self-efficacy → Intentions	.006	.001	.013	.020

4.3 Summary of the Findings

Overall, the findings provide consistent support for the hypothesised mediation model and offer empirical evidence for the proposed relationships (see Figure 1). First, entrepreneurial self-efficacy was positively associated with entrepreneurial intentions, lending support to H1 and confirming its central role as a key proximal predictor of intention formation.

Second, the results highlight the importance of entrepreneurial role models. Exposure to entrepreneurial role models was positively associated with entrepreneurial intentions, supporting H2, and was also positively related to entrepreneurial self-efficacy, providing support for H3. These findings suggest that role models contribute both directly to entrepreneurial motivation and indirectly by strengthening individuals' confidence in their entrepreneurial capabilities.

Third, gender effects were observed in line with theoretical expectations. Gender was significantly associated with entrepreneurial intentions, with men reporting higher intentions than women, supporting H4. In addition, men reported slightly higher levels of entrepreneurial self-efficacy than women, providing support for H5.

Importantly, the mediation analyses confirmed that entrepreneurial self-efficacy functions as a partial mediator in the proposed relationships. The indirect effect of role model exposure on entrepreneurial intentions through self-efficacy was statistically significant, supporting H6. Likewise, a smaller but significant indirect effect of gender on entrepreneurial intentions via self-efficacy was observed, providing support for H7. Because the direct effects of both gender and role model exposure remained significant, the mediation was partial rather than full.

Taken together, all proposed hypotheses (H1–H7) received empirical support. The results reveal a layered process in which social exposure and gender shape entrepreneurial intentions partly through entrepreneurial self-efficacy, while also exerting independent influences beyond psychological confidence alone. These findings highlight the value of integrating social and psychological perspectives in models of entrepreneurial intention formation.

5. Discussion and Conclusions

This study examined how entrepreneurial self-efficacy mediates the relationships between gender, exposure to entrepreneurial role models, and entrepreneurial intentions. The findings provide consistent support for the proposed hypotheses and offer a more detailed understanding of the relationships illustrated in Figure 1. By integrating psychological and social determinants within a single empirical model, the study provides a more detailed understanding of entrepreneurial intention formation. The findings reinforce the central role of entrepreneurial self-efficacy as a key proximal determinant of entrepreneurial intentions, in line with earlier research (Zhao, Seibert and Hills, 2005; Newman et al, 2019). Individuals who perceive themselves as capable of performing entrepreneurial tasks are more likely to report entrepreneurial intentions, supporting the view that perceived capability is a core mechanism in intention-based models (Ajzen, 1991). At the same time, the results show that this confidence is shaped by social context.

The findings concerning role models suggest that knowing an entrepreneur in one's close social environment is associated with both stronger entrepreneurial intentions and higher perceived entrepreneurial capability. These results are consistent with the conceptual model presented in Figure 1, where both direct and indirect paths through self-efficacy are supported. This is consistent with Bandura's (1997) view that efficacy beliefs are shaped not only by direct experience but also by vicarious experience, and with earlier research linking role models to entrepreneurial intentions and self-efficacy (Nowiński and Haddoud, 2019; Abbasianchavari and Moritz, 2021). The positive association between role model exposure and self-efficacy, together with the significant indirect effect on intentions, indicates that knowing entrepreneurs can make entrepreneurship appear more feasible and accessible. At the same time, the mediation is only partial, suggesting that the association is not explained by self-efficacy alone. Role models may also influence how desirable, legitimate, or socially proximate entrepreneurship appears as a career option.

Gender differences were observed in line with prior literature. Men reported higher entrepreneurial intentions and slightly higher self-efficacy than women, supporting earlier findings on the gender gap in entrepreneurship (Wilson, Kickul and Marlino, 2007; Haus et al, 2013). The results further show that self-efficacy partly mediates the relationship between gender and entrepreneurial intentions, indicating that differences in perceived capability contribute to this gap. However, the remaining direct effect suggests that additional structural or contextual factors also play a role.

By examining these relationships simultaneously, the study contributes to entrepreneurship research by showing how psychological and social factors operate together rather than in isolation. Entrepreneurial self-efficacy emerges as an important mechanism linking both role model exposure and gender to entrepreneurial intentions, while the partial mediation highlights the presence of additional pathways influencing intention formation.

The findings also offer several practical suggestions. From a practical perspective, they underline the importance of strengthening entrepreneurial self-efficacy and increasing exposure to entrepreneurial role models. Educational and policy interventions should therefore focus on enhancing individuals' confidence in their entrepreneurial capabilities through experiential learning, mentoring, and opportunities to engage with entrepreneurial tasks. In addition, increasing opportunities to interact with entrepreneurs may help make entrepreneurship more visible and attainable. Addressing the gender gap in entrepreneurial intentions may likewise require targeted measures that support the development of self-efficacy among women, alongside broader efforts to reduce structural and contextual barriers.

This study has some limitations. The study is based on cross-sectional data and dichotomous measures, which limits causal interpretation and the ability to capture more nuanced variation in the constructs. In addition, the analysis focuses on a single national context. Future research could build on these findings by using longitudinal designs, more detailed measures, and comparative data across countries.

In conclusion, entrepreneurial intentions are shaped by a combination of individual beliefs and social context. Entrepreneurial self-efficacy plays a central mediating role in this process, but it does not fully account for the influence of gender and role model exposure, highlighting the need for more integrated approaches to understanding entrepreneurial intention formation.

Public Funding, Collaboration and Intellectual Assets in a Moderate Innovator: Evidence From Portugal

Cidália Jorge and Florinda Matos
ISCTE, Portugal

Cidalia_Jorge@iscte-iul.pt
Florinda.Matos@iscte-iul.pt

Abstract: Innovation is a central driver of economic competitiveness, which grants science, technology and innovation policies a prominent role. In this respect, Portugal is a paradigmatic case: across successive editions of the European Innovation Scoreboard, it has remained a moderate innovator, below the European Union average, despite sustained public investment, with persistent weaknesses in intellectual assets and in the commercial translation of innovation. Although the literature widely discusses the relationship between public policy and innovation ecosystems at the macro level, firm-level evidence on the mechanisms linking public funding and collaboration to the creation of intellectual assets remains scarce, particularly in peripheral economies dominated by small and medium-sized enterprises. This study addresses that gap by analysing how public funding, collaboration and export orientation relate to the patenting activity of Portuguese firms. An explanatory sequential mixed-methods design is adopted. In the quantitative phase, hypotheses on the association between patent applications and factors of public funding, collaboration and internationalisation are tested using chi-square and t-tests on data from the Community Innovation Survey (CIS 2022), covering 13,802 national firms. In the qualitative phase, two interviews with national experts, analysed through content analysis, interpret and contextualise the observed patterns. The results show that public funding is significantly associated with patenting, but with small effect sizes, whereas collaboration, particularly with universities, displays the strongest association, exceeding inter-firm cooperation; patenting, in turn, is associated with greater export orientation. An asymmetric articulation of the innovation system's helices emerges: a robust academic sphere and a structurally fragile business sphere that does not generate enough demand to convert funding and knowledge into intellectual assets. Reading these results through the triple helix model suggests that, in a moderate innovator, strengthening the articulation between academia and the business fabric is a precondition for the transition towards more complex and sustainable innovation ecosystems. The study contributes to the innovation management literature with firm-level empirical evidence from an under-explored peripheral context, and offers practical implications for innovation policy, underlining that public effort is more effective when directed at science-industry articulation rather than at direct funding alone. It also warns of the limits of indicators such as the European Innovation Scoreboard in assessing economies with Portugal's profile.

Keywords: Innovation Policy, Intellectual Assets, Triple Helix, University-Industry Collaboration, Moderate Innovator, Portugal

1. Introduction

Innovation is today one of the main drivers of economic competitiveness, which is why science, technology and innovation (STI) policies hold a prominent place on the political agenda (Freeman 1987; Edler and Fagerberg 2017). The literature stresses that a country's innovative performance does not stem from the isolated action of firms, but from the interactions among the institutions that make up its National Innovation System (Nelson 1993). Within this framework, the articulation between university, industry and government, formalised in the triple helix (Etzkowitz and Leydesdorff 1998), has been extended to the quadruple and quintuple versions, which incorporate civil society and the natural environment (Carayannis et al. 2012; Cai 2022). The present study situates itself within this line of thought but concentrates its empirical analysis on the three original helices, state, academia and industry, as these are the spheres whose interaction the available data allow to be tested directly.

Despite the consensus on the importance of public policy, the question remains of how public investment translates into innovation outcomes, particularly in peripheral economies dominated by small and medium-sized enterprises. Portugal is a paradigmatic case: across successive editions of the European Innovation Scoreboard (EIS), it has remained a moderate innovator, below the European Union average, even after sustained public investment in STI. Its weaknesses are persistently concentrated in intellectual assets and in the commercial translation of innovation, precisely the dimensions that reflect the capacity to derive economic value from knowledge.

Although the literature discusses the macro-level relationship between public policy and innovation ecosystems, firm-level evidence on the mechanisms linking public funding and collaboration to the generation of intellectual assets in moderate-innovator contexts remains scarce (Zheng and Cai 2022). This is the gap the study seeks to address, drawing on data from Portuguese firms to examine how public funding and collaboration relate to

patenting and export orientation. The article draws on a master's dissertation of broader scope, from which the subset of variables concerning patent-applicant firms is extracted.

The study is guided by two questions: in which of the EIS indicators should Portugal improve its performance, and which firm-level relationships between patenting and the factors of funding, collaboration and internationalisation offer clues for that improvement. The analysis is anchored in the triple helix and in the national innovation systems approach, and employs an explanatory sequential mixed-methods design. Following this introduction, Section 2 presents the theoretical background, Section 3 the methodology, Section 4 the results, Section 5 the discussion and Section 6 the conclusions.

2. Theoretical Background

A country's innovative performance is now understood less as the sum of the isolated efforts of its firms and more as the product of the interactions among a set of public and private institutions, the National Innovation System (NIS). Nelson (1993) defines it as the set of institutions whose interactions determine the innovative performance of national firms, stressing that what distinguishes each country is its institutional arrangements: intellectual property rights, university-industry relations and the role of small firms. Freeman (1987) assigns public policies supporting science, technology and innovation a central role in building national innovative capacity. This perspective is particularly relevant for peripheral economies, where institutional weaknesses constrain the translation of knowledge into economic outcomes (Albuquerque 2007). The Portuguese case illustrates this: a fabric of small and medium-sized enterprises, an intellectual property valuation system poorly suited to the national reality, and an incipient articulation between science and industry constitute the main constraints on national performance (Godinho 2016).

The formalisation of the interaction among actors finds its reference framework in the triple helix model. Etzkowitz and Leydesdorff (1998) describe innovation as an endogenous phenomenon, sustained by the trilateral articulation among university, industry and government. The model has been successively extended: the quadruple helix incorporates civil society and the quintuple adds the natural environment, linking innovation to sustainability (Carayannis et al 2012). Cai (2022) synthesises these variants in the neo-triple helix model, distinguishing a genetic level, corresponding to the university-industry-government relations that generate innovative dynamics, from a systemic level, in which those dynamics interact with social structures and the environment. It is this core, the three original helices, that the present study mobilises, as these are the spheres whose interactions the data allow to be observed; the dimensions of civil society and the environment are taken up in the discussion as research frontiers.

At the level of mechanisms, the literature highlights three pathways. First, public policies structure enduring institutional capacities beyond political cycles (Edler and Fagerberg 2017), although research on their translation into outcomes remains scarce (Zheng and Cai 2022); at firm level, public funding reinforces innovative performance, especially when combined with external knowledge flows (Costa and Moreira 2022). Second, collaboration is an essential channel for knowledge transfer: university-industry cooperation stimulates technological innovation (Perkmann et al 2021) and inter-firm cooperation also contributes, albeit with a smaller effect (Radicic et al 2020). Third, the valuation of knowledge takes the form of formal protection through patents, long associated with export performance and international competitiveness (Fagerberg 1988; Dosi et al 1990) and, in recent firm-level evidence, with the commercial success of innovation (Lambrecht et al 2026). The empirical design in the following section rests on these three mechanisms.

3. Methodology

3.1 Research Design

The research adopts a mixed-methods approach with an explanatory sequential design (Creswell and Plano Clark 2017), justified by the complementarity of the two logics: quantitative methods offer strong external validity and qualitative methods strong internal validity, their combination ensuring a reasonable degree of validity in both (Serapioni 2000). A first phase tests hypotheses on the association between firms' patenting and a set of factors; a second phase deepens the identified patterns with national experts, in order to interpret them.

3.2 Hypotheses

Anchoring the analysis in the triple helix (Etzkowitz and Leydesdorff 1998), the hypotheses are organised into three blocks reflecting a pathway of creation and valuation of intellectual assets, and are framed in terms of association, not causation. Block A, public funding: H1, association between patents and local or regional public funding; H2, between patents and central public funding. Block B, collaboration: H3, between patents and cooperation with universities; H4, between patents and cooperation with other firms. Block C, internationalisation: H5, between patents and export orientation. Hypotheses H3 and H4 are tested separately for national and European Union partners.

3.3 Data and Analysis

The data come from the Community Innovation Survey (CIS 2022, reference period 2020-2022), released as open data by the DGEEC/INE/FCT partnership. The sample comprises 13,802 national firms with ten or more employees, mostly small: 64.6% employ between ten and 49 workers and 82.2% have been active for nine years or more.

The dependent variable records whether the firm applied for a patent during the period. The independent variables correspond to the factors in each hypothesis: in Block A, two dichotomous items on the receipt of local/regional and central public funding; in Block B, the type of cooperation partner, disaggregated by geographic location; in Block C, the percentage of turnover derived from EU/EFTA and non-EU markets. The funding and cooperation items refer to the 2020-2022 period and the export item to 2022.

The analysis was conducted in IBM SPSS Statistics. Given the dichotomous nature of the variables in Blocks A and B, the association was tested using Pearson's chi-square test of independence; in Block C, since export orientation is continuous, an independent-samples t-test was used, which justifies presenting the results in two tables. A significance level of 0.05 was adopted, and effect sizes are reported: Phi and Cramér's V in the association tests and Cohen's d in the t-test, following the conventional benchmarks whereby, for one degree of freedom, V values close to 0.10 denote small effects and 0.30 moderate ones (Cohen 1988). The observational and cross-sectional nature of the data does not allow causal inferences.

3.4 Qualitative Phase

The qualitative phase draws on two structured interviews with national experts experienced in the field of R&D and innovation investment. The interview guide, built from the quantitative results, covered the institutional reorganisation of the system, the diagnosis of national performance and the policy pathways; in line with the study's scope, the analysis privileges the dimensions linked to patenting. The responses were subjected to content analysis (Bardin 2016), with aggregated and anonymised treatment under informed consent.

4. Results

4.1 Quantitative Results

The association tests between patenting and the factors of public funding and collaboration are shown in Table 1 (N = 13,802; one degree of freedom throughout). In Block A, both types of funding show a significant association: the proportion of applicants is higher among firms with local/regional funding (4.4% versus 2.0%) and central funding (4.5% versus 1.8%). However, the effect sizes are very small (Cramér's V = 0.041 and 0.062), indicating limited practical relevance despite statistical significance.

Block B reveals a different pattern. The associations with university cooperation are significant and of greater magnitude (V = 0.194 for national universities and 0.180 for EU ones), representing small to moderate effects. Inter-firm cooperation is also significant, but weaker (V = 0.158 national and 0.151 EU). Two regularities stand out: cooperation with universities is more strongly associated with patenting than inter-firm cooperation, and, in both, national partners slightly exceed European ones, which may reflect institutional proximity.

Table 1: Association tests (chi-square) between patent applications and the factors of public funding and collaboration

Hypothesis	Factor	$\chi^2(1)$	p	Cramér's V	Magnitude
H1	Local/regional public funding	22.934	< 0.001	0.041	Very small
H2	Central public funding	52.585	< 0.001	0.062	Very small
H3a	University cooperation (PT)	519.846	< 0.001	0.194	Small to moderate
H3b	University cooperation (EU)	449.431	< 0.001	0.180	Small to moderate
H4a	Firm cooperation (PT)	342.607	< 0.001	0.158	Small to moderate
H4b	Firm cooperation (EU)	313.741	< 0.001	0.151	Small to moderate

Note: N = 13,802. Source: own elaboration based on CIS 2022.

In Block C, the relationship between patenting and export orientation was examined using the t-test (Table 2). Applicant firms show a greater propensity to export: on average 4% of turnover in EU/EFTA exports versus 1% for non-applicants, and 5% versus 1% in non-EU markets. Both differences are significant, with small but consistent effect sizes (Cohen's d = 0.15).

Table 2: T-tests between patent applications and export orientation

Hypothesis	Market	Mean Turnover (With Patent)	Mean Turnover (Without Patent)	t	p	Cohen's d
H5a	EU/EFTA	4%	1%	9.04	< 0.001	0.15
H5b	Non-EU	5%	1%	10.29	< 0.001	0.15

Note: Source: own elaboration based on CIS 2022.

In sum, public funding is associated with patenting in a significant but tenuous way; collaboration, particularly with universities, shows the strongest association; and patenting is associated, downstream, with greater export orientation.

4.2 Qualitative Results

The two interviews, analysed through content analysis, help interpret these patterns through five themes.

4.2.1 Structural Constraints

The experts attribute the moderate-innovator position to persistent structural problems, linked to a fabric dominated by micro-enterprises with no innovation strategies and oriented towards the domestic market. This frames the very small effects in Block A: funding meets a base with little propensity to convert it into intellectual assets.

4.2.2 Asymmetry of the Helices

An uneven development is emphasised: universities and research centres have attained international excellence, while few firms are competitive and exposed to the pressure that stimulates innovation. This reading interprets the central finding of Block B, the stronger association with university cooperation than with inter-firm cooperation.

4.2.3 Misalignment of the Patent System

The adequacy of the patent as an indicator is questioned: much process innovation is not patentable, the fragmented model penalises SMEs, part of multinationals' R&D is registered in their home countries, and software is protected under US law. This calls for caution in reading patents as an absolute measure.

4.2.4 Public Funding as a Conditioned Lever

Funding is acknowledged to play a decisive role, though dependent on the capacity to stimulate private investment, historically scarce and risk-averse, with a strong association between the withdrawal of funding and the contraction of business effort during the troika and pandemic periods.

4.2.5 Focus on Strategic Technologies

The experts recommend concentrating effort on a limited number of differentiating domains, replacing the logic of sectors with that of technologies, with emphasis on biotechnology, energy, digital technologies, and security and defence.

5. Discussion

The results allow the mechanisms linking public funding, collaboration and the valuation of intellectual assets to the performance of Portuguese firms to be interpreted through the triple helix, following the order of the three blocks.

5.1 Public Funding: Significant but Insufficient

Block A confirms that public funding, local/regional and central, is significantly associated with patenting (H1, H2), but with very small effect sizes. This combination, robust significance and limited practical relevance, is the most informative finding: funding matters, but is not, on its own, a strong determinant of the creation of intellectual assets. The experts' interpretation provides the key: in a fabric dominated by micro-enterprises with no innovation strategies and oriented towards the domestic market, funding meets a business base with little propensity to convert it into patents. The result dialogues with Costa and Moreira (2022), who find a robust effect of funding especially when combined with external knowledge flows, suggesting that it is not funding itself that generates assets, but its articulation with collaboration. The experts further note a strong association between the withdrawal of funding and the contraction of business effort during the troika and pandemic periods, pointing to an asymmetric relationship: if the marginal effect of more funding is contained, its removal produces disproportionate negative effects. Given the cumulative nature of innovation capabilities (Nelson 1993), the stability and predictability of instruments become as relevant as their amount.

5.2 Collaboration and the Asymmetry of the Helices

Block B constitutes the core of the contribution. The associations of patenting with university cooperation (H3) are clearly higher than those with public funding and with inter-firm cooperation (H4), an ordering consistent with Perkmann et al (2021) and Radicic et al (2020). The experts give it systemic meaning: the asymmetry reflects an uneven development of the helices, with an academic sphere that has attained international excellence and a business sphere in which few firms are competitive. Read through the triple helix (Etzkowitz and Leydesdorff 1998), the Portuguese situation constitutes a trilateral articulation operating at half capacity. It is here that the multi-helix evolution acquires meaning: the extension to civil society (quadruple) and the environment (quintuple), proposed by Carayannis et al (2012) and Cai (2022), does not replace the underlying work but presupposes it. In a moderate innovator, the path towards more complex ecosystems runs first through strengthening the business helix and its link to academia.

5.3 Patenting, Internationalisation and the Limits of the Indicator

Block C confirms that patenting is associated, downstream, with greater export orientation (H5), with small but consistent effects, closing the input-asset-outcome pathway. This reading nonetheless requires the caution the experts recommend: the misalignment of the patent system, the non-patentability of much process innovation, the registration by multinationals in their home countries and the penalisation of SMEs by the fragmented model, suggests that the patent underestimates real innovative effort. The observed effects thus probably represent a lower bound of the true relationship. This underestimation reaches the very construction of indicators such as

the European Innovation Scoreboard, which, by anchoring themselves in metrics oriented towards technologically advanced production structures, tend to penalise economies with the Portuguese profile. Acknowledging this does not invalidate the diagnosis, the weaknesses in intellectual assets are real, but it calls for caution in the literal reading of the scores. Taken together, the three blocks converge: Portugal's performance does not stem from the absence of public funding, but from the structural fragility of business demand and its insufficient link to a robust scientific capacity.

6. Conclusions

The study sought to identify the dimensions in which Portugal, as a moderate innovator, shows the greatest weaknesses in the European Innovation Scoreboard, and to examine, at firm level, the relationships that offer clues for overcoming them. The evidence points to intellectual assets and the commercial translation of innovation as the most critical sub-areas. Focusing the analysis on patenting, the results outline a coherent pathway: public funding is associated with the creation of assets in a significant but tenuous way; collaboration, particularly with universities, is the strongest associated factor; and patenting is accompanied, downstream, by greater export orientation. The experts' interpretation situates this picture within a fabric of small and medium-sized enterprises, with structurally weak business demand for innovation that is insufficiently linked to a robust scientific capacity.

Three contributions follow. Theoretically, the study offers firm-level empirical evidence on the operationalisation of triple helix interactions in a moderate innovator, revealing an academic helix that fulfils its role and a business helix that does not generate enough demand to draw out its full potential. In practical terms, public effort will be more effective if directed at science-industry articulation rather than at direct funding alone, requiring stable instruments and a focus on strategic technological domains. Methodologically, the triangulation of large-scale data with expert interpretation strengthens the validity of the inferences.

The study has limitations that open avenues for future research. The data are observational and cross-sectional, precluding causal inferences; the qualitative validation rested on a small number of experts, with an interpretive function; and the unavailability of regionalised CIS data prevented the testing of territorial hypotheses. Extending the framework to the quadruple and quintuple layers of the helix model, incorporating civil society and the environment, would make it possible to examine the extent to which the consolidation of the underlying interactions opens space for more complex and sustainable innovation ecosystems.

Data Availability Statement

The data can be made available by the paper's authors upon request.

Ethics Declaration

This study did not require ethical clearance, as it ensured the anonymity of all participants and obtained their informed consent prior to conducting the interviews.

AI Declaration

In this article, the authors utilised an AI tool to assist with language refinement and grammar checks. The authors reviewed and verified all AI-generated content to ensure its accuracy and integrity and take full responsibility for the final manuscript.

Acknowledgements

The authors thank DGEEC/INE/FCT for making the Community Innovation Survey data available, and the experts who kindly agreed to be interviewed for this study.

Venturethon: A Validation-First, Studio-Templated Pedagogical Model for Entrepreneurship Education

Artūras Jurgelevičius
Faculty of Governance and Business, Mykolas Romeris University, Vilnius, Lithuania

a.jurgelevicius@mruni.eu

Abstract: This paper develops a conceptual framework for Venturethon, a sprint-based pedagogical model for entrepreneurship education centered on real-world business model validation. Its novelty is configurational rather than componential. Entrepreneurship education has shifted, over two decades, from lecture-based instruction toward experiential formats, yet a persistent gap remains between pedagogical methods and the authentic processes of new venture creation. Two competition-based formats dominate practice: hackathons, which compress innovation into 24 to 72 hours and rarely enable customer interaction; and business plan competitions, which reward written planning over market evidence. Recent empirical reviews show that lecture-centered teaching persists even where experiential intent is stated, and that participation in assessment-based startup competitions yields no significant entrepreneurial-intention advantage over controls. In parallel, a separate research stream — four randomized controlled trials covering 759 firms and a recent extension in Tanzania — has shown that a hypothesis-driven, theory-based approach to entrepreneurial decision making improves search efficiency and idea quality. The design challenge is therefore not whether validation matters, but how to embed it pedagogically. The Venturethon model rests on three theoretical pillars: experiential learning theory, hypothesis-driven entrepreneurship, and venture studio architecture. The paper specifies nine testable propositions linking program design features to expected learner outcomes and articulates four boundary conditions: deep-tech ventures with multi-year R&D timelines, regulated industries with constrained customer access, pre-undergraduate participants, and prior-MBA participants shown to resist hypothesis-driven methods. No existing format — hackathon, business plan competition, accelerator, I-Corps, or studio — jointly instantiates the translation of venture studio architecture (cohort parallelism, shared infrastructure, systematized process) into educational program design combined with open access, evidence-gated pedagogy, and pre-committed post-sprint pathways. The paper concludes with a quasi-experimental design for empirical evaluation against matched hackathon and business-plan-competition cohorts, inviting independent empirical testing.

1. Introduction

Entrepreneurship education has shifted, over two decades, from lecture-based instruction toward experiential and practice-oriented formats (Neck and Greene, 2011). Yet a persistent gap remains between pedagogical methods and the authentic processes of new venture creation. Recent empirical reviews show that the field still lacks consensus on which experiential designs reliably produce entrepreneurial competence, and that lecture-centered teaching persists even where experiential intent is stated (Kim, 2025; Liszt-Rohlf et al, 2026). Two competition-based formats dominate practice: hackathons, which compress innovation into 24 to 72 hours and rarely enable customer interaction (Resch, Freudhofmayer and Martínez-Usarralde, 2025; Sánchez et al, 2025); and business plan competitions, which reward written planning rather than market evidence (Mauer et al, 2021).

Against this backdrop, a parallel research stream has accumulated rigorous evidence — most prominently four randomized controlled trials covering 759 firms (Camuffo et al, 2024) and a recent extension in Tanzania (Agarwal et al, 2025) — that a hypothesis-driven, theory-based approach to entrepreneurial decision making improves search efficiency and idea quality. This evidence suggests that the design challenge for entrepreneurship education is not whether validation matters, but how to embed it pedagogically.

This paper introduces Venturethon as a sprint-based, validation-first model designed to do precisely that. The contribution is conceptual: the paper develops formal propositions linking program design features to learner outcomes and articulates boundary conditions under which the model is and is not expected to apply. Section 2 reviews three relevant literatures: entrepreneurship education pedagogy and competition-based learning; hypothesis-driven entrepreneurship; and venture studio research. Section 3 presents the theoretical framework. Section 4 specifies the Venturethon model and its nine propositions. Section 5 differentiates it from existing formats, including the NSF I-Corps. Section 6 discusses implications and boundary conditions. Section 7 concludes.

Methodologically, this is a conceptual contribution drawing on theory-building from existing literature. Sources were identified through purposive search of Scopus and Web of Science (2020-2026) using the terms "entrepreneurship education", "business model validation", "lean startup", "venture studio", "hackathon", and "I-Corps", supplemented by targeted backward and forward citation tracing of seminal works.

2. Literature Review

2.1 Entrepreneurship Education and Competition-based Learning

Entrepreneurship education in higher education has expanded since the 1990s, but its effectiveness remains contested. Mauer et al (2021) reviewed 159 articles and concluded that entrepreneurship education research relies overwhelmingly on short-term self-report outcomes, frequently fails to specify the pedagogy under test, and that participation in curricular education or assessed startup competitions yields no significant entrepreneurial-intention advantage over controls. Recent work has reinforced these critiques: Kim (2025) finds, in a U.S. mixed-methods study, that lecture-centered pedagogy persists despite stated experiential intent, and Liszt-Rohlf et al (2026), in a systematic review of 1,419 abstracts using the EU EntreComp framework, document the heterogeneity of designs and the under-specification of competence outcomes.

Hackathons have attracted growing scholarly attention. A PRISMA-guided systematic mapping by Sánchez et al (2025) finds limited methodological standardization across student hackathons, with reported outcomes dominated by tangible artefacts and soft skills and long-term impact rarely evaluated. Resch, Freudhofmayer and Martínez-Usarralde (2025) and Rys (2025) confirm benefits for peer learning and problem-solving while flagging a structural mismatch between event duration and validation requirements. Across this literature, a recurring finding is that short-format events generate energy but do not scaffold the validation journey from idea to investable venture (Kohne et al, 2023); follow-through support and structured post-event pathways emerge as decisive moderators of longer-term entrepreneurial outcomes (Jurgelevičius et al, 2025).

2.2 Hypothesis-driven Entrepreneurship and the Scientific Approach

The lean-startup tradition (Ries, 2011; Blank and Dorf, 2012) and its articulation tools — the Business Model Canvas (Osterwalder and Pigneur, 2010) and Lean Canvas (Maurya, 2012) — propose that entrepreneurs translate ideas into falsifiable hypotheses, test them through minimum viable products, and decide to persevere, pivot, or abandon based on evidence. Until recently the empirical foundation for these prescriptions was thin (Frederiksen and Brem, 2017). The most rigorous evidence now comes from the "scientific approach" research programme of Camuffo and colleagues. Their original randomized controlled trial (Camuffo et al, 2020) showed that training entrepreneurs to formulate and test theory-driven hypotheses raised the rate of pivot and exit decisions and improved revenue. The large-scale replication across 759 firms (Camuffo et al, 2024) confirmed and extended these findings, showing that the scientific approach increases search efficiency and "methodic doubt." A 2025 extension to a Tanzanian sample (Agarwal et al, 2025) demonstrates that adding an explicit "theory of value" component generates further benefits in low-resource contexts. Gambardella et al (2025) further distinguish theory-based from design-based decision making, situating the scientific approach as a predictive complement to constructivist entrepreneurship.

Two implications follow. First, the practitioner-derived "validate before you build" principle (Ries, 2011) now rests on cumulative experimental evidence, not anecdote. Second, this evidence has not yet been systematically translated into entrepreneurship education pedagogy. The Venturethon model, developed below, can be read as one such translation.

2.3 Venture Studios as an Organizational Template

Venture studios — also termed startup studios or company builders — systematically create multiple ventures in parallel through shared resources, expertise, and capital (Sansone et al, 2023). Curran and Ozcan (2025) show that studios break the conventional individual-opportunity nexus by separating opportunity identification from founder recruitment, with implications for how entrepreneurial agency itself is theorized. Belingheri and Lechner (2025) provide a systematic mapping of the venture-builder phenomenon across 350 studios in 34 countries, identifying seven defining features (focus, idea sourcing, service package, volume, funding, governance, output) and noting that peer-reviewed empirical evidence remains thinner than the topic's prominence in practitioner discourse. Industry surveys report higher Series A rates for studio-backed ventures than for traditional pre-seed startups; these figures should be read as suggestive rather than causal, given selection and survivorship biases (Belingheri and Lechner, 2025).

Crucially for this paper, the venture studio model has not, to the author's knowledge, been previously theorized as a pedagogical template. Studios are usually analyzed as organizational forms or financing vehicles. The argument developed below is that their three architectural features — cohort parallelism, shared infrastructure,

and systematized validation process — translate into a coherent pedagogical design, independently of any financing question.

3. Theoretical Framework

The Venturethon model rests on three interconnected pillars: experiential learning theory, hypothesis-driven entrepreneurship, and venture studio architecture. Table 1 maps each pillar onto specific design features of the model and the entrepreneurship education limitation it is intended to address.

Table 1: Three-pillar architecture of the Venturethon model

Theoretical Pillar	Core Mechanism	Design Feature in Venturethon	EE Limitation Addressed
Experiential learning (Kolb, 1984; Neck and Greene, 2011)	Iterative cycle: experience, reflection, conceptualisation, experimentation	Weekly sprint cadence with mandated customer-evidence checkpoints	Hackathon brevity; lecture-centric instruction
Hypothesis-driven entrepreneurship (Ries, 2011; Camuffo et al, 2020, 2024)	Falsifiable hypotheses tested via MVPs and customer interviews	Phase-gated assessment: teams advance only on validated evidence	Document-centric business plan competitions
Venture studio architecture (Sansone et al, 2023; Curran and Ozcan, 2025)	Cohort parallelism, shared infrastructure, systematised process	Synchronous multi-team cohorts, shared toolkits, repeatable five-phase protocol	Absent post-competition pathway; isolated team learning

3.1 Experiential Learning

Kolb's (1984) experiential learning cycle provides the pedagogical architecture. The mechanism by which a one-week sprint instantiates the four stages is empirical, not assumed: each week, teams encounter a concrete set of customer or market data (concrete experience), discuss what the data show in facilitated reflection sessions (reflective observation), revise their business model hypotheses on a shared canvas (abstract conceptualization), and re-enter the field with updated interview protocols and MVP elements (active experimentation). This iterative loop is observable in coded artefacts — interview logs, canvas revisions, MVP versions — that constitute the assessment evidence. Recent entrepreneurship education pedagogy research (Kim, 2025; Mujuru, Hyams-Ssekasi and Mushunje, 2026) emphasizes that experiential intent without scaffolded artefact production typically defaults back to lecture; Venturethon's artefact-centered design is intended to resist that default.

3.2 Hypothesis-driven Entrepreneurship

The lean-startup tradition (Ries, 2011; Blank and Dorf, 2012) supplies the operational logic; the scientific-approach research programme (Camuffo et al, 2020, 2024; Agarwal et al, 2025) supplies the empirical warrant that the logic generates measurable performance gains when properly trained. Venturethon adopts both: the Business Model Canvas (Osterwalder and Pigneur, 2010) and Lean Canvas (Maurya, 2012) serve as articulation tools, while teams are explicitly trained to formulate falsifiable hypotheses, identify the riskiest assumption, and design minimum-viable tests — the cognitive plus experimental architecture distinguished by Gambardella et al (2025).

3.3 Venture Studio Architecture

Three studio principles transfer to pedagogy. First, cohort parallelism: simultaneous teams generate cross-pollination, peer benchmarking, and a shared learning trajectory absent in solo-team formats (Belingheri and Lechner, 2025). Second, shared infrastructure: a common toolkit (interview templates, validation rubrics, mentor pool) lowers the friction cost of meaningful experimentation, addressing the documented hackathon barrier of insufficient scaffolding (Resch et al, 2025). Third, systematic process: a repeatable five-phase protocol encodes learning-curve advantages across cohorts (Curran and Ozcan, 2025) and supports cumulative program improvement.

4. The Venturethon Model

This is a conceptual contribution and does not present a PRISMA-style systematic review; it follows the integrative literature review approach articulated by Torraco (2016) and Snyder (2019), which is appropriate where the aim is theory synthesis rather than effect-size aggregation. This positioning is made explicit to avoid overclaiming methodological reach.

Sources were identified through structured searches of Scopus and Web of Science between January and March 2026, covering the period 2010–2026, with priority given to 2020–2026 publications to capture the recent maturation of the scientific-approach evidence base (Camuffo et al, 2020, 2024; Agarwal et al, 2025). The following search strings were used, combined with Boolean operators: "entrepreneurship education", "business model validation", "lean startup", "scientific approach to entrepreneurship", "venture studio" OR "startup studio" OR "company builder", "hackathon", and "I-Corps". Inclusion criteria were: (i) peer-reviewed journal articles, systematic reviews, or seminal scholarly books; (ii) direct relevance to one of the three theoretical pillars or to the comparative analysis in Section 5; and (iii) methodological transparency. Exclusion criteria were: (i) practitioner blog posts and non-peer-reviewed grey literature, except where they reported primary data not yet available in peer-reviewed form; (ii) studies focused exclusively on corporate intrapreneurship; and (iii) duplicates and editorials. Backward and forward citation tracing of seminal works was used to capture earlier foundational sources (Kolb, 1984; Ries, 2011) and the most recent 2025–2026 contributions not yet fully indexed.

4.1 Construct Definitions

Three constructs are defined explicitly. Validation evidence denotes documented feedback from at least 15 in-depth customer interviews per team, plus at least one of: a behavioral signal (sign-up, pre-order, letter of intent) or a willingness-to-pay test result. Investment-readiness, in this educational context, is operationalized not as actual fundraising but as the pedagogical state in which a team can articulate a falsifiable value hypothesis, an identified customer segment, evidence of problem-solution fit, and a path-to-revenue logic — the four components on which the program's rubric assesses pitches. Sprint duration is parameterized at four to eight weeks to accommodate institutional calendars; all propositions below specify duration as a moderator rather than a fixed value.

4.2 The Five-phase Sprint

Table 2 summarizes the five sequential phases. Each phase is gated by a deliverable that constitutes evidence rather than intent. Iteration loops between Phase 3 (Solution Hypothesis) and Phase 2 (Problem Definition) are required, not optional: teams that find their problem statement does not survive customer contact return to Phase 2 rather than continuing to Phase 4.

Table 2: The Venturethon five-phase sprint

Phase	Focus	Deliverable	Assessment artefact
1	Segment and ecosystem mapping	Specified customer segment plus actor map	Ecosystem map; segment definition memo
2	Problem definition and framing	Validated problem statement	At least 15 interview transcripts; coded problem themes
3	Solution hypothesis and MVP design	Falsifiable solution hypotheses plus MVP plan	Hypothesis register; MVP test design
4	Market validation and traction	Behavioural and willingness-to-pay evidence	Test logs; signed letters of intent / pre-orders / sign-ups
5	Investor-readiness and pitch	Evidence-based pitch plus venture model	Pitch deck; updated BMC; validation portfolio

4.3 Assessment

Evaluation is rubric-based and evidence-weighted. Four criteria carry equal weight: depth of customer discovery (number, quality, and coding rigour of interviews); specificity of validated problem-solution fit; credibility of traction indicators; and coherence of the business model and clarity of the resulting investment narrative. This rubric aligns with the scientific-method orientation of the Camuffo programme (Camuffo et al, 2024) and resists the common entrepreneurship education failure of rewarding presentation polish over substantive evidence.

4.4 Propositions

Nine testable propositions follow from the framework. Each links a design feature to an expected learner outcome and identifies the relevant moderator or boundary.

P1. Evidence gates → entrepreneurial self-efficacy. Sprint formats that require pre-pitch customer-evidence artefacts (≥10 problem interviews, demand signals, or LOIs) will produce higher post-program entrepreneurial self-efficacy and lower overconfidence bias than equivalent-duration formats assessing only pitch quality, controlling for cohort selection and prior founder experience.

P2. Cohort parallelism → evidence-based decision revision. Cohort formats running multiple teams synchronously will produce higher rates of *evidence-based business model revision* (pivots justified by validated learning, not founder intuition) than solo-team formats, mediated by peer benchmarking and inter-team disconfirmation. Effect strength will follow an inverted-U with cohort size, with diminishing returns beyond ~15 teams.

P3. Hypothesis-formulation training → search efficiency. Explicit hypothesis-formulation training (theory-based reasoning, falsifiable predictions, pre-registered tests) will improve idea-search efficiency — measured as time-to-validated-problem and reduction in unproductive directions — replicating the Camuffo et al. (2020, 2024) scientific approach effect within an educational rather than firm-level setting.

P4. Structured post-sprint pathways → venture creation. Structured post-sprint pathways (incubation slots, accelerator fast-track, venture studio integration, or follow-on funding) will increase 12-month venture-creation and 24-month venture-survival rates among program alumni, relative to terminal-event formats such as classical hackathons. Effect will be moderated by pathway *commitment credibility* — pre-committed slots outperform conditional invitations.

P5. Founder experience → competence gains, not absolute outcomes. The model's effects on *learning gains in entrepreneurial competence* will be larger for first-time founders than for experienced founders (ceiling effect), while *absolute venture quality outcomes* will favor experienced founders (Gompers et al, 2010). Programs should therefore be evaluated on value-added, not graduate-level performance. These propositions are presented for empirical testing rather than as established findings; Section 6 sketches a quasi-experimental design.

P6. Mentor structure → venture quality. Mentor *density and diversity* (ratio of active mentors to teams, breadth across functional and industry expertise) will predict venture quality at exit more strongly than mentor *seniority* alone, consistent with Cohen et al.'s findings on accelerator effectiveness. A "directed but plural" mentorship structure (multiple mentors, single accountable lead) outperforms both single-mentor and unstructured-network models.

P7. Pre-committed kill criteria → resource efficiency and learning. Sprint formats incorporating pre-committed *kill criteria* (defined evidence thresholds below which teams formally discontinue) will produce higher resource efficiency and stronger post-program learning outcomes than formats with open-ended continuation, by reducing escalation of commitment.

P8. Founder-problem fit screening → team performance. Venturethon formats that screen for founder-problem fit before team formation (matching participants to problem domains based on prior exposure or motivation) will outperform random or self-selected team formation on both venture progression and team cohesion, with effects strongest for deep-tech and regulated-industry challenges.

P9. Reflection cadence → learning transfer. Structured reflection protocols embedded between sprint phases (not only post-program) will increase learning transfer to subsequent ventures, drawing on Kolb's experiential learning cycle and Argyris's double-loop learning.

5. Differentiation from Existing Formats

Five formats are most directly comparable. Table 3 contrasts them on seven dimensions. Most notably, the closest functional analogue is the U.S. NSF I-Corps program, which has trained more than 2,300 individuals in customer-discovery sprints and is associated with over $7 billion in follow-on funding (NSF, 2025). I-Corps and Venturethon share the validation-sprint logic and the 100-interview ethic of customer discovery (Leatherbee and Katila, 2020). They differ in two important respects: I-Corps is targeted at deep-tech academic researchers commercializing NSF-funded science, with eligibility tied to research output; Venturethon is targeted at first-time founders and students with no commercialization prerequisite. Second, I-Corps does not adopt the studio template of cohort parallelism plus shared infrastructure plus a structured post-sprint pathway. Venturethon's contribution, therefore, is not to invent the validation sprint — that credit belongs to the lean-startup and I-Corps traditions — but to combine the validation sprint with venture studio architecture and to translate the combination into an entrepreneurship education format accessible at scale.

Table 3 positions Venturethon against four adjacent formats — hackathons, business plan competitions, accelerators and the NSF I-Corps programme — across twelve design dimensions. The dimensions are organised in three layers: theoretical and pedagogical positioning (rows 1–3), structural design (rows 4–7) and process and outcome governance (rows 8–12).

Table 3: Venturethon and adjacent entrepreneurship education / venture-creation formats

Dimension	Hackathon	Business plan competition	Accelerator	NSF I-Corps	Venturethon
Theoretical anchor	None; build-test-learn folk wisdom	Strategic planning tradition	Signaling theory and mentorship	Lean Startup (Blank, Ries)	Scientific approach to entrepreneurship (Camuffo et al, 2020) and discovery-driven planning (McGrath)
Pedagogical method	Ad-hoc; build-fast	Written analysis and forecasting	Mentorship-driven iteration	Customer discovery interviews	Hypothesis-driven testing with evidence gates
Primary focus	Prototype	Written plan	Growth	Customer discovery	Falsifiable hypothesis testing under time compression
Eligibility	Open	Open	Selective	NSF-funded research only	Open (broad access)
Stage	Idea	Idea or early	Post-MVP	Pre-MVP	Pre-MVP
Duration	24–72 hours	Weeks to months	3–6 months	7 weeks	Compressed sprint of 4–8 weeks with structured post-programme tail
Cohort design	Parallel (loose)	Solo	Parallel	Parallel	Parallel (tight); inverted-U size optimum at approximately 6–15 teams
Team formation	Random or ad-hoc	Pre-formed	Pre-formed (selected)	Pre-formed (PI-led)	Structured matching on founder–problem fit
Assessment	Demo or pitch	Document	Metrics	Discovery report	Evidence rubric (validated learning, falsified hypotheses, demand signals)
Kill criteria and pivot governance	None	None	Implicit (investor signal)	Implicit (go or no-go)	Explicit, pre-committed evidence thresholds

Dimension	Hackathon	Business plan competition	Accelerator	NSF I-Corps	Venturethon
Mentor structure	None or ad-hoc judges	Faculty or judges	Single lead mentor and network	Instructor and teaching team	Plural mentorship: multiple mentors with single accountable lead
Post-event pathway	None (typical)	Prize only	Investor introductions	Phase II grant eligibility	Pre-committed pathway slots (incubation, accelerator fast-track or studio integration) with credibility guarantees

The comparison reveals that Venturethon's distinctive position emerges from the simultaneous combination of three properties not jointly present in adjacent formats: open access, in that eligibility is not gated by selectivity (cf. accelerators) or institutional funding (cf. I-Corps); methodological rigour, in that pedagogy is anchored in scientific and hypothesis-driven reasoning rather than ad-hoc build cycles (cf. hackathons) or written planning (cf. business plan competitions); and continuity, in that the programme terminates in pre-committed pathway slots rather than as a stand-alone event. The cohort-size inverted-U and pathway-credibility moderator referenced in the Venturethon column correspond to Propositions P2 and P4 of the framework introduced in Section 4.4.

6. Discussion: Implications, Boundary Conditions, Limitations

6.1 Implications for Entrepreneurship Education Design and Policy

Two implications follow. First, assessment design is the leverage point. Mauer et al (2021) and Kim (2025) both attribute the modest measured effects of entrepreneurship education in part to assessment regimes that do not capture entrepreneurial action. Venturethon's evidence-weighted rubric is one concrete instantiation of an action-centered assessment, in line with calls for "putting pedagogy back in" (Udeozor et al, 2025). The studio-borrowed insistence on systematic process also means programme quality is not solely dependent on individual instructor charisma, addressing a known scalability barrier (Liszt-Rohlf et al, 2026).

Second, the model is institutionally portable. The five Venturethon phases map naturally onto the EU EntreComp framework — opportunity-spotting and valuing ideas in Phase 1; mobilizing others in Phase 2; planning, coping with uncertainty and taking initiative in Phases 3–4; and financial literacy and communication in Phase 5. This mapping suggests Venturethon can be embedded within institutional accreditation regimes rather than running parallel to them, which materially eases adoption by policy actors funding entrepreneurship education infrastructure.

6.2 Boundary Conditions

The model is not universal. At least four boundary conditions limit its applicability. First, deep-tech ventures with multi-year R&D timelines (regulated medical devices, advanced materials, climate technologies) cannot meaningfully complete behavioral-validation tests within an 8-week window; for such ventures, I-Corps-style discovery is more appropriate than the Venturethon outcome rubric. Second, regulated industries where customer access is constrained (defense, certain financial products) may require modified validation protocols. Third, pre-undergraduate participants may lack the cognitive scaffolding for hypothesis-formulation training; Rys (2025) suggests adaptation is necessary for younger cohorts. Fourth, MBAs and other business-educated participants have been shown to resist hypothesis-driven methods (Leatherbee and Katila, 2020), implying a moderation by prior education that programme designers should anticipate.

6.3 Limitations and Future Research

The model presented here is conceptual; the propositions in Section 4.4 require empirical evaluation. A defensible evaluation design would be a quasi-experimental pre/post comparison of Venturethon participants against matched hackathon and business-plan-competition participants, using validated instruments — the Entrepreneurial Self-Efficacy Scale (Chen, Greene and Crick, 1998) and the Entrepreneurial Intention Questionnaire (Liñán and Chen, 2009) — augmented by 12-month venture-creation tracking. Mediation analyses

should test whether peer benchmarking (P2) and hypothesis-formulation training (P3) account for any observed effects.

Two further research directions merit attention. First, the cultural assumptions embedded in lean-startup orthodoxy — the importance of speed, the legitimacy of pivoting, the centrality of individual entrepreneurial action — are themselves a research object; cross-cultural entrepreneurship education research (Kurniawan and Saputro, 2026) suggests these assumptions do not travel without adaptation. Second, the integration of generative-AI tooling into validation sprints (Doshi, Hauser and Ulu, 2025) is changing the cost of MVP creation and customer-interview synthesis, with implications the present model does not yet address.

7. Conclusion

This paper has presented Venturethon as a theoretically grounded, falsifiable conceptual model for entrepreneurship education that integrates experiential learning theory, hypothesis-driven entrepreneurship as evidenced by the scientific-approach research programme, and venture studio architecture. The contribution is not the validation sprint itself — that idea has antecedents in lean startup, I-Corps, and the broader hypothesis-driven tradition — but the explicit translation of venture studio architecture into educational programme design, paired with nine testable propositions and explicit boundary conditions.

The model is offered to the entrepreneurship education community as an object for empirical critique. Independent evaluation, particularly through randomized or quasi-experimental designs comparing Venturethon to alternative formats, is the necessary next step. The data infrastructure and cohort access required for such studies is in principle available; what is missing is the independent evaluative apparatus. Building that apparatus — through researcher-led collaborations, data-sharing agreements, and pre-registered protocols — would advance not only Venturethon as a model but also the broader project of putting entrepreneurship education pedagogy on an evidence-based footing.

Ethics Declaration

No ethical clearance was required for the research presented in this paper. The paper is conceptual and does not report data from human or animal subjects.

AI Declaration

This paper involved the use of an AI language model (ChatGPT by OpenAI) to support language refinement and formatting clarity during manuscript preparation. The tool was used to improve the articulation of ideas originally developed by the author. All AI-assisted texts were reviewed and edited to ensure academic integrity and accuracy. The author bears full responsibility for the content, analysis, and conclusions presented in this manuscript.

Aligning the Expectations for University–Industry Cooperation: Experiences from the Field

Pasi Juvonen
Faculty of Business and Hospitality Management, LAB University of Applied Sciences, Lappeenranta, Finland

pasi.juvonen@lab.fi

Abstract: Finland has lacked economic growth for almost two decades. Universities of applied sciences can help facilitate growth. This article examines misaligned expectations of value creation between SMEs and universities. The study focuses on LAB University of Applied Sciences in South Karelia and Päijänne Tavastia, Finland. LAB runs about 200 RDI projects annually, several of which aim to strengthen SMEs' innovation capabilities and improve cooperation that creates business opportunities. Despite extensive cooperation, UASs and SMEs often differ on what creates value. UASs tend to approach companies with solutions, while companies expect needs-led dialogue. The research asks: What should change to create more mutual value in UAS–SME relationships? Data include findings from regional RDI projects (2023–2025) and sixteen theme-based interviews with LAB staff, other stakeholders, and company representatives. The data were analyzed thematically as a qualitative case. The results suggest that companies want universities to be more customer-focused and proactive in outreach. Companies also need to communicate their needs and participation conditions more clearly in publicly funded RDI projects.

Keywords: Value Creation, Expectations, University-Industry Cooperation, Qualitative Research

1. Introduction

University–industry collaboration (UIC) has been defined as "a method of social cooperation, or a voluntary effort made by industrial entities and educational and research institutions to solve problems or issues of common interest cooperatively" (Ha and Kwon 2016, p. 2). UIC can be observed at different levels and from different perspectives. The UIC phenomenon has a multi-level nature, and the collective actions of UIC require analysis at multiple levels of innovation (Albats 2018).

There are several types of UIC (see Rossoni et al. 2023). This study focuses on the actions needed to build research, development, and innovation (RDI) cooperation between a UAS and companies. For such cooperation to emerge, something valuable must be exchanged: ideas to develop further, products, services, or combinations of these, often in return for time and money. In ideal situations, all parties involved create value for one another while also capturing value for themselves. This forms a solid basis for UIC in the context of RDI. Thinking in terms of mutual benefit supports this process (Covey, 2004). When creating new RDI cooperation, an innovator's task is "to figure out where you create the most value for the customers" (Furr & Dyer 2014, p. 54).

There is an important difference between targeting short-term single deals and building long-term customer relationships. In UIC, the latter is usually the more fruitful objective. Individuals who operate from strong intrinsic motivation rather than external rewards (Pink 2009) are also more likely to invest in long-term relationships. Even when the goal is long-term cooperation, the relationship often begins with a small project. A further challenge is the difference in time horizons: universities typically take a long-term view of research, while industry often expects shorter-term results and implementation (see Rossoni et al. 2023). In an ideal situation, universities offer expertise in new areas that help industry access cutting-edge scientific knowledge, create advanced offerings, and improve existing ones (Polese et al. 2021). In practice, however, universities often end up collaborating with partners who are simply willing to participate in collaborative research projects (Rantala, 2019).

At the beginning of cooperation, there is often little shared understanding to build on. This uncertainty can be frustrating, but it can also become a source of creativity, innovation, and new growth (Furr & Dyer 2014). Before making initial contact with a potential customer, there is a great deal of preparation that can be done. Identifying what would benefit the customer most, the key pain points , and how they could be relieved (Osterwalder et al. 2014) makes it easier to explore UIC possibilities. Entering encounters with a clear focus on the customer and the customer's situation also helps to begin with the bigger picture: the "why" before the "how" and the "what" (Sinek 2009). If there is alignment on why, it becomes easier to find solutions to the other questions. This study examines what should change in practice to create more mutual value in UAS–SME relationships.

2. Data Collection and Analysis

The study draws on three data sources. First, the public results of past projects conducted by LAB and other stakeholders together with companies during 2023–2025 formed the first dataset. Second, sixteen themed interviews with employees in key positions in the company cooperation at LAB, other stakeholder organisations, and companies formed the second dataset. Half of the interviewees were directors (C-level) from different organisations, and the other half consisted of managers and specialists working with UIC. Third, between March 2025 and February 2026, the author participated in over 50 meetings with companies to explore cooperation possibilities. Field notes from these meetings formed the third dataset.

The research question for the study was: "*What needs to be changed to bring more mutual value to relationships between UASs and SMEs?*" The objective was to identify themes that would require more detailed exploration in future studies.

The data were analysed using qualitative thematic analysis (Byrne 2022) to build an understanding of the phenomenon and to describe it as a qualitative descriptive case (Yin 2003). Theoretical sampling (Glaser 1992) guided data collection during the interview phase.

3. Results

This chapter presents the findings in four parts. It first summarises lessons from previous projects, then reports the interview findings, reflects on field notes from company meetings, and finally brings the findings together in a condensed synthesis.

3.1 Results From the Previous Projects

Findings from previous projects suggest that UIC often suffers from weak commitment among universities and other organisations that support companies. Repeated reasons included limited trust, weak mutual measures, and insufficient communication between stakeholders. One project also reported that many companies lack input–output planning for RDI actions, which reduces their willingness to invest in them. Together, these conditions create passivity in UIC.

The same project materials also suggest a clear mismatch in expectations. Companies want research-based knowledge that is easy to access, clearly presented, and practical enough to use in business development. Based on the survey results (n = 291), company representatives felt that cooperation with other companies, rather than with universities, would benefit them most. Because external RDI funding limits what universities can do, this expectation gap must be communicated clearly to avoid false assumptions about UIC.

Suggested solutions in previous projects included building trust through clear and continuous communication, increasing face-to-face encounters, listening more closely to customer needs, setting concrete goals, and creating a digital platform to support ecosystem development and UIC. Across several projects, one recurring idea was that universities could offer companies a practical skill set in project management: planning, goal setting, action planning, implementation, and data-driven decision-making . In other words, a more systematic approach to RDI appears to benefit many companies.

3.2 Results From the Interview Round

The theme-based interviews focused on three areas: the current state of university-industry cooperation, encounters that create value, and an ideal model for cooperation. As an additional prompt, interviewees were asked what they would change if anything was possible. Selected quotations from the interview data are presented in Tables 1–3.

Table 1: UIC: current reality, showstoppers, and ways forward.

Topic / Theme	Quotation
Snapshot of current reality	"…Cooperation would benefit a lot if everyone would be familiarized to dialogue principles…" – IR12 – "We are not familiar with public funding opportunities. You who are working at the universities should tell us what we need to do, and how much our time and money are needed for cooperation." – IR22 – "Universities could describe their offering in a normal business language. It would help company representatives to understand what you offer." – IR23 –

Topic / Theme	Quotation
	"We should focus more on customers and cooperate in that to better serve customers." – IR26 –
Showstoppers for cooperation	"…There is not enough will to learn and develop. Secure and conventional actions are emphasized over others… … It seems that we are lacking courage to build cooperation with companies and therefore we end up developing service models etc. repeatedly." – IR11 – "Universities should not publish fancy strategies if they are not actualizing them with their actions." – IR22 – "Biggest challenge in cooperation is difference in clock rate between companies and universities. I cannot wait for two years for the results I will need in two weeks… … It is not rocket science to show more passion and act more rapidly." – IR24 – "In some cases, the gap between universities' offering or way of presenting the offering, and company needs is too wide. It seems that university representatives live in a little bit different reality than companies do… …In one case a university had certain equipment that company would have needed. It took several weeks to get an answer about whether the equipment could be utilized. In this case the answer was eventually no, but the company had already explored alternative solutions to their need… … Procrastinating will kill cooperation possibilities very quickly." – IR22 – "It is a challenge to a university to get into discussions where mutual value is created with companies. Companies have given feedback that university representatives often use language, which is hard to understand, even when they are asked to be more practical." – IR29 –
Solutions for better alignment of value creation	"Focus should be put more to customer needs. Many companies develop products or services without real market studies. It leads to wasting resources. Universities could discuss more with companies to gain their trust and by that way understanding where the help is really needed." – IR21 – "Universities could describe their service offering at their web pages with common business language rather than with academic language. I bet companies who read the webpages would contact universities more when they would understand the offering better… …University representatives could spend more time discussing with company representatives and asking their needs and will to cooperate." – IR22 – "Also, companies should be more active communicating their needs and in making prompt decisions when and in what topics they want to cooperate. Clear yes or no is fair answer and help both parties to go on or move on." – IR16 – "Communication must be upright… …Sooner the facts are on the table, better it is… … It is okey to hear if something is not possible when reason for that is told. It is better to honestly estimate and communicate risks and not to raise any unnecessary hope." – IR22 – "Universities should not try to capture value too soon. It is not possible. You must first patiently co-create and then capture value for both parties." – IR29 –

Most interviewees saw the current state of UIC as far from ideal. They identified room for improvement on both the university and company sides. Much of the discussion focused on differences in objectives, measures, and incentives between universities and companies, but the strongest emphasis remained on operational issues that could be improved without major policy changes. A repeated message was that universities should communicate in plain business language. Interviewees noted that misunderstandings often arise not only in meetings but also in written communication, such as university web pages. In their view, services for SMEs should be described in more practical, non-academic language.

A major showstopper for future UIC was slow responsiveness from university representatives. Interviewees described cases in which the company's needs were highly time-dependent, yet the company could not get a prompt answer on whether the university could help. When no answer arrived within a reasonable time, the company often stopped considering that university as a future partner. Importantly, the issue was not hearing "no"; it was not getting an answer at all.

Table 2: UIC: interactions that create value.

Topic / Theme	Quotation
Interaction bringing value	"You must understand situation where a company is, what kind of pain points they may have, and what kind of solutions you could offer to relief them. It is also important to recognize who makes decisions and try to figure out what kind of budget there is to solve the existing pain points… …When there is a recognized need, then it is reasonable to offer solutions to it. Otherwise, both parties just waste their time." – IR23 – "Both university people and company people would benefit from being humbler. We could be more open to what our objectives are and how we could both benefit from cooperation. We have examples of compact cooperation, for example during Covid19, and we could act like that also without any existing crisis." – IR24 –

Topic / Theme	Quotation
	"In ideal situation companies make an initiative and openly describe their needs to university representatives. This would be an opening discussion where to start with… … Money is not an issue when enough value is created… Good preparation for communicating value, how the cooperation will help us to develop our business, from customers viewpoint is important." – IR25 –
	"Preparing to meet with potential customers is very important. I will prepare myself to offer something that I already know that a potential customer would benefit from… …I will start by telling why I contacted her, because it is transparent and creates trust… …Creating a relationship with a potential customer first is crucial… …After that I will map customer's need and summarize them with the customer." – IR27 –
	"If you can find a way to produce personal value for the customer, it will make it easier to build cooperation. Value for the company of course comes next, but the personal value comes first." – IR28 –
	"You must be able to communicate with language the companies understand. Otherwise, there is no way forward." – IR29 –

Interviewees emphasized that the exploration phase of cooperation should be straightforward and well prepared. Because time is a limited resource for all parties, each side should arrive ready for discussion. In practice, this means conducting background research in advance to understand the company's situation and potential needs based on publicly available information. The same issue also appeared from the companies' perspective: several interviewees argued that companies must be more open and clearer about their own objectives for UIC. If objectives are unclear or if the company has no goals for RDI, that should first be discussed internally and then with a potential university partner.

Interviewees also recognised a clear paradox. Companies may need long-term university partners for their RDI activities, and they understand that valid research-based results take time. At the same time, they often feel that useful results from cooperation come too slowly. This tension suggests that universities should present more concrete examples of how UIC benefits companies over time. As one interviewee put it: "It is not about who you are, but what you can do to help us to succeed."

In the final phase of the interviews, participants were asked to imagine that they could change one aspect of UIC with a magic wand. Some examples of their answers are presented in Table 3.

Table 3: Using the magic wand with UIC.

Topic / Theme	Quotation
Using a swing of a magic wand	"At Finnish scale we should decide that different areas would focus on certain topics. We need to avoid situations where every university tries to build knowledge and skills, for example defense sector. When some area focuses and becomes good enough at the national and international level, company ecosystem will follow." – IR21 –
	"I have a bias. I think that those who operate with public money do not always use it in an efficient way. It would help if university representatives would openly communicate how the money they have received from companies will be spend." – IR23 –
	"Clock rate for universities' actions must become better. Otherwise, I do not see much hope for cooperation to grow. Currently, in most cases it takes too much time to get things moving ahead… …And we all must learn to speak aloud what needs development in cooperation and overall. Things do not come better if we say that everything is fine." – IR24 –
	"To get every employee to recognize a bigger picture and objectives of cooperation, and act based on it. For example, to explore situation and needs from companies in every encounter with them." – IR15 –
	"A shared platform for universities and companies to list and discuss cooperation ideas. Now and then it may be easier to read and analyze topics before starting discussions about them." – IR25 –
	"UIC should be organized and lead at organisational level." – IR28 –
	"I have been thinking should we arrange our actions in a way that those who have passion for UIC would be organized and led separately from conventional organisation. It would include setting measures and incentives, and freedom to operate." – IR29 –

The "magic wand" question served three purposes. First, it gave interviewees space to express the change they considered most important. Second, it helped identify the level at which change was seen as necessary. In other words, did interviewees locate the problem outside themselves, or did they also see possibilities for changing their own actions? Jim Collins (Collins 2010) presents this distinction as a useful perspective for analysis. Third, the question helped reveal the complexity of the problems described, including whether they resembled tame or wicked problems (Roberts 2014). In most cases, the issues raised could have been addressed without a magic wand.

3.3 Reflections on Field Notes from Company Meetings

3.3.1 Common Denominators of Successful Appointments

The field notes complement the interview data by showing how similar tensions appear in real company meetings. The most promising cooperation partners were companies that already understood that they would need to sit down with university representatives and work together to build new knowledge and skills. When both sides recognised that RDI cooperation takes time and that there are no shortcuts at the beginning of UIC, it became easier to discuss other resources, including funding. In these cases, time was the central issue: once time was allocated, spending money and other resources on UIC became less problematic. Aligning expectations about spending time together to learn supported future negotiations. After the exploration phase, commitment also strengthened as the next steps became clear and the company was guided through them. As the discussion deepened, mutual understanding grew, and trust grew, making it easier to ask questions that could not be asked in the first meeting.

3.3.2 Feedback from Unsuccessful Cases

A common reason for rejecting suggestions to explore RDI cooperation was a lack of time. In several cases, company representatives explained that current business operations already consumed all available attention, making it a poor moment to plan new or longer-term development activities. Even so, many of these representatives remained interested in discussing cooperation later.

Some companies were dissatisfied with the earlier RDI cooperation with a university. In these cases, more detailed follow-up questions were needed to understand the kind of cooperation offered, what the company had expected, and what had actually been promised. Based on these answers, university representatives may have overpromised.

Some entrepreneurs were not interested in exploring RDI cooperation because they felt they already had all the partners they needed. They explained that local universities were already serving their needs well. When no clear gap in the company's needs was recognised, there was little reason to explore UIC further.

Overall, the most common concern expressed by company representatives was that RDI cooperation with universities takes a great deal of time. In many cases, the company's needs were more short-term, and expectations therefore did not match at the start of the discussion. At the same time, many CEOs admitted that closer cooperation with universities may be the only way for companies to learn to plan for the longer term. In most rejected cases, the answer was not "No" but rather "Not now", suggesting that future cooperation may still be possible.

3.3.3 Identified Drivers and Barriers for UIC

Previous studies suggest that UIC challenges can be reduced through tools such as tax incentives and stepwise collaboration: beginning with small projects, building experience, and then increasing complexity (Rossoni et al. 2023). Their review also highlights the roles of relational social capital, trust, cultural alignment, and intermediary support. In practical terms, universities, industry, and government can strengthen UIC by providing clearer incentives, experienced boundary-spanners, goal alignment, and gradual project scaling. These observations are consistent with the present study.

The results of this study are aligned with previous findings on the topic. A condensed presentation of the key themes, findings, and lessons learned from the QTA is shown in Table 4.

Table 4: Condensed results of the QTA.

Theme	Key Finding(s)	Lessons Learned for UIC
Relational foundation	Trust, clear communication, and understandable language are the basic conditions for cooperation.	Without relational credibility, cooperation does not progress to concrete joint action.
Practical alignment	UIC works better when university offerings match company needs, timing, and decision-making realities.	The central barrier is misalignment between academic ways of operating and business expectations.

Theme	Key Finding(s)	Lessons Learned for UIC
Strategic co-creation	Sustained UIC requires shared responsibility, systematic practices, and a focus on mutual value creation.	UIC is most effective when treated as a long-term strategic process rather than a series of isolated encounters.

3.3.4 Summary of the Results

In summary, the findings point to a recurring mismatch between universities' operating rhythm and companies' expectations. Interviewees emphasised the need for more rapid action, clearer communication, stronger customer orientation, and more explicit discussion of mutual value creation. At the same time, they recognised that research-based results take time and that deeper UIC requires patience, shared goals, and continued dialogue.

4. Summary and Discussion

Company representatives expect university representatives to be better prepared for interaction. When companies' situations are understood, relevant solutions are considered, and cooperation options are clearly presented, expectations align more effectively. This short study suggests that this is still often not the case, leaving ample room for improvement. Company representatives also noted that firms should communicate their needs and conditions for cooperation more openly. In addition, the rules governing public RDI funding must be clearly communicated within UIC relationships to avoid misconceptions and false expectations. Both parties save time and effort when cooperation focuses on cases with clear potential to create value for both sides.

Building cooperation with companies is challenging and does not always lead to success. This is a normal part of the UIC exploration phase, yet it may cause university specialists to avoid actions in which failure is possible, even though such experiences support learning. As Chris Argyris (1991) noted, professionals who rarely fail may never learn how to learn from failure. Systematically reflecting on past experiences and using those insights to guide future action, individually or collectively, is essential to better align expectations for value creation at UIC.

Improving UIC and aligning expectations between universities and industry requires more entrepreneurial thinking: understanding what companies value, identifying their pain points, and considering how to address them. As Eric Ries (2017) suggests, this also calls for coaching that strengthens entrepreneurial thinking alongside experimentation, reflection, and learning. Such change may feel threatening to those focused on protecting existing assets and established ways of working, but it also creates opportunities for those able to act, motivate, and mobilise others (Hagel et al., 2012). A new culture begins to emerge when people see that new actions produce results. Better UIC outcomes are possible, but they require a willingness to do the necessary work.

Qualitative analysis does not seek a single correct answer; it offers the researcher's interpretation for readers to assess. Other researchers might interpret the data differently. However, these findings are consistent with earlier studies on the topic.

Ethics Declaration

This research did not require ethical approval. All participants gave informed consent prior to participating in interviews.

AI Declaration

Copilot was used to find and correct grammatical errors and to condense text in the final revision phase. Also, Grammarly was used to correct grammatical errors. No AI tools were used during data collection and data analysis, or during the writing process of the article.

Abstract: This exploratory study examines students' experiences and career-related reflections following participation in an impact entrepreneurship course. Data were collected through structured self-reflection protocols completed by 26 Bachelor-level students from eight countries after participating in an interdisciplinary and international entrepreneurship course delivered in the winter term 2025/26. The course focused on impact entrepreneurship. The material was analysed using qualitative content analysis supported by MAXQDA. Participants described several ways in which the course informed their thinking about future professional pathways. Some expressed interest in establishing an impact-oriented venture, pursuing intrapreneurial roles, or working for mission-driven organisations. Students who did not report a change in their intended career direction nevertheless indicated that social and environmental impact had become an important criterion in evaluating future professional opportunities. The findings provide exploratory evidence of the perceived career relevance of impact entrepreneurship education. They reflect students' self-reported experiences and aspirations rather than observed career decisions.

Keywords: Entrepreneurship Education, Impact Entrepreneurship, Project-based Education, Career-related Student Reflections

1. Introduction

Many universities have sought to integrate sustainability into their curricula; however, substantial progress is still needed (Leal Filho, 2020). Interdisciplinarity plays a major role in successfully addressing sustainability in higher education (Leal Filho et al., 2020). Adding sustainability content to existing entrepreneurship courses leads to higher sustainability literacy among students, especially if students are allowed to choose the challenges to be tackled by themselves (Kaiser, Maisch, et al., 2024).

The present study moves beyond immediate learning outcomes to explore how students describe the relevance of an impact entrepreneurship course to their career-related thinking. Impact entrepreneurship focuses on generating business ideas with a clear focus on environmental, social, and governance factors while also maintaining economic viability (Lehmann et al., 2024). Previous research on entrepreneurship education has primarily examined immediate outcomes such as entrepreneurial knowledge, skills, attitudes, self-efficacy, and entrepreneurial intention (Maheshwari et al., 2023; Otache et al., 2021). However, entrepreneurial intention provides only a partial view of students' future professional orientations, particularly in the context of impact entrepreneurship. Students may also pursue impact through intrapreneurship, employment in mission-driven organisations, or by applying social and environmental criteria to future employers. A narrow focus on the intention to establish a business may therefore overlook other ways in which students relate impact entrepreneurship education to their careers. Despite the growing interest in sustainability-oriented entrepreneurship education, less is known about students' own accounts of these broader career-related reflections.

Accordingly, the aim of this exploratory study is to examine students' self-reported experiences and career-related reflections following participation in an impact entrepreneurship course. The study addresses the following research question:

RQ: How do students describe their career-related reflections and future professional aspirations following participation in an impact entrepreneurship course?

The study does not assess actual career decisions. Instead, it explores students' self-reported perceptions, reflections, and aspirations.

The paper first presents the theoretical foundation of the study, followed by the methodology and results. The theoretical and practical implications of the findings are then discussed. Finally, the limitations of the study are discussed, avenues for future research are suggested, and conclusions are drawn.

2. Theoretical Foundation

The United Nations Sustainable Development Goals (SDGs) provide a widely recognised framework for understanding social and environmental impact. However, only 18% of the SDG targets are currently on track (United Nations, 2025), even though sustainability can lead to companies' stronger financial performance. Most studies report a positive link, while only a few identify reverse or less favourable relationship (Rahi, Johansson, Blomkvist, et al., 2024). Environmental initiatives, social engagement, and the integration of sustainability metrics into corporate strategy have been associated with stronger financial performance and competitive advantage (Affes & Jarboui, 2023; Atz et al., 2019; Coelho et al., 2023). These effects have been observed through indicators such as Tobin's Q, return on assets, market capitalisation, and corporate financial performance (Eccles et al., 2014; Moussa et al., 2024; Rahman et al., 2025; Servaes & Tamayo, 2013). Sustainability can also stimulate innovation, which may further strengthen company performance (Nidumolu et al., 2009). Overall, the evidence suggests that corporate sustainability and financial success can be mutually reinforcing rather than conflicting objectives (Soytas et al., 2019). Such benefits are especially evident in the long run. The effect is also dependent on whether the macro business environment is favourable regarding institutional quality (Rahi, Johansson, & Lions, 2024), legitimacy requirements (Rahi, Johansson, Blomkvist, et al., 2024), and customers' awareness of responsible firms (Akisik & Gal, 2025).

All of this demonstrates that creating a positive impact and contributing to the achievement of the SDGs isn't just possible; it's a necessity for any company that wants to thrive (Che et al., 2024). Sustainability is not a compromise but a catalyst for economic and financial profitability (Pérez Estébanez & Sevillano Martín, 2025). When companies make money through impactful projects, they can reinvest in even bigger ideas, hire more people, and continue to create impact. This can enhance a company's valuation and access to fresh capital (Serafeim, 2015). The effect varies depending on the institutional context in which a company is located (Vargas-Santander et al., 2023), but it is visible everywhere.

Regarding entrepreneurship education, students' entrepreneurial aspirations consistently focus on problem-solving, tackling significant challenges, and the profound satisfaction derived from self-employment (Venugopal, 2025). Entrepreneurship education is one of seven main factors which determine entrepreneurial intention (Maheshwari et al., 2023). Students are more likely to acquire entrepreneurial skills through effective education and training (Gieure et al., 2019). Their intention to become entrepreneurs increases significantly after exposure to entrepreneurship education (Otache et al., 2021) and it mediates the effect of need for achievement, locus of control, and innovativeness on entrepreneurial intentions (Biswas & Verma, 2022). Especially green entrepreneurial intentions generated through entrepreneurship education were found to have a direct positive effect on green entrepreneurial behaviour (Yi, 2021).

However, entrepreneurial intention captures only one potential outcome of entrepreneurship education. Experiential approaches to entrepreneurship education engage students in learning through action, real-world problem-solving, and the application of theoretical knowledge in practical settings. Bell and Bell (2020) conceptualise experiential entrepreneurship education as a process informed by reflective and transformative learning, in which experience is gained through interpretation and subsequent application.

Reflection is therefore not merely an additional course activity but an important mechanism through which students interpret their experiences and relate them to future action. Reflective learning enables learners to reconsider assumptions, integrate new insights with existing knowledge, and identify implications for their further development. Structured and reflective questions can support this process by directing attention towards the meaning of the experience and its possible relevance beyond the immediate educational setting (Fessl et al., 2017). Donnellon et al. (2014) argue that entrepreneurial learning also involves the construction of entrepreneurial identity, particularly when students participate in action-based learning. From this perspective, participation in an impact entrepreneurship course may provide students with an opportunity to consider different impact-oriented professional roles, without necessarily leading to an intention to establish their own venture. Such roles may include intrapreneurship, employment in mission-driven organisations, or the incorporation of social and environmental criteria into future employment decisions.

Figure 1 shows the theoretical foundation for this research.

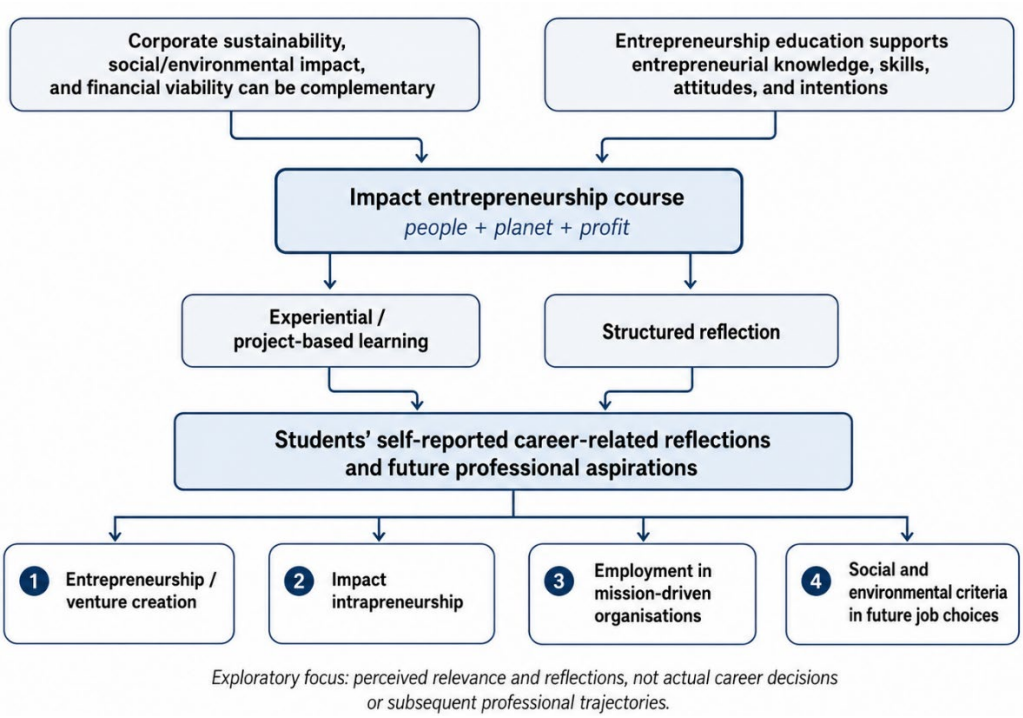

Figure 1: Theoretical foundation of the study (source: own illustration).

The evidence reviewed here converges on two points: companies that create positive impact advance the SDGs while simultaneously improving their long-term financial outcomes, and entrepreneurship education effectively fostering entrepreneurial intention among students. The question is whether this includes intrapreneurial intention, working in mission-driven organisations, or evaluating sustainability criteria for future career choices.

3. Methodological Approach: Research design

The research design of this study is based on a pragmatist perspective and an inductive approach to data analysis. The study adopts an exploratory qualitative design and examines students' structured self-reflections after participating in an interdisciplinary, international bachelor-level entrepreneurship course. The research was conducted within one specific educational context and at one point in time. Its purpose was not to establish causal effects or produce statistically generalisable findings, but to explore how students described their experiences, career-related reflections, and future professional aspirations.

3.1 Educational Context

The entrepreneurship course in which the study was conducted was delivered during the winter term 2025/26 at Munich University of Applied Sciences. The instructors from the Business School, along with the Department of Applied Sciences and Mechatronics, collaboratively facilitated an entrepreneurship course. Subject-matter expertise in food, green tech, and agriculture was ensured by inviting a food scientist from Wroclaw University of Economics and Business in Poland. This course was specifically designed for students from participation departments as well as international incoming students. Employing a problem-based learning methodology and using a flipped-classroom approach for the theoretical underpinnings, students were challenged to devise innovative business solutions addressing existing issues within the food, green tech, and agriculture industries. The faculty, in conjunction with their business network, introduced potential practical challenges for the participants to work on. Additionally, students were invited to come up with their own challenges they were keen on finding solutions to, as this was a recommendation from previous courses (Kaiser, Maisch, et al., 2024). Impulse speeches from founders talking about their sustainability journeys additionally offered input for problem and need finding, and for solution spaces. This element was also added based on feedback from previous classes (Kaiser, Krzywonos, et al., 2024). This educational design provided students with direct exposure to impact-oriented problem solving, interdisciplinary teamwork, and financially viable business models, thereby creating a suitable context for examining their subsequent reflections and professional aspirations.

3.2 Data Collection and Analysis

Data were collected through structured self-reflection protocols completed by 26 students from Germany, Spain, France, Ireland, the United Kingdom, Tunisia, Palestine, and Hungary. The reflections captured students' self-reported experiences and perceptions after the course.

Four open-ended questions from the self-reflection protocol were selected for analysis because they directly addressed the study's focus on career-related reflections, impact entrepreneurship, and future professional aspirations:

- What is the most important aspect for your career decision and why?
- What have you learned about impact entrepreneurship?
- Has the knowledge you acquired on impact entrepreneurship changed your career plans? If yes, how?
- Would you consider becoming an entrepreneur?

Because the questions elicited retrospective and self-reported accounts, the responses were interpreted as students' perceptions and declared aspirations rather than as evidence of actual changes in career plans or subsequent professional trajectories.

The data was analysed using qualitative content analysis (Kuckartz & Rädiker, 2022), supported by the software MAXQDA used to organise, code, retrieve, and compare the textual material. Qualitative content analysis is a method that involves organizing text, audio, or visual data into categories through the development and implementation of a structured coding framework, allowing for quantitative analysis (Saunders et al., 2023). In this study, solely text data derived from the self-reflection protocols was utilized.

Initially, the first author analysed and coded 20% of the entire dataset (five protocols) to establish an initial coding framework. The primary categories of this coding scheme were developed deductively, based directly on the protocol questions. Responses to the question "What is the most important aspect for your career decision and why?" were assigned to the main category *Career decision aspects*. The question "What have you learned about impact entrepreneurship?" built the main category *New insights on impact entrepreneurship*. And the questions "Has the knowledge you acquired on impact entrepreneurship changed your career plans? If yes, how?" and "Would you consider becoming an entrepreneur?" were analysed within the main category *Changes in career plans*. The sub-categories were constructed inductively and in vivo during the coding phase. The coding framework was refined iteratively during the analysis.

The AI-Assist functionality in MAXQDA was only used to summarize answers in bullet points. However, it was not used for code generation, category development, or interpretation because the automatically generated paraphrases did not adequately preserve the intended meaning of the responses. Once the initial coder had established the foundational coding system, all authors jointly reviewed the framework and applied it to two additional protocols. Throughout this process, minor adjustments were made to the nomenclature of several codes, and one coded paraphrase was reassigned to a different subcategory.

A codebook was developed that provided definitions and anchor examples for each code, facilitating consistent interpretation and discussion among the authors. All modifications to the coding framework were documented using the logbook feature of MAXQDA to ensure traceability and reliability. Once inter-coder reliability was confirmed, the first author manually coded the rest of the self-reflection protocols. The final coding system consisted of three main categories and 20 subcodes. Figure 2 shows the coding system.

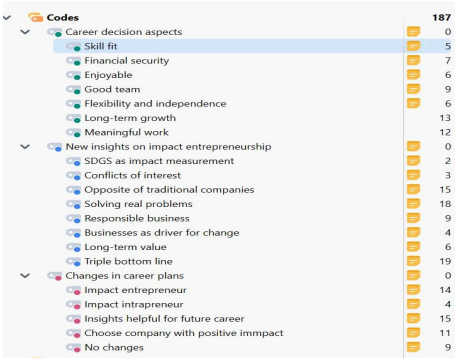

Figure 2: Coding system overview (source: own illustration from MAXQDA).

4. Results

The findings are presented according to the three main categories: Career decision aspects, New insights on impact entrepreneurship, and Changes in career plans.

First, a quantitative analysis on the three main codes and their respective subcodes was run and displayed in the proportional code frequency matrix in Figure 3.

Career decision aspects	# of coded segments	percentages
Long-term growth	13	22,41
Meaningful work	12	20,69
Good team	9	15,52
Financial security	7	12,07
Enjoyable	6	10,34
Flexibility and independence	6	10,34
Skill fit	5	8,62
SUM	58	100,00

New insights on impact entrepreneurship	# of coded segments	percentages
Triple bottom line	19	25,00
Solving real problems	18	23,68
Opposite of traditional companies	15	19,74
Responsible business	9	11,84
Long-term value	6	7,89
Businesses as driver for change	4	5,26
Conflicts of interest	3	3,95
SDGS as impact measurement	2	2,63
SUM	76	100,00

Changes in career plans	# of coded segments	percentages
Insights helpful for future career	15	28,30
Impact entrepreneur	14	26,42
Choose company with positive immpact	11	20,75
No changes	9	16,98
Impact intrapreneur	4	7,55
SUM	53	100,00

Figure 3: Proportional code frequencies (source: own illustration from MAXQDA).

For *Career decision aspects*, the most frequently mentioned aspect was *Long-term growth*, reflecting a preference for roles that offer continuous learning and personal development. An anchor example for this category is the following quote: "…continuously develop my skills, take responsibility, and see clear progress over time." (SP_1, Pos. 19). Meaningful work was the second most frequently coded theme. As one student explained: "The most important aspect for my future career decision is finding meaning in what I do." (SP_13, Pos. 19). Other recurring criteria included working within a supportive team and achieving financial security. Enjoyment, flexibility, and alignment between the position and the student's individual skill set were coded less frequently. The results for the main category *Career decision aspects* do not surprise, except for the fact that *Meaningful work* ranks second. This might be since students who consciously chose an entrepreneurship class (among seven other possible courses) that focuses on impact entrepreneurship generally are more prone to choosing a job that gives them a sense of meaning.

Regarding *New insights on impact entrepreneurship*, one fourth of the coded segments refer to the *Triple Bottom Line*, meaning that it is possible to make money and at the same time have a positive impact on people and planet, as outlined in chapter two. This theme was consistent with the course's emphasis on integrating people, planet, and profit. An illustrative exemplar citation is: "…not about choosing between profit and purpose, but about designing them to reinforce each other." (SP_6, P. 2). In that regard, a lot of students also mentioned that impact entrepreneurship solves real problems: "…creating a solution to make the future better than today." (SP_3, P. 2) and is the opposite of a traditional company only focusing on profit: "I realized that business does not have to be harmful or only profit driven. Instead, it can be a powerful tool for positive change." (SP_8, Pos. 21). Less frequently coded themes included the responsibility of all businesses to contribute to sustainability, the role of entrepreneurship as a driver of change, the relevance of the SDGs, the need to manage conflicts between competing objectives, and the long-term orientation. The responses indicate that participants were able to articulate several of the central concepts addressed during the course. However, because the data were collected through end-of-course self-reflections, the findings represent students' reported interpretations of their learning rather than an independently assessed measure of knowledge acquisition.

The category *Changes in career plans* captured students' self-reported reflections on whether and how the course-related learning was relevant to their intended professional pathways. While 16,67% of the coded segments state that students' career plans have not changed, almost one-third referred to insights that participants considered relevant to their future careers. One Student wrote that the course: "…has given me a clearer sense of direction for my future career." (SP_15, P. 2). More than one quarter of the coded segments referred to the possibility of becoming an impact entrepreneur. Some participants explicitly connected the course experience with increased interest in venture creation. For example: "Everything I have learned about impact entrepreneurship has changed my professional plans, since in the near future I would like to be an entrepreneur, and as I said before, you not only have to focus on the economic benefits, but also on the positive impact you can have on society." (SP_26, Pos. 20). One student team subsequently continued developing the business idea created during the course, contacted the university's start-up support unit, and participated in a pitch competition. This observation provides contextual evidence of continued engagement but was not treated as systematic evidence of a change in longer-term career behaviour. More than one-fifth of codes in this category are referring to students now considering working for a company with a positive impact, e.g.: "I realized that I want my future work to have a positive contribution to society or the environment beyond financial success as well. I am now more interested in working for purpose-driven companies, social enterprises, or organizations that integrate sustainability into their core strategy." (SP_15, P. 2). Becoming an impact intrapreneur, however, was rarely mentioned. The resulting implications for course design are discussed in Section 5.2.

Figure 4 provides a visual representation of the relative prominence of the subcategories within *Changes in career plans*. The most visible themes concern insights considered useful for future careers, interest in impact entrepreneurship, and interest in working for organisations that create positive impact.

Figure 4: Code cloud for *Changes in career plans* (source: own illustration from MAXQDA).

In response to the research question, the findings show that students associated participation in the impact entrepreneurship course with different forms of career-related reflection. These included greater attention to meaningful and impact-oriented work, consideration of employment in mission-driven organisations, and, for some participants, interest in founding an impact-oriented venture. The findings concern students' self-reported perceptions and aspirations and do not demonstrate that the course caused actual changes in career decisions or subsequent professional trajectories.

5. Discussion

This exploratory qualitative study provides insights into how students described their career-related reflections and future professional aspirations following participation in an impact entrepreneurship course. The following sections discuss the study's theoretical and practical implications, as well as directions for future research.

The study contributes to entrepreneurship education research by extending the discussion beyond entrepreneurial intention as the primary career-related outcome. Previous research has largely examined whether entrepreneurship education increases students' intention to establish a venture. The present findings suggest that students may associate impact-oriented professional activity with a broader range of pathways, including venture creation, employment in mission-driven organisations, intrapreneurship, and the use of social

and environmental criteria when evaluating future employers. The exploratory contribution therefore lies in identifying how students themselves describe these different possibilities rather than in demonstrating actual career changes.

The findings also support a broader understanding of the relationship between impact and financial viability. Participants frequently described profitability not as being incompatible with positive impact, but as a condition for sustaining and scaling it. This interpretation is consistent with prior literature showing that sustainability and financial performance can be complementary.

A further theoretical implication concerns the role of experiential and reflective learning in impact entrepreneurship education. The combination of project-based work, interdisciplinary collaboration, exposure to real-world challenges, and structured reflection may provide students with opportunities to connect course experiences with possible professional roles. The present study does not establish that these pedagogical elements caused changes in students' aspirations. Nevertheless, the findings suggest that such course designs can create a context in which students articulate and consider creating impact in their professional futures.

Taken together, the findings suggest that the career-related relevance of impact entrepreneurship education may be better understood as a spectrum of perceived professional possibilities rather than as a single intention to become an entrepreneur.

5.1 Implications for Practice

The findings have practical implications for educators designing impact entrepreneurship courses. They suggest that students may benefit from opportunities to explore several forms of impact-oriented professional engagement rather than being presented primarily with venture creation as the expected outcome of entrepreneurship education.

In their self-reflections, some students expressed interest in becoming employed in organisations with a clear social or environmental mission. Even where participants did not report a fundamental change in intended career direction, some indicated that impact-related criteria had become more relevant to their evaluation of future professional opportunities.

Impact intrapreneurship was mentioned less frequently than entrepreneurship or employment in mission-driven organisations. This may indicate that students were less familiar with intrapreneurship as a potential professional pathway.

In response, the instructors plan to place greater emphasis on intrapreneurship in future editions of the course by introducing challenges situated within established organisations. This may help students better understand how social and environmental impact can also be pursued without founding a new venture. The findings also informed the further development of the reflective component of the course. In future editions, the instructors plan to expand the self-reflection exercise to address students' personal and professional aspirations more explicitly, drawing on the concept of entrepreneurial life design (Wolf et al., 2024). The revised activity will include two tasks. First, students will be asked to reflect on the following questions:

- What is your personal vision for your life?
- What is your professional vision?
- What kind of mission would you like to follow?
- Which values are especially important to you?
- How would you like to position yourself in the long term?
- What kind of person, professional, intrapreneur, entrepreneur, or leader, would you like to become?

Second, students will be asked to write a short press release about themselves and their achievements ten years after graduation. They will be encouraged to approach the press release as a future-oriented narrative: "What would you like others to read about you in ten years?"

5.2 Limitations

The findings of this exploratory qualitative study may offer useful insights for educators designing impact entrepreneurship courses. However, they were generated within one specific educational context and should

not be treated as statistically generalisable to other institutions, courses, or student populations (Saunders et al., 2023, p. 214).

The analytical procedure can be replicated with future cohorts, but the findings themselves are context-dependent and may differ across groups, institutions, course designs, and time periods. Repeating the study with subsequent cohorts would therefore support comparison and analytical replication rather than exact reproduction of the present findings.

The alignment between the self-reflection questions and the research question supported the relevance of the collected material. Transparency of the analytical process was strengthened through a detailed description of the educational context, the development of a codebook with definitions and anchor examples, and documentation of all changes to the coding framework in the MAXQDA logbook (Goldenstein et al., 2018, p. 104).

Because the study relied on a single type of self-reported qualitative data, methodological and data-source triangulation were not possible.

As the authors were also involved in teaching the course, their prior expectations and familiarity with the participants may have influenced both data interpretation and students' responses. The involvement of an external researcher or independent coder could have provided an additional analytical perspective.

Student assessments based on self-reflection protocols could have led to a potential bias, as students might have produced socially desirable responses because they may have believed that reporting positive learning outcomes or career-related changes would be viewed favourably by the instructors. This potential bias warrants consideration, and the validity of the data should be approached with caution. Nevertheless, several students explicitly reported that the course had not changed their intended professional direction, including students who received high grades. This suggests that socially desirable responding may not have determined all responses, although it cannot be ruled out.

Because the reflections were collected at one point in time, immediately following the course, the findings represent a snapshot of students' self-reported perceptions and aspirations. A longitudinal follow-up would be required to examine whether the professional pathways described by participants were subsequently pursued and whether the reported reflections remained salient over time. Such a design would also help distinguish short-term post-course reactions from more enduring developments in professional orientation.

A further limitation concerns the wording of the self-reflection question asking whether the acquired knowledge had changed students' career plans. Because this question explicitly introduced the possibility of change, it may have encouraged participants to frame their responses in those terms.

5.3 Future Research

The exploratory findings provide a basis for examining the following proposition in future research: integrating explicit discussion of different impact-oriented professional pathways into entrepreneurship education may be associated with changes in students' career-related perceptions and intentions. This proposition could be examined through multi-institutional and longitudinal research in which students' career-related perceptions, entrepreneurial intentions, and professional preferences are measured before the course, immediately after it, and at later follow-up points. Including comparison groups would help distinguish course-related developments from broader changes occurring over time.

Another avenue for future research involves a more detailed examination of students' career aspirations to understand their initial focus before the course, the reasons and nature of any shifts, their specific contributions to the SDGs, and how they intend to generate income in their chosen career paths. Such research could investigate how students understand different impact-oriented professional roles, including entrepreneurship, intrapreneurship, and employment in mission-driven organisations, as well as how they evaluate possible tensions between financial security, personal development, and social or environmental impact.

Semi-structured interviews could provide deeper insight into the reasoning underlying students' self-reported aspirations and decision criteria. These data could be examined through qualitative content analysis (Kuckartz & Rädiker, 2022). Future studies could also compare students from different disciplines, countries, and educational formats to assess the transferability of the identified patterns.

Finally, following up the present participants after graduation would make it possible to compare their earlier self-reflections with actual employment, intrapreneurial activity, or venture creation.

6. Conclusions

In conclusion, this exploratory qualitative study provides insight into how students described their career-related reflections following participation in an impact entrepreneurship course structured around people, planet, and profit. The findings extend the discussion beyond entrepreneurial intention by showing that students associated impact-oriented work with several possible professional pathways, including employment in mission-driven organisations, intrapreneurship, and the use of social and environmental criteria in future job choices. Participants also commonly described financial viability and positive impact as compatible rather than conflicting objectives. For educators, the findings support the inclusion of experiential, project-based, and structured reflective activities that expose students to multiple ways of pursuing impact-oriented professional work. However, the results reflect students' self-reported perceptions collected within one course and do not demonstrate actual changes in career behaviour or subsequent professional trajectories. Longitudinal and comparative research is therefore needed to examine whether the identified reflections translate into later professional choices.

Ethics Declaration

For this study, self-reflection protocols collected from students enrolled in an entrepreneurship class were analysed to explore specific learning and developmental aspects. The data obtained through these protocols is intended to contribute to the understanding of students' career choices and educational outcomes within this context. Prior to the collection of the self-reflection protocols, students were fully informed that their reflections would be anonymized and used for research purposes. This information was provided verbally and in writing via slide decks and the learning management system, ensuring that students understood the nature and purpose of the research and their involvement.

The self-reflection protocols were anonymized by the researchers before any analysis commenced. Anonymization involved removing any identifiable information from the documents to protect the privacy of the participants. Each protocol was assigned a unique identifier ranging from SP_1 to SP_26 and stored in the MAXQDA software for analysis. This process ensures that individuals cannot be identified from the data. The anonymized data is stored securely and is only accessible to the research team. The protocols will be used solely for the purpose of this research and will be retained in accordance with institutional data management policies. After completion of the research, data will be kept in a secure archive for potential future studies, contingent upon further ethical review and approval.

This research complies with the ethical standards set forth by Hochschule München University of Applied Sciences. The authors conducted the university's ethical self-assessment questionnaire prior to data collection.

The research involves minimal risk to participants as it solely utilizes anonymized expressed reflections. The results of this research aim to benefit educational methodologies and improve pedagogical strategies in entrepreneurship education, offering value to both educators and students. For any questions or concerns regarding this research, participants or interested parties may contact the main author.

AI Declaration

The authors hereby declare that they have written this paper independently and have not used any AI sources and aids other than those specified in the methodology chapter, i.e., the AI functionalities of MAXQDA. All adopted content, as well as content generated with AI support, has been identified. Excluded from that are orthographic or grammatical corrections, translations, and improvements of formulations that do not change the meaning. For these changes, the university's own ChatGPT version (4.0) and Grammarly were used. Additionally, the authors have asked Notebook LM to give reviewer feedback on the first version of the paper. This feedback (focusing on more depth in the literature section) was considered and an additional paragraph on entrepreneurial intention added, without the use of AI. The authors declare that they have only used AI tools as an aid, that they have critically reviewed the content generated by AI, and that their independent cognitive and creative influence prevails in this work.

Network Capital as a Success Factor for Entrepreneurs: Beyond the Buzzword

Eva-Yasmine Kaiser and Jan Schikofsky
Department Business, Design, Technology, Macromedia University of Applied Sciences, Stuttgart, Germany

eykaiser@macromedia.de
ja.schikofsky@macromedia.de

Abstract: Startup success has long been a point of interest within entrepreneurship discussions and ecosystems. Startup and entrepreneurial success have often been based upon and measured by hard factors such as performance and sales volume. Although these hard factors are important, there is increased discussion surrounding the topic of networking. Particularly, the topic of social capital and weak ties. There is often acknowledgement that social contacts and networks help shape the success of an entrepreneur equally. Network capital research supports the vitality of social relationships in the growth and sustainability of startups. This paper thus explores the role of network capital and weak ties in building ecosystems as a success factor, analyzing how these factors shape entrepreneurial endeavors. This research paper includes theories from the Expectancy-Value-Cost Theory. The research follows a quantitative method. Data was collected via a survey with 200 participants within the entrepreneurship community. The data was analyzed using Structural Equation Modeling (SEM) and SmartPLS. This research identifies significant influencing motivational factors behind network-oriented behavior patterns. The findings also demonstrate mental tradeoffs between expectations and costs (time and effort) associated with networking activities. In this regard, self-expected competence can be identified as an important influencing factor on network-related activities. Furthermore, the results show that network activities significantly affect startup success in different ways (i.e., access to external investors and funding, internal startup performance, and identification of new business opportunities). Our findings contribute to entrepreneurship research by explaining important interrelations between motivational influencing factors on networking activities and building supportive ecosystems for progressive startup development. Practical implications include making a concerted effort to invest in social capital, network and maintain relationships. This may not only positively affect startup success, but in turn can lead to a positive return on investment in terms of crucial resources such as knowledge, expertise and opportunities.

Key words: Entrepreneurs, Startups, Social Capital, Weak Ties, Expectancy-Value-Cost Theory, Success

1. Introduction

The success of startups has long been a focal point of academia, policy makers and investors (Alvarez-Salazar, Seclen-Luna and Vasquez Neyra, 2025) within entrepreneurship discussions and innovation ecosystems. Traditional frameworks for analyzing entrepreneurial performance and success have often focused on quantitative aspects such as a founder's individual capability and skillset. Further key success determinants have been the innovativeness and potential market opportunities of the startup. However, the past decade has seen an increasing awareness that who you know matters just as much as what you know. The rise of network and social capital as a concept in entrepreneurship studies highlights the transformative power of social relationships, weak ties, and network effects in the growth and sustainability of early-stage ventures. This is in part due to the supportive ecosystem, not only quantitative factors. This paper offers relevant insights into how entrepreneurs' ecosystem shapes access to resources, opportunity discovery, funding, and knowledge, which in turn aides in success. From financing and innovation to talent acquisition and market access, networks uphold and support core entrepreneurial processes. Entrepreneurial networks function as catalysts connecting entrepreneurs to opportunities and resources (Frid, Wyman and Shaver, 2025) and influence startup funding outcomes (Abakah, Kim and Somé, 2025). Data emphasizes the scale of this challenge since roughly 90 percent of early-stage startups fail within five years, most often due to capital shortages, product-market-fit or poor ecosystem connections (Agarwal, 2025; Calloway, 2025). These figures reinforce the importance of intangible network resources extending beyond technical knowledge. While recent studies highlight the growing importance of entrepreneurial ecosystems (Babar, 2025) research remains limited on the interplay between social capital, networking, and the associated trade-offs. In particular, expectancy–value cost theory has been underused in explaining networking decisions. The cost component is often neglected, as noted by earlier scholars who argue that researchers have "forgotten" this dimension (Flake, 2012, p. 1), a gap that persists in startup research. Existing studies tend to treat costs as mediators or enablers rather than as core motivational factors (Chammassian and Sabatier, 2020). As a result, entrepreneurship research still lacks models that incorporate perceived costs in networking and relationship-building decisions, despite the significant time investment and opportunity costs faced by founders.

1.1 A Brief History of Entrepreneurship Theory

Entrepreneurship as a field of study has evolved from classical economic discussions of innovation and profit to multifaceted perspectives which include, but not limited to, sociological, psychological, and strategic perspectives. The earliest beginnings of entrepreneurship theory can be traced to Richard Cantillon (18th century), who characterized entrepreneurs as risk-bearers navigating market uncertainties (Dias, Rodrigues and Ferreira, 2019). Later, Joseph Schumpeter (1934) furthered this perspective, deemed entrepreneurs as innovators, and introduced the notion of "creative destruction"—the process through which entrepreneurs disrupt existing markets through innovation (Tülüce and Yurtkur, 2015). In the mid- to late-20th century, scholars like Drucker emphasized opportunity identification and „Theory of Business" (Felin and Zenger, 2017, p. 262), while later research such as Felin and Zenger positioned entrepreneurs as theorists who generate knowledge of markets and create value.

1.2 Entrepreneurship vs. Startups

The distinction between entrepreneurship and startups has drawn growing scholarly attention. Abdelghani (2024) notes that recently there has been a surge in startups alongside small and medium-sized enterprises (SMEs). These two words are frequently inferred synonymously, although key differences exist. Abdelghani points out that while both involve opportunity orientation and innovation, startups tend to exhibit scalability and high-growth intent, whereas SMEs focus on stability and incremental development. Abdelghani also refers to startups as "aspiring entrepreneurs" (p. 2499), reflecting their ambition-driven, innovative, adaptive, and dynamic nature within the entrepreneurial ecosystem. Ehsan (2021) underscores the economic importance of startups, emphasizing that they foster innovation, job creation, and economic diversification. Yet Ehsan observes that a lack of definitional clarity persists. Ehsan's refers to startups at one point referred to as "budding entrepreneurs" (p. 1), further highlighting their emerging identity and evolving nature within broader entrepreneurial classifications. Startups can therefore be conceptualized as a specific subset of entrepreneurial ventures characterized by high-growth ambitions, innovation orientation, and scalability potential, often under conditions of extreme uncertainty (Arinkina, 2025). They can be temporary in nature and are designed for scalability. Startups create value and solve problems with many risks Alvarez-Salazar et al. (2025). For this research paper, startups and entrepreneurs will thus be used interchangeably.

1.3 The Importance of Networking

Networking is an important and strategic resource available to entrepreneurs. According to Singh and Basri (2024) „The process of building, cultivating, and mobilizing network links is known as networking" (p.6), which can provide information, resources, legitimacy, or opportunities. According to Eyo-Udo et al. (2025), networking not only improves visibility but also facilitates collaborative learning and information exchange that enhances survival and growth. *Eyo-Udo et al.* (2025) note that „the transformative power of connections in shaping the trajectory of enterprises" (p.824). Entrepreneurial networks encompass personal, professional, and organizational relationships—ranging from mentors, stakeholders and investors to customers and partners. These connections perform multiple roles in a startup's life cycle. Some examples include but are not limited to access to funding, knowledge transfer and resource access along with legitimacy. Startups embedded in strong networks are more likely to secure financing due to enhanced trust and investor confidence (Abakah *et al.,* 2025). Networks transmit tacit knowledge and other informational resources (Peng, Li and Liu, 2022). Networks may connect startups to early adopters, suppliers, and strategic partners, which could expand their ecosystem. Perotti and Yu (2015) discuss the role of social networks in terms of „startup tribes" capturing how entrepreneurial connections join communities to create support. The intertwined ecosystems enhance collective resilience, performance, and probability of success. Singh and Basri (2024) note that entrepreneurial networking behavior is an antecedent of business performance. Moreover, the networking landscape has shifted dramatically toward digital environments. Online networking can extend network reach and transform traditional social capital, reaching potential contacts and connections that would not be possible in traditional settings.

1.4 Social Capital: Definition and Role in Entrepreneurship

Social capital is defined by Nahapiet and Ghoshal (1998) as the „sum of the actual and potential resources embedded within, available through, and derived from the network of relationships possessed by an individual or social capital unit" (p. 243). It encompasses trust, shared norms, and relationships facilitating coordination

for mutual benefit and shared advantage. Social Capital can also be seen as „the size of a founder's network" (Frid *et al.,* 2025, p. 29). Within entrepreneurship, it constitutes the infrastructure and platform through which founders access knowledge, legitimacy, and opportunity. Do *et al.* (2025) argue that social capital promotes innovation by supporting knowledge combination—where insights from diverse stakeholders can merge to create new offerings. Rijal, Utomo, and Ramdhani (2024) agree that social capital enhances collaboration and provides emotional and practical support for entrepreneurs. It can also be a vital resource particularly for nascent entrepreneurs (Mickiewicz *et al.,* 2025).

1.5 Weak Ties: Origins of the Concept

An important concept to mention within the topic of networking and social capital is the strength of weak ties (Granovetter, 1973). Granovetter posits that weak acquaintances, defined as acquaintances or casual contacts, often provide richer and newer information than close friends. De Witte (2023) observes, the theory's relevance has only deepened amid digital connectivity. Dizikes (2022) confirms the importance of weak ties on LinkedIn and Fronczak, Mrowinski and Fronczak (2022) confirm the strength of weak ties theory within scientific collaborations. Further advancing this area, Feehan, Hai Son, and Abdul-Quader (2022*)* introduced refined empirical methods for gauging and evaluating the scope of weak-tie networks. This demonstrates the continued interest and importance of the weak tie theory.

1.6 Weak Ties in Entrepreneurial Contexts

For startups, weak ties function as bridges between isolated social clusters. Nozawa and Kang (2024) note that as ventures mature, they increasingly rely on weak ties for novel insights and external referrals and are thus more influenced by weak ties. They deliver diverse knowledge access across industries, certain skillsets, capital and labor which are vital to startups and their business activities. Cheng (2025) extends Granovetter's theory into the digital era, showing that weak-tie interactions on online platforms underpin successful startup funding. Likewise, Ricciardi, Cerrato, and Antoldi (2025) demonstrate that in micro-firms, collaborators and informal contacts spark innovation by bridging knowledge gaps. Weak ties and informal networks offline and online can create a connectivity that helps startups grow, especially in the beginning phases.

1.7 Network Capital and Entrepreneurial Success

Network capital—combining the structural and relational elements of social capital—has emerged as a decisive factor for startup performance. It represents not merely the number of contacts but the ability to mobilize and convert those relationships into actionable resources. Abakah et al. (2025) confirm that network proximity predicts early-stage investment success. Frid et al. (2025) find that "emerging gazelles," or high-growth startups, flourish within supportive network infrastructures. Alvarez-Salazar et al. (2025) likewise identify networking as a leading stimulus and factor of growth and collaboration. Specifically, they demonstrate that in Peruvian startups, networking, experimentation, and financing jointly drive rapid expansion—which is central to startup ecosystems. Ricciardi et al. (2025) show that micro-firms use network collaboration to sustain continuous innovation through social proximity and professional diversity—dynamics mirrored by tech startups seeking agility. Similarly, Perotti and Yu (2025) note that the network structure of the startup is essential to business success. Entrepreneurs can leverage network capital through several mechanisms such as accelerators and incubators, meetups, mentorship programs and digital ecosystems. These layered systems generate network effects, where each additional connection enhances shared opportunity. As such network capital can be an input for growth and an outcome of sustained entrepreneurial collaboration (Frid *et al*., 2025; Ricciardi *et al.*, 2025).

2. Theory and Research Model

Expectancy-Value-Cost Theory (EVC) is used for analyzing the motivational factors behind social capital-oriented network activities and building weak ties (Eccles et al., 1983). According to EVC, human motivation is based on three main factors: 1) expectancy (a feeling of competence regarding a certain task, perception of having the skills to be successful in the activity), 2) perceived value (involvement and perceived personal benefit regarding the task), as well as 3) cost (the intention to avoid effort and time associated with the task) (Kosovich et al., 2014, Eccles et al., 1983). In addition to these core factors, it has been shown that intrinsic motivation (perceived emotional value and a feeling of self-fulfillment) represents a promising extension of the theory for predicting human behavior (Marlek, Sarin and Haon, 2020).

2.1 Hypotheses

If one follows the EVC, then one can assume that entrepreneurs are more motivated to invest in social capital, because they then perceive themselves as competent in successfully engaging in these activities. Furthermore, we assume that startups will be motivated to show network-oriented behavior if respective entrepreneurs value social capital building activities. On the other hand, they may avoid network-oriented activities associated with high perceived effort, thus leading to the following hypotheses:

H1a/b: *"he higher entrepreneurs' expectations of success regarding networking activities"…*

H2a/b: *"The more value entrepreneurs associate with networking activities"...*

…"the more likely they are to invest time and effort in (a)social capital/(b)building weak ties."

H3a/b: *"The more effort entrepreneurs associate with networking activities, the more likely they are to avoid investment in (a)social capital/(b)building weak ties."*

Finally, research shows that intrinsic motivation can also play a crucial role in explaining human behavior, which goes beyond external influencing factors. In this regard, individuals are more motivated to show a certain behavior if they feel self-determined and have fun while showing this behavior. On the other hand, purpose can play a crucial role as a motivational driver. Thus, it can be assumed that perceived value can also affect intrinsic motivation leading to the following hypotheses:

H4a/b: *"The more intrinsically motivated entrepreneurs are towards network-oriented activities, the more likely they are to invest time and effort in (a)social capital/(b)building weak ties."*

H5: *"The more entrepreneurs value networking activities, the higher their intrinsic motivation regarding networking activities."*

Furthermore, this research analyzes the impact of network-oriented activities on startup success. In this regard, startups may profit from network-oriented activities due to improved visibility to external investors and higher credibility. Finally, startups may profit from better market information and identify business opportunities based on external networks. Finally, these advantages can also lead to higher performance of the startup. This leads to the following hypotheses:

H6a/b: *"The more entrepreneurs invest in (a)social capital/(b)build up weak ties, the higher the access to external investors (funding)." (success factor I)*

H7a/b: *"The more entrepreneurs invest in (a)social capital/(b)build up weak ties, the better the internal startup performance." (success factor II)*

H8a/b: *"The more entrepreneurs invest in (a)social capital/(b)build up weak ties, the more business opportunities can be identified by the startup." (success factor III)*

Figure 1 summarizes the postulated research model.

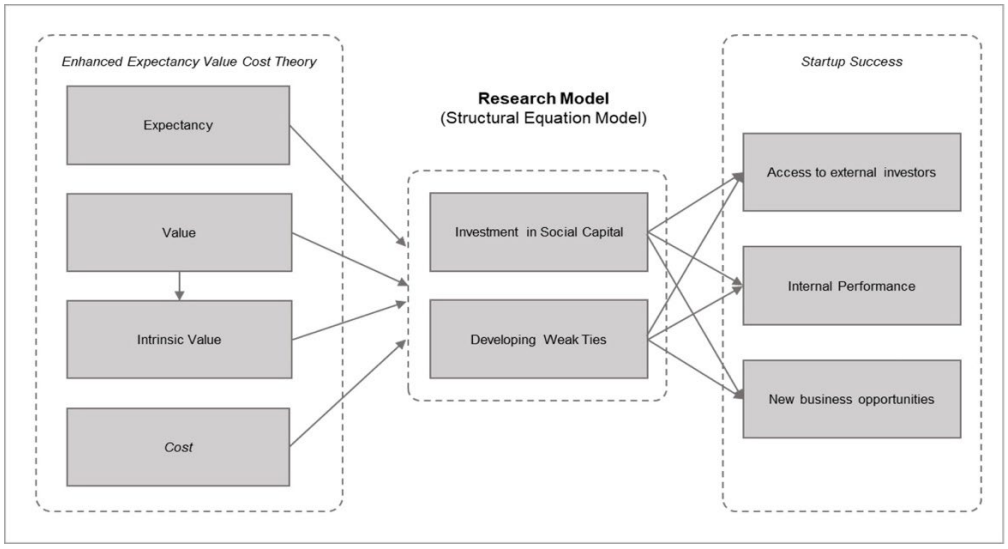

Figure 1: The research model.

3. Methodology

This study employs a quantitative research method. The quantitative approach enables the researcher to reach a wider audience with a varied background. Participants for this study were recruited via the Pollfish platform which is ISO-certified and aligned with ESOMAR standards. In total, 200 entrepreneurs participated in our survey with the following sample structure: owners of a startup, most of them (86,7%) with 1-5 years of startup experience, coverage of different branches, most of them (20%) Software and IT, E-commerce (15%), and service sector (15%). Since our study focuses primarily on examining fundamental construct relationships rather than on conducting a representative market survey or going into specific market segments, we did not apply any quotas with regard to the sample structure. Structural equations modeling, based on SmartPLS 4.0, was used to investigate the postulated interrelations and effects between the constructs of this study's research model (Chin, 1998, Ringle *et al*., 2024).

3.1 Results for the Measurement Model

For measuring the constructs of the Expectancy-Value-Cost Theory and intrinsic motivation, established indicators from the literature (Kosovich et al., 2014; Marlek, Sarin and Haon, 2020) were used and applied. The Theory of planned behavior was applied and adapted to this research context (Madden, Ellen and Ajzen, 1992) to measure behavior-related constructs "Investment in social capital" and "Developing weak ties". Three self-developed single items (the indicators are shown in table 1), were used to measure three different areas of startup success. We used 7-point Likert scales (with 1="I strongly agree" to 7="I strongly disagree") for each of the items. For all the indicators, high factor loadings for each of the intended constructs can be certified which exceeds the recommended threshold > 0.7 (Hair et al., 2014). Furthermore, internal consistency reliability and convergent validity were investigated based on Cronbach's alpha, composite reliability, as well as average variance extracted (AVE). Regarding internal consistency, all values for composite reliability are above the threshold of 0.7 certifying high reliability (Chin, 1998, Hair *et al*., 2014). The corresponding values for the measurement model can be seen in table 1.

Table 1: Outer loadings.

Item	Outer loading
Expectancy *(EXP, reflective)*	
"I know I can build substantial social capital/networks for supporting my startup."	0.89
"I believe that I can be successful in increasing relevant social capital/networks for my startup."	0.83
"I am confident that I have the competence for building up useful social capital/networks for my startup."	0.82
Value *(V, reflective)*	
"I think social capital/networks is important for startup success."	
"I value building up social capital/networks for my startup."	0.79
"I think social capital/networking is useful for startup success."	0.83
	0.79
Intrinsic value *(IV, reflective)*	
"I have the feeling that that investing in social capital/networking is a reward in itself."	
"I have the feeling that investing in social capital/networking offers opportunities for growth and development to me."	0.74
"I have a feeling of self-fulfillment from being able to build social capital/networks."	0.79
Cost *(CO, reflective)*	0.84
Despite other things that I do, I do have time to invest in social capital building/networking (inverse).	
I'm able to put in the time needed to do well in social capital building/networking (inverse).	0.91
Investment in social capital *(ISC, reflective)*	
"I have actively invested in social capital/networks within the last 18 months."	0.89
"I have actively engaged in social capital building/networking within the last 18 months."	
"I actively made an effort to invest in social capital/networks within the last 18 months."	0.86
Developing weak ties *(DWT, reflective)*	0.88
"I actively build up weak ties within the last 18 months."	0.87
"I have actively engaged in building weak ties within the last 18 months."	
"I actively made an effort to build up weak ties within the last 18 months."	0.86
Startup success I: Access to external investors (SUC1)	0.92
"Social capital/network has played a key role in acquiring funding for my startup."	0.91
Startup success II: Internal Performance (SUC2)	
"Social capital building/networking led to measurable internal performance improvement of my startup."	*(single item)*
Startup success III: New Business Opportunities (SUC3)	
"Social capital building/networking led to more business opportunities of my startup."	*(single item)*

For AVE, all respective values are above the critical threshold of 0.5 which also supports the measurement model (Hair et al., 2022). For all the values see table 2.

Table 2: Construct reliability and convergent validity for the reflective measurement model.

Construct	Cronbach's Alpha (CA)	Composite Reliability (CR)	Average Variance Extracted (AVE)
Expectancy (EXP)	0.80	0.81	0.72
Value (V)	0.74	0.77	0.65
Intrinsic value (IV)	0.70	0.70	0.63
Cost (CO)	0.77	0.77	0.81
Investment in social capital (ISC)	0.84	0.85	0.76
Developing weak ties (DWT)	0.88	0.89	0.80

Based on the Fornell-Larcker Criterion discriminant validity can also be certified (Fornell and Larcker, 1981). Table 3 shows the respective values of the analysis (*square root of AVE on diagonal):*

Table 3: Fornell-Larcker Criterion.

	COS	DWT	EXP	IV	ISC	SUC1	SUC2	SUC3	V
Cost (COS)	**0.900**								
Developing Weak Ties (DWT)	0.447	**0.894**							
Expectancy (EXP)	0.704	0.349	**0.847**						
Intrinsic Value (IV)	0.633	0.373	0.568	**0.790**					
Investment in Social Capital (ISC)	0.591	0.524	0.609	0.560	**0.871**				
Success 1 (SUC1)	0.440	0.388	0.429	0.464	0.444	**1.000**			
Success 2 (SUC2)	0.599	0.463	0.551	0.584	0.557	0.460	**1.000**		
Success 3 (SUC3)	0.381	0.294	0.417	0.510	0.495	0.416	0.487	1.000	
Value (V)	0.567	0.303	0.638	0.575	0.515	0.342	0.457	0.371	0.804

3.2 The Structural Model

Path coefficients were estimated to analyze the structural interrelations between the constructs in this research model and for validating the hypotheses. Statistical significance was tested based on the bootstrapping procedure (with a resample size of 5000). The respective results for the structural model and hypotheses testing can be seen in table 4:

Table 4: Results of structural model assessment (*significant path coefficient).

	Path (Hypothesis)	Path Coefficient (β)	p-value	f^2	Result
H1a	EXP à ISC	*0.285**	0.001	0.063	*supported*
H1b	EXP à DWT	0.026	0.822	0.000	not supported
H2a	V à ISC	0.096	0.196	0.009	not supported
H2b	V à DWT	0.021	0.816	0.000	not supported
H3a	CO à ISC	-0.198	0.062	0.031	not supported
H3b	CO à DWT	*-0.331**	0.002	0.058	*supported*
H4a	IV à ISC	0.218	0.072	0.046	not supported
H4b	IV à DWT	0.137	0.179	0.013	not supported

H8b	DWT à SUC3	0.047	0.599	0.002	not supported

4. Discussion and Conclusion

The results provide new insights into the impact of entrepreneurs' self-perception and psychological factors on their networking behavior. The results demonstrate that expected networking skills affect entrepreneurs' investment in social capital building. From a practical standpoint, coaching on networking may help to boost entrepreneurs perceived self-efficacy. Interestingly, on the other hand, perceived costs associated with networking activities (effort and time) do not affect entrepreneur's motivation to invest in social capital. However, perceived cost has negative effects on the creation of weak ties. This result underlines clear prioritization of entrepreneurial activities and differentiated networking behavior patterns. Thus, e.g. networking events should focus on fundamental social capital building and clear added value. Although value has a significant influence on intrinsic motivation, the latter does not appear to be a clear determinant of actual network behavior. However, these results indicate that intrinsic motivational factors may play a supportive role in networking activities. Thus, in practice, networking activities and supportive networking solutions (e.g. apps, cooperation websites, incubator and accelerator programs) should also consider emotional aspects or gamification. Finally, it can be demonstrated that investment in social capital significantly affects startup success (access to external investors, internal performance as well as the identification of new business opportunities). Weak ties can also support startup performance which may result from know-how exchange. Overall, this research shows that startup network activities are affected by a mental tradeoff regarding competence-related expectations and cost assumptions. Furthermore, it can be shown that network activities significantly affect startup success in different areas.

5. Limitations and Future Research

Our research estimates fundamental construct relationships with a focus on research contribution. Market-oriented research should follow, which also involves a comparative analysis of representative samples across different markets and regions. Additionally, further complementary data sources and also qualitative research would be suggested for investigating motivational factors to supplement our research findings. Finally, in our research, startup success was measured by single-items. Future additional research should also include multi-item (or multi-dimensional) measurement models for investigating startup success.

Ethics Declaration

The researchers obtained Institutional Review Board approval, although ethical clearance was not required for this study because it involved an anonymous, minimal risk online survey (Exempt category 2) of adult entrepreneurs and their perception of networking. This approval was granted. Participation was entirely voluntary, no vulnerable populations were targeted, and no sensitive topics (i.e. health, illegal behavior) were asked. The respondents could discontinue at any time without penalization. Data were analyzed in aggregate only. All data was anonymized with no personal identifiable information.

AI Declaration

AI was used in the 'Introduction' section and the section titled 'A Brief History of Entrepreneurship Theory' to improve readability. AI was also used to help translate the survey questions from English to German to ensure proper grammar. AI was not used for sources or references.

Communicating the Dual Mission: Analysis of Websites of Finnish Social Enterprise Mark Holders

Päivi Karhunen
LAB University of Applied Sciences, Lahti, Finland

paivi.karhunen@lab.fi

Abstract: Social enterprises are defined as organizations that prioritize social goals over profit maximization. However, to sustain these goals, they must also remain economically viable. The tension between social and commercial logics, and the ways organizations manage this balance, is a central theme in social enterprise research. Despite this, little attention has been paid to how such tensions are communicated externally. This paper addresses this gap by analyzing the websites of 157 Finnish limited companies that have been awarded the Social Enterprise Mark. The study examines how these firms communicate the two main criteria for receiving the mark: generating social good and allocating a significant share of profits toward that goal. Additionally, the analysis explores whether and how companies incorporate commercial aims—such as growth and profitability—into their strategy and mission statements. The findings identify three distinct ways in which social and commercial logics are combined, resulting in a typology of three company types. The first type, labeled "idealists," emphasizes social impact as the primary purpose of the organization and does not explicitly address commercial aspects. Some even rhetorically distance themselves from traditional business language, presenting themselves as communities rather than companies and referring to customers as partners. The second type, "pragmatists," presents profitability as a means to achieve social objectives. These organizations—often owned by municipalities or non-profit entities—highlight cost-efficiency and financial sustainability as necessary conditions for fulfilling their social mission. The third type, "legitimizers," communicates social goals in very broad or unclear terms and does not explicitly state how profits contribute to social purposes. As a result, these firms are difficult to distinguish from conventional companies based on their external communications. The study contributes to academic discussions by demonstrating that organizations labeled as social enterprises vary significantly in how they interpret and communicate compliance with certification criteria. Practically, the findings offer insights for organizations responsible for awarding social enterprise labels, particularly in evaluating how clearly and consistently such criteria are communicated.

Keywords: Social Enterprise, External Corporate Communications, Social Goals, Commercial Aims, Social Enterprise Mark

1. Introduction

Social enterprises (SE) have become in the recent quarter of a century acknowledged players in the global economy, representing three per cent of all enterprises in the world and generating ca. two per cent of the global gross domestic product (GDP) (Schwab Foundation and WEF, 2024). Similarly, research on social enterprises has burgeoned. Although there is no unanimously agreed definition of the SE, engagement in business activities to achieve social goals is commonly recognized as its *raison d'être* (Saebi et al, 2019). Correspondingly, balancing of social and commercial goals has persisted as one of the key themes in social enterprise research (Li and Bosma, 2025). Scholars have addressed it in terms of identity dimensions of entrepreneurs establishing SEs (Moura-Romero and Pertuze, 2026), of organizational identities (Cornelissen et al, 2021) and strategies for dealing with the sources of potential conflict between social and commercial logics (Civera et al, 2020).

An emerging area of research is corporate communications, where the SE needs to find a balance of showing its social impact whilst also coming across as a professional business (SE forum, 2026). Research on the topic has addressed this issue from the perspectives of social value communication in social media (Wang et al, 2025), gaining legitimacy in the eyes of different stakeholders (Bergfeld et al 2021) or using narratives in brand building (Nicholls 2009). Interestingly, social enterprise marks (SEM) granted by various national organizations are mentioned by communication professionals as means for showing SE legitimacy as social actor and as business enterprise (SE Forum, 2026). There is, however, scant research on how such marks are actually used in the external communication of SEs (cf. Sutton et al, 2018 on higher education institutions), or how well they reflect the reality of social enterprises in general (Ridley-Duff and Southcombe, 2012).

This paper contributes to filling this research gap by exploring how 157 Finnish Limited Liability Companies (Ltd) which have received the national SEM communicate the two main criteria for getting the Mark: The goal of generating social good on the one hand, and the use of a major share of the profits to promoting this goal. In addition, it is depicted whether and how companies have included their commercial aims, such as business growth, cost-efficiency, or profitability, into their strategy and mission statements. Theoretically the paper positions itself in the constantly growing SE literature which uses an institutional-theory based approach (Li and

Bosma, 2025). It views the communication statements as representation of the two competing institutional logics: social logic and commercial logic (Bruneel et al 2020).

The paper identifies three types of companies: The “idealists” emphasize only the social aims of the company without mentioning the commercial or financial aspects. The “pragmatists” report that the purpose of their company is to operate in a profitable and cost-effective manner to serve its social aims. The “legitimizers” formulate their social aim very broadly or not at all, and do not explicate how they distribute the profits. Enterprises in this category are as a matter of fact difficult to distinguish from “ordinary” enterprises operating solely on commercial logic.

The paper is of interest to academics, because it shows how companies "labeled" as social enterprises may interpret and communicate their meeting the criteria for this mark very differently. The practical value of the paper lies in the applicability of its results by organizations granting such marks. The results raise the question whether the mark criteria should include the demand for transparently communicating how the other key criteria are met.

2. Theoretical Background and Analytical Framework

This paper positions itself and contributes to the constantly growing literature which applies institution-theory based perspective to approach various dimensions of SE (Li and Bosma, 2025). The starting point of the research is that the SE needs to balance its social and commercial goals, which has persisted as one of the key themes in social enterprise research (ibid). The paper applies the concept of institutional logics (Thornton et al 2012) which focuses on how broader belief systems shape the cognition and behaviour of actors (Thornton, 2004). Such belief systems operate at multiple levels of the society from economic and political systems to professions and communities (Thornton et al, 2012). In organization studies the concept of institutional logics has mainly been applied to analyse tensions between competing logics (Greenwood et al 2011) such as the social logics and commercial logics in the case of SE, often applying methods borrowed from discourse theory and relying of textual sources (Thornton et al 2012). According to a recent review (Li and Bosma, 2025) on institutional-theory based SE research, prior research on the manifestation of competing logics in SE has addressed it on different levels including organizational responses to macro-level institutional complexity (e.g. Zhao and Lounsbury, 2016), or tensions on managerial level (e.g. Liu et al, 2016) or in inter-organizational and stakeholder relations (e.g. Huybrechts et al, 2017).

This paper applies the concept of institutional logics to study how the competing social and commercial logics manifest in the ways in which SE formulate their mission and strategy in their external communication. The analysis is based on publicly available textual data, namely the websites of holders of the Finnish Social Enterprise Mark (SEM). The Mark holders were selected as representatives of SE because there is no commonly accepted definition of SE in Finland, and the Finnish legislation does not recognize SE as a legal entity (Kostilainen and Pättiniemi 2016). The SEM holders can thus be considered as representing the most institutionalized SE form in Finland (ibid).

The paper advances research knowledge on corporate communications of SE, which has largely focused on the communication of the social value only (e.g. Wang et al, 2025; Cornelissen et al 2021; Nicholls 2009). The few studies addressing whether and how SEs communicate their commercial value show that they may consciously avoid commercial terminology to retain legitimacy in the eyes of their some stakeholders (Bergfeld et al 2021), but also tactically use commercial language in order to convince others, such as potential funders of their entrepreneurial efficiency (Dey and Teasdale 2016). Interestingly, SEM granted by various national organizations are frequently mentioned by communication professionals as means for showing SE legitimacy as social actor and as business enterprise (SE Forum 2026). There is, however, scant research on how SEs actually use SEM in their external communication (cf. Sutton et al, 2018), or how well they actually capture the characteristics of social enterprises (Ridley-Duff and Southcombe, 2012).

The analytical framework is constructed by using the criteria which the granting organization of the Finnish SEM applies when considering the applications for the Mark. The Mark can be granted to an enterprise which employs in Finland, and which has been established to solve social or environmental problems. The social dimension of the two competing institutional logics is reflected in the primary criteria for granting the mark. These criteria implies that the purpose of the SE is to generate social good, and that the major share of the profits are used to advance this purpose. The commercial logics is captured in the secondary granting criteria which emphasizes that both the business and communications about it are transparent and open.

3. Data and Methods

The data was compiled from the list of Finnish Social Enterprise Mark holders, available at the website of the granting organization “Finnish Work” (Finnish Work, 2026). The list includes 346 organizations, and we selected into the dataset those organizations whose legal entity form is Ltd (Oy in Finnish). This limitation was made because the Finnish legislation defines the primary purpose of the Ltd (Oy) as the generation of profits to its shareholders. Hence, it can be assumed that such SE face more prevalent pressure to follow commercial logics than SE whose legal form is for example a non-profit organization.

The dataset consists of 157 SEs which represent a variety of sectors and types of ownership. The largest group, ca. a third of the SEs operate in the healthcare and social services sector, maintaining for example care homes or providing other types of social care services. The second largest group, ca. 20% is the category other services which includes for example different consultancy SEs. Education services and waste management services comprises ca. 10% of the SEs each. As to the ownership structure, the largest group is private ownership (66) which includes entrepreneur-led and family SEs, as well as other types of private companies. 45 SEs can be characterized as the “commercial arms” of non-profit organizations such as registered associations (25) or foundations (20). 39 SEs are in public ownership, owned by municipalities or joint municipal authorities in education or healthcare and social sectors. The rest are in mixed ownership, or no ownership information is given on the website.

The data collection started from accessing the websites of the SEs between 1 January – 31 March 2026. The Finnish version of the website was analyzed when available. English version was used only in case the company did not have Finnish version (only 3 cases). Sections relevant to the research problem, i.e. strategy and mission were reviewed, in addition to which data on the ownership of the company and use of profits were searched. The relevant pages were archived. The sample included some cases where the mark holder was a subsidiary of a larger group. If the subsidiary had its own website, it was used as data, otherwise the data was retrieved from the group website. This was the case mainly for SEs owned by large non-profit foundations which organize their for-profit activities into different companies. Relevant pieces of text were extracted into a Word document containing the SE name, sector, type of ownership, website address, and access date.

The next stage of analysis was to reduce and organize the textual data into a data table (Table 1) as deducted coding according to a codebook, in which the codes and their descriptions represented first, the criteria for the Mark (social goal and use of profits), and second, commercial goals. Unavailable of ambiguous information was coded as N/A or with a brief description of what constitutes the ambiguity. The data was coded and analyzed by the sole author of the paper. Single-coder validation was followed by ensuring intra-rater reliability (Mackey and Gass (2005) by coding the whole data and then and -recoding part of it after few weeks. The validity of the coding process was assessed by "peer checking" (Cresswell, 2012), i.e. writing the conference paper at hand.

In the codebook, the **social goal** was defined as the social or environmental challenges which the SE aims to solve, or benefits that its mission orients to bring. Examples include social inclusion, employment of disadvantaged groups, or promotion of circular economy. The **use of profits** was defined as statements on how the SE uses its profits, or what kind of use is excluded. Examples include development of operations, making charitable donations, or not paying dividends to owners. The **commercial** goal was defined as aspiration to maintain financial sustainability and thereby enable the SE’s meeting its social goals. Examples include expressions related to profitability, competitiveness, or cost-efficiency.

Table 1: Excerpt from the data table

Name	Sector	Ownership	Social Goal	Use of Profits	Commercial Goal
2M-IT	Media, ICT	Municipal	To develop healthcare solutions which improve wellbeing of people	We do not seek profits, but promote the interest of our owners as we are publicly-owned company	To operate in a cost-effective manner
Asuntosäätiön Asumisoikeus Oy	Construction services	Foundation	To provide affordable and sustainable housing	We do not aim at quick profits or economic benefits. Income from the activities is used to maintain and construct housing	To operate effectively, economically sustainably, and to be competitive based on price-quality ratio.

Name	Sector	Ownership	Social Goal	Use of Profits	Commercial Goal
AtCare Oy	Healthcare and social services	Private	To search for new, accessible solutions to prevent and treat mental health problems	According to company statutes 51% of profits is used for developing new services or supporting initiatives promoting mental health	Financial profitability (operating as Ltd) is the most effective way of promoting our social goals.

As shown in the table, the dataset includes SEs which duly meet all essential criteria for the SE Mark by openly communicating their social purpose and use of profits for advancing this purpose. In addition, their business principles are openly stated. The compiling and initial organization of the data revealed that this was, however, not the case for all SEs included in the dataset. Therefore, the next step of the analysis was to organize the data into subcategories based on the availability of information on the three analytical dimensions of social goal, use of profits and commercial goal (Table 2).

Table 2: Data subcategories based on availability of information

Category	No. of SEs
Hybrid dimensions a: Social goal, use of profits, commercial goal	25
Hybrid dimensions b: Social and commercial goals	24
Social dimension a: Social goal and use of profits	28
Social dimension b: Only social goal	59
Commercial dimension: Only commercial goal	8
Data not available	13

As shown in the table, minority of the SEs actually report only on their meeting of all criteria for the SE Mark, and some enterprises in the sample do not even explicitly formulate what the "social" dimension of their operations constitutes as a factor distinguishing them from "ordinary" business enterprises. The final step of our empirical analysis was to take these subcategories as a basis for constructing different types of SEs along the social-commercial continuum and the different combinations of the two competing logics.

4. Results: A Typology of Social Enterprises

This section presents the findings of the paper by identifying three types of SE among the SE Mark holders: The "idealists" emphasize only the social aims the of the company without mentioning the commercial aspects. The "pragmatists" report that the purpose of their company is to operate in a profitable and cost-effective manner to serve its social aims, or report transparently how they use the (potential) profits to advance its social aim. The "legitimizers" formulate their social aim very broadly or vaguely, if at all, and do not explicate how they distribute the profits or what the "social" actually means for them. Enterprises in this category are as a matter of fact difficult to distinguish from "ordinary" enterprises operating solely on commercial logic. This category also includes enterprises which reveal practically no information on their operations, including why they are qualified as SE Mark holders.

4.1 Idealists: Social Logic as the Overriding Principle

The first type of SEs, idealists, comprises enterprises which emphasize in their communication the social goal of the enterprise and do not discuss the commercial aspects of the enterprise. Only part of them reveals how they use the potential profits of the operations. This group is heterogeneous in terms of sector and ownership, including both private and publicly owned enterprises. Some of the SEs represent ideology-driven social entrepreneurship as they are based on the owner's vision of doing good, whereas others operate in sectors such as healthcare and social services, where the philanthropist tradition and participation of non-profit actors are strong. Some SEs even rhetorically distance themselves from commercial activities by speaking about themselves rather as communities than as companies, and of their customers as partners.

The "social" manifests in the company websites in different ways and on different levels. Some refer to their social aim in a rather abstract manner, stating for example as "*to advance sustainable development and circular economy"*, whereas others refer concretely to how their operations contribute to solving societal or

environmental problems. This include statements such as "*To provide a novel technology for recycling of biowaste".* Most SEs fall somewhere in between by describing the social or environmental problem their business addresses, including social goals such as "*To advance employment of disadvantaged groups"*. Interestingly, some of the publicly-owned SEs in this group seem to define "social" in terms of "societal", as they formulate their goal as supporting the public sector to function and to produce services to citizens in, for example, as follows: *"To provide secure and safe ICT solutions to the public sector".*

In sum, this type of SE perfectly qualifies with the first part of the primary criteria of the SE Mark by clearly stating its social goal, but often fails in meeting the second part which is the openness of the use of profits for advancing this goal. When looking at the profiles of the SEs, a minority of SEs of this type explicitly describes that they invest the profits to the development of the operations, although this is likely the general principle for other SEs of this type as well.

4.2 Pragmatists: Combining Social and Commercial Logics

The second type of SEs, pragmatists, represents hybrid enterprises combining social and commercial logics. They communicate their social goal and ca. half of them also reveals how their profits are used. This group differs from the previous one as to the commercial logic which is reflected in statements illustrating the business principles of the SE. Similarly to the previous one, this group is heterogeneous in terms of sector and ownership, including both private and publicly owned enterprises.

The social logic manifests on the company websites in a rather similar way as for the previous group, including expressions such as "*Our aim is to advance circular economy and to provide employment for disadvantaged groups*", or "*Our mission is to contribute to the production of impactful municipal services to citizens*". The commercial logic is visible in expressions and terms rooted in the business vocabulary. These includes highlighting cost-efficiency and profitability as guiding principles of the SE. Interestingly, there are multiple cases in which the SE combines the two logics into one statement. This is done by highlighting financial sustainability as a precondition for advancing the social goals: "*Profitable operations enable doing social good"*, or by viewing social and economic dimensions as equally important: "*Financial sustainability is as important as environmental one*". Interestingly, some SEs make a distinction from purely commercial firms by stating that they aim at economic sustainability and efficiency, but not to profit maximization.

To sum up, all SEs of this type qualify with the first part of the primary criteria of the SE Mark by clearly stating its social goal, but half of them fails in meeting the second part which is the openness of the use of profits for advancing this goal. In addition, they use rhetoric rooted in business to describe the commercial aims of the SE, and view economic and financial aspects as precondition for achieving the social goals.

4.3 Legitimizers: Absence of the Social Logics

The final type of SEs in our data comprises enterprises which rarely qualify as social enterprises based on the information provided on their public websites. This is the smallest group in our data, comprising mainly service companies which seem to have applied for the SE Mark for image or branding purposes only. The strategy and mission statements do not explicitly refer to the social dimension of their operations or do it in a very vague and general way. An example is a company which declares its mission as "*To accelerate growth of digital commerce in Finland*". Through this mission the company aims to *"contribute to the competitiveness and growth of Finnish companies"*. The aim itself is important in the big picture for the economic sustainability of the Finnish society, but it is relatively loosely connected to the idea of a SE. Hence, when reflected against the criteria for the SE Mark, such firms practically meet none of them.

5. Discussion and Conclusion

This study set out to explore how Finnish limited companies holding the Social Enterprise Mark (SEM) communicate their social aims, commercial aims and the use of profits on their websites. By applying an institutional logics perspective, the paper sheds light on how competing social and commercial logics are reflected—or omitted—in external corporate communications. The findings reveal substantial variation in how SEM holders interpret and communicate the core criteria of the Mark, despite their shared formal status as "labeled" social enterprises.

The identification of three types of enterprises—idealists, pragmatists, and legitimizers—illustrates that the coexistence of social and commercial logics does not materialize in a uniform or standardized manner in SE

corporate communications. The idealists represent organizations which strongly emphasize social or environmental goals while largely neglecting commercial considerations. This finding resonates with earlier studies suggesting that strong normative commitment to social goals may lead to the under-communication of economic rationality in social enterprises (Nicholls, 2009). The avoidance of commercial terminology may also be a deliberate choice to retain legitimacy in the eyes of those stakeholders which emphasize social logics (Bergfeld et al 2021).

The pragmatists, by contrast, most clearly reflect the hybrid organizational ideal described in the social enterprise literature. Their communications integrate social and commercial logics by framing economic sustainability, efficiency, and profitability as enablers of social impact rather than as ends in themselves. This rhetorical strategy aligns with research suggesting that successful hybrid organizations often articulate a hierarchy or complementarity between competing logics instead of treating them as contradictory (e.g. Civera et al, 2020). On the other hand, existing research suggests that the pragmatists may also tactically use commercial language in order to convince others, such as potential funders of their entrepreneurial efficiency (Dey and Teasdale 2016). However, even within this group, only about half explicitly describe how profits are allocated to advance social goals, indicating that hybridity in purpose does not automatically translate into transparency in financial narratives.

The legitimizers constitute the most problematic category from both a theoretical and a practical standpoint. Their mission statements either define social goals in extremely broad and generic terms or omit them altogether, making it difficult to distinguish these enterprises from conventional for-profit firms. From an institutional theory perspective, these organizations appear to adopt the SEM primarily as a symbolic device to gain legitimacy, without substantively reflecting the social logic that the Mark is intended to signal. This finding echoes earlier critiques of certification and labeling schemes, which may be subject to decoupling between formal compliance and actual practices (Ridley-Duff and Southcombe, 2012). The presence of this group raises concerns about the credibility and signaling function of the SEM if its holders do not consistently communicate the core criteria on which the Mark is based.

Taken together, the findings suggest that while the SEM represents an important institutional mechanism for recognizing social enterprises in a context lacking a formal legal definition, its meaning is actively constructed and negotiated by its holders through external communications. Therefore, variation observed in this study contributes to institutional-theory-based SE research by demonstrating how micro-level communication practices mediate macro-level institutional arrangements such as certification schemes.

The study has its limitations which also provide avenues for future research. The data was collected and analyzed by a single author in one country, and the purpose was to demonstrate how the social and commercial dimensions show in SE external communication. The analysis of organizational determinants such as company size, sector or ownership accounting for variety in the dataset was beyond the scope of this paper. The dataset can be utilized in future research for such analysis. Future research is also invited to depict the reasons for the variety in communication strategies by collecting interview data from the SE in the dataset.

Finally, the study has practical implications for organizations granting social enterprise marks and labels. The results raise the question of whether the criteria for granting such marks should place greater emphasis on transparent external communication, particularly regarding the use of profits for social purposes. Without clearer communicative expectations, there is a risk that the Mark's signaling value may erode, potentially undermining trust among stakeholders.

In conclusion, the paper demonstrates that balancing social goals and business profitability is not only an operational challenge for social enterprises but also a communicative one. How social enterprises articulate this balance publicly plays a crucial role in shaping their legitimacy and in defining the meaning of social entrepreneurship more broadly. As social enterprise marks continue to gain prominence as tools of recognition and governance, greater attention should be paid to how their criteria are interpreted, enacted, and communicated by the organizations they are intended to represent.

Ethics Declaration

I declare that ethical clearance for the research referred to in this paper was not needed. The research is based on publicly available data only.

AI Declaration

The AI tool Microsoft Copilot was used in the development of the paper as supportive tool for identifying relevant research, and for assisting in drafting the discussion and conclusion section. The accuracy of the research references provided by the AI was verified by the author from the original articles. The final version of the discussion and conclusion section was produced by the author. Text generated by the AI was edited and some of its suggestions were rejected.

The Global State of Digital Transformation Across Organisations: Evidence from a Large-Scale Survey

Florian Kidschun, Ronald Orth and Rusudan Kavtaradze
Fraunhofer IPK, Division Corporate Management, Berlin, Germany

florian.kidschun@ipk.fraunhofer.de
ronald.orth@ipk.fraunhofer.de
rusudan.kavtaradze@ipk.fraunhofer.de

Abstract: Digital transformation is widely recognised as a key driver of innovation and competitiveness, yet systematic empirical insights into its implementation across organisations remain limited. Existing studies are often fragmented, based on limited samples or focused on specific sectors, technologies or organisational contexts. This paper addresses this gap by analysing the status quo of digital transformation based on 2,024 valid organisational responses collected between June 2020 and March 2026 through the Digital Transformation Assessment (DTA). The DTA is a scientifically grounded and empirically validated self-assessment instrument that conceptualises digital transformation as a holistic organisational phenomenon across seven dimensions: Corporate Strategy, Leadership and Corporate Culture, Organisation and Processes, Employees and Competences, Technology, Products and Services, and Supply Chain and Networks. The analysis combines descriptive, comparative and benchmark-oriented methods to examine maturity patterns across dimensions, items and contextual variables. Results show a globally moderate digital transformation maturity of Ø 3.12. Technology is the strongest dimension, whereas Employees and Competences is consistently the weakest dimension across regions, industries, organisational sizes and management levels. The findings suggest that the main bottleneck of digital transformation is increasingly human and organisational rather than purely technological. The paper contributes large-scale empirical evidence on digital transformation maturity and provides implications for research and managerial practice.

Keywords: Digital Transformation, Maturity Assessment, Benchmarking, Organisations

1. Introduction

Digital transformation has emerged as one of the most significant challenges facing organisations today. Driven by advances in information and communication technologies, data analytics, artificial intelligence, cloud computing, automation and digital platforms, it reshapes how organisations create value, compete, interact with stakeholders and organise work. In contrast to earlier waves of IT-enabled organisational change, digital transformation is increasingly understood as a strategic and organisational phenomenon affecting value propositions, business models, organisational identity, dynamic capabilities and long-term competitiveness (Bharadwaj et al., 2013; Vial, 2019; Warner and Wäger, 2019; Wessel et al., 2021). It therefore extends beyond technology adoption and process automation, requiring coordinated change across strategy, leadership, culture, processes, employees, products and services, customer interfaces and external value networks (Bockshecker et al., 2018; Matt et al., 2015; Kidschun et al., 2021).

To support the management and evaluation of organisational digital transformation, numerous digital maturity models have emerged in both research and practice. These models seek to capture the extent to which organisations have developed the capabilities required for digital transformation and often provide structured roadmaps for future development. Despite their popularity, however, digital maturity models face important conceptual and methodological challenges. Many assume a normative and linear progression toward an idealised future state, while empirical evidence validating the relationship between maturity levels, organisational capabilities, and performance outcomes remains limited (Thordsen and Bick, 2023; Hórtoványi et al., 2023). Moreover, self-assessment instruments primarily capture respondents' perceptions rather than objectively verified organisational conditions, making results susceptible to calibration differences and social desirability biases. These limitations do not invalidate maturity assessments as diagnostic tools, but they underline the need for large-scale empirical studies that examine whether observed maturity patterns remain robust across diverse organisational contexts.

Although empirical research on digital transformation has grown, systematic large-scale evidence on digital maturity across heterogeneous organisational contexts remains limited. Reviews point to fragmentation in the field and to limited empirical validation for many maturity models. Teichert (2019), for example, identified 24 relevant studies and 22 digital maturity models, illustrating the diversity of approaches but also the limited consolidation of the field. Thordsen and Bick (2023) similarly argue that the value of digital maturity models remains contested, partly because of limited empirical evidence on the assumed relationships between

maturity, organisational capabilities and performance. Hórtoványi et al. (2023) further note that capability maturity models for digital transformation often lack empirical validation despite their practical relevance.

Existing empirical studies provide important insights but are often limited in scope. Giotopoulos et al. (2017) analyse ICT adoption based on 3,500 SMEs in Greece but focus on ICT penetration rather than holistic digital transformation maturity. Berghaus and Back (2016) derive maturity stages from 547 individuals representing 417 organisations in Switzerland and Germany. Petzolt et al. (2022) develop and apply a maturity model for SME business model transformation based on 310 organisations. Hórtoványi et al. (2023) examine digital maturity in 302 manufacturing firms, while Ladu et al. (2024) analyse digital maturity in the conformity assessment industry using data from 1,447 organisations across 15 countries. These studies advance empirical understanding, but are typically focused on ICT adoption, specific countries, SMEs, manufacturing/B2B firms or single industries. A research gap therefore remains regarding large-scale empirical studies that apply a consistent, holistic digital maturity assessment across diverse industries, regions, organisational sizes and management levels.

In response to this need, researchers at Fraunhofer IPK developed the Digital Transformation Assessment (DTA), a self-assessment instrument for evaluating digital transformation maturity across seven organisational dimensions: Corporate Strategy, Leadership and Corporate Culture, Organisation and Processes, Employees and Competences, Technology, Products and Services, and Supply Chain and Networks (Kidschun et al., 2021). This paper uses the DTA dataset to analyse digital transformation maturity based on 2,024 valid organisational responses collected between June 2020 and March 2026. By leveraging the multidimensional structure of the instrument and contextual variables such as industry sector, organisational size, management level and geographic region, the study provides differentiated insights into how digital transformation unfolds across organisational settings.

The contribution is threefold. First, the paper promotes the understanding of digital transformation as a multidimensional organisational capability rather than a technology-centred implementation challenge. Second, it provides large-scale empirical evidence on global digital transformation maturity. Third, it identifies persistent maturity gaps relevant for research and practice, particularly regarding workforce capabilities, strategic execution and digital value creation.

The remainder of the paper is structured as follows. Section 2 defines the core concepts of digitisation, digitalisation, and digital transformation. Section 3 introduces the DTA. Section 4 describes the dataset and sample. Section 5 presents the empirical findings, including global maturity patterns, top-quartile benchmarks, item-level results and contextual comparisons. Section 6 discusses implications and limitations. Section 7 concludes with key findings and directions for future research.

2. Theoretical Background

Digitisation, digitalisation, and digital transformation are central concepts in the theoretical foundation of this study. Although the terms are often used interchangeably in practice, they describe different levels of digital change and therefore need to be clearly distinguished (Bockshecker et al., 2018; Legner et al., 2017; Gong and Ribiere, 2021; Vial, 2019). This distinction is particularly important for maturity and benchmarking approaches, as unclear terminology complicates the systematic assessment of digital progress.

Digitisation refers to the technical process of converting analogue information into digital formats, such as scanning paper-based documents or transforming analogue media into digital data (Bockshecker et al., 2018; Legner et al., 2017; Freitas Junior et al., 2016). It provides the technical and infrastructural basis for digital information processing, but does not, by itself, imply substantial organisational change (Parviainen et al., 2017).

Digitalisation goes beyond this technical conversion and describes the use of digital technologies to improve, automate and connect existing business processes (Bockshecker et al., 2018). Examples include ERP, CRM or workflow systems that increase efficiency, transparency and process quality. While digitalisation may already have strategic implications, it typically remains focused on optimising existing organisational structures and processes rather than fundamentally changing the business model.

Digital transformation represents the most comprehensive form of digital change. It describes a long-term process of strategic, organisational, cultural and technological change driven by digital technologies (Bharadwaj et al., 2013; Matt et al., 2015; Vial, 2019). In contrast to digitisation and digitalisation, digital transformation affects the organisation as a whole, including strategy, structures, culture, employee competencies, products, services, customer interactions and business models (Haffke et al., 2016; Hess et al., 2020). Its objective is to enable new forms of value creation and secure long-term competitiveness (Bharadwaj et al., 2013; Li, 2020).

In summary, digitisation provides the technical foundation, digitalisation applies digital technologies to optimise existing processes, and digital transformation refers to holistic strategic change at the organisational and business model level. This study focuses on digital transformation, as it captures the broader organisational adaptation process required to respond to digital challenges and opportunities.

3. Digital Transformation Assessment

The Digital Transformation Assessment (DTA), developed by Kidschun et al. (2021), is a reference-model-based and empirically validated instrument for assessing organisational digital transformation maturity. It conceptualises digital transformation as a holistic organisational change process integrating strategic, cultural, structural, process-related, technological and market-oriented dimensions.

The development of the DTA followed an exploratory multi-stage research design. First, a systematic literature review and an analysis of 25 maturity models – using binary coding of the conceptual elements present in each – and frameworks were conducted. Recurring model elements were consolidated and complemented through a structured expert process. In subsequent workshops, more than 300 aspects of digital transformation were collected, prioritised and transferred into a reference model consisting of seven dimensions: Corporate Strategy, Leadership and Corporate Culture, Organisation and Processes, Employees and Competences, Technology, Products and Services, and Supply Chain and Networks. This combination of literature-grounded construct development and two-stage expert review establishes the content validity of the DTA.

The DTA is operationalised as a standardised online self-assessment comprising 33 items distributed across the seven dimensions. Each item is formulated as a precise statement and evaluated on a five-point Likert scale. Concrete best-practice examples support respondents in assessing their organisation realistically and consistently.

Table 1: Overview of the seven DTA dimensions and assessment items

Dimension	Assessment Items
1. Corporate Strategy	1.1 Digitalisation and corporate strategy; 1.2 Roles and responsibilities; 1.3 Measurable goals; 1.4 Monitoring
2. Leadership and Corporate Culture	2.1 Top management commitment; 2.2 Middle management commitment; 2.3 Openness to change; 2.4 Participatory culture; 2.5 Internal communication
3. Organisation and Processes	3.1 Innovative forms of work; 3.2 Interdisciplinary cooperation; 3.3 Process analysis and continuous improvement; 3.4 Digital process models
4. Employees and Competences	4.1 Professional and methodological competencies; 4.2 Social-communicative competences; 4.3 Personal competences; 4.4 Evaluation of employee competencies; 4.5 Education and qualification in digital technologies (digital expertise); 4.6 Digital technologies in human resource management
5. Technology	5.1 Investment in digital technologies; 5.2 Updating the IT infrastructure; 5.3 IT-Security; 5.4 Data integration; 5.5 Collaboration technologies
6. Products and Services	6.1 Analysis of market potentials (business model development); 6.2 Analysis of usage data; 6.3 Stakeholder integration for product and service development (open innovation); 6.4 Diversification through digital product/service innovations
7. Supply Chain and Networks	7.1 Customer Management; 7.2 Digital customer interfaces; 7.3 Supplier management; 7.4 Digital supplier interfaces; 7.5 Network of experts

After completion, participants receive an automatically generated, organisation-specific maturity profile. The results show the maturity level across the seven dimensions as well as an aggregated overall maturity score. This enables organisations to identify initial strengths and development areas. In addition, the assessment supports benchmarking by allowing organisations to compare their maturity profile with relevant peer groups.

The DTA therefore serves not only as a diagnostic instrument, but also as a basis for strategic prioritisation and transformation roadmap development. Overall, the DTA combines a theory-driven and evidence-based model architecture with a structured, best-practice-supported item design and a statistically validated measurement logic. It therefore provides a holistic and methodologically robust instrument for assessing, comparing and strategically steering digital transformation in organisations.

4. Empirical Dataset and Sample Characteristics

This chapter presents the empirical basis of the study and describes the composition of the analysed DTA dataset. It first explains the data collection process, inclusion criteria and methodological limitations of the dataset. It then summarises the sample structure in terms of geography, industry sector, organisational size and management level, which forms the basis for the subsequent results analysis.

4.1 Data Collection and Inclusion Criteria

The empirical analysis is based on data collected through the DTA online self-assessment platform. The platform has continuously collected organisational responses since June 2020 and enables respondents to assess the digital transformation maturity of their organisation across the seven DTA dimensions. All responses are stored in anonymised form in compliance with Art. 4 EU-GDPR.

The dataset analysed in this paper comprises 2,024 valid organisational responses, derived from 2,275 complete submissions received between June 2020 and March 2026. Responses were included if respondents had answered at least 50% of the items in each DTA dimension. This threshold ensures sufficient data for calculating dimension-level maturity scores while preserving the breadth of the sample. A total of 251 submissions, corresponding to 11.0% of all complete submissions, did not meet this criterion and were excluded from the analysis. For included responses, dimension scores were computed from the available items within each dimension (available-case analysis); no imputation of missing values was applied.

The final dataset covers organisations from 105 countries across all major world regions. However, the dataset should not be interpreted as a longitudinal panel of unique organisations. Participation was voluntary and anonymous; therefore, multiple individuals from the same organisation may have participated, and individual respondents may have completed the assessment in more than one year. Due to the anonymised design, organisational-level deduplication is not possible. In addition, the self-selected nature of participation may introduce an upward bias in maturity scores, as the sample likely overrepresents organisations actively engaged with digital transformation. The findings should therefore be interpreted as reflecting the perceptions of digitally engaged respondents across the observation period, rather than statistically representative organisational-level maturity distributions.

4.2 Sample Characteristics

The analysed dataset comprises 2,024 valid responses from organisations in 105 countries. Europe constitutes the largest regional group (n = 966; 47.7%), followed by South America (n = 400; 19.8%), Asia (n = 296; 14.6%) and North America (n = 205; 10.1%). The remaining responses originate from the Middle East, Africa and Oceania. The five countries with the highest response counts are Germany, Brazil, the United States, Taiwan and Ireland.

The sample covers a broad cross-section of sectors classified according to NACE. Manufacturing is the largest named sector (n = 641; 31.7%), followed by Information and Communication (n = 200; 9.9%) and Other Service Activities (n = 166; 8.2%). With respect to organisational size, 60.8% of respondents are SMEs, defined as organisations with up to 500 employees, while 39.2% are large organisations. Top, Middle and Lower Management together account for 77.7% of the sample. Employees without managerial responsibility account for 7.9%, while 14.4% provided no management-level information. Figure 1 summarises the sample distribution.

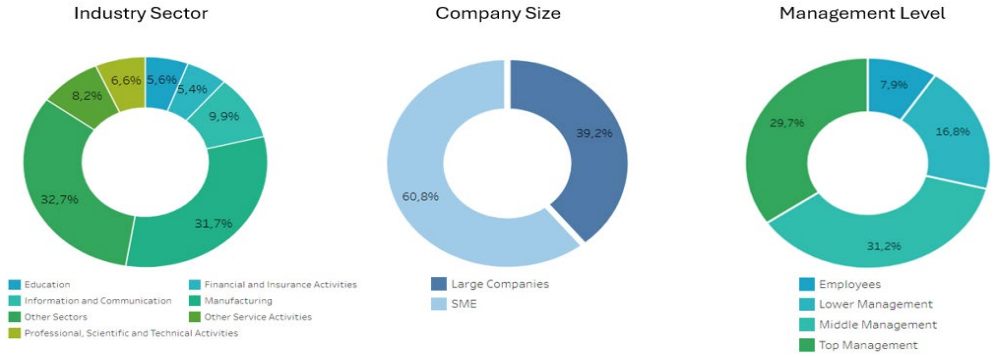

Figure 1: Sample composition – industry sector, organisational size, and management level distributions (N = 2,024)

5. Results Summary

This section presents the main empirical findings of the DTA global results analysis. It focuses on robust patterns across the dataset rather than reporting all subgroup analyses in detail. The results are organised into three parts: global maturity profile and top-quartile benchmark, item-level maturity patterns, and contextual comparisons.

5.1 Analytical Approach

The analysis combines descriptive, comparative and benchmark-oriented methods. Dimension-level maturity scores are calculated as unweighted means of the respective assessment items. The overall maturity score is calculated as the unweighted mean across all seven DTA dimensions. Three maturity bands are applied: Weak (1.0–2.99), Moderate (3.0–3.99) and Strong (4.0–5.0). Unweighted aggregation was chosen for transparency and comparability across dimensions; no differential item or dimension weighting was applied.

The empirical analysis examines global maturity levels at dimension and item level, the distribution of responses across maturity bands and differences between the global sample and the top quartile of respondents. The top quartile is defined by the 75th percentile of the overall maturity score. Contextual comparisons are conducted across geographic regions, organisational size, industry sector and management level. Temporal developments between 2020 and 2026 are reported only briefly and interpreted cautiously, as annual samples differ in composition and do not represent a longitudinal panel of identical organisations.

All subgroup comparisons are descriptive: differences are reported as observed mean differences and were not subjected to inferential significance testing, consistent with the exploratory, non-probabilistic nature of the sample.

5.2 Global Dimension Overview and Top-Quartile Benchmark

The global dimension overview provides the central maturity profile of the dataset. Figure 2 shows the distribution of Weak, Moderate and Strong responses by dimension and compares the global mean score with the average score of the top-quartile respondents.

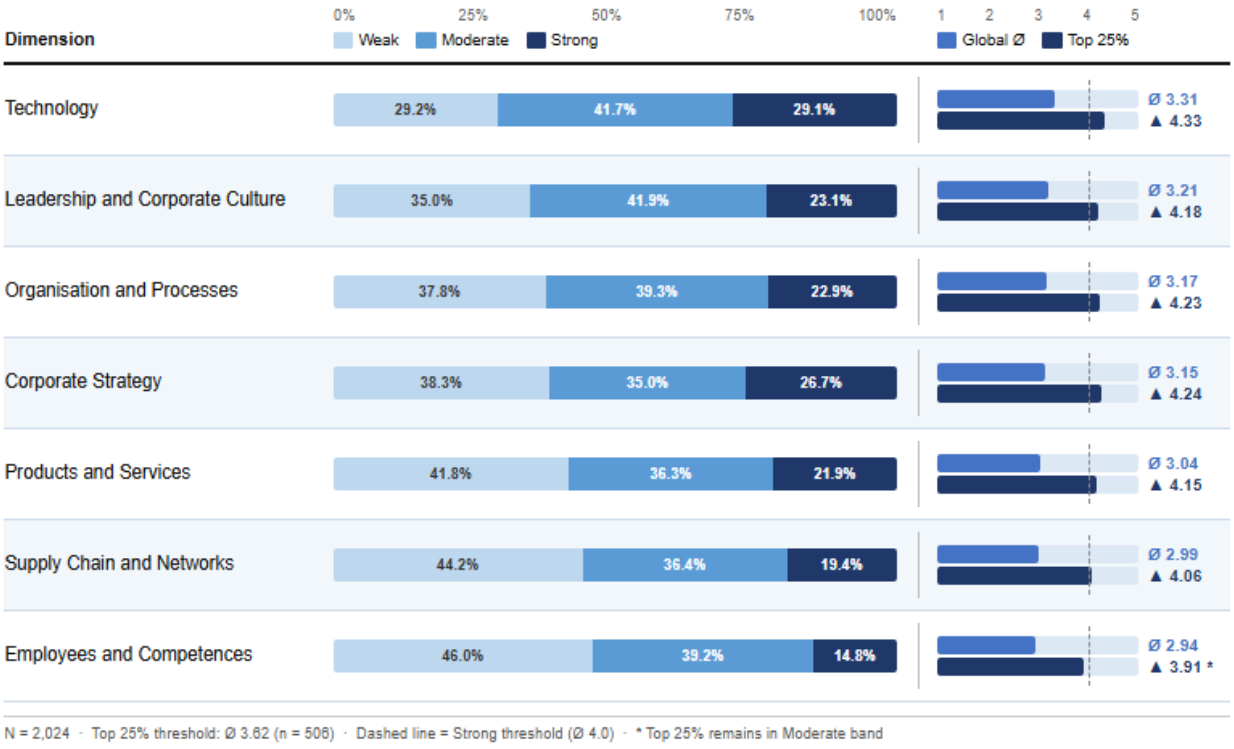

Figure 2: Dimension overview – distribution of Weak, Moderate, and Strong responses with global mean score and top-quartile average per dimension (right panel); dashed line = Strong threshold (Ø 4.0); N = 2,024; top 25% threshold Ø 3.62 (n = 506).

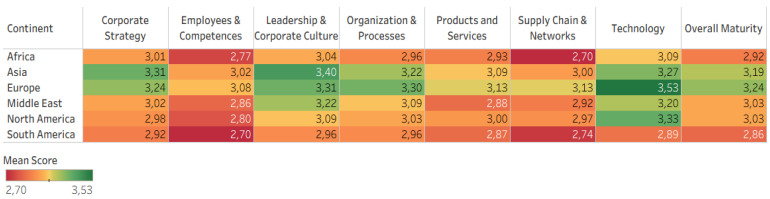
The results indicate a globally moderate level of digital transformation maturity, with an overall mean score of Ø 3.12. All seven dimensions fall within the Moderate band; none reaches the Strong threshold. Technology is the strongest dimension (Ø 3.31), with 29.1% of responses classified as Strong. Leadership and Corporate Culture (Ø 3.21), Organisation and Processes (Ø 3.17) and Corporate Strategy (Ø 3.15) follow. Products and Services (Ø 3.04) and Supply Chain and Networks (Ø 2.99) score lower, indicating that maturity is less advanced where digital transformation requires broader value creation and ecosystem integration. Employees and Competences is the weakest dimension (Ø 2.94), with the highest share of Weak responses (46.0%) and the lowest share of Strong responses (14.8%). Workforce capability development, therefore, represents the most pronounced maturity gap in the global sample.

The top-quartile benchmark reinforces this interpretation. The top 25% of respondents reach a mean overall maturity of Ø 4.16, which is 1.04 scale points above the global mean. The largest gaps between the global average and the top quartile occur in Products and Services (+1.11), Corporate Strategy (+1.09) and Organisation and Processes (+1.06). This suggests that digitally mature organisations differentiate themselves particularly through digital value creation, strategic execution and process maturity. Notably, Employees and Competences is the only dimension in which even the top-quartile average remains below the Strong threshold (Ø 3.91), confirming workforce capability development as a persistent bottleneck.

5.3 Item-Level Analysis

The item-level analysis provides a more granular view of the organisational practices underlying the dimension scores. The highest-scoring items are Top Management Commitment (Ø 3.65), IT Security (Ø 3.64) and Digitalisation and Corporate Strategy (Ø 3.64), indicating that many organisations have established strategic awareness, leadership commitment and technological safeguards.



At the same time, the weakest items reveal implementation gaps. The lowest-scoring item is the systematic evaluation of digital competences (Ø 2.50), followed by Digital Technologies in Human Resource Management (Ø 2.86). Both belong to Employees and Competences, confirming that organisations struggle less with recognising the relevance of digital transformation than with systematically developing and managing the workforce capabilities required to implement it.

A further pattern is the gap between strategic intention and execution. Within Corporate Strategy, Digitalisation in Strategy scores comparatively high (Ø 3.64), whereas Monitoring of Goal Achievement scores substantially lower (Ø 2.80). A similar pattern appears in Employees and Competences: general social-communicative competences reach a moderate maturity level (Ø 3.16), while the systematic evaluation of digital competences remains the weakest item (Ø 2.50). Overall, the item-level findings suggest that many organisations have established strategic and technological foundations but still lack governance and capability-management mechanisms for consistent transformation progress.

5.4 Contextual Comparisons

The following contextual analysis examines whether maturity patterns differ across regions, organisational sizes, industry sectors and management levels.

The regional comparison (Figure 3) shows that Europe records the highest overall maturity score (Ø 3.24), followed by Asia (Ø 3.19), the Middle East (Ø 3.03) and North America (Ø 3.03). Africa (Ø 2.92) and South America (Ø 2.86) score below the global mean. Europe demonstrates strength in Technology and Corporate Strategy, while Asia scores comparatively high in Leadership and Corporate Culture. Despite these differences, one pattern is consistent across regions: Employees and Competences is among the weakest dimensions in every regional profile. This confirms that workforce capability development is not a region-specific issue, but a global challenge.

Continent	Corporate Strategy	Employees & Competences	Leadership & Corporate Culture	Organization & Processes	Products and Services	Supply Chain & Networks	Technology	Overall Maturity
Africa	3,01	2,77	3,04	2,96	2,93	2,70	3,09	2,92
Asia	3,31	3,02	3,40	3,22	3,09	3,00	3,27	3,19
Europe	3,24	3,08	3,31	3,30	3,13	3,13	3,53	3,24
Middle East	3,02	2,86	3,22	3,09	2,88	2,92	3,20	3,03
North America	2,98	2,80	3,09	3,03	3,00	2,97	3,33	3,03
South America	2,92	2,70	2,96	2,96	2,87	2,74	2,89	2,86

Figure 3: Regional comparison – mean dimension scores by continent (n=2024, regions with fewer than 40 responses excluded)

Organisational size also influences maturity levels. Large organisations (n = 793; Ø 3.29) outperform SMEs (n = 1,231; Ø 3.00) across all seven dimensions. The largest gaps appear in Technology and Corporate Strategy, suggesting that larger organisations benefit from greater resources for infrastructure investment and formal governance. Industry differences are also visible: Information and Communication companies achieve the highest overall maturity (Ø 3.40), while Other Service Activities records the lowest maturity (Ø 2.90). Manufacturing, the largest named sector in the dataset (n = 641), scores slightly below the global mean (Ø 3.05), with relative weaknesses in Products and Services and Supply Chain and Networks.

The analysis by management level reveals a notable perception gap. Employees (Ø 3.22) and Lower Management (Ø 3.18) report higher maturity levels than Top Management (Ø 3.09) and Middle Management (Ø 3.07). One interpretation is that top managers assess transformation maturity against broader strategic ambitions and dependencies, while employees evaluate implemented tools and local process improvements more directly. Across all management levels, Employees and Competences remains the weakest dimension.

6. Discussion

Across regions, industries, organisational sizes, and management levels, Employees and Competences is the weakest dimension. The systematic evaluation of digital competences is the weakest item in the assessment (Ø 2.50), indicating that the main bottleneck of digital transformation is not technology, but the structured development, measurement and management of workforce capabilities.

Viewed through an innovation lens, this pattern suggests that digital technologies act as innovation enablers only when matched by the workforce capabilities required to absorb and recombine them; the persistent Employees and Competences gap therefore constitutes a latent constraint on organisations' innovation and entrepreneurial capacity, not merely a training shortfall.

The globally moderate overall maturity score (Ø 3.12) confirms that most organisations remain in an active but incomplete state of digital transformation. This is consistent with prior digital maturity research, which describes digital transformation as a multidimensional and ongoing organisational development process rather than a one-time technology implementation effort. The fact that no dimension reaches the Strong threshold reinforces the view that digital transformation maturity requires balanced progress across strategy, technology, organisation, people and external value creation.

A second important finding is the strategy-to-execution gap. While many organisations report relatively high maturity in digital strategy formulation and top management commitment, they score considerably lower on monitoring, goal achievement and competence governance. The findings show that digital transformation strategies require not only strategic intent, but also governance structures capable of coordinating and monitoring transformation progress.

The top-quartile benchmark shows that more digitally mature organisations differentiate themselves through Products and Services, Corporate Strategy, and Organisation and Processes. This indicates that advanced maturity is associated with digital value creation, strategic execution and process maturity. However, even among top-quartile organisations, Employees and Competences remains below the Strong threshold, confirming that workforce capability development is a persistent bottleneck across maturity levels.

The management-level comparison highlights the interpretive complexity of self-assessment data. Employees and Lower Management report higher maturity levels than Top and Middle Management. One possible explanation is that senior managers assess transformation maturity against broader strategic ambitions and systemic dependencies, while employees evaluate implemented tools and local process improvements more directly. This underlines the importance of considering the respondent perspective when interpreting self-assessment results.

Several limitations must be acknowledged. First, the DTA captures perceived maturity rather than externally verified performance, which may introduce social desirability bias, calibration differences and role-specific perception effects. Second, the sample is voluntary and non-probabilistic, limiting population-level generalisation. Third, organisational-level uniqueness cannot be guaranteed due to anonymised participation. Finally, regional and sectoral comparisons may be influenced by uneven sample distributions. Nevertheless, the consistency of the core findings, particularly the weakness of Employees and Competences, across all contextual subgroups strengthens confidence in their directional robustness.

Beyond these study-specific constraints, self-assessment validity in digital transformation research warrants explicit attention. Respondents assess maturity without external reference points: one who has never encountered a digitally advanced competitor may calibrate responses differently from one in a highly competitive environment. This context-dependent variance introduces calibration bias that aggregate scoring cannot fully control, and it is particularly consequential when comparing across industries and size classes where the operational meaning of the scale anchors may differ. This is not unique to the DTA but a structural challenge for the field. The consistency of the core findings, especially the universality of the Employees and Competences gap, across all subgroups nonetheless strengthens confidence in their directional robustness, even where precise measurement remains an open challenge.

7. Conclusion

This paper provides a large-scale empirical analysis of digital transformation maturity based on 2,024 organisational self-assessments across 105 countries. The findings show that global digital transformation maturity remains moderate and incomplete, with an overall maturity score of Ø 3.12 and no dimension reaching the Strong threshold.

Three central conclusions can be drawn. First, Employees and Competences represents the most persistent maturity gap and is the weakest dimension across all regions, industries, organisational sizes and management levels. Second, digitally more mature organisations differentiate themselves primarily through digital value creation, strategic execution and process maturity. Third, the gap between strategic ambition and operational implementation remains a key barrier: many organisations have recognised digital transformation strategically, but have not yet established sufficient mechanisms for monitoring, capability development and implementation control.

For practitioners, the results suggest three priorities: systematically assess and develop digital competences, strengthen governance mechanisms linking digital strategy to measurable targets, and pay greater attention to digital value creation in products, services and external networks. For researchers, the study highlights the need for longitudinal panel designs, multi-respondent assessments, context-specific benchmarking and the integration of objective performance data with subjective maturity ratings.

Overall, the findings confirm that digital transformation cannot be reduced to technology adoption. While technological foundations are comparatively advanced, sustainable digital transformation depends on the integrated development of strategy, organisation, people and value creation capabilities.

Ethics Declaration

The research draws exclusively on anonymised self-assessment data collected in compliance with Art. 4 EU-GDPR. No external ethical clearance was required.

AI Declaration

AI-assisted tools were used for automated data processing, transformation, and quality validation of the raw survey dataset. All analytical decisions, interpretations, and written content were developed and reviewed by the authors.

Beyond Profit: Sustainable Business Model Innovation in Ireland's Emerging Seaweed Bioeconomy

Wankya Ronald Kiduma and Ciarán Ó hAnnracháin
Faculty of Business, Atlantic Technological University, Donegal, Ireland

ronaldkiduma@gmail.com
Ciaran.OHannrachain@atu.ie

Abstract: In the transition toward sustainable economies, niche blue bioeconomy ventures must rethink how they create, deliver, and capture value beyond purely financial returns. This study examines how Ireland's seaweed-based small and medium-sized enterprises (SMEs) design and adapt sustainable business models within a context characterised by resource constraints, fragmented markets, and evolving regulatory frameworks. The research adopts a qualitative approach based on eight in-depth interviews conducted across Ireland, including six seaweed processing firms, one regulatory representative, and one sector expert. Using Resource-Based View (RBV) and Dynamic Capabilities (DC) frameworks, the study analyses how firms build, reconfigure, and deploy capabilities for sustainability-oriented innovation. Findings reveal a sector driven by entrepreneurial commitment and market-proximate experimentation, yet constrained by capability gaps, regulatory complexity, and limited institutional support. The paper contributes to understanding how micro-enterprises in the niche food business sectors operationalise sustainability in business models and highlights the need for coordinated policy and innovation support systems to enable scaling in emerging bio-based industries.

Keywords: Sustainable Business Models; Blue Bioeconomy; Seaweed SMEs; Dynamic Capabilities; Circular Bioeconomy

1. Introduction

The transition toward sustainable and circular economies has increased attention on bio-based industries (Bugge *et al.* 2016; D'Amato *et al.* 2017; Stegmann *et al.* 2020). Within this context, the blue bioeconomy, particularly seaweed production, has emerged as a promising sector due to its low-input biomass production, carbon sequestration potential, and applications across food, pharmaceuticals, and materials (Buschmann *et al.* 2017; Duarte *et al.* 2017; Barbier *et al.* 2020). Global seaweed production now exceeds 30 million tonnes annually, reflecting growing strategic importance. However, translating this ecological and economic potential into scalable and resilient business models remains a significant challenge (Van Den Burg *et al.* 2016; Araújo *et al.* 2021).

In Ireland, the seaweed sector is a small but strategically important part of the bioeconomy, consisting mainly of micro- and small-scale enterprises operating within fragmented value chains and evolving regulatory environments (Monagail and Morrison 2020; van den Burg *et al.* 2021). These firms are embedded in coastal communities and engage in activities including food production, nutraceuticals, cosmetics, tourism, and animal feed, often guided by strong sustainability orientations (Duarte *et al.* 2017; Campbell *et al.* 2019; Barbier *et al.* 2020; Araújo *et al.* 2021; van den Burg *et al.* 2021). However, growth is constrained by finance, capability gaps, and institutional complexity.

Although research highlights the technological and environmental potential of seaweed industries, limited attention has been given to how small firms operationalise sustainable business models in resource-constrained contexts (Araújo *et al.* 2021; van den Burg *et al.* 2021). The micro-foundations of capability development and sustainability integration also remain underexplored (D'Amato *et al.* 2017; Bocken *et al.* 2019).

Drawing on the Resource-Based View (RBV) (Barney 1991), and Dynamic Capabilities (DC) (Teece *et al.* 1997), this study examines Irish seaweed SMEs by asking: (1) how sustainability is integrated into business models; (2) what capabilities and supports shape innovation and growth; and (3) how resource and regulatory constraints affect scaling. The study advances understanding of sustainable entrepreneurship in emerging bioeconomy sectors.

2. Literature Review

This study examines sustainable business models (SBMs) within the bioeconomy using Resource-Based View (RBV) and Dynamic Capabilities (DC) perspectives to strengthen theoretical understanding. It identifies a significant gap in scholarly research on sustainable business models and innovation dynamics within the seaweed sector, where existing literature is largely dominated by industry and policy reports. The study contributes empirical and conceptual insights into innovation and governance in emerging seaweed enterprises and offers a

useful framework for research on micro-businesses operating in niche sectors characterised by unique structural and sustainability-related challenges.

2.1 Sustainable Business Models in the Bioeconomy

Sustainable business models (SBMs) extend traditional business approaches by integrating environmental and social value creation alongside economic performance (Boons and Lüdeke-Freund 2013; Bocken *et al.* 2014; Schaltegger *et al.* 2016). In the bioeconomy, SBMs are linked to circular resource use, ecosystem stewardship, and stakeholder collaboration (D'Amato *et al.* 2017; Geissdoerfer, *et al.* 2018). However, empirical research remains limited, particularly regarding how small firms operationalise SBMs under resource constraints. Existing studies focus mainly on technological innovation and macro-level transitions, with less attention to firm-level value creation and delivery processes (Bocken *et al.* 2014; D'Amato *et al.* 2017). This gap is evident in seaweed enterprises, which contribute to carbon sequestration, biodiversity, and sustainable food systems but operate within fragmented markets and evolving regulatory environments (Buschmann *et al.* 2017; Barbier *et al.* 2020; van den Burg *et al.* 2021; Araújo *et al.* 2021).

2.2 Resource-based View and Capability Constraints

The Resource-Based View (RBV) explains how firms achieve competitive advantage through valuable, rare, inimitable, and non-substitutable resources (Barney 1991). It is particularly relevant for SMEs in emerging bioeconomy sectors, where firms rely on intangible assets such as entrepreneurial expertise, ecological knowledge, and relational networks to support innovation (Baker and Nelson 2005; Parida *et al.* 2017). In seaweed SMEs, these challenges are intensified by the need to manage harvesting, processing, compliance, and market development simultaneously (Buschmann *et al.* 2017; Barbier *et al.* 2020; Araújo *et al.* 2021; van den Burg *et al.* 2021). However, while RBV explains differences in resource endowments, it provides limited insight into how firms adapt and reconfigure resources to support sustainability-oriented innovation, indicating the need for complementary theoretical perspectives.

2.3 Dynamic Capabilities and Innovation

Dynamic Capabilities (DC) provide an important analytical lens for SMEs in the seaweed sector by complementing the Resource-Based View (RBV) and focusing on firms' abilities to adapt to changing environments rather than merely possessing resources. For resource-constrained seaweed SMEs, DC supports the alignment of business activities and Sustainable Business Model (SBM) development through the capacities to sense opportunities, seize them strategically, and reconfigure resources in response to market, regulatory, and environmental changes (Teece *et al.* 1997; Teece 2018). This is particularly relevant in emerging sustainability-driven sectors characterised by uncertainty and rapid change. Research shows that DCs are shaped by learning, stakeholder interactions, and experimentation (Bocken *et al.* 2019), but their development is often constrained by weak institutional support and fragmented innovation ecosystems (Schot and Geels 2013; Adner 2017; Reim *et al.* 2019). Integrating RBV and DC helps explain how SMEs operationalise SBMs in emerging bioeconomy industries.

3. Methodology

This study investigates how sustainable business models are developed and operationalised in Ireland's seaweed sector. First, the research design is outlined. Then, the data collection procedures are described. Finally, the analytical approach used to interpret the findings is presented.

3.1 Research Design

A qualitative exploratory multiple-case study design was used to examine sustainable business model development in an emerging bioeconomy sector, integrating firm-level and system-level perspectives to understand interactions between internal capabilities and external institutional conditions.

The study focused on six seaweed-based SMEs operating within Ireland's small and geographically dispersed seaweed sector, mainly along the west coast. At the time of the research, only 14 active seaweed food-processing firms existed nationally, highlighting the sector's niche and emerging character. All firms produced seaweed-based food products but varied in business models and operational strategies. Most were micro-enterprises employing 1–3 staff, while one employed approximately 25 employees, offering insights into both early-stage and more established organisational contexts within Ireland's evolving marine bioeconomy.

3.2 Data Collection

Data were collected through eight semi-structured interviews conducted between March and May 2024 with six SME founders/managers, one regulatory representative, and one sector expert. Purposive sampling ensured variation in firm size, product focus, and sectoral experience. Interviews lasted 45–60 minutes, were recorded and transcribed verbatim, and averaged 12 pages each. The interviews explored business model design, sustainability practices, resource constraints, capability development, and regulatory and market interactions, generating a rich qualitative dataset capturing both strategic and operational perspectives.

3.3 Data Analysis

Data were analysed using Braun and Clarke's (2006) six-phase thematic analysis framework, selected for its flexibility in identifying patterns across qualitative data. The process involved familiarisation with transcripts, initial coding, theme development, theme review, theme definition, and final analysis. Coding combined inductive and deductive approaches, allowing themes to emerge from the data while being informed by the Resource-Based View (RBV) (Barney 1991) and Dynamic Capabilities (DC) frameworks (Teece *et al.* 1997; Teece 2018). Particular attention was given to resource configurations, capability development, and business model adaptation. An iterative constant comparison process was used to refine themes and strengthen coherence between empirical findings and theoretical constructs, thereby enhancing analytical depth and validity.

4. Findings

The findings are structured as four interrelated analytical themes, derived from the thematic analysis and aligned with the integrative framework presented in Figure 1. These themes including (1) values-driven entrepreneurship, (2) resource constraints, (3) informal innovation practices, and (4) a fragmented and uncertain environment represent higher-order dimensions, while the subsections (e.g., market experimentation, multi-role structures) are embedded mechanisms within these core themes. Together, these dimensions explain how sustainable business models are enacted through the interaction of internal motivations, capability limitations, innovation practices, and external conditions.

4.1 Values-Driven Entrepreneurship as the Foundation of Business Models

Sustainability emerges as a core organising logic, shaping how firms define value beyond profit. Environmental stewardship, food system transformation, and ethical production underpin decision-making. As P8 stated, *"A regenerative form of food… based on food justice and food security,"* while P5 emphasised, *"Aquaculture is where it needs to be going… to prevent overexploitation."* Business models are strongly founder-centric, reflecting personal motivations and identities. P3 noted, *"I'm more of an educator than a businesswoman… I'm not in it for the money,"* while another respondent reflected, *"It's just because I love it… I wouldn't be alive if I didn't have too much."* These values shape not only value propositions but also constrain growth choices, reinforcing hybrid logics that integrate lifestyle, sustainability, and experimentation.

4.2 Resource Constraints Shaping Capability Development

Severe financial and human resource limitations directly influence how firms operate and scale. As P8 observed, *"The business has not had the trajectory that I hoped… mainly because of lack of finances,"* while P2 highlighted capability gaps: *"We are a small business… nobody in-house that has that knowledge."* These constraints result in multi-role organisational structures, where founders manage production, compliance, and commercial activities simultaneously. This limits specialisation and strategic capacity, particularly in critical areas such as marketing. As P1 stated, *"I'm lacking a lot in marketing. I desperately need someone… this is my weak point."*, resource scarcity not only restricts growth but actively shapes how capabilities are developed and deployed.

4.3 Informal and Market-proximate Innovation Practices

Innovation is embedded in practice-based, iterative processes rather than formal R&D systems. Firms rely on experimentation, reinvestment, and direct market engagement. As P7 explained, *"We go out to test… get feedback, tweak and change. Try again,"* while P1 noted, *"All the money, I always reinvested… I did research, I did test and tried to understand."* This is complemented by strong customer proximity, enabling rapid feedback and co-creation. As P6 stated, *"We're a small business. So, we know our customers intimately,"* and P1 added, *"I*

always bring along some food for people to taste." While this model fosters agility and responsiveness, it limits formal knowledge accumulation and standardisation, constraining scalability.

4.4 Fragmented and Uncertain Institutional Environment

Firm-level dynamics are shaped by a weakly coordinated ecosystem and regulatory ambiguity. Collaboration remains limited, as P1 noted: *"We are very bad at working and cooperating with each other… other companies are not interested in coming together."* However, when present, it enables growth, as P4 highlighted: *"We have got a lot more consumers through that collaboration… and expansion to markets like Thailand and the UK."* Regulatory uncertainty further constrains development. P1 stated, *"It is not clear what processes to follow… this hampers the efforts of the sector to grow,"* while P8 added, *"The sector is very confused… we should have proper regulation."* These institutional conditions create barriers to investment, coordination, and long-term planning.

4.5 Integrating the Dimensions

Figure 1, below visualises these four themes as an integrated system. Values-driven entrepreneurship defines the purpose and direction of firms; resource constraints shape capability development; informal innovation practices represent how firms respond; and the fragmented environment conditions what is possible.

Figure 1

The findings show that seaweed SMEs operate through hybrid business models shaped by sustainability, place-based identity, and experimentation rather than purely profit-driven logics. Value is created through natural resources and experiential knowledge, delivered via relational and proximity-based channels, and captured through premium and diversified revenue streams. However, these firms face major constraints, including limited resources, fragmented collaboration, weak institutional support, regulatory complexity, limited market access, and capability gaps. The study highlights that scaling sustainable business models depends not only on firm-level innovation but also on supportive policy frameworks, coordinated ecosystems, and stronger collaboration platforms.

Figure 2 presents an exploratory, empirically grounded representation of innovation processes within seaweed SMEs, illustrating an iterative cycle of experimentation, product development, market testing, and feedback-driven refinement. Rather than proposing a formalised or generalisable framework, the figure provides context-specific insight into how micro-enterprises in emerging bioeconomy sectors operationalise innovation under conditions of uncertainty and resource constraints, contributing modestly to understanding sustainability-oriented value creation in practice.

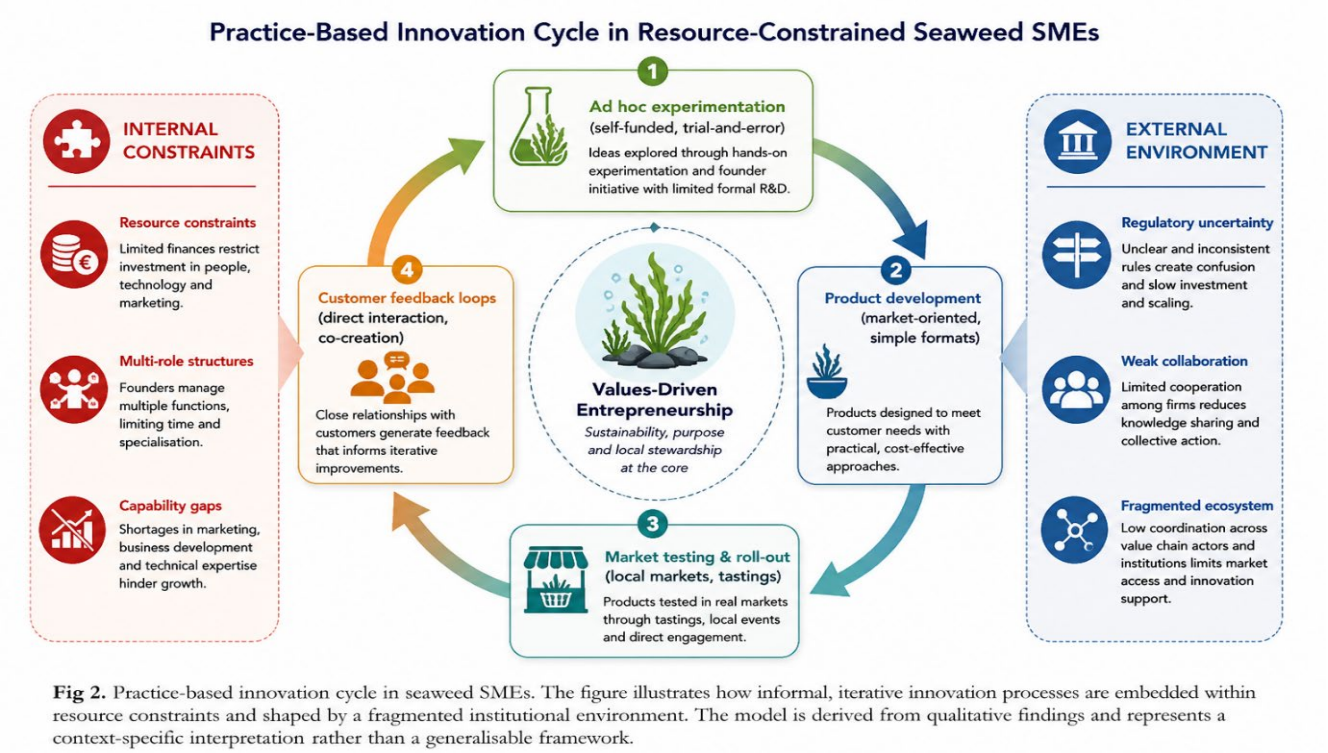

Fig 2. Practice-based innovation cycle in seaweed SMEs. The figure illustrates how informal, iterative innovation processes are embedded within resource constraints and shaped by a fragmented institutional environment. The model is derived from qualitative findings and represents a context-specific interpretation rather than a generalisable framework.

Figure 2

5. Discussion

This section examines the findings in relation to existing literature and theoretical frameworks. First, the micro-foundations of dynamic capabilities are discussed. Then, the sustainability-specific tension between agility and scalability is analysed, followed by implications for value creation in sustainable entrepreneurship.

5.1 Micro-foundations of Dynamic Capabilities in Sustainability-Oriented Contexts

The findings extend understanding of the micro-foundations of dynamic capabilities by showing that, in sustainability-oriented ventures, adaptability responds not only to market uncertainty but also to ecological and ethical commitments. Consistent with prior studies, capabilities emerge through experimentation, customer interaction, and iterative learning (Salunke *et al.* 2011; Teece 2016; Wenzel *et al.* 2021). However, these processes are guided by sustainability values rather than solely efficiency or growth objectives. In line with research on resource-constrained SMEs (Senyard *et al.* 2014; Salunke *et al.* 2019), capability development is shaped by entrepreneurial action, environmental stewardship, and local embeddedness. Stakeholder co-creation supports both innovation and alignment with sustainability and community values (Ramaswamy and Ozcan 2014,pp1-80; Aarikka-Stenroos and Ritala 2017). Similarly, adaptive experimentation reflects continuous negotiation between ecological responsibility, product viability, and market acceptance (Bocken *et al.* 2019; McGrath 2019,pp 25-120).

5.2 A Sustainability-specific Tension: Agility, Scaling, and Integrity

Although tensions between flexibility and scalability are common in SMEs (Rosenbusch *et al.* 2011; Coad *et al.* 2016), the findings show that in sustainability-oriented ventures this becomes a normative and strategic dilemma. In seaweed SMEs, scaling is constrained not only by limited resources and weak formalisation (Teece 2018; Bocken *et al.* 2019; Barbier *et al.* 2020; van den Burg *et al.* 2021), but also by commitments to local sourcing, low-impact production, and authenticity, reflecting the "emergent vs. incumbent" tension identified by Hockerts and Wüstenhagen (2010). Unlike conventional SMEs, growth may threaten ecological responsibility, traceability, and community embeddedness (Boons and Lüdeke-Freund 2013; Schaltegger *et al.* 2016), requiring continuous balancing between expansion and sustainability values.

5.3 Beyond Profit: Sustainability as a Structuring Logic of Value Creation

The findings reinforce that sustainable entrepreneurship redefines value creation by integrating environmental, social, and economic objectives (Bocken *et al.* 2014; Schaltegger *et al.* 2016;Geissdoerfer *et al.* 2018). Unlike conventional firms, seaweed SMEs embed ecological stewardship and community engagement into core operations, shaping decision-making and limiting strategic choices. Although firms create environmental and social value, they often struggle to capture corresponding economic value due to weak institutional support (D'Amato *et al.* 2017;Geissdoerfer *et al.* 2018). This creates a structural misalignment where sustainability contributions are insufficiently rewarded by markets and policy systems (Doh *et al.* 2017; Teece 2018). Consequently, sustainable entrepreneurship reshapes capability development, scaling dynamics, and value appropriation processes within firms.

6. Policy Implications and Recommendations

The findings highlight the need for integrated policy measures that address the structural and institutional barriers facing seaweed SMEs. Regulatory ambiguity emerged as a major constraint, with unclear compliance processes limiting innovation, investment, and business scaling. Policymakers should therefore prioritise clear, coherent, and streamlined regulatory frameworks that reduce administrative burdens and improve institutional coordination. Such reforms would enhance predictability, lower entry barriers, and support entrepreneurial experimentation within the bioeconomy. More broadly, the study suggests that sustainable sector development requires an enabling ecosystem in which regulatory clarity, institutional stability, and targeted support mechanisms operate as mutually reinforcing conditions for innovation and market growth.

The study highlights significant resource and capability constraints within seaweed SMEs, particularly the reliance on informal and self-funded experimentation due to limited tailored financial support. This underscores the need for mission-oriented funding mechanisms designed for micro-enterprises in emerging bioeconomy sectors, combining financial assistance with capability development in marketing, product innovation, and regulatory compliance. The findings also reveal a fragmented innovation ecosystem characterised by weak collaboration and limited knowledge exchange. Policymakers should therefore promote coordinated knowledge networks linking entrepreneurs, researchers, policymakers, and market actors to strengthen collective learning, resource sharing, and innovation capacity. Such ecosystem-based approaches are essential for supporting sustainability-driven innovation and long-term sectoral development.

Finally, the study highlights the lack of structured mechanisms for translating sustainability-oriented experimentation into scalable business models within seaweed SMEs. Although firms exhibit strong values-driven innovation, these practices remain largely informal and difficult to replicate. This underscores the need for a context-specific sustainable business model framework that formalises existing practices while preserving flexibility, strengthening value capture, and integrating capability development with market responsiveness. Such a framework should align with regulatory and financial support systems to ensure that business scaling remains consistent with environmental sustainability and community embeddedness. Overall, the findings demonstrate that supporting sustainable entrepreneurship in emerging bioeconomy sectors requires coordinated policy approaches that integrate regulatory clarity, targeted finance, capability development, and ecosystem collaboration. In response, the proposed framework presented in Fig. 3 offers a practice-oriented tool for embedding sustainability across value creation, delivery, and capture while strengthening innovation capacity and long-term sectoral development.

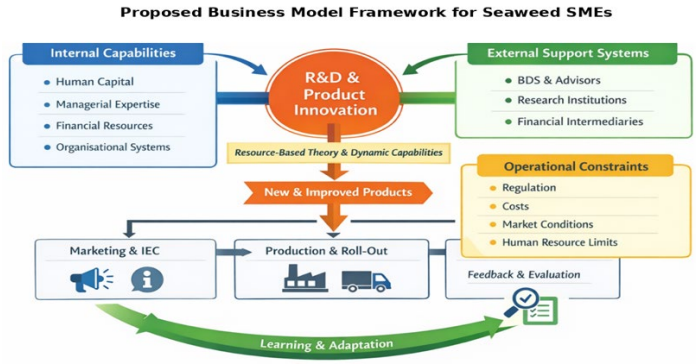

Figure 3: Proposed Business Model Framework for Seaweed SMEs

The proposed framework explains how sea vegetable SMEs generate and commercialise innovation within resource-constrained environments by integrating internal capabilities, external supports, and iterative market engagement. Grounded in Resource-Based Theory and Dynamic Capabilities, it emphasises that competitive advantage arises not from resource possession alone, but from the ability to organise, deploy, and reconfigure these resources in response to changing market conditions.

At its core are SME competences of human capital, managerial expertise, financial resources, and organisational systems which shape firms' capacity to innovate. These capabilities are activated through R&D, encompassing both experimental and incremental product development. Innovation is thus an adaptive, learning-driven process supported by continuous resource recombination. External support systems, including Business Development Services, research institutions, and financial intermediaries, extend internal capabilities by providing specialised knowledge and addressing capability gaps. However, firms operate under significant constraints related to regulation, costs, market dynamics, and limited human resources, which shape strategic decision-making and innovation pathways. The framework highlights the importance of continuous marketing and education to build consumer awareness in emerging markets, alongside the need for reliable production and distribution systems to support commercialisation. Crucially, feedback and evaluation mechanisms enable iterative learning, allowing firms to refine products and strategies over time.

Overall, the framework positions innovation as a dynamic, capability-driven, and cyclical process, where SMEs continuously adapt to environmental conditions while balancing sustainability, market demands, and resource limitations within the evolving blue bioeconomy.

7. Contributions

This study contributes to the literature by demonstrating how sustainable business model innovation is enacted within Ireland's emerging seaweed sector, a niche and resource-constrained marine bioeconomy context. Addressing calls for greater firm-level insight beyond technological perspectives (D'Amato *et al.* 2017), the findings show that dynamic capabilities in Irish seaweed SMEs develop through informal, practice-based processes shaped by regulatory uncertainty, limited resources, and market experimentation, extending previous work on SME capability development (Senyard *et al.* 2014; Teece 2018). The study also highlights the importance of experiential learning, local ecological knowledge, and stakeholder collaboration as critical micro-foundations of innovation, reinforcing and contextualising existing co-creation and learning literature (Ramaswamy and Ozcan 2014; Bocken *et al.* 2019).

8. Conclusion

Ireland's emerging seaweed bioeconomy illustrates both the promise and challenges of sustainable entrepreneurship. While firms demonstrate strong commitment to sustainability and innovative practices, their ability to scale is constrained by capability gaps and institutional fragmentation. Supporting these enterprises requires not only financial investment but also coordinated policy frameworks, knowledge networks, and regulatory clarity. By aligning profitability with environmental and social value, the seaweed sector can play a key role in advancing resilient, circular, and regenerative economies.

9. Limitations and Future Research

This study is exploratory in nature, and its findings should be interpreted within clearly defined boundaries. First, the empirical base is limited to six SMEs, which, while enabling rich and in-depth insights, restricts the breadth of representation across the Irish seaweed sector. Consequently, the findings cannot be fully generalised to the wider sector. Second, the qualitative design prioritises contextual depth and firm-level understanding over broad generalisability, capturing sector-specific dynamics shaped by Ireland's evolving marine bioeconomy landscape. Future research will build on this work through larger comparative studies across regions and marine sectors. In particular, further research will be conducted to analyse how policy implementation and regulatory systems influence sustainable business model development in the seaweed sector, and how these governance mechanisms can be better aligned and improved to support Seaweed SMEs more effectively.

Declaration of Conflict of Interest

The authors declare that there are no conflicts of interest associated with this study. Furthermore, the authors confirm that this manuscript has not been submitted, in whole or in part, to any other journal or publication for

consideration. All research participants have been fully anonymised, and no identifying information is disclosed, ensuring the confidentiality and privacy of respondents.

kati.korhola@lab.fi

Abstract: Finland has set a national objective to increase the number of companies engaged in research, development, and innovation (RDI), with a particular focus on encouraging small and medium-sized enterprises (SMEs) to scale up their RDI investments and deepen collaboration with other businesses, research organisations and RDI stakeholders. The innovation capacity of SMEs plays a crucial role in driving regional growth and competitiveness. This paper introduces the innovation bridge concept, developed within a joint project between higher education institutions operating across Finnish regions. The concept is grounded in an innovation capability assessment conducted among 50 innovation-oriented SMEs in South Savo, Finland, which examined barriers and support needs related to innovation commercialisation. The assessment identified key structural and competence-related gaps in existing regional innovation support. The results indicated that promising business ideas often remain unrealised due to a lack of timely support, limited local expertise, or the absence of suitable testing and development environments. The innovation bridge addresses this gap by integrating fragmented regional support services into a clear, company-oriented service pathway that brings complementary expertise and resources closer to SMEs. It functions both as a practical tool for SME support and as a strategic mechanism for regional development. The model is built on regional Digital Innovation Hubs (DIHs), which act as local one-stop shops and coordinate access to specialised expertise, testing environments, and networks across regions. Through cross-regional collaboration, the innovation bridge offers a concrete approach to strengthening SME innovation activity and regional vitality, particularly in structurally challenged regions. The innovation bridge enables intentional sharing and movement of know-how so that ideas, technologies, skills, and practices developed in one region can be understood, adapted, and used in the other. In the long term, the innovation bridge benefits both regions involved and their companies, while enabling development actors to operate within a more impactful innovation landscape and achieve more significant outcomes.

Keywords: University-industry Collaboration, Cross-regional Cooperation, Innovation Bridge, Digital Innovation Hub, SMEs, Digital Transformation

1. Introduction

Innovation is commonly understood as the development and implementation of new and significantly improved products, services, or processes that create value in economic or societal contexts. Within regional innovation systems, innovation is typically viewed as a distributed process emerging through collaboration across organisational and geographical boundaries (OECD, 2018). Strengthening such collaboration is essential for addressing complex societal and economic challenges and for enhancing the innovation capacity of small and medium-sized enterprises (SMEs), which play a key role in regional growth and competitiveness. Finland's national objective is to increase the number of companies engaged in research, development, and innovation (RDI), with a particular focus on encouraging SMEs to scale up their RDI investments and deepen collaboration with businesses, research organisations, and RDI stakeholders.

The innovation capacity of SMEs plays a crucial role in driving regional growth and competitiveness. In terms of innovation activities, Finland performs well above the EU 2025 average in both innovators and linkages. However, recent trends indicate a decline in the share of SMEs introducing product and business-process innovations. Although collaboration remains a key feature of Finland's innovation system, indicators for SME cooperation and the mobility of science and technology professionals have also declined. Concerns about weakening research–business collaboration have been raised. Finland has a relatively high level of RDI investment, currently at 3.1% of GDP, with a government target to reach 4% by 2030. Most companies develop new products and business processes in-house and rely primarily on their own innovation capabilities, while public–private RDI collaboration remains limited. SMEs in particular face barriers to engagement due to complex support systems, weak incentives, and limited capital for scaling, which contribute to Finland's "middle technology trap". Government support for business RDI remains below the EU average, and collaboration with higher education institutions is constrained by systemic, institutional, and cultural factors, as well as a shortage of RDI talent and low mobility between sectors. (European Commission, 2025a; 2025b).

This paper introduces the innovation bridge concept, developed within a joint project between higher education institutions (HEIs) operating across Finnish regions. To respond to the innovation challenges faced by SMEs, the model is grounded in an innovation capability assessment conducted among SMEs in South Savo, Finland, focusing on barriers and support needs related to innovation commercialisation. This paper proceeds as follows. First, the findings are used to outline the structural and competence-related challenges identified in regional innovation support. The paper then introduces the innovation bridge as a response to these challenges, describing how it integrates fragmented regional support services into a clear, company-oriented service pathway that connects complementary expertise and resources across regions. Finally, the innovation bridge is positioned both as a practical support mechanism for SMEs and as a strategic approach to strengthening regional innovation systems.

2. Context: Innovation Imperatives and Regional Synergy

Regional councils in Finland operate as statutory joint municipal authorities responsible for coordinating regional development in collaboration with the central government, municipalities, cities, higher education institutions, and other stakeholders. In South Savo, RDI activities are constrained by limited resources, skills shortages, funding constraints, and a fragmented support landscape, all of which particularly affect SMEs and start-ups. The region's small business structure and limited number of leading companies contribute to low RDI activity, while access to national and EU funding remains challenging. To address these issues, South Savo has pioneered a business-oriented RDI roadmap and invested in RDI platforms and cluster initiatives, supporting SME participation in international projects, although access to Business Finland funding continues to be limited (The Ministry of Economic Affairs and Employment of Finland n.d.; South Savo Regional Council 2023; Etelä-Savo ennakoi n.d.).

According to Costin & Radulescu (2020), in a knowledge-based economy characterised by rapid transformation, SMEs find it increasingly difficult to build and sustain competitive advantage, particularly given the costs of adopting technological innovations, pursuing digital transformation, and addressing other critical innovation challenges. Cross-regional cooperation that extends beyond administrative and regional boundaries creates new opportunities for businesses to develop and scale their operations. By accessing expertise, markets, and support services located in other regions, companies can identify new growth paths that would not be available within a single region alone. Effective cooperation requires well-functioning networks that actively disseminate information about available services and guide companies toward solutions that match their specific development needs. Importantly, these networks must operate seamlessly across regional borders to ensure that businesses can benefit from the most relevant services regardless of their location.

European Digital Innovation Hubs (EDIHs) are initiatives under the EU's Digital Europe Programme. They act as service centres that promote digital investments, with a particular focus on advancing the digitalisation of SMEs. Their objective is to facilitate the rapid and widespread adoption of new technologies across both the business and public sectors. The EDIH service helps SMEs enhance their processes, services, and products by providing expert support, including training, financial guidance, and technical development (Ministry of Economic Affairs and Employment of Finland n.d.; European Digital Innovation Hubs Network n.d.). The initiative was launched in 2016 by the European Commission through the Digitising European Industry (DEI) Strategy. The programme aimed to strengthen the EU's competitiveness in digital technologies by ensuring that all organisations across Europe have access to nearby digital innovation centres, known as Digital Innovation Hubs (DIHs), while also fostering the development of a Europe-wide network among these stakeholders. Integrating DIHs into business and marketing requires clear strategic alignment with organisational goals, supported by well-defined objectives, resources, and a roadmap. Employee training, stakeholder engagement, and effective change management are essential to support adoption, while continuous evaluation ensures impact and ongoing improvement. Through a structured approach, DIHs can strengthen innovation, collaboration, and competitiveness (Georgescu et al. 2021; Sotirofski & Kraja 2024).

3. Innovation Bridge Model for SME Support and Cross-Regional Competence Sharing

The development of the innovation bridge builds on a background study that forms the analytical basis for the work. The following section provides the empirical and theoretical grounding for the development of the innovation bridge model. It integrates findings from a regional assessment of SME innovation capabilities and commercialisation support needs with relevant literature on collaborative innovation, knowledge transfer and

interregional innovation systems. These perspectives highlight key capability gaps, systematic constraints, and collaboration challenges that inform the design and focus of the proposed model.

3.1 Context for the Innovation Bridge Model

The INNOCOM – Supporting the Commercialisation of Innovations project (1.1.–31.10.2024) assessed the innovation capabilities and commercialisation support needs of 50 companies in South Savo region, Finland. Innovation capability assessments examined customer, product, and business perspectives, and the assessment sessions identified development needs and relevant support measures. Companies were selected using purposive, non-random sampling to identify SMEs with innovation potential in South Savo. Candidates were identified primarily through searches on a Finnish sales intelligence and data platform Vainu and company lists using visible indicators of innovation activity, such as growth, project or EU funding, internationalisation, media visibility, technology adoption, and prior development work. This was complemented by the project team's local knowledge, colleague recommendations, and company websites. Selection also considered regional relevance to South Savo's RDI roadmap and smart specialisation themes, sectoral diversity, and the inclusion of firms not already closely engaged with public support services or higher education collaboration. Practical feasibility further shaped the final sample, as companies needed to be reachable, have identifiable contact persons, and be able and willing to participate within the project timeframe. The sample represents a purposive group of innovation potential regional SMEs.

Data were collected through facilitated innovation capability assessment sessions conducted via Teams using a semi structured approach. Sessions concluded with an open discussion on broader innovation activities and experiences with public innovation support. Each session was conducted by two project team members, one facilitating the assessment and the other documenting observations for post session analysis. The analysis combined structured capability gap scoring with qualitative interpretation and cross case synthesis. Within each company, importance and current state ratings were used to identify capability areas that were both critical and underdeveloped, thereby prioritising development needs. The top two or three areas were reviewed with the company representative and discussed in more depth, focusing on underlying resource constraints, competence gaps, and support needs.

The results suggest that innovation in South Savo SMEs is often pragmatic, customer-driven and closely tied to day-to-day business, but constrained by limited time, personnel and systematic development practices. The clearest recurring gaps concern the transition from ideas and technical development to commercial impact: launching and scaling innovations, strategic planning, productisation, market-facing capabilities and the ability to turn customer insight into structured development. Companies recognise the value of public and higher-education-based support, but often experience the support landscape as fragmented, complex or insufficiently aligned with concrete business needs. They therefore call for clearer, more targeted and business-oriented support, especially for commercialisation, piloting, scaling and practical implementation, as well as more accessible, company-driven collaboration with higher education institutions. (South-Eastern Finland University of Applied Sciences, 2024).

The innovation bridge model builds on recent research on collaborative innovation, knowledge transfer, and interregional innovation systems. Innovation in SMEs depends on access to external knowledge and participation in collaborative networks, especially in contexts where internal resources are limited. Absorptive capacity, defined as the ability to recognise, assimilate, and apply external knowledge, is a key factor linking collaboration to innovation performance (Cohen & Levinthal, 1990; Zahra & George, 2002; Mata, Martins & Inácio, 2024; Motohashi, Ikeuchi & Yamaguchi, 2025). At the ecosystem level, structural challenges such as fragmentation, uneven distribution of capabilities, and limited mechanisms for effective knowledge utilisation continue to constrain innovation outcomes. Externally acquired knowledge does not automatically translate into innovation without processes that support its interpretation and application, especially in SMEs (Durst, Foli & Edvardsson, 2024). Intermediary organisations and structured cross-regional collaboration mechanisms help address these challenges. The concept of interregional innovation bridges provides a framework for sustained cooperation between regions by reducing information asymmetries, aligning stakeholder priorities, and enabling continuous exchange of expertise, technologies, and resources (Karanikolova et al., 2024). Within this framework, the innovation bridge functions as a connective structure between regional innovation ecosystems, facilitating mediated knowledge transfer, adaptation, and application in new contexts.

3.2 Creating the Innovation Bridge in Practice

Strengthening SMEs innovation capabilities calls for new cooperation models between higher education institutions (HEIs), development organisations, and companies. The construction of the innovation bridge is grounded in the joint development project *INKA.* The objective is to build a cross-regional innovation bridge between two DIHs and their regions to offer SMEs broader and more accessible development services through a one-stop shop approach. The participating hubs are DIH eSavo (South Savo Digital Innovation Hub coordinated by South-Eastern Finland University of Applied Sciences) and Digital Innovation LAB (LAB University of Applied Sciences).

Developing the innovation bridge applies service design methods and emphasises a customer-centric approach to support SME innovation through cross-regional cooperation. Service design is founded on a mindset that prioritises practicality, human and customer-centred focus, and collaborative development. Its objective is to create well-developed solutions through iterative processes, utilising a range of service design methodologies and tools. A key responsibility of the service designer is to determine which tools are best suited to address specific challenges. An effective service design process enables participants to view the service from the user's perspective and fosters the creation of innovative concepts and solutions through structured, creative approaches (Stickdorn et al., 2018, pp. 37–40). The process of developing the innovation bridge model has included benchmarking, co-creation and cross-regional workshops, guided discussions based on predefined questions, brainstorming, and the systematic collection and utilisation of information from stakeholders. The innovation bridge must evolve dynamically in response to changing company needs, priorities, and resources. The following observations are based on experience gained during implementation and reflect insights gathered by the project midpoint.

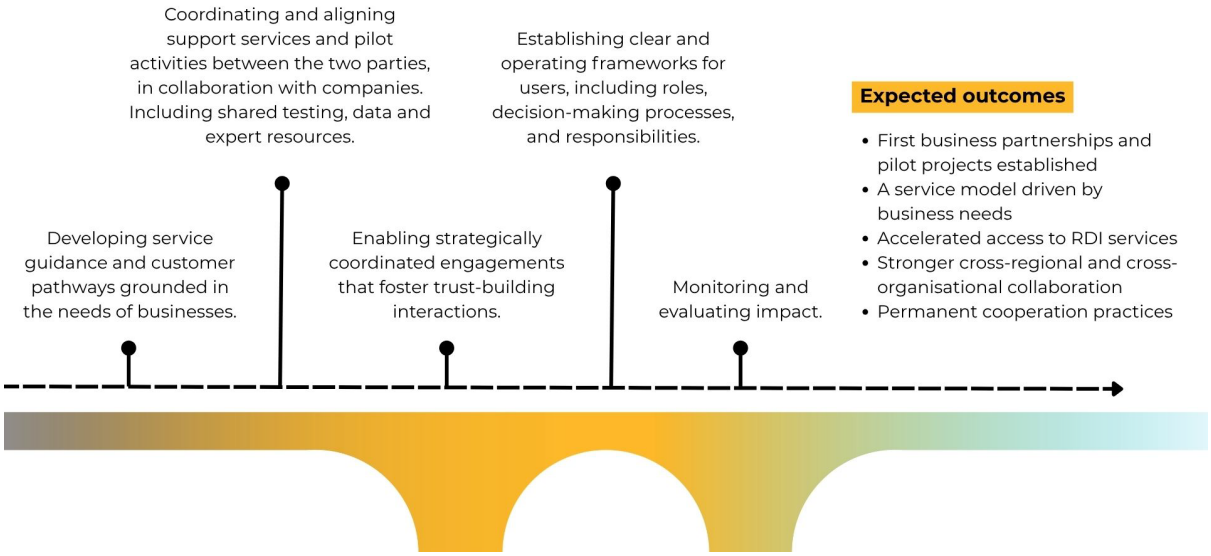

Figure 1: Illustration of the project developed model of the innovation bridge and the pathway towards a functional cross-regional cooperation model (INKA – Strengthening SMEs' Innovation and Growth Potential in Internationalising Ecosystems project).

3.3 Implementation of the Innovation Bridge

Several significant challenges should be tackled throughout the innovation bridge development from a service design point of view. This includes coordinating the timing of development services, allocating resources efficiently, and ensuring effective communication among participants. To address this systematically, distinct phases were implemented to resolve the issues and establish the innovation bridge. The methods and phases of the Innovation Bridge are illustrated in Figure 1. Through these practical phases, the aim is to respond to the previously identified challenges and to gradually open an innovation bridge between two regions. The methods and phases have functioned as a development framework, even though the work has not always progressed in a fully linear manner, as several activities have been carried out in parallel.

3.3.1 Developing Service Guidance and Customer Pathways

When developing the innovation bridge, it became evident that regional characteristics shape SME needs and the delivery of development services, making it essential to adapt operating models to regional contexts through customer-centric approaches, service design, and co-creation. The strategy builds on the features of two universities of applied sciences (UASes) and their environments in the South Savo, Päijät-Häme, and South Karelia regions. The local business structures, ecosystem growth, and company needs have been considered in the development process. Reaching SMEs requires targeted communication tailored to different customer profiles. For example, in rural contexts, engagement could be more effective when focused on concrete business needs and conducted in familiar environments, whereas digitally mature companies could seek collaboration related to technology experimentation, research, or international networks. The innovation bridge also considers the user experience of DIH operators, internal actors in organisations and the public-sector actors. Within the innovation bridge, communication methods, service processes, and channels are systematically refined. Comprehensive, customer-focused service descriptions, effective management of expectations, and an integrated one-stop shop approach, complemented by accessible expert engagement, are critical to foster trust and deliver an excellent customer experience.

3.3.2 Coordinating and Aligning Support Services and Pilot Activities

Coordination forms the basis of innovation bridge operations, as it enables consistent and customer-oriented cooperation between different actors. Based on the experiences of the project, effective coordination is not based solely on structures, but on active encounters, consortia, and expert networks that integrate SMEs and experts. This coordination requires active engagement from stakeholders but especially from DIH coordinators and regular structured meetings.

3.3.3 Enabling Strategically Coordinated Engagements

The role of DIH coordinators emerged as central to enabling strategically coordinated engagements. Coordinators' proactivity, reliability, and sense of responsibility proved decisive for collaboration and service success. This role requires proactivity that refers to *actively connecting companies and experts*, *organising meetings and events*, *communicating about the opportunities for digitalisation and RDI*, and *suggesting new openings for cooperation*. Coordinators also interact widely with SMEs, public-sector actors, and internal organisational units. With multiple DIH coordinators, responsibilities should be shared. Through these strategically coordinated engagements (services, meetings, events, and communication), the aim is to build trust among companies and other stakeholders, so they can be confident they will receive reliable, high-value services and opportunities. Early successes include theme-based networks established between the regions, two successful cross-regional events that brought together companies, experts, and other key regional actors, closer cooperation between internal units, and improved communications, which have strengthened stakeholder commitment and demonstrated the potential for joint value creation.

3.3.4 Establishing Clear Operating Frameworks

The functioning of the innovation bridge requires a balance between flexibility and common structures. Although services adapt to changing needs, it is important that the parties share a mutual understanding of roles and responsibilities. This can be supported through jointly agreed operating models, documentation, and planning templates. The responsibility for documentation lies with both the DIH in question and the DIH coordinator. DIH organisations may have different internal policies regarding documentation. However, in connection with the INKA project at DIH eSavo, we have found that careful documentation of key information is essential. This way, information related to the customer relationship is also easily available to other DIH coordinators, for example, in connection with personnel changes. Documentation enables the analysis of customer processes and needs and supports data-driven operational development, which serves the interests of both DIH and the customer company. In addition, the project has concluded that the maintenance of the customer relationship will be kept light, and that contracts will not be drawn up unless there is a specific need for a particular measure or service.

3.3.5 Monitoring and Evaluating Impact

The innovation bridge is intended to function as a lasting operational approach, and its long-term success depends on fostering trust, motivation, and enthusiasm while integrating the model into routines. As mentioned earlier, the innovation bridge is intended to be a flexible model whose development is based on needs. The goal

is to be able to test the bridge with the first customer companies. Practical work is expected to accelerate access to RDI services, enhance cross-regional collaboration, and establish the operating model as a lasting component of core activities. Overall, the Innovation Bridge functions as an operating model rather than a single service. Its activation and maintenance require proactive coordinators and stakeholders who have a common will to promote SMEs' access to RDI services and expert networks and to build cross-regional cooperation. The coordination of activities requires common practices and systematic documentation, but the operating model must also be flexible and shaped according to the needs of the companies, regional characteristics and the starting points of the implementing organisations. The identification of different customer profiles and their associated customer paths support the appropriate targeting of services and communications.

4. Discussion and Conclusion

The innovation bridge model presented in this paper was developed through a joint project between two Finnish higher education institutions operating across regions, with the aim of improving SMEs' access to research, development, and innovation (RDI) activities. Responding to increasing challenges faced by SMEs in building and sustaining competitive advantages amid rising innovation and digital transformation costs (Costin & Radulescu, 2020), as well as identified structural and competence-related gaps in regional innovation support in South Savo, the model integrates fragmented services into a clear, company-oriented pathway. It is built on regional Digital Innovation Hubs (DIHs), which function as local one-stop shops and coordinate access to specialised expertise, testing environments, infrastructure, and networks across regions. Through intentional cross-regional collaboration, the innovation bridge enables the sharing and transfer of ideas, technologies, skills, and practices so that knowledge developed in one region can be understood, adapted, and utilised in another. As both a practical support mechanism for SMEs and a strategic coordination model, the innovation bridge strengthens regional innovation systems and supports more effective participation in collaborative innovation ecosystems, particularly in structurally challenged regions where individual regional DIHs are insufficient on their own.

Practical experience shows that a successful innovation bridge requires both complementary expertise and ongoing alignment between organisations. Coordinated practices, such as shared definitions, clear roles and responsibilities, and agreed processes for communication and contracting, have proven essential in ensuring smooth collaboration across organisational and regional boundaries. A key success factor lies in motivated and active network members who continuously develop the operational model, work actively across the different interfaces of the innovation bridge, and closely monitor company needs. By maintaining direct engagement with SMEs, these actors can identify emerging demands and proactively build effective pathways to relevant support services, expertise, and resources across the network. More broadly, the innovation bridge facilitates the deliberate circulation of knowledge, skills, and practices across regions, strengthening regional innovation capacity and resilience, especially in regions facing structural challenges. Through the DIH network, SMEs can also be connected to EDIHs, expanding access to specialised services and international collaboration opportunities. The effectiveness of such cross-regional models depends on a shared strategic vision and a mutual understanding of the value of collaboration for regional and national development. In a rapidly changing innovation environment, strengthening cross-regional cooperation and continuously refining operational models are increasingly important.

Despite the promising outcomes of the innovation bridge model, several limitations remain. Achieving sufficient timeliness in matchmaking and collaboration has proven challenging, and although the communication practices supporting the model have evolved, further development is required to ensure more effective and proactive information flow. The operational environment of the innovation bridge consists of a complex set of actors, objectives, and regional conditions, which complicates both coordination and evaluation.

While the model has generated several good practices that form a solid foundation for regional innovation support, there is no certainty that the approach can be directly scaled or transferred to other regions without significant adaptation. Consequently, scalability should be a central focus of future iterative development. Moreover, additional empirical experience is needed to draw robust conclusions about the long-term functionality and impact of the innovation bridge. Although, trust among key stakeholders is gradually increasing; however, overall awareness and visibility of the model within the region remain limited, posing a clear challenge and an important area for further development. While discussing further research, the focus shifts to evaluating the long-term impact of the innovation bridge on SME RDI activity and its effectiveness as a service and knowledge-sharing network. In addition, a greater understanding is needed to explore both the potential and the demand for cross-regional services within the innovation bridge, as well as effective approaches for reaching and engaging SMEs with innovation bridge services.

Governance of Innovation Ecosystems: Evidence From Lisbon Through the Quadruple Helix Lens

Leani Lauermann Koch
Universidade do Oeste de Santa Catarina, Chapecó, Brazil

leanikoch@gmail.com

Abstract: This paper examines how government, industry, academia, and civil society perform their respective roles within the innovation ecosystem of Lisbon, Portugal, focusing on the governance mechanisms that sustain cross-sector collaboration and on how such coordination contributes to fostering innovation. The study adopts a qualitative approach based on semi-structured interviews with eleven key informants drawn from across the four helices, complemented by documentary analysis of public innovation policies implemented in the territory. The analysis focuses on four analytical dimensions: the governance of the public policy cycle, inter-organisational integration, the alignment across funding instruments and strategic priorities, and the extent of civil society participation in decision-making processes. Findings indicate that Lisbon exhibits an institutionally stabilised ecosystem in which the government plays a central coordinating role by designing consistent policy instruments, leveraging national and European resources, and coordinating regional development mechanisms. The private sector demonstrates high capacity for collaboration with universities and research centres, particularly in knowledge-intensive sectors, a dynamic facilitated by a predictable regulatory environment and formal cooperation channels. Non-governmental organisations and other civil society organisations are recognised as relevant stakeholders, especially in social and urban agendas; however, their strategic influence, whilst formally acknowledged, has yet to be decisively embedded in co-productive decision-making processes. The paper argues that innovation processes in the Lisbon ecosystem derive less from individual sectoral excellence and more from structured coordination among the helices. The ecosystem's long-term resilience, however, depends on strengthening the meaningful and substantive participation of civil society organisations and consolidating mechanisms for inter-institutional learning that convert technocratic integration into social co-production. The study's principal theoretical contribution is the empirical operationalisation of the distinction separating procedural and substantive civil society participation as the critical variable differentiating a functional Triple Helix from a realised Quadruple Helix. Practical implications address the redesign of civil society engagement mechanisms and the simplification of compliance requirements that disproportionately burden peripheral ecosystem actors.

Keywords: Innovation Ecosystems; Quadruple Helix; Governance; Civil Society Participation; Lisbon; Innovation Policy

1. Introduction

Innovation ecosystems are no longer adequately understood as the sum of individual organisational competencies. Contemporary scholarship reconceptualises them as products of systemic interactions among heterogeneous actors whose collaborative capacity determines the ecosystem's overall innovativeness (Adner and Kapoor, 2010; Russell and Smorodinskaya, 2018; Granstrand and Holgersson, 2020). This relational turn implies that the unit of analysis shifts from the firm or the university to the governance architecture that coordinates their interdependencies. Within this framing, public policy ceases to be a background condition and becomes a constitutive element of the ecosystem's structure: it shapes incentive systems, defines institutional boundaries, and allocates resources in ways that directly influence the nature and depth of inter-helix collaboration (Edler and Fagerberg, 2017; Koch et al., 2025; Zheng and Cai, 2022).

The Quadruple Helix model, proposed by Carayannis and Campbell (2009, 2012) as an extension of Etzkowitz and Leydesdorff's (1995) Triple Helix framework, incorporates civil society as a fourth, constitutive helix. This addition is not merely additive; it represents a qualitative shift in the conception of innovation governance. Civil society introduces social legitimacy, value plurality, and territorial embeddedness into innovation processes that would otherwise risk remaining technocratically closed. However, empirical research has consistently revealed a structural gap separating formal recognition of the fourth helix and its substantive integration into decision-making processes (Cai and Lattu, 2022; Bellandi, Donati and Cataneo, 2021). This gap — separating procedural participation and co-productive influence — constitutes the central empirical and theoretical problem motivating this study.

Lisbon represents a theoretically pertinent case for examining these dynamics. The Portuguese capital has undergone a substantial institutional transformation over the past two decades, consolidating a network of research institutions, technology companies, startup accelerators, and public innovation agencies that positions it among the more institutionally advanced urban innovation ecosystems in Southern Europe (Vlaisavljevic et al., 2020; Talmar et al., 2020; Koch et al., 2025). At the same time, the persistence of governance fragmentation, human capital absorption paradoxes, and the marginal strategic role of civil society in policy processes makes

Lisbon an analytically productive site for stress-testing the empirical applicability of the Quadruple Helix as an analytical lens.

The research question guiding this study is: how do government, industry, academia, and civil society interact to govern the Lisbon innovation ecosystem, and to what extent is civil society substantively integrated into that governance? The study deploys four analytical dimensions — governance of the policy cycle, inter-organisational integration, alignment of funding and strategic priorities, and civil society participation — to structure the empirical analysis. The central argument is that innovation in Lisbon derives less from isolated sectoral excellence and more from structured, institutionally mediated coordination among the helices. This coordinated architecture, while robust, remains incomplete: the Triple Helix is consolidated; the Quadruple Helix is aspirational.

2. Theoretical Background

2.1 Innovation Ecosystems: Systemic Interaction and Governance

The concept of the innovation ecosystem, introduced by Moore (1993) and subsequently developed within innovation studies, describes a dynamic configuration of interdependent actors whose co-evolutionary interactions generate and sustain innovative capacity (Adner and Kapoor, 2010; Gomes et al., 2018). Granstrand and Holgersson's (2020) influential definition characterises it as an evolving set of actors, activities, artefacts, institutions, and relations oriented towards the creation and diffusion of innovation. This definition foregrounds the institutional dimension: ecosystems are not simply networks of organisations but institutionally structured fields whose rules, norms, and coordination mechanisms shape what kinds of innovation are possible and for whom.

Dense relational networks and adaptive coordination among heterogeneous actors are identified as key determinants of ecosystem performance (Russell and Smorodinskaya, 2018; Cai, 2022). In this light, public policy functions not merely as a facilitating instrument but as an architectural force: it constitutes the institutional scaffolding within which actors interact (Zheng and Cai, 2022; Koch et al., 2025). The concept of ecosystem orchestration (Autio, 2022) extends this insight by framing coordination as a deliberate, multilevel process in which certain actors — typically state agencies — assume integrative roles that cannot be reduced to market transactions or voluntary collaboration. Orchestration implies purposive design of interaction rules, resource flows, and feedback mechanisms across the ecosystem.

2.2 Helix Models and the Quadruple Helix as an Analytical Lens

The Triple Helix model proposed by Etzkowitz and Leydesdorff (1995) established the triadic interaction among university, industry, and government as the structural basis of knowledge-based innovation. The model's enduring contribution lies in its emphasis on the relational, processual character of innovation — each helix not only occupies a distinct institutional domain but generates hybrid spaces where new governance forms and knowledge products emerge. Recent scholarship has extended this emphasis on relationality: Zhao et al. (2026) demonstrate that the lateral interactivity of helix ties — the density of social bonds among institutional actors — functions as a catalyst for innovation legitimacy and the institutionalisation of sustainable practices, suggesting that the quality of inter-helix connections matters as much as their structural configuration.

The Quadruple Helix extends this logic by incorporating civil society as a fourth helix (Carayannis and Campbell, 2009, 2012). This extension is conceptually significant because it introduces elements — social legitimacy, value plurality, territorial knowledge, participatory governance — that the Triple Helix treats as exogenous. For Arnkil et al. (2010) and Bellandi, Donati and Cataneo (2021), civil society's inclusion transforms innovation governance from a technocratic enterprise into a democratic one, embedding social accountability into the core of the innovation process. The model becomes particularly relevant in contexts where innovation is deployed for social and territorial ends, where public mediation is required, or where co-production of public value is an explicit policy objective (Cai and Lattu, 2022).

A critical distinction runs through the Quadruple Helix literature: the difference distinguishes the presence of civil society actors in ecosystem structures and their substantive participation in defining innovation priorities. Carayannis et al. (2018) argue that relational density — the intensity and reciprocity of interactions across helices — is a more reliable predictor of innovation capacity than formal actor composition. An ecosystem populated by all four helices but characterised by asymmetric, consultative interactions does not realise the

governance potential implied by the model. The Quadruple Helix, in this reading, functions as an analytical lens that asks not merely who is present but how governance power is distributed, and whether civil society shapes agendas or ratifies them post hoc.

For analytical purposes, this study operationalises the Quadruple Helix along four governance dimensions: (i) state coordination of the policy cycle; (ii) inter-organisational collaboration among helices; (iii) alignment connecting funding mechanisms and strategic priorities; and (iv) the depth and quality of civil society participation. This operationalisation follows Cai and Lattu (2022) in treating the framework as a diagnostic instrument rather than a descriptive catalogue of actors.

3. Methodology

This study adopts a qualitative case study design (Creswell and Poth, 2018; Yin, 2018), selecting Lisbon as a theoretically significant case of an institutionally stabilised urban innovation ecosystem in a semi-peripheral European economy. Case selection was theory-driven rather than representative: Lisbon offers the analytical leverage of a context in which all four helices are formally present, enabling examination of the quality — not merely the existence — of inter-helix governance.

Empirical data were generated through semi-structured interviews with eleven key informants, distributed across the four helices: four from government (national and regional agencies), three from academia (research universities and research centres), two from industry (technology firms and innovation intermediaries), and two from civil society (non-governmental organisations active in urban and social innovation). This composition reflects the structural asymmetry of helix representation in the Lisbon ecosystem and was designed to enable systematic cross-helix comparison rather than quantitative parity (Aguinis and Solarino, 2019). The under-representation of the fourth helix in the sample mirrors its structural position in the ecosystem and is itself an analytical finding.

Interview data were complemented by documentary analysis of primary policy instruments, including the National Recovery and Resilience Plan (PRR), the National Innovation Strategy, the Lisbon Smart City Agenda, and the instruments of principal innovation agencies — ANI (National Innovation Agency), FCT (Foundation for Science and Technology), IAPMEI (Agency for Competitiveness and Innovation), and CCDR-LVT (Commission for the Coordination and Regional Development of Lisbon and Tagus Valley). This triangulation of interview and documentary sources strengthens interpretive validity (Yin, 2018). Data were analysed using qualitative content analysis (Bardin, 2016) with the support of ATLAS.ti software (Friese, 2019), applying a coding scheme organised around the four analytical dimensions. The interpretive logic followed was abductive: theoretical categories guided initial coding, while emergent themes informed iterative refinement of the analytical framework.

4. Results and Discussion

4.1 State Coordination of the Public Policy Cycle

The Lisbon innovation ecosystem is marked by strong state coordination. National agencies such as ANI, FCT and IAPMEI, together with regional and municipal bodies, organise policy instruments, channel European and national resources, and define conditions for collaboration among government, academia, industry and civil society. This architecture gives stability and direction. Instruments are broadly consistent with European smart specialisation agendas and with the National Recovery and Resilience Plan (PRR). Thus, the state does not merely facilitate innovation; it orchestrates incentives, priorities and formal arenas through which actors interact (Mazzucato, 2018; Koch et al, 2025).

This confirms that public policy is constitutive of ecosystem governance. In Lisbon, the state defines strategic priorities, coordinates resource flows and institutionalises channels of inter-helix interaction. These functions are especially relevant in semi-peripheral innovation contexts, where private investment density and market maturity may be insufficient to sustain systemic coordination without public direction. This interpretation aligns with the view that policy mixes are complex governance arrangements that shape actor behaviour and institutional learning (Flanagan et al., 2011; Kuhlmann and Rip, 2018).

However, the policy cycle is not equally open across all stages. Interviewees recognised consultations, working groups and formal interaction channels, but these mechanisms often operate after strategic priorities have been defined. Participation is therefore procedurally present but substantively limited. Civil society organisations and

smaller firms are more often invited to validate, adapt or implement agendas than to co-define them. Lisbon thus has a consolidated Triple Helix governance base, but its transition toward a fully operational Quadruple Helix remains incomplete.

The analysis also reveals administrative complexity. Multiple agencies and instruments increase delivery capacity, but raise transaction costs for actors with fewer administrative resources, especially small and medium-sized enterprises, social enterprises and non-governmental organisations. The Lisbon case therefore resonates with research showing that innovation policies may unintentionally privilege actors already capable of navigating complex funding and compliance environments (Audretsch et al., 2023).

4.2 Inter-Organisational Collaboration among Helices

Inter-organisational colloboration in Lisbon is institutionally visible and relatively mature. Competitiveness Clusters, Collaborative Laboratories (CoLabs), incubators, accelerators and municipal innovation platforms create repeated interaction among universities, firms, public agencies and intermediaries. These arrangements strengthen knowledge circulation and support innovation in digital services, biotechnology, renewable energy and urban technologies. The academia-industry interface is especially relevant, as universities and research centres provide scientific capabilities while firms and intermediaries translate part of this knowledge into applied projects.

These collaborative arenas show that Lisbon has moved beyond a fragmented collection of innovation actors and developed an ecosystemic architecture. This is compatible with innovation ecosystems as co-evolving configurations of actors, activities and institutions, in which value is created through complementarity and interdependence (Gomes et al., 2018). It also converges with the Triple Helix tradition, which emphasises hybrid spaces and university-industry-government relations as mechanisms for knowledge-based development (Leydesdorff, 2012).

Despite this progress, collaboration remains more project-based than relational. Actors often converge around funded initiatives and disperse when projects end, limiting durable inter-institutional trust. A second tension is temporal asymmetry: academic cycles, organised around multi-year projects and publication requirements, do not always match firms' faster decision cycles. Technology transfer offices, incubation spaces and co-location platforms partly address this gap, but do not fully solve long-term knowledge valorisation. Similar tensions appear in knowledge-intensive entrepreneurial ecosystems, where project-based interaction can stimulate outputs without durable relational embeddedness (Gifford et al., 2021).

The civil society helix occupies a weaker position in this architecture. Non-governmental organisations and social innovation actors are present in consultations, urban projects and sustainability agendas, but less often in spaces where priorities are defined. Quadruple Helix governance depends not only on actor presence, but on the quality, reciprocity and intensity of interactions. Lisbon therefore has considerable organisational density, but uneven relational density, consistent with debates on co-evolutionary innovation systems and more advanced Quadruple Helix configurations (Carayannis et al., 2024).

4.3 Alignment Connecting Funding Instruments and Strategic Priorities

The alignment connecting funding instruments and strategic priorities is among the strongest features of the Lisbon ecosystem. European and national programmes give innovation policy clear direction, especially in digital transformation, sustainability, research commercialisation and urban development. Large-scale consortia, mission-oriented calls and PRR-related instruments concentrate resources around strategic priorities, induce cross-sector collaboration and reinforce the state's capacity to orient ecosystem trajectories. Funding therefore operates as a governance device, not only as a financial mechanism.

The PRR and related instruments reinforce strategic selectivity by linking financial support to economic transformation and territorial resilience. This orientation is compatible with the policy emphasis on science, technology and innovation as drivers of long-term transformation (OECD, 2024). It also reflects ecosystem strategy, in which actors position themselves within interdependent structures of value creation, competition and co-opetition (Ritala, 2024).

At the same time, this architecture creates exclusionary effects. Large consortium-based projects favour actors with administrative capacity, prior experience and established networks. Smaller firms, social enterprises and civil society organisations face higher relative costs in applications, compliance reporting and project management. One government informant stated that bureaucracy has been “installing itself and killing”

participation by less-resourced actors. Thus, while funding instruments are strategically aligned at the macro level, they are not equally accessible at the ecosystem level, reproducing participation asymmetries.

The evidence also suggests that funding alignment is stronger in technological and economic domains than in social and democratic dimensions. Instruments mobilise universities, firms and public agencies around innovation performance, but are less effective in enabling civil society organisations to act as agenda-setting actors. Public financing allocates resources and defines which problems are legitimate, which forms of knowledge are valued and which actors become central. Universities therefore contribute not only research, but also mediation, translation and social embedding of knowledge (Thomas et al., 2021).

4.4 Civil Society Participation: From Consultation to Co-Production

Civil society is formally recognised in the Lisbon innovation ecosystem, especially in social innovation, urban development, sustainability and public services. Open science initiatives, municipal innovation districts and participatory forums expand channels through which social actors access knowledge and engage with innovation debates. These developments show movement beyond a narrow technology-centred approach and incorporate elements of social embeddedness.

This movement is consistent with the Quadruple Helix, which extends innovation governance beyond government, academia and industry by incorporating civil society, culture, values and participation. In Lisbon, this fourth helix is recognised but asymmetrically positioned. As Quadruple and Quintuple Helix literature suggests, ecosystems become more resilient when knowledge circulates across institutional, social and cultural boundaries rather than remaining concentrated in technocratic networks (Carayannis and Campbell, 2021; Carayannis et al., 2018).

Nevertheless, civil society engagement remains consultative rather than co-productive. Non-governmental organisations reported being invited to provide feedback, participate in hearings or contribute contextual knowledge after agendas have been designed. They are less often positioned to influence problem definition, priority setting or evaluation criteria. This limits the democratic quality of the Quadruple Helix and the ecosystem's capacity to capture territorial knowledge beyond government, universities and firms. The issue is not civil society's absence, but the limited conversion of presence into governance influence.

This limitation also appears in feedback mechanisms used to evaluate innovation policy. Current indicators privilege outputs such as publications, patents, spin-offs, funded projects and employment. These metrics matter, but do not capture governance capacity, institutional learning, social inclusion or the quality of civil society participation. The result is an incomplete learning cycle: the ecosystem receives strong signals about innovation outputs, but weaker signals about inclusive and socially responsive governance.

Lisbon's human capital profile reinforces this point. The ecosystem has benefited from tertiary education expansion and consolidated research capabilities, but private sector absorption of highly qualified human capital remains uneven (OECD, 2023). Knowledge production alone does not guarantee structural transformation. The ecosystem must strengthen institutional bridges connecting education, research, industry, social needs and territorial development. Trust, reputation and relational continuity are relevant because actors need credible, repeated and socially recognised interactions to sustain collaboration beyond isolated projects (Chaudhary et al., 2024).

Overall, Lisbon presents an orchestrated and institutionally stabilised innovation ecosystem. Coordination among government, academia and industry is comparatively strong, and funding instruments provide directionality. Yet the fourth helix remains structurally peripheral. Two transitions are necessary to realise the promise of the Quadruple Helix: from technocratic integration to social co-production, and from procedural participation to substantive influence over innovation priorities.

5. Conclusion

This study has examined the governance dynamics of the Lisbon innovation ecosystem through the analytical lens of the Quadruple Helix, focusing on four dimensions: policy governance, inter-helix integration, funding-strategy alignment, and civil society participation. Three conclusions emerge from the analysis.

First, Lisbon exhibits an institutionally stabilised, state-orchestrated innovation ecosystem in which innovation capacity derives primarily from structured coordination among the helices rather than from the isolated excellence of individual actors. The government’s central coordinating role — operationalised through ANI, FCT,

and IAPMEI — has generated a consistent, multi-generational policy architecture aligned with European frameworks. The university-industry interface is functional and growing, particularly in knowledge-intensive sectors. These are the characteristics of a well-developed Triple Helix configuration.

Second, the Quadruple Helix remains aspirational rather than operational in the Lisbon context. Civil society organisations are formally present within the ecosystem's governance structures — they appear in consultation documents, advisory bodies, and strategic planning exercises — but their influence over agenda-setting remains procedurally bounded. The distinction distinguishing formal presence and substantive participation, identified in the theoretical literature as the central analytical challenge of the Quadruple Helix (Cai and Lattu, 2022; Bellandi, Donati and Cataneo, 2021), is empirically confirmed in the Lisbon case. This is not a transitional feature of an ecosystem that will naturally resolve itself over time; it reflects structural asymmetries in governance capacity and institutional access that require deliberate policy redesign.

Third, the study identifies a human capital paradox — high doctoral production combined with low private sector absorption — and a governance fragmentation problem — multiple agencies with overlapping mandates generating disproportionate compliance costs for peripheral actors — that are under-documented in the existing literature on Portuguese innovation governance. These findings contribute to a more detailed understanding of the institutional conditions under which semi-peripheral European ecosystems achieve and sustain innovation performance.

The study's theoretical contribution lies in the empirical operationalization of the distinction distinguishing technocratic integration and social co-production as the critical variable differentiating a functional Triple Helix from a realised Quadruple Helix. The mode of inter-helix integration — not merely its intensity — emerges as a determinant of ecosystem resilience. An ecosystem that integrates all four helices procedurally but excludes the fourth from substantive governance generates structural vulnerabilities: reduced legitimacy, attenuated feedback signals, and inadequate incorporation of the social and territorial knowledge that civil society uniquely contributes.

The study carries practical implications for innovation policy in comparable contexts. Simplification and functional integration of policy instruments would reduce the compliance burden that disproportionately affects smaller actors. More consequentially, the redesign of civil society participation mechanisms — moving from consultation to co-production at the agenda-setting stage — would strengthen both the legitimacy and the adaptability of ecosystem governance. Achieving this transition requires, as Mazzucato and Kattel (2026) argue, a fundamental reconfiguration of public sector capacities: the state must develop not only the administrative infrastructure to coordinate complex ecosystems but also the institutional routines to incorporate social feedback and co-create value with peripheral actors. These recommendations are consistent with the broader argument advanced by Mazzucato (2024) that innovation ecosystems generate inclusive and resilient outcomes only when governance architecture is explicitly designed to redistribute agenda-setting power.

Limitations. The study is based on a single qualitative case, which precludes statistical generalisation; analytical transferability is conditional on the existence of comparable institutional conditions in other contexts. The eleven-informant sample provides systematic cross-helix coverage but cannot exhaust the diversity of perspectives within each helix; the fourth helix is particularly under-represented. The study captures a temporal cross-section of a continuously evolving ecosystem.

Future Research Agenda. Three directions merit priority attention: (i) the mechanisms through which procedural civil society participation may be converted into substantive co-production in semi-peripheral European ecosystems, examined comparatively; (ii) the decoupling linking qualified human capital production and private sector absorption, investigated longitudinally to distinguish structural from cyclical determinants; and (iii) the differential bureaucratic transaction costs generated by complex policy mixes, analysed through governance network methods to identify the institutional configurations most conducive to inclusive ecosystem participation.

Ethics Declaration

This research was conducted in accordance with established ethical standards for qualitative social science research. All participants provided informed consent, anonymity was guaranteed, and data were handled in conformity with applicable data protection regulations. No conflicts of interest are declared.

AI Declaration

Artificial intelligence tools were used in the drafting and editorial revision of this manuscript. All intellectual content, analytical judgements, empirical interpretations, and theoretical arguments are the exclusive responsibility of the authors.

Organisational Aesthetics in Sustainable Human Resource Management: A Four-Dimensional Framework

Daniela Kond and Arvi Kuura
University of Tartu, Pärnu College, Estonia

Daniela.Kond@ut.ee
Arvi.Kuura@ut.ee

Abstract: Organisations increasingly face pressure to develop more human-centred and sustainable approaches in complex and rapidly changing environments. One such development is the 'aesthetic turn' in management, which integrates sensory and artistic dimensions into organisational practices. This study examines the relationship between organisational aesthetics, human resource management (HRM), and sustainability, addressing a gap in the literature on sustainable HRM. A systematic literature review of 38 peer-reviewed journal articles, identified through searches in Scopus and Web of Science, was conducted using an iterative coding process. The analysis identified 20 themes, which were aggregated into four key dimensions: (1) talent attraction, (2) organisational culture and diversity, (3) physical work environment, and (4) employee well-being and satisfaction. The findings show that organisational aesthetics function as a connecting mechanism between HRM practices and the social dimension of sustainability. The analysis also reveals key limitations, including the uneven distribution of aesthetic benefits, the superficial use of aesthetics in employer branding, and the risk of reinforcing appearance-based biases. The study contributes to theory by proposing a four-dimensional framework of organisational aesthetics in sustainable HRM and by integrating fragmented multidisciplinary insights into a coherent structure. It also highlights the need for further empirical research and demonstrates that organisational aesthetics is a critical, yet underexplored, driver of sustainable HRM.

Keywords: Human Resource Management, Sustainability, Organisational Aesthetics, Workplace Aesthetics, Employee Well-Being

1. Introduction

Quickening and aggravating changes in environments, particularly crises and disruptive events, force organisations to respond adequately and to find novel solutions to upcoming problems. Operating in an increasingly complex and unpredictable world calls for innovation, imagination, intuition, improvisation, etc. (Mairesse et al., 2022). Such novel approaches can be 'borrowed' from other, sometimes close, sometimes (apparently or actually) rather distant realms. As Kuhn (1962) noted, when the existing does not provide sufficient results, something novel is needed. This concerns the 'aesthetic turn' in organisation studies – collating organisations and their management with art and aesthetics has led to a novel, artistic approach exploring fluidity, creativity, and playfulness (Strati 2010).

Organisational aesthetics as an 'epistemological metaphor' offers considerable alternatives to the traditional logical-rational understanding of organisations. Strati and Guillet de Montoux (2002) qualified this notion by three dilemmas: the essential (survival) versus the superfluous (pleasure); the serious (income, etc.) versus the facetious (human relations, etc.); and notably, the scientific (methodical rigour, etc.) versus the artistic (seeing the unusual, sensitive-aesthetic judgement, etc.). They also delimited three research approaches in organisational aesthetics, labelled 'archaeological', 'empathic-logical', and 'empathic-aesthetic' (ibid).

Aesthetics in organisations concerns resources, processes, organisation, and environment. The last embraces physical spaces, including all socio-material dimensions. Physical spaces are nowadays increasingly affected by information technology, forming hybrid (physical and virtual) workspaces with new possibilities and limitations. This brings along specific aesthetic aspects. (Petani and Mengis, 2021) A focal keyword in this context is *socio-materiality* which combines 'social' (symbols, meanings, desires, culture, etc.) and 'material' (things: forms, machines, databases, furniture, etc.). Various human–machine (including robots and artificial intelligence) interactions are increasingly important, as all these have aesthetic aspects. (Moura and Bispo, 2020)

The role of artistic thinking and (metaphorical) learning from the arts is increasingly recognised. Artistic interventions have proved useful in several ways. In the context of this paper, particularly important is making the work (more) meaningful (Berthoin Antal et al., 2018). Organisational aesthetics and organisational culture are inherently linked, and both have an influence on employee satisfaction and motivation (Bjerke et al., 2007). Aesthetical organisations promote the well-being of employees, thereby helping to attract and retain employees, especially talents, also older personnel and other specific groups. Human resource practices and

organisational culture affect performance, including service quality (ibid). This is increasingly important in the current situation because of hard competition in consumer as well as in labour markets.

Human resource management (HRM) is a complex (sub)field in practice and a (sub)discipline in academic education and research. Significant developments in HRM, caused by rapidly advancing technologies, changes in labour force expectations, etc., are generally recognised. The literature points to various trends that have shaped and will shape the future of HRM. For example, the overall digital transformation has revolutionised most organisational practices: traditional human and paper-based tasks are gradually automated and transferred to digital systems. The forming new conjuncture, labelled as HRM 4.0, implies modern features like Artificial Intelligence (AI), Big Data, etc., augmenting data-based decision-making, agility and innovation. Nowadays, HRM is a strategic organisational function, not just administrative work. (O'Brien et al., 2025) Another case is remote and hybrid work that proliferated during the COVID-19 pandemic (Liang et al., 2022).

Contemporary HRM involves several fascinating developments in practice and in research. Recently, Hewett and Meier-Barthold (2026) reiterated that HRM is inherently complex, involving systems of principles, practices, and activities at individual, group, organisational, and macro levels, conjoined through systems of interconnected processes. To address this, they called for shifting from isolated variables to patterns, processes, and interdependencies that change in time. Among other aspects, they (ibid) point to temporary organising that "… requires us to conceptualise HR systems as dynamic ecosystems". Temporary (project) organisations became usual, yet HRM and employment practices are still treated in the context of routine tasks and 'permanent' organisations (Samimi et al., 2026). HRM and temporality deserve more attention, also because of a loop to organisational aesthetics: more aesthetic temporary organisations may bring along more aesthetic permanent organisations, and vice versa (Raadik and Kuura, 2025).

As cited before, Liang et al. (2022) noted that the COVID-19 pandemic had an effect on incorporating sustainability principles into HRM. Emerging 'sustainable HRM' includes four types: as socially responsible HRM activities; as green HRM; as triple bottom line HRM, and as common good HRM (Aust et al., 2020). Sustainable HRM has deserved significant attention in research: prevalent themes are sustainable leadership, environmental sustainability, organisational performance, and notably, paradoxical tensions between HRM and sustainability. Particularly important is the social dimension of sustainability, including social responsibility and relations with multifarious stakeholders. (Macke and Genari, 2019)

Surprisingly, the relationship between HRM practices and organisational aesthetics has not deserved much attention in academic literature. So, there is a certain research gap that this paper attempts to fill. Furthermore, this paper integrates another neoteric topic – sustainability. The next section presents a scoping review of existent literature, concerning relations between organisational aesthetics, HRM and sustainability issues. The final section is for discussion and conclusions.

2. Systematic Literature Review

The research approach relied on the grounded theory, starting with open coding and proceeding with axial coding to aggregate the second- and third-level constructs. Searches of literature were conducted in the Scopus and Web of Science (WoS) databases, using a structured query of keywords: "sustainability", "human resource management", and "organisational aesthetics". The searches were restricted by publication type (articles in peer-reviewed journals), but not by publication date. The search in Scopus revealed 15 and in WoS 30 matches, including six duplicates. So, the initial sample included 39 articles, all published during the past two decades. All the articles were then evaluated through a multi-stage iterative process, involving the title, abstract, and full-text reviews. One source lacked sufficient contemporary relevance and was omitted in the screening, resulting in a final analytical sample of 38 articles. To ensure systematic selection, thematic relevance was assessed using a traffic light principle. Green was assigned to articles directly addressing the research questions, whereas yellow indicated studies offering valuable theoretical parallels or secondary insights. The articles marked both green and yellow were included in the final sample; however, those categorised as red were excluded. These typically lacked sufficient theoretical grounding, were only peripherally related to the scope, or used keywords in an unrelated context, such as solely describing a target population. By applying these criteria, the final synthesis focused exclusively on the sources providing clear empirical or conceptual contributions to the intersection of organisational aesthetics and sustainable HRM. Keywords were selected based on their conceptual centrality within each source rather than their mere presence. The analytical objective was to identify recurring patterns, relational structures, and thematic consistencies across the dataset. The analysis began by examining the keywords in individual articles before comparing their recurrence across the sample. To ensure consistency,

terms were consolidated and then grouped into themes, following their contextual application. This approach yielded 20 themes, which underwent further refinement to ensure analytical depth and clarity. To enhance consistency, the keywords and themes were iteratively refined. The coding process followed an iterative approach. In the first stage, recurring concepts and keywords were identified across the selected articles. These initial codes were then compared and grouped based on their conceptual similarity. The resulting themes were further refined by assessing their frequency and theoretical relevance, leading to the aggregation of twenty themes into four broader dimensions. This process ensured that the identified dimensions were grounded in the literature while also reflecting consistent patterns across the dataset. The identified dimensions form the basis for the conceptual framework, discussed in the next section.

The sample included 38 journal articles, both conceptual and empirical. Academic impact was evaluated through citation counts and annual citation rates (citations per year availability). The earliest publication in the sample is Avgerou et al. (2007), ranking third in terms of the overall citation count with 331 citations. The most cited is the study by Suh et al. (2017) with 465 citations, which examines the consistent use of gamified information systems in the workplace. The annual citation rate indicates that the contribution of Suh et al. (2017) maintains the highest academic impact within this sample.

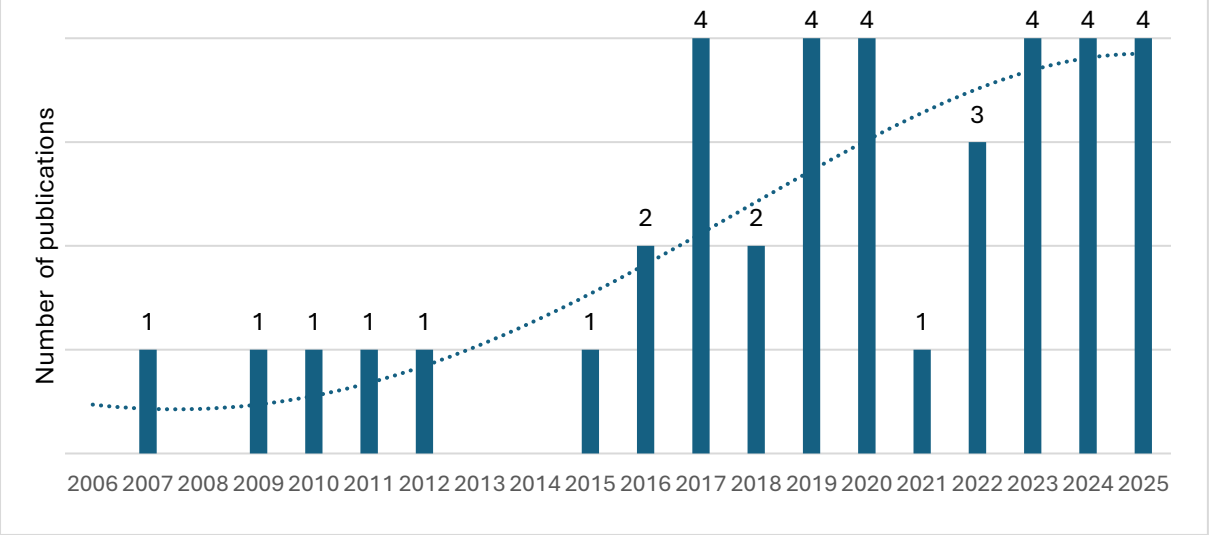

Figure 1: Distribution of selected publications over time

As depicted in Figure 1, the distribution of publications over time indicates that research on this topic is in its early stages and has only shown a growth trend over the last decade. Remarkably, 32 of 38 articles in the sample have been published within the last decade.

The discerned twenty initial themes were subsequently aggregated into four broader dimensions: (1) talent attraction, (2) organisational culture and diversity, (3) physical work environment, and (4) employee well-being and satisfaction (see Appendix 1 for the coding structure). Based on these findings, a four-dimensional framework of organisational aesthetics in sustainable human resource management is proposed (see Figure 2).

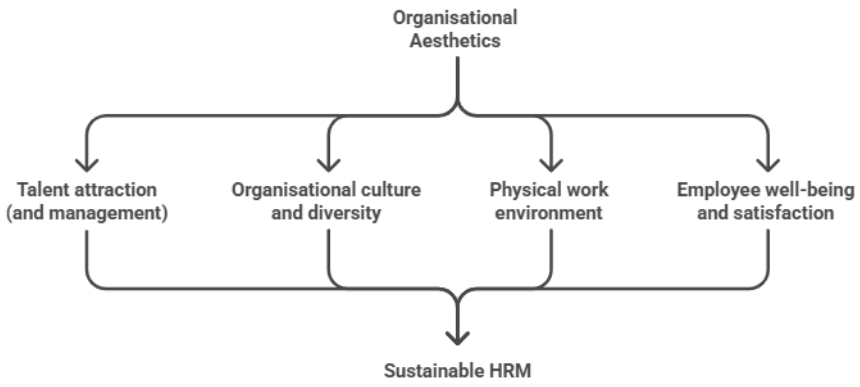

Figure 2: A four-dimensional framework of organisational aesthetics in sustainable HRM

The constructed four-dimensional framework illustrates how organisational aesthetics operates through four key dimensions that collectively influence sustainable HRM. It highlights the integrative role of aesthetics in linking organisational practices with employee experience and sustainability objectives.

Talent attraction appeared an important dimension that formed from six themes which aggregated 26 initial keywords with a total number of 55 mentions. A clearly prevalent theme *Competenc_* formed from the keywords that were mentioned 31 times, which is over 80% of articles in the final sample of 38.

Organisational culture and diversity aggregated eight themes. The number of total occurrences was a bit smaller (50) but mentions in more than ¾ of articles in the final sample indicates the importance of the topic. The prevalent theme organisational culture accounts for a third of the total occurrences; followed by discrimination.

Physical work environment formed from a single theme that indicates its specificity. This theme and dimension comprised 21 initial keywords with the highest total number of occurrences (70). This means that an average article in the final sample mentioned about two related initial keywords. The initial keywords varied significantly.

Employee well-being and satisfaction formed from five themes and 21 initial keywords that occurred in 33 sources of the sample. The two most universal themes in this dimension were well-being and teamwork that concern also management.

3. Discussion and Conclusions

This section discusses and develops the four dimensions of the framework.

*Talent attraction.*Organisational aesthetics plays a significant role even before the first contact between an employer and a potential employee. As Ganesan and George (2019) note, the visual aspect of recruitment advertisements is not merely a matter of taste but an important indicator of organisational values and culture. Similarly, Merriman et al. (2025) show that the inclusion of biophilic or nature-inspired elements can signal diversity and social orientation, thereby increasing employer attractiveness. However, as Kele and Cassell (2023) warn, a critical limitation arises when such external representations do not match internal organisational reality, creating a disconnect between image and practice. This is further reflected in recruitment processes, where Torres and Gregory (2018) found that although first impressions are influenced by visual cues, final decisions still rely on candidates' communication and problem-solving skills. At the same time, Ronda and De Gràcia (2022) demonstrate that applicants increasingly consider office design and spatial layout as key decision factors, sometimes even more important than traditional benefits such as salary or working hours.

It should be noted that the literature in the formed sample concentrated on talent attraction as a particular stage in employee lifecycle. However, office design and spatial layout, not to mention salary and working hours, indicate the importance of the following stages in employee lifecycles. This means that talent attraction is not enough, it is necessary to cover the whole lifecycle of a talent and speak about talent management. This idea is depicted in Figure 2.

Organisational culture and diversity. Aesthetics also shapes how employees represent the organisation in their everyday work. Organisational culture is reflected through employee behaviour, where charisma, empathy, and professional conduct act as aesthetic expressions of service and organisational identity (Gelacio-Macedo et al., 2025). Supporting this interplay between people, space, and technology requires deliberate alignment through human-centred design and resource management (Majid et al., 2020), as well as the development of practical and technological skills (Teng et al., 2019). Cultural change cannot be achieved solely through top-down rules; authentic identity and internal coherence are essential for maintaining legitimacy (Benn et al., 2009). Leaders may support this process through narrative-building and dramaturgical approaches that create shared meaning (D'Souza, 2024). At the same time, organisations risk losing legitimacy when external diversity signals do not reflect internal reality (Kele and Cassell, 2023), which may lead to superficial diversity practices and even appearance-based discrimination (Jones et al., 2024).

The *physical work environment* shapes how spatial design and aesthetics influence employee productivity and well-being. Barton and Le (2023) position an aesthetically pleasing work environment as a fundamental employee need that directly influences job satisfaction and psychological comfort. This perspective is reinforced by Abu-Lail et al. (2025), who show that the adaptive reuse of historic buildings, where architectural heritage is integrated with modern features such as natural light and acoustics, enhances both individual creativity and collective well-being. However, spatial design may also generate unintended consequences. Rolfö et al. (2018) observe that while activity-based workspaces may improve visual and acoustic conditions, the absence of fixed

seating introduces challenges for team cohesion. Employees may spend excessive time searching for available desks or attempt to reclaim control over their surroundings through personal items, which can further increase spatial tensions. In addition, Kirillova et al. (2020) highlight spatial inequalities, where employees in less visible areas experience lower levels of aesthetic satisfaction. This is particularly significant given that employees may prioritise aesthetic improvements even over ergonomic ones, as environmental aesthetics is closely linked to both psychological and physical health outcomes (Schell et al., 2011).

Employee well-being and satisfaction reflect how these aesthetic conditions are experienced by employees in everyday work. In work environments where employees are treated primarily as instruments for organisational goals, the neglect of human sustainability becomes evident (Crichton and Shrivastava, 2017). Combined with high workloads, particularly in service-related roles, this leads to emotional exhaustion and reduced job satisfaction (Masters et al., 2025). Traditional approaches, such as formal codes of ethics, often remain insufficient. Instead, Agostini et al. (2016) argue that preventing burnout requires aesthetic flexibility and a greater acceptance of improvisation and imperfection within organisational culture. This perspective challenges the separation of mind and body and emphasises the need for a holistic approach, where employee vitality is continuously supported.

Taken together, our findings clearly demonstrate that organisational aesthetics operates as a multidimensional mechanism linking HRM practices with sustainability. Empirical evidence indicates that neglecting workplace aesthetics is associated with concrete health risks, including stress, sleep disturbances, and musculoskeletal problems (Schell et al., 2011). At the same time, aesthetic qualities such as spatial unity, variety, and the inclusion of natural elements contribute directly to employees' perceived comfort and daily work experience (Kirillova et al., 2020; Barton and Le, 2023). These effects are not limited to physical conditions alone. As Akgün (2020) shows, employee satisfaction is also shaped by social interaction, where teams' ability to communicate in an empathetic and meaningful way supports learning and collaboration. In this context, aesthetic sensitivity extends beyond visual design to include interpersonal dynamics, as highlighted by Niemi-Kaija (2022) and Ferri et al. (2017), who emphasise its role in reducing social tensions and strengthening cohesion within diverse teams.

Although the literature highlights the positive role of organisational aesthetics in improving employee well-being and organisational attractiveness, several critical limitations remain. Aesthetic benefits are not equally distributed across organisational contexts, as employees in less visible roles may experience lower levels of aesthetic satisfaction. Furthermore, aesthetics may be used superficially as part of employer branding strategies, creating a discrepancy between external image and internal organisational practices. In addition, the growing emphasis on aesthetics may reinforce appearance-based biases, contributing to discrimination in recruitment and evaluation processes. Finally, despite increasing academic interest, empirical evidence linking organisational aesthetics to HRM and sustainability outcomes remains limited, indicating the need for further research.

Although research on these intersections is still in its early stages, continuous development requires a multi-disciplinary integration of architecture, environmental psychology, and information technology. In response to these limitations, this study proposes a four-dimensional framework of organisational aesthetics in sustainable human resource management (see Figure 2). For one, enlarging the first dimension from talent attraction to talent management points to opportunities and needs for further research.

From a practical perspective, the findings suggest that human resource managers should treat organisational aesthetics as a strategic rather than a purely decorative element. First, organisations should integrate aesthetic considerations into recruitment and employer branding, as visual and symbolic cues influence organisational attractiveness. Second, aesthetic improvements should be distributed across all organisational spaces, including less visible work areas, in order to avoid inequalities in employee experience. Third, organisations should align external aesthetic representations with internal practices to prevent discrepancies between employer image and actual working conditions. Finally, HRM practices should support holistic approaches to employee well-being by incorporating aesthetic flexibility in workplace design, including elements such as natural light, spatial harmony, and opportunities for personalisation.

These implications highlight that organisational aesthetics is not merely a matter of design, but a critical factor in achieving sustainable HRM and long-term organisational resilience.

Ethics Declaration

This study is based on published literature and does not involve human participants or sensitive data. No ethical clearance was required.

AI Declaration

ChatGPT 5.4, GeminiAI, and NotebookLM were used as tools to compress and structure the text during the review. The authors critically reviewed and checked all outputs generated by artificial intelligence.

From Strategic Planning to Innovation: The Mediating Role of Environmental Proactivity in Food Industry Firms

Laura Könönen, Sanna Joensuu-Salo and Emilia Kangas
Seinäjoki University of Applied Sciences, Seinäjoki, Finland

laura.kononen@seamk.fi
sanna.joensuu-salo@seamk.fi
emilia.kangas@seamk.fi

Abstract: This study examines how strategic planning and environmental proactivity relate to firm-level innovation in small and medium-sized enterprises. Drawing on the resource-based view and dynamic capabilities perspective, the study conceptualizes strategic planning and environmental proactivity as complementary organizational capabilities that enable firms to respond to sustainability-related challenges while fostering innovation. Recent research has emphasized that environmental proactivity can function as a strategic resource rather than compliance-driven costs. However, empirical evidence on how these capabilities jointly relate to different types of innovation remains limited. Using survey data from 185 food industry firms and covariance-based structural equation modeling, the study examines relationships between strategic planning, environmental proactivity, operational innovation, and market-oriented innovation. The results indicate that strategic planning is positively associated with operational innovation and market-oriented innovation. Environmental proactivity shows a strong positive relationship with operational innovation and a moderate but significant association with market-oriented innovation. The study contributes to sustainability and innovation research by demonstrating how strategic and environmental capabilities jointly shape innovation within SMEs. For practitioners, the findings highlight the importance of integrating environmental considerations into formal strategic planning processes to support innovation.

Keywords: Strategic Planning, Environmental Proactivity, Innovation, SMEs, Food Industry

1. Introduction

Firms across industries face increasing pressure to respond simultaneously to competitive dynamics and escalating environmental demands. Climate change, resource scarcity, and tightening environmental regulation have shifted sustainability from a peripheral concern to a central strategic issue for firms. In parallel, innovation remains a key mechanism through which firms seek to enhance competitiveness, efficiency, and market relevance. As a result, understanding how sustainability-oriented practices interact with firm-level innovation has become a critical topic in management research (Delmas, Lyon, & Maxwell, 2019).

A growing body of literature suggests that environmental initiatives can function not only as compliance mechanisms but also as sources of strategic advantage. Early work grounded in the resource-based view argued that environmental proactivity may generate valuable, rare, and difficult-to-imitate resources (Aragón-Correa & Sharma, 2003). More recent studies have extended this view by emphasizing the role of organizational capabilities, such as strategic planning and environmental proactivity in enabling firms to adapt to sustainability-related challenges while fostering innovation (Teece, 2007, 2018).

Strategic planning represents a central managerial capability through which firms articulate long-term objectives, allocate resources, and coordinate organizational activities. Prior research has consistently linked strategic planning to improved firm performance and innovation outcomes (Mousa, Ali, & Gurler, 2024), particularly in small and medium-sized enterprises where formal structures are often less developed (Brinckmann, Grichnik, & Kapsa, 2010). By providing clarity of direction and coherence in decision-making, strategic planning may also facilitate the integration of environmental considerations into core business processes rather than treating them as isolated initiatives.

Environmental proactivity refers to a firm's voluntary and forward-looking efforts to reduce environmental impacts beyond regulatory requirements. Empirical research increasingly shows that environmentally proactive firms are more likely to engage in innovation activities, as sustainability challenges often stimulate process and product improvements and the exploration of new markets (Dangelico & Vocalelli, 2017). From a dynamic capabilities perspective, environmental proactivity can be viewed as a sensing and seizing capability that enables firms to anticipate environmental pressures and reconfigure resources accordingly (Teece, 2007).

Despite these advances, important gaps remain in the literature. While prior studies have examined the links between environmental practices and innovation, they often treat innovation as a unidimensional construct. This approach overlooks the possibility that different types of innovation—such as operational innovation aimed at efficiency improvements and market-oriented innovation focused on products, markets, and

commercialization—may respond differently to strategic and environmental capabilities. Second, existing research has largely focused on large firms, leaving smaller firms underrepresented, even though they play a critical role in sustainability transitions (Delmas et al., 2019). Third, relatively little empirical work has examined how strategic planning and environmental proactivity jointly relate to innovation outcomes within an integrated structural framework.

Addressing these gaps, the present study investigates how strategic planning and environmental proactivity are associated with two distinct dimensions of innovation: operational innovation and market-oriented innovation. Drawing on the resource-based view and the dynamic capabilities framework, the study conceptualizes strategic planning and environmental proactivity as complementary organizational capabilities that jointly shape firms' innovation behavior. Using survey data from 185 firms operating in food industry and applying covariance-based structural equation modelling, the study empirically tests a model linking these capabilities to innovation outcomes.

This study contributes to sustainability and innovation research by showing that environmental proactivity is positively associated with both operational and market-oriented innovation, while strategic planning acts as an enabling capability supporting innovation alongside environmental initiatives. By distinguishing between operational and market-oriented innovation, the study provides a more nuanced understanding of how sustainability-oriented capabilities translate into different innovation outcomes. The findings also offer practical insights by emphasizing the importance of integrating environmental considerations into formal strategic planning processes rather than treating them as reactive measures.

2. Theory and Hypotheses

2.1 Strategic Planning and Innovation

Strategic planning is commonly understood as the extent to which firms articulate goals and develop long-term plans to guide activities and allocate resources systematically (Armstrong, 1982). In a similar vein, Wolf and Floyd (2017) conceptualize strategic planning as a relatively formalized and structured process encompassing strategy formulation, implementation, and control. This structured orientation provides a foundation for coordinating organizational efforts and aligning resources with strategic objectives. Innovation, in turn, has been conceptualized from multiple perspectives. At the organizational level, it reflects a firm's propensity to be creative, proactive, future-oriented, open to change, and willing to take risks (Shoham et al., 2012). From a process perspective, innovation involves the generation and implementation of new or improved products, services, processes, or practices aimed at enhancing firm competitiveness (Forsman, 2011). Underpinning these processes are organizational capabilities, which capture a firm's ability to sense environmental changes, learn, and respond effectively (Den Hertog et al., 2010). More broadly, capabilities can be viewed as mechanisms that transform resources into desired outcomes (Dutta et al., 2005), or as bundles of skills and knowledge that enable firms to coordinate activities and leverage assets for competitive advantage (Day, 1994). Within this context, innovation capability is a multidimensional construct and can be understood as a firm's ability to acquire, integrate, and apply knowledge to generate new ideas, products, or processes (Hurtado-Palomino et al., 2022). Lawson and Samson (2001) further conceptualize innovation capability as a framework of organizational actions that enhance the success of innovation activities. Together, these perspectives emphasize that innovation capability is rooted in organizational learning, resource integration, and coordinated action.

A growing body of research suggests that strategic planning plays a critical role in the development of such capabilities. Empirical studies link strategic planning to outcomes such as innovativeness (Davis & Bendickson, 2021) and strategic learning (Sirén & Kohtamäki, 2016), indicating that planning processes contribute to capability building. Firms facing changing conditions tend to develop planning approaches that balance flexibility with specificity. In line with this view, Araújo et al. (2022) argue that strategic planning supports both the development and execution of dynamic capabilities by enabling firms to identify opportunities, align internal resources, and coordinate actions in pursuit of innovation. Strategic planning also facilitates innovation by providing strategic direction, helping firms anticipate environmental changes, mobilize resources efficiently, and align innovation initiatives with long-term objectives (Posch & Garaus, 2020; Araújo et al., 2022). Furthermore, planning routines structure how knowledge is gathered, interpreted, and utilized, thereby enabling organizations to respond to emerging opportunities.

However, the relationship between strategic planning and innovation is not uniform across all forms of innovation. For instance, service innovation may follow different underlying mechanisms than product

innovation, reflecting its more intangible and process-oriented nature (Jansen et al., 2016). Innovation is commonly understood as a multidimensional construct comprising several dimensions, such as product, process, market, behavioral, and strategic innovativeness (Wang & Ahmed, 2004). Consequently, the influence of strategic planning on innovation outcomes is likely to vary across different types and dimensions of innovation, depending on how strategic intentions are translated into specific organizational practices.

2.2 Environmental Proactivity as a Strategic Capability

Environmental proactivity refers to firms' forward-looking efforts to reduce their environmental impact beyond regulatory compliance (Aragón-Correa & Sharma, 2003; González-Benito & González-Benito, 2006; Delmas et al. 2011). Such efforts include setting environmental goals, systematically measuring environmental performance, and integrating environmental considerations into purchasing, production, and product design decisions (González-Benito & González-Benito, 2006). While environmental proactivity primarily aims to improve firms' environmental performance, it has also been linked to improved overall firm performance (e.g., Könönen & Joensuu-Salo, 2025; Torrent-Sellens, Ficapal-Cusí, & Enache-Zegheru, 2022). From a resource-based and dynamic capabilities perspective, environmental proactivity can be understood as a strategic capability that enables firms to sense emerging environmental demands, seize new opportunities, and reconfigure internal processes accordingly (Teece, 2007; Aragón-Correa & Sharma, 2003). In this sense, environmental proactivity reflects a firm's orientation toward anticipating and addressing environmental challenges through organizational actions. It is therefore closely related to firms' broader proactive strategic orientation (Sharma et al., 2007; Tyler et al., 2023).

Environmental proactivity has been shown to foster learning and cross-functional collaboration (Kitsis & Chen, 2023; Sharma & Vredenburg, 1998), thereby supporting firms' ability to generate and implement innovation. Proactive environmental practices often require firms to rethink production processes, invest in cleaner technologies, and develop new solutions that reduce resource use and environmental harm (Dangelico & Vocalelli, 2017). As a result, environmental proactivity is particularly closely linked to operational innovation, as it directly challenges existing routines and encourages process improvements. Environmental proactivity can also support market-oriented innovation by enabling firms to respond to changing customer preferences, differentiate offerings, and access environmentally conscious markets (Dangelico & Pujari, 2010).

Importantly, environmental proactivity may serve as a mechanism that translates strategic intent into concrete innovation activities. While strategic planning defines goals and directions, environmental proactivity operationalizes these intentions by embedding them into day-to-day practices and decision-making processes.

2.3 Hypotheses Development

Strategic planning provides a foundation for environmental proactivity by articulating long-term objectives and legitimizing investments in environmental practices. Firms with more systematic planning are better positioned to anticipate future environmental requirements, allocate resources to environmental initiatives, and integrate environmental considerations into their overall strategy. Furthermore, prior research indicates that environmental proactivity tends to co-occur with a broader proactive strategic orientation within firms (Tyler et al., 2023; Sharma et al., 2007). As systematic strategic planning reflects such an orientation, firms engaging in it are more likely to adopt proactive environmental practices. Consequently, strategic planning is expected to be positively associated with environmental proactivity.

H1: Strategic planning is positively associated with environmental proactivity.

Strategic planning may directly influence innovation outcomes (Davis & Bendickson, 2021), particularly those related to markets and commercialization. By clarifying strategic priorities and growth paths, planning activities can support decisions related to product development, market entry, and the adoption of new distribution channels. Therefore, a positive relationship between strategic planning and market-oriented innovation is expected.

In contrast, the relationship between strategic planning and operational innovation is less straightforward. Operational innovation often involves incremental process improvements and efficiency-enhancing changes that emerge from learning-by-doing and problem-solving rather than from formal strategic plans alone. As such, strategic planning may not be sufficient to directly stimulate operational innovation without complementary mechanisms.

H2a: Strategic planning is positively associated with market-oriented innovation.

H2b: Strategic planning is positively associated with operational innovation.

Environmental proactivity is expected to have a positive effect on both operational and market-oriented innovation. Environmental proactivity frequently requires changes in production processes, investments in new technologies, and improvements in resource efficiency (Dangelico & Vocalelli, 2017), thereby fostering operational innovation. At the same time, environmental proactivity can enhance firms' ability to develop environmentally differentiated products, strengthen their market position, and respond to environmentally conscious customers (Dangelico & Pujari, 2010), supporting market-oriented innovation.

H3a: Environmental proactivity is positively associated with operational innovation.

H3b: Environmental proactivity is positively associated with market-oriented innovation.

Taken together, strategic planning and environmental proactivity suggest a sequential process through which strategic intent is translated into innovation outcomes. Strategic planning alone may be insufficient to drive certain forms of innovation, particularly operational innovation, unless it is accompanied by proactive environmental practices that embed strategic goals into organizational routines and processes. Environmental proactivity thus functions as a mediating mechanism linking strategic planning to innovation.

H4a: Environmental proactivity mediates the relationship between strategic planning and operational innovation.

H4b: Environmental proactivity mediates the relationship between strategic planning and market-oriented innovation. model of the study.

3. Data and Method

3.1 Data Collection

The data were collected in 2024 through an online survey targeting Finnish SMEs operating in food sector. The sampling frame was constructed using Vainu database, which provides comprehensive coverage of Finnish limited liability companies. The survey link was distributed to identified firms, and responses were obtained primarily from CEOs and owner-managers. The response rate was approximately 10%. However, as the survey targeted the entire population of Finnish food-industry SMEs and the respondent firms represented a broad cross-section of the industry, including bakery (30%), meat and fish (14%), beverage (17%), and dairy (3%) companies, and different firm sizes, the achieved sample can be considered broadly representative of the target population.

Following data collection, large firms (defined as those employing 250 or more employees) were excluded from the dataset to ensure consistency with the SME definition. The final sample comprised 185 firms, representing a heterogeneous group of SMEs in terms of firm size. Approximately 31% of the firms were solo entrepreneurs (0–1 employees), while 24% employed 2–4 individuals. Firms with 5–9 employees accounted for 16% of the sample, and 9% had 10–19 employees. The remaining 19% of firms employed 20 or more people.

With respect to firm age, 27% of the firms were younger than five years, 25% were between 5 and 9 years old, and 12% were 10–19 years old. More established firms were also well represented: 24% were between 20 and 49 years old, and 12% were at least 50 years old.

3.2 Measures

All constructs were measured using validated scales or items from prior literature. While established scales were used for strategic planning and environmental proactivity, the innovation measures were operationalized to capture firm-level innovation outcomes in line with prior research. Minor wording adjustments were made to ensure clarity and relevance for the target respondents. All items were measured using a seven-point Likert scale, where higher values indicate stronger agreement or better performance relative to competitors (1 = strongly disagree / much worse than competitors; 7 = strongly agree / much better than competitors).

Strategic planning (SP) was measured using four items adapted from Posch and Garaus (2020). The scale captures the extent to which firms engage in systematic and goal-oriented planning activities. Respondents were asked to indicate the degree to which the following statements describe their firm:

- SP1: We have clear business goals.

- SP2: We know what we need to do to reach our business goals.
- SP3: We have a clear strategy for achieving our business goals.
- SP4: We have a clear plan for implementing our business model.

Environmental proactivity was measured using seven items adapted from González-Benito and González-Benito (2005). Respondents were asked to evaluate the extent to which the following statements apply to their firm's operations:

- EP1: We have clear goals and long-term plans for managing environmental impacts.
- EP2: We have established procedures for measuring and assessing our environmental impacts.
- EP3: We utilize environmental aspects in our marketing.
- EP4: We take environmental considerations into account when selecting subcontractors or suppliers.
- EP5: We replace environmentally harmful materials or components with environmentally friendly alternatives.
- EP6: We consider reusability and recyclability in our packaging design.
- EP7: We prefer environmentally friendly products or materials in our purchasing decisions.

Innovation was operationalized as firm-level innovation performance, reflecting both process-related (operational) and market-related (product and commercialization) outcomes. This approach is consistent with prior literature conceptualizing innovation as a multidimensional construct encompassing both process improvements and market-oriented outputs (e.g., product development and commercialization) (Wang & Ahmed, 2004; OECD/Eurostat, 2018).

Operational innovation (OI) was measured using three items reflecting improvements in internal processes, efficiency, and operational capabilities. Respondents were asked to assess their firm's performance relative to competitors:

- OI1: Our company has improved its production or service processes.
- OI2: Our company has enhanced efficiency in its operations.
- OI3: Our company has improved its capacity or operational performance.

Market-oriented innovation (MI) was measured using three items capturing product development, market expansion, and commercialization activities. Respondents evaluated their firm relative to competitors:

- MI1: Our company has introduced new or significantly improved products or services.
- MI2: Our company has entered new markets or customer segments.
- MI3: Our company has improved its commercialization or market performance.

3.3 Measurement Model

The measurement model was assessed using confirmatory factor analysis (CFA) with AMOS (N = 185). Four latent constructs were specified: Strategic Planning, Environmental Proactivity, Operational Innovation, and Market-Oriented Innovation. All indicators were measured on seven-point Likert scales.

Model fit indices indicated an acceptable to good fit to the data ($\chi^2 = 225.62$, df = 111, $\chi^2/df = 2.03$, CFI = .947, TLI = .935, RMSEA = .075, 90% CI [.061, .089]). Given the sensitivity of the chi-square statistic to sample size (N = 185), incremental and absolute fit indices were emphasized.

All standardized factor loadings were statistically significant ($p < .001$) and exceeded the recommended threshold of .50, providing support for convergent validity (see Table 1). Composite reliability (CR) values ranged from .755 to .934, exceeding the recommended minimum of .70. Average variance extracted (AVE) values ranged from .507 to .779, indicating that each construct explained more than half of the variance in its indicators (See Table 2).

Table 1: Standardized factor loadings

Construct	Indicator	Standardized Loading
Strategic Planning	SP1	0.891
	SP2	0.892
	SP3	0.839

Construct	Indicator	Standardized Loading
	SP4	0.908
Environmental Proactivity	EP1	0.815
	EP2	0.760
	EP3	0.813
	EP4	0.801
	EP5	0.833
	EP6	0.753
	EP7	0.792
Operational Innovation	OI1	0.798
	OI2	0.922
	013	0.606
Market-Oriented Innovation	MOI1	0.756
	MOI2	0.682
	MOI3	0.697

Note: All loadings significant at $p < .001$.

Table 2: Construct reliability and convergent validity

Construct	CR	AVE
Strategic Planning	0.934	0.779
Environmental Proactivity	0.923	0.633
Operational Innovation	0.825	0.618
Market-Oriented Innovation	0.755	0.507

Discriminant validity was assessed using the Fornell–Larcker criterion (see Table 3). For each construct, the square root of AVE exceeded its correlations with other constructs, supporting discriminant validity. In addition, the maximum shared variance (MSV) for each construct was lower than its AVE.

Table 3: Discriminant validity (Fornell–Larcker criterion)

Construct	SP	EP	OI	MOI
Strategic Planning (SP)	**0.883**			
Environmental Proactivity (EP)	0.522	**0.796**		
Operational Innovation (OI)	0.337	0.470	**0.786**	
Market-Oriented Innovation (MOI)	0.449	0.417	0.561	**0.712**

Note: Diagonal elements (bold) represent √AVE.

To account for shared content and method variance within Environmental Proactivity, residual covariances were specified between two pairs of indicators reflecting (1) formalized environmental management practices (long-term goals and established measurement procedures) and (2) concrete environmentally responsible material and purchasing decisions. These modifications were theoretically justified and limited to indicators within the same construct.

Overall, the results indicate satisfactory reliability, convergent validity, and discriminant validity of the measurement model, supporting its suitability for subsequent structural model analysis.

4. Results

4.1 Structural Model and Model Fit

The hypothesized structural model was estimated using structural equation modeling (SEM) with maximum likelihood estimation in AMOS. Strategic Planning was specified as an antecedent of Environmental Proactivity, which in turn was modeled as a predictor of two innovation dimensions: Operational Innovation and Market-oriented Innovation. Firm size (LnSize) and firm age (LnAge) were included as control variables predicting both innovation outcomes.

Overall, the model demonstrated an acceptable fit to the data. Although the chi-square statistic was significant ($\chi^2 = 284.74$, df = 142, $p < .001$), this is expected given the sample size and model complexity. The relative chi-square ($\chi^2/df = 2.01$) indicated a reasonable fit. Incremental fit indices suggested good model fit (CFI = .932, TLI = .918, IFI = .933). The RMSEA value of .076 (90% CI [.063, .088]) indicated acceptable approximation error. The fit indices suggest that the proposed structural model fits the data adequately.

4.2 Direct Effects

The standardized path estimates are presented in Table 4. Strategic Planning showed a strong and positive effect on Environmental Proactivity ($\beta = .523$, $p < .001$), indicating that firms with more developed strategic planning practices are more likely to engage in proactive environmental management.

Environmental Proactivity was positively associated with both innovation dimensions. Specifically, it had a strong positive relationship with Operational Innovation ($\beta = .401$, $p < .001$) and a moderate positive relationship with Market-oriented Innovation ($\beta = .262$, $p = .011$). These results suggest that environmentally proactive firms are more likely to invest in process improvements, efficiency-enhancing innovations, and operational development, as well as in market- and commercialization-oriented innovations.

In contrast, Strategic Planning did not have a significant direct effect on Operational Innovation ($\beta = .044$, $p = .613$). However, Strategic Planning was positively related to Market-oriented Innovation ($\beta = .240$, $p = .018$), indicating that strategic planning may directly support market-facing innovation activities, such as product development and market expansion.

Regarding control variables, firm size was positively related to both Operational Innovation ($\beta = .359$, $p < .001$) and Market-oriented Innovation ($\beta = .306$, $p = .001$). Firm age was negatively related to Market-oriented Innovation ($\beta = -.220$, $p = .017$), while its effect on Operational Innovation was not significant.

Table 4: Structural paths (standardized estimates)

Path	β	p
Environmental Proactivity ← Strategic Planning	.523	< .001
Operational Innovation ← Strategic Planning	.044	.613
Market-oriented Innovation ← Strategic Planning	.240	.018
Operational Innovation ← Environmental Proactivity	.401	< .001
Market-oriented Innovation ← Environmental Proactivity	.262	.011
Operational Innovation ← LnSize	.359	< .001
Market-oriented Innovation ← LnSize	.306	.001
Operational Innovation ← LnAge	−.010	.897
Market-oriented Innovation ← LnAge	−.220	.017

4.3 Indirect Effects and Mediation Analysis

To examine whether Environmental Proactivity mediates the relationship between Strategic Planning and innovation outcomes, indirect effects were assessed using bootstrapped estimates (2,000 resamples). The results indicate that Environmental Proactivity plays a central mediating role (see Table 5).

Strategic Planning had a positive indirect effect on Operational Innovation via Environmental Proactivity (standardized indirect effect $\beta = .210$). Given that the direct effect of Strategic Planning on Operational

Innovation was not significant, this pattern is consistent with an indirect-only mediation, suggesting that Strategic Planning contributes to operational innovation primarily by fostering environmentally proactive practices.

Similarly, Strategic Planning exhibited a positive indirect effect on Market-oriented Innovation through Environmental Proactivity (β = .137). While Strategic Planning also had a significant direct effect on Market-oriented Innovation, the presence of a substantial indirect effect indicates complementary partial mediation. This suggests that Strategic Planning enhances market-oriented innovation both directly and indirectly by strengthening firms' environmental proactivity.

Total effects further support this interpretation. The total effect of Strategic Planning on Operational Innovation was β = .254, whereas the total effect on Market-oriented Innovation was β = .377, highlighting the stronger overall association between Strategic Planning and market-oriented innovation activities.

Table 5: Direct, indirect, and total effects of Strategic Planning (standardized)

Outcome	Direct Effect	Indirect Effect via Environmental Proactivity	Total Effect
Operational Innovation	.044	.210	.254
Market-oriented Innovation	.240	.137	.377

Overall, the results demonstrate that environmental proactivity is a key mechanism linking strategic planning to innovation outcomes. While strategic planning alone does not directly drive operational innovation, it strongly promotes environmental proactivity, which in turn translates into both operational and market-oriented innovations. These findings underscore the importance of integrating environmental considerations into strategic planning processes to foster innovation in resource-intensive industries.

5. Discussion

This study set out to examine how strategic planning and environmental proactivity jointly relate to different dimensions of firm-level innovation in SMEs. The results provide clear support for the view that these capabilities operate as complementary rather than independent drivers of innovation. In particular, the findings demonstrate that strategic planning is strongly associated with environmental proactivity, which in turn has significant positive effects on both operational innovation and market-oriented innovation.

Importantly, the results reveal distinct patterns across innovation dimensions. While strategic planning has a direct effect on market-oriented innovation, its effect on operational innovation is fully indirect, operating through environmental proactivity. This suggests that formal planning alone is insufficient to drive process-related innovation unless it is translated into concrete environmental practices embedded in daily operations.

These findings contribute to the resource-based view and dynamic capabilities literature by empirically demonstrating how strategic and environmental capabilities interact in shaping innovation outcomes. Consistent with prior theoretical arguments (Aragón-Correa & Sharma, 2003; Teece, 2007, 2018), environmental proactivity appears to function as a key mechanism through which firms sense and respond to sustainability-related challenges while reconfiguring their operational processes. At the same time, strategic planning provides the direction and resource alignment necessary for market-oriented innovation activities, such as product development and market expansion.

Taken together, the results suggest that innovation in sustainability-oriented contexts is not driven by isolated capabilities but by their interaction. In particular, environmental proactivity translates strategic intent into actionable practices, thereby enabling firms to achieve both efficiency-oriented and market-facing innovation outcomes.

Abstract: The technology startup sector in Indonesia has experienced rapid growth in recent years. Startups are characterized by their reliance on digital transactions, flexible corporate structures, and platform-based business models. However, in 2024, many startups went bankrupt or faced serious internal challenges. One of the primary factors contributing to this situation was weak working capital management, which directly affected corporate liquidity and operational sustainability. Beyond financial mismanagement, a more serious concern has emerged: the misuse of startup business entities as instruments for economic crimes, including corruption and money laundering. This study aims to examine startups implicated as suspects in alleged corruption cases involving the mismanagement of investment funds by MDI Ventures at TaniHub and its affiliates between 2019–2023. In addition, this study investigates suspected money laundering practices involving startups such as eFishery and Crowde, which allegedly engaged in financial manipulation, falsification of investment data, and embezzlement of funds. Using normative legal research methods, this study finds that startups can be exploited as vehicles to conceal or disguise the proceeds of predicate crimes, particularly corruption, by channelling illicit funds into corporate investments. Corporations, including startups, are legal entities that may be held criminally liable, especially in cases involving corruption and money laundering. Accordingly, startups may be charged with money laundering if they are involved in concealing, disguising, or benefiting from the proceeds of criminal activities. Similarly, startups may be implicated in corruption when their business operations are proven to have actively or passively facilitated such unlawful activities. In conclusion, corporations operating as startups may be subject to criminal prosecution under the doctrine of corporate criminal liability. This liability extends not only to the corporate entity itself but also to its employees, directors, commissioners, and shareholders when criminal acts arise from or are embedded in business activities.

Keywords: Startups, Corruption, Money Laundering, Technology, Indonesia

1. Introduction

The rapid development of the startup business in Indonesia has become one of the main drivers of national digital economic growth. Startups not only play a role in technological innovation (Uriarte et al., 2025) and job creation but also form part of the emerging architecture of the financial and investment system (Zhang and Gu, 2024), including through the involvement of venture capital (Kato and Manchidi, 2025), the banking sector, and state-owned enterprises (Molnár and Jáki, 2020). However, the characteristics of startups which rely on digital transactions, flexible corporate structures, and platform-based business models also create opportunities for the misuse of business entities as vehicles for economic crimes, including corruption and money laundering (Apriliansah and Yusuf, 2024). In this context, the legal framework governing startup business is the same as that applicable to corporations, namely Law No. 40 of 2007 on Limited Liability Companies.

'Corporation' is a term commonly used by experts in criminal law and criminology to refer to what is known in civil law as a legal entity (Rodliyah *et al.,* 2021). Startups are generally structured as limited liability companies (LLCs) because they require formal legal entity status to secure investor funding, protect personal assets, and ensure operational legitimacy. Indonesia's startup ecosystem has grown rapidly, with over 3,161 active startups as of July 2025, placing the country sixth globally according to Startup Ranking. Total funding reached a record high of over USD 5 billion in 2025, driven by the fintech, e-commerce, AI, and green technology sectors, as well as expansion into cities such as Bandung and Surabaya (Grehenson, 2025). However, this growth is accompanied by significant risks, including mass bankruptcies and corruption cases involving startups.

Indonesia is expected to have between 2,700 and 3,161 active startups by 2025, dominating Southeast Asia with 15 unicorns and two decacorns such as GoTo and J&T Express. The government, through Komdigi, provides

support via the Garuda Spark programme, while 60% of founders are millennials and Gen Z, focusing on hybrid and subscription-based business models. This ecosystem has emerged from high internet penetration and a population of 275 million, but remains vulnerable to internal conflicts and market failures.

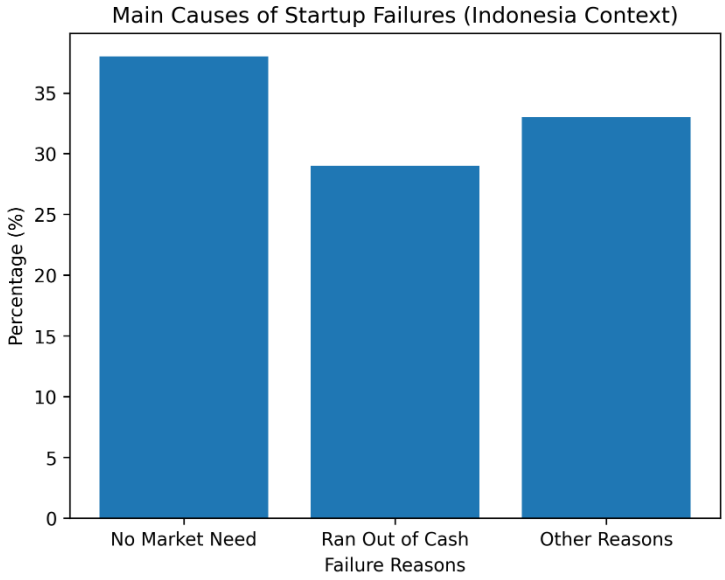

Figure 1: Main Causes of Startup Failure in Indonesia between 2023 and 2024 (Source: CB Insights)

Figure 1 shows a significant number of Indonesian startups have closed down between 2023 and 2024 due to funding constraints and unsustainable business models. Crunchbase recorded 138 failures of startups in 2023 alone. In 2024, several startups also ceased operations, including Zenius (edutech, temporarily closed), TaniFund, Investree (fintech), Ula, GetPlus, and Octopus. CB Insights reports that 38% of startup failures were due to a lack of market need, while 29% resulted from insufficient fundings. This period also witnessed widespread workforce reductions, including mass layoffs at Shopee Indonesia in 2023.

In 2022, President Joko Widodo stated that approximately 80–90% of startups fail during their early stages. This figure largely applies to technology startups in Indonesia. These failures are driven by several factors, including limited access to funding, a shortage of talent in areas such as data science and digital marketing, and complex regulatory requirements such as local content rules of up to 40%. In addition, many startups struggle with product–market fit, often replicating foreign business models without adequately adapting them to local market conditions. Intense competition from both domestic and global companies with substantial resources further exacerbates these challenges (Nugraheny and Setuningsih, 2022).

Within Indonesia's current technology startup ecosystem, a significant legal phenomenon is emerging concerning the use of startup businesses as a vehicle for laundering the proceeds of corruption. The South Jakarta District Prosecutor's Office has named nine suspects in a case involving alleged corruption and money laundering offences relating to the company TaniHub. The case relates to the management of investment funds originating from MDI Ventures and BRI Ventures, with a total value of approximately US$25 million (equivalent to Rp409 billion), over the period from 2019 to 2023. It involves not only individuals but also a number of corporate entities, including PT. TaniHub Indonesia, which is suspected of involvement in the misuse of these funds (Salsabila and Hidayat, 2025). These corporations are business partners of PT. TGI, namely PT. THI, PT. TSI, and PT. TFMI.

Empirical data further reinforces the existence of systemic risks. Records from Indonesia Corruption Watch show that between 2016 and 2023, there were 212 corruption cases involving state-owned enterprises, resulting in total state losses of approximately Rp64 trillion, and involving 349 suspects at various organisational levels, ranging from the board of directors to middle management (Alimudin, 2025). These figures indicate that corrupt practices are not merely incidental but have become structurally embedded in the governance of investment and the management of public funds, including those channelled into the startup sector. A number of cases further illustrate this pattern of misconduct. In the TaniHub case, for example, funding from MDI Ventures (a Telkom affiliate) and BRI Ventures amounted to approximately US$25 million (equivalent to Rp407 billion) during the 2019–2023 period, and it is suspected to have been misused through data manipulation, fictitious projects,

and money laundering practices. The handling of this case has also implicated high-ranking officials, including directors from the investor side. Another case involving Taspen, which recorded losses of approximately Rp200 billion due to illegal investments in startup entities. The emerging pattern is relatively consistent involving weak verification mechanisms, misuse of funds for personal gain, and the use of shell companies to obscure the flow of funds (Setiawati and Vitrana, 2025).

This situation highlights a gap in the literature regarding the enforcement of laws on corruption and money laundering in relation to the characteristics and dynamics of the startup business sector in Indonesia. Consequently, this study aims to strengthen law enforcement policies against corporate-based economic crimes involving the startup model. The fundamental questions addressed in this study are how criminal liability for corruption and money laundering are currently applied within the startup business sector in Indonesia, and how future formulations of such liability should be developed.

2. Methods

This study employs normative legal research, commonly referred to as legal literature research which involves the examination of legal literature and secondary data (Soekanto and Mamudji, 2010). The approaches adopted includes statutory, conceptual, comparative, and case approaches (Ibrahim, 2013). This research is descriptive in nature and aims to provide a systematic, factual, and accurate analysis of the facts, characteristics, and relationships between the phenomena under investigation. To address the research issues, this study employs corporate liability theory, focusing on the theories of strict liability and vicarious liability as analytical tools .

3. Discussions

3.1 Criminal Liability for Corruption and Money Laundering Through Startup Businesses in Indonesia

Startups are generally incorporated as limited liability companies because they require a formal legal entity status to secure investor funding, protect personal assets, and ensure operational compliance. Where a startup is established as a limited liability company (PT), it is subject to the Limited Liability Companies Act and must comply with Law No. 40 of 2007 on Limited Liability Companies, as amended by Law No. 11 of 2021 on Job Creation, particularly regarding legal protection, limited liability, access to capital, and risk-based licensing. As legal entities, such companies and corporations are independent from the personal assets of the owners/shareholders, and possess legal rights and obligations, including the capacity to sue and be sued. A limited liability company is one of the most common forms of corporation, and must be established through a notarial deed in accordance with applicable legal requirements.

In positive criminal law, the concept of a corporation has a broader meaning than that of a legal entity. In the context of money laundering offences, a corporation is defined as an organised group of persons and/or assets, regardless of whether it has legal entity status. This definition is broader than the concept of a legal entity in civil law. In other words, every legal entity qualifies as a corporation, but not all corporations are legal entities, as certain organised groups of persons and/or assets such as partnerships do not possess legal entity status (Rodliyah *et al.,* 2021).

In recent developments, startup businesses have been used as a vehicle for money laundering involving the proceeds of corruption. It should be noted that money laundering is a subsequent offence to the predicate crime of corruption. The term ‘money laundering’ often refers to the process of concealing or disguising the origin of funds obtained from illicit transactions to make them appear legitimate. It has various connotations and is commonly referred to as ‘dirty money’, ‘hot money’, ‘illegal money’ or ‘illicit money’. In Indonesian terminology, similar terms are used, including ‘dirty money’, ‘*haram* money’, ‘hot money’, or ‘black money’ (Yustiavandana *et al.,* 2010). The Financial Action Task Force on Money Laundering (FATF) defines money laundering as “the process of concealing or disguising the origin of the proceeds of crime”. This process is employed to obscure the illicit nature of such funds, enabling the perpetrator to enjoy the proceeds without revealing how the funds were acquired (Zalif, 2008).

Law of the Republic of Indonesia Number 8 of 2010 on the Prevention and Eradication of Money Laundering Offences defines “money laundering” as any act that fulfils the elements of a criminal offence in accordance with the provisions of this Law. Pursuant to Article 5 of Law No. 8 of 2010, companies including startups that fail to fulfil their obligations regarding the prevention of money laundering offences may be subject to criminal

sanctions. In addition, Law No. 1 of 2023 on the National Criminal Code provides regulation under Articles 607 and 608 which classify offences into specific categories. Active perpetrators of money laundering are subject to a maximum prison sentence of 15 years and a Category VII fine (Rp 5 billion), while passive perpetrators face a maximum imprisonment of 5 years and a maximum Category VI fine (Rp 2 billion). These sanctions apply not only to the company but may also extend to directors, board members, or commissioners where negligence is established. If a startup company is found to be involved, whether intentionally or unintentionally, in money laundering, its reputation may be severely damaged and its assets may be subject to freezing. This represents a significant risk and may threaten the continuity of the business.

In the context of corporate criminal liability, three main theories are employed: strict liability, vicarious liability, and the identification theory. In Indonesian legal practice, the Law on the Eradication of Corruption, particularly Article 20, adopts the concept of vicarious liability, whereby a corporation may be held liable for acts committed by its directors or employees within the scope of their duties (Suud, 2023). Meanwhile, under Law No. 8 of 2010 on the Prevention and Eradication of Money Laundering Offences, specifically Article 6, the approach reflects the identification theory, whereby corporate liability is based on the actions of the "directing mind", such as the board of directors or the company's principal controllers (Rahmayanti and Ifrani, 2025). Strict liability, although relatively rarely applied, carries significant implications in the form of administrative sanctions and substantial criminal fines, which may even reach Rp100 billion, accompanied by additional penalties such as the dissolution of the corporation (Ningrum and Hariyono, 2025).

Table 1: Comparison of Theories of Corporate Criminal Liability

Theory	Definition	Legal Basis in Indonesia	Characteristics	Relevance to Startups
Strict Liability	Liability without the need to prove fault	Implicit in several criminal regulations	Focuses on consequences rather than intent	Startups can still be held criminally liable even without proof of *mens rea*
Vicarious Liability	A corporation is responsible for the actions of its employees	Anti-Corruption Law (Article 20)	Based on superior-subordinate relationship	Directors/employees of startups act on behalf of the company
Identification Theory	Acts of management = acts of the corporation	Anti-Money Laundering Law (Article 6)	"Directing mind" represents the corporation	Startup CEO/founder is considered the corporation itself

Source: Author's analysis (2026).

Startups may therefore be prosecuted under either Article 3 or Article 4 of Law No. 8 of 2010 on the Prevention and Eradication of Money Laundering Offences if they conceal, disguise, or benefit from the proceeds of crime, including those arising from corruption offences. Article 3 focuses on active perpetrators, while Article 4 targets those who receive or control the proceeds; both have the potential to implicate the startup business and its controlling personnel. In relation to corruption offences, if a startup business is found to have actively or passively concealed, disguised, or benefited from the proceeds of such offences, it may be held criminally liable. Similarly, controlling personnel may be prosecuted if the startup business is found to have been involved in laundering the proceeds of corruption to gain illicit benefits.

Nevertheless, there is a regulatory gap in addressing this phenomenon. Law No. 40 of 2007 on Limited Liability Companies, as amended by the Job Creation Law, still focuses on civil law aspects and does not specifically address digital crimes within the startup ecosystem. Although Law No. 1 of 2023 on the Criminal Code has strengthened sanctions against money laundering, its implementation in the context of startups remains limited. Furthermore, although the Corruption Eradication Commission handles various corruption cases every year, there are few court rulings that specifically recognize startups as corporate entities in corruption and money laundering cases.

3.2 The Future of Criminal Liability for Corruption and Money Laundering Through Startup Businesses in Indonesia

The emergence of criminal activity, which is now committed not only by individuals but also by legal entities or corporations such as startups in the digital age, has become a matter of international concern. During the Fourth United Nations (UN) Congress on Crime Prevention held in Geneva in 1970, discussions also addressed the evolving forms and dimensions of crime, including 'Crime and Business', that is, crime aimed at obtaining material gain through activities in the business or industrial sectors and generally carried out in an organised manner by individuals holding prominent positions in society. This includes crimes related to environmental pollution, consumer protection, and the banking sector, as well as those commonly known as "organised crime" or "white-collar crime" (Rodliyah *et al.,* 2021). Another form of white-collar crime involves corruption offences in which corporations are implicated, including startup businesses in the digital age. Corporations in the form of startups are recognised as subjects of criminal law in relation to corruption in Indonesia under Law No. 31 of 1999 in conjunction with Law No. 20 of 2001 (the Anti-Corruption Law) and Law No. 1 of 2023 (the New Criminal Code), as well as under money laundering regulations. These frameworks allow corporations to be held liable for criminal acts committed by directors, employees, or related parties for the benefit of the company.

A corporation deliberately controlled for the purpose of committing a crime serves as a vehicle for criminal activity and as a cover for its criminal intent (Setiyono, 2002). In the context of law enforcement in Indonesia, corruption remains an extraordinary crime with systemic implications for state finances and public trust. To strengthen the fight against corruption, Law No. 8 of 2010 on the Prevention and Eradication of Money Laundering provides a legal basis for law enforcement agencies to trace, freeze, and confiscate assets derived from criminal offences, including those arising from corruption as the predicate offence. This law emphasises that money laundering does not stand alone, but is closely linked to the predicate offence, which aims to disguise or conceal the origin of unlawfully required assets (Nainggolan and Kornelis, 2024).

Many studies indicate that money laundering practices are becoming increasingly complex in line with technological advances and the digitalisation of financial systems. Money laundering schemes are no longer confined to the conventional banking sector, but have expanded to various sectors, including investment, capital markets, financial technology, and digital-based businesses (Pane *et al.,* 2024). Methods employed by business startups include the use of corporate structures, whereby the corruption is controlled by corporate personnel, and the corporation itself benefits from the criminal acts. PT Tani Group Indonesia (TaniHub) is an agritech startup focused on the digitalisation of the agricultural supply chain. In its development, TaniHub has secured funding from venture capital firms affiliated with State-Owned Enterprises (SOEs), namely PT Metra Digital Investama (MDI Ventures), a subsidiary of PT Telkom Indonesia (Persero) Tbk, and PT BRI Ventura Investama (BRI Ventures), a subsidiary of PT Bank Rakyat Indonesia (Persero) Tbk. Investments channelled to TaniHub and its affiliates during the 2019–2023 period are reported to have reached approximately USD 25 million, equivalent to over Rp 400 billion (Nurhakim, 2025).

In the course of the investigation, the South Jakarta District Attorney's Office has named a number of individuals as suspects in a case involving alleged corruption and money laundering offences related to the management of these investment funds. The suspects include members of TaniHub's management as well as officials from state-owned venture capital firms, including MDI Ventures and BRI Ventures. Investigators suspect that investment approvals were granted unlawfully, accompanied by the manipulation of company data and documents to secure the disbursement of investment funds. These actions are alleged to have caused financial losses to the state, as the funds used originated from state-owned entities (Putri, 2025).

The TaniHub case serves as an important precedent in criminal law studies concerning startup businesses and the governance of state investment. It demonstrates that state-owned enterprise (SOE) investments in the startup sector may be vulnerable to misuse for personal gain and can be exploited as a vehicle for corruption and money laundering. This case reinforces the argument that weak due diligence mechanisms, inadequate internal oversight, and limited accountability in state-owned venture capital investments create opportunities for such offences. Ultimately, such failures may result in state financial losses and undermine public trust in Indonesia's startup ecosystem.

The forms of corporate criminal liability for unlawful acts committed by startup businesses, particularly when used as instruments for corruption and money laundering, have far-reaching negative impacts on social life. On this basis, legal entities have increasingly become the focus of legal scholars, who argues that corporations should not only be treated as subjects of civil law but must also be recognized as subjects of criminal law, capable of being prosecuted and sanctioned. This approach is consistent with Law Number 1 of 2023 on the Criminal

Code. The concept of corporate liability in corruption offences is formally recognized in Indonesia, whereby corporations (both legal and non-legal entities) can be treated as subjects of criminal law and held criminally responsible. A criminal act is attributed to a corporation when it is committed by its management or by individuals who possess the "directing mind," acting for the benefit of the company (Darmawan, 2025).

Therefore, when analysed through the lens of strict liability, it may be understood as a doctrine of stringent criminal responsibility imposed by statute. In this context, as a consequence of recognizing corporations as legal subjects, when a corporation violates or fails to fulfil certain obligations required by law, that artificial legal entity must bear criminal responsibility. A key feature of this doctrine is that the legal subject is held accountable for the resulting harm without the need to prove fault or negligence. Under the theory of vicarious liability, a superior is generally responsible for the acts committed by subordinates. This principle holds that a person may be held liable for the actions of another, when both are engaged in a form of joint or collective activity. Under the Identification Theory, corporate criminal liability takes the form of direct (non-vicarious) liability. This theory holds that senior officers of a corporation, or individuals to whom authority has been delegated, are regarded as the corporation itself for specific legal purposes. Consequently, their actions and mental states (*mens rea*) are directly attributed to the corporation. The scope of criminal acts that may be attributed to a corporation under this principle is broader than under the doctrine of vicarious liability. This is because the acts or faults of senior officers are identified as those of the corporation. This conception is also known as the "alter ego" doctrine or the "organ theory" (Rodliyah *et al.,* 2021).

To anticipate the evolution of corporate crime within the digital ecosystem, the concept of criminal liability in Indonesia's startup sector must be developed in a forward-looking approach. This is essential given that digital transformation not only enhances economic efficiency but also increases the complexity of criminal modus operandi, particularly in technology-based corruption and money laundering. Based on empirical projections, Indonesia's startup ecosystem in the 2026–2030 period is expected to experience significant growth, with the number of entities exceeding 5,000 startups and total investment value, including that from state-owned enterprises (SOEs) projected to surpass USD 10 billion (Kusumah *et al.,* 2025). However, approximately 25% of such activities are potentially at risk of irregularities, particularly in the form of technology-driven valuation manipulation, misuse of special purpose vehicles (SPVs), and collusion between business actors and institutional investors.

As a solution, it is necessary to develop an integrative model of liability through a hybrid approach, combining the strengths of the three main theories: strict liability, vicarious liability, and identification theory. This model can be formulated within a "Startup Liability Matrix" framework, aligning types of violations with the most appropriate forms of liability. In this context, administrative compliance failures may be subject to strict liability; violations committed by employees within the scope of their employment fall under vicarious liability; Strategic actions taken by directors or controlling parties are attributed through identification theory (Radhali and Asnawi, 2025).

Table 2: Startup Liability Matrix (Future Model of Liability)

Theory	Application in Startups	Proposed Sanctions
Strict Liability	Violations of the OSS system and administrative compliance	Fines of up to 10% of the company valuation + licensing restrictions
Vicarious Liability	Data manipulation by employees within the scope of their employment	Corporate liability for compensation of up to twice the amount of losses
Identification Theory	Crimes committed by directors (directing mind)	Imprisonment + business prohibition for up to 10 years

Source: Author's analysis (2026).

Through this model, liability can be formulated more progressively by aligning the severity of sanctions to the level of digital risk and the benefits gained by the corporation. This approach not only strengthens the deterrent but also promotes more transparent and accountable corporate governance. Accordingly, the future concept of corporate criminal liability in startup businesses is no longer merely reactive but can comprehensively anticipate the evolving dynamics of digital economic crime.

4. Conclusions

Criminal liability in Indonesia's startup sector has a strong juridical foundation, under the legal regimes governing corruption and money laundering offenses. As corporations, startups may be held liable if they are proven to be involved in activities such as concealing, disguising, or benefiting from the proceeds of crime, whether actively or passively. The application of corporate liability theories such as strict liability, vicarious liability, and identification theory demonstrates that not only individual perpetrators, but also corporations and their controlling organs, including directors, commissioners, and shareholders, may be subject to criminal sanctions. Accordingly, in modern criminal law, startup businesses are no longer viewed merely as economic entities but as legal subjects that bear full responsibility for any unlawful activities conducted within the scope of their operations.

The future concept of criminal liability must be oriented toward a more adaptive and progressive approach in response to the evolving digital ecosystem. The increasing complexity of technology-based crimes requires a liability model that is not only reactive but also preventive and risk-based. Accordingly, it is necessary to develop a hybrid liability approach that integrates strict liability, vicarious liability, and identification theory within a systematic framework, supported by stronger regulation, data transparency, and technology-based oversight. In addition, the adoption of international best practices and digital risk projections is crucial in building a legal system capable of anticipating potential misconduct. This approach will enable law enforcement against corruption and money laundering in startup businesses to operate more effectively, accountably, and sustainably.

Circular Business Models of Biocomposites: Value Creation in an Industrial Ecosystem

Anu Kurvinen and Alexander Matrosov
Faculty of Business and Hospitality Management, LAB University of Applied Sciences, Lappeenranta, Finland

anu.kurvinen@lab.fi
alexander.matrosov@lab.fi

Abstract: Market and regulatory drivers encourage circularity of materials and the development of circular business models. Governments, companies, and consumers aim to reduce carbon footprints and plastic dependency. The use of biocomposites is increasing globally in various industrial applications. Biocomposites are natural fibre-reinforced materials composed of two or more materials. Conventional materials are in some cases replaced with biocomposites. Product development of substitute products and the establishment of suitable manufacturing infrastructure are complex processes. Business models determine how an organization creates value, delivers value, and captures value linked with internal strategies and processes. All these are needed for business model development and innovation. Linear business models are typically based on the use of virgin materials. In circular business models, resources are circulated as long as feasible, thus eliminating waste, and circulating products and materials. Business models are an interplay between regulations, varying market expectations, and market opportunities. Transition from linear business models towards circular business models requires a system-level approach. This incorporates circular design as a holistic starting point for new product development. The circular approach needs to cover both biological and technical material flows. Strategic business choices for circularity are developed for circular value chains. In a circular approach, the product design process is integrated at an early stage, because design and material choices are closely interlinked, and they affect resources, infrastructures, and activities. This research article combines a literature review of circular business models with the case of biocomposites and studies how adopting biocomposites affects business models and value networks. Circular business models in biocomposite value network are further studied via combining the theoretical insights with interviews that were conducted among companies that participated in a two-year research project related to biocomposites.

Keywords: Circular Business Model, Circular Design, Biocomposite, Natural Fibre Biocomposite

1. Introduction

There is increasing demand for solutions that enhance the sustainability of products throughout product lifecycles, taking into consideration manufacturing, use and end-of-life phases of a product. The concept of the Circular Economy was first introduced in 1989 (Pearce and Turner, 1989). They introduced the new idea of a closed-loop concept where fractions of End-of-Life products can be reinserted as raw materials for new production. Further working and promotion of the idea has been done e.g. by Ellen MacArthur Foundation (2013) when opportunities of Circular Economy were highlighted with the idea to keep materials at their highest value in all phases of their lifecycle in a way where natural benefits of material are enhanced and renewable material flows are managed. The idea of designing products that are circular by design forces value network actors to innovate and to cooperate. Material recycling requires reverse logistics networks and collection systems to support the circular economy. It also leads to higher rates of technological development, improved materials, and more profit opportunities for companies in the industry's value network. Market and regulatory drivers encourage circularity of materials and the development of circular business models. According to Krmela et al. (2022), established businesses face comprehensive circular economy issues at corporate level and sectoral level. Business model dynamics is changing through the implementation of circular economy strategies. Implementing selected circular economy strategies requires thus adapting business models or business model elements. (Krmela et al. 2022) The Finnish research project ABiCo studied biobased biocomposite solutions to replace fossil-based primary raw materials and to increase the use of recycled polymers and biobased raw materials in new, demanding applications, in accordance with the principles of the circular economy. In conjunction with technical development, study on sustainability regulations on biocomposites, techno-economical study, and study on circular business models were conducted. This research article presents a case study of circular business models in case of advanced biocomposites.

Research questions were formulated as follows:

- RQ1: Which business model elements can be aligned with the practical realities of circular business models of advanced biocomposites?

- RQ2: Are there barriers limiting the translation of circular design principles into viable business models for advanced biocomposites?
- RQ3: How can value network actors benefit from implementation of circular business models in advanced biocompsites business?

There are the following limitations to this research. The research is a case study conducted in a co-innovation research project. The study of circular business models is limited to the value network level. The detailed end-of-life analysis of different biocomposite compositions and their business models is excluded from this study.

2. Advanced Biocomposites for Improved Sustainability

Composite materials are a wide family of heterogeneous materials composed of two or more phases, with distinct physical properties. They consist of wood fibers embedded in a petrochemical plastic matrix.

Advanced biocomposites combine the advantages of natural and synthetic components to produce desired qualities, including improved mechanical, thermal, and biological performance (Kiratli 2023). Typical applications of biocomposites are in furniture, automotive, everyday products and construction applications such as decking or cladding (Carus and Partanen, 2018). Biocomposites have been available on the market for decades, but their use has been restricted to limited application areas due to their current performance levels and processability. Now, many industrial areas and brand owners around the world are demanding biocomposites with higher performance levels, suitable for high-quality products. According to market research institutions (Grand View Research, Market Research Future 2026) global use of biocomposites is predicted to grow as the use of eco-friendly materials in industrial applications is promoted.

2.1 Circular Design Framework

A circular design framework comprises multiple disciplines that enable business leaders to develop a step-by-step, systematic circularity strategy. These disciplines are design thinking, futures thinking, service design, and behavioral economics. (Raudaskoski 2022). Circular business models concern how businesses create and capture value in the circular economy framework. Circularity of materials becomes fundamental to how the business model is conceived. Ellen MacArthur Foundation (2019) has described circular economy systems as a diagram with the left wing being biological material cycle and the right wing being technical material cycle. Figure 1 illustrates these cycles.

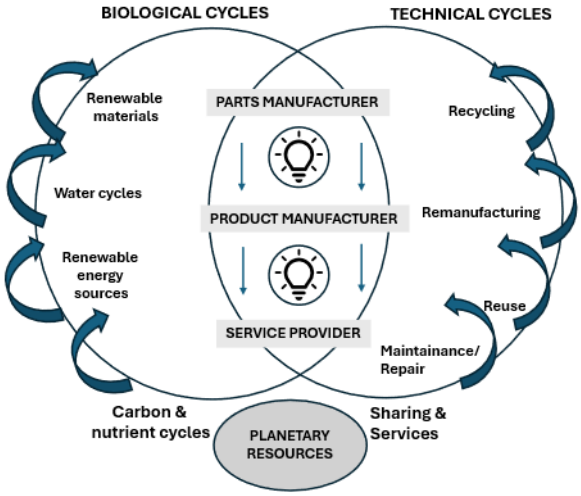

Figure 1: Circular Economy Systems Diagram (adapted from Ellen MacArthur Foundation 2019)

The technical cycle describes how non-renewable materials and products made of these are circulated. Circular business models are based on reuse, repair, and refurbishment, and eventually, when there is no longer a use for the product, its components can be reused. Non-recyclabe parts are broken down into constituent materials and will be recycled when possible. Successful circulation of products in either the biological or the technical cycle requires that they have been designed with their eventual circulation in mind. Designing products that stay in the economy and do not end up as waste is the primary target. The left butterfly wing also applies to all companies, even those that use non-renewable materials. Climate regulation, energy sources, and the scarcity

of natural resources affect business and business decisions. EU regulation e.g. *Ecodesign for Sustainable Products Regulation* (ESPR) requires all products to be designed and manufactured according to circularity principles (European Commission 2026).

2.2 Value Network of Advanced Biocomposites

Value chain and processing of advanced biocomposites includes typically following steps: choosing the raw materials, pretreatment, and composite construction. Natural fibers and polymers are some of the raw materials used in biocomposites. For increase of mechanical properties the raw materials are processed using a variety of techniques, like chemical or physical alteration. (Kiratli 2023) Several manufacturing methods were used in the ABiCo project - extrusion, 3D printing and injection molding were tested.

2.3 Circular Business Models – Value Creation with Circularity

New approaches and solutions require new business models that support circularity. A business model describes how an organization functions. (Massa et al., 2016). It presents the ”architecture of the value creation, delivery, and capture mechanisms”. Business model is an abstract concept, describing the logic of how the company does business and creates value, what its value proposition is, for whom it creates value and why it is profitable. To capture the value created by innovation, companies need to understand customer needs and technological development opportunities. (Teece, 2010) Main dimensions in business models, as categorized by Osterwalder and Pigneur (2009) are: value proposition - products and services, value delivery - target customers and value delivery processes, value creation - partners, stakeholders, and value creation processes, value capture - revenues and costs. Business models that change dynamically support transition to sustainability (Krmela et al.2022). Business models relate to business ecosystems. Understanding the customer and target industry value network needs not only in the short term but also in the long term, opens new avenues for circular innovation. Adding circularity conditions to the business model thus describes how an organization minimizes the ecological impact of its actions. Breuer et al. (2018) studied sustainability-oriented business model development and stated that there is a contextual expansion of company-centric business models from customers to stakeholders, and from monetary to multiple forms of value. Sustainability orientation requires thinking not only in terms of a single business view but also in terms of a network and systems perspective. According to Breurer et al. (2018), sustainable business models experimentation requires shared principles that guide organizations towards sustainability. These principles are named as sustainability-orientation, extended value creation, systemic thinking, and stakeholder integration. Table 1. presents these guiding principles. (Breurer et al. 2018)

Table 1: Requirements for sustainable business model development (Breurer et al. 2018).

	Guiding Principles		Process-Related Criteria
1	Sustainability orientation	1	Reframing business model components
2	Extended value-creation	2	Context-sensitive modelling
3	Systemic thinking	3	Collaborative modelling
4	Stakeholder integration	4	Managing impacts and outcomes

Systemic thinking includes the concept of circular economy, the physical product life cycle, product-service systems, as well as reflecting the outcomes of the applied business model and how well it delivers sustainability value. In creation of sustainability-oriented business models, all traditional business model components need to be viewed with a sustainability perspective e.g. sustainability impact and potential (Breurer et al. 2018). Circular economy strategies are often called as *9R circular economy framework* (Potting et al. 2016) Each circular economy strategy requires applying business model elements differently. 9R strategies aim to keep materials in the production and consumption cycle and at the most optimal possible level. Waste is to be minimized. Recycling of materials as raw material to new industrial process when possible and gaining better yield of raw materials by e.g. use of industrial side streams as raw material in other production processes, are typical approaches supporting circular economy incentives. 9R strategies with circular economy business model features are listed in Table 2. In addition to 9R’s, there is a row ‘carbon cycle’ added to the table to combine biological material cycle with the technical cycle presentation.

Table 2: 9R Circular economy framework (adapted from Potting et al. 2016) and circular economy business models (adapted from Lüdeke-Freund et al. 2019)

CE Strategy	Key Principle	Description	Circular Economy Bms Used
R0	Refuse	Make redundant, abandon use	
R1	Rethink	Intensive use, sharing, multi-functionality	
R2	Reduce	Consume less resources	
R3	Re-use	Use by another customer	Maintain, redistribute, next-life sales
R4	Repair	Repair, maintain	Repair, product life extension
R5	Refurbish	Restore, bring up to date	
R6	Remanufacture	Use parts for same function	Remanufacturing, next-life sales, product life extension, extending product value
R7	Repurpose	Use parts for different function	
R8	Recycle	Process and obtain same or lower quality	Closed-loop production, rematerialization, recycling & waste management
R9	Recover	Incinerate for energy	
CARBON CYCLES	Organic feedstock	Raw materials derived from plants used as inputs to produce energy, fuels, or industrial products	Co-product generation from waste, circular material supplies, side streams, industrial symbiosis

Lüdeke-Freund et al. (2018) studied recycling business model patterns based on the above-mentioned business model dimension. Material supply chains and reverse material cycles are core in circular economy business models. Recycling business models are part of a value network with partners in a circular supply chain. The value proposition is delivered by closing the resource loops and organizing reverse logistics. This way, users, raw material suppliers, and parts manufacturers are connected. End-users also become resource providers by returning used items to resource loops; manufacturers become customers of raw materials; and waste-collecting operators act as suppliers to manufacturers. Recycling business models relate to both biological and technical cycles. The value created by recycling occurs at both the material and product levels and can be considered downcycling or upcycling. Downcycling means converting waste into materials of lower value than the original material. Upcycling refers to converting waste materials into materials or products of higher quality or value (Sung 2015). The value that is created is captured through additional product revenues or cost savings. Summarizing the cornerstones of circular economy business models is done in Figure 2. (Islam et al. 2025)

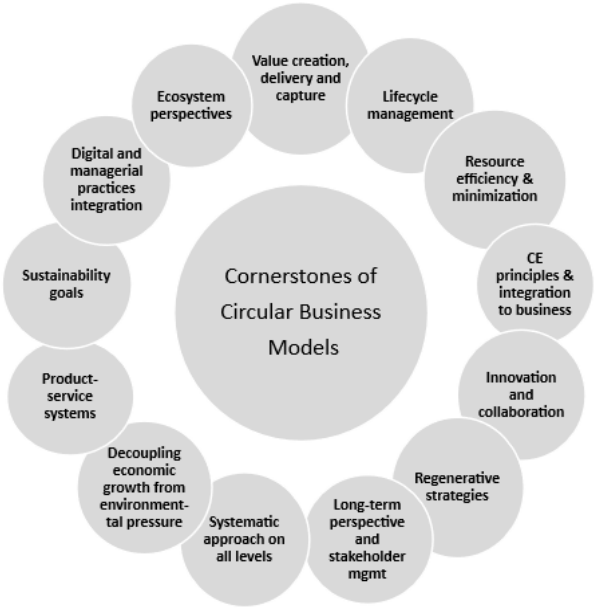

Figure 2: Cornerstones of circular economy business models (adapted from Islam et al. 2025)

2.4 Circular Business Innovation

Circular business encourages innovation, as companies and entire industries seek novel, viable products, services, and solutions that support both biological and technological cycles. In the long run, companies need a long-term vision on sustainability or circularity. Circular innovation becomes more systematic. Based on Image 1, companies and industrial-scale operations require partnering and collaboration with ecosystem partners. New partnerships are needed when new materials and processing methods are adopted and developed. New knowledge is created and must be turned into concrete actions on various parts of the supply chain. Slowing the resource loop can be done by designing products to have a long lifetime and durability, and for extension of product lifetime through maintenance, repair and upgrading (Bocken et al. 2016). Zaei and Klincewicz (2025) classified sub-types of circular product and process innovations in agri-food system. This classification is also valid for advanced biocomposites and is presented in Table 3.

Table 3: Typology of circular product and process innovations (modified from Zaei and Klincewicz, 2025)

Sub-type of Products	Description
Substitute products	More sustainable than existing, known products
Durable products	Products with extended life, longer life span
Recyclable products	Products reducing the need for raw materials, having a “second life” beyond the initially intended use
Material efficiency improvements	New or significantly improved technologies that increase the utilization rate of a material, reduce emissions, cost, or energy usage
Take-back processes (reverse logistics)	Valorization of materials or parts of products
Circular process technologies	Novel and more efficient processing of materials, including the valorization of side streams

3. Methods

Co-innovation project ABiCo forms empirical background for the researched case study. The aim of the project was to develop innovative high-performance biobased biocomposite solutions to replace fossil-based primary raw materials and increase the use of recycled polymers and biobased raw materials in new, demanding applications in accordance with the principles of the circular economy. The advanced biocomposites studied consist of wood fibre and plastics. In the project, advanced biocomposites were created from selected raw materials and additives. Material combinations were tested using standard testing methods and industry-specific requirements (e.g., weathering, UV, fire-retardancy, and material safety testing), as well as processing methodologies (extrusion, 3D printing, foam-forming), and modern AI-aided manufacturing phases. Circular design was the key approach in designing demo compositions and designs, with end-of-life options that support circularity. As a result, material combinations with potential for further industrial-scale development were found. The goal was also to explore potential products that could be designed with the materials tested in the project. Another goal was to scout the legislative environment and business potential for the developed composite materials. The consortium partners - five research institutions and industrial partners closely collaborated throughout the project. Figure 3 describes the project content and stakeholders in the value network.

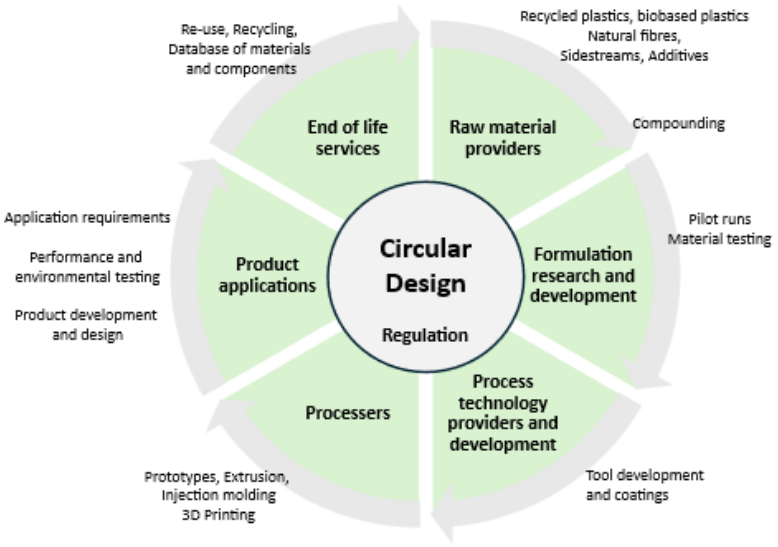

Figure 3: Content of ABiCo project (ABiCo, 2026)

3.1 Research Approach

This research article combines a literature review of circular business models with the case of advanced biocomposites ABiCo project and studies how adopting biocomposites affects business models and value networks. Circular business models in biocomposite value networks are further studied by combining theoretical insights with data from seven company interviews with eight company representatives. All the companies interviewed participated in the two-year ABiCo project. Semi-structured interviews were conducted in May 2025 as one-hour online sessions using Microsoft Teams. Interview data were transcribed, categorized, and analyzed using grounded theory. This method is suitable when the phenomenon under study is new and complex, and when new knowledge is created. The interview questions were sent to the interviewees in advance. Eight topics related to regulatory demands and future business models were discussed with all the companies. The aim was to find out the companies' current and future standpoint towards circular business models in biocomposites sector. Project companies represented the industry value network from different perspectives: material/recycling actor, fibre material actor, construction product manufacturer, biocomposite producer, industrial OEM/device manufacturer, marine industry end user, plastic product manufacturer, circular material producer. The interviewees were from R&D, production, top management, and sales and marketing functions. Industrial end users were from three application areas. Industry partners had their own R&D projects parallel to the public research project, which directed their interest toward the topic.

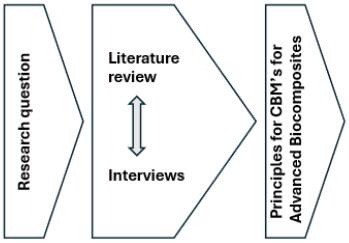

Figure 4: Research approach

As a secondary data source, research documentation from participating research institutes was used. Data collection and analysis took place simultaneously.

3.2 Research Results

When researching new business potential for the whole value network, the following themes were covered: Regulatory viewpoints and role of emerging regulation as driver for market demand, existing customer awareness, existing customer demand, business potential – sustainability vs. cost, recyclability, material loops, market opportunities, value network, and partnering. Table 4 presents a summary of interview results connected

with the value network level. While reviewing circular business, the concept of value networks offers a useful, holistic view of value creation across all network partners in the short and long run.

Table 4: Summary of the interview data

	Raw material supply	Technology providers & Development	Processing/ Manufacturing	Product applications/ Target market	End of life
Reliable supply needed	x		x	x	x
Possible plastic materials to be used in advanced biocomposites.	x	x	x	x	
Biocomposite as an option when another material supply limited	x		x	x	
Direct replacement of existing material in existing process challenging		x	x	x	
Biocomposites as solutions among existing ones		x	x	x	
Possible plastic materials to be used in the manufacturing process	x	x	x		
Material properties. Must work in the production line			x	x	
Demand exists	x		x	x	
Fit company's product selection			x	x	
Value after recycling	x		x		x
Material identification: material knowledge for better recyclability (in order to be utilized to the fullest value)	x				x
Closed-loop recycling systems work.	x		x		x
Raw material waste recycling exists	x		x		x

Circular design and both material cycles – the biological cycle and the technical cycle - presented earlier are both present. During the ABiCo project it was confirmed that there is interest and expectation in the development of selected advanced biocomposite materials for circular materials loops. They also represent potential for further material innovation, technological and process innovation, as well as product and service innovation. Advanced biocomposites are promising materials in circular business models. This is supported by the growing demand, which can be reinforced through the adoption of circular design. Ideologies of circular business models and circular design presented in the literature and use of novel material combinations are challenging due to several reasons. E.g., there are no existing material libraries for designers yet. Circular design could be potentially achieved in large-scale industrial processes that enable their own large-scale material testing, consumption, and development for certain selected end-use applications. There are also end-of-life solutions that can be more easily adapted – raw material flows are easier to control, and material identification is easier. Advanced biocomposites often offer the benefits end users seek (e.g., lightweight structures). The limitation, according to the current study, is that each material and technology solution is tailored for the current product lines. Each

value network stage has its own raw material supply cycles, which, in the case of plastic, may be the so-called first or second life of plastic. The technical cycle concerns the processes, materials, and technological innovations by which products are transformed into new materials. Technologies that enable the processing of waste materials into higher-value materials and products are needed. The essential differences from the customers' point of view are the sorting of raw materials and compliance with application-specific quality criteria. Typically, in the second-life plastic cycle, the quality of the raw materials differs from that of virgin plastic. It is also common in recycling that facility processes use several plastic recyclates. It required that the design of value propositions, value creation, value delivery, and value capture mechanisms be developed through collaborative efforts.

Martina and Oskam (2021) studied business models of textile composite products. They identified that principles for recycling and scalable business models require technologies that convert waste materials into higher-value products. Manufacturers need to understand materials science and product design. Automatable technologies are needed. There are take-back systems that guarantee an efficient, predictable, and consistent inflow of materials. There exist take-back systems that guarantee inflow of quality materials. Ecosystem partners have trust for mutual development. Existing technological infrastructures can be expanded. Positive cash flows are generated. Business models are adaptable to legal regimes. Problem-solution fits are developed to match the customer needs and address large markets or markets with growth potential (Martina and Oskam 2021). Based on the interview results, we can state that these principles are also valid for the case study's advanced biocomposites.

3.3 Discussion and Conclusion

The ideal of materials circularity and alignment with sustainability targets can be a challenging balance. The conducted literature review described the motivation and operation of circular design and circular business models. Combined with the interview data, the researchers were able to generate new knowledge on circular business models for biocomposites in the framework of Finnish ABiCo project. The stated research questions 1-3 are answered below:

3.3.1 RQ1: Which Business Model Elements can be Aligned with the Practical Realities of Circular Business Models of Advanced Biocomposites?

Guiding principles for circular business model development are visible in the case of biocomposites. There is a sustainability orientation and an extended idea of industrial value-creation among the ecosystem parties. Systemic thinking can be applied. When analysing the studied biocomposites, we can see that there is potential in selected advanced biocomposite materials for circular materials loops. There is room for innovative technologies in this area related to material recognition and sorting on an industrial scale. New innovations can also be expected in end-of-life solutions. One recognized solution is new closed-loop systems. These are high-cost solutions to establish and maintain, but when biocomposite use and recycling are at a substantial level, this kind of recycling loop can be organized. This development is also supported by the growing demand in large end-use segments such as the automotive and construction industries. Before that, other end-of-life solutions will need to be applied. Industrial side streams offer potential as raw materials for biocomposites. Forming industrial sites where symbiosis of different ecosystem players can operate can cut costs in logistics in form of reduced warehousing and transportation costs.

3.3.2 RQ2: Are There Barriers Limiting the Translation of Circular Design Principles into Viable Business Models for Advanced Biocomposites?

This co-innovation project on biocomposites states that the lack of circular products and materials within the biocomposites sector can be a limiting barrier. The regulatory environment of recycled plastic products is complex, and recycling targets are demanding. The following systemic barriers exist: a lack of reverse logistics, missing incentives for recyclers, and data gaps that affect material traceability. The collection of plastic waste needs to be increased, and new methods need to be developed. New sorting technologies must be adopted more widely, and further development is needed to achieve good yields and purity across different plastic types. Chemical recycling processes are another approach to plastic recycling, complementing mechanical recycling. Strict regulations not only direct sustainable development but can also increase costs and inefficiencies, such as excessive reporting requirements for businesses. In product and solution marketing, a holistic approach is needed to avoid greenwashing. The end-of-life phase opens new technological development needs and business opportunities in industrial-scale material recognition and material flow management.

Ecosystem dependency rather than firm-level innovation activities. Circular design principles require change towards thinking of the whole material and product cycles from both biological and technical points of view. This is challenging and requires close co-operation with industrial designers. Co-operation can help strengthen customer-supplier relationships as both parties can improve their business and circularity.

From the designers' perspective, new material opportunities need to be brought to knowledge. Different material libraries and solutions for selecting circular materials can help identify the right material choice with sufficient quality. Ideally, design students could be given more knowledge about circular materials and their possibilities in different applications and industrial processes. More material knowledge about biocomposites is needed to grow the demand.

3.3.3 RQ3: How can Value Network Actors Benefit from Implementation of Circular Business Models in Advanced Biocompsites Business?

Demand of biocomposites is growing. This means that all value network actors can develop solutions that meet the growing demand and thus bring new business potential to all value network levels. There are some actor roles that are not that developed yet, and there is lot of room for innovation and new business ideas. All this requires close co-operation between business partners. The ABiCo project consortium, with research institutions and industrial partners, represented an interdisciplinary collaboration that merges technological expertise, industry insight, and market-driven approaches. A combination of deep technical expertise from the industry and research institutions was present.

Ethics Declaration

This study is based on semi-structured interviews with professionals representing different roles of the biocomposite value chain. Participation was voluntary, and the purpose of the study was explained to the respondents. The interview data were anonymised, and no personal or sensitive data are reported in the paper.

AI Declaration

Artificial intelligence tools were used only for language refinement, including grammar correction and improvement of readability. AI was not used to organize literature data, nor interpret interview data, conduct the analysis, or generate the conclusions. All analytical decisions and final interpretations remain the responsibility of the authors.

julie.berube@uqo.ca

Abstract*:* Entrepreneurial success depends on several ecosystem-related factors, including social capital, the presence of support structures, and the ability to leverage the unique characteristics of a given territory. While innovative entrepreneurship can emerge across an entire territory, entrepreneurs operating in regional areas face challenges that differ significantly from those encountered in metropolitan environments. This paper explores regional entrepreneurship as a lens through which to better understand the opportunities, challenges, and barriers associated with starting and growing innovative ventures outside major urban centers. Labor shortages are particularly acute in more remote regions, which often contend with limited infrastructure and greater distance from markets, suppliers, and specialized resources. In this context, attracting and retaining innovative entrepreneurs can be especially challenging. The objective of this research is to identify ways to strengthen regional entrepreneurial ecosystems and enhance their capacity to attract, support, and retain innovative entrepreneurs. To address this issue, the study adopts an action research approach based on focus groups conducted with innovative entrepreneurs established in 10 remote regions. Five sectors with strong potential for innovation were targeted: technology, culture, agriculture, the social economy, and green technologies. The project seeks to foster the exchange of best practices while recognizing the distinctive characteristics and development needs of each region. Consistent with the principles of action research, the study aims not only to generate knowledge but also to produce practical outcomes that can be readily implemented by regional stakeholders. Preliminary findings identify four key attractiveness factors, three major regional strengths, and six significant challenges, along with potential solutions to address them.

Keywords: Entrepreneur, innovation, attraction, ecosystem, talent

1. Introduction

This research focuses on attracting and retaining talent in remote régions to promote innovative entrepreneurship. In a context where regions on the outskirts of urban centers are seeking to strengthen their economic vitality, innovative entrepreneurship appears as a promising avenue for both practical and academic circles, particularly because it represents an engine of economic development and contributes to the well-being of society (Bradley et al, 2021). Although innovation is polysemous, several authors agree on certain key notions. These include the creation of new products, services, production methods or business models that can foster organizational growth, generate value-added jobs and create wealth for individuals, organizations and society. Innovative entrepreneurship can therefore be found in various types of organizations, of different sizes and from different sectors. Innovative entrepreneurship needs a supportive environment to develop and encourage action from individuals and organizations. Bäumle and Bizer (2023) studied the importance of government incentives to create this environment. However, there is no "miracle recipe" in terms of public policy to attract and retain talent in remote régions and thus stimulate the entrepreneurial ecosystem (Cisneros et al., 2022), and several questions remain. Specifically, is it preferable to rely on subsidies, invest in business incubators, or develop the infrastructure of a territory? Regardless of how the aid is declined, the environment and context remain important factors in individuals' interest in innovative entrepreneurship (Autio et al, 2014).

2. Project Description

Organizations in Quebec, Canada, as well as in other countries, have faced several challenges in recent years, notably inflation, which has seen a cumulative increase of approximately 14% since 2021 (IST Quebec, 2025). The trade war with the United States puts significant economic pressure on organizations, as well as the labor shortage, with approximately 500,000 jobs in Quebec dependent on exports to the United States (Carbasset and Caillou, 2025). This last challenge is particularly important for several regions, where at the end of 2022, 65% of available jobs were located in regions outside urban centers (Lesage, 2023). This situation highlights an imbalance, with the majority of job vacancies concentrated in remote regions. Thèse regions also face more limited infrastructure and distance from markets and suppliers (Polèse and Shearmur, 2002). This hinders the development of innovative regional entrepreneurship, despite the dynamism previously observed in this area.

It therefore appears that regions more distant from urban centres face particular challenges while also presenting significant innovative potential. Given this situation, our research question is, "How can we attract

and retain innovative talent in remote regions to stimulate the economy through entrepreneurship?". The ultimate goal is to identify the advantages, factors, and challenges of establishing an innovative project in a regional area rather than in major urban centers. Ten regions were selected in Quebec, Canada. The aim of this project is to conduct a regional diagnosis through knowledge sharing with support organizations, incubators, accelerators, and innovative entrepreneurs across regional ecosystems. Based on this diagnosis, the project seeks to develop recommendations for a comprehensive attraction and retention strategy that leverages the unique strengths of each region.

3. Literature Review

This literature review aims to highlight the theme of entrepreneurship, more specifically the innovative regional entrepreneurs, as a basis for reflection, in order to discover the strengths and weaknesses, the factors of attraction and barriers of remote regions compared to urban centers.

3.1 Innovative Entrepreneurs

The epistemological field of entrepreneurship aims to be fruitful, even if it remains somewhat fragmented (Omrane et al., 2011). For many authors, it is not possible to separate entrepreneurship from innovation. Indeed, according to Schumpeter (1928; 1965), one of the first scholars to take an interest in entrepreneurship, it is about changing the existing order to seize opportunities by innovating. He considers that the innovation brought by entrepreneurs constitutes the driving force of economic growth. Also, the OECD (2024) supports that entrepreneurship appears as a process expressed in terms of innovation, oriented towards economic creation.

This economic value creation is particularly evident in entrepreneurship’s intrinsic ability to identify market asymmetries and transform latent commercial opportunities into action (Shane, 2000). Indeed, the entrepreneurial cognitive process regarding innovation is intrinsically aligned with the individual's idiosyncratic goals and value systems (Walder et al., 2019). Trott and Simm (2017), demonstrate the effects in practice of activities such as learning by doing, on the job problem solving and the use of external firm sources, as knowledge sharing, for the process of innovation in low and medium technology industries (LMT). Entrepreneurship thus becomes systemic, which can be explained in part by the wide range of factors influencing entrepreneurial intentions and actions. These are particularly economic (Wennekers et al., 2005), political (Cisneros et al., 2022), socio-cultural (Degeorge et al., 2018; Shane and Venkataraman, 2000), and psychological (St-Jean and Duhamel, 2023).

Both theoretically and empirically, there is no doubt that the innovative entrepreneur is the result of intrinsic values and a set of structural and operational means through which economic and social value is created.

3.2 Régional Entrepreneurship: Between Agility and Resilience in the Face of Disruption

Entrepreneurship in remote regions is a complex system of value creation, dependent on specific local roots and regulation mechanisms that are both internal and external. Jean (2012) notes that rural life is no longer just about agriculture; it is becoming a rural life of residence, where development is driven by the efforts of local actors trying to maintain their living environment in the face of globalization pressures.

Urban entrepreneurship benefits from agglomeration forces, whereas more rural regions must contend with geographical disadvantages and a dependence on natural resources (Arthur et al., 2023). Mura et al. (2025) emphasize that remote regions benefit from localized innovation systems, but peripheral areas suffer from a lack of resources and even technological transfer infrastructure. However, regions are not just spaces or environments with constraints. According to Dent et al. (2023), the remote regions offer fertile ground for what is called soft innovation and ecological leadership models. Where urban areas seem to prioritize density, the region focuses more on social and cultural closeness, a community development spirit, to reduce transaction costs and encourage stronger and therefore more lasting strategic alliances (Natário and Oliveira, 2025) which may give rise to innovations.

At the micro level, Nnanna et al. (2024) point out that Quebec's regional entrepreneurship, in particular, stands out for its increased psychological resilience, often shown through the concept of entrepreneurial tinkering. This concept refers to adapting to external shocks, for which regional entrepreneurs demonstrate adaptability by reconfiguring available relational and material resources to cope with current constraints.

Thus, entrepreneurship in the remote regions is inseparable from its cultural roots. The sustainable development of the regions also depends on their ability to attract creative human capital (Dent et al., 2024).

3.3 Ecosystems and Innovation put to the Test by Regional Entrepreneurship

The ecosystem of remote regions isn't identified just by its geographical isolation or by the difficulty of accessing markets; it's a setup characterized by the network, community institutions, and resource endowment (Aguilar, 2021). Julien (2015) developed a pyramid representing the entrepreneurial ecosystem. In the middle of the pyramid are the factors that encourage the emergence of endogenous entrepreneurship and its development through: 1) information, which is at the heart of the knowledge economy and serves as the link to the vibrancy of the economy; 2) networking, for better access to and adaptation of this information; and finally 3) innovation, which is at the core of a company's competitiveness in the knowledge economy and relies on the information provided by networks (Julien, 2015: 17). It therefore appears that entrepreneurial innovation is fostered by networks and the sharing of information.

Moreover, Lachapelle and Cloutier (2020) highlight the importance of knowledge sharing in environments with feedback loops of information exchange to encourage the entrepreneur to come up with innovative ideas that provide a differentiating added value for adapting. Also, according to Arthur et al. (2023), the systemic perspective shows that innovation in the region works through feedback loops.

One way to foster information sharing is through closeness. Torrès (2007) explains that the management of small businesses is unique and can be expressed through various forms of proximity among entrepreneurs, whether hierarchical, functional, temporal, or spatial. This proximity, which translates into closeness that fosters the conditions for action and reflection in small firms, also relates to company functions, such as local marketing, local finance, and local information systems.

Forms of closeness can thus resonate with the local entrepreneurial ecosystem, and this proximity encourages the sharing of knowledge, especially in regional areas. Regional entrepreneurship can therefore be highlighted in a rational way, notably through the model of entrepreneurial ecosystems developed by Stam and Van de Ven (2021). According to the authors, the foundation of the entrepreneurial ecosystem is based on institutional arrangements (formal institutions, culture, network). These foundations create an environment of trust and rules that makes it easier for resource endowments such as infrastructure, talent, funding, and knowledge to emerge. A circular causal link is thus encouraged because entrepreneurial success doesn’t just create wealth; it reinvests that wealth into the ecosystem, which strengthens networks and the entrepreneurial culture in the environment (Stam and Van de Ven, 2021) or the region.

Ultimately, the remote region appears as a reservoir of forces around which a dynamic can be structured, where the territory is no longer merely a site of entrepreneurial activity, but an innovative initiative that generates economic value (Korsgaard et al., 2015).Moreover, from Müller and Korsgaard's (2017) point of view, rurality is also seen as a kind of toolbox of finite and available resources, at the service of the regional entrepreneur, who can integrate them into their value creation process and better differentiate themselves in the market. The remote region therefore presents both strengths and significant challenges for innovative entrepreneurs, and in a context where innovative entrepreneurship is a central driving force of regional development, it becomes necessary to examine the factors that can attract them and support their retention within regions.

4. Methodology

The selected methodological approach aligns with the principles of action research (Fendt and Kaminska-Labbé, 2011) important for the co-creation of knowledge with practitioners. This research involves 10 support organizations for incubation and acceleration (OIA) who are partners in the project and helped to recruit innovative entrepreneurs from all sectors in their region.

This empirical qualitative research using focus groups highlights the current challenges facing by the remote regions, and the key concepts of attraction and retention. The 10 OIAs, through their expertise in the field, recruited (between May and July 2024) entrepreneurs for a total of 10 focus groups lasting approximately two (2) hours each. The groups série spread across the 10 regions of the OIA in Quebec located from two (2) to 18 hours from Montreal Metropolitan, Canada. The 10 groups were composed from three (3) to 10 innovative entrepreneurs for a total of 51 participants. In order to give an overall picture of each region, the innovative entrepreneurs who participated come from different sectors ranging from technology (8), agriculture (6), social economy (9), to green technology (13) and culture (15).

The discussion groups were recorded and transcribed to allow for the analysis of results (Miles et al, 2020) by region and subsequently to develop a regional diagnosis followed by general recommendations.

5. Analysis of Results

The analysis of the results across all focus groups (11) highlights four main strengths key factors that influence innovative entrepreneurs' decisions to establish their businesses in regional areas for their business projects, and these factors also represent competitive advantages for many regions are: Quality of life; Strategic business considerations; Financial advantages and Ecosystem from the community. The analyses also identify the major challenges entrepreneurs face, and the solutions proposed by participants.

5.1 Main Strengths of These Regions

5.1.1 Quality of Life

The main factor that has attracted innovative entrepreneurs to the region is the quality of life and peaceful environment it offers. This includes proximity to nature and recreational activities, opportunities to achieve a healthier work–life balance, and a less stressful lifestyle than that offered by large urban centers. Some entrepreneurs deliberately chose to return to their home region—particularly in very remote areas located more than five hours from a major urban center—to reconnect with their families, professional networks, and personal roots. This reflects both a strong attachment to the region and the family and social considerations cited by several participants.

5.1.2 Strategic Business Considerations

The second factor that was highlighted was Strategic business considerations which also played an important role in attracting entrepreneurs to certain regions, whether through commercial opportunities in underserved markets, lower levels of competition, or proximity to key suppliers.

5.1.3 Financial Advantages

In addition, many participants emphasized the financial advantages of operating in regional areas, including lower costs for purchasing land or buildings and more affordable commercial rents.

5.1.4 Ecosystem from the Community

Participants also highlighted the strong sense of community found in regional areas, close relationships with local stakeholders, a culture that emphasizes collaboration over competition, and the welcoming attitude toward new entrepreneurs.

"I would also point to the sense of proximity and the local business environment. There are many partnerships between companies, and a lot of relationships develop naturally that way. I think that was one of the region's strengths from the very beginning. For example, someone might say, "Oh, they do welding just down the road." There's a strong culture of businesses supporting one another. I believe that has been a real asset. It's also something the business owners have always valued—working with companies that are as close to them as possible, for both financial and relationship-building reasons." Participant -Chaudière Apalache, three hours from a urban center.

Some participants expressed a desire to contribute to the local community or promote cultural development, while others were attracted by specific features of the regional entrepreneurial ecosystem, such as its dynamism, independence, or the presence of industry-specific business incubators.

5.2 Entrepreneurs' Challenges in Regional Areas

Regarding the challenges associated with operating in regional areas, participants identified several issues that are more pronounced than in urban centers. One of the most significant is the shortage of skilled labor and specialized resources resulting from a smaller talent pool. This challenge is compounded by difficulties in recruiting specialized employees and by business succession issues affecting many regions.

In addition, the shortage of housing and family support services, such as childcare, is closely linked to workforce attraction and retention, as larger urban centers generally offer a broader range of services.

> *"There are no daycare spaces because there aren't enough early childhood educators. There aren't enough educators because they can't find housing. It's the classic chicken-and-egg problem. So even if people want to move here and settle in the region, those in their fifties, for example, obviously aren't the ones who need daycare services"* Participant, Iles de la Madeleine, 10 hours from urban centers.

In some regions, the lack of commercial space and worker accommodations also limits business growth. Limited or inadequate public transportation further complicates the recruitment of both skilled and general workers. Participants also identified several financial challenges, including high transportation and supply costs—particularly in remote regions—limited access to financing tailored to innovative businesses, and the relatively small size of local markets.

In remote region some participants emphasize limited brand recognition and visibility also emerged as barriers to innovation, suggesting that businesses located in regional areas are often perceived as riskier than those based in major urban centers. Several entrepreneurs reported losing credibility with partners, investors, or clients simply because their businesses were located outside large cities.

Challenges related to innovation and the lack of specialized support services were mentioned in half of the regions studied. Participants also pointed to administrative barriers, such as the complexity of government programs, funding criteria that are not always well suited to innovative businesses, and insufficient personalized support.

To address these challenges, participants proposed several potential solutions. These include encouraging and facilitating immigration to regional areas, providing support to help newcomers access housing and childcare services, and fostering greater collaboration, resource sharing, and mutual support among businesses. Participants also recommended strengthening mentorship and business advisory services, investing in business succession planning and entrepreneurship transfer initiatives, supporting the development of housing and public infrastructure, and more effectively promoting the strengths of regional areas to enhance their attractiveness for innovative entrepreneurs.

6. Discussion

Regions are places where entrepreneurs are drawn to settle, both for their personal lives and their professional activities, because of the quality of life they offer. Also, to get closer to their established network, which helps them seize opportunities and innovate. Remote regions provide the chance to relax as soon as they leave the office and make it easier to balance work, family, and social life due to the closeness. Which empirically confirms Boone et al. research "The magnitude and qualities of livelihoods, lifestyles, connectivity, and place create the degree of urban-ness of intertwined human experiences and land configurations"(Boone et al., 2014:314.).

For some companies, region is also a strategic choice, given the lower costs associated with operating expenses (raw materials, business partners in the same field, etc.). However, it should be noted that this is not the case for other companies, particularly those in more remote regions, namely that the distance from major urban centers increases their shipping costs, etc. Aspects of innovative entrepreneurship have been well studied, and significant progress has been noted. Living in a rural area can now be an advantage in several aspects. Knowledge is sometimes centralized in large cities, but with urban development and the relocation of businesses to the regions, this knowledge is being shared outside of university towns (Fu et al, 2023). The driving forces behind innovation are change, a factor facilitated by urban development. The economy also drives change and opens new doors for entrepreneurs by developing, among other things, various local structures (Khodakivska et al, 2022).

Surprisingly, since the participants were invited by organizations for the incubation and acceleration (OIA) of the region and the discussion groups took place in the OIA offices, very few participants highlighted the help and support they received from the OIA itself. Nevertheless, Stam and Van de Ven (2021) point out that the foundation of the entrepreneurial ecosystem is based on institutional arrangements (formal institutions, culture, networks). These foundations create an environment of trust and rules that makes it easier for resource endowments like infrastructure, talent, funding, and know-how to emerge. The interaction between the institutional setup and the resource endowment shapes the quality of the ecosystem. So, when the conditions are right, these interactions feed what's called "productive" entrepreneurship, which is the tangible outcome of the system. There's kind of a circular cause-and-effect here because entrepreneurial success doesn't just generate wealth, it reinvests that wealth back into the ecosystem, which strengthens networks and the entrepreneurial culture in the community.

The regions are at a disadvantage in terms of resources, public transportation, and networking (Fu et al, 2023). On the other hand, links created in the regions tend to be stronger, while those in the city are more common, and short-term. Furthermore, the solutions established to address the lack of resources and transportation require a certain degree of innovation and strong problem-solving skills, which are the foundation of innovative entrepreneurship (Deakins, 2018). This can also foster the opening of opportunities in the regions, as the market sometimes seems already saturated, and even closed to new developments, in more remote areas (Block et al, 2017). Deakins' study (2018) establishes a gradation for comparing the level of rurality. In particular, it appears easier for local rural businesses to develop than those that depend on city dwellers who commute daily. The opposite is actually more common, due to the centralization of resources. In particular, rural areas are affected by the following factors: the export of resources and workers to rural areas and the influence of urban areas. However, it is possible to classify rural areas by placing them in this gradation (rural with a strong urban influence, rural with a moderate urban influence, rural with a weak urban influence or very rural/remote) and better study their particular needs of innovative entrepreneurs.

Finally, the literature recognizes that entrepreneurship is a good way to encourage and stimulate an economy dependent on raw materials. Economic diversification is directly proportional to the wages of the inhabitants of the region studied (Asitik, 2023). Moreover, there is less competition in rural areas, so these businesses can take advantage of an emerging environment and encourage other companies to do the same (Bousmah, 2021).

7. Conclusion

This empirical study aims to identify how to attract and retain innovative talent in remote regions to boost the economy through entrepreneurship. Our research argues that quality of life and proximity to networks—personal, family, and business—are key. Regions have every advantage in highlighting their strengths in family well-being and business. To retain innovative companies, regions with university networks should train a skilled workforce and make sure they can provide housing and develop industrial parks. Innovative entrepreneurs are especially looking for financial support to develop or grow their business projects.

What wasn’t surprising is the fact that it’s hard to hire qualified staff. However, big centers also have this problem but more easily deal with other issues like public transportation.

In conclusion, this empirical research cannot identify the strengths or weaknesses of the ecosystem in the region, nor confirm or deny the lack of effectiveness of ecosystem players in order to better understand the issues in their region and promote knowledge sharing through geographic proximity. However, it does seem possible for remote regions to identify strategic levers for coordination among ecosystem players and the willingness to address their region's specific issues together.

There is one limitation of this research stems from the impossibility of analyzing the results according to the sector of activity of the innovative entrepreneurs, given that the groups were mixed and the sectoral sampling of each group is small and limited.

Ethics Declaration

This research project involving human beings has obtained an ethical approval certificate that attests to the compliance of the research project with the UQO Policy on Ethics in Research with Human Beings and is therefore issued on May 1, 2024, its number being 2024-3201.

From Utility to Belonging: Re-Socializing the Technology Entrepreneur through Evolutionary Psychology

Sami Lanu
LAB University of Applied Sciences, Lappeenranta, Finland

sami.lanu@lab.fi

Abstract: Technology-driven startups typically emerge from a "product-first" logic, where systematic consideration of markets often lags behind technical development. In early-stage venture creation, entrepreneurs frequently reduce customer understanding to functional utility or demographic segments, neglecting the deep-seated psychological and social dimensions that drive long-term brand resilience. This research addresses this gap by documenting the initial strategic mindsets of technology entrepreneurs and proposing a theory-informed training framework designed to shift their focus toward social value creation. The paper presents a "Customer Understanding" training module, which functions as a specific intervention within the broader Tech2Scale startup coaching programme. This framework integrates evolutionary psychology (EP) and tribal branding theory to reframe brands as "social coordination mechanisms" rather than mere symbols of product differentiation. By utilizing evolutionary insights into human motives—such as the need for status signaling and cooperative group membership—the training guides entrepreneurs to move from "use value" (technical utility) toward "linking value" (social embeddedness). Empirically, the paper analyzes baseline data collected from a targeted cohort of university researchers, startup founders, and students (n=10) specifically prior to the commencement of training. Although the sample size is small, it represents a high-validity group of nascent entrepreneurs actively engaged in new venture creation, rather than a generalized student population. Exploratory evidence suggests the presence of a techno-centric bias in this cohort of early-stage entrepreneurs, with participants emphasizing technical utility over social and relational dimensions of value creation. Crucially, the pre-training data suggest relatively low interest in social dynamics; respondents showed the lowest agreement with the idea that a brand should act as a coordination mechanism for users to find one another (M=2.6) and largely conceptualized customers as isolated problem-solvers rather than members of affectual tribes. Given the small sample (n = 10) and the descriptive nature of the analysis, these findings should be interpreted as indicative rather than generalizable. The empirical component is therefore positioned as exploratory, aimed at diagnosing initial cognitive orientations prior to intervention.

Keywords: Technology Entrepreneurship, Evolutionary Psychology, Branding, Evolutionary Mismatch, Customer Understanding, Tech2Scale.

1. Introduction

The contemporary landscape of technology entrepreneurship is characterized by unprecedented innovation alongside persistently high rates of venture failure. While technical feasibility is often achievable, challenges related to market adoption—particularly difficulties in attaining product–market fit—remain a central concern in early-stage ventures. Prior research suggests that one contributing factor may be the prevalence of a "product-first" or "techno-centric" logic, whereby founders, often with strong scientific or engineering backgrounds, emphasize functional novelty and technical performance over broader considerations of customer value (Mullins 2014; Ries 2011).

This orientation tends to reflect an implicit model of the consumer as primarily rational and utility-driven, evaluating innovations based on "use value" such as efficiency, speed, or cost reduction. However, alternative perspectives in marketing and consumer research highlight the importance of "linking value"—the social connections, identities, and shared meanings associated with consumption (Cova 1997). From this viewpoint, consumption is not solely an individual, problem-solving activity but is also embedded in social dynamics. Consequently, the assumption that superior technical performance alone ensures adoption may be incomplete.

Insights from consumer behavior and evolutionary psychology further suggest that decision-making is influenced by evolved motivations related to social connection, status signaling, and group belonging (Saad 2007; Griskevicius and Kenrick 2013). These perspectives indicate that value perception extends beyond functional attributes to include socially embedded and symbolic dimensions. The potential divergence between a technically oriented value conception and a socially grounded consumer reality may therefore represent an important, yet underexplored, source of misalignment in early-stage ventures.

In this paper, this divergence is tentatively conceptualized as a form of cognitive bias that may be related to what has been described in evolutionary research as an "evolutionary mismatch" (Van Vugt and Ronay 2014). Modern technological environments often encourage abstract, feature-based reasoning, whereas human cognition evolved in contexts where navigating social relationships and group dynamics was central. From this

perspective, entrepreneurs may underemphasize the "linking value" of their offerings—the capacity of products or brands to facilitate social interaction and coordination—while prioritizing their functional utility (Cova 1997).

To explore this possibility, the present study introduces a pedagogical intervention, the "Customer Understanding" module, developed within the Tech2Scale startup training framework. The module draws on evolutionary psychology to reframe branding as a process of enabling social coordination rather than solely communicating product features. The aim is to support a shift in entrepreneurial thinking from a focus on individual users toward a broader consideration of social and communal dynamics in value creation.

This paper contributes to entrepreneurship education and early-stage venture research in two ways. First, it offers an evolutionary psychology–informed conceptualization of techno-centric bias as a potential constraint on market-oriented thinking. Second, it presents a theory-informed training intervention alongside an exploratory empirical component. Specifically, the study reports descriptive baseline data from a small, targeted sample of nascent technology entrepreneurs (n = 10), which provides initial, diagnostic insight into how participants conceptualize customer value. Given the limited sample size and descriptive design, these findings are interpreted as indicative rather than generalizable, and are used primarily to motivate and inform the proposed training framework.

2. Theoretical Background

To construct a robust pedagogical framework for shifting entrepreneurial mindsets, we must first deconstruct the theoretical underpinnings of the "techno-centric" bias and the alternative "socio-centric" perspectives offered by evolutionary psychology and tribal marketing.

2.1 The "Product-First" Logic and the Engineering Mindset

Technology ventures often originate in laboratory and engineering environments where value is framed as objective, measurable, and functional. This context reinforces a “product-first” logic (Mullins 2014) in which technical superiority is assumed to translate into adoption. When founders move into venture creation, they may carry a stable preference for proximate, feature-based explanations of value and view customers primarily as utility maximizers. In practice, however, market responses are shaped by social and motivational factors that are not fully captured by technical performance alone. Bridging this gap therefore requires a conceptual vocabulary that links product attributes to the broader psychological and social drivers of choice.

2.2 Evolutionary Psychology: Proximate vs. Ultimate Causation

Evolutionary psychology (EP) challenges the rational-actor model by proposing that human decision-making is shaped by domain-specific psychological mechanisms that evolved to solve recurrent adaptive problems (Saad 2007; Cosmides and Tooby 1997). Within this perspective, a key analytical distinction is between proximate and ultimate causation (Saad 2012; Griskevicius and Kenrick 2013). Proximate explanations refer to the immediate triggers of behaviour and typically map onto functional product attributes (“what the product does”). Ultimate explanations refer to the underlying functional motives that make those attributes meaningful (“why it matters” in terms of evolved goals). For example, cybersecurity can be framed not only as data encryption (proximate), but also as harm avoidance and protection of valued resources (ultimate). This distinction is relevant for technology entrepreneurs because early-stage communication often remains at the proximate level, while stronger resonance may occur when product benefits are linked to deeper social and motivational concerns.

2.3 The Evolutionary Mismatch Hypothesis

Mismatch theory suggests that intuitions shaped for small-scale, relational environments may not transfer well to large, anonymous markets (Van Vugt and Ronay 2014). Founders may therefore over-rely on the assumption that functional utility will be self-evident and sufficient for adoption. In contemporary markets, however, direct maker–user relationships are often weak and information is abundant but unevenly trusted. Under these conditions, brands can partially substitute for personal reputation by compressing reputational information, signaling reliability, and reducing uncertainty in evaluation.

2.4 Prestige-Biased Social Learning and Branding

Evolutionary accounts of social learning suggest that humans preferentially attend to, imitate, and defer to individuals who display success, skill, or knowledge—an adaptation that supports efficient learning under

uncertainty (Henrich and Gil-White 2001). In contemporary markets, brands can function as abstract prestige targets by aggregating reputational cues and making them legible at scale. Strong brands therefore operate as simplified signals of credibility and competence, helping audiences form evaluations in environments where direct experience is limited. In this sense, brand communication can be treated as strategic signaling that reduces evaluation costs and shapes cooperative expectations (Henrich and Gil-White 2001; Sundararajan and Sundararajan 2023).

2.5 From Use Value to Linking Value: The Societing Perspective

To operationalize these evolutionary insights, this research draws on the "Latin School of Societing," particularly the work of Cova (1997). This perspective critiques the "Northern" marketing tradition, which views consumption as an individualistic act of utility maximization (Use Value). Instead, the Latin approach argues that "the link is more important than the thing"—that is, products are consumed primarily for their ability to facilitate social interaction and tribal bonding (Linking Value).

- Use Value: The functional utility of the product (e.g., the code, the machine). This is the domain of the engineer.
- Linking Value: The social embeddedness provided by the product (e.g., the community, the status, the identity). This is the domain of the tribal marketer.

In the context of the Tech2Scale program, "Tribal Marketing" is presented not as a superficial trend, but as a mechanism to "re-establish communal embeddedness" in a fragmented world. It is a "Trojan horse" to induce technical companies to engage with the social reality of their users. By teaching entrepreneurs to design for linking value, this approach encourages them to view their startup not as a vendor of goods, but as a social coordination mechanism.

2.6 Positioning Evolutionary Psychology Among Complementary Perspectives

While evolutionary psychology provides a useful framework for identifying underlying motivational drivers of consumption, it is important to recognize its scope and limitations. In particular, evolutionary accounts tend to focus on ultimate explanations—why certain psychological tendencies exist—rather than fully specifying how these tendencies are expressed in specific institutional, cultural, or situational contexts (Saad 2012; Griskevicius and Kenrick 2013). As a result, complementary perspectives remain important for a comprehensive understanding of entrepreneurial decision-making and consumer behavior.

For example, cognitive and information-processing approaches offer insight into how individuals form judgments under uncertainty, while sociocultural and institutional perspectives emphasize how meanings, norms, and practices are shaped through interaction and context (Ries 2011; Cova 1997). Similarly, behavioral and situational frameworks highlight how environmental cues and reinforcement structures influence observable behavior. From this perspective, evolutionary psychology is best understood not as a replacement for these approaches, but as a complementary layer that helps explain the deeper motivational foundations upon which context-specific processes operate.

In the context of this study, the evolutionary lens is therefore used as a theoretical tool to illuminate why social motives such as affiliation, status, and trust may remain relevant even in highly technical markets, while recognizing that their manifestation depends on the specific market, cultural, and organizational conditions in which entrepreneurs operate (Taheran et al. 2024). Figure 1 summarizes the conceptual shift from a techno-centric to a socio-centric understanding of value that underpins the proposed training framework.

Table 1: From Techno-Centric to Socio-Centric Value Orientation

Techno-Centric Orientation	→ Shift (Training Intervention)	Socio-Centric Orientation
Value = functional utility (“use value”)		Value includes social embeddedness (“linking value”)
Focus on product features and performance		Focus on identity, status, and affiliation
Customer as individual problem-solver		Customer as member of a social group (“tribe”)
Communication: “what the product does”		Communication: “why it matters”

Techno-Centric Orientation	→ Shift (Training Intervention)	Socio-Centric Orientation
Brand as differentiation label		Brand as social coordination mechanism

The figure illustrates the conceptual shift targeted by the Tech2Scale Customer Understanding module, moving from a product-centered, utility-focused logic toward a socially embedded understanding of value that incorporates identity, signaling, and coordination functions.

3. Methodology

This study uses an exploratory, descriptive design to profile the strategic mindsets of technology entrepreneurs prior to training. The paper reports baseline survey responses collected immediately before the Customer Understanding module.

3.1 Context: The Tech2Scale Programme

The research was conducted within the Tech2Scale startup coaching programme, a specialized accelerator for early-stage technology ventures. It is important to note that the training intervention described in this paper constitutes only two specific modules within the broader Tech2Scale curriculum. The full programme encompasses diverse topics such as financial modeling, intellectual property rights, and technical scaling. The "Customer Understanding" module, which serves as the intervention for this study, was designed specifically to address the weaknesses observed in previous cohorts regarding brand and customer conceptualization

3.2 Participants

The study cohort consists of 10 participants recruited from the Tech2Scale programme. While the sample size (n=10) is numerically small, it is theoretically significant and highly relevant for the purpose of this study. The participants are not a generalized student population; they represent a "hard-to-access" group of **nascent entrepreneurs** (Davidsson and Honig 2003). These individuals are actively engaged in the venture creation process, possess verifiable intellectual property (IP), and have committed resources to their startups.

Demographic Profile (n=10):

The cohort is predominantly male and highly educated, reflecting the typical demographic of university-spinoff and deep-tech ecosystems.

- Gender: 90% Male (9), 10% Female (1). This gender imbalance is consistent with the broader "techno-centric" bias literature, which often associates male-dominated engineering cultures with a focus on functional utility over social empathy (Saad 2007).
- Age Distribution: The participants span a range of developmental stages, with 50% aged 25-34, 30% aged 35-44, 10% aged 18-24, and 10% aged 45-54.
- Professional Status: The group is a mix of academic and entrepreneurial identities: 40% are University Researchers/Academic Staff, 30% are Full-time Entrepreneurs/Founders, and 30% are Bachelor-level Students (who are also founders).
- Geographic Origin: The cohort is primarily based in Finland (80%), with representation from Spain (10%) and Romania (10%).

This demographic profile suggests a group that is high in technical literacy but potentially resistant to "soft" marketing concepts, making them an ideal testbed for the "Trojan Horse" pedagogical strategy.

3.3 Instrumentation

To measure the "techno-centric" vs. "socio-centric" orientation of the participants, a structured survey instrument was developed based on the theoretical frameworks of Evolutionary Psychology and Tribal Marketing. The survey consisted of 6 core items scored on a 5-point Likert scale (1 = Strongly Disagree, 5 = Strongly Agree).

Survey Items and Theoretical Justification:

Utility vs. Status: "The primary value of our innovation is its utility (how well it performs a task) rather than the social status it confers."

Construct: Measures the dominance of "Use Value" over "Signaling/Status" motives.

Feature Differentiation: "Our product/innovation/company/brand is primarily a tool to differentiate our technical features from competitors."

Construct: Measures adherence to "Product-First" logic and the view of branding as a label rather than a symbol.

Demographic Definition: "Our target market is best defined by demographic data (age, gender, income) and geographic location."

Construct: Measures reliance on traditional, static segmentation versus fluid, psychographic/tribal segmentation.

What vs. Why: "Our early-stage communication focuses on explaining 'what' the product does rather than 'why' humans need it biologically."

Construct: Measures the focus on proximate vs. ultimate causation in communication strategy (Saad 2012).

Isolated vs. Tribal: "I view our customers as individual problem-solvers rather than members of an affectual 'tribe'."

Construct: Measures the "Atomistic" view of the consumer characteristic of Northern marketing versus the "Tribal" view of the Latin school.

Social Coordination: "A Company/brand should act as a 'social coordination mechanism' that allows users to find one another."

Construct: Measures the awareness of the brand's function as a Knowledge Management/Coordination system.

3.4 Procedure

The survey was administered electronically to all participants immediately prior to the first session of the training module. This ensured that the responses reflected the participants' raw, uninfluenced strategic instincts. The data was collected and anonymized for analysis.

4. Findings

The following findings are presented as descriptive indicators of participants' baseline orientations and should be interpreted as exploratory rather than statistically generalizable. The analysis of the pre-training survey data (n=10) suggests a techno-centric orientation across the cohort. The participants consistently prioritized functional and technical dimensions of value while deprioritizing or rejecting social and symbolic dimensions.

4.1 The Primacy of Utility and Features

One of the more consistent patterns among participants was the belief that their value lies in the tool itself, consistent with the 'product-first' hypothesis.

Utility Dominance (M=4.3): Item 1 received the highest mean score (M=4.3), with 50% of respondents selecting "Strongly Agree" (5) and 40% selecting "Agree" (4). Only one respondent scored it a 3. This suggests a strong tendency that the innovation's worth is intrinsic to its performance of a task. The notion that "status" could be a primary value driver appeared to be less salient in participants' responses. This aligns with the engineering worldview where "utility" is objective and "status" is subjective or superficial.

Differentiation via Features (M=4.1): Item 2 also received high agreement (M=4.1). Participants view their brand not as a vessel for meaning or emotion, but as a taxonomy for their technical specifications. Participants appear to treat the brand primarily as a vehicle for communicating technical differentiation rather than as a mechanism for conveying identity, affiliation, or social meaning. This reflects limited emphasis on the brand's role as a "knowledge compression device"; they are using the brand to transmit complex data (features) rather than efficient signals (prestige).

4.2 Limited Emphasis on Social Coordination

One of the more notable findings is the cohort's limited awareness regarding the social functions of a brand.

Rejection of Social Coordination (M=2.6): Item 6 received the lowest score in the survey (M=2.6). Responses were polarized but skewed negative, with several participants scoring 1 or 2. This suggests that the concept of a brand acting as a "social coordination mechanism"—a central tenet of both the Tech2Scale framework and Tribal Marketing theory— was not strongly represented in participants' responses. They do not see their companies as platforms for connecting users to one another.

Atomistic Customer View (M=3.0): Responses to Item 5 were mixed (M=3.0), indicating ambivalence. While not as strongly rejected as social coordination, the score suggests a default view of the customer as an isolated agent ("Homo Oeconomicus"). Participants tended to describe customers as individuals struggling with a problem in a vacuum, rather than as members of an "affectual tribe" who might use the product to signal affiliation or competence to peers.

4.3 Communication and Segmentation Biases

Proximate Communication (M=3.5): Item 4 (M=3.5) suggests a moderate tendency to focus communication on "what" the product does. While some entrepreneurs recognized the need for "why" messaging, the bias leans toward functional description. This is consistent with the difficulty technical founders face in articulating "ultimate" evolutionary benefits.

Traditional Segmentation (M=3.1): Item 3 (M=3.1) shows a reliance on standard demographic segmentation. While not overwhelmingly high, it suggests that the shift toward psychographic or tribal segmentation is not strongly evident in the responses. Participants are still defining their markets by "who they are" (age, location) rather than "what they love" (passion, tribe).

Table 2: Baseline Survey Results (n=10)

Survey Item	Mean	SD	Min–Max	% Agree (4–5)	% Neutral (3)	% Disagree (1–2)	Interpretation
1. Utility vs. Status	4.3	0.68	3-5	90%	10%	0%	High utility emphasis
2. Feature Differentiation	4.1	0.99	3-5	60%	40%	0%	Strong product/feature focus
3. Demographic Market Definition	3.1	1.29	1-5	50%	10%	40%	Mixed; moderate traditional segmentation
4. What vs. Why Communication	3.5	1.43	1-5	70%	10%	20%	Moderate "what"-focused communication
5. Isolated vs. Tribal View	3.0	1.15	1-5	30%	40%	30%	Mixed / ambivalent customer model
6. Social Coordination	2.6	1.17	1-5	10%	50%	40%	Low endorsement of social coordination

Baseline results (n = 10) indicate a clear product-first orientation. Participants strongly endorsed the primacy of functional utility (Item 1: M = 4.3, SD = 0.68), with 90% agreeing and no disagreement, and they also tended to view the brand primarily as a vehicle for technical feature differentiation (Item 2: M = 4.1, SD = 0.99; 60% agree, 40% neutral). In contrast, items capturing social and community-oriented dimensions received weaker endorsement. The lowest-rated construct was the view of the brand as a social coordination mechanism (Item 6: M = 2.6, SD = 1.17), with only 10% agreement, 50% neutral responses, and 40% disagreement. Customer conceptualization was similarly mixed: perceptions of customers as isolated problem-solvers versus members of an affectual tribe clustered around neutrality (Item 5: M = 3.0, SD = 1.15; 40% neutral, 30% agree, 30% disagree). Finally, responses to segmentation and communication items suggest moderate variability: demographic/geographic market definition was polarized (Item 3: M = 3.1, SD = 1.29; 50% agree, 40% disagree), while early-stage messaging showed a moderate tendency to emphasize "what" the product does over "why" it matters (Item 4: M = 3.5, SD = 1.43; 70% agree, 20% disagree).

4.4 Limitations and Analysis Plan

This paper reports baseline descriptive results from a small cohort (n=10) recruited from a specialized accelerator context. The limited sample size constrains statistical power and generalizability; accordingly, the findings are interpreted as exploratory rather than confirmatory. The cohort is also heterogeneous (researchers, founders, and students), which may introduce variation in prior market exposure and familiarity with branding concepts. The six-item instrument is theory-driven and aligned with the study's conceptual framework, but it is not presented as a fully validated psychometric scale; results are therefore interpreted at the item level as indicators of founders' baseline assumptions. Given the small sample, this paper reports item-level descriptives and does not model a latent "techno-centric bias" factor.

Given these constraints, the analysis emphasizes transparent reporting of response patterns (e.g., central tendency and distribution by item) and a cautious interpretation that links observed baseline profiles to the paper's theoretical argument and training framework. The study is conducted by a single researcher, which limits opportunities for independent verification of interpretation; to mitigate this, the paper prioritizes procedural clarity, explicit mapping from theory to measurement, and appropriately bounded claims.

5. The Intervention: Two-Module Training Framework

Based on the baseline findings, the Tech2Scale "Customer Understanding" training is structured into two modules embedded within the wider Tech2Scale curriculum. The pedagogical approach uses evolutionary psychology as a theory-led entry point for introducing socially embedded interpretations of value to technically trained founders.

5.1 Module 1: Exploring Human Nature

Objective: Expand founders' value framing from proximate product attributes ("what it does") to underlying motivational functions ("why it matters").

- Introduce the Fundamental Motives framework and discuss how consumption often reflects recurring motives such as harm avoidance, affiliation, and status (Griskevicius and Kenrick 2013; Taheran et al. 2024).
- Activity: Founders reframe their value proposition by mapping key product features onto one or more fundamental motives (e.g., cybersecurity as both encryption and harm avoidance).

5.2 Module 2: Strategic Brand Building for Value

Objective: Translate evolutionary insights into practical brand-building choices that emphasize linking value and social coordination.

- Introduce linking value and the role of brands as mechanisms that coordinate expectations and signal identity and credibility (Cova 1997).
- Activity: Founders create a brief "tribal map" that specifies the focal user group, the identity/status signals the brand supports, and concrete ways the brand can help users connect with one another (social coordination).

6. Discussion

The baseline profile offers a focused snapshot of how early-stage technology entrepreneurs in this cohort conceptualize value and branding prior to any training. Two patterns are particularly noteworthy. First, participants strongly endorsed the primacy of functional utility and feature-based differentiation (Items 1–2), consistent with a product-first logic. Second, the cohort showed comparatively low endorsement of the idea that a brand can function as a social coordination mechanism (Item 6), suggesting that "linking value" is not yet a salient category in founders' mental models.

Interpreted cautiously, these descriptives are consistent with the paper's core premise: in founder cognition, the customer appears to be approached as an individual problem-solver evaluating technical attributes, rather than as a socially embedded actor whose consumption decisions can be shaped by affiliation, status, trust, and group membership motives. From an evolutionary psychology perspective, this pattern is consistent with an emphasis on proximate explanations (what the product does) over ultimate explanations (which fundamental motives the product helps satisfy). The implication for entrepreneurship education is not that functional utility

is unimportant, but that founders may benefit from an expanded value ontology that includes symbolic and social functions of brands—particularly in markets where products are difficult to evaluate directly and where trust and reputation reduce uncertainty.

The proposed pedagogical approach is intentionally designed to meet technical founders "on their own epistemic ground." Rather than introducing branding as an aesthetic or purely affective exercise, the intervention frames social motivations and symbolic meaning as stable regularities in human decision-making. In this framing, brands can be understood as culturally transmitted knowledge structures that simplify choice and coordinate expectations among dispersed actors. The intervention logic is therefore straightforward: if founders can map product attributes onto fundamental motives (e.g., harm avoidance, status, affiliation), they may become more capable of articulating "why this matters" in ways that resonate with users' evolved social psychology, not only users' functional problem definitions.

These results should be interpreted in light of the study's constraints (small, context-specific sample; baseline-only reporting). Nevertheless, the baseline pattern serves an important role: it provides empirical grounding for the training design and identifies the specific cognitive "blind spot" the intervention targets—namely, limited recognition of brands as social coordination mechanisms and underutilization of linking value as a strategic lens.

7. Conclusion

This paper develops a theory-informed approach for broadening technology entrepreneurs' conceptions of value beyond a predominantly product-first orientation to include social embeddedness and linking value. Drawing on baseline data from a cohort of nascent founders (n=10), the study describes a pattern consistent with techno-centric assumptions: strong prioritization of utility and feature differentiation alongside comparatively low endorsement of brands as mechanisms that coordinate and connect users.

The implications are primarily pedagogical and conceptual. In complex and information-rich markets, product performance may be necessary but not sufficient for sustained adoption. Evolutionary psychology provides a coherent explanatory vocabulary for why social motives—such as status, affiliation, and trust—remain relevant in contemporary consumption contexts and can therefore complement functional accounts of customer value. Within this framing, the Tech2Scale Customer Understanding module is presented as a structured way to translate these motives into founder-relevant managerial language, with the aim of improving how technically trained entrepreneurs conceptualize customers and articulate value propositions.

Given the study's scope and sample characteristics, the findings should be interpreted as exploratory. The paper therefore emphasizes transparent description of baseline response patterns and uses these patterns to motivate the proposed training framework and articulate bounded implications for entrepreneurship education and early-stage venture development.

Ethics Declaration

The data collection procedures described in this study involved human participants (survey respondents) within the context of an educational training program. The study was conducted in accordance with the ethical guidelines of the participating institutions. All participants were informed of the purpose of the survey and provided consent prior to participation. Data was collected anonymously to protect participant privacy. No formal ethical clearance committee review was required for this low-risk educational assessment, in accordance with the regulations of the host institution regarding pedagogical research.

AI Declaration

Artificial Intelligence tools were used in the drafting and editing of this paper. The author utilized a large language model to assist in structuring the argument, refining the language for academic tone, summarizing the theoretical backgrounds based on the provided reference materials, and formatting references. The author reviewed and verified all AI-generated content for accuracy and coherence.

Challenges in Developing Student Entrepreneurship in the New Startup Ecosystem of Eastern Finland

Emma Latvala and Vesa Alatalo
LAB University of Applied Science, Finland

emma.latvala@lab.fi
vesa.alatalo@lab.fi

Abstract: Student entrepreneurship is a key source of future innovation and potential vitality, especially in areas where population development and skills shortages challenge economic growth. In Eastern Finland, student entrepreneurship is strongly linked to the functionality of regional entrepreneurship ecosystems and the role of universities as enablers of new business ideas and paths. Despite this, the development of student entrepreneurship appears fragmented and project-based, and the current structure does not support the long-term and systematic construction of entrepreneurship skills. The aim of this article is to examine what is missing from the student entrepreneurship ecosystems in Eastern Finland and why the current structures do not meet the needs of student entrepreneurship. Special attention is paid to Generation Z, whose work-life values, expectations, and ways of operating challenge traditional entrepreneurship support models. The study was conducted as a descriptive case study, and the data consists of semi-structured theme interviews and a group interview with key ecosystem actors and student entrepreneurship actors. In addition, the results are reflected in the observations of the Slush Finnish Founder Survey. The results show that the most significant deficiencies in the student entrepreneurship ecosystem are the lack of systematics and continuity, the weakness of trust between actors, and the lack of common physical and digital spaces. These factors weaken the ecosystem's ability to meet Generation Z's expectations of a meaningful, communal, and well-being-supporting entrepreneurial environment. The article highlights the need to move from fragmented support measures towards a systematic, student-centered, and generation-sensitive ecosystem development in Eastern Finland. The findings indicate that the current ecosystem lacks structural coordination and long-term continuity, which limits its ability to support student entrepreneurship in a sustainable manner. The results contribute to entrepreneurship ecosystem research by highlighting the importance of generation-sensitive and student-centered design. Future research should focus on comparative ecosystem models and the impact of coordinated interventions on student entrepreneurial outcomes.

Keywords: Generation Z, Student Entrepreneurship, Incubators

1. Introduction

Entrepreneurship has emerged as a key source of regional competitiveness, renewal, and economic growth, especially in a rapidly changing global environment. Higher education institutions play a significant role in this development, as they generate new innovations, knowledge, and entrepreneurial paths. Student entrepreneurship is increasingly seen not only as an individual career option but also as a broader ecosystem phenomenon that requires effective cooperation between higher education institutions, student communities, businesses, and public actors. Particularly in Eastern Finland, the development of student entrepreneurship is strategically important from the perspective of regional vitality and talent retention.

In recent years, startup and entrepreneurship actors in Eastern Finland have sought to strengthen their cooperation by building a common regional entrepreneurship ecosystem. Despite this, student entrepreneurship still appears fragmented, and the activities largely rely on individual projects, events, and active actors. Previous research shows that a functioning entrepreneurship ecosystem requires a shared vision, trust-based networks, and structures that enable the continuous circulation of resources, knowledge, and skills. Without these elements, the ecosystem easily becomes fragmented and does not sustainably support the emergence and growth of new businesses.

At the same time, expectations related to working life and entrepreneurship are changing with Generation Z. Generation Z values meaningfulness, flexible roles, continuous learning, psychological safety, and structures that support well-being. These expectations challenge traditional, hierarchical, and short-term entrepreneurship support models and emphasize the importance of community-based and student-centered ecosystems. If student entrepreneurship ecosystems are unable to meet these expectations, a significant portion of entrepreneurial potential remains untapped.

The aim of this article is to answer the research question: what is missing from student entrepreneurship ecosystems in Eastern Finland and why does the current structure not support the development of student entrepreneurship? The article examines the phenomenon from the theoretical framework of entrepreneurship ecosystems and systems thinking, considering the specific features and expectations of Generation Z. The study

uses a qualitative case study design and provides practical information on the structural and cultural development needs of student entrepreneurship in Eastern Finland.

In addition to answering the research question, the study contributes by integrating ecosystem theory with generation-based perspectives, particularly highlighting how Generation Z's values reshape the requirements of entrepreneurship ecosystems. The study also provides empirically grounded insights for regional ecosystem development in resource-constrained environments.

2. Work-life Values and Expectations of Generation Z

Generation Z (born approximately between 1997 and 2012) is rapidly establishing its position in the European and Finnish job markets. Several recent international studies show that their work-life expectations differ significantly from previous generations, particularly in terms of the meaningfulness of work, flexibility, and well-being. Work-life balance repeatedly emerges as the most important career preference. According to a European study conducted by EDHEC Business School and JobTeaser in 2025, about six out of ten Generation Z respondents consider work-life balance as their most important career goal. (EDHEC Business School & JobTeaser, 2025) This phenomenon is confirmed by an analysis published by Novorésumé in 2026, which states that as many as 77 percent of Generation Z place balance as more important than rapid career progression. This challenges organizations to examine work time structures, workload, and remote and hybrid work practices more strategically. (Novorésumé, 2026)

The role of meaningfulness and purposefulness of work is strongly emphasized in the work-life experience of Generation Z. According to the Gen Z and Millennial Survey published by Deloitte Global in 2025, nearly nine out of ten Generation Z respondents consider the meaningfulness of work as a key source of job satisfaction and well-being. In addition, LinkedIn HR reviews show that Generation Z is willing to compromise on salary level to choose an employer whose values, responsibility, and social impact are perceived as genuine (LinkedIn, 2025). This suggests that an organization's mission, value base, and practical actions are becoming an increasingly central competitive factor in the talent market. (Deloitte, 2025.)

Continuous learning and professional development are also key factors guiding Generation Z's employer choices. Deloitte reports that the opportunity to learn new things and develop skills is one of the most important reasons to seek employment with a particular employer. Generation Z expects structural support for development, such as mentoring, short-cycle learning opportunities, and flexible role transformation. In particular, the development of skills related to technology and artificial intelligence is seen as a critical part of future careers. (Deloitte, 2025.)

Well-being and mental health have become key criteria for choosing a workplace. According to The Interview Guys report, over 60 percent of Generation Z would be willing to change jobs to get better mental health support services. This shows that psychological safety, restorative work rhythm, and low-threshold well-being practices are no longer additional benefits, but basic prerequisites for an attractive work environment. (The Interview Guys, 2025.)

For Generation Z, flexibility is not limited to working hours and location, but also extends to roles, career paths, and organizational culture. Based on EDHEC/JobTeaser's research, they prefer flat hierarchies, a more informal culture, and the opportunity to influence their own work. This is reflected in a particular interest in small and medium-sized organizations, where responsibilities, projects, and roles are dynamic. (EDHEC Business School & JobTeaser, 2025.)

In terms of leadership, Generation Z expects openness, authenticity, and continuous interaction. McKinsey's analyses show that they value easily approachable leaders, quick feedback, and dialogue related to values more than traditional annual development discussions. (McKinsey & Company, 2025.) At the same time, many studies show that a traditional leadership career is not the primary goal for Generation Z. Deloitte and Novorésumé report that only about six percent of Generation Z primarily aim for leadership positions, although career development per se is considered important. (Novorésumé, 2026, Deloitte, 2025) Development is seen as new areas of responsibility, projects, and skill sets rather than hierarchical titles.

In summary, it can be said that the work-life values of Generation Z are built on balance, meaningfulness, continuous learning, well-being, and people-oriented and open leadership. Organizations that can meet these expectations structurally and culturally significantly improve their attractiveness in the future talent market.

3. Student Entrepreneurship Ecosystems

Recent research shows that digitalization significantly changes the structure and development dynamics of entrepreneurship ecosystems. Marquardt and Harima (2024) emphasize that digital solutions enable ecosystems to transcend traditional regional boundaries and utilize external resources, which is particularly important in resource-scarce areas such as Eastern Finland. Digital border crossing allows the expansion of student entrepreneurship ecosystems and the utilization of international expertise and capital without physical presence. (Marquardt & Harima, 2024)

Estonia's e-Residency program serves as an example of how digital infrastructure can attract foreign entrepreneurs and experts as part of the local ecosystem. Similar digital solutions in Eastern Finland can support student entrepreneurs in networking, sharing expertise, and internationalizing business operations. According to the research, the development of the ecosystem requires four interrelated capabilities: joint definition of system-level goals, harmonization of ecosystem management (integration of physical and digital structures), coordination of resource flows, and continuous renewal of the ecosystem architecture. (Marquardt & Harima, 2024)

The development of student entrepreneurship ecosystems has been studied in several international studies, emphasizing the importance of both internal and external support structures. Astuty et al. (2022) show that the entrepreneurship orientation of students is particularly strengthened by the synergistic combination of internal (e.g., entrepreneurship courses, mentoring) and external (networks, environment) elements of the ecosystem. The study found that students who received support from both the university and external networks were more active in business and felt their entrepreneurial skills were developing comprehensively. (Astuty, Suharti & Hidayat, 2022.) Jurgelevičius et al. (2025) highlight the importance of teachers' entrepreneurial experience and mentoring programs in the emergence of student-led startups. Their research found that traditional support forms, such as space and funding, are not enough alone, but more important is the development of attitudes and skills in a communal environment. (Jurgelevičius, Stankevičienė & Šimanskienė, 2025.)

Villegas Mateos and Amann (2025) in their extensive survey show that a university-based ecosystem, where resources, mentors, and entrepreneurial culture are systematically supported, significantly increases students' entrepreneurial intentions - especially among those who do not study business (Villegas Mateos & Amann, 2025). Matt and Schaeffer (2018) emphasize that expanding the ecosystem stakeholder field (alumni, incubators, public sector) and strengthening coordination between physical and digital support is crucial for student entrepreneurship growth (Matt & Schaeffer, 2018). Ketemaw et al. (2025) in their systematic review highlights that a strong ecosystem increases students' entrepreneurial self-confidence, practical experiences, and network support, which is reflected in concrete business growth (Ketemaw, Zewde & Bogale, 2025).

Based on the research results, diverse support, practical learning environments, mentoring, and the ecosystem's ability to renew and adapt particularly affect the growth of student entrepreneurship. Ecosystem work provides Eastern Finnish universities and regional actors with the opportunity to build a strong, student-centered entrepreneurial culture that utilizes both local and global resources.

4. Methodology and Data Collection

The research method applied in this article is an explanatory case study. The aim of the study is to explain why the examined case is as it is, or why it has developed in a particular way. The phenomenon to be explained concerns the relationships between complex real-life events or related practices (Eriksson & Koistinen, 2014). The thematic analysis employed data triangulation and was used to generate insights and analytical perspectives on the current state of the student entrepreneurship ecosystem in Eastern Finland.

The link between empirical findings and theory was established through a holistic examination of the phenomenon, interpretative analysis of the observations, and systematic connection of the findings to the applied theoretical framework. The analysis focused on identifying recurring and general patterns in the data and examining the relationships and interconnections between these phenomena (Ojasalo, 2018, pp. 110–111). Four clearly recurring themes emerged from the individual interview data, which were readily alignable with the theoretical framework. The data derived from the focus group interview likewise correspond well with existing theoretical understandings of students’ experiences of entrepreneurship promotion measures.

The study is based on qualitative data consisting of six semi-structured individual interviews and one focus group interview. The focus group interview included four active actors from student entrepreneurship organisations in Eastern Finland.

5. Results

5.1 Finnish Founder Survey

The Finnish Founder Survey conducted by Slush provides a comprehensive empirical overview of the experiences of Finnish startup founders in their operating environment and the development needs they face. Over 300 founders responded to the survey, which represents approximately ten percent of Finland's active startup scene, making the data exceptionally broad and representative. According to the results, over half of Finnish startup founders are seriously considering moving their business outside of Finland or are actively planning to do so, indicating structural challenges in the national entrepreneurial environment. However, it is significant that the majority of potentially relocating companies see their future in Europe rather than the United States, signaling the founders' willingness to build their companies close to their home country and European institutional context, provided the basic conditions are in place. (Slush, 2026)

Based on the survey results, the most significant barriers to growth are perceived to be cultural and attitudinal factors. The stigma associated with risk-taking, the poor awareness of career paths in growth companies, and the caution of large companies and the public sector in procuring from domestic startups create an environment that does not fully support rapid growth and a culture of experimentation. Alongside these, more structural factors also emerge, such as taxation, the small size of the domestic market, and the complexity of regulation, which together reduce Finland's attractiveness in the international competition for growth companies. According to Slush's interpretation, the current legislation and institutional framework reflect a time when startup activity was more marginal and do not meet the needs of the current, employment-creating, and economic growth-driving startup sector. (Slush, 2026)

The report positions startup companies as a central source of economic growth and emphasizes that founders make their location decisions based on the best possible operating conditions in a global comparison. Therefore, according to the survey, relative goodness alone is not enough, but Finland should strive to be the best possible environment for founding and scaling companies. Based on the survey, Slush has compiled a set of concrete reform proposals and submitted them to the government for use in economic policy preparation, reflecting the direct connection of the research to decision-making processes. Overall, the Finnish Founder Survey challenges us to examine the Finnish startup ecosystem as a systemic whole, where cultural, institutional, and economic factors together shape entrepreneurs' opportunities and national competitiveness. (Slush, 2026)

5.2 Thematic Interviews

According to a study conducted by Slush, the most significant factor in startups' dissatisfaction in Finland relates to structures, but attitude also emerges in the study as a significant barrier. Attitude, and especially courage, also came up in the interviews when stakeholders were asked what is currently missing from the student/startup entrepreneurship ecosystem (Table 1.).

What is missing from the student entrepreneurship ecosystem?

Table 1: Interviewees' responses to deficiencies in the student entrepreneurship ecosystem.

"During the time of Covid, a lot was lost. The ecosystem is slowly built through collaboration, and the remote period during the pandemic dismantled a lot. Now, the right people should be brought together to work in unison. Students and their ideas need to be taken seriously and met with courage." (A1)	Trust, communal space, continuity.
"A chaos control system cannot manage chaos. So first, there needs to be a will to start building trust, and next, leadership is required. There should also be continuity in knowledge sharing and development of operations. If we know what has already been done and how we can avoid many unnecessary mistakes in the future." (A2)	Systematic work, trust,

"For instance, even a virtual platform where initial 'friend' trading could take place. And this should be supported in such a way that teams would actually network with each other and utilize each other's expertise. We should support even bold ideas and teams in developing their own ideas forward, not try to predict who will succeed and who will not." (A3)	Shared spaces, systematic support and guidance.
"Continuous exchange of information and mutual sparring. I don't mean that someone's actions should be directed from the outside, but if new initiatives were always discussed in advance together, much more could be achieved with less. Twice a year, there should be a joint information exchange and planning day for the entire entrepreneurship ecosystem, where each actor would also boldly seize new initiatives without prejudice." (A4)	Systematic and planned action, continuity.

The four most common terms that recurred in interviews when asked what is currently lacking in the entrepreneurship ecosystem were systematicity, continuity (basic funding), trust, and common spaces. Support for business activities also emerged in many interviews. By support, it is meant that entrepreneurship would be supported and encouraged throughout the studies, including postgraduate studies. It is difficult to commercialize business ideas originating from research, and if the institute does not support this path, many ideas remain at the idea level. In many interviews, events were discussed, mainly noting that there are already many business idea competitions, and the same teams are already circulating the events throughout Eastern Finland anyway. "We don't need more events, their level should be raised in the eyes of investors, but we don't need any new ones."

The interviews also emphasized the respondents' desire for cooperation across regional boundaries. Respondents recognized the added value of cooperation directly as customer benefit and were ready to invest to make the ecosystem work. Respondents were also willing to help student entrepreneurship organizations develop their own activities and support them in securing their funding.

5.3 Group Interview

The group interview was conducted via Teams and was attended by four experienced actors from student entrepreneurship organizations across Eastern Finland. The interview was semi-structured and consisted of themes such as what is good and what needs to be developed in the current ecosystem? As well as what kind of hopes do student representatives have for other actors in the ecosystem, those who work for student entrepreneurship as paid employees either in higher education institutions or in other public organizations.

What is now missing from the student entrepreneurship ecosystem?

Table 2: Students' views of the student entrepreneurship ecosystem in the group interview.

"An early-stage fund. One that could finance the initial development of student business ideas, regardless of the institution where the student studies."	Early-stage fund,
"Incubator place and a community manager. Someone should also organize programs in the space and help startups move forward. And such an event where one would push their own idea forward. For example, a hackathon."	Incubator place, hackathon,
"The basic funding for the operation is now completely missing. Every year, we have to find the basic budget from somewhere anew. We need to secure permanent funding."	Continuity, Fund,
"Accelerator program. We can only focus on a few main events per year. There is no such program where one could genuinely develop their own idea further. *Also, the connection to the area's large companies is missing."*	Acceleration program, networks

In Eastern Finland, the situation between different student entrepreneurship organizations varies greatly. While one organization is in its early stages, another has a long history and strong basic funding. However, there is still very little cooperation between entrepreneurship communities, and it was brought up in the group interview

how smaller, early-stage ES organizations could learn and receive support from those that have been operating for a longer time. This would require a common mission or a clear bridge builder.

Another observation in the group interview was that, although the students had been operating in the area for some time and had been part of student entrepreneurship activities for a long time, they were not fully aware of their area's startup services. The interviewees discussed, among other things, the lack of an incubator program, even though all areas in Eastern Finland have some kind of incubator concept. This reflects more the fact that networks are still limited, and the functions and structures of the area may still be unfamiliar. Structured communication is therefore needed. As well as support for students to get to know the area's companies and economic structure. Cooperation with local companies was a wish of all the students participating in the interview, but it was still seen as challenging and laborious. "If we wanted to organize a hackathon for a company in the area, we would call and ask, but the other way around, for them to contact us, hardly ever happens."

The significance of student entrepreneurship organizations is clearly not yet understood by all actors, especially on the public side, as almost without exception, organizations highlighted the challenges of their own operation's financing. A lot of resources go into basic funding acquisition, and therefore only a few larger events can be focused on each year.

6. Conclusions

The results of this study provide a consistent and empirically grounded explanation of why student entrepreneurship development remains fragmented in Eastern Finland.

Compared to previous studies on entrepreneurial ecosystems (e.g. Matt & Schaeffer, 2018; Marquardt & Harima, 2024), the findings emphasize more strongly the role of cultural and relational factors, particularly trust and continuity, rather than merely structural components. This suggests that ecosystem maturity is not only dependent on resource availability but also on social cohesion and coordination mechanisms.

Based on this study, it can be concluded that the key development challenges of student entrepreneurship ecosystems in Eastern Finland are not related to individual forms of support, events or actors, but primarily to the structural and cultural functionality of the ecosystem. Empirical results show that the lack of systematicity, continuity, trust, and common physical and digital spaces weakens the ecosystem's ability to support student-led entrepreneurship in the long term. Both the Slush Finnish Founder Survey and the interview material emphasize that factors related to attitudes and culture form significant barriers to the growth of entrepreneurial activity, even though there would be actors and potential in themselves.

When examining the results in relation to the theory dealing with entrepreneurship ecosystems, it can be stated that the student entrepreneurship ecosystem of Eastern Finland is still in the development phase in relation to the maturity models of ecosystems. The ecosystem lacks a commonly shared mission, a coordination structure that brings together actors, and mechanisms that would enable the systematic sharing of resources, knowledge, and skills. The results of the study support the view that without mutual trust and structural continuity, individual support measures remain detached, and the ecosystem is unable to renew or learn collectively. Digitalization emerges in the study as a possible catalyst that can support the expansion of the ecosystem, cross-border cooperation and more efficient use of resources, but it does not alone replace the importance of the physical community and encounters between people.

From the perspective of Generation Z's work life values and expectations, the results of the study are particularly significant. Generation Z is motivated by meaningfulness, continuous learning, well-being, flexible roles, and low hierarchies, which are in line with the basic principles of entrepreneurship ecosystems. However, current structural deficiencies prevent the ecosystem from responding to these expectations consistently. The need for trust, courage, and community that emerged in the interviews directly reflects Generation Z's need for a psychologically safe and inclusive operating environment. Without clear continuities, mentoring, and visible paths to entrepreneurship, student entrepreneurship easily remains project-like and short-term, which is against the wishes of Generation Z.

The results have clear practical implications. They suggest the need for coordinated ecosystem governance, permanent funding mechanisms, and shared platforms that connect students, universities, and companies. In addition, the findings highlight the importance of designing entrepreneurship support structures that are aligned with Generation Z’s expectations of meaningfulness, flexibility, and community. The discrepancy between existing theoretical models and the empirical findings may be explained by the regional context of Eastern

Finland, where ecosystem structures exist but lack integration and coordination. This indicates that the challenge is not the absence of elements, but their fragmentation.

In conclusion, it can be stated that the development of the student entrepreneurship ecosystem in Eastern Finland requires a transition from fragmented actions towards systematic, student-centered, and generation-sensitive ecosystem work. This means building permanent structures, a common direction, and trust-based cooperation between universities, student communities, and regional actors. Only in this way can student entrepreneurship respond to both regional vitality goals and the values and expectations of Generation Z and serve as a sustainable basis for future startup and innovation activities in Eastern Finland.

Crafting the Entrepreneurial Persona: Insights From the Narratives Entrepreneurs Tell

Katherine Lewis, Anh Mattick and Simon Buchart

Abstract: Entrepreneurship research increasingly recognizes storytelling as a central mechanism through which founders interpret venture experiences, mobilize resources, and construct entrepreneurial identities. Yet little is known about the linguistic patterns that shape these narratives in contemporary media environments such as podcasts. This study addresses that gap by examining how entrepreneurs narrate venture creation, growth, and emotionally salient experiences in long-form podcast interviews. We adopt a mixed-methods design based on a corpus of 81 founder interviews and combine natural language processing with inductive narrative analysis. Quantitatively, we use co-occurrence network analysis to identify relationships among entrepreneurial key terms and dictionary-based sentiment analysis to assess evaluative language surrounding those terms. Qualitatively, we analyze a curated subsample of interviews following the Gioia methodology to interpret the meanings embedded in salient and ambivalent concepts. The findings reveal a dense semantic core structured around *business*, *company*, *work*, *money*, *need*, *product*, and *learning*, indicating that founders narrate entrepreneurship primarily through interconnected themes of venture building, economic activity, and personal development. Sentiment analysis shows that entrepreneurial narratives are predominantly positive overall, while terms such as *problem* and *risk* are framed more ambivalently, appearing both as sources of strain and as catalysts for opportunity, resilience, and learning. Further qualitative analysis shows that founders present themselves as learning-oriented protagonists, frame money as both a practical resource and a symbolic marker of success, and connect emotions such as love and passion to ventures, products, and social relationships. This study contributes to entrepreneurship research by offering a language-centered perspective on entrepreneurial sensemaking and identity formation in a fast-growing media setting. Methodologically, it demonstrates the value of combining computational text analysis with qualitative narrative interpretation to capture both structural patterns and contextual meaning. Practically, the findings provide implications for entrepreneurship education, mentoring, and founder support by showing how entrepreneurial stories can shape self-understanding, legitimacy, and opportunity perception.

Keywords: Entrepreneurship, Entrepreneurial Narratives, Natural Language Processing, Sentiment Analysis, Entrepreneurial Identity, Storytelling

1. Introduction

Humans have long been drawn to stories, and entrepreneurship is deeply rooted in storytelling—from "rags to riches" narratives to cautionary accounts of failure. As noted by Audretsch and Lehmann (2023), entrepreneurs can be understood as storytellers whose success depends on their ability to craft compelling narratives around ideas, timing, and vision. This aligns with the broader concept of the "narrative boom" identified by Hänninen (2004), reflecting a growing interdisciplinary interest in narrative as a bridge between scientific inquiry and artistic expression. The rise of podcasting further illustrates this trend, particularly through popular entrepreneurship-focused formats that captivate large audiences. Within narrative entrepreneurship research, two perspectives emerge: an exogenous view that downplays the role of narrative and an endogenous view that sees it as central. This study adopts the latter, emphasizing language as a key factor shaping entrepreneurial activity across its lifecycle. Language functions not only as a tool for persuading stakeholders but also as a means of constructing identity, meaning, and organizational culture. This paper examines how entrepreneurs use language to narrate their experiences and project their identities. Using a mixed-methods approach combining Natural Language Processing and narrative analysis of podcast interviews, the study reveals that entrepreneurial narratives balance positive, business-oriented language with themes of risk and opportunity, while framing founders as purpose-driven, learning-oriented actors.

2. Literature Review and Theoretical Background

Entrepreneurship is widely understood as a social and discursive process in which language plays a central role. Entrepreneurs use language to negotiate meaning, construct identities, and establish credibility in interactions with stakeholders. Practices such as pitching and storytelling mobilize engagement, reduce uncertainty, and legitimize new ventures. Linguistic choices—ranging from vocabulary to idiomatic expressions—also signal social alignment and cultural belonging, making language a constitutive element of identity rather than merely a

communication tool. To identify current research directions, a literature review was conducted focusing on English-language journal publications from the past 20 years. The findings highlight storytelling as a key component of entrepreneurship education and practice. For example, Fletcher (2007) links entrepreneurship education to career intentions, while Recke and Perna (2021) demonstrate how emergent narrative systems enhance learning outcomes. Similarly, Fernandez-Vázquez and Álvarez-Delgado (2019) emphasizes storytelling as a tool for developing entrepreneurial skills in experiential contexts. Beyond education, storytelling plays a significant role in entrepreneurial research and practice. Martens et al. (2007) identify narratives as crucial for resource acquisition, while Brattström et al. (2021) show how storytelling frameworks shape research and influence audience perceptions. Studies on entrepreneurial storytelling (e.g., Holt & Macpherson, 2010) further underline its role in constructing identities, guiding entrepreneurial action, and gender differences (e.g., Ahl, 2007). Overall, the literature demonstrates that narrative practices are central to shaping entrepreneurial processes across contexts.

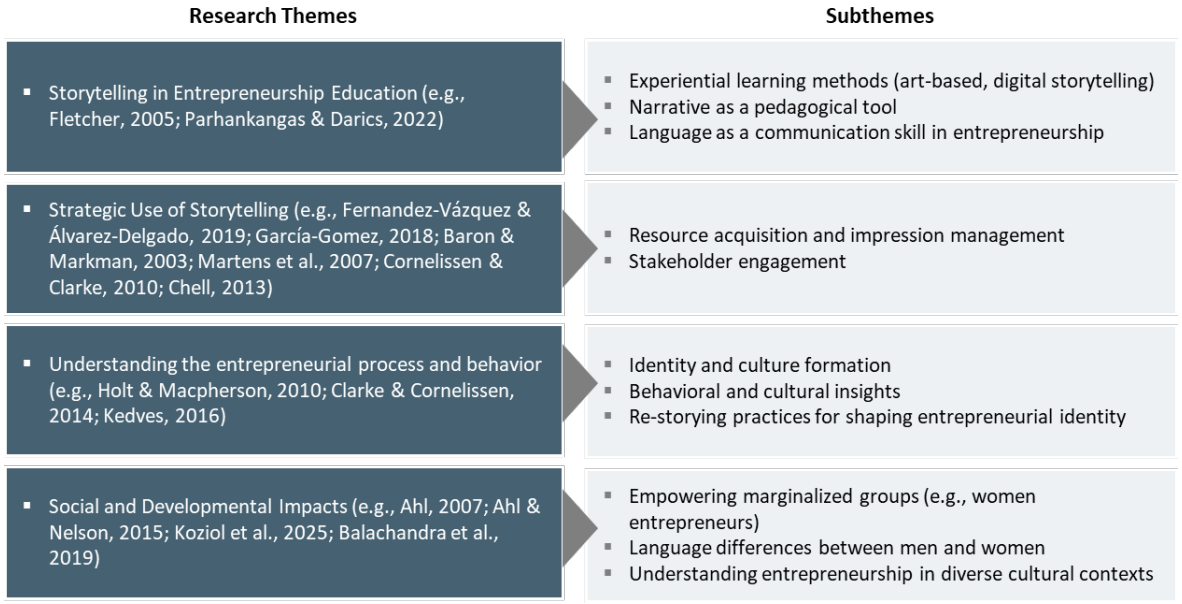

Figure 1: Literature review

3. Overall Research Design and Methodology

Our study adopted a mixed-methods approach, integrating both qualitative and quantitative methodologies. Following an extensive literature review and theoretical analysis, which provided a foundation by highlighting prior research in this domain, we formulated our research questions. To address the quantitative research questions, we employed methods from Natural Language Processing (NLP). In contrast, narrative analysis was utilized to provide in-depth answers to the qualitative research questions.

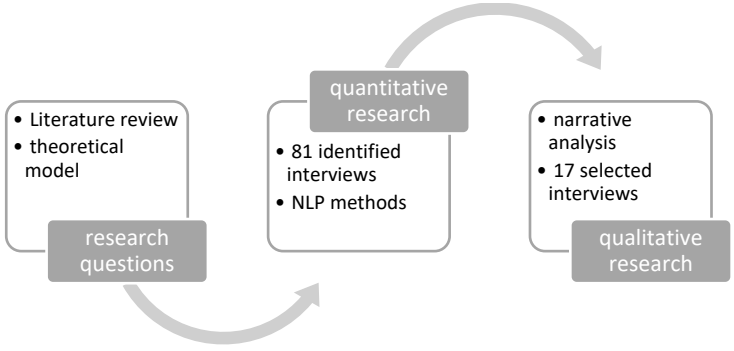

Figure 2: Research approach (own illustration)

3.1 Research Questions

This study addresses two complementary dimensions of entrepreneurial storytelling: quantitative patterns of language use and the qualitative meanings embedded in these linguistic choices. Quantitative questions provide a data-driven overview of language use, while qualitative questions build on those findings to offer in-depth, contextualized interpretations of salient terms. By focusing on these key terms in context, the study examines their role in entrepreneurial meaning-making and identity construction.

Quantitative research questions:

1. Which terms are associated with specific entrepreneurial topics, and how are these terms related to one another?
   (Co-occurrence analysis)
2. How do founders evaluate their entrepreneurial experiences emotionally?
   (Sentiment analysis)

Qualitative research questions:

1. Sentiment analysis indicates that the term problem carries both positive and negative evaluations. In what situations do entrepreneurs perceive problems as positive, and in which contexts are they viewed negatively? To what extent do personal experiences shape these evaluations?
2. Co-occurrence analysis shows that money is frequently mentioned in entrepreneurial narratives. In which situation is money discussed as part of the venturing process, and what meanings are attributed to it?
3. Emotional terms such as love, passion, and excitement appear frequently but are not strongly connected to one another. What role does the term love play in entrepreneurial narratives, and in which entrepreneurial situations are emotional expressions and references to social systems used?
4. What role does learning play in the context of entrepreneurial venturing, and how is it integrated into founders' narratives?
5. How are social-system-related terms connected, and in which entrepreneurial situations are these key terms employed?

4. Method of Quantitative Analysis

4.1 Sample Selection and Process

For the quantitative analysis, a corpus of 81 unique YouTube interviews with founders was assembled. The interviews were selected because they focused on founders reflecting on the creation and development of their ventures. All audio material was transcribed using Whisper (Radford et al., 2022) and subsequently prepared for text analysis. Preprocessing involved several steps. First, transcripts were cleaned by removing line breaks and bracketed insertions. The text was then tokenized, lowercased, stripped of punctuation, digits, and English stop words, and stemmed to reduce lexical variants to common stems. Based on the qualitative analysis and theoretical considerations, a predefined list of entrepreneurial keyterms was then identified and matched to the cleaned corpus. Because the quantitative analyses focus on relations between the keyterms and their evaluative framing, the transcripts were additionally segmented into sentences. Socio-demographic metadata were linked to the corpus for subgroup analyses by gender, age group, educational attainment, and business model category. These metadata were only available for 75 founders of the corpus and as a result, subgroup analyses should be interpreted as descriptive comparisons.

4.2 Quantitative Methodology

To address the quantitative research questions, two complementary NLP methods were applied: co-occurrence analysis and dictionary-based sentiment analysis. Structural Topic Modelling was explored initially but not retained, as the topic solutions proved insufficiently robust and interpretable given the limited sample size.

Co-occurrence analysis was used to answer the quantitative research question one. Co-occurrence was defined as the appearance of two keyterms within the same sentence. On this basis, a symmetric co-occurrence matrix was constructed and visualized as a weighted network, in which nodes represent keyterms and edges represent the frequency with which two terms co-occur. This allows the identification of central terms, dense semantic cores, and more peripheral concepts in entrepreneurial narratives.

For interpretive purposes, the keyterms were grouped into four predefined thematic categories informed by the qualitative analysis: *Social system*, *Business and career*, *Emotions*, and *Own experiences and attitudes*. These categories were used to structure the visual interpretation of the networks rather than to derive themes inductively from the data.

Sentiment analysis was used to answer the quantitative research question two. A dictionary-based approach was implemented using the Lexicoder Sentiment Dictionary 2015 (Young and Soroka, 2012). Only sentences containing at least one keyterm were retained. Within these sentences, positive and negative dictionary matches were counted. Accordingly, the analysis does not classify full sentences as positive, negative, or neutral; rather, it captures the relative frequency of positive and negative evaluative language surrounding entrepreneurial keyterms.

Together, co-occurrence analysis and sentiment analysis provide a structured quantitative overview of entrepreneurial language. Co-occurrence analysis maps how central concepts are linked within founders' narratives, while sentiment analysis indicates how these concepts are evaluatively framed. These quantitative results serve as the basis for the subsequent qualitative analysis.

4.3 Results

4.3.1 Sample Characteristics

Analyzing the 75 metadata-coded founder entries, male founders clearly predominated, with 62 male and 13 female founders. Most founders were between 30 and 49 years old, with smaller numbers in the younger and older age categories. Educational attainment was predominantly at bachelor level, and service-based ventures constituted the largest business model category. Because several subgroup categories are small, all subgroup comparisons below should be interpreted cautiously.

4.3.2 Frequency of Key Terms

The frequency analysis shows a strong concentration around a small set of highly salient entrepreneurial concepts. The most frequent keyterms were *business*, *company*, *work*, *money*, and *need*. This lexical core suggests that founders' narratives are structured primarily around venture activity, organizational development, labor, financial concerns, and perceived necessity or demand. Beyond these highly frequent terms, a second tier of keyterms includes *product*, *love*, *create*, *market*, *friend*, *learn*, *invest*, *customer*, and *problem*. By contrast, terms such as *discover*, *choice*, *luck*, and *recognize* occurred much less frequently and occupied a more peripheral place in the corpus. Overall, the frequency distribution indicates that entrepreneurial narratives are dominated by practical, venture-related concepts, while social and emotional terms appear less often.

4.3.3 Co-occurrence Analysis

The overall co-occurrence network reveals a dense semantic core centred on *business*, *company*, *work*, *money*, *need*, *product*, and *market* (see Figure 3: top left). These terms frequently appear together within the same sentence, indicating that founders commonly describe entrepreneurship through an interconnected vocabulary of venture building, economic activity, market orientation, and problem solving. The network therefore suggests that entrepreneurial experience is narrated less through isolated concepts than through tightly linked semantic constellations.

The thematic subgraphs further clarify this structure. Within the *business and career* category, the network is especially dense, with central nodes including *business*, *work*, *money*, *product*, *market*, *create*, *invest*, *customer and experience* (see Figure 3: top right). This pattern indicates that founders often connect entrepreneurial action with operational and financial concerns. Problem and solve are also closely linked within this field, suggesting that challenge-solution framing is a recurring narrative structure.

A similarly dense configuration appears in the category *own experiences and attitudes* (see Figure 3: bottom left). Here, terms such as *need*, *success*, *learn* and *company* are strongly interconnected. This suggests that founders frequently frame their entrepreneurial journeys in terms of necessity, effort, learning, and achievement. By contrast, terms such as *creative*, *career*, and *luck* appear more peripheral and less consistently integrated into the central experiential cluster.

The *social system* category displays a more compact and relational structure (see Figure 4: bottom right). *Friend* and *family* form the central anchors of this cluster, while *mom* and *dad* occur less frequently but remain visibly

connected. This indicates that social support is present in founders' narratives, though it is more often articulated through broad relational categories than through highly specific family references.

The *emotions* category is comparatively sparse. *Love* is the most integrated emotional term, whereas *passion* and *excitement* appear less frequently and are less densely connected to one another. Emotional language is therefore clearly present in the corpus, but it does not form an autonomous semantic core. Rather, emotional terms tend to appear alongside more central entrepreneurial themes. Taken together, the co-occurrence findings indicate that founders' narratives are structured above all by a dense entrepreneurial core, while social and emotional concepts play a secondary but still meaningful role. These findings informed the qualitative stage by highlighting both dominant lexical constellations and comparatively weakly integrated but theoretically relevant concepts.

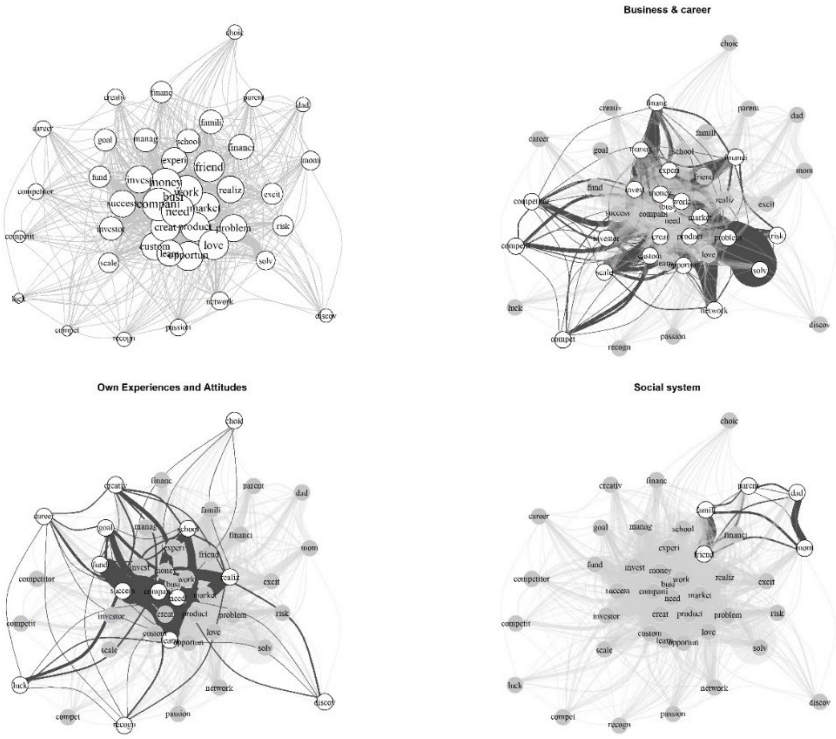

Figure 3: Co-occurrence network graphs (own illustration)

4.3.4 Sentiment Analysis

The sentiment analysis shows that the evaluative language surrounding entrepreneurial keyterms is predominantly positive. Across sentences containing at least one keyterm, positive dictionary matches clearly outweighed negative ones. This suggests that founders tend to frame entrepreneurial experiences more often in affirmative and opportunity-oriented than in negative terms.

At subgroup level, the distributions remain broadly positive, although some descriptive differences are visible. Women showed a slightly more positive sentiment profile than men, with 83.4% positive and 16.6% negative sentiment-bearing matches, compared to 82.0% and 18.0% for men. Across age groups, founders aged 60 and above displayed the highest negative share at 27.3%, followed by founders aged 50 to 59. This suggests a somewhat more mixed evaluative framing in older age groups, even though positive sentiment still predominates overall.

Differences by education and business model are also visible, though they should be interpreted cautiously because some categories contain few cases. Founders coded as having no diploma showed the highest negative share, while content-creation ventures displayed the highest positive share at 84.5%. Product- and service-based ventures were likewise predominantly positive, but slightly less so.

At the level of individual keyterms, most terms were associated substantially more often with positive than with negative evaluative language. Two terms, however, stand out because of their relative ambivalence: *problem* and *risk*. Sentences containing problem showed 54.0% positive and 46.0% negative sentiment-bearing matches,

while sentences containing risk showed 47.2% positive and 52.8% negative matches. These are markedly more balanced distributions than for most other keyterms in the corpus.

This pattern is theoretically relevant for entrepreneurship research. Whereas founders generally evaluate entrepreneurial experience positively, terms such as problem and risk appear to be framed in more ambivalent ways. They can signal threat and difficulty, but also opportunity, growth, and learning. For that reason, these terms were especially important in guiding the subsequent qualitative analysis.

5. Method of Qualitative Analysis

5.1 Qualitative Methodology

Based on the quantitative analysis, we selected 18 interviews from the original 81, preserving demographic proportions, particularly female representation, while ensuring rich narrative content containing salient terms such as risk, problem, and money. The qualitative analysis followed the inductive approach of Gioia, Corley, and Hamilton (2013), moving iteratively from informant-centric expressions to researcher-centric interpretations without imposing predefined categories. Rather than imposing predefined categories, we allowed concepts to emerge inductively from the data while remaining guided by the results of the quantitative analyses. The qualitative analysis was structured around three areas: (1) ambivalent key terms, (2) frequently mentioned terms, and (3) relational patterns identified through co-occurrence. First, we examined ambivalent terms (*risk, problem*) by analyzing their narrative contexts and identifying first-order concepts, which were then aggregated into second-order themes such as risk as opportunity versus threat and problems as learning triggers versus obstacles. Second, we analyzed frequent terms (*money, need*), distinguishing domains, themes, contexts, and illustrative quotes to capture how financial aspects were framed (e.g., growth opportunities, constraints, or validation signals. Third, we explored relationships between emotions (e.g., *passion, love*) and learning, examining how these were embedded in social contexts and entrepreneurial identity formation. Overall, this systematic, inductive approach enhances rigor and enables nuanced insights into how entrepreneurs construct meaning through language

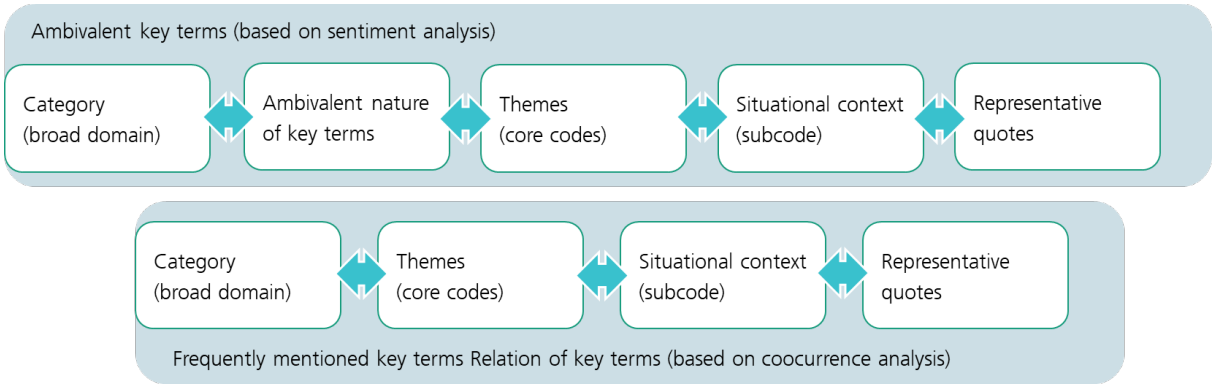

Figure 4: Qualitative Coding Scheme (own illustration)

5.2 Results and Interpretation of Qualitative Analysis

The purpose of the qualitative analysis is to explore how entrepreneurs utilize specific linguistic resources to construct professional identities and make sense of their ventures. Following the Gioia et al. methodology to build upon the semantic ambivalence, we took a closer look into the key terms *risk* and *problem*. Entrepreneurs utilize risk as a dual-edged narrative device. In a positive light, risk is portrayed as a "necessary trait" and a form of "investment" essential for the catalyst of successful entrepreneurship. Taking risk is a central concept of entrepreneurship and this result is aligned with entrepreneurial models that consider risk as a trait and that entrepreneurs are more prone to taking risky opportunities (Macko & Tyszka, 2009; Palich & Badgy, 1995; Shane & Venkatraman, 2000).

> Representative quote: "*You know, they're inherently already risk takers [parents].*
>
> *I mean, both of them grew up completely with dirt floors under their feet.*"

Conversely, it is evaluated negatively when associated with "sacrificing previous status" or navigating the "unknown and unpredictable" stages of testing a business model. Here, we realize that risk is not considered as a trait but rather as a factor when making consequential decisions within the venturing process. This has been discussed in literature. For instance, Hou et al. (2025, p. 10) discussed employment versus entrepreneurship. The results show "that greater unemployment risk leads to an increased tendency for employees to become entrepreneurs, and this effect is more pronounced for employees with longer tenures." Unemployment risk can push employees toward entrepreneurship, however, in our research there were also people thriving in their career and therefore, have even higher opportunity cost when pursuing self-employment.

> Representative quote: "*The thought crossed my mind, like, should I even risk my life and my career if everything's okay?*"

Analyzing the frequently mentioned terms *money* and *need*, we realized that they serve as fundamental anchors in entrepreneurial storytelling. Money is narrated as a multi-dimensional construct: it functions as an "internal and external measure of success," a "status signifier," and a "stepping stone" for growth. This perspective aligns with existing literature on self-enhancement motives (e.g., wealth accumulation) as primary drivers for entrepreneurship, motives that are often more pronounced in male founders (Schwartz & Rubel, 2005; Verheul et al., 2006). Money further acts as a cognitive tool for "weighing decisions" regarding risk. The term *need* highlights the tension between professional requirements and personal evolution. Narrative excerpts demonstrate that founders use *need* to articulate business-centric requirements such as "more customers," "staff," or "strategies", while simultaneously expressing personal needs for "knowledge" or "space" to maintain a strategic overview of the business.

> Representative quote: "*And meantime, that $1.4 million was need going to last that long, right? Oh my gosh, it was lasting us forever. So that was kind of the problem was our investors kept saying like, you need spending any money. You guys need to hire people. And we were making money. We were selling free samples. We were making money. We were funding ourselves. And as we started working more and more hours, it became clear we had to hire some people*."

While emotional terms like *passion* and *love* were found to be loosely connected in the quantitative network, the qualitative data reveals that love is frequently directed toward the act of business itself, described as the "ultimate fulfilment" and a source of intense "personal and professional satisfaction". These findings reinforce existing literature regarding the profound link between entrepreneurial passion and love and the founder's self-conception. As Murnieks et al. (2020, p. 3) observe: "an individual's identity plays a central role in the development and manifestation of passion itself." In this light, the business is not just a commercial venture, but a narrative extension of the entrepreneur's identity.

> Representatives quote: "*I love to talk about business. It's like my favorite thing in the whole world. I write books about this. I make courses about this. I make content about business… then I do business in the meantime, like I fucking love business*."

Finally, learning emerges as a mandatory prerequisite for success in our analysis. Founders narrate a continuous developmental arc, where learning evolves from "learning through experience" to an "exploratory narrative process" that facilitates both business growth and long-term personal development. Learning is not just an activity but a mandatory prerequisite that provides coherence to the lived narrative. By narrating their journeys as continuous learning processes, founders can integrate failures and pivots into a positive life story. The evidence highlights a critical demand for practical, inquiry-based learning models.

> Representative quotes: "You've got to learn quite a lot of different things in order to create a successful business."

6. Discussion and Conclusion

The integrated findings of this study provide a structured overview of how entrepreneurs linguistically construct their founding journeys through a "hero-narrative" lens (Anderson & Warren, 2011). Quantitative analyses confirm that founders' narratives are dominated by business- and work-related terms, specifically *business*, *company*, *work*, *money*, and *need*. These high-frequency terms form dense clusters within the topics of "Business

& Career" and "Own Experiences & Attitudes," indicating that entrepreneurial discourse is primarily organized around the practical engagement of venture creation, financial planning, and growth-oriented activities. In contrast, social and emotional terms appear more loosely connected and context-dependent, reflecting the highly individualized nature of personal support systems and affective experiences (Gedajlovic et al., 2013). A defining characteristic of these narratives is the sentimental ambivalence surrounding the concepts of *risk* and *problem*. While sentiment analysis shows nearly balanced positive and negative evaluations, qualitative data demonstrates that this is a deliberate narrative strategy rather than a sign of confusion. Founders utilize "redemption narratives" to reframe problems and risks as essential catalysts for learning, opportunity recognition, and innovation (McAdams & Jones, 2017). By transforming objective challenges into triggers for solution development, entrepreneurs resolve inherent venture tensions and project a persona of resilience and agency.

The study also highlights how founders leverage financial and emotional language to build legitimacy. Terms like *money* and *need* serve a dual purpose: acting as instrumental tools for operational growth and as symbolic measures of personal and market validation. Furthermore, the pervasive emphasis on *love* for the business illustrates that entrepreneurship is narrated as a journey of ultimate fulfilment and constant evolution.

Finally, observed variations in sentiment across business models, particularly the higher positive sentiment in content creation, suggest that these narratives are often shaped by the medium and the founder's agenda. In environments where the individual's personality is the marketed product, founders may strategically exclude negative or socially undesirable experiences to maintain a favorable public brand. Ultimately, these stories allow founders to synthesize lived experiences into a coherent narrative that mobilizes resources and legitimizes their ventures in the eyes of stakeholders (Fisher, Neubert and Burnell, 2021).-

7. Limitation of Study

Despite combining NLP and narrative analysis, this study has several limitations to acknowledge. First, it relies on secondary interview data, preventing follow-up questions and increasing the risk of response and social desirability bias, as participants may present curated personas to a public audience. Selection bias is also possible due to the non-random, manual sampling of interviews. Methodologically, automated transcription and NLP tools may introduce inaccuracies, particularly with accented speech, background noise, or culturally specific language such as metaphors and sarcasm. Additionally, sociodemographic data was partly drawn from public sources (e.g., LinkedIn), which depends on self-reported accuracy. The relatively small sample size further limits generalizability. These constraints are partially mitigated through qualitative narrative analysis, which contextualizes ambiguous terms and improves the interpretation of emotional framing.

8. Research and Practical Implications

To extend these findings, future research should further examine categories such as *risk*, *problems*, *emotions*, and *learning*. Entrepreneurial risk, especially in connection with money, could be explored from a cognitive perspective and linked to narrative frameworks like Hänninen's (2024) "Model of Narrative Circulation." Applying this model to entrepreneurship would allow researchers to systematically analyze how narratives shape business realities. Methodologically, adopting modern analytical approaches involving Large Language Models (LLMs) offers significant potential. Techniques such as automated thematic coding and sentiment analysis can enhance quantitative analysis and enable more nuanced data interpretation, making their integration a logical next step.

Our findings highlight learning as a central element of the entrepreneurial journey. While personal traits are often emphasized, entrepreneurs strongly value experiential learning, suggesting that entrepreneurship is a developable process rather than an innate ability. We therefore encourage educators to integrate podcasts and storytelling into curricula. Long-form entrepreneurial narratives can foster engagement and align with research promoting digital tools like YouTube and blogs. For example, Vidal et al. (2021) demonstrate the value of the *Enfactor* podcast, supporting connectivism (Siemens, 2005), which emphasizes collaborative, technology-enabled learning communities composed of individuals who share learning goals and harness the connective power of modern technology to collaborate, teach and learn from each other". By incorporating these narratives of learning and resilience into teaching programs, educators can effectively encourage students to perceive entrepreneurship as a skill set that can be developed over time.

Declaration of Interest, Ethics and Use of AI

The authors declare no known financial or personal conflicts of interest that could have influenced this work. They also confirm that this manuscript has not been submitted elsewhere. The research followed established scientific ethics and good practices. As the study relies on publicly available interviews, informed consent was not required, and no primary research involving human participants was conducted by the authors. Generative AI was used to proofread language and condense text for non-Native English authors, support the literature review by identifying relevant sources, and transcribe 81 podcast interviews. All AI outputs were carefully reviewed and edited, and the authors take full responsibility for the final content.

Bridging the Readiness Gap: A Framework for Transitioning Generation Z into Practice

Melany Lotter
University of Johannesburg, South Africa

mlotter@uj.ac.za

Abstract: A readiness gap leaves financial planning graduates technically proficient but underprepared for the socio-emotional and cognitive demands of professional fiduciary practice. This transition is complicated by the unique cognitive profile of Generation Z, characterised by digital fluency but a preference for fragmented information processing over complex sensemaking. To address this, this paper proposes a multidisciplinary framework, a pedagogical shift designed to address the misalignment between students' digital habits and the rigorous sensemaking required in the professional financial practice. Using situated and authentic learning as a lens, this study highlights a shortcoming of conventional lecturing: it doesn't move students beyond informal habits and peer-group logic toward the professional discernment required in practice. Anchored in the situated cognition paradigm, the paper conceptualises a workplace simulation: an authentic sociotechnical environment that utilises legitimate peripheral participation to move students from the classroom periphery toward the centre of professional practice. By navigating ill-defined case studies and high-stakes client-advisor interaction under industry supervision, students are compelled to activate inert knowledge and stabilise professional logic. This approach mitigates the vulnerability of inexperience and offers a scalable path to mastery; it builds the interactional agility and fiduciary readiness required not just to secure a role, but to sustain a career and eventually transition into independent practice. The study aligns pedagogy with industry demands, building a more resilient entrepreneurial ecosystem.

Keywords: Workplace Simulation, Financial Planning Education, Soft Skills, Conceptual Framework

1. Introduction

While technical proficiency secures initial workforce entry, it is now a baseline requirement rather than a guarantee of success. Beyond securing employment, soft skills are vital for retention and career growth. This divergence between academic preparation and professional expectations is further evidenced by a mismatch between institutional curricula and the agility required in the modern world of work (Osman et al. 2023). Graduates in high-stakes fields like financial planning must move beyond academic qualifications to master the human element (Rattiner 2021), demonstrating the interpersonal sophistication required to apply technical knowledge in complex workplace situations. This evolution requires situation awareness: the ability to perceive and comprehend client cues to project future financial and emotional outcomes (Chaffin and Grable 2018). Practitioners are expected to serve as behavioural mentors and financial architects (Rattiner 2021), where socio-emotional competence is not merely a soft skill but a significant driver of client referrals and long-term financial well-being (McCarthy 2020). Pedagogy must shift to maximise graduate market-readiness and professional employability, as identified by the expectation gap, in which traditional accounting and finance curricula fail to align with the evolving skills employers require (Aryanti and Adhariani 2020). Similarly financial planning skills gap is a systemic higher education challenge that requires a pedagogical re-evaluation of how multidisciplinary skills align with evolving industry standards. This study develops a conceptual framework using workplace simulation as a critical bridge, facilitating the transition from abstract theory to the integrated technical and socio-emotional demands of professional practice. The efficacy of this approach is demonstrated by Aldamen et al. (2021), who utilised a cross-cultural workplace simulation in accounting to successfully integrate technical expertise with global core competencies, proving that such models can effectively reconcile technical rigour with professional skill acquisition in a globalised context. Foundational theory must be complemented by immersive simulations tailored to contemporary student profiles, which mitigate inert knowledge, ensuring classroom gains are activated through simulated client-facing interaction. This dual approach, retaining rigorous theory within a simulated context, aligns pedagogy with the industry shift toward relationship-driven models and the human element (Rattiner 2021). The simulation ensures students develop the behavioural coaching and high-stakes social competencies required to navigate modern fiduciary complexities (Chaffin and Grable 2018; McCarthy 2020).

2. The Student Profile

The transition from Millennial to Generation Z students necessitates a re-examination of instructional methods (Attardi et al. 2021). This new generation often exhibits a marked divergence from their predecessors in verbal, social, and reading skills, as well as significantly compressed attention spans (Attardi et al. 2021). This skills gap is particularly acute in professions that require high emotional intelligence, such as financial planning, where the ability to synthesise complex data into empathetic, face-to-face advice is paramount. Many educators remain unaware of these unique attributes until prompted by longitudinal reflection (Attardi et al. 2021). Unlike previous cohorts, contemporary students exhibit a distinct cognitive profile shaped by lifelong digital immersion. This environment favours shallow information processing, characterised by rapid attention-switching and a preference for visual-first, fragmented content over complex sense making (Loh and Kanai 2016). This behavioural shift is manifested as a habituation to instant gratification, where the constant immediacy of digital stimuli conditions learners to bypass deep, deliberate processing in favour of rapid, intuitive cognitive shortcuts (Twenge 2017) and is further exacerbated by the permanent great rewiring of attention spans observed in the current post-pandemic educational landscape (Haidt 2024). Neurobiologically, the high rates of multitasking prevalent in this demographic are correlated with diminished executive control and altered reward-processing mechanisms, leading to increased distractibility and a cognitive state akin to addictive behaviours (Loh and Kanai 2016). These learners increasingly demand instantaneous feedback and struggle with the sustained attention required for traditional teaching instruction (Ziatdinov and Cilliers 2021). The transition intensified the expectation of digital immediacy, potentially compromising the long-term work readiness of graduates entering a high-stakes fiduciary landscape (Mkhize and Reddy 2025). Traditional learning-to-learn competencies are often bypassed in favour of hasty, intuitive study methods that prioritise speed over semantic depth (Kirschner and De Bruyckere 2017). While traditional students practised information literacy, a linear search for authoritative data, this cohort exhibits information sensibility, a socially informed awareness of value (Hassoun et al. 2023). These learners do not intentionally search for information; they encounter it through algorithmic feeds and social circles. Their cognitive profile has shifted toward shallow processing, characterised by high proficiency in scanning and task-switching, yet a profound struggle with deep work or intense case study evaluation (Loh and Kanai 2016).

3. The Multidisciplinary Skills Gap

Standard classroom methods often result in the acquisition of inert knowledge, concepts that are acquired but cannot be retrieved or applied in functional settings (Whitehead 1929; Brown et al. 1989). Herrington and Oliver (2000) expand on this phenomenon, observing a persistent rift between formal academic instruction and professional practice. They argue that this gap exists because students are conditioned to view knowledge as a static, final product of their degree, rather than a dynamic tool required to address the ill-defined problems inherent in a fiduciary environment. This readiness gap is empirically supported by findings in the accounting sector, where students' self-perceptions of their professional skills often fail to align with the technical and pervasive competencies demanded by the industry (Kirstein et al. 2019). Rattiner (2021) argues that the true gap in practitioner readiness lies in a failure to master the client experience, a shift from technical processing to a relationship-driven model that prioritises behavioural coaching and emotional resonance. These competencies serve as the essential catalysts that bridge theoretical mastery with the high-stakes, interactive demands of effective fiduciary performance. Emerging business models are predicated on a relationship-driven approach, which demands that practitioners transition from mere technical technicians to financial architects and behavioural mentors (Rattiner 2021). This requires a sophisticated level of emotional resonance and professional diplomacy to navigate the modern fiduciary landscape where emotional intelligence and social competence are significant drivers of both client referrals and long-term financial well-being (McCarthy 2020). This misalignment between academic output and professional requirements is not an isolated phenomenon within financial planning but is a persistent challenge across other fiduciary disciplines, such as auditing and accounting, where students may achieve technical proficiency but often remain unaware of the importance of communication and leadership competencies until exposed to the authentic complexities of the workplace (Bautista-Mesa et al. 2018; Aldamen et al. 2021). Graduates often lack the multidisciplinary agency required to mobilise technical data within the socio-emotional interaction phenomenon (Asebedo 2024). By adopting Asebedo's (2024) financial planning client interaction theory, this study identifies that the professional value of a planner is defined by the integrated area where technical expertise and interpersonal relationship skills intersect. However, current educational models treat these as siloed domains rather than a unified practice. While the curriculum rigorously develops the technical X-axis, it fails to provide the psychological and emotional Y-axis necessary to navigate the

human element, leaving graduates unable to bridge the gap between knowing the math and putting it into practice. This imbalance is exacerbated by the cognitive fragmentation and syndrome of impatience identified in modern student profiles (Loh and Kanai 2016). These learners are often neurologically unequipped to handle the professional competencies required for the financial planning client interaction theory intersection through passive instruction alone. This results in a diminished area of value for the client and accounts for the perceived incompetence of graduates in professional settings.

4. The Theoretical Foundation

Financial planning students' mental models often lack the conceptual synthesis required for stable professional performance, creating a significant obstacle when transitioning from the informal social logic of digital networks to rigorous fiduciary practice. Therefore, financial planning pedagogy should incorporate situated cognition, recognising that learning is fundamentally inseparable from the activity, context, and culture in which it is developed and deployed (Brown et al. 1989; Lave and Wenger 1991). Situated learning theory (SLT) posits that mastery is not an abstract cognitive acquisition but a social process occurring through legitimate peripheral participation within a community of practice (Lave and Wenger 1991), where learning is inherently tied to authentic activity and context when engaging with the culture and tools of the specific domain. The professional essence of financial planning is best articulated through financial planning client interaction theory, which posits that mastery resides in the interactional phenomenon of the sophisticated interpersonal exchange between the client and advisor (Asebedo 2024). Professional value is conceptualised as the integration of technical expertise and interpersonal efficacy over time; however, for the new generation of students, this value is compromised because traditional teaching models strip the learning of its authentic context, failing to simulate the dense, emotional, and regulatory landscape unique to financial advice (Brown et al. 1989). Therefore, incorporating authentic learning environments provides the applied competency framework and multidisciplinary perspectives required to bridge the gap between theory and professional practice. These environments allow learners to move from peripheral observers to competent practitioners capable of navigating the high-stakes demands of formal fiduciary labour (Herrington and Oliver 2000). Empirical evidence from related fiduciary disciplines supports this transition: Assigning junior students the role of assistants under the oversight of senior-level peers, educators replicated the hierarchical sociotechnical environments and collaborative dependencies observed in professional audit firms (Bautista-Mesa et al. 2018); Subjecting student outputs to expert review serves as a catalyst for technical precision and organisational accountability, where this level of professional scrutiny, ensures that inert theoretical knowledge is transformed into the active situational logic required for independent advisory practice (Aldamen et al. 2021). Such a model provides a practical application of legitimate peripheral participation, allowing students to navigate the culture and tools of the domain within a structured community of practice. Furthermore, the readiness gap is not a simple knowledge deficit, but a byproduct of undeveloped clinical synthesis. Seel (2001) suggests that mental model stability (the way a student mentally organises information to make sense of a specific task) is contingent upon the learning environment's situational logic, or the specific set of professional rules, pressures, and cultural norms that dictate how a task is completed in the real world.

5. Conceptual Framework

The development of the proposed workplace simulation framework follows a deductive conceptual design methodology. This study employs a theory-into-practice synthesis to bridge the identified disconnect between this cohort's cognitive profile and the professional demands of financial planning. The methodology for constructing this framework is structured around three critical design phases (Figure 1): the student profile, the theoretical foundation, and the integration of multidisciplinary skills. The framework originates from understanding the modern learner student profile, by synthesising Hassoun et al.'s (2023) information sensitivity with the social-verbal deficits identified in recent generational research. The first phase maps the specific cognitive barriers, such as instant gratification and fragmented social learner, that render a solely traditional, individualistic pedagogy insufficient. This understanding serves as the justification for why a conventional curriculum requires the integration of immersive simulations to bridge the readiness gap. The theoretical foundation involves interlocking situated learning theory and authentic learning to create a dual-layered pedagogical response. SLT is deployed to construct the social-structural architecture, leveraging the student's inherent drive for peer validation to facilitate a community of practice (Lave and Wenger 1991). Simultaneously, authentic learning engineers the intervention's analytical complexity, applying Herrington and Oliver's (2000) design elements, specifically ill-defined activities and multiple perspectives, ensuring the simulation forces deep

work and cognitive effort required by the professional landscape. The professional integration aligns the theoretical construct with the financial planning client interaction theory (Asebedo 2024). This phase ensures that the simulation is not merely an academic exercise but a high-fidelity replica of the interaction phenomenon. The framework is contextually anchored in the financial planning environment, requiring students to move from passive scanning to the verbal synthesis of complex advice.

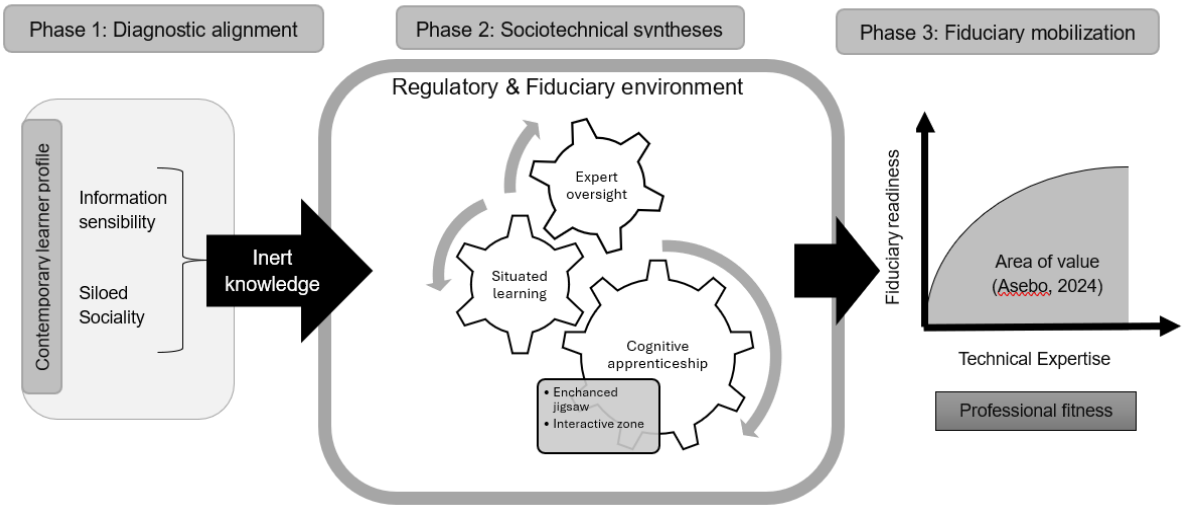

Figure 1: Conceptual framework

6. The Workplace Stimulation

The proposed workplace simulation acts as the functional manifestation of the conceptual framework. It serves as a cognitive corrective by engaging students in high-stakes fiduciary tasks within a sociotechnical environment, transitioning students from a state of relational alignment toward the interpersonal and technical integration that constitutes professional value (Asebedo 2024). At the same time, traditional lecturing provides the field's essential linear logic, and the simulation couples this with social validation to effectively manage the cognitive load, ensuring that the area of value under the professional curve is expanded, as learners reconcile empirical demands with the complex synthesis developed through immersion. Unlike standard group presentations, which often reinforce isolated silos, this simulation utilises an enhanced jigsaw structure (Reba et al. 2022). This structure converts the social gap into a professional asset by mandating collaborative dependency, which necessitates deep work; the accuracy of the collective advice hinges on the rigour of each component. By replicating the situational logic of a professional firm, the framework provides a critical buffer against the risks of practice and directly addresses Seel's (2001) construct of mental model construction. The simulation stabilises the learner's transition from fragmented preconceptions to coherent, professional mental models. It operationalises the transition from theory to practice by replacing abstract case studies with a fictitious client, thereby necessitating the performance of actual fiduciary labour. The efficacy of such immersive designs is evidenced by similar interventions, in which structured workplace simulations have been shown to significantly shift student perceptions, moving them from a purely technical focus to a sophisticated awareness of the communication and leadership competencies required in practice (Bautista-Mesa et al. 2018). Expert oversight provides a structured clinical environment, a safe space for learners to master complex interpersonal exchanges, avoiding the high-stakes risks of unmediated practice. This cognitive apprenticeship equips graduates to navigate the intersection of stringent regulatory frameworks and the human complexities of the interaction phenomenon (Asebedo 2024).

7. Proposed Intervention

7.1 Simulated Fiduciary Environment

The simulation is structured as a fiduciary practicum, with students assigned to advisory teams of three to five members. This replicates the collaborative environment of modern firms, mandating a move from siloed sociality to professional interdependence. Teams are presented with a deliberately ill-defined case study of a fictitious client that encompasses a complex web of information representing all the financial planning pillars.

This deliberate complexity aligns with empirical justifications for messy simulations (Herrington and Oliver 2000), which argue that traditional, clean case studies often fail to prepare students for the rhetorical and social demands of the workplace (Balzotti and Rawlins 2016; Fincham et al. 2022). By presenting students with ill-defined problems, the simulation prevents the simple retrieval of textbook answers. It forces the development of sitaution awareness, specifically the capacity to perceive and comprehend conflicting client data to project viable financial outcomes (Chaffin and Grable 2018). This executive functioning is essential for navigating the authentic uncertainty of fiduciary practice (Balzotti and Rawlins 2016) and for integrating the primary pillars of financial planning, requiring students to parse intricate legislation in real time.

Technical mastery is facilitated through a cognitive apprenticeship in which students must internalise and then externalise complex advice. Within each team, students are assigned lead responsibility for a specific financial pillar. This necessitates complex sensemaking, as each lead must ensure their specific solutions align with the broader multidisciplinary strategy. Before the final presentation, students conduct a formal internal peer review, redirecting the cohort's natural preference for relational alignment (Hassoun et al. 2023) toward professional accountability. Students must justify their technical contributions to their peers, simulating the internal checks and balances of a professional firm.

The simulation culminates in a formal inquiry initiated by a panel of industry practitioners and academics acting as client-judges, testing the stability of the students' mental models under the pressure of the interaction phenomenon (Asebedo 2024) and the students' mastery of the human element, requiring them to transition from a technical technician to a financial architect capable of managing complex behavioural dynamics (Rattiner 2021). This expert oversight provides model-based feedback, exposing students to causal explanations and rigorous scrutiny by industry experts, which triggers a discrepancy-based transition (Seel 2001). Students are compelled to refine intuitive preconceptions and realign them with the sophisticated structural knowledge of a professional practitioner, which transcends technical correction, guiding them through the socio-emotional, bespoke decision-making required in practice and ensuring that fading support leads to genuine professional autonomy (Herrington and Oliver 2000).

7.2 Theoretical Alignment

The simulation's structural integrity is validated by its alignment with the nine critical elements of authentic learning environments. Table 1 maps the specific features of this intervention, from the sociotechnical environment to expert coaching, to the design framework established by Herrington and Oliver (2000).

Table 1: Mapping the Workplace Simulation Design

Element	Implementation in Proposed Simulation
Authentic Context	Use of real-world, holistic financial data sets rather than simplified textbook examples.
Authentic Activity	Students solve ill-defined problems that require sustained investigation and multidisciplinary integration.
Expert Performance	Involvement of industry professionals who model the situational logic required in client interactions.
Multiple Perspectives	Jigsaw-style group work in which students must defend strategies from different specialist perspectives.
Collaboration	Mandatory group-based synthesis of the final financial plan, mirroring a professional practice.
Reflection	Post-presentation debrief forces students to re-evaluate their intuitive shortcuts.
Articulation	The client-judge defence, in which students must verbally justify their advice in a public forum.
Coaching and Oversight	Real-time guidance from industry mentors, with support that fades as the simulation progresses.
Authentic Assessment	Evaluation based on professional fitness for practice rather than multiple-choice technical testing.

Source: Adapted from Herrington and Oliver's (2000) Nine Elements of Authentic Learning

7.3 Evaluating Design

The simulation utilises a multi-dimensional assessment matrix (Table 2). This tool shifts focus from rote memorisation to situated competence, bridging the gap between digital consumption and the professional

competencies of fiduciary practice. Evaluation efficacy depends on a strategic client-judge panel that serves as a dual-layered validator of professional fitness. By synthesising academic and industry expertise, the simulation creates a feedback loop reconciling theoretical excellence with practical deamands. Academic faculty ensure pedagogical rigour and verify the legislative mastery required for qualification. Conversely, industry partners inject the situational logic unique to the financial sector. These practitioners scrutinise professional presence and fiduciary readiness. This collaborative oversight ensures the student's transition from the classroom periphery to the professional centre is validated by both academic standards and the interaction phenomenon (Asebedo 2024).

Table 2: Conceptual assessment framework

Evaluation	Theoretical Foundation	Assessment Criteria
Technical Integration	Authentic learning (Herrington and Oliver 2000)	Accuracy of statutory application; the ability to synthesise multiple pillars into a cohesive fiduciary strategy within a non-linear case study.
Interactional efficacy	Financial planning client interaction theory (Asebedo 2024)	The student's ability to manage the client-advisor relationship, demonstrating empathy and clarity while translating complex data.
Epistemic Maturity	Information Sensibility (Hassoun et al. 2023)	Evidence of cognitive effort; moving beyond intuitive shortcuts and peer-mediated biases toward evidence-based judgment.
Executive Function	Situated cognition: mental model stability (Seel 2001)	Stability of the student's mental models during the defensive inquiry, and the ability to justify advice under professional pressure.
Professional Enculturation	Situated learning: legitimate peripheral participation (Lave and Wenger 1991)	Quality of internal peer-review: the transition from a peripheral student identity to a junior practitioner identity.

8. Discussion and Limitations

Contemporary learners prioritise relational alignment over the sustained cognitive effort required for complex financial planning (Loh and Kanai 2016; Hassoun et al. 2023). Traditional teaching models fail where they treat financial pillars as static facts rather than as interactive phenomena (Asebedo 2024). By situating learners within an authentic sociotechnical environment, immersion disrupts the cycle of shallow task-switching. It forces a transition from screen-based consumption to executive functioning, redirecting the learner's drive for social validation toward professional accountability and technical accuracy. The student must move beyond simple perception to higher-level comprehension and the real-time projection of client needs (Chaffin and Grable 2018) and reconcile internalised intuitive shortcuts with the exacting standards of a fiduciary environment. This integration of situated cognition (Brown et al. 1989) and cognitive apprenticeship utilises industry partners as expert practitioners, making the tacit situational logic of financial advisory visible and ensuring that technical mastery is not achieved in a vacuum but developed within the high-fidelity pressure cooker of the regulatory sector. Such expert coaching and oversight of experiential learning are essential when the consequences of error are profound (Wooley and Jarvis 2007). The outcome is a discrepancy-based transition (Seel 2001), in which the student is compelled to refine their intuitive preconceptions to align with the sophisticated structural knowledge of a professional practitioner. Through this immersion, students cultivate the cognitive habits necessary to process multifaceted client data, an essential requirement for the financial architect who must maintain situational clarity under pressure (Chaffin and Grable 2018). The workplace simulation addresses the emerging industry requirements for sophisticated relationship management and the mastery of the human element in financial advisory (McCarthy 2020). The modern practitioner must transcend technical competency to provide a client-centric experience that relies on high-level emotional resonance and the ability to navigate complex behavioural dynamics (Rattiner 2021). By implementing an enhanced jigsaw structure, the design converts the cohort's siloed sociality into a professional asset through collaborative dependency (Reba et al. 2022). This structural choice ensures that the area of value under the professional curve is expanded. The student is no longer a peripheral observer of a textbook; they are transformed into a junior practitioner who must synthesise multidisciplinary data to manage the client-advisor interaction. This redefines the student's identity to a behavioural coach capable of driving long-term financial well-being (McCarthy 2020). This conceptual study focuses on the theoretical justification for workplace simulations over longitudinal empirical outcomes; however, further research must confirm whether participants achieve higher ethical consistency than those in solely conventional lecturing tracks. Although resource-intensive, transitioning to an authentic sociotechnical

environment is a necessary extension of traditional instruction. Future studies should explore the model's scalability within larger institutions to ensure theoretical excellence consistently translates into professional readiness.

9. Conclusion

This study presents a theoretical framework to align digital-native cognitive profiles with the rigorous demands of fiduciary practice. By integrating client interaction theory with modern information sensibilities, the research demonstrates that while foundational, traditional teaching methods alone are insufficient for high-level professional efficacy, synthesising with immersive simulations prepares graduates for the interaction phenomenon inherent in the client-advisor relationship. The proposed model represents a pedagogical innovation in higher education, transforming abstract theory into a validated professional reality. This framework does not replace technical instruction; rather, it provides a high-fidelity professional environment for students to transition from shallow, peer-mediated intuitive perceptions toward the sustained cognitive effort required for independent practice. By involving industry practitioners in assessment, the model ensures fitness for practice is validated by the professional community, mitigating the onboarding risks for entry-level practitioners. This dual-layered approach, coupling technical foundations with situated learning and cognitive apprenticeship, equips planners with the interactional agility and entrepreneurial self-efficacy necessary for a volatile landscape. These high-fidelity simulations answer a global call for future-ready education, ensuring graduates possess the cross-functional agility to thrive in an automated industry. By bridging the classroom-practice divide, this framework secures the fiduciary relationship and fosters resilient ecosystems. The model cultivates the professional habits necessary to enter the industry and remain employable, creating a foundation for those who aim for independent ownership. It acknowledges that unless a graduate is competent from day one, they cannot successfully navigate the shift toward self-managed practice. The result is a cohort of practitioners with an owner-manager orientation, capable of launching independent practices and driving global financial innovation.

Ethics Declaration

Ethical approval was obtained for this research. An application for full ethical approval was submitted to the CBE Research Ethics Committee at the University of Johannesburg, and ethics consent was received on 22 May 2026. The ethics approval number is 26SOM01.

AI Declaration

The author used generative AI (Gemini 3 Flash) during the preparation of this manuscript. The tool was utilised specifically for sentence restructuring, linguistic refinement, and the synthesis of complex theoretical terminology to improve the clarity and professional tone. The author maintains sole authorial oversight and full responsibility for the creation of the paper and the overall intellectual integrity of the work. No AI tools were used to generate primary data or to conceptualise the research.

Developing Entrepreneurial Competencies in Tourism Higher Education: A Design-Based Curriculum Innovation

Michal Lukáč, Ján Ganobčík, Stanislava Honzová and Peter Pisár
Institute of Management, University of Ss. Cyril and Methodius in Trnava, Slovakia

michal.lukac@ucm.sk
jan.ganobcik@ucm.sk
stanislava.honzova@ucm.sk
peter.pisar@ucm.sk

Abstract: The paper presents a design-based curriculum innovation framework developed for a bachelor's programme in Tourism and Hospitality Management at a public university in Slovakia. The innovation includes two newly introduced courses: Entrepreneurial Marketing and Branding in Tourism and Venture Ecosystem. The approach is based on project-based learning, real-world cases, and the use of digital tools. The study adopts a design-based conceptual approach to curriculum development and proposes a structured model for integrating entrepreneurial, digital, and innovation competencies. The paper also outlines implications for educators and policymakers. The paper represents the first phase of a broader research project, focusing on conceptual development, with empirical validation planned in subsequent stages.

Keywords: Entrepreneurship Education; Tourism; Venture Ecosystem; Branding; Innovation

1. Introduction

The tourism and hospitality sector has undergone significant transformation in recent years, driven by digitalisation, increasing competition, and changing customer behaviour. Technological progress, the development of online platforms, and a growing emphasis on customer experience have fundamentally reshaped how businesses operate in this sector (Buhalis and Law, 2008; Sigala, 2018). As a result, there is increasing demand for graduates who possess not only theoretical knowledge but also practical skills, entrepreneurial thinking, and the ability to adapt to dynamic market conditions.

Despite these developments, higher education in tourism often remains predominantly focused on the transmission of theoretical knowledge, with insufficient emphasis on the development of practical competencies (Hjalager, 2010). This misalignment creates a gap between educational outcomes and labour market needs, particularly in areas such as digital marketing, branding, customer engagement, and entrepreneurial problem-solving.

Contemporary approaches to entrepreneurship education emphasise a shift from transmissive teaching models to competency-based approaches grounded in active learning, experimentation, and real-world problem-solving (Fayolle and Gailly, 2008; Neck and Greene, 2011). In this context, the integration of project-based learning, digital tools, and collaboration with practice becomes essential.

The aim of this paper is to present a design-based approach to the innovation of a bachelor's study programme in Tourism and Hospitality Management at a Slovak public university, reflecting labour market needs and principles of smart specialisation. The paper focuses on the introduction of two new courses, Venture Ecosystem and Entrepreneurial Marketing and Branding in Tourism, and analyses their potential to support the development of entrepreneurial and digital competencies.

This paper contributes to the literature by proposing a structured design-based curriculum innovation model that integrates entrepreneurial, digital, and innovation competencies. Unlike existing studies that focus on isolated skills or general pedagogical approaches, the paper conceptualises curriculum design as a systemic process linking labour market needs, venture ecosystem logic, and experiential learning.

This study represents Phase 1 of a broader research project, focusing on conceptual development and theoretical grounding, while subsequent phases will address implementation and empirical validation.

2. Context and Background

Entrepreneurship education is increasingly shifting towards competency development and experiential learning (Fayolle and Gailly, 2008; Neck and Greene, 2011). In the context of tourism, this shift implies the ability to create value, build brands, and respond effectively to evolving customer needs.

At the same time, digitalisation is transforming marketing communication and customer relationship management (Chaffey and Ellis-Chadwick, 2019), requiring the integration of digital tools, branding, and entrepreneurial thinking into educational programmes. These developments highlight the need for curricula that go beyond theoretical instruction and actively develop practical and transferable competencies. Recent approaches to entrepreneurship education also distinguish between early-stage opportunity validation and the preparation of comprehensive business plans (Carvalho, 2025).

Despite these trends, the connection between higher education and real-world practice remains limited, reducing graduates' preparedness for entrepreneurial and innovation-driven environments. Moreover, existing research has paid relatively little attention to the structured design of curricula that systematically integrate entrepreneurial, digital, and innovation competencies, particularly in tourism education.

This gap underscores the need for a more systemic and design-oriented approach to curriculum innovation, which forms the basis of the model proposed in this paper.

3. Design-Based Conceptual Approach

The paper adopts a design-based conceptual approach to curriculum innovation, reflecting contemporary trends in entrepreneurship education that emphasise experimentation, iteration, and learning through practice (Ries, 2011; Blank, 2013). This approach is particularly suitable when the objective is not only to describe existing conditions but also to design, justify, and conceptually validate an educational solution responding to real-world needs.

The proposed model conceptualises curriculum design as a systemic process linking labour market requirements, innovation ecosystem logic, and experiential learning principles. It is grounded in an analysis of labour market needs, strategic documents related to smart specialisation (SK RIS3 2021+), and the specific requirements of the Tourism and Hospitality Management study programme.

The curriculum innovation is operationalised through the introduction of two courses: Entrepreneurial Marketing and Branding in Tourism and Venture Ecosystem. Both courses are designed to develop entrepreneurial, digital, analytical, and communication competencies. The learning process is structured around project-based learning, case studies, teamwork, iterative feedback, and the development of practical outputs such as marketing strategies, business models, value propositions, and investment pitches.

The approach builds on three complementary theoretical foundations: experiential learning theory (Kolb, 1984), which emphasises learning through action and reflection; entrepreneurship education theory (Neck and Greene, 2011), which highlights practice-based and competency-oriented learning; and innovation ecosystem perspectives, which frame entrepreneurship as embedded in a broader network of actors and institutions.

The study is positioned as the first phase of a broader research project. In line with design-based research methodology, this phase focuses on conceptualisation and model development, while subsequent phases will involve implementation, iterative refinement, and empirical validation in real educational settings.

The proposed curriculum innovation is summarised in Figure 1, which presents a structured framework linking external drivers, learning processes, and competency outcomes.

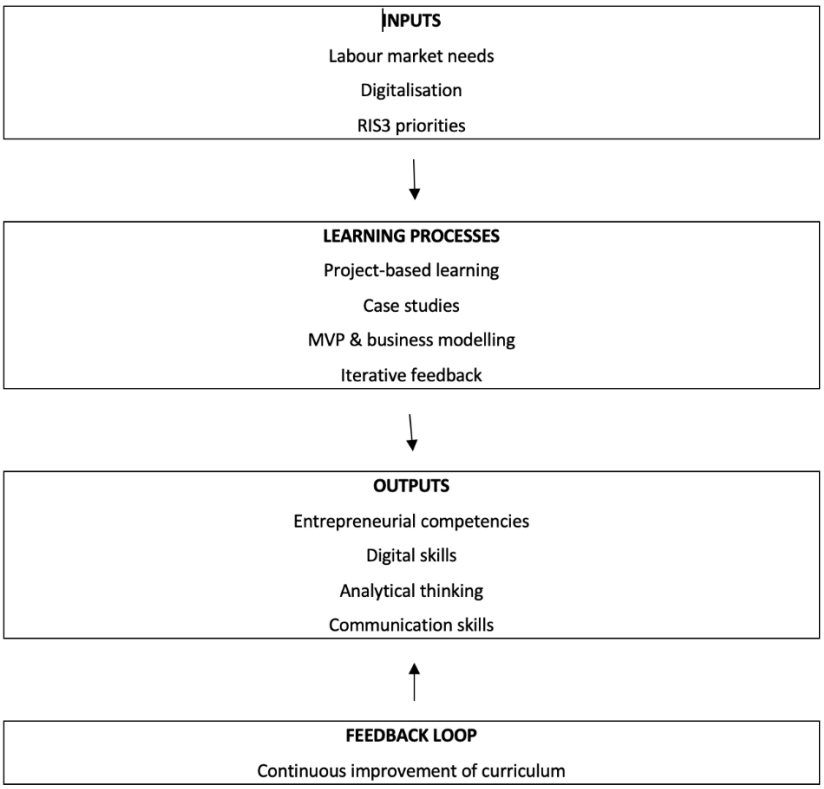

Figure 1: Design-based curriculum innovation framework linking external drivers, learning processes, and competency outcomes.

Source: Authors' research.

The model illustrates how external drivers are translated into structured learning processes, which in turn lead to the development of key competencies. The feedback loop reflects the iterative nature of curriculum design and continuous improvement. The framework reflects a systemic approach to curriculum design, ensuring alignment between educational objectives and labour market needs.

3.1 Evaluation Framework

To complement the design-based conceptual approach, the paper proposes a preliminary evaluation framework for assessing the effectiveness of the curriculum innovation.

The framework focuses on three dimensions:

- development of entrepreneurial competencies,
- acquisition of digital and marketing skills,
- student engagement and applied learning outcomes.

Entrepreneurial competencies can be assessed through students' ability to identify opportunities, develop business models, and present investment pitches. Digital competencies relate to the use of marketing tools such as social media, SEO, and CRM systems. Engagement can be measured through participation in project-based activities and the quality of outputs.

The framework provides a basis for future empirical validation and enables systematic evaluation of curriculum innovation in tourism education.

The study is positioned as the first phase of a multi-stage research design. In line with design-based research methodology, the initial phase focuses on conceptualisation and model development, followed by iterative implementation and empirical validation in real educational settings.

4. Curriculum Innovation

The introduction of new courses responds to the need to align the curriculum with labour market requirements, employer expectations, and developments in tourism, digital marketing, innovation, and entrepreneurship.
The course Entrepreneurial Marketing and Branding in Tourism strengthens competencies in marketing strategy, customer engagement, branding, and digital communication. The course Venture Ecosystem reflects the growing importance of startup environments, entrepreneurial thinking, and opportunity recognition. Both courses are also linked to a national project aimed at supporting students' entrepreneurial innovation potential. Project-based learning and real-world cases are recognised in the literature as key tools for developing entrepreneurial competencies (Kolb, 1984; Pittaway and Cope, 2007).

4.1 Venture Ecosystem

This course focuses on developing entrepreneurial thinking and understanding the functioning of entrepreneurial ecosystems. It aims to equip students with the ability to identify opportunities, design business models, and test them in simulated or real environments.

Course content includes:

- analysis of the business environment,
- generation of entrepreneurial ideas,
- development of a value proposition,
- fundamentals of the startup ecosystem,
- application of the MVP concept, opportunity validation, and iterative development before preparing a complete business plan.

Learning outcomes are structured in terms of knowledge, skills, and competencies. Upon completion of the course, students understand the functioning of the venture ecosystem and the roles of startups, investors, incubators, accelerators, and public institutions. They can identify entrepreneurial opportunities, assess their market and innovation potential, design a business model, and prepare a basic investment pitch. At the same time, they develop analytical, systemic, and communication competencies necessary for operating in a dynamic and uncertain entrepreneurial environment.

The course builds foundational courses in economics, management, and marketing, extending them towards practical application in the context of innovative entrepreneurship and startup ecosystems.

4.2 Entrepreneurial Marketing and Branding in Tourism

This course focuses on developing competencies in marketing strategy, brand building, and digital communication. It responds to the need for a systematic development of skills related to customer engagement and customer experience management.

Course content includes:

- brand identity development,
- definition of the value proposition,
- brand positioning,
- digital marketing (SEO, content marketing, social media),
- email marketing and CRM tools,
- customer journey management.

4.3 Teaching Methods

The proposed teaching model is based on active and participatory learning approaches that support the development of practical competencies (Pittaway and Cope, 2007; Neck et al., 2021).

Key methods include:

- project-based learning (development of real solutions),
- case studies,
- teamwork,
- iterative feedback,
- presentation and defence of solutions.

The teaching methods are grounded in active learning, encouraging student engagement in solving real or simulated entrepreneurial situations. Project-based learning enables students to progressively move through the entire problem-solving process from problem identification, through the design of a value proposition and business model, to the presentation and defence of their solutions. Case studies enhance the ability to apply theoretical knowledge to specific situations in tourism, while teamwork fosters communication, collaboration, and role distribution. Students are encouraged to validate business ideas through iterative testing and customer feedback before developing comprehensive business plans.

Iterative feedback is a crucial element of the teaching process, as it allows students to refine their solutions based on continuous evaluation, instructor feedback, and group discussion. This approach is consistent with the principles of experiential learning and entrepreneurship education, which emphasise learning through action, experimentation, and reflection.

Table 1:

Course	Entrepreneurial Competencies	Digital Skills	Key Outputs
Venture Ecosystem	Opportunity recognition, business modelling	Basic analytics	Pitch, business model
Marketing & Branding	Strategy, positioning	SEO, social media, CRM	Marketing strategy

Source: Own research.

5. Expected Contributions and Insights

The proposed curriculum innovation is expected to bring a significant shift in the development of students' entrepreneurial competencies. Based on the analysis of current trends in education and business, the implementation of the proposed courses and teaching methods is anticipated to strengthen students' ability to apply theoretical knowledge in practical contexts.

Project-based learning and the use of real-world cases are expected to enhance students' understanding of entrepreneurial processes and develop their ability to solve complex problems. At the same time, an increase in student engagement and motivation is anticipated, which is consistent with findings on the effectiveness of experiential learning (Kolb, 1984; Neck and Greene, 2011).

The proposed approach is also expected to support the development of digital competencies, particularly in marketing communication and customer engagement. The integration of tools such as social media, content marketing, and CRM systems will better prepare students for labour market requirements.

From a programme design perspective, a key insight is the importance of linking theoretical knowledge with practical application through systematically designed learning activities. Feedback, an iterative approach to problem-solving, and flexibility in teaching play a crucial role in this process.

The implementation of the redesigned courses in practice is expected to improve students' ability to apply knowledge, increase their engagement, and strengthen their understanding of entrepreneurial processes.

As the project is currently in its initial phase, the proposed curriculum innovation has not yet been empirically implemented and evaluated. Therefore, the paper focuses on the conceptual design and theoretical justification of the model. At the same time, a structured evaluation framework is being developed to enable future assessment of the curriculum's effectiveness in terms of entrepreneurial competencies, digital skills, and student engagement. Empirical validation of the proposed model will be conducted in subsequent phases of the project using quantitative and mixed-method approaches.

This staged approach reflects the logic of design-based research, where conceptual development precedes iterative testing and refinement.

6. Implications

The findings highlight the need for systematic innovation of study programmes in line with labour market requirements and the principles of smart specialisation. The proposed approach is consistent with the priorities of SK RIS3 2021+, which emphasise the importance of developing innovation and entrepreneurial competencies.

From an educational policy perspective, it is essential to:

- strengthen the link between education and practice,
- develop digital and entrepreneurial skills,
- implement flexible and innovative teaching methods (European Commission, 2020).

The contribution of the paper lies in proposing a structured curriculum innovation model that integrates entrepreneurship, digital marketing, and venture ecosystem thinking in tourism education.

7. Conclusions

This paper presented a design-based approach to curriculum innovation in tourism and hospitality education. The proposed model responds to the growing need to develop entrepreneurial, digital, and marketing competencies among students, while effectively linking theoretical knowledge with practical application. The introduction of the courses Venture Ecosystem and Entrepreneurial Marketing and Branding in Tourism creates a structured framework for developing key competencies required in a dynamic and innovation-driven tourism sector.

The main contribution of the paper lies in conceptualising curriculum design as a systemic process that integrates labour market needs, venture ecosystem logic, and experiential learning principles. The proposed framework offers a practical and transferable model for aligning higher education outcomes with evolving industry requirements.

This study represents the first phase of a broader research project and focuses on the conceptual development and theoretical grounding of the proposed model. In line with design-based research methodology, subsequent phases will involve implementation, iterative refinement, and empirical validation in real educational settings.

The study is limited by its conceptual and design-based nature, without empirical validation at this stage. Future research will focus on testing the proposed model and evaluating its impact on student competencies, learning outcomes, and employability.

Innovation Measurement During Organizational Constraints: Opportunities and Challenges

Kinga Lundholm-Reinert and Thomas Østergaard
VIA University Collage, Denmark

reinert.kinga@gmail.com

Abstract: Businesses across the world compete to maintain market leadership, with innovation playing a central role in long-term competitiveness, growth, and resilience (Bouncken et al., 2024). For this reason, innovation is also prioritised by institutions such as the European Union through initiatives like the EU Green Deal and the EU Innovation Fund.Despite this, many organisations struggle to measure innovation effectively. Without credible measurement practices, innovation becomes difficult to justify financially, particularly during economic constraint. This study examines how the quality of innovation measurement influences innovation outcomes in a large organisation during financial pressure and governance constraints. Drawing on qualitative interviews, observations, and innovation theory, the findings reveal fragmented definitions of innovation, inconsistent expectations across organisational levels, lack of measurement ownership, and a tendency to deprioritise innovation during financially difficult periods. The study concludes that improving innovation measurement requires structural alignment and outlines recommendations for strengthening innovation processes and making innovation more visible, defensible, and sustainable.

Keywords: Innovation in large Organizations, Sustainable Innovation, Measuring Innovation, The Invincible Company, Innovation in the Green Deal

1. Introduction

Innovation has always been part of human development, but today it has evolved into a structured, strategic, and highly complex organisational activity (Moeller et al. 2008). This shift increases the need for clarity, coordination, and especially measurement, as innovation is now expected to justify investments and demonstrate value. Although innovation is widely recognised as critical, the way organisations measure it remains inconsistent or insufficient. Many companies rely on short-term or output-focused KPIs, which fail to capture the long-term and uncertain nature of innovation. As a result, innovation becomes difficult to justify when budgets tighten. This highlights the central role of measurement in shaping how innovation is prioritised and sustained. Without clear and aligned measurement practices, innovation cannot be effectively communicated or defended. This creates a gap between the intention to pursue continuous innovation and the reality of how it is managed in practice, particularly during periods of constraint.

Many organisations treat innovation as a strategic process embedded in their operations. However, despite this development, innovation remains resource-demanding and must navigate internal structures, hierarchies, and external pressures such as regulations and market conditions.

Especially in times of economic or political uncertainty, innovation becomes vulnerable within existing governance structures and financial pressure conditions. This is evident in cases such as the Danish energy company Ørsted, which faced challenges following changes in the U.S. administration (Mathis, 2025). As highlighted in the literature, innovation is often among the first areas to face budget cuts when organisations experience financial pressure and governance-driven prioritisation decisions.

Innovation typically involves cross-functional collaboration, creating opportunities for knowledge sharing and creative problem-solving. However, as organisations grow, innovation often becomes fragmented and influenced by misalignment, internal politics, and bureaucratic structures (West et al., 2004). This increases the risk that innovation is misunderstood, deprioritised, or reduced to incremental improvements.

These challenges become particularly visible during periods of financial constraint. Based on observations within a large global energy company, innovation activities were among the first to lose funding when cost reductions were required. This reflects a broader pattern where innovation is treated as optional, despite being framed as strategically important.

1.1 Research Question

How does the quality of innovation measurement influence innovation outcomes in large organisations during periods of constraint?

To address this question, the study explores how innovation is understood across organisational levels, how it is currently measured in practice, and how these factors influence innovation outcomes under financial and operational pressure.

2. Methodology

This paper follows a qualitative, exploratory case study design. Since the goal is to understand how innovation is prioritized, measured, and managed in a large organization during times of constraint and financial pressure, a case study approach was considered most suitable, providing in-depth insight into internal organisational processes. It allowed a close examination of one company from within and provided insight into how employees experience innovation work in practice beyond theoretical assumptions and surface-level observations.
