24th European Conference on Knowledge Management

ECKM 2023

Hosted by the ISCTE – Instituto Universitário de Lisboa, Portugal

7-8 September 2023

Edited by

Prof Florinda Matos and Prof Álvaro Rosa

A Conference Organised by ACI, UK

Proceedings of the

24th European Conference on Knowledge Management

ECKM 2023

A Conference Hosted By

ISCTE – Instituto Universitário de Lisboa, Portugal

7-8 September 2023

VOLUME ONE

Copyright the authors, 2023. All Rights Reserved.

No reproduction, copy or transmission may be made without written permission from the individual authors.

Review Process
Papers submitted to this conference have been double-blind peer reviewed before final acceptance to the conference. Initially, abstracts were reviewed for relevance and accessibility and successful authors were invited to submit full papers. Many thanks to the reviewers who helped ensure the quality of all the submissions.

Ethics and Publication Malpractice Policy
ACIL adheres to a strict ethics and publication malpractice policy for all publications – details of which can be found here:
http://www.academic-conferences.org/policies/ethics-policy-for-publishing-in-the-conference-proceedings-of-academic-conferences-and-publishing-international-limited/

Self-Archiving and Paper Repositories
We actively encourage authors of papers in ACIL conference proceedings and journals to upload their published papers to university repositories and research bodies such as ResearchGate and Academic.edu. Full reference to the original publication should be provided.

Conference Proceedings
The Conference Proceedings is a book published with an ISBN and ISSN. The proceedings have been submitted to a number of accreditation, citation and indexing bodies including Thomson ISI Web of Science and Elsevier Scopus.

Author affiliation details in these proceedings have been reproduced as supplied by the authors themselves.

The Electronic version of the Conference Proceedings is available to download from https://papers.academic-conferences.org/

The Conference Proceedings for this year and previous years can be purchased from http://academic-bookshop.com

VOLUME 1

Academic Papers

Knowledge Creation Among Managers and Supervisors in Palm oil Estates in Malaysia
Zabeda Abdul Hamid, Shangkar Ganesh Chandiram, Rodrigue Fontaine 1-9

R&D cooperation and innovation networks: lessons from SME participation in H2020
Ricardo Abreu, Jorge Antunes, Mafalda Escada, Muriel Pádua, Maria Teresa Patrício 10-17

Empowering Rural Public Library Users Towards Sustainable Community Development Goal.
Roziya Abu, Siti Khadijah Rafie, Haziah Sha'ari 18-23

Factors influencing professional virtual communities towards public service efficiency
Geeta Albert, Goh See Kwong, Nor Takrim Ibrahim 24-32

Learning Problems in a Remote Working Situation: A Generation Z Perspective
Anna Albrychiewicz-Słocińska 33-41

Knowledge Management and HRM Innovation through Expatriates
Dora Martins, Bruno Alexandre 42-49

Knowledge Sharing for Contextual Performance: An Empirical Study in the Ministry of Culture, Tourism and Antiquities in Iraq
Sawasn Al-husseini 50-57

The Place of Academia in the Knowledge Triangle: How Students Recognize the Role of Scientists for Building an Innovation Ecosystem
Dilyan Georgiev, Albena Antonova, Elissaveta Gourova 58-66

Financial Literacy and its Relationship to the Indebtedness of a Bank's Customers
Gerson Orlando Arce-Cruz, Juan Carlos Valencia-Mayuri, Wilder Oswaldo Jimenez-Rivera, William Miguel Jiménez Rivera, Franklin Cordova-Buiza 67-73

Knowledge Management: The Value of Inter and Intra-firm Activities Towards Innovation Performance
Emmanuel Ebo Arthur, Jan Stejskal 74-81

Preconditions for the development of organizational knowledge ecosystem inside an audit firm
Giedrius Jucevicius, Ema Aukscenyte 82-88

Impact of Non-Human Actors in Communicating Meaning: Towards a Knowledge Translation Framework
Alexeis Garcia-Perez, Professor Denise Bedford 89-97

SMEs in Collaborative Innovation Networks: A Maturity Model Evaluating their Absorptive Capacity
Lamiae Benhayoun, Marie-Anne Le Dain, Bouchaib Bahli 98-106

Rejecting Innovation: How Italian Public Employees are Killing Creativity and Digitalisation
Marco Berardi, Andrea Ziruolo, Fabrizia Fontana 107-113

Hologram of Firms with Respect to the Productive Fabric of a Region: A Case of Business Transformation through Knowledge Transfer in Medellín (Colombia)
Jorge Betancur, Rodriguez, G., Restrepo, J.P., Mr. 114-123

KM Challenges in Small KIBS Companies: Multi-case Analysis in Two Countries
Ettore Bolisani, Tomas Cherkos Kassaneh, Anna Lis, Enrico Scarso, Ewa Stolarek-Muszynska, Malgorzata Zieba 124-131

Instrumental and Integrative Ethics in the Context of a Knowledge Management Policy
Manfred Bornemann 132-139

Knowledge Dynamics and Expert Knowledge Translation: A Case Study
Constantin Bratianu, Alexeis Garcia-Perez 140-147

Exploring Onboarding Processes for IT Professionals: The Role of Knowledge Management
Vebjørn Brødsjø, Benjamin Sandøy, Eli Hustad 148-158

Online Patient Account: A Tool to Support Older Adults or Digital Exclusion?
Magdalena Bsoul-Kopowska 159-168

Examining the Impact of Intra-group or Inter-group Social Capital on Innovative Climate in Enterprises of the Innovation Sector
Felicjan Bylok 169-177

Futurizing the Intellectual Capital Theory
Aino Kianto, Sladjana Cabrilo 178-183

Intellectual Capital for Enhancing Sustainable Industrialization: Towards the Sustainable Development Goal (SDG) 9
Maria Cabrita, Lina Užienė, Alexeis Garcia-Perez , Jose Maria Viedma 184-190

Innovational Leadership and Knowledge Sharing: The Mediator Role of Self-efficacy
Delio Ignacio Castaneda, Camilo Ramirez 191-198

Linking Institutional Voids with Blind Spots Through Counter-Knowledge in the Spanish National Healthcare System
Juan Gabriel Cegarra Navarro, Aurora Martínez-Martínez, Raghda El Ebrashi, Anthony Wensley 199-205

The Role of the Intellectual Potential of Employees in Creating the Goodwill of a Teaching Hospital
Jolanta Chluska 206-213

The Influence of Relational Intellectual Capital and Information Technology on Hospital Efficiency
Andrzej Chluski 214-223

Knowledge Management in the Ecolabnet Project: Practical and Theoretical Utilisation of Eco-innovations
Grzegorz Chmielarz 224-231

Knowledge Management in the Context of Remote Work in the Opinions of Employees. Challenges and Opportunities
Leszek Cichobłaziński 232-239

Knowledge Transfer in Hybrid Organizations: A case study of Smart Energy Community (SEC)
Simone Cifolelli, Andrea Ziruolo, Marco Berardi 240-249

Tacit Knowledge and Skills Transfer in a Family Business During Generational Succession
Concetta Lucia Cristofaro, Sabrina Bonomi, Rocco Reina 250-256

East vs West: Satisfaction With Knowledge Sharing Among Millennials
Carla Curado, Mírian Oliveira, Paulo Lopes Henriques, Anna Dolot 257-265

Stakeholder's Perception of Subsequent Goodwill Measurement: An Analysis of IASB Comment Letters
Mónica D'Orey, Carla Carvalho 266-274

Identifying Knowledge Management Processes in Futures Research
Jonathan Augusto da Silva, Matheus Argôlo, Carlos Eduardo Barbosa, Yuri Oliveira de Lima, Herbert dos Santos, Alan Lyra, Jano de Souza 275-283

Current State and Future Direction of Digital Knowledge Management in Small and Medium Enterprises
Yannick Dassen, Luca Liehner, Philipp Brauner, Simon Storms, Werner Herfs, Martina Ziefle 284-292

Knowledge Absorptive capacity in Fintechs: Evidence from Latin America
Paul Marcelo Pimentel Bernal, Guillermo Antonio Davila, Maria Teresa Cuenca-Jiménez, Susanne Durst 293-301

Risks for Knowledge-uptake in Dutch Marine Spatial Planning: Incompatibilities Between Research and Policy-making
Jort Wabbe Vries, de, Christian Zuidema, Rozanne Spijkerboer 302-309

Knowledge and Innovation Performance in Czech Firms: The Influence of Decision-Making Structure
Denys Dmytrenko, Viktor Prokop 310-317

Shortcomings of Current Performance Measurement and Management Systems: A Literature Review
Anna Dvořáková, Michaela Kotková Stříteská 318-326

Data Framework for Retrieving Failure Information from Earlier Plant Engineering Projects
Robert Egel, Sabrina Karch, Bernd Kuhlenkötter, Arndt Lüder 327-334

Intelligent Virtual Assistants and New Perspectives of Knowledge Acquisition
Tomasz Eisenbardt 335-343

The Impact of Knowledge and Experience on Opinion Formation: The Case of Cryptocurrencies
Monika Eisenbardt, Tomasz Eisenbardt 344-353

Knowledge Visualization for Learning in Higher Education Contexts: Systemizing the Field
Christian Spletter, Martin Eppler 354-361

The Impact of the COVID-19 Pandemic on Investment Management in the Housing Market in Turkey
Celal Erdogdu, Inese Spica 362-368

Relational Capital & Media Brands
Scott Erickson, Helen Rothberg 369-376

Sharing Knowledge in Multi-generational Teams in Remote Working Conditions During the Covid-19 Pandemic
Joanna Gajda 377-383

A Panel Regression Analysis of the Role of Globalization and Internet penetration on Economic Development in the Czech Republic and Slovakia
Mohammed Ibrahim Gariba, Romana Provazníková 384-393

Green Knowledge Management and Innovation for Sustainable Development: A Comprehensive Framework
Maryam Ghorbani 394-399

A Transdisciplinary Research Model Through Knowledge Co-production in Complex Sociotechnical Systems
Eduardo Giugliani, Priscila Susin, Maria Angélica Jung Marques ` 400-404

Smart Village Concept: What are the Crucial Categories of Elements?
Konrad Głębocki 405-410

Model for Developing the Creativity of Future Engineers
Marek Goliński, Małgorzata Spychała, Magdalena Graczyk-Kucharska 411-420

Undesirable Knowledge Behaviours and Task Conflict in Hospitals: Effects on Quality of Care
Tiago Gonçalves, Carla Curado 421-429

Employee Well-being and its Potential Link with Human Knowledge Risks
Malgorzata Zieba, Martyna Gonsiorowska 430-436

Analysis of Tools Supporting the Formation of Relations in an Educational-and-economic Network
Magdalena Graczyk-Kucharska, Mousselli Kamil , Szafrański Maciej, Goliński Marek,
Spychała Małgorzata 437-445

Developing Intellectual Capital Through Knowledge Management in International Assignments: A Conceptual Model
Adriana Gradim, José Vale, Vera Vale 446-453

The Dynamics of the Development of Knowledge Ecosystem
Kristina Grumadaitė, Giedrius Jucevičius 454-461

Knowledge Management Practices in Research and Development Strategic Projects Undertaken by Banks
Tadeusz A. Grzeszczyk, Tomasz Groszkowski 462-468

University-Industry Technology Transfer and Coproduction: A Case Study
Fernanda Guimaraes, Roberto Carlos dos Santos Pacheco, Monica Ramos Carneiro, Fernando Alvaro Ostuni Gauthier 469-476

Virtual Reality for Supporting Knowledge Sharing: An Exercise of Technology Assessment
Gennifer Gurian, Ettore Bolisani, Kathrin Kirchner 477-485

Onboarding and Knowledge Sharing: Cases from the Netherlands and Norway
Hanne Marit Haave, Pascale Peters, Yasmina Khadir-Poggi, Tone Vold 486-490

Knowledge Management for the Micro Enterprise: A Taxonomy
Stephen Hall 491-498

The Effect of Knowledge Creation Practices on Managerial and Marketing Innovation Through Creativity
Rawâa Hammami, Karima Bouzguenda 499-508

Towards Industry 5.0: Developing Knowledge and Skills in a Research and Innovation Lab
Irina-Emily Hansen, Ola Jon Mork, Paul Steffen Kleppe, Lars Andre Langøyli Giske 509-517

A New Framework for Gaining Emotional Health Knowledge Through Virtual Reality-IoT Technology
Lázaro Hardy, Diego De Castro , Guilherme Agnolin, Gabriel Ronney da Silva, Marcela Purificação 518-524

Gamification Influence on the Quality of Employee Knowledge Contributions: Gender Disparity in Service Organizations Post Covid-19
Ikramul Hasan, Jannatul Nahin Chandni, Humayra Adiba Sheikh 525-532

The Role of Marketing Knowledge Sharing in Building Organizational Immunity
Tareq Hashem 533-540

CLARK: Building Conversational Intelligence for Knowledge Management in the Space Domain
Marcel Henriquez, Andrew Herd, Paulius Danènas, Darius Dilijonas, Jose Ontiveros 541-549

Threshold Concept for Promoting Business Transformation
Yayoi Hirose 550-556

Use of Knowledge Management Strategies to Prevent Knowledge Loss in a Government Agency
Ike Hlongwane, Kamogelo Molekwa 557-563

Moneyball of X
Henri Hussinki, Harri Laihonen 564-571

Identification of Knowledge Workers and Analysis of Methods for Managing their Competencies in Baltic Sea Region Enterprises
Michal Igielski 572-582

Changes in the Labor Market in the Era of the COVID-19 Pandemic: Occupations Desired by Employers in the Polish Labor Market
Waldemar Jędrzejczyk 583-590

Reimagining Power and Micro-politics in Project Organisations
Johan Olaisen, Helene Jevnaker 591-598

Mapping Scientific Production on Organizational Knowledge Flow
Jaime Miranda Junior, Lídia Neumann Potrich, José Leomar Todesco, Paulo Mauricio Selig 599-608

Analysis of Critical Knowledge for Strengthening Resilience and Operational Safety
Jaime Miranda Junior, Denilson Sell, Lídia Neumann Potrich, Heron Jader Trierveiler 609-618

GLAM Wikiprojects as a Form of Organization of Cooperation Between Wikipedia and Cultural Institutions
Anna Karczewska 619-627

Aesthetics as Knowledge: An Aspect of the Future of Knowledge Management?
Clemen Kerschbaum 628-634

Knowledge Sharing and Service Innovation in Academic Libraries
Omar Khalil, Hatem Khalil 635-644

Value Orientations of Students at the Kazakh National Women's Teacher Training University and their View Towards Mixed Education
Neilya Khibina, Aizhan Salimzhanova, Zada Khibina 645-656

Domain Applications of Project Management Knowledge (DAPMK): Beneficial Knowledge Transfer and Soft Skill Development for Life-long Enhancement
Nasrullah Khilji, Stephen A. Roberts, George Middleton-Baker 657-665

Knowledge Management in Multimedia Communication Using Software Agents
Leszek Kieltyka 666-672

The Concept of a Subsystem to Support the Management of the Protection of Intangible Assets of Companies from a Behavioural Perspective
Paweł Kobis 673-682

Awareness Level of Information Security Managers in Small Enterprises in Poland
Paweł Kobis, Grzegorz Chmielarz 683-691

Business Environment Institutions as a Catalyst for Knowledge and Technology Transfer
Patrycja Krawczyk, Patrycja Kokot-Stępień 692-699

What Drives People to Share? The Relationship Between Working Style and Workplace FoMO
Edit Kovari 700-707

Relatedness and Futureness: Key Pillars for Developing Knowledge-based Management for Sustainability
Florian Kragulj, Clemens Kerschbaum, Alexander Kaiser 708-714

Intuition - Knowledge over Management Science: Lessons from the past decades
Patrycja Krawczyk, Patrycja Kokot-Stępień 715-723

Managing Remote Negotiation Strategies
Joanna Krzywda 724-732

Gender Differences and Readiness Towards Knowledge Sharing among Remote Working IT Sector Employees
Ewelina Krzyżowska 733-740

Managing Knowledge Acquired from Smart Meters in a Distributed Advanced Metering Infrastructure
Robert Kuceba 741-748

The KLC Cultures, Tacit Knowledge, and Trust Contribution to Organizational Intelligence Activation
Wioleta Kucharska, Denise A. D. Bedford 749-759

Collaborative Structures in WikiProjects. Wikipedia Users' Activity Case Study
Katarzyna Kukowska 760-768

Distinguishing the Dimensions of Learning Spaces: A Systematic Literature Review
Rosaria Lagrutta, Daniela Carlucci, Francesco Santarsiero, Giovanni Schiuma, Antonio Lerro 769-778

The Fusion of Talent Management and Knowledge Management: An Odd Couple or Happy Nuptial
Lawrence Abiwu, Martins Isabel 779-789

How Sharing Pro-Environmental Knowledge Creates Business Management Processes
Małgorzata Łęgowik-Małolepsza 790-799

Creating Knowledge of the Competitiveness of Enterprises in the Context of Changes in Management Processes
Sylwia Łęgowik-Świącik 800-809

Knowledge Management in Enhancing Organizational Flexibility in Manufacturing Enterprises
Anna Lemańska-Majdzik 810-817

Strengthening Organisational Resilience Through Knowledge Management: The Santa Catarina´s Civil Defense Case
Carlos Eduardo de Lima, Denilson Sell, Regina Panceri 818-827

A Meta-analysis Study about the Relationship Between Knowledge Management Strategy and Business Performance
Gang Liu, Eric Tsui, Aino Kianto, Yixiao Zhao 828-834

Spiritual Knowledge Management: Practical Wisdom and Faith-at-Work Brought to Life
Elaine Long 835-843

Strategies for Knowledge Management Readiness in an Engineering Consulting organization in South Africa
Edigar Mahuni, Madeleine Fombad 844-851

Impact of Organisational Culture and Employee Commitment on Knowledge Workers in an Insurance Company
Portia Makgalo, Ophillia Ledimo 852-861

Knowledge Management Practices and the Evolution of Healthcare Organizations based on a Certification Program
Patsy Mandelli, Cínthya M.S. Zanuzzi, Lia Caetano Bastos, Gregório Varvakis 862-871

Mitigating the Disruptive Consequences of Knowledge Loss in Organizational Settings: Knowledge Loss Clusters and Potential Organizational Interventions
Stefania Mariano 872-880

Decision Making for Knowledge Management in the Tequila Sector: A Fuzzy Logic Model
Antonieta Martinez-Velasco, Antonia Teran-Bustamante 881-892

Profiling European Consumers that Engage in Boycotting
Fernando Mata, Nuno Baptista, Maria Dos-Santos, Natacha Jesus-Silva 893-899

Managing Human Capital with Employee Clustering Through the Interplay of the Persona Concept
Anastasiia Mikhlina, Juha Saukkonen 900-907

Supporting Knowledge Communities: Examples from Organisations with Innovative Management Models
Ludmila Mládková 908-915

The Transition of Higher Education for Continuous Lifelong Learning: Expert Views on the Need for a new Infrastructure
Peter Mozelius, Martha Cleveland-Innes, Marcia Hakansson Lindqvist, Jimmy Jaldemark 916-923

Drivers of Environmental Responsibility in Family Firms: The Role of an Environmental Manager
Kateřina Myslivcová, Nikola Hausmannová, Lucie Zapletalová 924-931

Knowledge Sharing and Lean Manufacturing in Companies: An Empirical Investigation
Justyna Maria Myszak 932-939

Knowledge Sharing and Transfer Frameworks: Lessons from Sub-Saharan South Africa
Donovan Nadison, Obafemi Olekanma , Viwe Mgedezi 940-948

Mediating Role of Knowledge Management in the Relationship between Organizational Memory Building and Human Resource Management
Munawwar Najim, Iyad Edajani , Fayez Shaldan, Safinaz El Sheikh Khalil 949-959

Vulnerabilities and Knowledge Risks in Knowledge Processes
Andrei Stefan Nestian, Alexandra Luciana Guta 960-968

Exploring the Intersection of Knowledge Management and Spirituality in Higher Education Institutions
Carla Neves, Raysa Rocha, Paulo Pinheiro 969-977

VOLUME 2

The importance of digital and soft skills in the digital age
Nóra Obermayer, Tibor Csizmadia, Zsuzsanna Banász, Pál Purnhauser 978-987

Knowledge-Oriented Leadership in Enhancing Corporate Sustainable Performance in Small and Medium-Sized Enterprises – Development Potential Perspective
Małgorzata Okręglicka 988-997

A Comparative Study of ECKM Papers 2017-2022
Johan Olaisen 998-1006

The Knowledge Economy and Quality of Work in the Future: An Exploratory Study
Florinda Maria Carreira Matos, Pedro Oliveira 1007-1015

Capabilities for knowledge management in virtual collaboration: A systematic review
Anne Pedersen, Christine Ipsen, Kathrin Kirchner, Kasper Edwards 1016-1024

Autonomy and Knowledge Processes - a Systematic Literary Review
Jarmo Pekkanen, Aino Kianto, Mika Vanhala 1025-1033

A Digital Chain of Custody for a Blue Circular Economy
Gabriel Pestana, Carlos A. Rosa, Carlos A. M. Duarte, Isabel Farinha 1034-1041

Human Capital as a Key Factor for Organizations' ESG Goals
Adrian Petre, Doru Alexandru Plesea 1042-1048

The Challenges of Banco Crédito Agrícola in Portugal to the European Commission's Sustainable Finance Action Plan
Eduardo Tomé, Osvaldo Peuyadi, Andew Hatch 1049-1059

Building knowledge absorptive capacity in South African public companies through recruitment practices
Malefetjane Phaladi 1060-1068

Digital natives and their learning habits in acquiring knowledge
Luiza Piersiala 1069-1073

Remote work and human resources challenges from the Covid-19 pandemic scenario: The cases of Italy and Portugal
Piteira Margarida, Sara Cervai, Rosana Duarte, Kiall Hildred, Joana Carneiro Pinto 1074-1083

IC Theory and Public Healthcare
Paula Pusenius, Harri Laihonen, Johanna Lammintakanen 1084-1089

Data-Driven Approach in Knowledge-Based Smart City Management
Aleksandra Radziszewska 1090-1098

Academic development through course enhancements – becoming reflective practitioners
Ole Jørgen Ranglund, Hanne Marit Haave, Tone Vold 1099-1105

Knowledge Dissemination of Sustainable Product Development
Marcin Relich 1106-1115

The Role of a Manager in Managing Information in the Remote Work of Generation Z Employees
Elżbieta Robak 1116-1122

Towards sustainable rural communities
Mauro Romanelli 1123-1128

The Intellectual Capital and the perception about self
BERNADETE M V F DA ROSA, ALEXANDRE JORGE MIZIARA, PERCY NOHAMA 1129-1137

Knowledge sharing in manufacturing subsidiaries: proactive and reactive perspective in knowledge exploitation context
Aleksandra Rudawska 1137-1146

Utilising Shared Service Organisations for dynamic service networks
Linda Ryan 1147-1154

Managing knowledge in non-profit organisations
Anna Rybak 1155-1164

Relationships between leaders, capital, and knowledge
Agnieszka Rzepka 1165-1172

Mapping Knowledge-Life Cycle to Process Architecture
Mohammad Omar Sabri 1173-1177

Conceptual model of the product development process using the tacit knowledge of disables
Robert Sałek 1178-1187

Knowledge and Skills Development for Implementing the Industry 5.0 Concept
Sebastian Saniuk, Sandra Grabowska 1188-1195

Effectiveness of the Lessons Learned Process in ESA OPS Directorate
Stefano Scaglioni, Alfio Mantineo, Hanna Siebert 1196-1203

Beyond Knowledge Transfer: Why Building Information Modeling Requires More Than Just Knowledge for Success
Torsten Schwandt, Stefan Voigt, Stefanie Samtleben 1204-1210

The effects of Demand-side policy on firm innovation: The Mediating role of R&D activities
yeeyee sein, Viktor Prokop 1211-1218

Exploring Elegant and Practical Explanation Age® Concepts: KM as Learning
Philip Sisson 1219-1227

The Meaning of the Power Users in the Wikipedia Working Environment
Sebastian Skolik 1228-1236

Protection & Promotion of Traditional Knowledge of Marginalised Communities: A Legal Perspective
ROBERT SMITH, Mark Perry 1237-1245

Intellectual Capital of Humanities and Art Sciences and the Efficiency of its Formation at Scientific Institutions
Inese Spica, Baiba Berzina, Ernests Spics, Rozite Katrina Spica, Peteris Ponnis 1246-1254

How LinkedIn can boost SMEs' Digital Marketing Strategies on International Markets: A Case Study of an Apulian Tech-Intensive company
Claudia Spilotro, Giustina Secundo, Pasquale Del Vecchio, Vincenzo Barbieri 1255-1262

Knowledge Management in the Implementation of the Company's Business Strategy
Marcin Stepien 1263-1270

Scientific Ethos and Knowledge Management
Constantin Stoenescu 1271-1277

A bibliometric analysis deconstructing research on how cognitive technologies affects man-machine collaboration
Karl Joachim Breunig, Tina 1278-1287

The effect of Intellectual Capital and Strategic Partnerships in Construction Companies
André Sucena, Florinda Matos, António Nunes 1288-1293

Strengthening Collective Action and Sustainability of Traditional Farmers Organizations from an Indian Philosophical Perspective
Veena Suresh, Sreejith SS 1294-1302

Strategic knowledge bases in the context of discovering and creating business opportunities
Aleksandra Sus, Edmund Pawłowski 1303-1312

Training Initiatives in a Cooperative Network: A Polish Case Study
Scott Erickson, Maciej Szafrański 1313-1320

Knowledge management in HRM: so that the content of job offers could attract more candidates
Maciej Szafrański, Dorota Woźna, Magdalena Graczyk-Kucharska 1321-1329

A Framework for Analytical Demands of Alumni Capital
Rudger N. N. Taxweiler, Denilson Sell, Roberto C. S. Pacheco 1330-1337

Practices that Mitigate Organizational Knowledge Hiding: A Systematic Literature Review
Mirian Oliveira, Jaime Teixeira, Carla Curado, Clécio Araújo 1338-1345

Engagement of Actors in Expert Communities
Ilkka Tikanmäki, Harri Ruoslahti 1346-1352

Knowledge Management and Cryptocurrencies: review and reflection
Eduardo Tomé, Elizaveta Gromova 1353-1357

Knowledge of the Business Ecosystem and the Implementation of a Circular Economy
Jowita Trzcielinska 1358-1365

Knowledge in the discovery of market opportunities
Stefan Trzcielinski, Grzegorz Pawlowski 1366-1374

Impact of Business Intelligence Systems on Profitability - Empirical Study
Remigiusz Tunowski 1375-1382

Digital innovation through cybersecurity learning factories
Namosha Veerasamy, Thuli Mkhwanazi, Zubeida Khan 1383-1390

Organizing decision making process in public administration: the impact of knowledge visualization
Walter Vesperi, Anna Maria Melina, Marzia Ventura 1391-1398

Advancing the Intellectual Capital Theory- Some Ways Forward
Jose Maria Viedma Marti, Maria do Rosario Cabrita 1399-1409

Linking adult learning to knowledge management in a multigenerational workforce
Ms. Mary Viterouli, Dr. Dimitrios Belias, Dr. Athanasios Koustelios, Dr. Nikolaos Tsigilis 1410-1420

Preparing for work-life through work-like situated learning: A case study
Tone Vold, Hanne Haave, Carl-Henrik Wahl, Ole Jørgen Ranglund, Afra Koulaei-Van Oest 1421-1428

Inter-hospital knowledge sharing: Insights from case studies on infrastructure issues during COVID-19
Carl-Magnus von Behr, Tim Minshall, John Clarkson 1429-1439

Knowledge Management Dynamics in Offshore Wind Farms in the Netherlands
Heleen Vreugdenhil, Gerald Jan Ellen, Jort de Vries 1440-1445

Towards a Deeper Understanding of Intellectual Capital
Antthony Wensley, M. Max Evans 1446-1453

Knowledge About Medical Waste Management: How do Healthcare Professionals Learn and Practice?
Ane Linden, Amanda Werlang 1454-1461

Technological tools KM and innovation in SME enterprises
Dariusz Wielgórka 1462-1470

A Cross-Disciplinary Knowledge Management Framework for Artificial Intelligence in Business Projects
Andrzej Wodecki 1471-1480

Fostering a virtual knowledge sharing community in a Malaysian financial institution
Ali Imran Zakaraia, Sharifah Nur Izma Syed Izaddin, Geeta Albert 1481-1490

Knowledge Management and Interorganizational Networks of the Wine Industry
Cinthya Mônica da Silva Zanuzzi 1491-1499

Law and Judicial Records in Israel: Invalid Management and Sharing of Public Knowledge
Joseph Zernik 1500-1509

Validation of a framework for evaluating knowledge mobilization strategies: A Delphi method approach
Saliha Ziam, Sèverine Lanoue, Esther McSween-Cadieux, Quan Nha Hong, Julie Lane, Ollivier Prigent, Christian Dagenais, Valery Ridde, Emmanuelle Jean, Mathieu-Joël Gervais, France Charles Fleury 1510-1515

Great Resignation and Quiet Quitting as Post-pandemic Dangers to Knowledge Management
Krzysztof Zieba 1516-1522

Knowledge management based on the dynamism of the character of students, who are members of teams implementing social projects
Izabela Ziebacz 1523-1533

An Initial Standardized Knowledge Management Framework, Formed from Learning During a Humanitarian Crisis
Ewa Lipianin-Zontek, Zbigniew Zontek 1534-1541

PhD Papers

A meta-data-analysis of knowledge creation pattern of small businesses in Africa: Exploring the past to predict the future
Ronke Adesina, Dennis Ocholla 1543-1551

Impact of knowledge management process on Business Model Innovation: the moderating role of Wise Leadership
Insaf Ben Ghanem, Ayoub Nefzi, Amel Chaabouni 1552-1560

Appropriately Managing Knowledge in Romanian Entrepreneurial Businesses: Finding Balance in Restructuring Companies
Decebal Dumitrescu 1561-1570

Exploring knowledge management from a software engineering perspective
Dilyan Georgiev 1571-1578

Examining Digital Readiness in the Era Of Industry 4.0 in Tunisia
chaima hmida, Nóra Obermayer 1579-1585

The role of social initiatives in developing front-line employees' capabilities in the service industry: the case of a delivery company
Ali Krubally 1586-1595

Designing an Analytical Framework for Measuring Knowledge Mobilization in Higher Education Institutions in the Philippines
John Natividad, Dr., Dr. 1596-1606

How Knowledge-intensive Organizations Thrive Under Dynamic Conditions: An Organizational Capability Perspective
Gerald Stei, Alexander Rossmann, Levente Szász 1607-1614

A Systematic Literature Review on Agility in Knowledge-intensive Organizations
Gerald Stei, Levente Szász, Alexander Rossmann 1615-1622

Influences of cultural dimensions on knowledge-sharing behaviours: Insights for higher educational institutions in the Philippines
Malvin Tabajen, Farzad Sabetzadeh, Chulatep Senivongse 1623-1632

Knowledge management in crisis conditions and financial results of enterprises
Wiktoria Trzepizur 1633-1641

Masters Paper

How Can the Irish Construction Industry Become Less Fragmented and More Productive?
Philip Toland, David Collery 1643-1650

Non-Academic Papers

How to … Lessons Learned - a space sector study of best practice
Andrew Herd, Francesca Piretti 1652-1661

Knowledge Management in Public Transport: a Portuguese Empirical Study
Mariza Motta Queiroz 1662-1670

Next Generation Knowledge Management for Europe based Life Insurer: An end-to-end solution to assist Insurance Platform modernization and ongoing efficiency improvement
Mahesh Chandra Puvvada, Peru, Sathish 1671-1676

The Agile Knowledge Projector: enhancing the adaptive creation of knowledge
Tiziano Villa 1677-1682

Work in Progress Papers

Female Academics' Knowledge Sharing Behaviour in a Gender Non-Mixed Work Environment
Huda N Almutairi, Paul Gooding, Adele Redhead 1684-1688

Ecotourism Capital as an Enabler of Positive Change in Tourism Sustainability
Clara Cubillas-Para, Laura DiChiacchio, Juan Gabriel Cegarra-Navarro,
Alexeis Garcia-Perez 1689-1693

Navigating the Challenges of Deduplicating Actors in Historical Letter Exchanges
Senka Drobac, Petri Leskinen, Muhammad Faiz Wahjoe 1694-1697

Bringing novices from the passive role in knowledge sharing to the active role
Hamid Roham, Jorge F.S. Gomes 1698-1703

Renewal capital matters: Comparison between Lithuania and Taiwan
Te-Yi Lin, Lina Užienė, Carol Yeh Yun Lin 1704-1708

Understanding Organizational Knowledge Loss (OKL): A Bibliometric Analysis
Joachim Lorenz, Conrado Carrascosa-Lopez, M Rosario Perello-Marin, Michael Müller 1709-1713

The Workplace Podcast: Expanding Intraorganizational Knowledge Capacity
Edwin K. Morris, Emily Morris, Andrew Herd, John Jamison 1714-1718

Big Data and Performance: The Mediating Effect of Customer Agility
Victoria Yousra Ourzik 1719-1723

Entrepreneurial Capacities and Knowledge Development Processes – insights from a research project
Maria Sousa 1724-1728

ECKM Preface

Knowledge Management (ECKM 2023), hosted by Iscte – Instituto Universitário de Lisboa, Portugal on 7-8 September 2023. The Conference Chair is Prof Florinda Matos, and the Programme Chair is Prof Álvaro Rosa, both from Iscte Business School, Iscte – Instituto Universitário de Lisboa, Portugal.

ECKM is now a well-established event on the academic research calendar and now in its 24th year the key aim remains the opportunity for participants to share ideas and meet the people who hold them. The scope of papers will ensure an interesting two days. The subjects covered illustrate the wide range of topics that fall into this important and ever-growing area of research.

The opening keynote presentation is given by Professor Leif Edvinsson, on the topic of *Intellectual Capital as a Missed Value.* The second day of the conference will open with an address by Professor Noboru Konno from Tama Graduate School and Keio University, Japan who will talk about *Society 5.0, Knowledge and Conceptual Capability*, and Professor Jay Liebowitz, who will talk about *Digital Transformation for the University of the Future*.

With an initial submission of 350 abstracts, after the double blind, peer review process there are 184 Academic research papers, 11 PhD research papers, 1 Masters Research paper, 4 Non-Academic papers and 11 work-in-progress papers published in these Conference Proceedings. These papers represent research from Australia, Austria, Brazil, Bulgaria, Canada, Chile, China, Colombia, Cyprus, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, India, Iran, Iraq, Ireland, Israel, Italy, Japan, Jordan, Kazakhstan, Kuwait, Latvia, Lithuania, Malaysia, México, Morocco, Netherlands, Norway, Palestine, Peru, Philippines, Poland, Portugal, Romania, South Africa, Spain, Sweden, Switzerland, Taiwan, Thailand, Tunisia, UK, United Arab Emirates and the USA.

We hope you enjoy the conference.

Prof Florinda Matos
Iscte – Instituto Universitário de Lisboa
Portugal
September 2023

ECKM CONFERENCE COMMITTEE

Prof Rute Abreu, Guarda Polytechnc Institute, Portugal; Dr Sawasn Al-husseini, Middle Technical University, Iraq; Dr Mousa Al-kfairy, Zayed University, United Arab Emirates; Dr Ali Alawneh, Philadelphia University, Jordan; Dr José Álvarez-García, Facultad de Empresa, Finanzas y Turismo, Spain; Albena Antonova, Sofia University, Bulgaria; Dr Nekane Aramburu, University Of Deusto, San Sebastian, Spain; Dr Pierre-Emmanuel Arduin, Paris-Dauphine University, France; Prof Oscar Arias Londono, Institucion Universitaria de Envigado, Colombia; Prof Andrea Bencsik, University of Pannonia, Veszprem, Hungary; Marco Bettoni, Steinbeis Consulting Center Knowledge Management & Collaboration, Basel, Switzerland; Heather Bircham-Connolly, University of Waikato, Hamilton, New Zealand; Dr Ettore Bolisani, University of Padua, Vicenza, Italy; Prof SARA BOUZID, University of Cadi Ayyad, Morocco; Prof Constantin Bratianu, Bucharest University of Economic Studies, Bucharest, Romania; Dr Lukasz Bryl, Institute of International Economics, Poland; Prof Robert Buchmann, Babes-Bolyai University of Cluj Napoca, Business Information Systems Department, Romania; Dr Anthony Buckley, Faculty of Business, TU Dublin, Ireland; Prof Acma Bulent, Anadolu University, Turkey; Ass Prof Sladjana Čabrilo, I-Shou University, Kaohsiung, Taiwan; Dr Daniela Carlucci, University of Basilicata, Potenza, Italy; Dr Francisca Castilla-Polo, Universidad de Jaén, España; Delio Castaneda, Pontificia Universidad Javeriana, Bogota, Colombia; Dr Francisca Castilla-Polo, University of Jaén, Spain; Prof Juan-Gabriel Cegarra-Navarro, Universidad Politécnica de Cartagena, Spain; Prof George Chiladze, University of Georgia, Tblisi, Georgia; Dr Koteshwar Chirumalla, Malardalen University, Sweden; Dr Pieris Chourides, European University Cyprus, Cyprus; Dr Ritesh Chugh, Central Queensland University, Australia; Expert Technologist Maria Laura Clemente, CRS4, Italy; Dr Desiree Cranfield, Swansea University, United Kingdom; Assistent Professor PhD Cosmulese Cristina Gabriela, "Stefan cel Mare" University of Suceava, Romania, Romania; Anikó Csepregi, University of Pannonia, Hungary; Associate Professor Roberta Cuel, Università degli Studi di Trento, Italy; Dr Francesca Dal Mas, University of Rome/University of Rome La Sapienza, Italy; Prof Monica De Carolis, University of Calabria, Italy; Dr María de la Cruz Del Río-Rama, Universidade de Vigo (Campus de Ourense), España; Dr Souad Demigha, Univ Paris 1 Sorbonne And Univ Paris 11 Orsay, France; Research Assistant Anıl Dinç Demirbilek, İzmir University of Economics, Türkiye; Dr Bablu Kumar Dhar, Mahidol University International College, Mahidol University, Thailand, Thailand; Dr Mihaela Diaconu, "Gheorghe Asachi" Technical University, Romania; Prof Laura Diaconu Maxim, Faculty of Economics and Business Administration, "Alexandru Ioan Cuza" University of Iasi, Romania; Dr Yan Qing Duan, University of Bedfordshire, University Square, Luton, , UK; Assoc Prof Nasser Easa , American University in the Emirates , UAE; Prof John Edwards, Aston Business School, UK; Dr Tomasz Eisenbardt, University of Warsaw, Poland; Dr Monika Eisenbardt, University of Economics in Katowice, Poland; Dr Ramadan Elaiess, University of Benghazi, Libya; Dr Scott Erickson, Ithaca University, USA; Dr Pedro Ferreira, REMIT, University Portucalense, Portugal; Dr Vitor Ferreira, Polytechnic Institute of Leiria, Portugal; Prof Elisa Figueiredo, Guarda Polytechnic Institute, Portugal; Dr Silvia Florea, Lucian Blaga University of Sibiu, Romania; Dr Qiang Fu , Institute of Technical Education, Singapore, Singapore; Associate Professor Dr Liu Gang, Shenzhen Technology University, China; Dr Lidia Garcia zambrano, University of the Básque Country UPV EHU, Spain; Dr Daniel Glauber, KMAG, USA; Georg-Friedrich Göhler, Helmut-Schmidt University / University of the Federal Armed Forces, Hamburg, Germany; Prof Sofia Gomes, Portucalense University, Portugal; Prof Tadeusz A. Grzeszczyk, Warsaw University of Technology, Faculty of Management, Poland; David Gurteen, Gurteen Associates, UK; Dr Leila Halawi, Embry-Riddle Aeronautical University, USA; Ragna Kemp Haraldsdottir, University of Iceland, Reykjavík, Iceland; Dr Mahmoud Hassanin, Ahram Canadian University , Egypt; MSc Ann-Therese Hedqvist, Region Kalmar, Sweden; Ilona Heldal, Western Norway University of Applied Sciences, Bergen, Norway; Andrew Herd, European Space Agency, Leiden, Netherlands; Dr Ali Hessami, Vega Systems Ltd., UK; Prof Yayoi Hirose, Toyo University, INIAD, Japan; Prof Henri Hussinki, LUT University, Finland; Dr Eli Hustad, University of Agder, Norway; Prof Brigita Janiunaite, Kaunas University of Tehnology, Lithuania; Prof Waldemar Jędrzejczyk, Czestochowa University of Technology, Poland; Birgit Jevnaker, , Norway; Dr Magdalena Jurczyk-Bunkowska, Opole University of Technology, Poland; Dr Marta Kadłubek, Czestochowa University of Technology, Poland; Prof Alexander Kaiser, Department for Knowledge Management at the Vienna University of Economics and Business (http://wu.ac.at/kbm), Austria; Dr Marcela Katuščáková, Faculty of Social and Economic Sciences of the Comenius University in Bratislava, Slovakia; Prof Dr Turksel Kaya Bensghir, TODAIE - Public Administration Institute for Turkey and the Middle East, Turkey; Dr Nasrullah Khilji, University of West London, UK; Dr Kathrin Kirchner, Technical University of Denmark (DTU), Denmark; Ute Klotz, Lucerne University of Applied Sciences and Arts, Switzerland; Dr Florian Kragulj, WU Vienna University of Economics and Business, Vienna, Austria; Dr Patrycja Krawczyk, TUC - department of finance banking and accounting , Poland; Prof Robert Kuceba, Czstochowa University of Technology, Management Faculty, Department o Information Management Sytems, Polska; Assoc. BIOGRAPHIES

Conference and Programme Chairs

Florinda Matos is a Professor at ISCTE - University Institute of Lisbon. She is the founder and president of the Intellectual Capital Association (ICAA), whose mission is to help transform intellectual capital into added value by contributing to Sustainable Development. She is also a member of the New Club of Paris, an international organisation whose main objective is to create awareness about the Knowledge Economy. As a Knowledge Management and Intellectual Capital expert, she works with several international organisations to promote the management of the intangibles as accelerators of Innovation, Competitiveness and Sustainability in the Digital Economy.

Prof Álvaro Rosa is associate professor (with Habilitation) at ISCTE Business School. Currently is the director of the Master of International Management at Iscte - Instituto Universitário de Lisboa and member of Scientific Committee of Iscte Doctoral Programme on Applied Management. His research interests are strategy, qaulity and cross-cultural management. He is a regular visiting scholar in faculties in China, Brazil, UK, and Slovenia.

Keynote Speakers

Leif Edvinsson is a key pioneering contributor to the theory and practice of Intellectual Capital (IC). He is the world's first Director of IC in 1991. He was prototyping in 1996 the Skandia Future Center as Lab for Organisational design. In 1998, he was awarded by Brain Trust "Brain of the Year" award, UK; listed in Who's Who in the world; earlier associate member of the Club of Rome; and Co-founder and Founding Chairman of the New Club of Paris. In 2013, he was awarded the Thought Leader Award by the European Commission, Intel and Peter Drucker Association. In 2015, he was appointed Advisory Board to JIN—the Japan Innovation Network. He was appointed in 2016 to the Advisory Board of Norway Open Innovation Forum. Together with the UN he was awarded the KM Award 2017, in Geneva Palais des Nations, by km-a.net.

Dr. Jay Liebowitz is the Executive-in-Residence for Public Service at Columbia University's Data Science Institute. He was previously a Visiting Professor in the Stillman School of Business and the MS-Business Analytics Capstone & Co-Program Director (External Relations) at Seton Hall University. He was ranked one of the top 10 knowledge management researchers/practitioners out of 11,000 worldwide, and was ranked #2 in KM Strategy worldwide according to the January 2010 Journal of Knowledge Management. At Johns Hopkins University, he was the founding Program Director for the Graduate Certificate in Competitive Intelligence and the Capstone Director of the MS-Information and Telecommunications Systems for Business Program, where he engaged over 30 organizations in industry, government, and not-for-profits in capstone projects. Prior to joining Hopkins, Dr. Liebowitz was the first Knowledge Management Officer at NASA Goddard Space Flight Center. Dr. Liebowitz is the Founding Editor-in-Chief of Expert Systems With Applications: An International Journal (published by Elsevier; ranked as a top-tier journal; Thomson Impact Factor from June 2021 is 8.665). He is a Fulbright Scholar, IEEE-USA Federal Communications Commission Executive Fellow, and Computer Educator of the Year (International Association for Computer Information Systems). He has published over 45 books and a myriad of journal articles on knowledge management, analytics, financial literacy, intelligent systems, and IT management. He has lectured and consulted worldwide.

Professor Noboru Konno is an eminent pioneer in "knowledge ecology," with a distinguished career encompassing extensive research on knowledge creation and its application in fostering innovation through the concept of "ba" or place. He has contributed to diverse consulting projects, ranging from knowledge management and design strategy initiatives to change management for design organizations and the development of innovative workplaces. Currently holding positions as a professor at both Tama Graduate School and Keio University, Konno is widely recognized for his practical roles as the President of Japan Innovation Network (JIN) . Among his achievements, Konno's book titled "Intellectualizing Capability" stands out, earning him the Financial Times Global Best Business Book Award. In addition, he has authored other influential works such as “Methodology of Conceptualizing Capability," "The Principles of Knowledge Creation Management," and "Purpose Engineering.”

Mini Track Chairs

D.Sc. Sladjana Cabrilo is a Professor at I-Shou University in Taiwan. She holds a PhD degree in Industrial Engineering and Engineering Management from the University of Novi Sad, Serbia. Sladjana’s research focuses on intellectual capital, knowledge management, innovation, business performance, and digital transformation. Her experience includes participation in scientific and industry-related projects, publishing more than 80 academic articles & serving on editorial boards.

Francisca Castilla-Polo (PhD): Lecturer specialized in Reputation, Corporate Social Responsibility and Non-Financial Indicators. She is an Associate Professor within the Financial Economy and Accounting Department at the University of Jaén (Spain). Her research interests are focused on the measurement and disclosure of non-compulsory accounting information and its effects on corporate reputation together with other intangible assets such as human capital, social capital and relational capital. She has published in first position top-journals indexed within Web of Knowledge Science (WOS) and she has taken part in numerous research projects related to her areas of interest.

Andrew Herd is a knowledge management and lessons learned senior expert and practitioner. He has worked at the European Space Agency for 20 years and for the last 7 years been dedicated to the area of knowledge management at ESA including being the lead for corporate lessons learned since its conception at the Agency. Andrew has been part of internal activities for KM as well as knowledge sharing on KM and LL processes outside of the Agency: with industry, academia and also other non-profit organisations. Whilst working as a thought leader in this area, he is actively open to new ideas and adopting or adapting these within the specific organisational context of the Agency.

Prof Ali Hessami was the Chair and Technical Editor of IEEE’s first global standard “Model Process for addressing Ethical Concerns in System Design”, referred to as P7000. This generic process standard that’s been published as IEEE 7000 in September 2021 is aimed at identification, evaluation and protection of ethical human values in products, services and systems. Ali is also VC of IEEE Ethics Certification Programme for Autonomous and Intelligent Systems (ECPAIS)

D.Sc. Aino Kianto is a Full Professor in Knowledge Management at the LUT School of Business and Management, LUT University, Finland. Her research focuses on knowledge management, intellectual capital, creativity, innovation and organizational renewal. Prof. Kianto has delivered keynote speeches and acted as a track chair in many international conferences and serves in the editorial board of five academic journals.

Anna Maria Melina is a research fellow at University of Catanzaro. She is adjunct professor in Organizational Theory and Organizational Behavior. Her research focuses on Knowledge Management, Family Business, Small & Medium Business, Generational Change and Healthcare System. She is a speaker in national and international conferences. She is the author and/or co-author of several publications, including books, articles, research reports and working papers.

Paulo Gonçalves Pinheiro is a Professor of Beira Interior University (UBI), Business & Economics Department, and a researcher at the NECE, Research Center in Business Sciences (UBI). His teaching activities are mainly on knowledge management and comprehend undergraduate, master, and doctoral students. He is a Ph.D. in management and author of several publications. His main research areas are information management, organizational spirituality, organizational practical wisdom, and knowledge management. https://orcid.org/0000-0003-2397-6463

Raquel Puentes Poyatos is a Professor of Organization theory and Human Resource Management at the University of Jaen (Spain), where she received her Ph.D. Currently, her research is focused on the fields of HRM, Corporate Social Responsibility and knowledge management. She publications appeared in academic journals.

Raysa Rocha teaches at the University of Beira Interior (UBI). She is project manager in the ENTRANCE, RE-START and ENTER_EdTech projects (Erasmus+). Raysa received her PhD with distinction from UBI. She is part of international networks, i.e., Academy of Management - AOM, International Association for Knowledge Management, and the Social Responsibility Research Network. During her PhD, Raysa received international awards for her thesis project, including the MSR 2021 Promising Dissertation Award given by the MSR-AOM. She is interested in studying organizational practices that lead to a humanized strategy. Raysa's has published in journals of great distinction, i.e., Journal of Business Ethics and the Social Responsibility Journal. https://orcid.org/0000-0002-6542-1397

M. Isabel Sánchez-Hernández (PhD): Lecturer specialized in Corporate Social Responsibility, Human Resources and Sustainable Entrepreneurship for Regional Development. Professor within the Business Management and Sociology Department at the University of Extremadura (Spain). Her research interests range across several key areas within the Business Organization and Sustainability Management.

Assoc. Prof. Dr hab. Eng. Sebastian Saniuk is employed as a professor at the University of Zielona Góra (Poland). Since 2015 he is a member of the Committee of Production Engineering of the Polish Academy of Sciences. His research interests include issues related to production management, industrial engineering and logistics, employees' knowledge and skills, sustainable development, corporate social responsibility, particularly planning and control of production flow and modelling of production networks of SME's, rapid prototyping, CSR in SME's. The results of his research have been presented in over 270 national and international scientific publications including journals, monographs and conference proceedings of national and international conferences indexed in Web of Science and Scopus database (in countries including: China, Turkey, Slovakia, Czech Republic, Croatia and Germany). During his career, he has conducted research under several grants awarded and funded by the Polish Ministry of Science and Higher Education, The National Centre for Research and Development and the European Union. H-index=14 (WoS), h-Index=15 (Scopus).

Dr. Changiz Valmohammadi is Associate Professor at, Islamic Azad University, South Tehran Branch. His areas of interest are quality management, knowledge management, operations management, strategic management, and application of IT in business operations. For more than 25 years he has taught and supervised undergraduate, graduate students at both national and international universities, such as Taylor's university and Universidad de las Américas Puebla (UDLAP) and offered consulting services to the Iranian public and private organizations. He has published research papers in journals such as Information & Management, International Journal of Production Economics, The TQM Journal, International Journal of Productivity and Performance, Resources Policy, Total Quality Management & Business Excellence and Journal of Enterprise Information Management. He sits on editorial board of Journals such as Management Decision, Industrial and Commercial Training, JUST to name a few.

Marzia Ventura, Ph.D., is a researcher and Professor at Magna Graecia University of Catanzaro and she is member of Research Center "Economics and Management of Services". The main topic of research is on human resource management, intellectual capital, corporate social responsibility, knowledge sharing in organizations.

Walter Vesperi is Ph.D. in Management and Economics in University of Messina actually is Research and Professor at Magna Graecia University of Catanzaro. His research in terests are knowledge management that influence organizational development and change in dynamically evolving environments. His publications appeared in academic journals and he attended at several international conferences.

Yong Wang is Professor in Family Business & Entrepreneurship at Wolverhampton Business School and Fellow of the International Family Enterprise Research Academy (IFERA). Prof. Wang's research focus on family business and entrepreneurship. His publications have appeared in the Journal of Small Business Management, Journal of Strategic Information System, Journal of Family Business Strategy, International Journal of Entrepreneurial Behaviour and Research, as well as others.

Biographies of Contributing Authors

Zabeda Abdul Hamid is attached to the Department of Business Administration, Faculty of Economics and Management Sciences, International Islamic University Malaysia. She has a degree in Psychology and a Masters and Ph.D. in Human Resource Management. Zabeda teaches, supervises, and publishes in the areas of Knowledge Management, Organisational Behaviour, Management, and Talent Development.

Lawrence Abiwu, is an adjunct lecturer at the School of Management, Information Technology and Governance at the University of KwaZulu-Natal. He holds a PhD in Human Resource Management and his research interests are talent management, human capital formation and development, industrial action, organisational sustainability, employer branding, workplace discipline and employee dismissals.

Ricardo Abreu obtained a bachelor's degree in consumption sciences by the Portuguese Institute of Marketing Administration (IPAM). He holds a master's degree in sociology, innovation and society, and a PhD in innovation public policy, obtained at ISCTE-IUL. He is a professor and researcher at ISCTE-IUL and IPAM, focusing on innovation, technology, consumer and market behavior.

Roziya Abu is an associate professor at MARA University of Technology (UiTM) Malaysia. She received her PhD in social science and psychology from Victoria University, Melbourne, Australia, in 2014. Her study focuses on small/rural libraries and community development, data analytics and information management.

Aderonke Adesina is an employability project officer at Nottingham Trent University, UK. She received her PhD in information science from the University of Zululand in 2022. She has ten academic publications. Her main research areas include knowledge management, information systems, and enhancing the employability of individuals.

Pia Adibe. As a Doctoral Researcher, my research focus is on collaboration and organizing, and I am drawn to research that aims to bring individual narrative knowing and dialogic methods to the core of learning and development of sustainable systems and digital solutions. I hold a master's degree in knowledge management and have several positions of trust.

Guilherme Agnolin. Master's student in the Graduate Program in Engineering and Management of the Knowledge of the Federal University of Santa Catarina. Graduated in Chemical Engineering and MBA in Project Management. Has a course in Innovation, Entrepreneurship, and Marketing. Acts as a project manager at the SESI Innovation Center in Health Technologies.

Geeta Albert is a consultant attached in MIDF, Malaysia. She received her PhD in knowledge management from the Taylor's University (Malaysia). She has been implementing knowledge management systems and services since 2007 and has been involved in organising KM Conferences since 2014. Her main research area is cultivating virtual knowledge sharing communities in organisations.

Anna Albrychiewicz-Słocińska is an assistant professor at Częstochowa University of Technology, Poland. She received her PhD in social sciences from Częstochowa University of Technology in 2008. She has been participating and organizing several international conferences on human resources management. Her main research areas are human resources management, knowledge sharing, knowledge management, ethics and organizational behaviour.

Sawasn Jawad Al-Husseini assistant professor (Middle Technical University, Institute of Administration Rusafa, Baghdad, Iraq). Received her PhD degree in management information systems from Plymouth University, School of Management, Plymouth, UK. Publications are related to innovation, leadership style, knowledge management, knowledge sharing, and intellectual capital, she has many papers published at national and international journals and conferences.

Ali Mehanna Al-Naimi is a PhD student at Henley Business School, UK. He received his Master's in Human Resources Management and Training from University of Leicester in 2021. He received his Bachelor in Computer Hardware and Software engineering from Coventry University in 2016. His main research areas are tacit knowledge, Implicit knowledge and digital transformation

Huda Almutiari is a PhD candidate in Information Studies at the School of Humanities, University of Glasgow. Her research interests are in knowledge management and knowledge sharing.

Jorge Antunes obtained a bachelor's degree in modern and contemporary history, and a master's degree in science, innovation, and society, obtained at ISCTE-IUL. He also holds a postgraduate diploma in science and technology management and policies from NOVA University of Lisbon. Currently, Jorge Antunes is a R&D project director at COIN – Innovation Consulting.

Nekane Aramburu, D.Sc. (Econ. & Bus. Adm.). Associate Professor and the Head of the Departmental area of Strategy and Information Systems at Deusto Business School (DBS, University of Deusto, Spain). She specializes in Business Organization, Organizational Learning, Knowledge Management, and Innovation. She has been the Director of the Master's Degree in Competitiveness and Innovation at DBS.

Matheus Argôlo received his B.Sc. in Electronics and Computer Engineering from the Universidade Federal do Rio de Janeiro in 2021. He is an M.Sc. student in Systems Engineering and Computing at the Universidade Federal do Rio de Janeiro. His research areas include Computer Supported Cooperative Work, Knowledge Management, Work, and Education.

Emmanuel Ebo Arthur is a 2nd year PhD student at the University of Pardubice, Czech Republic. He received his master's in Business Administration and Leadership and management in Education from the KNUST, Ghana, and the University of Newcastle, Australia respectively both in 2014. His main research areas are knowledge production function and innovation.

Nuno Baptista received his Phd in Marketing and Strategy from Universidade da Beira Interior, Portugal. He is an Adjunct Professor at Escola Superior de Comunicação Social from the Instituto Politécnico de Lisboa, an Auxiliary Professor at Universidade Lusíada, and an integrated researcher at NECE-UBI. His research interests include business strategy and social marketing.

Michael Bell is the Chief Knowledge Officer (CKO) for the John F. Kennedy Space Center (KSC) and serves as the Program Manager for NASA's Lessons Learned Information System (LLIS) promoting and facilitating knowledge collection and knowledge sharing. He previously worked in the electronics manufacturing industry as an industrial engineer designing and managing factory layout projects.

Insaf Ben Ghanem: recently graduated as a doctor in management from the Higher School of Economics and Commerce, Tunisia.

Lamiae Benhayoun, PhD is Associate Professor in Management Information Systems at Rabat Business School - Morocco. She is head of the eLearning department and of the Master in Business Analytics. Her research focuses on emerging technologies, knowledge management, operational excellence, and innovation networks, and was published in highly recognized peer-reviewed journals in technology management.

As teacher, he lectures in Human Resource Management, Competency and talent management, Quality Management and Organizational performance. He also has 17 years of experience as a management consultant and trainer.

Carla Neves, PhD student in Management (University of Beira Interior). She has a master's degree in Human Resource Management. Additionally, she works full time in Consultua – Ensino e Formação Profissional, where she coordinates training projects. Besides, she teaches at IPB the Curricular Unit "Psychosociology of Organizations" of the bachelor's degree in Management and in Accounting. https://orcid.org/0000-0003-2527-799X

Anna-Maija Nisula, D.Sc. (Econ. & Bus. Admin.) is an Associate Professor in Knowledge Management at the LUT Business School, Finland. Her research interests are in knowledge management, creativity and knowledge work. Her research has been published, in the Int. Jour. of Project Management, Digital Creativity, CIM, Int. Jour. of Human Resource Management, and Journal of Business Research.

Nóra Obernater, PhD is a habil. associate professor, Head of Department of Management at the University of Pannonia in Veszprém, Hungary. She has taught a variety of management master courses, including Strategic Human Resource Management, Strategic Management, Intercultural Management, and Knowledge Management. Her research fields focus on knowledge management, social media, digitalisation, and national cultures.

Małgorzata Okręglicka works as associate professor at Faculty of Management, Czestochowa University of Technology, Poland. She is an author of over 200 scientific papers and 4 monographs. She was a supervisor of over 200 Bachelor, Master and PhD theses. In the scientific activity, she focuses on corporate entrepreneurship, sustainable development and SMEs.

Johan Olaisen is professor in knowledge management at BI Norwegian Business School. Ph.D. in KM from School of I, UC Berkeley. Publications within KM, innovation, strategy, and leadership

Mírian Oliveira is a Professor and researcher at Business School, Pontifícia Universidade Católica do Rio Grande do Sul (PUCRS), Brazil, and invited professor and member of Advance/CSG at Lisbon School of Economics and

Management, Universidade de Lisboa, Portugal. She obtained her doctoral degree in 1999. Her research interests include Knowledge Management, Knowledge Sharing, and Knowledge Hiding.

Victoria Yousra Ourzik (M. Res.): Lecturer and doctoral candidate (University of Paris Dauphine PSL). Teaches Marketing Management and Market Research. Extensive experience in both academia and industry, has worked in marketing and sales roles, most recently as a Consultant for Expedia Group in the travel tech industry. Expertise in the areas of big data, digital marketing, and firm performance.

Edmund Pawlowski, Institute of Engineering Management, Poznan University of Technology.

Anne Pedersen is a Ph.D. Candidate at DTU Management at the Technical University of Denmark. She has a master's degree in Learning and innovative Change from Aalborg University. Her Ph.D. is about virtual collaboration in hybrid work, and is particularly interested in how organizations enhance capabilities for Knowledge Management and organizational learning.

Gandhirajan Periyaswamy (**Peru**) has 24 years of experience in delivering customer experience through IT solutions. Expert in Data and Knowledge management, Peru has delivered solutions for major BFSI customers across world. Product owner for multiple TCS IP solutions, Peru played key role in building AKB capabilities and rolling out to customers.

Gabriel Pestana is a professor at Polytechnic University of Setubal, and a senior researcher at UNIDCOM/IADE. Holds a PhD in Information Systems from the Technical University of Lisbon and specialises in knowledge management and collaborative decision-making platforms. His research focuses on data governance workflows and visual analytics models to support intelligent business process automation.

Adrian Petre is a PhD student at the Bucharest University of Economic Studies, Romania. His main research areas are related to business administration, new economic models, knowledge economy, green economy, sustainability and risk management.

Osvaldo Peuyadi is a PhD student, expected to end his thesis on Sustainable Banking in 2022 at Universidade Europeia, with my supervision. He has a long standing interest in Ethics. He made is graduation in Philosophy.

Malefetjane Phineas Phaladi, PhD in Information Science, is the Director of Library Services and affiliated to the Department of Information Systems in the Faculty of Accounting and Informatics at the Durban University of Technology in South Africa. His research interests cover knowledge management, human resource management, organisational culture and design, leadership, strategy and management.

Luiza Piersiala is a assistance professor of social sciences in the discipline of management and quality sciences at Częstochowa University of Technology, Poland. She received his PhD in social sciences from CUT in 2017. Her main research areas are international management and entrepreneurship, innovations, special economic zones.

Margarida Piteira is professor at Lisbon Accounting and Business School (ISCAL, Portugal) and has a Ph. D. in Economics and Organizational Sociology (ISEG/ University of Lisbon). Researcher at Socius (Research Centre in Economics and Organizational Sociology). Her research areas are innovation, creativity and human resources management.

RAQUEL PUENTES-POYATOS. PhD in Economics and Business Administration (UNED). Official Master's Degree in Sustainability and Corporate Social Responsibility (UNED). Professor of University, University of Jaén. My lines of research are focused on Corporate Social Responsibility, Human Resources Management and Social Economy Enterprises, with a special focus on the olive oil sector

Mahesh Chandra Puvvada (**Mahesh**) has 23+ years of IT experience across sales, consulting, solution architecture and implementation services. As the head of transformation for UK & Europe geographies, Mahesh has been instrumental in providing solutions that improved operational excellence and customer experience across different customers.

Mariza Motta Queiroz is an economist with more than 30 years of experience in a public transport operator. She has also a PhD in Transportation Systems (IST). She is an Invited Professor at ISCTE and a member of U-Shift Lab at IST. Certified in Project Management and in Product Owner.

Aleksandra Radziszewska works at the Czestochowa University of Technology (Faculty of Management). Her scientific interests include different aspects of marketing, consumer behavior, electronic commerce research, as well as quality management and intercultural management. She is the author of numerous scientific publications from this field in national and international journals as well as chapters in monographs.

Marcin Relich is a researcher at the Faculty of Economics and Management, University of Zielona Góra. His research interests include knowledge management, knowledge acquisition, management information systems, decision support systems, business intelligence, and sustainability in the aspect of new product development, product design, and product innovation.

Elżbieta Robak is an assistant professor at Częstochowa University of Technology, Poland. She received her PhD in social sciences from University of Silesia. Her main research areas are: organizational behaviour, human capital management, psychology of management, occupational psychology. She is the author of numerous scientific publications from this field.

Raysa Rocha (PhD) is NECE-UBI Research Center Vice-Coordinator for Personal Development. She received her Ph.D. with distinction from UBI. She is a guest editor for the SI on Practical Wisdom in the JMSR and section editor of the Springer Encyclopedia of Diversity, Equity, Inclusion (DEI) and Spirituality under the section Spirituality, DEI, and KM. https://orcid.org/0000-0002-6542-1397

Hamid Roham has been a PhD student in management at the University of Lisboa, Portugal, since 2020. He received his DBA from the same institution in 2020. Hamid's educational background includes an MSc in biomedical engineering from the University of Technology Amir-Kabir, Iran. His research interests revolve around knowledge management and sharing.

Mauro Romanelli is Associate Professor in Organization and Human Resource Management at Parthenope University of Naples, Department of Business and Economics, Napoli, Italy. Research interests: Organizational change, innovation, ICT and sustainability within public sector organizations, smart and sustainable cities and communities, museums and cultural heritage, healthcare. He is member of Egos, Euram, itAIS, ICTO, Irpsm.

Bernadete Rosa is an undergraduate in Electrical/Electronic Engineering and worked in the industry for 20 years. She is a Master of Biomedical Engineering and a Ph.D. student in Biomedical Engineering at UTFPR. She has MBA in Information and Communication Technology Management, and she is a professor of Intellectual Capital Security.

Aleksandra Rudawska, PhD, is Assistant Professor of the Institute of Management, University of Szczecin, Poland. Her main research interests revolve around knowledge sharing behaviour, knowledge management, organisational learning, organisational behaviour, human resource management. She is a principal investigator and participant in several national research projects.

Consuelo Ruiz-Rodríguez is Professor in Financial Economy and Accounting Department, Faculty of Social and Juridical Sciences of the University of Jaén. She completed her PhD at the University of Jaén in 2016 with Cum Laude. Nowadays, her research interests are focused in Intellectual Capital, Disclosure of Intangibles, Social Responsibility and its integration in Higher Education, Non-financial Information and Cooperatives. All this research is complemented by attendance at numerous international conferences and the publication in high impact journals.

Linda Ryan is an associate professor and director of Postgraduate Studies in the Department of Design Innovation in Maynooth University. Her Ph.D. is in the area of Product Service Systems, transitioning organisational culture from product to service-orientated. Her research interests include user-centred design, service innovation, culture transition and public sector reform.

Anna Rybak, PhD, is Assistant Professor at the University of Technology, Czestochowa. Her research work focuses on innovation management, promoustiog and supporting entrepreneurship among non-governmental organizations and social innovation in the area of employment. She is an expert of the Intelligent Development Operational Program.

Aleksandra Rzepecka: Adjunct of Faculty of management and leadership, General Tadeusz Kościuszko Military University of Land Forces, Wrocław, Poland,. PhD in the field of Social Sciences in the discipline of Management and Quality Sciences. Research interests: organizational culture, professional career, organization image, CSR.

Agnieszka Rzepka is a Professor at Lublin University of Technology in the Faculty of Management in the Department of Economics and Economic Management. She specializes in inter-organizational management, intellectual capital, self-management, and SMEs. Her current research is focused on teal organizations. In addition to 140 papers, she has written seven proprietary and collective monographs.

Mohammad Omar Sabri: Assistant professor, finished his PhD from the University of the West of England (UWE), UK. Mohammad is currently the vice dean of scientific research at Zarqa University. Mohammad has a demonstrated history of working in the software development industry and is skilled in different research areas; Knowledge Management, Business Process Architecture and Ontologies.

Josune Sáenz is an Associate Professor and Vice Dean for Research and Transfer at Deusto Business School (University of Deusto, Spain). She also chairs the Academic Committee of the Doctorate Program on Business and Territorial Competitiveness, Innovation and Sustainability. Her research focuses on intellectual capital, knowledge management, and innovation.

Robert Sałek BEng, PhD, is an assistant professor at the Faculty of Management of the Czestochowa University of Technology in Poland. In 2012 doctoral degree in economics. Member of the Program Council and acts as an Innovation Broker, for contacts with business. He specializes in management sciences, knowledge management and production as well as logistics.

Sebastian Saniuk, Assoc. Prof. Dr Eng., is employed as a professor at the University of Zielona Góra. Since 2015 he is a member of the Committee of Production Engineering of the Polish Academy of Sciences. His research focuses on production management, Industry 4.0. The results of his research have been presented in over 220 scientific publications: journals, monographs and conference.

Stefano Scaglioni is working at the European Space Agency in Darmstadt, Germany. He covers the role of Product Assurance and Safety Manager, within the quality office of the ESA Operations directorate. His job consists in ensuring the quality of the space operations services (e.g. flying JUICE and EUCLID satellites) delivered to the customers.

Yee Yee Sein, Phd student who is studying at the University of Pardubice, in the Czech Republic. I have participated in 21st and 22nd European Conference on Knowledge Management ECKM. My main research areas are knowledge, innovation policy and regional development.

Denilson Sell is professor of Knowledge Engineering and Management at the Universidade Federal de Santa Catarina and at the Universidade do Estado de Santa Catarina (Brazil). He has led several research and development projects with public and private organizations. His most recent work focuses on Knowledge Engineering, Analytics, Digital Platforms, and Digital Transformation.

Daniel Silva is a PhD student in Management at the University of Beira Interior (UBI) and a researcher at the Research Group on Enterprise Science (NECE), with some studies already published. His research focuses on organizational psychology with a major focus on the study of personality traits in organizational context.

Philip W. Sisson is a retired Lockheed Martin Senior Program Manager, KM cross-division coordinator, and KM best practices track leader. Phil has degrees in mathematics, ORSA and economics, and computer information systems.

Sebastian Skolik is an assistant professor at Częstochowa University of Technology. He received his PhD in social sciences from University of Silesia in 2008. His main research areas are: social capital, social networks, knowledge sharing, open collaboration projects and institutionalization of free culture movement.

Tiffany Smith is the NASA Chief Knowledge Officer and Director of NASA's Academy of Program/Project & Engineering Leadership. She is responsible for ensuring that the agency's technical workforce maintains the critical knowledge needed for mission success by providing learning and development opportunities, strategic communications, and knowledge services in collaboration with all NASA Centers.

Robert Smith graduated with a BSc in 1969 and has undertaken postgraduate studies in Education, Engineering and Law. He holds a PhD in engineering and is currently a PhD candidate in law at the University of New England, Australia and an international development consultant working in Southeast and South Asia.

Cristina Sousa has a degree in Business Science and a master's degree in management. She works as a research fellow in the R&D project ETEIA (Energy Transition Entrepreneurs), in which she develops her research in Entrepreneurship, and an Assistant Professor in the Department of Economics, Sociology and Management of the School of Human and Social Sciences, University of Trás-os-Montes e Alto Douro.

Juha Saukkonen holds a position of a Senior lecturer of Management at JAMK University of Applied Sciences in Finland. He has published on topics of Futures Foresight, Knowledge Management, Entrepreneurial Learning, and Education. He is a guest lecturer on these topics in various universities and organizations in Finland and abroad.

Maria José Sousa (PhD in Management with Habilitation in Management and Public Management) is Pro-Rector for the Development of Distance Education and a professor and a research fellow at ISCTE. Is the former Portuguese President of the ISO/TC 260 – Human Resources Management. She was/is the coordinator of several European projects of innovation.

Inese Spica is leading researcher at the Scientific Institution Business Competence Centre and professor at the ISMA University. She received her PhD in economics sciences from University of Latvia in 2001. She is editor of scientific journals, monographs and has been managed international scientific conferences on Business Competences, on Trade Marketing, on Business Environment.

Claudia Spilotro is a Research fellow at the University LUM Giuseppe Degennaro (Bari, Italy). The research project she is working on is: "Data-driven Marketing for Apulian Aerospace SMEs". Her main research interests include digital transformation, digital marketing, technological innovation and business model innovation.

Christian Spletter is research associate and PhD candidate at the University of St. Gallen (MCM-HSG). He studied social sciences and psychology. His research interests include higher education contexts (e.g., Decision-Making and Knowledge Visualization).

Małgorzata Spychała, PhD, Eng. is an Assistant Professor at Poznan University of Technology. She specializes in managing the competences of employees and managers. She conducts research on improving incentive systems and improving communication in employee teams. Author of many foreign and domestic publications. Member of many design teams in Poland and abroad. ORCID 0000-0003-1471-5536

SS Sreejith is an Assistant Professor at the School of Management Studies, National Institute of Technology Calicut, Kerala, India. He completed his PhD from the Indian Institute of Science in Human Resource Management. His research interest includes individual and group behaviour, organizational sustainability, performance enhancement and productivity.

Gerald Stei is a PhD student at Babes-Bolyai University (Cluj-Napoca) and Reutlingen University (Reutlingen). His research integrates organizational management with information system studies. He examines the interplay of organizational management and knowledge management systems. In particular, he publishes on organizational performance effects of enterprise social media use.

Marcin Stępień holds a PhD in management sciences at the Department of Finance, Banking and Accounting at the Faculty of Management of the Częstochowa University of Technology in Poland. Scientific and research achievements include 101 items. The mainstream interests covers the area of accounting and related elements of business management.

Constantin Stoenescu, professor, Faculty of Philosophy, UNESCO Chair, University of Bucharest. Books (KM): *Theory of Knowledge. Topics-Texts-Bibliography* (co-author, 1999), *Knowledge Management* (co-author, 2007), *An Epistemological Perspective on Knowledge Management* (2011), *Epistemology and Knowledge Management* (editor, 2011), *Knowledge Management. Current Topics.* (editor, 2011). He also has published about 20 papers on knowledge management topics.

André Sucena, PhD student in management at the University of Beira Interior (UBI), Portugal. I have a degree in management and an MSc in development studies. Additionally, I work full time in a construction company where I am the financial project manager.

Marta-Christina Suciu is full professor, PhD supervisor, Economics 1 Doctoral School, Bucharest University of Economic Studies. She is also senior associate researcher at National Institute of Economics*, Romanian Academy* and corresponding member of *Romanian Academy of Scientists, Commission for Economics, Law and Sociology*. Her main research areas are: creative economy, KM, education.

Aleksandra Sus, Associate Professor, General Tadeusz Kościuszko Military University of Land Forces. Ph.D. Eng.

Sharifah Nur Izma Syed Izaddin has 25 years of experience in talent development, strategic communications, and management. Sharifah's career kicked off in the insurance industry, where she was involved in Public Relations for five years followed by a combined 15-year stint in financial services where she was responsible for multiple award-winning Corporate Sustainability and Responsibility projects.

Maciej Szafrański, PhD, Eng. is the author of nearly a hundred scientific publications, including monographs. His main research areas include competence management, quality management, marketing. He possesses more than 6 years of experience in the industry. Head and member of teams in many national and international projects. ORCID 0000-0002-4281-9845

Malvin Rivera Tabajen is an Associate Professor II at the Philippine Normal University (PNU). He is a candidate for the degree in Doctor of Philosophy in Knowledge Management at Bangkok University, Bangkok, Thailand. He has published articles and published research papers on knowledge management and ICT application.

Antonia Terán-Bustamante is a Senior Researcher and Professor at the School of Economics and Business Administration at the Universidad Panamericana and is a member of the Mexican National System of Researchers by CONACYT. She has a Ph.D. in Administration Sciences from Universidad Nacional Autonoma de México (UNAM). Her research is focused on Human Capital, Competitiveness, Innovation, and Entrepreneurship

Ilkka Tikanmäki MBA (Information Systems) is a Project Specialist in Safety, Security and Risk Management at Laurea University of Applied Sciences and a doctoral student of Operational art and tactics at the Finnish Defence University.

Eduardo Tomé made his PhD in Economics in 2001 addressing the Portuguese Experience of Human Resource Development investment using the European Social Fund. Since than he has taught in the Portuguese Universities, published a number of papers in refereed journals, attended conferences, organized conferences, written book chapters in addition to teaching at under-graduate, masters and PhD levels.

Philip Toland is a Commercial Manager for ESB in Ireland. He has 20 years' experience in the Construction industry with 16 of these years spent in the Civil Engineering, Quarrying and Road Construction industry where he previously worked as a contracts manager. He has a keen interest in renewable energy, sustainability and lean construction.

Jowita Trzcielinska: researcher (Faculty of Engineering and Management, Poznan University of Technology, Poland), employed there since 2008. Main research areas are entrepreneurship and the identification of market

opportunities by SMEs. Author of several scientific papers in this area and was involved in the organization of three conferences. She is also actively involved in university teaching.

Stefan Trzcieliński works at the Poznan University of Technology. He heads the Department of Management Systems. He is the chairman of the Organization and Management Sciences Committee at the Poznan branch of the Polish Academy of Sciences. He conducts research combining the issues of an agile enterprise, opportunity recognition, Industry 4.0 and the use of AI.

Wiktoria Trzepizur is a PhD student at the Częstochowa University of Technology. Her main research areas are innovation, knowledge management and the high technology sector.

Michał Trziszka was born in 1987 in Poznań (Poland). Since 2007, he has been the CEO of cal.pl providing hosting and cloud services. Assistant at the Faculty of Engineering Management at the Poznan University of Technology. Author of publications in the field of agile management and the use of cloud computing by enterprises.

Rebecca Tumwebaze is a Doctoral researcher at the Kemmy Business School, University of Limerick. Her research in Agriculture Knowledge Management, explores integration of different knowledge types and forms held by the diverse agriculture actors and how this knowledge can be leveraged to achieve a sustainable agriculture sector.

Remigiusz Tunowski: Assistant Professor at WSB Merito University in Gdańsk, Poland. Ph.D. in Economy and Finance, University of Life Sciences, Warsaw, Poland, 2019. Scientific publications in area of Business Intelligence. The author has practical experience in the field of BI systems. Since 2011 he has participated in practical implementations of this system in the USA and Poland.

Lina Užienė is an Associate Professor at the School of Economics and Business, Kaunas University of Technology, Lithuania. Her main scientific interests lie in intellectual capital management and national policy based on the management of intellectual resources. She is an author of several academic publications and a research manager focused on the impact of digital transformation.

José Vale is a professor at the Porto Accounting and Business School, Portugal, where he teaches several courses related to management accounting. He has a PhD in Management -Accounting and Management Control - from the Faculty of Economics, University of Porto. He is a member of the Porto Polytechnic's Centre for Organisational and Social Studies.

Gregório Varvakis - Mechanical Engineer from the Federal University of Rio Grande do Sul, Ph.D. in Manufacturing Engineering - Loughborough University of Technology. Professor at the Federal University of Santa Catarina, Department of Knowledge Engineering. Experience in administration, process management, knowledge management and service organization management. Researcher: innovation, knowledge management, productivity, continuous improvement, technology and information flow.

Namosha Veerasamy is a computer scientist in the field cyber security research and governance for over 15 years. She received her PhD from the University of Johannesburg. She is currently employed as a senior researcher at the Council for Scientific and Industrial Research (CSIR) in Pretoria. She also holds CISSP and CISM certifications.

Sathiskumar Venkataramani (**Sathish**) has 28+ years of experience across Sales, Pre-Sales, Consulting and delivery with a focus on Banking, Financial Services and Insurance customers. As the Global Head of BFSI Business Operations Transformation with a focus on Business Transformation enabled by Cognitive solutions, Sathish has been instrumental in providing strategic solutions to power customer's Growth & Transformation agenda

Mary Viterouli: teaching experience of over twenty years and is now also working as a Deputy Director at the Vocational Institute (DYPA, Chalkida). Scientific interests revolve around Strategic Management, Human Resources Management, Adult Education, Sociology and English Literature. Holds two Bachelor's Degrees, two Master's Degrees and is a PhD Candidate at the University of Thessaly, Greece.

José M. VIedma Marti. Doctor of Industrial Engineering, Graduate in Economics, and Emeritus Professor at the U.P.C., Barcelona, Spain. His current field of research and interest is focused on the strategic perspective of Knowledge Management, Intellectual Capital, and knowledge Based-Development and he has consulted and developed management frameworks and systems worldwide on those matters.

Tiziano Villa is a trainer and consultant in project management. PMP®, PMI-ACP®, PMI-DASSM®, SAFe® 6 Agilist. Founder of "the Project Management Lab®". Past Director of PMI® - NIC Northern Italy Chapter. Experiences as project manager and PMO coordinator. Professional activities in different industries, focused on knowledge management in projects, navigating complexity, agile development, organizational change management, benefits realization management.

Stefan Voigt is a researcher at Fraunhofer Institute for Factory Automation and Operation IFF. He received his doctoral degree in engineering at Otto-von-Guericke University Magdeburg in 2017. His main research areas are knowledge and information management, agile project management and digital transformation.

Tone Vold lectures at The Inland Norway University of Applied Sciences, Norway, in courses within Digitalization of Workforms in Organization and Knowledge Management, and is particularly interested in knowledge management, e-learning and games for learning. Her PhD is about work relevance of higher education for innovative and entrepreneurial behavior in organizations.

Carl-Magnus von Behr is a doctoral researcher at the Institute for Manufacturing (IfM), University of Cambridge, investigating how to improve knowledge sharing among NHS Estates and Facilities Management departments. He holds an M.Phil. in Industrial Systems, Manufacture and Management from Cambridge and a B.Sc. in Industrial Engineering and Management from the Technical University Berlin, Germany.

Heleen Vreugdenhil (PhD) works as a senior researcher at both Deltares and Delft University of Technology in the field of Policy Analysis and particularly in innovation management. She is experienced both academically and practically in pilot projects and living labs in which through innovative policy-research interactions new knowledge is developed to support policy processes.

Anthony Wensley is an Emeritus Associate Professor at the Management Department at the University of Toronto Mississauga and the Rotman School of Management, University of Toronto. Professor Wensley's work focuses on the development and implementation of major enterprise systems. Professor Wensley is an active member of IAKM.

Dariusz Wielgórka is an assistant professor at the Faculty of Management, Czestochowa University of Technology, Poland. He is the President of the Polish Economic Society in Czestochowa and finance director at company. He has organised 8 conferences on SME management including 3 international ones. His main areas of research include: management, finance, CSR, KM.

Andrzej Wodecki. Associate professor at the Warsaw University of Technology, artificial intelligence, machine learning model value management, CausalML and MLOps. With more than 20 years of experience in enterprise IT systems implementations, he shares his experience with managers on prestigous MBA Programs.

Adrian Xavier was born in Singapore, moved to Australia in 2006 before joining the Royal Australian Air Force (RAAF) in 2010 as a Director (Aeronautical Engineer). Mr Xavier has a BEng (Hons) from the University of Bristol (UK), an MSc in Aeronautical Science from USA and a Masters in Systems Engineering from UNSW.

Joseph Zernik, PhD, is Research Director at Human Rights Alert NGO. The NGO promotes government transparency, particularly in e-gov systems, and investigates the effect of e-gov on Human Rights and democratic institutions.

Saliha Ziam is an Associate Professor at TELUQ University of Quebec. His research interests focus knowledge transfer in health sector, health assessment tools for decision support and knowledge absorptive capacity strategies. His recent works on knowledge transfer have been published in Allergy, Asthma & Clinical Immunology Journal and Evidence & Policy.

Ali Imran Zakaraia has 7 years of experience in Library Management, Knowledge Management and Talent Development. He is currently responsible for driving the company's Knowledge Management's strategy, governance structure, and roadmap to transform the Group into a digitally connected knowledge-based organization. He is also a Certified Practitioner in Knowledge Management issued by International Professional Managers Association.

Krzysztof Zięba, PhD, DSc, works as a professor for the Department of Entrepreneurship at Gdańsk University of Technology, Poland. His teaching interests are focused on broad aspects of economics while major scientific interests include nascent entrepreneurship, family business, as well as small and medium size enterprises.

Izabela Ziębacz, research worker at the Jan Długosz University in Częstochowa, Poland, Department of Social Policy, Social Work and Tourism, Faculty of Social Sciences. Research interest: knowledge management, measurement of effectiveness of training, effectiveness of employee teams.

Zbigniew Zontek, lecturer, scientist at the University of Bielsko-Biala, working on research into innovation, business management, tourism services and social organizations. He has conducted guest lectures in several countries: Turkey, Germany, Italy, The Czech Republic and Slovakia. Currently, he is working also as a business consultant and board member of the tourism promotional organization in Bielsko-Biala.

Knowledge Creation Among Managers and Supervisors in Palm oil Estates in Malaysia

Zabeda Abdul Hamid, Shangkar Ganesh Chandiram and Rodrigue Ancelot Harvey Fontaine
International Islamic University Malaysia, Kuala Lumpur, Malaysia

zabeda@iium.edu.my

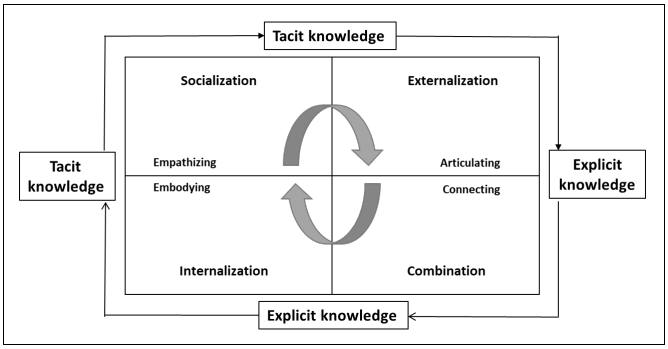
ridhwan_fontaine@iium.edu.my

Abstract: Knowledge of planting and seeding is critical to ensure the healthy growth of palm oil trees, maintaining efficient harvesting systems, and achieving quality products. However, there is a lack of studies in the palm oil industry on how knowledge is created within the managerial and supervisory staff of palm oil plantations that can enhance the workflow and output. This research conceptualises four knowledge creation tools; Socialisation, Externalisation, Combination, and Internalisation (SECI) based on Nonaka's Knowledge Spiral Theory. It is hoped the research can discover the knowledge creation tools most utilised among the Managers and Supervisory teams in palm oil estates in Malaysia who were the samples of this research. The findings of this research revealed that Socialisation and Combination significantly contributed to knowledge creation. However, Internalisation and Externalisation were not positively related to knowledge creation. When the data was analysed with moderating variables such as job category, upper management preferred using Socialisation tools while senior assistant or assistant managerial levels preferred Socialisation, Combination, and Internalisation. Furthermore, field supervisors or field conductor levels preferred utilising all four tools. As a result, Socialisation was identified as one of the major tools where there was a relationship with the three levels of job category. Therefore, plantation companies can develop relevant training programmes based on tacit-to-tacit conversion activities. The research data can be applied by plantation companies in Malaysia to implement appropriate training programmes for Managers, Assistant Managers, and Field Supervisors.

Keywords: Socialisation, Externalisation, Combination, Internalisation, Knowledge creation, SECI model



1. Introduction

Effective Knowledge Management (KM) needs a suitable combination of organisational and managerial initiatives and suitable information technologies. Malaysian palm oil plantations have been recognised as leaders in technology development and adoption. KM in the plantations started with the use of computerised inventory management systems. Subsequently, plantation companies applied KM to integrate various functions, including sourcing raw materials, production, and support activities (Kamarulzaman and Mohayidin, 2016). However, there is a gap in the Knowledge Creation process at palm oil plantations that need to be addressed. Therefore, this research focused on knowledge creation among Managers and Supervisors in palm oil estates in Malaysia as they are involved in managing the business.

1.1 Overview of Knowledge ManagemenT

Organisations are dynamic instead of static constructs (Nagpal, 2019) that change as people join and leave them over time. Furthermore, organisations also undergo diversification, merge with other organisations, and experience various changes. The dynamic nature of an organisation ensures that the knowledge accumulated or lost within an organisation is also dynamic (Botha et al., 2014). Hence, the people involved in KM must manage the knowledge created as staff continuously learn new knowledge. Additionally, they must identify new approaches to doing things and handle the loss of knowledge that gradually develops intellectual liabilities (Botha et al., 2014). As a field of study, KM has existed for more than 30 years and has moved to an essential component of organisational life from an academic theory (Girard and Girard, 2015).

The knowledge creation model was initiated by Nonaka in 1991. It is critical before a successful and effective knowledge transfer occurs. The model was then subsequently expanded in 1995 by Nonaka and Takeuchi (Li et al., 2018). The framework of the Socialisation, Externalisation, Combination, and Internalisation (SECI) knowledge creation model is shown in Figure 1. The model describes how tacit and explicit knowledge is created, transferred, and re-generated in an organisation.

(Source: Nonaka & Takeuchi, 1995; Nonaka & Teece, 2001)

Figure 1: The Framework of SECI Knowledge Creation

Tacit knowledge is also referred to as implicit knowledge and is defined as knowledge that is impossible to be conveyed in a written or spoken method. This form of knowledge explains an individual's skill, idea, or experience and is difficult to express in written form (Hadjimichael & Tsoukas, 2019). Conversely, explicit knowledge is a form of knowledge ready to be articulated, codified, documented, and accessible whenever needed. Therefore, explicit knowledge can be conveyed to one another in an organisation and can be stored in hard or soft copy forms (Hislop et al., 2018).

According to the SECI framework, knowledge is created through conversion and sharing. Four methods allow the processes of conversion and sharing. First, Socialisation is described as tacit knowledge sharing via observing, imitating, practicing, and participating among the members. The second knowledge-creation process is Externalisation, where tacit knowledge is articulated into explicit knowledge and is deeply internalised to knowledge-sharing creation. Third, Combination depicts the integration of concepts into the system of knowledge. Lastly, Internalisation, denotes expressing explicit knowledge into tacit knowledge (Bandera et al., 2017).

Ahmed and Mohamed (2017) stated that proper KM improves the performance of organisations whether it is public or private. They also emphasised that the retention and proper training of employees not only improve their skills but also build confidence. This paper, therefore, examined the importance of KM in modern organisations especially in the agricultural sector. Agriculture is an important sector in Malaysia for national growth and has been the backbone of the Malaysian economy. Palm oil is one of the largest agricultural products produced for the domestic and export market. As a palm oil producer, Malaysia is experiencing a robust development in new palm oil plantations and mills as this commodity plays a significant role in the economic growth of the country.

The palm oil industry including estates and millings, utilise considerable human resources and machinery. Thus, the industry aims to enhance KM and knowledgeable people for sustainability (Kamarulzaman & Mohayidin, 2016). Knowledge creation processes are very important for an organisation's success; hence, this research focuses on understanding SECI tools and how it helps in sharing and creating knowledge among Managers and Supervisory teams in palm oil estates in Malaysia. The findings could help companies in similar circumstances to improve their business processes and organise their knowledge flow between employees as management and supervisory teams are responsible for managing palm oil estates from planting seedlings until the harvest.

1.2 Malaysian Palm oil Industry

Agriculture has always been an important sector of the Malaysian economy as Malaysia is one of the largest producers and exporters of palm oil in the world. Planting palm oil for commercial purposes started in 1917 and grew rapidly in the early 1960s due to the government's agricultural diversification programme that was introduced to decrease the nation's economic dependence on tin and rubber (Samad et al., 2014) as well as land settlement schemes to plant palm oil to eradicate poverty among farmers and smallholders without lands. The industry's development has been centralised to increase prosperity and societal advancement nationwide, starting from the rural communities employed in plantations to the downstream industries and extending to cities and export zones (Kushairi & Ong-Abdullah, 2019).

As such, the Managerial and Supervisory team's knowledge of agricultural practices and land usage can reduce the ecological impact on the agroecosystem and mill supply (Bessou et al., 2017). They need to equip themselves with sufficient knowledge in these areas to produce Fresh Fruit Bunches (FFB) efficiently as poor process

management in palm oil estates impacts production. Lack of knowledge in the selection of plantation sites (i.e. soil depth, drainage, soil composition, and moisture availability) creates poor quality in the size and health of the trees (Hamdani & Musofa, 2015).

However, the performance of Malaysia's palm oil estates began to decline from 2019 onwards with a 11.06% drop in palm oil production after a steady increase until 2018. The last decline in production was recorded in 2014, but the percentage was much lower at 1.4%. Lower production, decreased prices, and weak demand reduced the country's palm oil export earnings from RM74.75 billion to RM65.12 billion (Shevade & Loboda, 2019).

In addition, palm oil production declined due to external factors such as unpredictable rainy seasons and internal factors such as process management of the plantations' operation (Seng & Ahmad, 2017). The impact from the internal factor is manageable with appropriate KM in the process, while the external factor is beyond the Managerial and Supervisory team's control (Kushairi & Ong-Abdullah, 2019).

1.3 Problem Statement

The Managerial and Supervisory team's knowledge in seeding and planting palm oil trees in the field can determine the yield's quality in future harvesting. Failure to use improvised planting materials reduces the profitability of palm oil production as absence of this knowledge causes the purchase of planting materials from the wrong channels. Adequate knowledge gives the Managerial and Supervisory teams access to the information and resources they need to do their jobs effectively. It also helps the business retain that knowledge for future use, which promotes efficiency, a better working experience, and less repetitive work.

Sufficient knowledge of palm oil plantation will enhance the Managerial and Supervisory team's skills in reasoning and problem-solving especially in planting patterns, planting palm seedlings, and planting density. The teams will become more efficient in applying knowledge and solving problems across different levels of the organisation. Unfortunately, currently, there is a gap in the knowledge of the Managerial and Supervisory teams in managing palm oil estates. Considering the situation, the research explored the knowledge-creation process using the SECI tools among Managerial and Supervisory teams to fill the research gap in KM practices, especially in palm oil estates in Malaysia.

1.4 Purpose of the Research

This research aims to investigate and identify the four knowledge-creation tools from the SECI Model: Socialisation, Combination, Externalisation, and Internalisation. Specifically, it seeks to determine the preferred tool (or tools) contributing to knowledge creation among the Managerial and Supervisory teams in Malaysian palm oil estates and to recommend appropriate training and development programmes accordingly.

1.5 Significance of the Research

From an academic point of view, this research benefits from the experiences of the Managerial and Supervisory team in managing knowledge in the workplace as the findings will encourage more individuals in the organisation to identify best practices in knowledge creation using SECI tools. In addition, the results could assist the human resource department in designing appropriate training programmes and equipping necessary mechanisms that can enhance knowledge sharing and creation among the managerial and supervisory teams using the SECI model.

2. Knowledge Management

As a critical process, KM is involved in every department regardless of its function in the organisation. However, the process of KM may differ to suit the department's function and be executed in diverse ways to improve organisational performance. Omotayo (2015) stated that KM addresses the crucial issues of organisational adoption, survival, and competence when facing progressively irregular environmental change. According to Nasimi et al. (2013), KM helps an organisation function by comprehending the data's relationship, determining and documenting rules to manage data, ensuring data accuracy, and maintaining data integrity. Furthermore, Yusof, Masrek and Noordin (2016) proved that KM application in an organisation is about mapping knowledge and information resources online and offline.

Studies have shown the various ways KM function helps organisations achieve and sustain performance. Widiatuti, Arachman, and Broto (2019) showed that KM is a measure to make the *know-how* residing in human brains gained through learning and performance initiatives accessible and beneficial to each person in the

organisation. The measure attempts to encapsulate or tap the organisation's collective experiences and wisdom and make it accessible to ensure everyone can utilise it to enhance performance.

2.1 The Development of Knowledge Management in Malaysia

Hegazy and Ghorab (2014) summarised that the fourth Malaysian Prime Minister, Tun Dr Mahathir Mohammad stimulated the KM agenda in 1991 to transform Malaysia's economy into a knowledge-based economy. Some organisations' initiatives in KM application emerged as an inspiration to many others to act similarly. Apriliadi (2019) stated that KM progressed in Malaysia when multinational firms such as Microsoft and Hewlett-Packard (HP), introduced their existing KM practices, processes, and applications.

According to Raudeliūnienė and Davidavičienė (2018), the Multimedia Development Corporation (MDC) was one of the first government-linked companies (GLCs) that practiced KM in the early 1990s. Malaysia started laying the way and placed the foundation for a knowledge-based economy (k-economy) in the early 1990s by assuming that continuous measures were required to enhance the country and the industries' competitive position. Contrastingly, a survey undertaken by Asrar-ul-Haq and Anwar (2016) discovered that Malaysia lagged behind leading nations such as Singapore and the USA concerning knowledge enablers. Malaysia was found to be nearly on par with developed countries only in technological cooperation. Several other efforts to assess KM directed researchers to report that KM was comparatively slow in Malaysia (Hashim, Talib, & Alamen, 2014). Previous studies discovered that the implementation level was not on par with the awareness level, although many organisations were aware of KM and the imminent advantages (Razi, Habibullah, & Hussin, 2019).

2.2 Research Hypotheses

This research was conducted among the Managerial and Supervisory teams in Malaysian palm oil estates to examine the relationships between:

- Independent variables (Socialisation, Externalisation, Combination, and Internalisation) and other moderator variables (Job Category and Years of Working Experiences).
- The dependent variable (Knowledge Creation) and moderator variables).
- The moderating effect on the relationship between the independent variables and dependent variables.

Relevant hypotheses were developed to test the relationships between the variables:

H1: Socialisation is positively related to individual knowledge creation.

H2: Externalisation is positively related to individual knowledge creation.

H3: Combination is positively related to individual knowledge creation.

H4: Internalisation is positively related to individual knowledge creation.

H5: The relationship between Socialisation, Externalisation, Combination and Internalisation, and knowledge creation is moderated by job category.

H6: The relationship between Socialisation, Externalisation, Combination and Internalisation, and knowledge creation is moderated by years of working experience.

3. Methodology

This research utilised a quantitative method and adopted existing questionnaires by Nasser (2012) and Huang and Wang (2002) to measure individual knowledge creation. The unit of analysis in this research was individuals and the samples for this research were selected from the Managerial and Supervisory teams in palm oil estates in Malaysia. In this study, the researcher used convenient sampling to obtain the sample. Etikan, Musa, and Alkassim (2016) defined convenience sampling as a type of nonprobability or non-random sampling where members of the target population that meet certain practical criteria, such as easy accessibility, geographical proximity, availability at a given time, or the willingness to participate are included for the purpose of the study. Managerial and Supervisory teams of various palm oil estates in Malaysia were contacted through personal networks and work groups and a link to the questionnaire was shared for data collection. A total of 325 useable responses were received and the data collected was analysed using SPSS version 27.

3.1 Research Framework

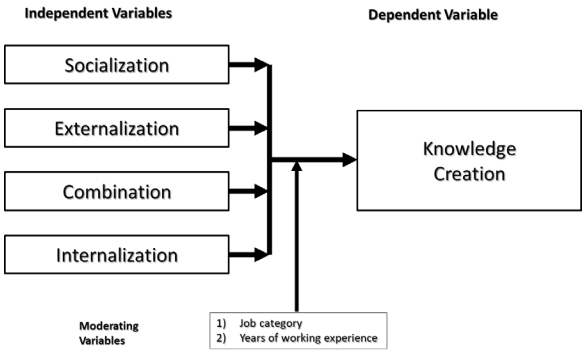


Figure 2: Research Framework

The SECI model by Nonaka and Takeuchi (1995) was reviewed as the research framework and foundation for this research. This model relates to the type of knowledge and its interaction with knowledge creation (Dalkir, 2017). Figure 2 exhibits the four knowledge-creation tools that are sequential. Therefore, knowledge evolves in a sequential pattern with differences. New quality of knowledge is created when the knowledge is converted from one tool to another. This study used these tools to develop the research hypotheses to examine the knowledge creation among the Managerial and Supervisory Teams in Malaysia (Syed et al., 2018).

4. Results and Conclusion

4.1 Linear Regression

Table 1 summarises the overall relationships among the variable. It was discovered that Socialisation and Combination had a positive relationship with Knowledge Creation if it is measured by simple linear regression with a group of Managerial and Supervisory teams with different levels of years of working experience.

Table 1: Summary of Linear Regression

Num	DV / IV	Knowledge Creation	F	R^2	p
1	Socialization	H1 Accepted	44.299	0.118	0.000
2	Externalization	H2 Rejected	3.078	0.006	0.080
3	Combination	H3 Accepted	48.177	0.127	0.000
4	Internalization	H4 Rejected	0.009	0.000	0.926

Therefore, it is concluded that Internalisation and Externalisation are not appropriate tools for generating Knowledge Creation for the group of Managerial and Supervisory teams with different years of working experience. Internalisation and Externalisation are related to learning from reading materials and Zulkifli et al. (2021) proved that issues of reading habits are still far behind due to a few factors such as lack of interest, motivation, previous knowledge, and vocabulary knowledge which could affect reading comprehension. Thus, H1 and H3 were accepted and H2 and H4 were rejected.

4.2 Linear Regression with Job Category

Table 2 shows the relationship between independent and dependent variables which are moderated by job category.

Table 2: Linear Regression with Job Category

No.	IV / Job Category	Socialization	Externalization	Combination	Internalization
1	Managerial or Above	Positive Relationship F = 7.040, R^2 = 0.079, p = 0.010	No Relationship F = 0.544, R^2 = 0.008, p = 0.463	No Relationship F = 1.675, R^2 = 0.010, p = 0.200	No Relationship F = 0.653 R^2 = 0.009, p = 0..422
2	Sr. Asst/Asst. Mgr	Positive Relationship F = 83.510, R^2 = 0.438, p = 0.000	No Relationship F = 0.002, R^2 = 0.000, p = 0.963	Positive Relationship F = 128.618, R^2 = 0.546, p = 0.000	Negative Relationship F = 12.864, R^2 = 0101, p = 0.001
3	Field Supervisor/ Conductor	Negative Relationship F = 48.453, R^2 = 0.245, p = 0.000	Negative Relationship F = 50.778, R^2 = 0.254, p = 0.000	Positive Relationship F = 8.648, R^2 = 0.050, p = 0.004	Negative Relationship F = 55.955, R^2 = 0.273, p = 0.000

From Table 2, it can be concluded that:

- For upper managerial levels, they preferred to create or exchange their knowledge through Socialisation but not with Externalisation, Combination, and Internalisation.
- For the Senior Assistant/Assistant Manager level, they preferred to create or exchange their knowledge through Socialisation, Combination, and Internalisation but not with Externalisation.
- For the Field Supervisor/Conductor level, they preferred to create or exchange their knowledge through these four tools: Socialisation, Externalisation, Combination, and Internalisation.
- Socialisation was identified as the most major tool where there is a relationship with all three levels of job category.

Based on the analysis 8 or 67% out of 12 tests showed $p \leq 0.05$, and Hypothesis 5 for this moderator was accepted. The job category moderates the relationship between Socialisation, Externalisation, Combination, and Internalisation and Knowledge Creation

4.3 Linear Regression with Years ff Working Experience

Table 3 shows the relationship between independent and dependent variables which are moderated by years of working experience.

Table 3: Summary of Linear Regression with Years of Working Experience as a Moderator

No.	IV / Experience	Socialization	Externalization	Combination	Internalization
1	< 5	No Relationship F = 2.511, R^2 = 0.044, p = 0.123	No Relationship F = 3.965, R^2 = 0.082, p = 0.055	Positive Relationship F = 7.047, R^2 = 0.155, p = 0.012	No Relationship F = 1.922, R^2 = 0.027, p = 0.175
2	6 – 10	No Relationship F = 0.260, R^2 = 0.012, p = 0.615	No Relationship F = 0.173, R^2 = 0.008, p = 0.682	No Relationship F = 0.176, R^2 = 0.008, p = 0.679	No Relationship F = 0.001, R^2 = 0.000, p = 0.975
3	11 – 15	No Relationship F = 0.087, R^2 = 0.001, p = 0.768	No Relationship F = 0.000 R^2 = 0.000, p = 0.992	Positive Relationship F = 6.792, R^2 = 0.083, p = 0.011	No Relationship F = 0.429, R^2 = 0.007, p = 0.515
4	16 – 20	No Relationship F = 1.476, R^2 = 0.009, p = 0.230	No Relationship F = 3.275, R^2 = 0.043, p = 0.076	No Relationship F = 0.053, R^2 = 0.001, p = 0.819	Positive Relationship F = 5.216, R^2 = 0.076, p = 0.027
5	21 – 25	No Relationship F = 2.604, R^2 = 0.032, p = 0.113	No Relationship F = 0.578, R^2 = 0.012, p = 0.451	No Relationship F = 0.129, R^2 = 0.003, p = 0.721	No Relationship F = 0.176, R^2 = 0.008, p = 0.051
6	> 25	Negative Relationship F = 8.540, R^2 = 0.071, p = 0.004	Negative Relationship F = 17.367, R^2 = 0.142, p = 0.000	No Relationship F = 0.048, R^2 = 0.000, p = 0.827	Positive Relationship F = 5.849, R^2 = 0.047, p = 0.017

From Table 3, it can be summarised that:

- For the category > 25 years of working experience, there are significant positive relationships with Internalisation but a negative relationship with Socialisation and Externalisation.
- For the category 16 – 20 years of working experience, there is a significant positive relationship with Internalisation.
- For the category < 5 years of working experience, there is a significant positive relationship with Combination.
- For the category 11 – 15 years of working experience, there is a significant positive relationship with Combination.
- There is no relationship between the categories 6 – 10 and 21 – 25 years of experience.
- Based on the analysis of years of working experience, 6 or 25% out of 24 tests showed $p \leq 0.05$, and Hypothesis 6 for this moderator was rejected. The years of working experience category does not moderate the relationship between Socialisation, Externalisation, Combination, Internalisation and Knowledge Creation. Therefore, years of working experience were omitted from further discussion.

4.4 Recommendations

The overall amount of Knowledge Creation outcomes posed by the Managerial and Supervisory team in palm oil estates in Malaysia may influence the outcomes and result in FFB production. Each level in the job category preferred a different level of Knowledge Creation tools. Upper managerial levels preferred Socialisation while Senior Assistant/Assistant Manager levels preferred Socialisation, Combination, and Internalisation to generate or share their knowledge before being upgraded to the Managerial level. While the lower rank of Field Supervisor/Conductor category chose all four tools: Socialisation, Externalisation, Combination, and Internalisation for their knowledge creation. Based on the research findings, it is recommended to any plantation company organise training programmes based on the SECI Model. Since Socialisation fits all types of job categories, the plantation company can develop its training programmes based on tacit-to-tacit conversion programmes such as presentations, talks, mentoring programmes, informal and formal gatherings, and case studies. Workplace collaboration with the right software, digital platforms, social media, and messengers could also help develop and capture tacit knowledge.

4.5 Implications of this Research

Two implications can be drawn from this research:

- The Knowledge Creation tools contributed to Knowledge Creation among Managerial and Supervisory teams in palm oil estates in Malaysia; and
- The mediating factors influenced the Managerial and Supervisory teams in palm oil estates in Malaysia in creating their knowledge.

The findings of the research identified that Knowledge Creation tools such as Socialisation, Externalisation, Combination, and Internalisation significantly contributed to generating knowledge among Managers, Senior Assistants/Assistant Managers, and Field Supervisors/Conductors. This is because these tools have the following attractive attributes; it is relatively simple to apply, take little time away from day-to-day organisational activities, generate results for the organisation, combine Knowledge Creation and Knowledge Sharing, enable a caring and sharing culture in the organisation, continuously builds relationships and dynamic communities of practice, is a possible tool for multi-project management, and reforms knowledge society (Carvalho & Ferreira, 2001). Most organisations spend vast sums of money for training and development. Some organisations have achieved their targeted goals by creating, generating, and sharing knowledge among their subordinates while others fail due to uncertainty on the proper way to create knowledge among their subordinates. The findings of this research can provide guidance for any plantation's HR Department by determining which tools can be applied to generate knowledge among Managerial and Supervisory teams.

This research implies that Socialisation is a favourable tool and positively affects Knowledge Creation among Managers, Assistant Managers, and Field Supervisors of palm oil estates in Malaysia. This is supported by Zabeda (2008) who discovered that organisations benefit further in terms of knowledge sharing and creation through personal networking, basic communication practices, and discussions between managers and employees, rather than on technology. In addition, a study by Raid et al. (2012) examined the impact of the knowledge-creation process including Socialisation, Externalisation, Combination, and Internalisation on implementing a learning organisation (LO) strategy in an Algerian international oil company. Raid et al (2012)'s research revealed that Socialisation, Internalisation, and Combination have a significant impact on the success of a LO strategy. Socialisation is the major influential factor, having the strongest impact on LO but Externalisation was found to have no statistical influence on LO. These findings also showed that there is no relationship between Externalisation at the Managerial and Senior Assistant/Assistant Manager levels.

4.6 Limitations of the Research

Due to limited internet coverage in the estate, not all Managerial or Supervisory teams could access the questionnaire. One of the major disadvantages of an online questionnaire system surfaces in remote locations where access to electricity, stable internet connection, and other basic system requirements are difficult to meet. Such barriers impede the respondents from responding to the online questionnaire.

4.7 Suggestions for Future Research

Achieving a knowledgeable society is not an easy task. Clear understanding and proper tools should be applied to create or generate knowledge among the Managerial and Supervisory teams in palm oil estates because different employees have different types of skills, attitudes, and behaviours. The findings from this research may assist human resource departments in palm oil plantation companies to design training programmes according

to specific job categories. This research is deemed one of the pioneer studies of KM in palm oil estates in Malaysia.

The current research only focused on how the Knowledge Creation tools affect the Knowledge Creation process and how they were moderated by job category and years of working experience. However, organisational culture aspects were not tested in this research.

Further studies need to strengthen the theory's adaption to the current scenarios and culture. Future research can also examine whether organisational culture such as innovation, technology, transparency, values and beliefs, and other moderating variables such as education, race, and age have an impact on the Knowledge Creation process and Knowledge Creation tools.

4.8 Conclusion

Most industrial countries have gradually changed from industrialised economies to information or knowledge-based economies, where human beings become the most valued asset due to the tacit knowledge embedded which is difficult to access. Therefore, we have a KM system that was developed to discover, capture, apply, and share knowledge. Unfortunately, KM is rather new in palm oil estates in Malaysia.

Based on the findings of this study, it can be concluded that KM is an effective way for Malaysian plantation companies to build competencies in the market not only to compete with our neighbouring countries but also to gain a reputation in the eyes of the world. More importantly, the training programmes based on the SECI Model could be used as a guideline for any palm oil plantation company to develop their training programmes for their subordinates.

teresa.patricio@iscte-iul.pt

Abstract: Portuguese SMEs are 'catching-up' to the European Commission's goal of 20% for SME participation in H2020, representing16,7% of allocated funds.. Previous R&D experience, and especially R&D cooperation, have been identified as key determinants of participation in Framework Programmes, such as H2020. Thus, it is important to know SMEs that engage in these experiences and the drivers that lead them to it. This paper seeks to identify why and how SMEs gain collaborative experience with HEIs; what are the organizational characteristics that foster collaboration; the types of experiences in which SMEs are engaged with HEIs; the obstacles they face when applying for FP funding, and how these can be overcome. Lastly, we aim to draw lessons that foster SMEs' participation in Framework Programmes. To achieve these goals, we conducted a survey with SMEs that collaborate with HEIs (N = 26), including SMEs that participated in H2020 and SMEs that didn't. We then complemented the survey with six in-depth qualitative interviews with both FP participants and non-participants.

Keywords: Small and medium enterprises, Higher education institutions, Framework programme, Collaborative R&D

1. Introduction

European Union Framework Programmes (FPs), such as Horizon 2020 (H2020) can create and strengthen research and development (R&D) networks and cooperation between higher education institutions (HEIs) and small and medium enterprises (SMEs), given the collaborative nature of participant consortiums. FPs thus contribute to innovation networks. For HEIs, FP funding can work as a strategy to tackle reduced national research budgets (Enger, 2018). Particularly for SMEs, FP funding can counter usually faced barriers relating to R&D, such as lack of financial resources for investment in technology and qualified human resources (Barajas and Huergo, 2010; Lesáková, 2009).

SMEs are a key element of the European economy accounting for 99% of the companies operating in the non-financial business sector (European Court of Auditors, 2020). In 2019, 64,5% of enterprise workers were employed by SMEs (Eurostat, 2023). The importance of SMEs and their tendency for low participation in the FP has led the European Commission to work towards increasing their participation, having set a goal of 20% for H2020 allocated funds to SMEs. Although the goal has been met (24%) (European Commission, 2020), this is not the case for every Member-State. For example, SMEs account for 16,7% of H2020 allocated funds in Portugal (Agência Nacional de Inovação, 2020).

Discrepancies in participation come as no surprise taken the literature on European funding for R&D points to a 'Matthew Effect' (Merton, 1968 as cited in Enger and Castellacci, 2016; Enger, 2018). When looking at FP participants, it is possible to identify 'oligarchic networks' that prevent newcomers through cumulative advantages, such as more resources for R&D and/or central network positions that reinforce themselves overtime (Enger, 2018). This 'Matthew Effect' also translates geographically. Some instruments in previous FPs, such as Networks of Excellence and Integrated Projects, have increased the bias towards large consortia located in North-West Europe thus accentuating inter-regional differences (Amoroso et al., 2018; Marimon, 2004). Although this literature points to plausible arguments explaining low participation of small entities and particularly small firms in peripheral Member-States such as Portugal, it doesn't focus on the specificities of such organizations. Most literature on FP participation focuses on HEIs. To address this gap, we turned to literature on corporate R&D, including focusing on SMEs' participation in FP, asking what determines SMEs' participation in European funding for R&D. Participation usually entails a successful application or project submission. Yet, participation can also be thought of as applying for funding, regardless of the application's success. Since a successful application depends on the decision to apply, we are interested in what drives SMEs to apply. Thus,

we ask what drives SMEs to be interested and apply for funding and not necessarily what determines application success which we nevertheless briefly address.

2. Research Questions and Literature Review

SMEs' decision to participate in the FP is based on trade-offs between expected benefits of cost sharing and expected short-term costs of participation (Faber et al., 2016). The FP's administrative requirements are complex and demanding, often leading SMEs not to apply (Barajas and Huergo, 2010). This decision may be the result of an objective cost-benefit calculus, but it can also result from misconceptions about the FP, such as 'loss of control' of the company, a perceived inadequacy of the FP for the firm's needs, or simply a lack of information (Romero-Martínez et al., 2010).

Apart from the H2020's SME Instrument, FP projects entail R&D cooperation which turns R&D partners, partnerships, and respective perceptions into important variables to consider. Different entities may pursue different goals, preferring specific kinds of R&D outputs over others. Commercial products as R&D outputs are more valued by SMEs (Luukkonen, 2002) than HEIs (Grimpe et al., 2022). SMEs are more market-driven than research-driven (Hervás-Oliver et al., 2021). A perceived incompatibility of goals may then result in SMEs deciding not to form partnerships. Conversely, it doesn't come as a surprise that SMEs with prior experience of R&D cooperation are more likely to apply for the FP (Barajas and Huergo, 2010). Previous experience gives firms more confidence for future cooperation (Mora-Valentin et al., 2004 as cited in Catarino and Teixeira, 2009). This, of course, points to previous R&D experience in general as a key factor for FP participation. Additionally, previous collaborative experience fosters networking which makes it easier to find adequate partners for future participation (Barajas and Huergo, 2010).

Although the FP can in principle create research networks, previous R&D experience and, especially, collaborative R&D experience appear to be an important factor determining participation in the FP. This resonates with the 'Matthew Effect' pointed by Enger (2018) when researching about HEIs' participation in H2020. Hence, it is important to ask: how and why do SMEs gain collaborative R&D experience with HEIs? What are the characteristics of SMEs that engage in these experiences? What obstacles do these experiences help overcome when applying for European funding? What can we learn from SMEs that participate in the FP?

Most literature regarding the relation between organizational characteristics and participation in the FPs focuses on HEIs. We thus sought to combine the literature on corporate R&D, especially regarding SMEs, with some important characteristics that help predict involvement in collaborative R&D. This, however, requires further research to which we pretend to contribute with this paper. Additionally, to better grasp the reality of SMEs that are more engaged in R&D, we borrow the concept of 'academic firms' (Campbell et al., 2013; Campbell and Carayannis, 2016). The 'academic firm' is an ideal type of firm focusing on knowledge application but also on knowledge production, balancing profit generation with a goal of knowledge production. These firms encourage research work, value education and life-long learning for their employees, have cross-employment experiences, such as hosting PhD researchers in collaboration with HEIs, and value 'traditional' academic R&D outputs such as scientific publications. We thus analyze Portuguese SMEs engaged in collaborations with HEIs with this ideal type in mind, contributing to its empirical verification.

Organizational size, as measured by the number of researchers, is a determinant of HEIs' participation in FP (Enger and Castellacci, 2016). Similarly, Kelly and Arora (1996) as cited by Catarino and Teixeira (2009) refer that SMEs only engage in collaborative R&D when they have enough human resources to do so, suggesting a relationship between size and collaborative R&D. However, in their study of Spanish SMEs, Barajas and Huergo (2010) found a negative relation between firm size as measured by the number of employees and propensity to apply for FP funding, highlighting that this may be explained by specific Spanish policies towards increasing SMEs' participation in FP, and thus pointing to policy as an important factor. Besides enough human resources, another important factor is their stability. Work force turnover negatively impacts SMEs' engagement in R&D (Grego-Planer and Kus, 2020). On another note, internationalized SMEs, such as exporters, are more likely to engage in collaborative R&D (Lesáková, 2009) and apply for FP funding (Barajas and Huergo, 2010).

Still regarding human resources, professional qualification is a key factor for R&D activity (Aschhoff, 2010; Lepori et al., 2015). Education and professionalism increase 'boundary-spanning activity' (Damanpour, 1991). However, it is important that firms have specific employees dedicated to R&D (Wang et al., 2010). A R&D formal organization, such as a R&D department or manager, is an important factor for R&D and innovation (Damanpour, 1991; Terziovski, 2010). Additionally, 'academic firms' usually engage in cross-employment, such

as the employment of PhD students, which suggests partnerships with doctoral programs and thus with HEIs as an important factor (Campbell and Carayannis, 2016).

Based on this literature review, focusing on SME-HEI relations, SMEs' organizational characteristics that may determine their engagement in collaborative R&D and, hence, their participation in FP funding, we intend to answer the already outlined research questions, hoping to draw lessons from Portuguese SMEs.

3. Methodology

To answer these questions, we conducted a survey with 'Leader' Portuguese SMEs that engage in collaborative R&D with HEIs (N = 26). Amongst these, 15,4% haven't participated (N = 4) in H2020 and 84,6% have participated (N = 22). All surveyed SMEs share the 'Leader' 'seal of approval' of the Portuguese Agency for Competitiveness and Innovation for high performance SMEs, indicating that both groups constitute highly competitive SMEs. Additionally, when gathering the data base for the survey, we 'matched' H2020 participant SMEs' activity sector and district with non-participant SMEs to make sure both groups were as similar as possible. We then complemented the survey with in-depth semi-structured qualitative interviews with three H2020 participant SMEs and three non-participants. The interviews allowed us to explore more deeply the answers provided in the survey. The interviews were transcribed, categorized, and analyzed through a common analysis grid.

4. Data Analysis

This section is divided into four major themes that will shed light on the elements that influence, enable or hinder R&D cooperation involving SMEs and HEIs. First, we examine the key organizational characteristics of SMEs engaging in R&D, exploring their structure and priorities. Second, we examine the importance of human resources in the context of R&D in SMEs, highlighting the critical role of skilled individuals in driving innovation and, thus, participation in R&D programs such as FPs. Third, borrowing from the concept of 'academic firms' which, among other factors, entail a balance between profit goals and knowledge production (Campbell and Carayannis, 2016), we discuss different preferences of R&D outputs and R&D strategies of SMEs, providing a deeper understanding of their approach to collaborative R&D, and exploring the empirical relevance of this concept. Finally, we identify the obstacles that SMEs with partnerships with HEIs find when applying for European funding. By examining these challenges, we aim to provide recommendations for policymakers and stakeholders to improve the environment for successful collaborations between SMEs and HEIs within FP.

4.1 Organizational Characteristics of SMEs Engaging in R&D

Table 1: Organizational Characteristics of SMEs for R&D

	Yes	No
Hiring PhD students	46,2%	53,8%
Partnerships with doctoral programs	38,5%	61,5%
Department, section, or R&D group	96,2%	3,8%
R&D manager or person in charge	80,8%	7,7%

Source: Author's survey

Table 1 suggests that nearly half of the organizations recognize the value of having highly educated researchers on their teams, since 46,2% hire PhD students. However, only 38,5% of SMEs have partnerships with doctoral programs, indicating that on the one hand, SMEs that hire PhD students do not necessarily have a formal ongoing partnership with HEIs, and that on the other hand, most SMEs are not currently involved in such partnerships. In the qualitative semi-structured interviews, when asked about hiring PhD students and partnerships with PhD programs, most SMEs' representatives recognized the importance of having PhD researchers on their companies. Yet, only one of the interviewed SMEs has a formal PhD protocol to host researchers. Interestingly, this protocol is held with the HEI where the SME itself was created as a spin-off. Others claim not to have an organized or big enough structure to formally host researchers themselves nor availability to do so given their workflow. However, the interviews allowed us to explore the relation between human resources and HEIs established through internships. Some of these SMEs host bachelor and/or master level interns. When asked about the origin of these partnerships, most stated that these arose from personal connections to HEIs, such as being alumni.

In terms of R&D organization, Table 1 highlights that a vast majority (96,2%) of SMEs have a R&D dedicated department, section, or group, with 80,8% stating to have a R&D manager or a person in charge. This indicates a strong commitment to research activities and the importance of leadership and management in driving R&D efforts. Amongst the interviewees, the spin-off SME - closer to the ideal-type of 'academic firm' given the centrality of R&D in the company – who regards FP participation as a key activity of the firm, not only has an R&D department and R&D manager, but also a person in charge of FP projects within the department. Contrastingly, three interviewees do not have an R&D formal organization, but two of them engage in R&D, nonetheless. Interestingly, both are in the agricultural sector and claim to have been approached by HEIs to engage in collaborative R&D. This points to at least an R&D dedicated person as a driver for collaborative R&D initiative and, hence, FP participation.

Regarding other characteristics of SMEs, our sample of SMEs engaged in collaborations with HEIs also revealed that 76.9% of SMEs are exporters; 65.4% participate or have participated in FPs; 34.6% have 10-49 workers, 23.1% have 50-99 workers, and 30.8% have 100-249 workers. These results point to SMEs that engage in R&D partnerships with HEIs as having certain characteristics in common. Most of them have an R&D department, group or section, and a R&D manager; invest up to 9% of their turnover in R&D; have up to 100 workers; and are exporters. Furthermore, most of these SMEs are or have been participants of FPs, have official partnerships with doctoral programmes, and hire PhD candidates. Therefore, these SMEs may represent embryo examples of 'academic firms' driven by supporting and advancing knowledge production (Campbell & Carayannis, 2016). However, the below target allocation of H2020 funding to Portuguese SMEs suggests we look at other possible explanatory variables.

4.2 Human Resources in SMEs and R&D

Table 2: Importance of Human Resources in SMEs for R&D

	N	Minimum	Maximum	Mean	Std. Deviation
It is difficult to recruit qualified human resources for R&D	23	1	5	3,57	1,237
R&D activities are performed by human resources that are already in the company	23	2	5	4,13	0,694
For R&D activities, it is important to have stable human resources in the company	23	4	5	4,70	0,470

Source: Author's survey

Table 2 focuses on the role of human resources in R&D. The data shows a moderate level of difficulty in recruiting qualified R&D personnel, with a mean score of 3,57 (1,24). This finding suggests that SMEs face challenges in attracting and hiring the right talent for their R&D initiatives. The data also reveals that most SMEs (4,13 (0,69)) rely on their existing workforce for R&D activities, potentially due to the difficulties in recruiting new talent or a desire to leverage in-house expertise. Finally, the high mean score of 4,70 (0,47) for the statement 'for R&D activities, it is important to have stable human resources in the company' emphasizes the need for a stable workforce in R&D endeavours. In the interviews, all SME representatives stated to value human resources stability, especially in highly skilled functions, namely due to the long 'on the job training'/integration time in the company's activities. However, most of them admitted to struggling to find and maintain appropriate human resources for different perceived reasons: a younger and more willing to rotate generation of skilled workers; competing for human resources with other sectors or foreign companies offering better conditions – the latter enhanced with the possibility of remote work; but also, an increasing demand and scarce supply of highly trained professionals, especially in the IT sector. Regarding qualifications, most of the interviewees privilege at least a bachelor's degree, except for the spin-off SME that demands a master's degree for the R&D department. This was also the only interviewed SME that currently employs workers with a PhD.

Drawing a connection between Table 1 and Table 2, SMEs that have a dedicated R&D department or group and an R&D manager might be more likely to invest in stable human resources and engage in collaborations, such as hiring PhD students or partnering with doctoral programs. Encouraging firms to pursue this kind of organization can eventually create more potential FP participants. Additionally, encouraging organizations that already

present these characteristics to actively participate in the FP can contribute to the creation and strengthening of research networks, fostering collaboration between SMEs and HEIs.

4.3 SMEs Engaged in HEIs Collaborations as 'Academic Firms'

Table 3: Importance of R&D Outputs for SMEs as Characteristics of "Academic Firms"

	N	Minimum	Maximum	Mean	Std. Deviation
Publication of scientific articles	26	1	5	3,35	1,06
Submission of patents	26	1	5	3,35	1,13
Trademark registration	26	1	5	3,31	1,29
Creation of new products	26	3	5	4,58	0,76
Collaboration with partners	26	2	5	4,42	0,86
Skills acquisition and development	26	3	5	4,65	0,63

Source: Author's survey

Table 3 provides some support to the concept of 'academic firms', highlighting different activities commonly associated with the concept, such as the publication of scientific articles, submissions of patents, trademark registration, creation of new products, collaboration with partners, and skills acquisition and development. The surveyed organizations place a strong emphasis on the creation of new products, with a high mean score of 4,58 (0,76). This suggests that SMEs and HEIs working together are focused on driving innovation and delivering tangible results. Furthermore, SMEs also prioritize collaboration with partners and skills acquisition and development, with mean scores of 4,42 (0,86) and 4,65 (0,63), respectively. These high scores indicate the importance of effective partnerships and the continuous development of expertise within these firms. Conversely, the data also shows that activities such as publication of scientific articles, submission of patents, and trademark registration have lower mean scores of 3,35 (1,06), 3,35 (1,13) and 3,31 (1,29), respectively. While these activities are pursued by academic firms, their lower scores suggest that they may be of secondary importance when compared to more practical aspects of innovation and collaboration in the case of the surveyed SMEs. This resonates with statements made during the interviews. Most interviewees regard R&D activities as depending on their clients' needs and/or aim at improving processes or products. Only the spin-off SME is responsible for 'all its technology' and engages in R&D activities that are not necessarily client-oriented, namely FP projects that they use as a strategy to explore new possibilities aiming at technology transfers and enhancing their networks for future partnerships, providing an example of an embryonic 'academic firm'.

In conclusion, data from Table 3 only partially supports the notion of academic firms. Despite showing a strong focus on the creation of new products, collaboration with partners, and skills acquisition and development, more traditional academic activities, such as publications of scientific articles, submission of patents, and trademark registration appear to be less emphasized. This may be a sign that the 'traditional' valued outputs of HEIs do not echo SMEs', eventually hindering potential partnerships. For example, an interviewed representative whose SME has not participated in H2020, but nonetheless has worked with HEIs, expressed that HEIs apply for FP to fund their current expenses and that their research has 'no interest' since it's not close enough to the market. On the other hand, other interviewees regard their relations with HEIs as *quid pro quo*, or as complementary. This points to the need of policymakers and stakeholders to better understand the priorities and needs of SMEs, enabling them to tailor support mechanisms and strategies to foster successful collaborations between SMEs and HEIs, aiming at increasing SMEs' participation in the FP.

Table 4: Importance of R&D Strategies for SMEs

	N	Minimum	Maximum	Mean	Std. Deviation
Developing R&D through internal resources	26	2	5	4,65	0,745
Develop R&D through the contracting of external resources	26	2	5	3,81	0,939
Developing R&D continuously	26	3	5	4,73	0,533
Open new lines of research	26	3	5	4,58	0,703

Source: Author's survey

Table 4 shows that SMEs value the importance of developing R&D through internal resources (4,65 (0,75)), continuously developing R&D (4,73 (0,53)) and opening new lines of research (4,58 (0,75)). However, they acknowledge the need to contracting external resources (3,81 (0,94)) to reach R&D goals. These results indicate that SMEs are engaging in R&D partnerships with HEI to create new products, but also to develop internal skills, reflecting an interest in their employee's training – distinctive of 'academic firms'. From the interviews, we were able to conclude that while some SMEs mainly resort to HEIs to compensate their lack of internal resources, others – like the spin-off SME - regard partnerships with HEIs as a strategy to be up to date on the state of the art within their sector and, thus, be more innovative and competitive. As in the case of R&D outputs, Table 4 also only partially supports the notion of 'academic firms'. On one hand, SMEs seem interested in contributing to knowledge production by recognizing the importance of continuously developing R&D, valuing opening new lines of research, and wanting to develop internal skills. However, especially given their internal resources limitations, these firms seem more focused on commercial goals than balancing profit goals with knowledge production.

Overall, these findings contribute to understanding the motivations of SME-HEI collaborations and point the need of policies that can help inform and support/facilitate them, for example, instigating doctoral partnerships between SMEs and HEIs that allow SMEs to overcome their difficulties in acquiring human resources for R&D, enabling them to pursue a more balanced 'academic/commercial' R&D strategy. Thus, to inform these policies, it is especially relevant to also look at the obstacles SMEs perceive regarding collaborations with HEIs which, once overcome, may significantly increase FP participation.

4.4 Obstacles for SME-HEI Collaborations

Table 5: Obstacles of SMEs with HEI partnerships in applying for European Funding

	N	Minimum	Maximum	Mean	Std. Deviation
Different perceptions of cost, time and/or productivity among partners	15	3	5	3,93	,46
Difficulty in obtaining immediate results	15	2	5	3,67	,90
Sharing of information on intellectual property	15	2	5	3,47	,92
Lack of stability of R&D public policies	15	2	5	4,00	1,00
Difficulty in obtaining R&D funding	15	2	5	4,00	1,00
Difficulty in finding R&D partners	15	1	4	2,80	1,15
Abstract academic research topics	15	2	5	3,53	,99

Source: Author's survey

According to our data, difficulty in obtaining partners for R&D projects (2,80 (1,15)) and different perceptions of cost, time and/or productivity among partners (3,93 (0,46)) are two relevant obstacles. This indicates that partners may struggle to align priorities and expectations when working together, which could hinder the success of collaborative projects. This is especially relevant for FP participation in that previous experience is a key determinant of participation. Other obstacles include the difficulty in obtaining immediate results (3,67 (0,90)), sharing information on intellectual property (3,47 (0,92)) and abstract academic research topics (3,53 (0,99)). This suggests that organizations face some difficulties in achieving quick outcomes, dealing with intellectual property issues, and bridging the gap between academic research and practical applications. However, regarding confidentiality, the interviewed representatives stated that even though it poses problems, such as managing who can access the information inside the company, it doesn't refrain them from engaging in collaborative R&D. Interestingly, the two representatives from the agricultural sector claimed that there is no confidentiality in their collaborative experiences and perceive it as a positive factor, since the sector is volatile to collective problems such as pests. This indicates that exploring inter-sector differences may be important for future research. Additionally, these findings also highlight the importance of stable public policies and adequate

funding to support R&D collaboration, as well as the need for effective networking to identify suitable partners. For example, one of the interviewees perceives publicly funded R&D projects as sporadic and poorly funded, not taking into consideration a long-term business strategy for SMEs. On another note, H2020 participants stated that being connected to big organizations, such as prestigious HEIs is key to finding new partners. When asked about the origin of relations with HEIs, SMEs' representatives usually referred to personal connections. This, once again, points the need for other networking mechanisms that do not leave SMEs dependent on individuals' social background and path which can contribute to the already mentioned 'Matthew Effect'.

Interviewing SMEs' representatives allowed us to further develop the topic of obstacles and directly enquire them about possible improvements to be made through policy. Regarding FPs, but also other R&D funding schemes, SMEs' representatives complained about the administrative burden they represent. While some view partnering up with HEIs and other organizations, such as bigger firms, as a strategy to deal with this burden, since these tend to have more resources and experience, others point the need for available adequate human resources to manage these projects. For example, one of the interviewees suggested that business and entrepreneurial associations could play a central role if they provided these administrative services and that the State should facilitate this role.

5. Discussion and Conclusion

If policies are to be more effective in promoting collaboration between SMEs and HEIs, thus enhancing the propensity of SMEs to apply for FPs, it is important to understand the different aspects of collaborative practices between firms and HEIs. This means also better knowing the SMEs that engage in these practices.

Our findings underline the importance of specific organizational characteristics of SMEs to assume collaborative R&D activities. Most of the surveyed SMEs are exporters, pointing to internationalization as an important factor driving R&D cooperation; most invest up to 9% of their turnover in R&D, and most participate in the FP – confirming that previous experience in R&D and cooperation in R&D is a driver of FP participation. A formal R&D organization also seems like an important driver of collaborative R&D and, thus, FP participation: a specific department, or at least a R&D manager is key. Regarding size, the number of overall employees doesn't seem to make a difference in collaborative R&D, unlike the case of HEIs.

However, for SMEs to engage in R&D, it is important that they have qualified and stable human resources, which is difficult to attain. Engaging in partnerships with HEIs appears to be a strategy to compensate for the lack of internal resources. Hiring or hosting PhD researchers can reflect this strategy, but it is important to address the difficulties signaled in the interviews, such as an insufficient structure and heavy workflow that hinder availability to monitor PhD researchers. Even though a significant percentage of SMEs stated to hire PhD researchers, most SMEs do not have official partnerships with doctoral programs. Thus, the 'academic firm' cross-employment practice seems only embryonic in our sample of SMEs. Additionally, SMEs' connections to HEIs are mostly based on personal connections. Creating different networking platforms or strategies may instigate partnerships which, in turn, can help SMEs counter their lack of resources and instigate R&D cooperation and FP participation. Yet, our survey shows that SMEs value R&D activities performed through internal resources. These findings point the need for further research about SMEs' R&D strategies and concerns regarding human resources for R&D activity.

Furthermore, our findings indicate that SMEs and HEIs tend to prioritize different types of outputs. SMEs are more market-driven than research-driven (Hervás-Olivier et al. 2021) and therefore focus more on the creation of new products, collaboration with partners, and skills acquisition and development. HEIs, however, tend to emphasize traditional academic activities, such as publications of scientific articles. Nevertheless, spin-off SMEs or 'academic firms' reveal a tendency for more diverse R&D outputs, such as joint co-publications, coordinated and mutually supportive activities and a balance between profit goals and knowledge production Yet, the difficulties of establishing collaborative partnerships between SMEs and HEIs remain significant. Our findings reveal difficulties between partners regarding different perceptions on cost, time, and productivity; difficulties regarding sharing information, obtaining funding and results. These difficulties need to be identified and faced so that the obstacles to collaboration and networking can be surpassed. However, to enhance SME-HEI collaborations, future research should also address this subject focusing on the perspective of HEIs.

Regarding the concept of 'academic firms', even though it proved to be a theoretically useful tool, guiding our analysis of SMEs, it doesn't translate empirically in the case of our sample of SMEs. In the case of the interviewed SMEs, the spin-off SME seems to fit into this ideal-type of firm. In general, the characteristics of 'academic firms' can only be observed as an embryonic tendency within our sample of SMEs. Future research aiming to explore

this concept should resort to a bigger sample of SMEs, whether for surveys or interviews. Future research could also draw on this concept in order to explore possible policy initiatives that bring SMEs closer to this ideal-type of firm, fostering corporate R&D and motivating SMEs to participate in the FP.

Lastly, the importance of participating, of learning by doing, of promoting learning behavior of SMEs concentrated on learning and network formation can help address the 'Mathew Effect' observed in FPs by promoting short-term exchanges that can lead to more long-term innovative capabilities of SMEs, and motivate them to participate in competitive research projects such as the FP.

Abstract: The Sustainable Development Goals (SDGs) are a set of international targets that were developed in 2015 by the United Nations. These goals aim to end poverty, protect the planet and ensure prosperity among human kind for all by the year 2030. They are divided into 17 goals and 169 targets that cover all aspects of life – including education, health care, housing, food, energy and climate, peace and justice, governance and sustainable economic growth. Plus, to ensure peace and prosperity. Empowerment is very important element for a community to become developed and to sustain the development. To be able to have self-empowerment, one must first have a sense of self-help and self-determination. Self-help and self-determination are related to the idea that helping one's self will create collaboration and improve one's quality of life (Christenson, 1989). Power in community development refers to the ability to influence change rather than the power to exploit or dominate others, it is an action of choice. This paper introduces Rural Community Learning Network (RCLN) Traits Model which offers a helpful insight for rural communities to value and support rural public library as community sustainable development center. This model was develop using qualitative approach through interviews with the rural public libraries' staffs, users and non-users, observations, and examinations of documents. Thematic analysis has been used to identify the empowerment sustainability characters for the traits model. This study concluded that rural public libraries in Malaysia had not fully implemented the empowerment elements which is identified as an important element in rural libraries and community development.

Keywords: Rural public libraries, Sustainable development, Community empowerment, Rural community development

1. Introduction

Sustainability development seems to be identified as an important area to be highlighted by governments, universities, business leaders and non-governmental organizations (NGO) (Annan-diab & Molinari, 2017). There are seventeen (17) elements of sustainable development goals (see in Figure 1), developed by United Nations set in 2000 which has been adapted by 193 countries all over the world.

Figure 1: The Sustainable Development Goals (United Nations, 2015)

The seventeen (17) development goals as can be seen in the figure above are; 1) ending poverty in any forms anywhere in the world, 2) ending hunger, improving nutrition and promoting sustainable agriculture, 3) ensuring healthy lives and promote well-being regardless of ages, 4) ensuring quality education to all especially children

at rural areas, 5) promoting gender equality and empower women and girls, 6) ensuring access to clean water and sanitation, 7) ensuring affordable and clean energy to all, 8) promoting the decent work and economic development, 9) building robust infrastructure, promoting inclusive and sustainable industrial development and foster invention, 10) reducing inequalities (among mental impairments or psychosocial disabilities) within and among countries, 11) promoting inclusive, safe, resistant and sustainable cities and human inhabitants, 12) ensuring sustainable depletion and manufacture designs, 13) promoting quick responds towards combating climate change and its impacts, 14) preserving, conserving and sustainably using the oceans, seas and marine resources for sustainable consumption, 15) protecting, restoring and promoting sustainable use of native ecosystems, periodically managing forests, avoiding desertification, and halting and reducing land deprivation and stop biodiversity loss, 16) ensuring peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels, and 17) empowering the means of employment and invigorating the global partnership for sustainable development. Hence, sustainability can be defined as the capacity to bear with certain situation, so that it will be maintained and is long lasting. There are more than 200 definitions of sustainable development can be found (Parkin, Sommer, & Uren, 2003). However, the concept of sustainability is promoting the well-being of current community without neglecting the future is the best definition of sustainability.

Nonetheless, empowering rural public library users towards sustainable community development is important to ensure that these essential public service institutions can play an effective role in facilitating community development and social cohesion in rural areas of developing countries (Public Libraries Association, 2015). These rural communities are often faced with numerous socio-economic challenges including inadequate infrastructure, lack of employment opportunities, inadequate access to basic services such as health care and education, limited access to technology, and other socio-economic disadvantages. Hence, rural public libraries provide multiple source of information, activities and programs that offers healthy and balanced lifestyle. The renewable energy in rural public libraries available in green library practice, reduce the consumption of energy and waste as well as supporting the ecosystem. Providing good jobs and economic growth closely related with the no poverty point which rural public libraries will help in local economic activities. The environmental sustainability is also about responsible consumption of the resources used for the rural libraries.

The library in general should have sustainability element incorporated into their organization's procedures, ensure the library can sustain its existence and service (Karioja, 2009), and not just to preserving the information for the patrons. Nowadays, change is essential to the world we live in whether in social, economic or environment. Community should put effort to follow international recommendations of specific field, so that sustainability issue is not just a simple ideology. Libraries should not be an exception to this effort (Dias, 2017). This study proved that library is more than just preserving the information, eventually as time goes by, library needs the sustainability elements to remain relevant in the community.

2. Malaysia Rural Public Library Sustainability Plan

In Malaysia, sustainability plan was included in 7th, 8th, 9th and 10th Malaysia plan. It started in 7th Malaysia Plan (1996-2000) (Yiing, Yaacob, & Hussein, 2013). The 8th Malaysia Plan (2001-2005) highlighted the sustainable development of energy resources and renewable, while the 9th Malaysia Plan (2006-2010) stressed on environment, economic and social aspects. In addition, improving the standard and sustainability of better life quality through public transport, electricity, water and healthcare were included in 10th Malaysia Plan (2011-2015).

There are four (4) common goals to ensure the sustainability of libraries based on Cottrill, et.al. in 2015; 1) ensuring that libraries have sufficient financial resources, 2) ensuring that community realize the importance of libraries and prioritize libraries more in budgetary as well as in political agenda, 3) developing policies to extend coverage of wireless network so that library have access, and 4) established policies that control library administration, facilities, services and staffing.

On the other hand, there are few challenges that will obstruct the library's sustainability which are insufficient funding for library services and library staff, losing of job among the library staff, lack of leadership among librarians, and outdated computer and poor Internet connection in libraries.

Library sustainability refers to the placement of a library's core values and resources such as staff time, facilities, collections, services and technology to endure the challenges in order to bring new and energetic life in all aspects of library operation and outreach (New York Library Association, 2017). Currently many Malaysian public libraries (including rural public libraries) ensure their sustainability by cooperating and engaging with non-

government organization (NGO), local industries and local higher learning institution. Building partnerships with other organization or agency at local, regional, national and international and also with the government organizations, non-government agencies, cultural organizations, etc. would help the rural libraries to achieve long-term sustainability and also introduces empowerment elements to local rural community.

A workshop on the contributions of Malaysia libraries to Sustainability Development Goals (SDG) 2030 Agenda was organized by National Library of Malaysia as part of supported the SDG Agenda. There are 41 librarians all over the country participated in this workshop held at Kuala Lumpur with the cooperation of Petronas Resource Centre. An International Federation Library Associations (IFLA) representative was invited to talk about IFLA and IFLA's contributions toward SDG Agenda 2030. The importance of Malaysian and Malaysian libraries as well as librarians to contribute toward SDG Agenda were highlighted. This study is the part of the contribution of the SDG agenda in the aspect of rural libraries specifically, as for currently there is no SDG stories from Malaysia (Akmal Ahmat, 2020).

In the context of Malaysia, rural libraries need to be sustained in the community due to its role of providing information to the rural community, fulfil lifelong learning efforts, social and cultural role among the community (Omar et al., 2014). Many related studies conducted by multiple researchers (Roziya et al., 2011; Omar et al., 2014; Shaifuddin, Ahmad, & Mokhtar, 2011), have proven that rural libraries have great potential to continuously enhance the knowledge of rural community. For rural community, sustainability is bigger than just environmental issues and support, in fact it is about empowerment – economically, socially and personally. A sustainable rural public library must also work toward empowering economic prosperity and social righteousness for the library staff, their users and the local rural community (Abu, 2012). Hence towards sustainability development of rural libraries in Malaysia, Malaysian rural public libraries have consistently sought to enhance their rural public library services, programs, and activities to satisfy the information needs of the local rural population and promote self-empowerment.

3. Research Methodology

A qualitative approach using structured interviews and group observation was used to investigate the local community engagement practices in Malaysian rural public libraries managed by Malaysia National Library and rural public libraries in the state of Victoria, Australia. In total three (3) prominent and engaging rural public library in the State of Victoria Australia and nine (9) rural public library in Malaysia from variety of different states were selected. The focus was to understand and compare rural libraries' empowerment programs and practices that lead to sustainability. In doing so, a multiple case study approach and cross case analysis method were used.

The respondents use to collect data, were rural public library's staff members, users, and non-users. Each of them was interviewed. Depending on their feedback, the interview session lasted between 30 and 60 minutes. The data was analyzed using ATLAS.ti version 7. Hundreds of codes were generated as a result of data analysis, which led to thematic classification. Hundreds of coding were generated as a result of data analysis, which led to thematic analysis of this study. The Rural Community Learning Network (RCLN) Traits Model was constructed by taking into account all respondents' responses, group observation discussions, and data analysis results.

Meanwhile group observation was used to provide rich and nuanced data about rural public library users' social interactions and behavior. This method complements interviews data, plus it provides a more comprehensive understanding of a research topic. Group observation is a common research method used in various fields such as anthropology, sociology, psychology, education, and management. It involves observing a group of people in a natural or controlled setting and recording their behavior, interactions, and communication patterns. Within this study a total of nine (9) group observation was done and the finding supports the results of the study objectives and question.

4. Results: The Rural Community Learning Network (Rcln) Traits Model

A traits model is a method for the prediction of human behavior. RCLN traits model provides a basis type of learning network behavioral approach using and based on local resources, material and knowledge, for instance, using local industries through partnership programs, local associations through affiliation activities, and government and non-government organizations through collaboration events and campaigns.

The Rural Community Learning Network (RCLN) Traits Model (Figure 2) provides useful insight for rural communities to value and support the rural public library as a community empowerment development center. The strategy identifies and emphasizes the significance of improving the four aspects of rural community

development for rural communities. Furthermore, the study helps to raise community members' awareness of the following community empowerment development components: 1) participation, 2) self-help and determination, 3) decision-making, and 4) leadership.

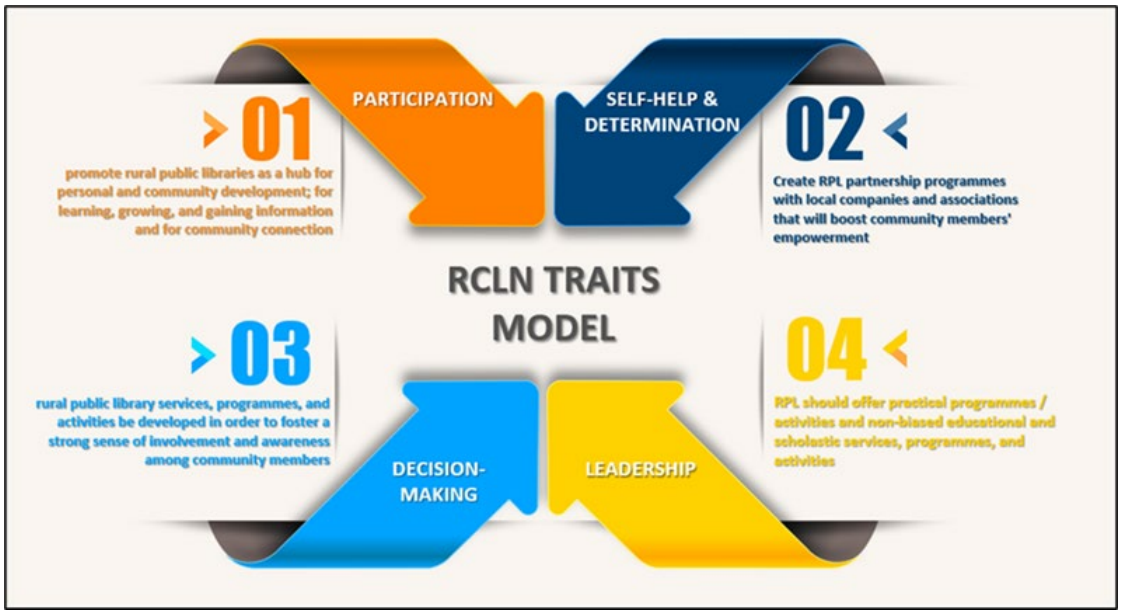

Figure 2: The Sustainable Development Goals (United Nations, 2015)

When developing services, activities, and programs for their communities, Malaysian rural public libraries incorporate elements of community empowerment development principles. Community development elements should be combined and fused so that local community members can strengthen their local, individual, and group self-empowerment. The model identifies and emphasizes the importance of improving rural community development characteristics for rural communities. Furthermore, the research contributes to raising community members' awareness of the following aspects of community development: 1) participation, 2) self-help and determination, 3) decision making, and 4) leadership. The RCLN Traits Model will be useful for current and future research in the development of rural community learning networks, which will involve major changes. The following are the elements:

- Participation: promote rural public libraries as a personal and community sustainable development hub for empowering, learning, growing, and gaining information (both formally and informally); and as a community connection and communication location.
- Self-help and Determination: Create rural public library partnership programs with local companies and associations to deliver library services, programs, and activities that will increase community members' empowerment.
- Making a Decision: It is recommended that rural public library services, programs, and activities be developed to foster a strong sense of involvement and awareness among community members. Allowing the local community to make decisions and make choices will assist them in solving problems and achieving their future goals, so rural public libraries will remain relevant to local community development.
- Leadership: It is advised that rural public libraries offer interactive, hands-on programs and activities, such as workshops on communication, management, and delegation skills, as well as impartial educational and scholastic services, programs, and activities. These engagement strategies will strengthen the local community's sense of leadership and empowerment.

The Rural Community Learning Network (RCLN) is created to provide rural communities with the opportunity to share and learn from each other. One unique aspect of the RLCN is that it allows members to helping individuals to find and learn from other community-minded individuals in their area. Through the use of the RLCN approach rural public library can help each member of local rural community to easily engage with their local community by participating in different discussion platform and sharing information and resources with one another. Individuals can also join various interest groups and create their profiles to connect with other like-minded individuals in their community. Malaysia's rural public libraries incorporate elements of community

development ideas into their services, events, and programs for their communities. Community development elements were integrated and fused to allow local residents to increase their local, individual, and group self-empowerment. Improve Malaysia's rural public libraries' programs, services, and activities by leveraging information and technology to strengthen the RCLN Traits Model.

4.1 RCLN Supporting Rural Community Consultation Effort

The Rural Community Learning Network (RCLN) works as rural community consultation as they are related in supporting community engagement and participation in rural areas.

The Rural Community Learning Network (RCLN) is a platform for sharing knowledge and resources among rural communities. It provides a way for individuals and organizations in rural areas to connect, share best practices, and learn from each other. The RCLN focuses on capacity building, skills development, and knowledge transfer, and seeks to improve the economic, social, and environmental well-being of rural communities.

On the other hand, Rural Community Consultation is a process of seeking input from rural communities on issues that affect them. It involves engaging with community members to gather their perspectives, needs, and ideas, and using this feedback to inform decision-making. Rural Community Consultation can take many forms, including public meetings, surveys, focus groups, and interviews.

Therefore, the RCLN can be seen as a tool for facilitating rural community consultation by providing a platform for sharing information and fostering dialogue between community members and stakeholders. The RCLN can also help to identify areas where consultation is needed and provide guidance on how to effectively engage with rural communities. Overall, the RCLN and rural community consultation are complementary approaches that can support the development of sustainable and resilient rural communities.

5. Conclusion

Public libraries have long been regarded as a pillar of democracy. The rural public library is no different. In fact, rural public libraries are more important than ever in empowering local communities. Furthermore, in order to achieve the Sustainable Development Goal of promoting inclusive and sustainable societies, rural public libraries must do more than just provide physical access to library resources and services in rural and remote areas; they must also ensure equitable digital access and digital literacy for all citizens, as well as provide training to rural public library staff members in information management, technology, and leadership skills. Most importantly, rural public libraries must strengthen partnerships among local libraries, local governments, and community groups in order to develop services that meet community needs and promote empowerment for long-term rural development.

Abstract: Communities of practice, which are often a central component of KM, are considered to be used to facilitate information sharing, resolve internal obstacles, and enhance mutual learning. The extensive use of ICT has enabled their transformation into a virtual environment – Professional Virtual Communities of Practice (VCoPs) – which is creating ideal conditions for collaborative information sharing and learning. This research examined factors predicting usage of the VCoP and how Malaysian public sector organisations, through their adoption, can influence their service efficiency. Based on the synthesis of the UTAUT2 and the DeLone & McLean Model of IS Success, a quantitative approach was adopted for this research. 313 valid respondent data was collected using a questionnaire from public sector organisations that had adopted a VCoP as a knowledge sharing tool. A logical sequence of methods, encompassing descriptive and inferential analysis, followed by using Structured Equation Modelling (SEM), and the SmartPLS software was conducted to determine relevant statistical tests. The findings suggest that the Malaysian Public Sector will benefit from improving their knowledge sharing environment with a VCoP system. Establishing appropriate facilitating conditions, quality knowledge and an enjoyable and up-to-date digital tool will ensure continuous usage.

Keywords: Public sector KM, Virtual communities of practice, UTAUT, DeLone & McLean

1. Introduction

Knowledge is widely regarded as crucial, particularly because it is the most valuable asset in any organisation. At all levels, new knowledge is created not just by individuals, but by teams and communities of people sharing their knowledge and experience throughout the enterprise. More recent interests have tended to introduce communities of practice as structures – tools to be deliberately created by policymakers and organisations for the instrumental purpose of targeted knowledge dissemination. Public organisations have begun to support professional virtual communities of practice (VCoPs), which have evolved into an effective knowledge sharing vehicle, where knowledge workers can voluntarily engage, share opinions, make informed decisions, and eventually enhance their performance. The aim of this research is to examine factors predicting usage of the VCoP and how Malaysian public sector organisations, through their adoption, can influence their service efficiency. The study is based on the integrated perspective of popular UTAUT2, and the DeLone & McLean Model IS Success models. Findings from the VCoP usage are highlighted and discussed, with the purpose to examine implications for research on KM in public services, and for the management of these social collaborative tools in Malaysian public organisations.

2. Literature Review and Hypotheses

2.1 Professional Virtual Communities (VCoP)

Alavi (2013), defines the VCoP as "social network of individuals, who interact through social media, potentially crossing geographical, political and psychological boundaries in order to pursue mutual interest or goals". It has been observed that employees in a VCoP collectively learn to achieve their knowledge seeking objectives (Frank et al. 2017). More recent interest has tended to introduce the VCoP as structures – tools to be deliberately created by policymakers and organisations for the instrumental purpose of targeted knowledge dissemination (de Carvalho-Filho et al., 2020; Zamboni et al., 2020). A recent review concerning papers about CoPs published in major KM Journals, testified the growing interest of scholars: 25% of empirical papers were devoted to Communities of Practice in the public domain (Bolisani & Scarso, 2014).

However, empirical evidence in the public sector about KM in general, and VCoPs in particular, are still lacking, particularly when compared to the private sector (Scarso et al., 2016). The shortage of studies undertaken to predict the use in adopting the VCoP in public sector organisations, has propelled research to mitigate this gap.

Organisations like the Malaysian Public Works Department, Ministry of Trade, and the International Islamic University Malaysia have become pioneers in cultivating the VCoP amongst their professional staff. The question addressed in this article assesses factors that predict use of the VCoP system towards efficiency in public sector organisations.

2.2 Predicting Usage of the VCoP in Public Sector Organisations

Quigley et al. (2007) stressed that "no single theoretical viewpoint can provide clarification of the information sharing and transition process" from the perspective of knowledge sharing. Hence, to explain user acceptance on a particular technology, researchers apply theories and models with different variables, which have been proven successful in determining usage of a system (Venkatesh et al., 2012). There is an inclination of using a combination of theories as the UTAUT2 and DeLone & McLean IS Success models in predicting the usage of IS systems (Tarhini, A. et al., 2019). Consistent with the exponential growth of VCoPs during the last decade, this study combines these two models to predict VCoP usage for the Malaysian public sector organisations.

2.3 The DeLone & McLean Model

The DeLone & McLean Information System (IS) Success Model has been acknowledged as one of most widely used technology assessment frameworks and had contributed towards an improved understanding of IS management (Stefanovic et al. 2016). After a comprehensive review of the literature in 180 empirical studies, the researchers DeLone & Mclean (1992) grouped the IS success dimensions into six main categories of which are multidimensional and closely related: 1.system quality, 2.information quality, 3.use, 4. user satisfaction, 5.individual impact, 6. organisational impact. DeLone & McLean revised the IS performance model ten years later, adding service quality as a new dimension of assessing IS success and combining organisational and individual impacts into a single impact measure called "net value" (Stefanovic et al., 2016). The emphasis of the DeLone & McLean, (2003) updated model is on the importance of measuring the success of information systems.

2.4 The Unified Theory on the Acceptance and Use of Technology (UTAUT2)

Numerous empirical studies provide support for UTAUT2 being a robust and parsimonious model that can be adopted to explain users' acceptance of new information technology as a tool, for performing an activity (Venkatesh et al., 2012). UTAUT2 with seven constructs that affect behavioural intention and use behavior include facilitating condition, performance expectancy, effort expectancy, social influence, hedonic motivation, price value, and habit, has been applied to explain the acceptance in various industries such as Internet Banking (Arenas et al., 2013), Mobile Applications (Wong et al., 2014) and Social Media applications (Baptisa et al., 2015). As price value is not significant in organisational contexts, studies in this research setting can exclude it (Venkatesh et al., 2012).

Having examined the existing VCoP studies, the researchers construed the VCoP will require factors from both models to better predict VCoP usage. With similarity of variables, the service dimension of the DeLone & McLean model has been merged with UTAUT's facilitating conditions. Existing VCoP studies (presented in Table 1) below, examine factors that influence its usage.

Table 1: Existing VCoP Studies That Examines Factors Predicting its use

No	Research Studies that affect VCoP usage	Variables: DeLone & McLean model		Variables: UTAUT2 Model	
		Knowledge Quality	System Quality	Behavioural variables	Facilitating Conditions
1	Andrew et al. (2008) The research focussed on the VCoP, with its potential application in nursing.	Access to reified and tested best practice statements.	Simple to use online systems	Ease of use, Social influence amongst practitioners and academics	A vibrant learning environment.

No	Research Studies that affect VCoP usage	Variables: DeLone & McLean model		Variables: UTAUT2 Model	
		Knowledge Quality	**System Quality**	**Behavioural variables**	**Facilitating Conditions**

2.5 The Research Model and Hypotheses

The research model posits that if the VCoP members have significant use intention, then this will result in increased VCoP System use and greater efficiency in public sector service delivery. The two notable models, UTAUT2 and DeLone & McLean IS Success model, was incorporated for the purpose of predicting use related to VCoP technology, based on theoretical evidence provided in the previous two sections and existing literature. The integrated research model presented in Figure 1 aimed to combine quality dimensions from the IS Success model with constructs of the UTAUT2 model, as independent variables, to predict VCoP usage. The research hypotheses and measures/items used to develop the constructs have been suggested below:

#	Research Hypotheses
H1	A higher level of a VCoP's system quality will produce a higher level of user satisfaction
H2	A higher level of a VCoP's knowledge quality will produce a higher level of user satisfaction
H3	Social influence will positively influence the use intention in the VCoP
H4	Effort expectancy will positively influence the use intention in the VCoP
H5	Performance expectancy will positively influence the use intention in the VCoP
H6	Hedonic motivation will positively influence the use intention in the VCoP
H7a	Habit will positively influence the use intention in the VCoP
H7b	Habit will positively influence the use behaviour in the VCoP
H8a	Facilities conditions will positively influence the use intention in the VCoP
H8b	Facilities conditions will positively influence the use behaviour in the VCoP
H9	User satisfaction will positively influence the use intention in the VCoP
H10	Use intention will positively influence the use behaviour in the VCoP
H11	Use behaviour will positively influence the efficiency in public service delivery

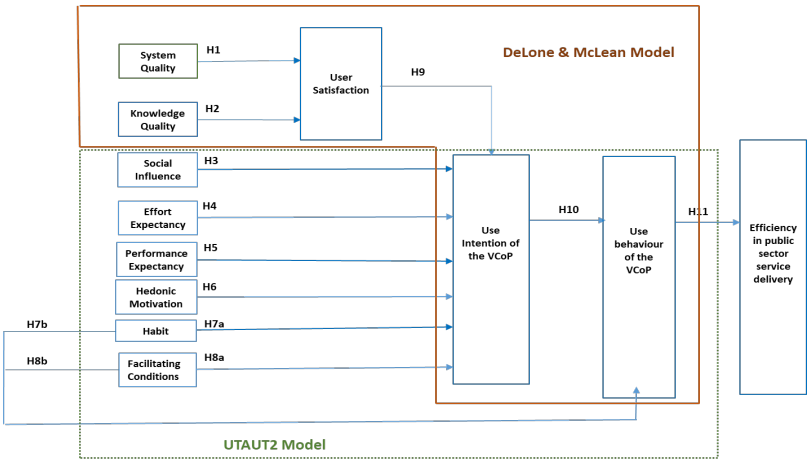

Figure 1: The Research Model

3. The Research Methodology

3.1 Design and Procedure

This study utilised a cross-sectional, questionnaire-based design. Using convenience sampling technique, 313 samples were analysed from employees adopting the VCoP in public organisations in the Klang Valley area of Malaysia in 2020. The results of power analysis following Cohen et al. (2013) and Hair et al. (2017) approach using G.Power 3.1, indicated that the sample size is big enough to achieve an alpha less than or equal to 0.05 (two-tailed) and a power greater than or equal to 80%. A link to the study's questionnaire was sent to employees to fill up. The questionnaire consisted of two sections including respondents' socio-demographic

attributes such as gender, age, academic qualification, frequency of VCoP usage, and job position, as well as the items prepared to measure the variables in the research model. Furthermore, the quantitative stand of this study, utilised the survey items originally derived by Venkatesh et al. (2003; 2012) from the UTAUT2 and the DeLone & McLean IS measurement models (2003); which supported these same items.

3.2 Participants

The sample consisted of 161 males (51.4%) and 152 females (48.6%). 74.2% of the respondents were young adults with an age range between 25-40 years of age. Majority of the participants (94%) were degree holders with 72.8% being officers. 86.3% of the respondents indicated that they have been accessing the VCoP for more than a year (34.5 % between 1-2 years, 28.8% between 2-3 years and 23% more than 3 years). Based on these responses, it is appropriate to assume that these respondents are experienced in using the VCoP and will be knowledgeable enough to provide their opinions on key success factors they feel will ensure sustenance of the VCoP.

3.3 Measures

User satisfaction was measured using two items adapted from DeLone & McLean (2003) (e.g., "The functionality and performance of VCoP website has met my expectations"). Behavioural intention was measured using three items adapted from Davis (1989) (e.g., "I intend to continue using the VCoP in the future"). To measure VCoP usage, respondents were asked to indicate if they use the seek problem solutions at work, learn about new knowledge or exchange of knowledge with other members. Systems quality was measured using four items adapted from DeLone & McLean (2003) (e.g., "It is easy to navigate within VCoP system"). To measure knowledge quality, respondents were asked to indicate if the information stored in the VCoP is relevant for their job, easy to understand, accurate, complete, and reliable (DeLone & McLean, 2003).

The items used to measure social influence (five items, e.g., "people who are important to me think that I should use VCoP") were adapted from Venkatesh et al. (2012). Also, the items to measure effort expectancy (four items, e.g. "Learning how to use the VCoP is easy for me") drawn from Venkatesh et. al (2003). Items to measure Peformance Expectancy (four items, e.g., "Using the VCoP helps me accomplish things more quickly"). Hedonic motivation was measure using three items adapted from Venkatesh et al. (2012) (e.g., "I find using the VCoP to be enjoyable") and habit (four items, e.g., "The use of VCoP has become a habit for me"). To measure facilitating conditions, respondents were asked to indicate if they have the resources, knowledge, and adequate training to use the VCoP (Venkatesh et al. (2012)). All items were measured on a 5-point likert scale.

3.4 Data Analysis

Categorical variables were presented as frequency and percentages. The measurement model and structural models were assessed using partial least squares structural equation modelling (PL-SEM) and SmartPLS 2.0 software. Data analysis revealed all missing values were addressed. Using SmartPLS, the data was analysed in several separate, but sequentially related steps. The implementation of these parameters in a systematic manner is a two-step method (presented in Figure 2). The first criterion was to evaluate the outer model (measurement model), which will include the reflective constructs' reliability and validity, followed by the Inner model (structured model).

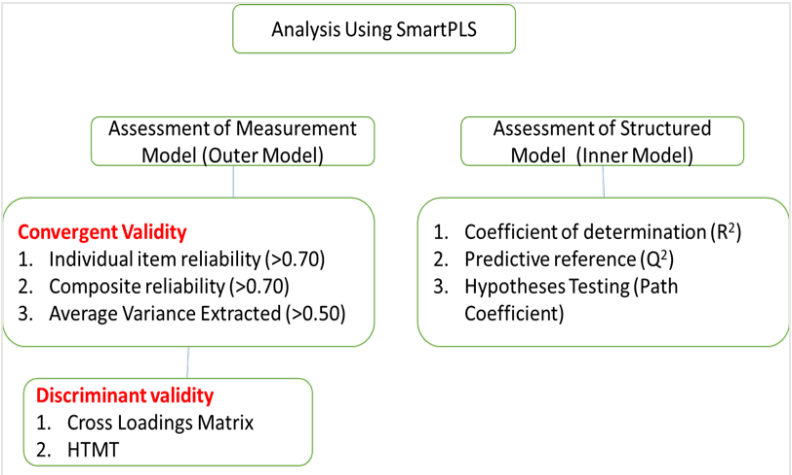

Figure 2: Model Validation Process

4. Results

The results supported construct reliability as well as convergent validity of all constructs. Cronbach's alpha (ranged from 0.754 to 0.929) indicated good internal consistency of the items of the constructs and composite reliability of the constructs (ranged from 0.754 to 0.912) support the construct validity. Convergent validity assessed average variance extracted of the constructs (ranged from 0.670 to 0.851), achieving discriminant validity. Factor loadings ranged from 0.730 to 0.929 and were significant at 0.001. As advised by Hair et al.(2017), Heterotrait-monotrait (HTMT) ratio was assessed and the value was less than 0.9, also fulfilling the requirements of discriminant validity.

4.1 Structural model assessment

While there were significant positive associations between habit (H7b), facilitating conditions (H8) and use intention (H10) towards use behaviour, this study could not support H3, H5 and H7a on the relationships between social influence, performance expectancy and habit towards use intention. There were significant positive associations between the two (2) factors of DeLone and McLean model, including systems quality and knowledge quality towards user satisfaction, supporting H1 and H2 respectively.

Also, the results supported H9 that positively associated user satisfaction to use intention. Finally, the results displayed a strong relationship between use behaviour (H11) and efficiency in public service delivery (presented in Figure 3).

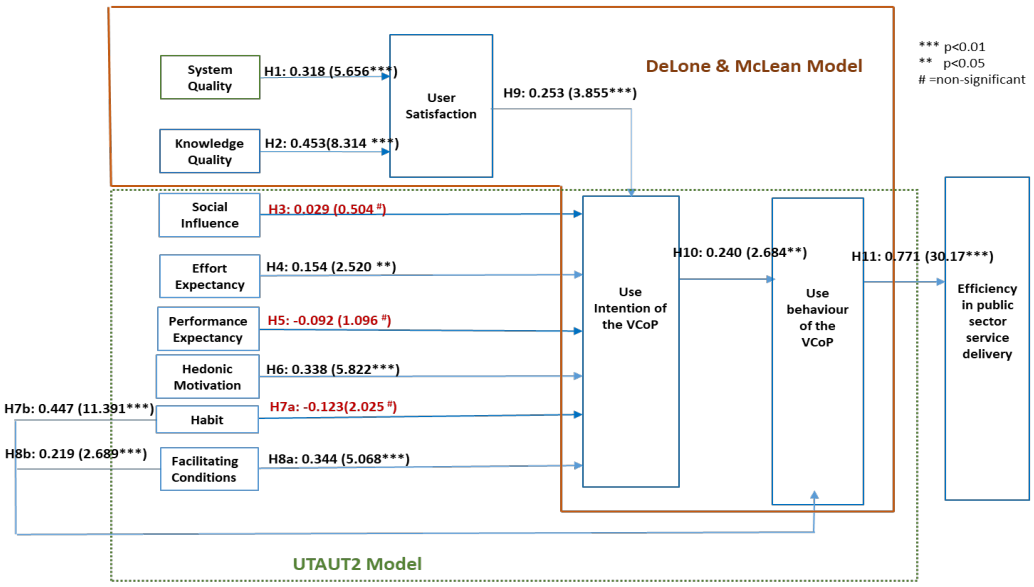

Figure 3: Research Model Assessment

4.2 Hypotheses Testing

Standard regression weights or path coefficients between constructs relevant to the proposed hypotheses were calculated to test the hypotheses. The statistical significance test was used to assess the intensity and existence of the relationships (which was either positive or negative). A t-test was used to determine the significance of the path coefficients, and hypotheses with t-statistics greater than 1.96 were found to be supported, as shown in table 3.

Table 3: Summary of Hypotheses Testing of the Research Model

#	Beta	T-stat value	Findings		#	Beta	T-stat value	Findings
H1	0.318***	5.656	Supported		H7a	-0.123#	2.025	Not supported
H2	0.481***	8.314	Supported		H7b	0.447***	11.391	Supported
H3	0.029#	0.505	Not supported		H8a	0.344***	5.068	Supported
H4	0.154**	2.520	Supported		H8b	0.219***	2.689	Supported

#	Beta	T-stat value	Findings		#	Beta	T-stat value	Findings
H5	-0.092#	1.096	Not supported		H9	0.253***	3.855	Supported

5. Discussion

This research contained 13 hypotheses in all, with 10 of them being supported. This study proved that that people seek the VCoP knowledge base to solve work related problems or seek for expertise (Wolf, P., 2011; Scarso, et al. 2016). Based on the integrated framework, this research clarified factors that can predict engagement in VCoPs for public sector organisations. As a result, this research adds to the theory on communities of practice and laid out options for the VCoP Administrators to strategise and put in place policies and procedures, to boost member participation in the virtual communities of practice. In particular, this research will be able to highlight individual user satisfaction and technological factors that are critical to motivate the VCoP members in adopting the VCoP for their knowledge sharing and learning initiatives.

As the VCoP is a source of knowledge for information seekers, there is a belief that the quality of the technology, being an integral component in the VCoP, was posited as a potential influence in impacting user satisfaction. The H1 hypothesis was supported by these findings, which indicated that the System Quality in a VCoP had a substantial positive direct impact on user satisfaction (β=0.318, t-statistic =5.656). Similarly, the results of the study revealed that Knowledge Quality had a positive direct impact on VCoP System User Satisfaction (β = 0.453, t-statistic = 8.314).

These findings were not unexpected, as they corroborated with previous De Lone and McLean studies (Chen (2007); Gauzdal (2008); Hew (2009) and Borzillo (2017). As a result, H2: A higher level of VCoP Knowledge Quality leads to higher levels of user satisfaction, was proven to be significant. The factor, Effort Expectancy (EE) had also a positive influence (β = 0.154, t-statistics = 2.520) on use intention of the VCoP, which is consistent with UTAUT findings (Venkatesh et al., 2003) and several previous studies (Al-Shafi et al. 2009; Gupta et al., 2008). Hence H4 – Effort Expectancy has a significant positive effect on use intention of the VCoP. Consistent with findings from several studies (Venkatesh et al., 2012; Moorthy et al., 2019), there is strong indication, that fun and enjoyment can predict technology adoption. Hedonic Motivation (HM) was found to have a significant positive direct effect on use intention (β = 0.338, t-statistic = 5.822). This indicates that the more users think of answering questions in the VCoP forums (Lai & Chen, 2015), as a pleasant and competitive environment, the more likely they are to use the virtual knowledge sharing platform. Limayem et al. (2007), with their findings had stated that "an operationalization of habit was seen have direct effect on technology use over and above the effect of intention" which can be a reason as why findings from this research followed a similar path. Hypothesis (H7a) was not significant (β = - 0.123, t-statistics = 2.025) in predicting users' intention, whilst H7b posits that Habit is positively associated with the use of the VCoP (β = 0.447, t-statistics = 11.391). Facilitating Conditions in Hypothesis H8a had a significant positive direct effect (β = 0.344, t-statistic = 5.068) on use intention. Similarly, hypothesis H8b analysed the influence of facilitating conditions on use of the VCoP, and findings indicate a positive relationship (β = 0.219, t-statistic =2.689). This was in line with previous research results (e.g., Neufeld et al., 2007; Im et al, (2011)). A deeper discussion on the non-significant relationships between Performance Efficiency and Social Influence with intention to use the VCoP, indicated that these results aligned with previous research findings (Al-Shafi, 2009; Cimperman et al., 2016; Ladan et al., 2018).

Theoretical contributions of this research are threefold, one being combining two models (UTAUT 2 and DeLone & McLean) to better predict VCoP usage for public sector organisations. Second, predicting the factors that will be required to adopt VCoP usage has been studied and the findings of the research can be used to develop a VCoP framework and adopted for KM in public sector organisations. Finally, this research is explored further by determining the impact or net benefits in adopting the VCoP in organisations. By implementing the VCoP successfully, the model can determine if the VCoP users enhance employees' decision-making skills, improve their work processes or service efficacy by acquiring new knowledge "captured" in the VCoP.

The findings of this research discovered several main factors that can influence users' adoption of a web based VCoP system and can improve service effectiveness in the Malaysian public sector. The quality of knowledge,

the stability and functionality of the system, cultivating a 'fun' environment and developing a habit of using the VCoP will be key constructs to consider in ensuring the success of VCoP adoption. Investing in quality infrastructure and initiating regular change management programs throughout the organisation via regular brainstorming sessions should be advocated to develop the VCoP facilitating infrastructure. The role of the VCoP policy makers entails developing a structured implementation approach, determining functional requirements of the VCoP Knowledge Portal and content reification processes in developing quality knowledge.

Several limitations of the present study include using self-report questionnaire that may induce several response biases (Podsakoff et al., 2012). Moreover, this study collected samples only at one point. It is proposed for further studies to examine adoption of VCoP systems from pre-implementation to later stage of implementation via a longitudinal study. A robust phased-based VCoP implementation strategy is proposed, hinged on significant factors in predicting usage, paving the way in constructing a VCoP maturity framework (Albert, G., et al., 2019), in assessing gaps and building strategies in enhancing its usage.

Learning Problems in a Remote Working Situation: A Generation Z Perspective

Anna Albrychiewicz-Słocińska
Department of Applied Sociology and Human Resource Management, Faculty of Management, Częstochowa University of Technology, Poland

a.albrychiewicz-slocinska@pcz.pl

Abstract: The transformations on the labour market related to the work modes, but also to the fact of new pension arrangements allowing early retirement, as well as the massive entry of the youngest generation of workers, known as generation Z, into the labour market, create numerous risks related to the irreversible loss of organisational knowledge, which cannot be replaced by external knowledge. New challenges that appear in modern companies are also connected with the massive implementation of remote work as a result of COVID pandemic. In these circumstances knowledge management and particularly knowledge transfer from employee to employee faced with new obstacles. In the context of the outlined econo-socio-demographic changes, the author of this paper focuses her analysis on answering the question of how remote working influences selected aspects of learning processes in organisations as experienced by Generation Z. The research was conducted in December 2022 on a sample of the Generation Z representatives with the aim to identify their experiences and opinions about the remote type of work. For the research purposes, the Likert scale-based questionnaire technique was applied. The data was analysed in the STATISTICA program using Kruskal-Wallis ANOVA on ranks test, Mann-Whitney test, and the Pearson's chi-square test. The results of the research reveal interesting dependencies between the respondents' opinions and variables such as gender, the industry in which the remote work was conducted, size of the organisation, experience in remote working and the preferred form of work in the future.

Keywords: Learning, Knowledge exchange, Remote work, generation Z

1. Introduction

The knowledge management is based on a principle that all knowledge, both explicit and latent, accumulated by the organisation is readily available to each of its members. This has an impact on decision-making processes and allows the organisation to become more agile (González-Ramos, Guadamillas, and Donate 2023). Knowledge management provides access to knowledge and information, allowing rapid development for those who are able to make good use of it (Schaefer and Makatsaria 2021). Knowledge management is often associated with modern information technology. Thanks to the latter, data streams flow from a variety of sources and can be processed and analysed in many different ways (Duque, Silva, and Godinho 2023). However, some experts on the subject argue that more attention should be paid to the human aspect of knowledge management rather than technological one (Evans, 2005, p. 23; Miković et al. 2020).

Modern technology means that work can also be geographically dispersed to a significant degree. This was demonstrated by the COVID-19 pandemic situation, when employees were redeployed to work remotely (and thus off-site) whenever possible. When we talk about the geographical dispersion of work today, we are more and more often referring to its provision not only from another city, but also from a different country or a continent. Remote working, much like outsourcing, has also become an element of operational cost control (Mueller-Langer and Gómez-Herrera 2022). Re-evaluations are taking place regarding expectations towards work and professional careers (Green 2022). The theme of work-life balance is resonating more and more strongly (Robak, 2017). The transformations on the labour market related to the work modes, but also to the fact of new pension arrangements allowing early retirement, as well as the massive entry of the youngest generation of workers, known as generation Z (Rodriguez et al, 2019; Bencsik et al, 2016;), into the labour market, create numerous risks related to the irreversible loss of organisational knowledge, which cannot be replaced by external knowledge. Part of knowledge 'leaks' out of the organisation, and some knowledge is additionally undervalued (Ritala et al. 2015). The latter specifically relates to the core tasks, that are easy to learn, but cannot be learned in the absence of teachers. In the workplaces, the generations do not work together as before. The master-apprentice relations ceased to exist. In addition, the division between the two latter groups is being blurred. Who is the master and who is the apprentice? Age or position is no longer a dividing line between these groups. The need to recruit staff with slightly different competences, such as exceptional intelligence, communication skills, the ability to solve problems and interpret information, is coming to the fore. At the same time, the demand for knowledge, that sometimes gets invalidated with time, is changing at a significant rate. Employees need to continually update their skills, so the continuous learning is becoming the norm.

In the context of the outlined econo-socio-demographic changes, the author of this paper focuses her analysis on answering the question of how remote working influences selected aspects of learning processes in organisations as experienced by Generation Z.

2. Learning as Part of Knowledge Management

Today, the importance of knowledge, both for organisations and for individual employees, is evident in the redefinition of many management terms. Among other things, the notion of career, hitherto understood as a sequence of positions of increasing hierarchical importance, is changing to a process of accumulation of information and knowledge in the form of qualifications, experience and contacts developed in the course of successive professional roles (Akkermans et al. 2021). Thus, the essence of a career lies in the lessons learnt from one's experiences - in the information, knowledge and views that one acquires and revises in the activities performed throughout one's life (Evans, 2005, p. 29). Such perception of career seems more typical for Generation Z, for whom rigid hierarchical organisational frameworks seem outdated, ossified and stifling to their own development (Dolot 2018; Duffy 2018; Hijzen and Menyhert, 2016; Lazanyi and Bilan 2017; O'Boyle et al, 2017; OECD 2014; Singh and Dangmei 2016; Zwart and Baker 2018).

Knowledge itself is also an increasingly difficult term to grasp, going far beyond what is collected in books. Its definition is now being pondered by philosophers, psychologists, management or IT specialists (Dreesens et al. 2020). As an intangible resource, it is difficult to assess. And its value is only revealed when we know what we want to know and only when we need to know it. New knowledge can emerge unexpectedly in our minds through the association of other seemingly incongruous types of knowledge or information. However, we often have no control over the process of such revelation.

Boydell (Evans, 2005, p. 30) distinguishes four types of knowledge: 'what it is', 'how to do it', 'how to become yourself', and 'how to achieve goals in collaboration with others', as well as three levels of knowledge: 'how to put it into practice', 'how to improve it', and 'how to combine it.' In contrast, Davenport and Prusak (2000) define knowledge as a fluid composition of focused experience, values, useful information and expert insight, providing a basis for evaluation and assimilation of new experiences and information. They emphasise that knowledge is born and proliferates in people's minds. In organisations, it is often recorded not only in documents and databases, but also in customs, norms and procedures. Furthermore, the aforementioned authors emphasise the distinction between information and knowledge (Liew 2007). Information only becomes knowledge by doing one of the following types of analysis: comparison (how does the information about a situation compare to other information?), corollary (how does the information affect decisions and actions), correlation (how does the information relate to the rest of the information you have), dialogue (what do other people think about the information). The views on knowledge cited are only an example of the view present in the literature that emphasizes the importance of human contact in generation and transfer of knowledge (Hau et al. 2013). At the organisational level, an interesting division of knowledge (maintaining, however, a socio-psychological perspective of knowledge) is represented by Evans (2005, pp. 31-33). It divides knowledge into four types:

- I know what - an operational knowledge (the basis for conducted normal day-to-day work);
- I know how - also an operational knowledge, but this time the body of knowledge is hidden in people's minds and consists of our experience of how something works and how to do something;
- I know why - a knowledge defining one's work, its meaning in the context of your strategic objectives;
- I know who - the lion's share of knowledge is in the minds of employees, it is crucial to have a good idea of who is who and what knowledge they have - both inside and outside the organisation).

From a personalisation perspective, knowledge management emphasises the need to build a dynamic working and learning environment that fosters the continuous generation, accumulation and application of individual and collective knowledge in order to discover new values for the company (Dagenais et al. 2020; Evans, 2005, p. 33). Thus, through a socio-psychological view of knowledge as such, knowledge management also focuses on the learning process, including mutual learning. Indeed, this process is a prerequisite for knowledge transfer between employees (Kamei and Ashworth 2023).

Discussions concerning the codifying or personalising approach to the knowledge are not just meaningless musings (Bermell-Garcia et al. 2012). The two approaches give rise to different knowledge management strategies. In the codifying approach, typical for enginnering, organisations focus on explicit knowledge. In contrast, in the psycho-social approach, managers focus on tacit knowledge. Its externalisation requires the creation of a conducive environment for the exchange of knowledge because you cannot force a person to share knowledge, nor can you force a person to accept knowledge (Akhmadi and Tsakalerou 2022). Full disclosure of

existing knowledge and acceptance of new knowledge must be guided by one's own volition and readiness lest it will be incomplete or ineffective. In today's reality, the competence to learn effectively and to teach others effectively is increasingly coming to the fore. With this in mind, management practitioners are increasingly often faced with the questions: How to create an environment conducive to learning in a remote working situation? How do you guide the development of the youngest Generation Z employees using the knowledge held by senior colleagues? Or What factors influence young employees' willingness to learn in a remote working situation. The problems and the attempt to address them are also part of this study.

3. Methodology

The research results presented in this paper are part of a quantitative survey entitled: 'Managerial aspects of managing remote working', conducted among young people working remotely, representing Generation Z. The survey was conducted in December 2022. The study presents an excerpt from the results of the research on respondents' opinions regarding the impact of remote working on learning processes. Among other things, the study posed the following problem: how does remote working affect employee learning, which is part of knowledge exchange processes.

The study was conducted with the use of quantitative research methods which utilizes the survey technique. The study included young people from Generation Z with a remote working experience including at minimum the year 2022. The most popular division in the literature assumes that Generation Z includes people born after 1995, although some researchers sometimes include those born in 1990, while others tend to include only those born in 2000 and later (Goh and Lee 2018; Kirchmayer and Fratricova 2018, Lazanyi and Bilan 2017; Bejtkovsky 2016; Hejnova 2015). Due to the fact that there are no statistics concerning the number of people aged 15-34 who perform remote work in Poland, the author focused on the group of young, economically active people representing the aforementioned category. Using the Labour Statistical Yearbook 2021 as a reference, the size of the working population in Poland in the age bracket relevant to this study was estimated to be 4,802,000 people. Table 1 presents the structure of the study population by gender and age. For the population estimated in such a manner, with the following statistical assumptions: fraction size: 0.5; confidence level: 95%; maximum error: 5% the study sample size was set at 384 persons. The study was conducted by a specialist market research agency - Fieldstat Ltd. The survey used quantitative research methods utilizing CATI (Computer Assisted Telephone Interview - 50% of respondnets) and CAWI (Computer-Assisted Web Interview - 50% of respondnets). The mixed technique was chosen because it allowed to increase the direct contact with the respondent. Contact was made with 2,783 persons working remotely. Some of the contacted people declined to participate, some could not participate due to the survey criteria (e.g., no experience of remote working in 2022), or saturation of the sample in terms of age or gender. The requirement of remote working experience in 2022 was introduced to eliminate the group of workers whose work was organised remotely only due to the COVID-19 outbreak. This is because these workers most often performed their duties and tasks in an extraordinary mode, significantly deviating from the conditions for remote work defined in the literature (Bareket-Bojmel, Chernyak-Hai, and Margalit 2023), with the most basic condition being the freedom to choose this particular form of work (Wiatr and Skowron-Mielnik 2023). The opinions of respondents who were forced to perform their work remotely due to external circumstances could therefore lead to false conclusions about their attitudes and beliefs. In the end, 388 correctly completed survey questionnaires were obtained (redundant surveys do not disrupt the planned structure of the study group). The research tool used was a standardised questionnaire consisting of 57 closed statements and 8 questions on the socio-demographic characteristics of the respondents. A Likert scale (the so-called Likert scaling technique) was used for the responses, making it possible to determine the relative intensity of the various responses (Babbie, 2004, p. 192). This form allows for a reliable and quick analysis of the collected material, as well as uniformity and ease of elaboration (Churchill, 2002, p. 309). The research tool (questionnaire) is proprietary and was prepared by members of the research team - employees of the Department of Applied Sociology and Human Resource Management, Faculty of Management, Częstochowa University of Technology.

The STATISTICA software was used in the process of compiling the research results. To assess the significance of differences in the analyzed variables, non-parametric tests were used: Mann-Whitney U test (UMW), Kruskal-Wallis ANOVA (AKW) test, Chi-square test. The obtained statistics were analysed using the publication by A. Stanisz (2006, pp.369-391). Four questionnaire validity procedures have been used: content (Rossiter 2008), face (Czakon 2014), construct (Cronbach and Meehl 1955) and nomological (Czakon 2014) ones. The scale reliability was validated using Cronbach's alpha that is a measure of internal consistency (α = ,970019).

4. Results of the Research

This paper focuses on an excerpt from the aforementioned research on employee learning issues in remote working situations. The analysis covered five indicators, for which the Cronbach's Alpha reliability coefficient was α = 0,863672 and which include the following statements:

- remote work necessitates learning new technical solutions;
- remote work involves solving problems on your own;
- remote work promotes learning from colleagues;
- remote work allows one to learn new things more effectively
- remote work allows one to learn from senior staff.

With regard to the analysis of indicators related to learning processes, the following distribution of respondents' answers was noted (Table 1).

Table 1: Percentage Distributions of Responses In Relation to Individual Indicators

Responses	%					
	1	2	3	4	5	Total
A	3.62	12.14	18.35	34.88	31.01	100
B	5.69	15,50	18.35	39.79	20.67	100
C	10.59	28.94	30.23	23.78	6.46	100
D	5.43	17.57	35.92	28.68	12.40	100
E	6.72	15.76	37.73	29.71	10.08	100

1:I completely disagree; 2: I rather disagree; 3: neither agree nor disagree; 4:I rather agree; 5:I completely agree.

Source: Research results

According to the results presented, it can be concluded that the vast majority of respondents, almost 66%, agree with the statement that remote working necessitates learning new technical solutions. A similar, but not as strong distribution of responses is presented by respondents with regard to the fact that remote working involves solving problems by oneself (60% agree or completely agree with this statement). With regard to the statement that remote working promotes learning from colleagues, the distribution of responses is more pessimistic. More than 39% disagree or completely disagree with this statement, while 30% express the opposite opinion. When it comes to the statement that working remotely allows one to learn new things more efficiently, almost 40% of respondents agree with this opinion and 23% hold the opposite view. However, the percentage of respondents without a clear attitude towards this issue is relatively high (35.92%). Similarly, with regard to the statement that remote working allows for learning from senior employees, as many as 37.73% presented an ambiguous attitude, more than 22% disagree with such a statement and almost 40% thinks this statement is true.

In relation to the indicators listed, the extent to which respondents differed in their answers has been analyzed, taking into account independent variables such as:

- gender,
- age (for the purposes of the study, it was assumed that the sample group of Generation Z representatives would be divided into three subgroups: 15-24 years old, 25-29 years old, 30-34 years old, in order to ascertain whether there are differences in opinion between the youngest and oldest generation representatives)
- the industry in which the remote work was conducted (the classification of industries adopted in the study is in line with the Polish Classification of Activities (https://stat.gov.pl/Klasyfikacje/doc/pkd_07/pkd_07.htm),
- size of the organisation (taking into account the number of employees: micro (1-9 employees); small (10-49); medium (50-249); large (more than 250)),
- experience in remote working (up to 6 months; 6 - 12 months; 1 - 3 years; more than 3 years),
- position (managerial, production)
- and the preferred form of work in the future (stationary, hybrid, remote).

Non-parametric tests were used to assess the significance of differences in the analysed variables. The distribution of results is presented in Table 2 - the table only shows statistically significant differences, which allows us to reject the null hypothesis H0 that there are no differences due to the independent variable, which allows us to accept the alternative hypothesis H1 that there are such differences.

Table 2: Kruskal-Wallis ANOVA and Mann-Whitney U tests for independent variables and selected indicators

Independent variables **AKW/UMW test at the assumed significance level (α = 0.05)**	**Analysed indicators**				
	A	B	C	D	E
Gender (UMW)	-	-	p = 0.0059	p = 0.0276	p = 0.0056
Age	-	-	-	-	-
Industry	-	-	p = 0	P = 0006	p = 0
Size of the organisation	-	-	p = 0	p = 0	p = 0
Remote working experience	p = 0.0025	p = 0.003	-	p = 0	p = 0.0004
Position (UMW)	-	-	-	-	-
Preferred form of work	p = 0.0498	p = 0.0002	p = 0	p = 0	p = 0

Source: Research results

In the light of the results presented for the significance tests, it must be concluded that the internal structure of the respondent sample in reference to age or position did not differentiate the responses on the issues in question.

Gender influenced respondents' opinions related to learning from colleagues, learning new things more efficiently and learning from senior staff. Men (35% of men surveyed) are more likely than women (23% of women surveyed) to recognise that remote working allows them to learn from their colleagues. The divide is even more pronounced with regard to learning new things, with almost 46% of men agreeing with this statement, as compared to 35% of female respondents. Similarly, when it comes to learning from senior staff, men have a much more positive outlook (34%) than women (25%).

The responses to questions on learning from colleagues and learning from senior employees were differentiated by the industry in which the remote workers were surveyed. Due to the extensive classification of industries (survey covered employees representing 19 different industries), the analysis of the significance of differences focused on the industries with the highest representation:

- Wholesale and retail trade; repair of vehicles - 26 respondents,
- Information and communication - 84,
- Manufacturing - 77,
- Water supply; sewage and waste management and recultivation activities - 33,
- Financial and insurance activities - 16,
- Real estate activities – 24,
- Professional, scientific and technical activities – 45,
- Health care and social assistance – 21.

A detailed analysis of the bivariate tables on the distribution of respondents' answers indicating statistically significant differences reveals interesting regularities. The elements of learning in the context of remote working are assessed most favourably by employees working in industries not traditionally associated with remote working, i.e., manufacturing, water supply, sewage and waste management, recultivation, and real estate activities. In industries where, according to the Polish Classification of Activities (https://stat.gov.pl/Klasyfikacje/doc/pkd_07/pdf/rozp_24_XII_2007.pdf), a significant share of remote working can be expected, such as financial activities, the IT sector or commerce, opinions on learning are moderately unfavourable, while in industries identified as highly specialised, such as professional, scientific and technical activities or health care, respondents had a strongly negative attitude towards the possibility of individual or mutual learning during remote work.

Difference significance indicators also demonstrate the impact of the size of the employing organisation on opinions related to learning during remote work. The least favourable statements were expressed by employees working in micro-organisations while the most favourable ones are found in small organisations. In medium and large organisations, positive feedback was also noted, but not as pronounced as in the case of small organisations.

Another variable conditioning respondents' statements was the experience of remote working. The issue of learning new technical solutions has been assessed negatively to a significant extent, regardless of the experience of remote working. Similar assessments were presented by respondents with regard to the statement that working remotely allows one to learn new things more efficiently. At the same time, the critical attitude was to a large extent proportional to the remote working experience. With regard to the statement that remote working involves solving problems as work by oneself, respondents showed the more optimistic outlook the higher their professional experience was. Among all groups, the respondents with shortest experience reported that they need to deal with work problems alone most often. And those with the longest experience of working remotely strongly disagree with the statement that remote working involves solving problems on one's own.

The most interesting distributions of responses to the questions, confirmed by indicators of significance of differences, were recorded in relation to the preferred form of work in the future. The distribution of indications is interesting because among the respondents who have been working remotely in 2022, only 68 of them would like to continue working in this mode, while 109 respondents preferred hybrid mode, and as many as 210 opted for stationary mode. The following patterns were observed in relation to selected learning indicators. Employees choosing remote working as their preferred mode of work in the future most often responded that remote working does not force them to learn new technical solutions (76% of the answers given, 6% were of the opposite opinion), does not involve independent problem solving (76%, 5% thought otherwise), but at the same time does not facilitate learning from colleagues (75%, 10% expressed the opposite view), does not allow them to learn new things more efficiently (69%, 10% thought otherwise) and does not allow them to learn from senior employees (50%, 15% were of the opposite view). With regard to employees choosing to work in stationary form, the distribution of responses looked slightly different. Although also in this group 60% of the respondents confirmed that remote working does not force one to learn new technical solutions (20% thought otherwise), 53% do not think that this type of work involves solving problems on one's own (29% have the opposite opinion), and 55% states that it does not facilitate learning from colleagues (28% have a contrary opinion), but only 25% do not think that remote working allows them to learn new things more efficiently (32% have opposite opinion) and 18% report that remote working does not allow them to learn from senior employees (50% have opposite opinion).

5. Discussion

There is a limitation that needs to be pointed out when considering the research results presented hereby. At the time of results analysis, no published studies on a similar issue could have been found, especially in the context of Polish labour market. This is somewhat of an obstacle, as the lack of comparative material does not allow the correctness of the research assumptions and conclusions made by the researchers to be fully verified. It should be emphasised that the survey design team made a deliberate research assumption that the remote working experience must include the year 2022, in order to eliminate the subgroup of employees who were transferred to remote working due to the COVID-19 pandemic from the group of employees with a short experience of remote working. This was done, because members of such subgroup very often performed their duties without proper preparation for remote working. In 2022, the epidemiological situation was already under control in Poland and workers doing remote work did so on their own volition or as a result of a planned organisation of work in the workplace and not as a result of external circumstances.

The first basic conclusion emerging from the picture of the survey results is that age was not a differiating factor as far as the answers to the questions are concerned. This means that, contrary to expectations, the age group defined as Generation Z, although quite stretched in the survey (15-34 years), is relatively homogeneous. Much more relevant to the issue of learning is the remote working experience. As the latter increases, the pressure to learn new technical solutions decreases, the ability to use technology for collaborative problem solving increases, but at the same time there is a growing awareness that this form of working is not conducive to learning new things more efficiently and learning from senior staff.

Women express much more critical attitudes towards remote working than men when it comes to issues of learning. Perhaps this is a result of the greater importance of interpersonal relationships in the workplace, and more social expectations of work in case of women.

It also seems that the more specialised the work the respondents did, the more learning constraints they recognised in performing their work remotely. In industries dominated by knowledge that is operational, explicit, and easy to codify and share, opinions on the impact of remote working on learning were much more favourable.

Also interesting is the observation indicating the impact of the size of the organisation on opinions about learning in remote working situations. In this case, of note are employees who believe that remote working does not promote independent problem solving learning from employees and learning from senior employees. The larger the organisation, the more favourable the opinions on the issues mentioned are, with the most optimistic statements being found among employees working in small organisations. It seems that micro-organisations lack sufficient intra-organisational stock of knowledge - a critical mass of knowledge. Learning in such organisations relies on the search for external sources of knowledge, which arguably poses difficulties that also include additional spending. As organisations grow, their structural capacity to organise work and the flow of information and knowledge also increases. At the same time, in small organisations there is the added benefit of a small number of employees who may know each other personally, facilitating direct contact. The superimposition of social relationships on structural networks for knowledge exchange and learning is a significant facilitator in this case.

Of the employees surveyed, more than half would prefer to work in a stationary mode in the future, but among those who declared to work remotely, it seems that the employees are fully aware of all the benefits and disadvantages this mode of work entails (Krzyżanowska 2020; Ewers and Kangmennaang 2023), also in terms of learning.

6. Conclusions

First and foremost, the conclusions of the research reveal that, when analysing the various aspects of the impact of remote working on elements of knowledge management, particular attention should be paid to the industry in which the organisation operates and the size of the organization itself. Any organisational knowledge is important and contributes to a company's competitiveness, but some organisations operate with highly specialised knowledge and in such cases special attention should be paid to creating an environment conducive to learning - knowledge transfer (in technical, structural and social terms). With regard to the socio-demographic factors of knowledge sharing, i.e., learning in the context of remote working, it is important to note the issues of the different needs expressed by women and men in this respect, as well as the importance of experience in working in such mode. This is because remote working requires the development of a different set of competences (from both the employee and the organisation), enabling the creation of a kind of 'prosthesis' of the classic forms of building and maintaining employment relationships that condition mutual learning. The issues analysed seem extremely interesting in the context of the ever-increasing popularity of remote working and the increased participation of Generation Z in the labour market. The study should be developed with use of qualitative methods.

Abstract: In this study, the main objective is to understand how the international assignment is related to the acquisition and transfer of knowledge. As specific objectives, we intend to understand the international assignments motivations and to explore how the international assignment can impact the employee's career development. Through an exploratory case study approach, a qualitative research methodology was used to collect data, using a semi-structured interview with a group of stakeholders from an international company (five expatriates and two organisational representatives of expatriations process) in order to answer to the following research questions *which factors contribute to the acquisition and transfer of knowledge of expatriates in companies?* and *how does the acquisition and transfer of knowledge of expatriates in companies take place?* The interviews were verbatim transcript and data analysed according to thematic analysis procedures. Our findings show that expatriates are simultaneously agents of knowledge acquisition and knowledge transferring. In addition, expatriates have many high expectations about the useful of their knowledge transferring to home company, specifically in their organisational career evolution and for business innovation and competitiveness. Using the findings, on the one hand international companies can improve human resources system to fit their support practices to needs and expectations of their expatriates after return to home company. On the other hand, the knowledge brought from expatriation, helps organisations at the strategic level through market knowledge and enables the implementation of international innovation human resources policies and practices, contributing to the globalisation of the company. Some conclusions to the contributes to the knowledge management will be highlighted in the last part of the paper.

Keywords*:* Expatriates, International assignment, Knowledge management, International HRM, International career

1. Introduction

The number of expatriates on international assignments continues to grow (Renshaw, Parry & Dickmann, 2021) and during COVID-19 pandemic, expatriates became more than just people who work abroad. They became a strategic element to enhance business strategy and opportunities, and to foster knowledge transfer (Marques, Miska, Crespo & Branco, 2021). Furthermore, in context of international organisations, expatriates can serve as agents of knowledge transfer and knowledge sharing (Wu et al., 2023). Given their importance, they are seen as more than just a set of employees. However, knowledge management related to expatriation process remains limited (Canestrino, 2010; Osland et al., 2020). Among this concern, Mockaitis, Zander and Cieri (2018) suggest that there are radical changes in the way organisations are operating, underlining whether traditional models of organisations and the HR function in international organisations need new perspectives. One of them is the benefits of global teams for international firms which can contribute positively to the performance of organisational units, and people.

The expatriation process comprises a set of strategies aimed at internationalising the company's management, increasing the repertoire of knowledge for the development of a specific project or unit. Training new leaders, raising the level of coordination of geographically dispersed units, increasing the strategic diversity of human resources (HR) in the face of global markets, and exemplifying important aspects of the culture of the parent company (Bertolini & Larentis, 2019) generate that expatriates assume great importance in the implementation of these strategies inside of international organisations. Diverse international human resource management (HRM) literature (e.g., Elahi et al., 2019; Martins, 2013; Renshaw et al., 2021) attributes to expatriation the purpose of transferring organisational knowledge between different organisational units, even if they are more geographically dispersed, while the hiring of new employees to operate in the international market aims at transferring the knowledge held by these employees during the international assignment.

Knowledge management is increasingly recognised as an essential aspect of management and international business (Shao & Ariss, 2020) and expatriates function as key agents for sharing this knowledge (Martins, 2013). In this regard, the study made by Martins and Tomé (2015) shows that the knowledge acquired, and the knowledge transferred by Portuguese expatriates have directly contributed to their career development after returning from the international assignment. In addition, the research conducted by Mohammed (2015)

suggests that knowledge management contributes to the resolution of organisational issues through the application of thoughts and practices with a view to a better orientation. As referred by Nisula and Kianto (2016, p. 1920), "the success of all types of organisations increasingly depends on how the individuals' specialised knowledge is employed and integrated into organisational capabilities". It is important to understand (1) how acquisition and transfer of knowledge of expatriates in companies take place as well as (2) to explore how the international assignment can impact the employee's career development.

This research intends to contribute to the theory and practice of knowledge management, namely at the level of the implications that the international assignment of employees may bring in the improvement of organisational performance and personal motivation, through the knowledge acquired and shared during the international assignment, and the purpose of this study is to help us fill this gap.

The following sections present the literature review related to Knowledge Management and HRM Innovation through expatriates (section 2), followed by the description of the methodology (section 3). Section 4 presents the main results of the study, and section 5 underlines main conclusions.

2. Literature Review

In the literature there is no consensual definition regarding the concept of expatriation. Some authors (e.g., Briscoe & Schuler, 2011; Dasari et al., 2012) present a generalised definition of expatriation, considering that an expatriate is an employee of an organisation who performs functions in a foreign subsidiary of that organisation, in order to achieve their professional, economic and financial goals.

On the other hand, there are definitions that present more specific requirements. For example, Martins (2013) postulates that expatriation consists of a means by which companies place employees to live and work in another country, which requires the following conditions, namely: 1) placement abroad for an increased time interval, usually 3 years, renewable for similar or extraordinary periods, if there is an agreement between the parties; 2) retaining the labour link to the parent company (Home Country); 3) the hierarchical relationship, as well as the expatriate's duty to pay retribution, presenting transfer benefits to the destination organisation (Host country); 4) having the right to reintegration in the home company to a compatible position, counting for their seniority the time of expatriation. Caliaguri (2000) also presents a more specific definition, arguing that the expatriate is an employee sent by the home company to live and work in another country, for a time interval between two and several years. According to Gallon et al. (2014), expatriation should be thought of as strategic for the HR area, involving three moments: the preparation for the international assignment; the international assignment itself; the return from the international assignment (repatriation). In the literature, repatriation is characterized as the return to the Home Country, that is, when individuals return to their country, the expatriates are referred as repatriates (Gallon, 2011). This phase of the international assignment is characterized by being a complex process, which involves renegotiation, readaptation, rebuilding professional networks, and anchoring the career in the company (Gallon et al, 2017).

The experience that the repatriate had as an expatriate assumes great importance, both for him and for the organisation (Gallon et al., 2014). Often, the primary purpose of expatriation is to bring knowledge to subsidiaries, and consequently, the focus of expatriation is the international assignment itself, making repatriation the end of a cycle (Gallon et al., 2014). In this regard, Wu and colleagues (2023, p. 708) remind us that "Knowledge sharing is especially important in expatriation, because one of the main Knowledge sharing for expatriates' purposes of expatriation is to develop talents and strengthen the flow of cultural knowledge between headquarters and offices in different countries". The same authors consider that through Knowledge sharing, expatriates can learn and improve internal processes, which can result on positive influence on financial performance of organisation. This argument makes sense specially when expatriates can effectively share knowledge, they are able to exchange their ideas, which leads to collective learning and motivate them to be more innovative (Wu et al., 2021). From this perspective, it is important to do an effective knowledge management. By knowledge management is meant the interaction and communication of implicit knowledge, the former must be evidenced, that is, codified, transformed into words or numbers so that any individual can access, understand and transfer (Martins, 2010).

In this sequence, any company that intends to have a knowledge management, will need to correctly perform the organisational knowledge transfer, considered as one of the elementary agents of the overall knowledge management process (Martins, 2010). According to Serrano and Fialho (2005), the success of a company is based on its ability to originate and transfer knowledge more effectively than its competitors.

Through several transfer procedures, knowledge must be spread quickly and effectively throughout the company, because ideas have greater repercussion when they are widely shared (Martins, 2010). The knowledge brought from a repatriation, helps organisations at the strategic level through market knowledge and enables the implementation of international HR policies and practices, contributing to the globalisation of the company (Gallon, 2014; Wu et al., 2021). Prior research (e.g. Barba-Aragón & Jiménez-Jiménez, 2020; Krammer, 2022) suggests that innovation allows the development of valuable and scarce resources in the organisation, namely, HRM has also extensively linked to innovation performance (Easa & Orra, 2020; Wikhamn et al, 2022).

Although the literature highlights that knowledge transfer is one of the most critical activities within organisations (Joshi et al., 2004; Osland et al., 2020; Shao & Ariss, 2020), multinationals rarely systematically collect and use expatriate knowledge, despite the competitive advantage it represents in a global knowledge economy (Osland et al., 2020). In this regard, Nisula and Kianto (2016) argue that organisations have been paying increasing attention to knowledge management, because they are becoming aware of the importance that the collective knowledge of an organisation can contribute in creating value to help an organisation to compete, stressing that knowledge management "is typically seen to consist of knowledge processes (such as knowledge creation, sharing, acquisition, transfer and application) and infrastructures or management activities that support and enhance the knowledge processes" (Nisula & Kianto, 2016, p. 1923).

The literature suggests that there are several factors that contribute to the acquisition and transfer of knowledge within organisations. Oddou et al. (2013) show that expatriates after an international assignment acquire new perspectives, highly relevant global knowledge, a more globalised mindset, new networks as sources of information and personal growth, and improved managerial and global communication skills. It is therefore important that organisations are able to: (a) create an organisational culture that promotes knowledge sharing, (b) incorporate expatriate knowledge in decision-making or (c) create mentoring programmes that enable expatriates to share their knowledge transfer skills with future expatriates. In line with this perspective, Doherty & Cormican (2017) and Elahi et al. (2019) reinforce that verbal communication should be considered as a knowledge transfer tool used between expatriates and local workers for the diffusion of organisational knowledge, while Burmeister and Deller (2016) highlight the promotion of seven high-performance work practices (selecting and hiring staff, training, career development, job design, performance appraisal, compensation and rewards and internal communication) throughout the international assignment period as the factors that could positively facilitate knowledge transfer. Przytuła et al. (2018) conducted a study whose objective was to develop a model of knowledge transfer between the company's headquarters and the local subsidiary and to empirically evaluate the knowledge transfer process in five foreign subsidiaries based in Poland. The results showed that local employees recognised the usefulness of expatriates' knowledge and highlighted their knowledge transfer skills, motivation for learning and knowledge acquisition (Przytuła et al., 2018). Other studies (e.g. Bucher et al., 2019; Doherty & Cormican, 2017; Wu et al., 2021) mention the role of leadership in the knowledge transfer process. On the one hand, Bucher et al. (2019) found that leadership facilitates knowledge transfer through the perceived trustworthiness of expatriates' co-workers. On the other hand, Doherty and Cormican (2017), report that one of the factors related to effective knowledge transfer in a multinational technology organisation is leadership. In turn, Suutari (2019) highlights that the ability of expatriates to engage in knowledge transfer is closely associated with their position or function in the organisation.

3. Methodology

Through an exploratory case study approach (Yin, 2014), a qualitative research methodology was used to collect data, using a semi-structured interview with a group of stakeholders from an international company (expatriates and organisational representatives of expatriations process). This semi-structured interview had three groups of questions, one related to interviewees characterisation, another related to the international assignment motivations, and the last related to the exploration of how the international assignment can impact the employee's career development. Two interview guides are developed based on general themes (e.g. motivations to transferring/sharing/acquisition of knowledge and contribution of expatriation for career advancement) which include 13 questions, namely about function, duration of international assignment, motives (individual and organisational) for carrying out the international assignment, expectations related to international assignment, contribution of international assignment to transferring/sharing/acquisition of knowledge, contribution of international assignment to career advancement or future perspectives about professional career in the organisation. In the case of expatriates, two criteria are identified to select the

participants: i) to be currently expatriates and to be in an international assignment, at least, 6 months. To select the organisational representatives, it is just necessary they have expatriates on their team and hierarchy report. Five expatriates and two organisational representatives were invited to participate in this exploratory research, between February and March 2023. Their personal contact (email and mobile phone) was obtained from the HMR Head. An informed consent document was also developed and sent to all the study participants to be signed. The average duration of each interview was 20 minutes. Confidentiality was granted to interviewees and to the organisation, as well. The interviews were recorded. The next phase involved the treatment and analysis of the information collected according to the content analysis method. The data analysis was supported in a detailed description of the theme categories (Braun & Clarke, 2006), each one including interview quotes. This analysis was carried out manually and it followed a cross-case synthesis analytical technique (Buchanan, 2013). In each of the empirical data collection phases, a pre-coding framework was developed, created from a set of thematic categories arising from the reviewed literature (Braun & Clarke, 2006). To ensure validity, the analysis of the empirical data was conducted separately by two researchers (King, 2013).

3.1 Case Description

The Alpha company is a subsidiary of a German multinational dedicated to the manufacture of semiconductors for renewable energy and has been present in the Portuguese market since 2007. In the Portuguese subsidiary it has around 2000 employees. Currently, Alpha has 200 expatriates. To preserve anonymity, we do not provide more demographic characteristics of company.

3.2 Participants Description

Five expatriates were interviewed (all males; aged 40 in average). All expatriates had a technical position (installation, assembly, maintenance functions), and they are within the company for 1 year at least (minimum 13 months and maximum 14 years) with an average of 4,5 years of international assignment. The research also includes two organisational representatives with responsibilities on expatriation process (1 male and 1 female, aged 44 in average). Both organisational representatives are management positions (expatriates team leaders). Their seniority in the organisation is 12 years.

4. Results

4.1 The Motivation to Transferring, Sharing and Acquisition of Knowledge

International assignments are predominantly for sharing and transferring, although the acquisition of knowledge is also valued:

> *"They will transmit more than acquire because as a rule they already know what they are going to do when they are going to work abroad, but I would say that they always acquire some knowledge as well." (Interviewee 6, organisational representative)*

> *"They acquire more cultural knowledge, but they mainly transmit technical knowledge to the teams. If this transfer did not exist it would not be positive at all for the company, so it is very important that these expatriates are trained to transmit, because if they refuse it will have negative consequences on the company's results and when they share it we have other colleagues from other plants of the group asking for help from our expatriates, given the experience and technical knowledge they hold" (Interviewee 7, organisational representative)*

> *"... seeing a project from start to end, a person learns and acquires a lot of knowledge. And for new colleagues who also join the company, a person can also pass on that knowledge to those colleagues." (Interviewee 5, expatriate)*

While, from the expatriate's point of view, the international assignment may have both monetary and technical enrichment motivations for the expatriate himself, the organisational representatives emphasise the benefits of expatriation in terms of greater productivity for the organisation, greater speed in carrying out the work and the ability to transfer knowledge to other colleagues, freeing these expatriates from the workload that they end up having to take on while other colleagues do not master the knowledge that they are sharing. For this reason, expatriates are encouraged to share knowledge in order to be more efficient and, inherently, to make the company more productive, as the following accounts clarify:

> *"It's not only the monetary factor, it's also because renewable energies are the future for me. From my point of view that will be the future, hence also investing in that area (...) if I know that my colleague*

does not know, if I do not transmit them the knowledge I have, the work will be all for me, because the colleague does not know how to do it." (Interviewee 4, expatriate)

"For the company it has benefits because it allows greater productivity, greater speed and efficiency in the execution of work. The company wins because it becomes more efficient in the execution of the work, so we encourage our expatriates to acquire knowledge in order to have more knowledge and to be more efficient, and therefore being more efficient the company will also be more efficient. We also encourage the sharing of knowledge to free the more experienced in knowledge so as not to overload them and also because if there is no sharing of knowledge, this decreases the efficiency both of the worker who has more knowledge and the one who has less knowledge and also the one from the company. The more knowledge they pass on to the less experienced the easier the day-to-day life of the more experienced becomes." (Interviewee 6, organisational representative)

"They acquire knowledge to transmit to other colleagues later, (...) for example we had technicians that went to Germany to acquire knowledge in a new type of machine and then these technicians were assigned to a project in the Netherlands to transmit the acquired knowledge to new colleagues that were in that team in the Netherlands (...) having that knowledge makes them perform well and, obviously, this makes our organisation achieve better global results and to be chosen to take on new international projects since organisation's work is recognized for having new knowledge and new international experience." (Interviewee 7, organisational representative)

4.2 Contribution of Expatriation for Career Advanced

Both expatriates and organisational representatives admit that the effects on career development may be more related to their career as expatriates than to management positions in the home company. One of the expatriates (expatriate 2) states that "since I joined the company, I feel that I grew as a worker and even as a person, in all the places I went I always learned something, no matter how small it was, but I was always able to learn something and I was able to grow a lot, yes. This idea is reinforced by the account of one of the organisational representatives interviewed (organisational representative 6) who assumes that "international assignments do not help in internal career progression because it doesn´t take place where they are needed, so we cannot consider international experience as a differentiating factor for internal career progression."

However, some expatriates expect the international assignment to have positive effects on the development of their career in the home company: "I usually say that I am giving up my family and social life for the sake of something and that something is to enrich an area where they may give me a good financial return immediately, yes, but that may open doors for me in the future as well. Without any doubt, that may help me to have greater opportunities for growth and continuity in the organisation" (Interviewee 4). This expectation is confirmed by one of the organisational representatives who was once an expatriate and today has a project team coordination role testifying that: "we have examples of technicians who were in the international and who were chosen to take on project Management coordination roles as a result of the knowledge they acquired over the years. They were expatriates and if they had not been expatriates, they would never have acquired this knowledge." (Interviewee 7, organisational representative)

5. Discussions and Conclusions

The results show that motivation can influence knowledge sharing, transferring and acquisition by expatriates of this case-study company. These results are in line with previous studies by Wu et al. (2023) because: (1) these expatriates were recruited based on their expertise and skills; (2) they may be not afraid of losing personal value if they transferred their knowledge with local colleagues and; (3) the rewards obtained in the future within the home company are attractive, such as salary increase, bonuses, career promotions, better learning and growth. Furthermore, the results obtained denote that expatriates who are sharing more knowledge, gathering more information and knowledge are enabled to manage global processes (cost reduction, low prices, reduction of delivery times and promotion innovative ideas) as underline Wu et al. (2023). Recent researchers (Li et al., 2022; Wu et al., 2023) also add that organisational support represents an important factor on knowledge sharing, considering crucial to promote more willing to share knowledge with their team colleagues (Wu et al, 2023) as well as will strengthen the influence of trust, commitment on knowledge sharing (Osland et al., 2020).

Regarding this organisational case study, expatriation is considered a strategy to meet the main organisational objectives through expatriates (e.g., new organisational techniques and processes). Taking into account the results presented here, it is suggested that for a better management and transfer of knowledge, companies

should provide adequate organisational support to their expatriate employees, and it is important that they perceive this support; they should motivate them so that the transfer of knowledge occurs, not only from the employee himself; they should invest in frequent and informal communication, improving the internal organisational communication mechanisms, as referred to Li et al., (2022).

Some conclusions can be obtained from this study. First, the effectiveness of knowledge transfer is a crucial issue for the successful operation of a business unit. Secondly, the study results show that, through expatriates, the home company can promote knowledge sharing to facilitate knowledge acquiring and consequently to increase the effectiveness of knowledge transferring. Third, our study shows that HRM and team leaders support in a home company could play an important role in employees knowledge acquiring, transferring and sharing, namely through promoting performance assessment, training opportunities and career advance within the home company. These conclusions are in line with previous literature (Li et al., 2022; Wu et al., 2023) which refer that organisational support can increase favourable employees' outcomes, including willingness to share knowledge. Furthermore, our results show that knowledge sharing can help expatriates collaborate with then colleagues and develop new ideas to facilitate organisational innovativeness and competitiveness as well as to improve the productivity and performance of MNE (headquarter and their subsidiaries) as recently also concluded Li et al. (2022).

Although the results of this research have provided several conclusions with implications to the managers and specifically to the HRM function, this study presents some limitations, which encourage future research directions. One limitation is related to research design centred on qualitative methodology and a specific time. We propose that future research can carry out longitudinal study. Therefore, the number of participants of this study are limited to expatriates involved on the same project at the same time, this number of participants may be small to represent all expatriates from the study company. Finally, this study adopts the semi-structured interview approach to acquire the perceptions from expatriates and organisational representatives. Future research studies should carry out quantitative study to investigate the correlations between some hypothesis involved with the phenomenon of expatriate's knowledge sharing, transferring and acquiring. For instance, to compare the different antecedents' mediators and moderators' factors to enhance expatriate performance related to knowledge sharing.

More studies in this area are desirable, namely in Portugal, to better understand this knowledge transfer process through expatriates. Future studies could replicate and extend our study in different subsidiaries within this MNE as well as different industries. However, given the current context of internationalisation of Portuguese companies, as well as the high costs inherent in an expatriation process, the development of further studies is urgent to contribute to scientific knowledge that can be applied in practice in Portuguese organisations, to optimize and maximize the benefits of an expatriation process, both from the employee and the organisation point of view. Such studies would help to expand theoretical understanding related to knowledge management and expatriation management, such as job attitudes and behaviours on knowledge sharing, transferring, and acquiring.

This study helped us to clarify that knowledge acquisition/sharing/transfer through expatriation is motivated differently by organisational representatives and expatriates. On the one hand, organisational representatives want the acquisition/sharing/transfer of knowledge to enable them to increase organisational productivity, on the other hand, expatriates consider that the acquisition/sharing/transfer of knowledge could be financially beneficial for them in the short term along with the opportunities for enriching technical skills. Expatriates perceive that the opportunity of acquiring/sharing/transferring knowledge may have repercussions on their professional growth in terms of their organisational career, either as expatriates or as supervisors of international teams.

Finally, the results of this study allow us to extract some managerial implications. Specifically, how expatriation can be an organisational strategy for the acquisition/sharing/transfer of knowledge between different subsidiaries and provides hints on how those responsible for expatriate management. It can guide activities related to the recruitment and selection of expatriates as well as the importance of investing in attractive short-term reward systems in order to ensure the retention of expatriates. In other words, those responsible for expatriate management should be prepared to manage two interlinked human resources management processes: the attraction and retention of expatriates. Therefore, this research may help managers to reflect carefully on how they manage expatriates to satisfy opposite motivations, and not always easy to align, especially when the organisation wants efficiency and effectiveness gains and expatriates want more money and internal career development.

Abstract: Knowledge and knowledge sharing are the main drivers of economic development and the main key to enhancing performance. This research aims to examine the impact of the knowledge sharing (donating and collecting) on the contextual performance at Ministry of Culture, Tourism and Antiquities in Iraq. To achieve the objectives of the research, the descriptive and analytical approach was used through the distribution of (278) questionnaires to the employees at the Ministry. Structural equation modeling with AMOS v.28 was used to build the model and analyse the relationships between variables. The research found that knowledge sharing can create a performance culture for the Ministry employees by building and encouraging knowledge collecting and donating inside and outside their departments, which in turn, increase their skills and experience in developing the performance of their tasks and duties. The implications of the findings and suggestions for future research are discussed.

Keywords: Knowledge sharing, Contextual performance, Service sector

1. Introduction

Today, service organizations operate in a complex environment and facing global challenges such as intense competition and rapid changes in IT, market instability, in addition to increasing demand for quality of services (Mathew 2010). These external pressures are forcing this sector to be not only efficient and effective but also innovative. Knowledge and knowledge sharing plays a vital role in increasing the effectiveness and creativity of the organisation by converting the tacit knowledge embedded in individuals into explicit knowledge through interaction (Hislop et al. 2018). It's can increase the ability of organisational members to solve complex problems at work, reduce errors and increase their organisational learning, and accordingly improving their job performance (Abbas and Sağsan 2019).

In developing countries like Iraq, cultural institutions such as the Ministry of Culture, Tourism and Antiquities play a vital role in the economic development of the country by creating a cultural environment stimulating creativity and prosperous tourism. This Ministry faced significant challenges, represented in how to improve its cultural, artistic and tourism activities. It needs to promote the cognitive interaction between its employees to be able to achieve its objectives and perform its work at a high level.

Previous studies have looked at the relationship between knowledge management and performance (Alghaila et al. 2017; Ali et al. 2018). However, few studies dealt with knowledge sharing (donating and collecting) and their impact on the contextual performance of the employees of service organisations in developing countries such as Iraq. Given the importance of the role played by this sector on the economic level, this study seeks to examine the impact of knowledge sharing on the contextual performance at the Ministry of Culture, Tourism and Antiquities, and to provide suggestions and recommendations to the decision makers in light of the results that will be realized.

The structure of the paper is as follows: In the next section the researchers will presents an overview of the literature as the basis for the main and sub-hypotheses. Then, the method used to analyse empirically the hypotheses. After that the findings will be presented. This will be followed by discussions of results of the research, and then, the implications of the research. Finally, outline the main conclusions and points out some of the recommendations for future research and limitation of it.

2. Knowledge Sharing and Contextual Performance

Knowledge is a dynamic humanitarian process to justify personal belief in reality (Hislop et al. 2018). It is one of the intangible assets that helps the organisation to continue and grow along with other resources such as capital, land and human resources (Abbas and Sağsan 2019). It consists of data including primary numbers, facts, and images based on observation, not analysis, and information that summarizes the data (Chen and Nonaka 2022).

Previous literature categorised knowledge into tacit knowledge and explicit knowledge: Tacit Knowledge reflects the skills and knowledge that exists within the mind, heart and behavior of each individual which is difficult to share or transfer to others (Akhavan and Hosseini 2016). It's subjective and intangible assets and rooted in the minds of individuals accumulated through study, learning and experiences and developed through talks, workshops, job training, and social interaction (Massingham 2019). While explicit knowledge refers to knowledge that can be easily transferred from an individual to another through written or oral messages and found in the books, databases, forms, procedures and policies, or, stored in the archives of the organisation (Abbas and Sağsan 2019).

Hislop et al.(2018) indicated that knowledge management is the process of creating, publishing and implementing organisational knowledge and exploiting new opportunities to improve the performance of the organisation. It's argued that the improving of the performance and creativity is achieved in knowledge management when knowledge sharing is considered (Chen and Nonaka 2022). Knowledge sharing refers to the transfer, interaction, understanding and creation of new knowledge that occurs between individuals. It is a two-dimensional process through which employees share their tacit and explicit knowledge and among themselves. Their daily interaction creates new knowledge through the process of sharing knowledge, which is donation and collection (Hooff and Weenen 2004). Donating knowledge process refers to the communication of individuals with others to share the knowledge they possess from their skills and experience (Akhavan and Hosseini 2016). The main objective of this process is to make individual knowledge become collective and organisational knowledge over time (Hislop et al. 2018). Accordingly, the organisation that creates an atmosphere that encourages individuals working within the organisation to share their knowledge within the group is more likely to develop new ideas and enhance organisational outcomes such as organisational performance (Abbas and Sağsan 2019). In contrast collecting knowledge represents the individual's desire to seek, accept capital and new intellectual knowledge (Hislop et al. 2018). This type of knowledge sharing processes represents the collection of knowledge by the individuals working in the organisation through asking questions, translation and consulting with others (Akhavan and Hosseini 2016). Hooff and Weenen (2004) indicated that knowledge collecting occurs when employees in the organisation are ready to learn from others. It means learning, understanding and applying knowledge.

These processes of knowledge sharing, promote trust and mutual respect, as well as facilitate the flow of knowledge assets to individuals to be invested and subsequently improve performance. It was also found that the collecting and donating of knowledge are linked to organisational learning because learning from others can help and generate new ideas that improve creativity and thus organisational performance (Akhavan & Hosseini, 2016).

Edgar and Geare (2013) asserted that contextual performance represents the employee behaviors that facilitate the organsational, social and psychological context in which the main technical tasks are performed. It consists of activities that improve morale, encourage cooperation among the organizational members, remove barriers to performance, maintain good working relationships, and help co-workers perform task-oriented job activities (Lopez-Cabarcos et al. 2022). Bryan and Vitello-Cicciu (2022) believes that contextual performance represents the behaviors which primarily aims at smooth performance of the organsation, as well as proactive behaviors aiming at changing and improving the work procedures and organisational processes, which include organisational citizenship behavior such as altruism, conscience, co-worker assistance, civil virtue, courtesy, sports spirit, and positive organisational behavior. Through contextual performance, employees can provide ideas for improving performance of the organisation and take action to protect the organisation from potential problems (Ribeiro et al. 2018). In the same context, Nam and Park (2019) explained that contextual performance represents the set of individual informal efforts that constitute the psychological, social and organisational context as a motivational and important factor for activities and processes related to the organization's tasks. When employees voluntarily assist co-workers, act in ways that maintain good working relationships, or make extra effort to complete the task on time, they are involved in contextual performance (Lopez-Cabarcos et al. 2022).

Organisation needs knowledge to improve its job performance, through knowledge sharing, problems are identified at work and new knowledge is created to solve them (Imran et al. 2018). Tacit knowledge is embedded in the minds of individuals working at all levels. Accordingly, it must be transformed into explicit knowledge (Hislop et al., 2018). When knowledge sharing processes practiced by members in the organisation, knew knowledge will create, routines and models, and which in turn facilitate solving business problems (Iqbal et al. 2019).The knowledge- based view recognises that knowledge is a valuable resource for the organization (Chen

and Nonaka 2022). The sharing of knowledge has emerged as an important area in the investigation of performance (Bryan and Vitello-Cicciu 2022).

Prior literature reported that knowledge management is an antecedent factor for performance. For instance, Urban and Matela (2022) found that that creativity plays a vital role in the relationship between knowledge management and the performance of companies. Meanwhile, Kokkaew et al. (2022) suggested that knowledge acquisition, creation, storage, retrieval, transfer and use positively related to the organisational performance in infrastructure construction companies in Thailand. In the same context, Ding et al.(2019) pointed out that prudent leadership has positive effects on the performance of organisational creativity through the mediating role of knowledge management.

Although these studies examined the relationship between knowledge sharing and performance, few studies dealt with knowledge sharing processes and their impact on the contextual performance of employees. Thus, there is a need for research that addresses practical difficulties of sharing knowledge on performance in developing countries such as Iraq in particular, and therefore, this research suggests the following:

H1: knowledge sharing through donating will positively effect on the contextual performance in the Ministry of Culture, Tourism and Antiquities in Iraq.

H2: knowledge sharing through collecting will positively effect on the contextual performance in the Ministry of Culture, Tourism and Antiquities in Iraq.

3. Method

This research used the quantitative approach to investigate knowledge sharing processes on contextual performance. This approach seeks to test the theory by examining causal relationships between variables. A self-administered questionnaire was used, all its elements were developed using the 5-point Likert scale ranging from 1 - strongly disagree to 5 strongly agree. The questionnaire was translated into Arabic using the translation back-translation procedure (Saunders et al. 2019).

3.1 Measurements

Ten items were developed from Hooff and Weenen (2004) to measure knowledge sharing, which reflect the exchange of work-related knowledge, experience and skills among employees at the Ministry through knowledge donating and collecting. Ten other questions measure contextual performance, which reflects the employees' adherence to job requirements, increasing the quantity and quality of work performed, perseverance and dedication to work, as well as helping others at work (Williams and Anderson 1991).

3.2 Sample and Procedure

The research was carried out in the Iraqi Ministry of Culture, Tourism and Antiquities, one of the ministries of the State sponsoring the oldest civilization and culture known in history. The Ministry was founded in 1964 and works diligently and faithfully to protect, and is committed to promoting and upgrading the pillars of Iraqi culture. It sponsors intellectuals and creatives, and develops tourist attractions, archaeological areas, and religious centers as one of the tributaries of the national economy.

The population size is 2000 employee in the ministry. Thus, a required precision level of 7% and a 95% confidence level gives a required sample of 185 employee according to Glenn (2003). Hair and Babin (2018) asserted that, in the structural equation modeling (SEM), the sample size should be greater than 100 to provide satisfactory statistical power. Thus, according to the results above, the sample size was deemed acceptable for the current study. 300 questionnaires were distributed using delivery and collection questionnaire to collect data. Employees from the ministry were randomly selected to receive the questionnaires. of which 278 (92% response rate) were returned and usable for analysis. The characteristics of the respondents are provided in Table 1. Females represented 41.4%% of respondents and males, 58.6%. Regards age profile, tenure and education level respondents were asymmetrically distributed across the different categories.

Table 1: Profiles of Valid Respondents

Characteristic		Frequency	Percentage
Gender	Male	163	41.4
	Female	115	58.6

Characteristic		Frequency	Percentage
Age	<30	45	16.2
	31-40	49	17.6
	41-50	120	43.2
	>51	64	23.0
Education Level	Secondary	46	16.5
	Diploma	12	4.3
	Bachelor	81	29.2
	Master	127	45.7
	Doctorate	12	4.3
Tenure	< 5	50	18.0
	6-10	54	19.4
	11-15	63	22.7
	>16	111	39.9

4. Findings

Structural Equation Modeling (SEM) with AMOS was used to test the impact of knowledge sharing processes namely donating and collecting on contextual performance. SEM consists of two steps: A measurement model to evaluate the convergent validity of the construct and structural model to test and evaluate causal relationships between variables.

4.1 Construct Validity of the Model

Confirmatory factor anaylsis (CFA) with AMOSv.28 was used in this research to evaluate the construct validity which consists of convergent validity and discriminant validity. The convergent validity indicates the degree to which independent measures are accurately related to the same variables under consideration. It was tested through the factor loadings and the average variance extracted (AVE) measure, both of, which should be 0.5 or higher (Hair and Babin 2018).

The research was assessed reliability based on Cronbach's alphas and composite reliability (CR), each of which should exceed 0.7. Table 2 shows that the convergent validity and internal reliability were satisfactory. All factor loadings, and the CR and AVE, were acceptable and significant:

Table 2: Results of the Confirmatory Factor Analysis

Construct	Item code	Loading	Average Variance Extracted	Campsite reliability	Cronbach's alpha
Knowledge donating	Q1	0.697	0.65	0.89	0.93
	Q2	0.784			
	Q3	0.865			
	Q4	0.840			
	Q5	0.836			
Knowledge collecting	Q6	0.880	0.66	0.88	0.94
	Q7	0.896			
	Q8	0.798			
	Q9	0.759			
	Q10	0.745			
	Q11	0.865	0.67	0.91	0.95

Construct	Item code	Loading	Average Variance Extracted	Campsite reliability	Cronbach's alpha
Contextual performance	Q12	0.885			
	Q13	0.716			
	Q14	0.806			
	Q15	0.868			
	Q16	0.659			
	Q17	0.818			
	Q18	0.901			
	Q19	0.759			
	Q20	0.839			

Note: N= 278

Discriminant Validity was also tested, which represents the internal consistency of one factor and distinguishes it from the another factor based on the standards established by (Fornell and Larcker 1981). According to them, the AVE should be greater than the squared correlation between two constructs.

Table (3) shows the acceptability of the discriminant validity for the model since the extracted AVE is higher than all of the squared correlations between items.

Table 3: Discriminant Validity and Descriptive Analysis

Construct	Mean	Standard Deviation	1	2	3
Knowledge Donation (1)	3.252	0.875	0.65		
Knowledge Collection (2)	3.410	0.885	0.512	0.66	
Contextual performance (3)	3.539	0.870	0.534	0.520	0.67

Note: N=278

The goodness of fit of the model was found to be acceptable, as shown in Table 4, according to (1) the absolute fit indices, namely χ^2/df and the root mean square error of approximation (RMSEA) and (2) the model comparison indices. The fit indices used most often are the incremental fit measurement, which includes a normed fit index (NFI), a comparative fit index (CFI) and goodness of fit index (GFI) (Byrne 2016):

Table 4: The fit Indices of the Model

Fit index	Knowledge Sharing	Contextual performance	Target
χ^2/df	1.35	1.32	≤ 2-5
GFI	0.960	0.970	≥ 0.90
NFI	0.975	0.950	≥ 0.90
CFI	0.983	0.967	≥ 0.90
RMSEA	0.034	0.044	< 0.05 – 0.08

4.2 Structural Model

The research used SEM with AMOS v.28 to test the impact of knowledge sharing processes on the contextual performance at the Iraqi Ministry of Culture, Tourism and Antiquities.

Table 5 and Figure 1 show the effect size of knowledge sharing on contextual performance to be 0.685. H1 is concerned with the effect of knowledge donating on contextual performance. The path coefficient for this is confirmatory at the level 0.533 and significance is shown by p<0.05, indicating that H1 is supported. H2 is

concerned with the effect of knowledge collecting contextual performance. The table shows an effective size of 0. 620, confirming H2(see Figure2).

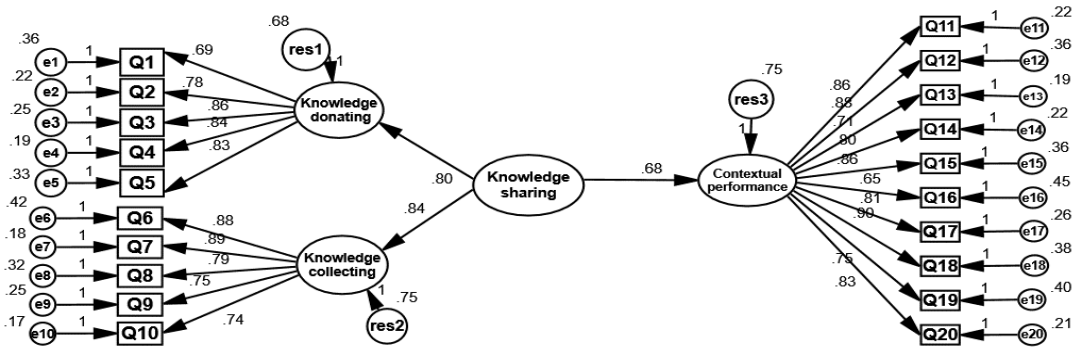

Figure 1: Structural Model

Table 5: Structural Equation Modelling Results

Independent variable	Dependent variable	Impact Value Estimate	t- value	Results
Knowledge Donating	Contextual performance	0.533**	112.11	Supported
Knowledge Collecting	Contextual performance	0.620 *	12.336	Supported
Knowledge Sharing	Contextual performance	0.685*	13.220	Supported
Fit indices	χ^2=819.264, χ^2/df=1.12, GFI=0.957, NFI=0.945, RMSEA=0.04, CFI=0.944			

Note: p * <0.05

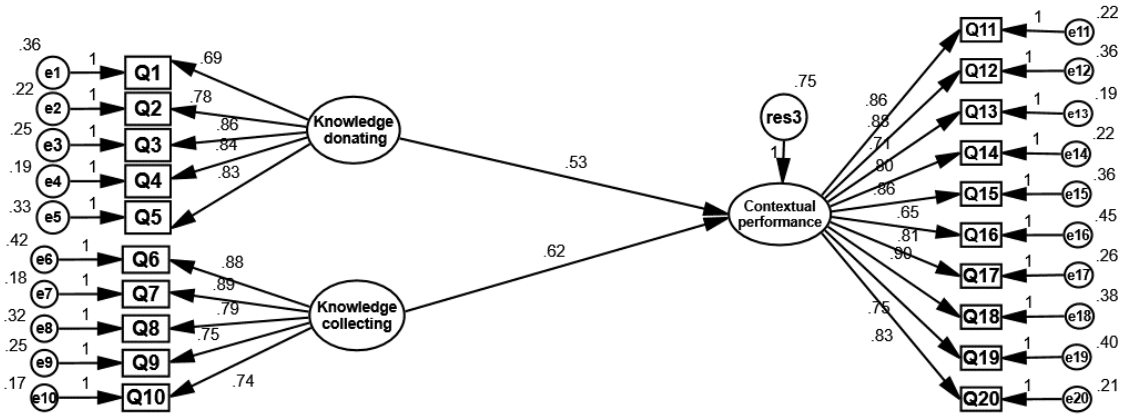

Figure 2: SEM results

5. Discussion

The results supported the impact of knowledge sharing processes (donating and collecting) on contextual performance (*H1* and *H2*) in the Ministry of Culture, Tourism and Antiquities in Iraq. The knowledge-based view considers knowledge is a valuable resource of organisations and suggests that organisations need not only to generate knowledge but also, more importantly, share it (Chen and Nonaka 2022). Knowledge sharing is a two-dimensional process, whereby the organisational members share their tacit and explicit knowledge. daily interaction creates new knowledge through donation and collection. knowledge donating aims to see tacit knowledge is transformed into explicit and proprietary to all. while collecting knowledge refers to searching for knowledge represented in consultations, which in turn improves the entire knowledge inventory available to the Ministry (Hooff and Weenen 2004).

The results indicated that, when knowledge is used, learning occurs, leading to the development of the knowledge inventory available to the ministry. This means that the performance will enhance when the Ministry's employees share their vision, skills, information, administrative knowledge and experience. Accordingly, it will increase the commitment of the employees at the Ministry by feeling that they want to make great efforts to achieve its objectives and talk about them proudly, thus improving the contextual performance (which emphasizes improving morale, encouraging cooperation among the employees of the Ministry, removing the barriers to performance, maintaining good working relationships, as well as helping the coworkers to perform job-oriented activities).

These findings are congruent with Kokkaew et al. (2022) who argued that knowledge knowledge management processes namely acquisition, creation, storage, retrieval, transfer and use can enhance organisational performance within infrastructure construction companies in Thailand.

The results of the current research have also shown that the effect of collecting knowledge on contextual performance is much higher both inside and outside departments than donating knowledge, whilst donating knowledge appears unnecessary outside departments. This is may be due to the Arab culture, especially those within the Iraqi organisational groups, where individuals tend to work in small groups with the same values, beliefs, and problems. Therefore, it may be easier to achieve a knowledge donation within departments, while knowledge collection requires active consultation with colleagues to learn from them. Therefore, it requires understanding new ideas and culture. These findings are consistent with the proposals from (Kamasak and Bulutlar 2010) who have also found that knowledge collection has a greater impact on creativity than knowledge donation.

6. Implications of Research

This research aims to examine the impact of knowledge donating and collecting on the contextual performance in the Iraqi Ministry of Culture, Tourism and Antiquities. These relations have not been considered before in this Ministry. This research provides a theoretical contribution to literature related to knowledge sharing and contextual performance. Knowledge sharing has been described as a key factor in building competitive advantage and is the main component of performance.

The results of this research emphasised the importance and role of knowledge sharing and performance and help provide a better understanding of the links between them. The research also provides support for a knowledge-based view and the strength of the role of knowledge sharing plays in enhancing contextual performance. The results indicated that contextual performance improves if the Ministry is able to encourage the culture of knowledge sharing among its employees. Therefore, the results contribute significantly to the literature on knowledge sharing and contextual performance, in addition to providing a better understanding of these relations in the service sector in developing countries, especially Iraq, which has been neglected in previous studies.

This research has field implications, as it can help managers at the Ministry of Culture, Tourism and Antiquities to develop strategies aiming at encouraging employees to share knowledge in order to improve contextual performance at the Ministry, such as conferences, seminars, workshops, training courses, formal and informal meetings…etc. In addition to spreading and encouraging team spirit, trust and cooperation among employees, encouraging them to increase communication among themselves, allowing them to express their ambitions and expectations, and encouraging the exchange of opinions and perspectives about work inside and outside their departments.

7. Conclusions, Limits and Future Research

Organizations need knowledge and knowledge sharing in order to enhance performance and competitive advantage. This research aims to study the impact of knowledge donation and collection on the contextual performance in the Iraqi Ministry of Culture, Tourism and Antiquities. The results of the research show the importance of performance and knowledge sharing processes.

The research has been applied in the service sector, specifically at the Ministry of Culture, Tourism and Antiquities. Therefore, the results cannot be generalised to other sectors. Future research can explore such relations in the industrial sector. The model was applied in a developing country, which is Iraq. Future research can examine the model in other countries that share similar structures, cultures, and contexts with Iraq.

elis@fmi.uni-sofia.bg

Abstract: Universities traditionally play a central role in building a thriving knowledge and innovation ecosystem. However, in many Central and Eastern European (CEE) countries, universities and research centres are hardly recognized by students as attractive places for career development or as partners for successful business endeavours. Many factors can explain why the public image of scientists in countries like Bulgaria is underestimated: from low investments and under-financed research to old research infrastructure, poor media coverage, low international mobility and lack of interest from local businesses. At the same time, new opportunities and investments remain hidden for students and young people who remain sceptical about pursuing a research career. Considering this, the paper aims to explore the main challenges for positioning Academia back in the centre of the innovation ecosystem. Starting with a short overview of the main pillars of the knowledge triangle, it further enlarges the analysis with the role of the new national institutions (such as Centre of Excellence and Centres of Competence) within the modern innovation ecosystem. Focusing on the researchers' role, the paper summarizes how universities can further help to strengthen the knowledge sharing within the society. The paper is structured as follows. The literature review identifies the main components of the thriving innovation ecosystem, considering some of the pressing national and international challenges, recent technology opportunities and public expectations. Then, it presents the EU-level initiative – the European Researchers Night (ERN) role in boosting public awareness and interest in science. More specifically, it explores the K-TRIO project activities in Bulgaria from a knowledge-sharing perspective. In the next part it analyses the opinions of about 107 ICT students who took part during the last year in surveys and round tables dedicated to the role of researchers, research careers and research opportunities for building a sustainable innovation ecosystem. The outcomes of the surveys and round table discussions are presented along with the main conclusions and lessons learned, summarizing their perceptions, prejudices and recommendations. The last part highlights how working with young people and attracting them to Academia can boost its importance for the innovation ecosystem.

Keywords: Innovation ecosystem, European researchers night, Knowledge triangle, Research career

1. Introduction

Adapting business and society to the challenges of the digital transformation requires substantial efforts for strengthening the role of Academia in the knowledge triangle. Policy initiatives and public investments in research and innovation (R&I) are increasing, but many of these efforts remain unrecognized for the young generations and the general public. For example, several actions are taken recently for making Europe a modern, resource-efficient and competitive economy, and the first climate-neutral continent and empowering people with a new generation of technologies. Research and innovation are considered crucial for the economic recovery, and are in the centre of the industrial transformation for Green and Digital Europe (European Commission, 2020a). Recent actions for Deepening the European Research Area (ERA) consider how to translate R&I results in the economy, and contribute for sustainable development and to the common European efforts for bridging global challenges, building Green and Digital Economy, Smart Cities and Smart Factories, and take full advantage of Clean Technologies, Internet of Things (IoT), Artificial Intelligence, BIG Data, Cloud computing, etc. In addition, the synergy of ERA and the European Education Area (EEA) are essential for the European competitiveness, dual transformation and knowledge-based growth (European Commission, 2020b). Several policy instruments have been in place to facilitate the knowledge transfer between academia and industry: university-industry research contracts, internship schemes, innovation vouchers or tax credits for industry-university collaboration, technology transfer offices, innovation centres, business incubators, science/technology parks, innovation platforms, etc. As outlined in Cervantes (2017) the institutionalisation of knowledge transfers from academia to industry have been not successful in most cases. Among the factors are considered *"the tacit nature of knowledge, and the cost of network building and the difficulty of pricing knowledge."* At the same time, as a general failure of innovation policies is considered the push on academia to transfer knowledge to industry, and underestimating the multidirectional flows in the knowledge triangle (Cervantes, 2017).

The changes in the economy and society towards higher knowledge intensity have created new demands on higher education institutions (HEI) to develop the human capital to better respond to the labour market needs, and support the industry research and competitiveness with its competencies. Moreover, the need for "nourishing talent for excellence" and developing the next generation of researchers and innovators, is related to new educational methods and emphasis on Science, Technology, Engineering and Maths (STEM) at an early age. At the same time, young people should be equipped with competencies facilitating their engagement as citizens in Open Innovation and Open Science (Gourova et al 2021).

Bulgaria as a European Union (EU) Member State (MS) has followed the trends in ERA and EEA, and has aligned its national strategy, regulations and funding schemes to the EU actions in the areas. For example, recent legislation aimed at modernising universities ensured a framework for enhancing the research excellence in the leading research universities. At the same time, the Innovation Strategy for Smart Specialisation (ISSS) outlined regional priorities for industrial development. The funding mechanism for developing Centres of Excellence (CoE) and Centres of Competence (CoC) clearly emphasised the need for building research excellence in the ISSS priority areas, and thus, the centres to better serve the economic and societal needs (Gourova et al, 2021).

Sofia University (SU) as a leading research university in Bulgaria has been involved in some consortia for developing CoE and CoC. In the paper will be presented the role of the CoE UNITe (Universities for Science, Informatics and Technologies in e-Society) in Information and Communication Technologies (ICT) ecosystem, and its approach towards building the next generation of researchers and innovators within the K-TRIO project. The paper initially focuses on some concepts related to the innovation ecosystem and the role of universities in the triangle of knowledge. Next are presented the UNITe role in supporting the digital society, and the approach of the K-TRIO project for attracting talents to research. Within K-TRIO activities is carried out a survey among young people which results are discussed in the paper as well.

2. Universities in the Triangle of Knowledge

2.1 Role of Academia in the Innovation Ecosystem

The concept of the knowledge triangle emerged in the works of Etzkowitz and Leydesdorff (1995) and Leydesdorff and Etzkowitz (1998), exploring the relationships between universities, industry and government and naming them "triple helix", focusing on the importance of coordinating their efforts for strengthening innovation and knowledge economy. As a "fourth helix" was added the civil society by Carayannis and Campbell (2009) in response to the changing nature of the knowledge society. As highlighted by Cai and Lattu (2022), both models are very popular in innovation systems research, and they are complementing each other to a large extend.

The innovation ecosystem is an evolving concept in the research literature. Several studies (Gu et al, 2021; Granstrand et al, 2020; Scaringella et al, 2018; Tsujimoto et al, 2018) have focused on the understanding of innovation ecosystem dynamics, structure, components and positioning. As stressed by Granstrand et al (2020), the ecosystem concept has its origins in ecology, and is related to the flows of resources to living systems, their relations with non-living systems, etc. Furthermore, one of the first definitions of innovation ecosystem is given by Adner (2006) and focused on firm ecosystem. Generally, different types of ecosystems have been discussed by scholars. For example, in (Scaringella et al, 2018) are presented the specifics of business, innovation, entrepreneurial and knowledge ecosystems. Tsujimoto et al (2018) consider four steams of ecosystem research: industrial ecology, business ecosystem, platform management, and multi-actor networks. In a review of innovation ecosystem (Gu et al 2021) are considered five research streams:

- Technology innovation – investigating the creation, evolution, orchestration and inter-organizational collaboration in technological innovation ecosystems;
- Platform innovation ecosystems – focused on their organization, cooperation and competition, and diffusion of platform technologies and services;
- Regional development – considering innovation ecosystems of clusters, national, industrial, or smart and sustainable cities;
- Conceptualization and theorization of innovation ecosystems;
- Entrepreneurship and innovation – including entrepreneurial university or firms, and individual entrepreneurs.

Despite the differences in theory and practice, some important characteristics of the innovation ecosystems could be outlined: It is a dynamic system of various stakeholders who interact among them with a specific purpose. In most cases, the system purpose determines the rules of its functioning, the actors involved, the internal processes and relations (cooperation or competition), and the input and output flows (tangible and intangible resources, products and services, etc.). For this paper the main focus is on the national/regional innovation ecosystems, and the interactions between academia and other public or private institutions of the ecosystem.

As outlined in (Scaringella et al, 2018), in the knowledge ecosystem the universities or research organizations are in its centre of a network of companied, and focus on knowledge generation and its transfer to industrial stakeholders. Etzkowitz and Leydesdorff (2000) considered that the university model is changing towards an "entrepreneurial university" and application and exploitation of the research results. In fact, a large share of the research activities is performed at HEIs, and they have an essential role for increasing the knowledge capital. Universities are positioned in the centre of the knowledge triangle due to their role in generation of knowledge, on the one side, the knowledge transfer to the future labour force in education, on the other, and last but not least, their involvement in innovation with companies. As outlined by Cervantes (2017), knowledge generated by universities is a result of the interactions among education, research and innovation, and "*the bi-directional or circularly-caused knowledge flows between the tree core elements of the knowledge building process constitute the Knowledge Triangle."* This concept shows also that the knowledge production is not a linear process, and is based on various paths of learning, knowledge gathering and exchange. At the same time, it is essential that universities position themselves not only in the centre of the knowledge triangle, but also in their specific innovation ecosystem. The successful model for universities requires contribution to the knowledge demands of their environment – local, regional or national, taking into account industrial or regional specialisation.

2.2 The UNITe Innovation Ecosystem

The main goal of the UNITe project is to build a Centre of Excellence as a highly competitive, internationally recognized scientific research complex, that satisfies the requirements of the modern research infrastructures and the excellent scientific level in the ISSS research priority Informatics and ICT. In the project participate five universities: Sofia University "St. Kliment Ohridski" (as a leading organization), Technical University - Sofia; University of Rousse "Angel Kanchev"; University "Prof. Dr. Assen Zlatarov" - Bourgas; University of Shumen "Konstantin Preslavski". As guiding principles for formation of partnerships within the project were defined: high scientific quality, synergy and complementarity, knowledge transfer experience, wide regional collaboration and established networks with R&I actors. The existence of trust and tradition in cooperation were also considered as essential factors for development of a sustainable partnership and prevention of possible risks associated with the collaboration within the project.

The project goals required the UNITe partners to enhance their collaboration in R&I with various interested stakeholders, both at international, national and regional levels. The consortium considered its role in the centre of the ICT ecosystem and the collaboration opportunities for each individual stakeholders' group. As illustrated in Figure 1, the cooperation with the different types of organizations has different goals, determined by the research program of the UNITe. They are targeted at supporting ICT innovations, the digital transformation of industry, the extensive use in industry, science, government and society of Big data, the development of a new generation equipped with new values, skills and abilities to participate in the digital society and economy, as well as to achieve higher integration in the ERA.

- *Partnership with the ICT industry:* In order to reach the project research objectives, and to support the ISSS through research excellence, it is essential to achieve a greater integration of the research and innovation systems in Bulgaria. The CoE UNITe aims primarily to strategic partnerships with the ICT industry, which suggests launching joint projects for new scientific knowledge generation and its implementation by the ICT industry for design of new products and offering them in the market. These projects facilitate closer integration between universities and industry related to staff exchange, joint supervision of PhD students and mentoring of young researchers working on the joint projects, optimal use of the CoE research infrastructure and the created scientific databases. Within the project, the main directions of cooperation with the ICT industry are outlined by the scientific work packages and the aim to overcome the challenges associated with cybersecurity, optimal use of Big Data, real-time virtualization, digitization and visualisation objects, prototyping, and supporting the development of Cyber-physical systems, Factories of the Future and smart cities.

- *Partnership with small and medium enterprises (SMEs) and non-ICT industry:* The main collaboration form with this group is related to knowledge transfer and provision of services for research and technological development (RTD), supporting the digital transformation of the industry and the more extensive use of ICT for build the Factories of the Future. This is also a prerequisite for the formation of a greater demand for ICT services and products, which on its turn to stimulate related research and innovation activities of the CoE and the ICT industry. Within the project, partnerships have been sought for joint pilot projects for testing the research results in a real environment.
- *Partnership with innovation intermediaries:* The knowledge transfer from the CoE to the industry is carried out mainly in collaboration with intermediaries in the innovation system (clusters, innovation centres, technology transfer centres, branch organizations, etc.), with which have been undertaken joint activities according to the specific regional industrial needs. A special attention is paid to organizations supporting start-ups and building innovation and entrepreneurship competencies of young people and employees.
- *Partnership with state bodies and local authorities:* The CoE UNITe has been collaborating with local authorities for the development of e-municipalities, and offering advanced electronic services to citizens and businesses, as well as for development of smart urban environment. Within the project as a main collaboration form is considered launching joint pilot projects to test the research results in a real environment.
- *Partnerships with schools and other educational organisations:* The wide ICT penetration in the economy and society, and the creation of R&I attitudes critically depends on the formation of the human capital – future researchers and innovators, ICT professionals and ICT teachers. Major roles in this area have the educational organizations that create the basis for the development of future citizens and professionals. Despite that the partners as universities have significant contribution for preparing the workers demanded on the labour market, at local level has been launched collaboration with schools and other educational organizations (incl. for training and life-long learning) in order to integrate new teaching methods and ICT in education, as well as raise the awareness on science among the younger generation.
- *Partnership with non-governmental organisations (NGOs):* In order to overcome the digital divide, expand the e-participation and create prerequisites for e-democracy, the UNITe partners have collaborated with NGOs for enhancing the e-skills of citizens, and to identify their demands for new ICT products and services. With these organizations have been organized joint activities for raising the awareness on the contribution of science to the development of the economy and society, and to form a more attractive image of researchers and attract young people to research careers.
- *Partnerships with other research performing organizations (RPO) and universities*: Of particular importance for UNITe CoE is to expand the collaboration with other research organizations and universities in the country, so as to provide them opportunities to benefit from the research results of the project and the established research infrastructure and scientific databases of the CoE. The partner universities have collaborated for years with research organizations and universities in the areas of Communication and Computer techniques, and in Informatics and Computer sciences. Within the project are discussed joint initiatives for knowledge transfer and new projects.
- *Partnerships with the international community*: The goal is to establish strategic collaboration for joint projects and use of the UNITe research infrastructure, knowledge sharing through mobility and specializations of UNITe researchers and PhD students, in order to achieve higher integration of the CoE in the ERA. The UNITe CoE aims at building long-term collaboration for the development of ICT science and innovation with leading universities, research organizations and scientific networks in the EU.

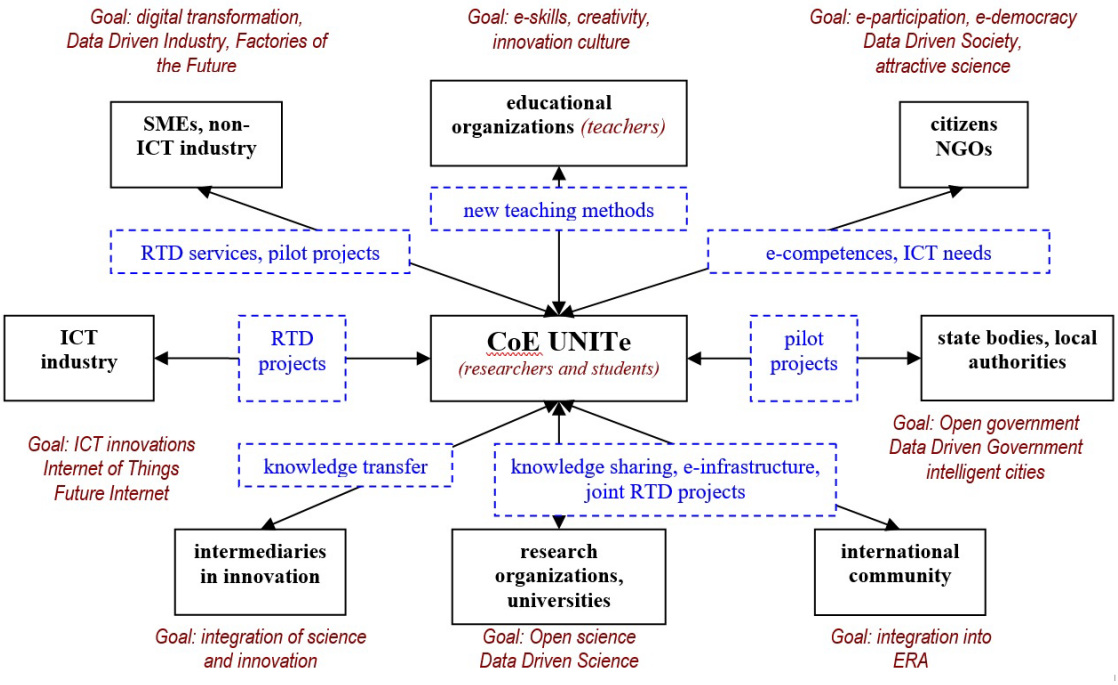

Figure 1: CoE UNITe Positioning in the ICT Ecosystem

3. Researchers in the Knowledge Triangle – the K-TRIO Concept

The difficult transition of Bulgaria caused a serious decline in education and in building real values of the new generations. The image of science and researchers, teachers and educational institutions was also damaged. Despite recent public attention to the impact of online education on building knowledge and skills of students, and the increased awareness of teachers' role, the challenges of Bulgarian R&I system remain (Gourova et al 2021). The UNITe Consortium has recognised that there is a need for cultural change and nurturing a new culture of creativity, scientific curiosity, innovative spirit and environmental responsibility. Subsequently, by designing the K-TRIO project, the partners considered how to address the human resources challenges of the national R&I ecosystem: How to encourage young people for research career? How to grow new talents? How to engage citizens with Open Science and Open Innovation? How to foster R&I and increase their role in Green and Digital transformation? There is no clear approach, however, the K-TRIO consortium followed a concept that universities should play a leading role in the knowledge triangle and facilitate:

- building the next generation of researchers by educating students to respect the principles of research integrity during their education, and involving them at an early stage in solving real problems and focusing on the needs of the economy, environment and society;
- integration of new teaching methods and tools in higher education of future teachers, and thus, facilitating changes in teaching styles in secondary education; nurturing creativity, innovation spirit and environmental responsibility, as well as Open Science and entrepreneurship attitudes at an early age;
- achieving scientific excellence and turning it into innovation by using the Open Innovation paradigm to engage the citizens in a dialogue on R&I agendas, valorisation activities, and subsequently, changing the attitude of the general public towards science and researchers;
- accelerating the change towards higher innovativeness and knowledge transfer by providing researchers with complementary skills and competencies to work with industrial stakeholders and better understand the role of academia for turning knowledge into innovation.

All partners collaborate with a large number of national or regional stakeholders, and have engaged more than 30 associated or supporting partners (the Ministry of Education and Science and its regional departments of education, several municipalities, schools, NGOs, etc.). This consortium composition has facilitated the smooth involvement of various target groups (Figure 2) in the K-TRIO activities.

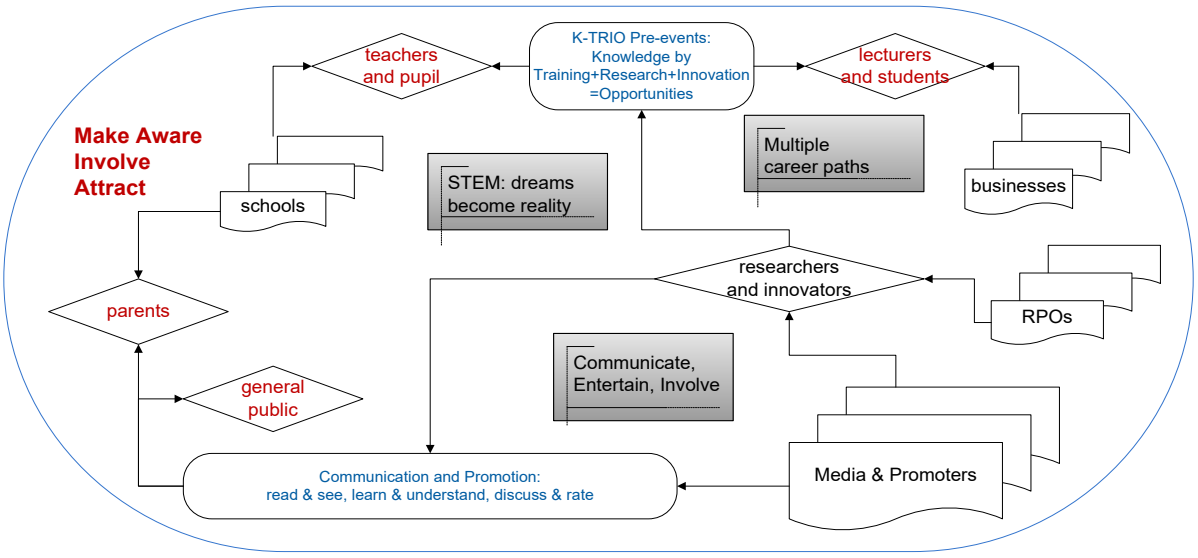

Figure 2: Stakeholders Engagement in K-TRIO Project

The K-TRIO project has engaged the most stakeholders of the UNITe ecosystem in the process of building the next generation of researchers.

- *Researchers and innovators,* both from industry, HEIs or RPOs, are placed in the centre of all activities as they can serve as role models for the youth with their R&I experience, and their multiple career paths.
- The K-TRIO partners involved researchers and innovators in joint activities with *schools and teachers* in order to raise the awareness of students and pupils on the R&I profession, involve them in STEM centres and research activities, thus, attracting the youth to a possible research career path.
- In the Open Labs or Open doors of partners universities and museums *students and pupils* (and the general public during the ERN) had opportunities to be involved in scientific experiments, learn and understand the real work of researchers, and discuss with them on various topics.
- At the same time, the K-TRIO partners focused on *teachers as multipliers* of the project messages, but also as essential actors for attracting students and pupils to STEM. Therefore, several seminars were organised to train teachers to use innovative teaching methods, or better use the available STEM centres infrastructure.
- Another essential target group are the *university students* who are involved in discussions about the R&I system and the respective career, involved in research projects or industrial internships. For talented students (both in schools and universities) have been organised also competitions (e.g. "Young and Energetic Scientists") whereas researchers were involved as their mentors or supervisors.
- *Civil society actors – NGOs, media and science promotors* have an essential role for attracting the young generations to research. The K-TRIO consortium used several communication channels (web sites, Facebook, YouTube, LinkedIn, traditional media) and formats (interview, podcast, short video, etc.) in order to present to the general public the contribution of individual researchers, research projects or RPOs to the economy and society, regional development and growth.

The K-TRIO model for collaboration with stakeholders facilitated the awareness raising and debates related to sustainable recovery, increasing the knowledge intensiveness of industry through R&I services or R&I projects, as well as focused on preparing of citizens for Open Innovation. The role of research for smart specialisation and regional; growth have been the focus of debates with public bodies and local authorities. In the centre, however, have been educational organisations and HEIs with their role for preparing the next generation of researchers and innovators, and facilitating a cultural change towards Open Science and Citizens Science.

4. Young People Attitude to Research and Innovation

4.1 Methodology of the Study

Within K-TRIO project, a short survey was made among the students in the ICT bachelor programs of SU in order to explore the perceptions and attitudes of young people toward the role of academia in the knowledge triangle. The students are an important part of the UNITe target groups, as ICT talents are among the most critical resources for further success of the research infrastructure. More specifically, the survey was completed anonymously as part of the seminars of the elective course "Knowledge Management", followed by a round table discussion on the role of science in the modern society.

The aim of the proposed approach was first to put students in the position to formulate their initial perceptions, and then, to openly discuss their concerns. Thus, students can prepare more carefully their arguments, considering evidence and examples for the round table and at the end they can summarize some common visions. The survey was organized in four parts:

- impact and role of the Bulgarian science in the society and the attitudes toward scientists in general;
- role of the science and technology transfer for the economy, business and social development;
- new perspectives and general attitudes for the role of the science in the society;
- statistical data.

4.2 Analysis of the Results

In total 107 students filled the questionnaire in 2022 and 2023. The demographic data shows that students are 45% females and 55% males, most of them (87%) aged between 21-22. To summarize the results, the answers are grouped in two main areas: the role of science in the modern society and economy and the attitudes of students towards research career.

- The role and the impact of science in the economy and society

The survey comprises 48 questions that directly or indirectly explore the role of science in the knowledge triangle. From this perspective, students recognize that Bulgarian research institutions significantly contribute to the progress of the economy and society. For instance, almost 80% of the students emphasize that research institutions promote knowledge discovery, and 77% consider its positive impact on the educational system and on national culture. At the same time, 61% of students find that research institutions contribute to a limited extent to the practical implementation of research discoveries in the business and society.

Almost 20% of the young people have concerns that science is underestimated in the last years, and students find that Bulgarian society in general is not really interested in new scientific endeavors. As identified on Figure 3, students find that Bulgarian science contributes very significantly for cultural heritage protection, for increasing the national prestige and for environment protection. At the same time, students don't see the role of Bulgarian scientific institutions for making better social regulations/strengthening institutions, for improved decision making on strategic company or government level and in general for innovative products and services.

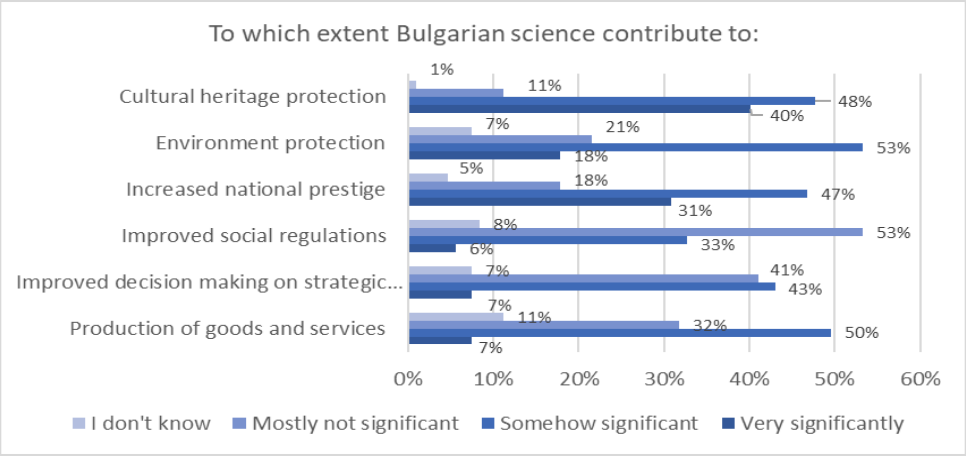

Figure 3: To Which Extent Bulgarian Science Contribute for the Economic and Social Development

Concerning the new challenges in front of the knowledge economy, most of the students agree that science should be supported as a national priority (68%). In the same time, the respondents find that the role of science is underestimated by the public authorities (62%) and by the businesses (35%). However, most of the students find that research institutions need to improve the visibility of the research career.

- The role and the impact of the scientists and the scientific career

In general, 86% of the students find that researchers and scientists have good reputation and about 60% find that research profession has a positive social image. However, considering the social status, almost all of the students (90%) claim that at least in the Bulgarian society, researchers receive low or very low renumerations comparing to their efforts. Concerning the personality of the researchers, most of the students find them to be smart and intelligent people (93%), good in theoretical knowledge (79%), mostly old (66%) and mostly men (30%). Some general (mis)conceptions for scientists are still recognized, viewing researchers as difficult for understanding (26%), with low communication skills (21%), and in general very distracted people (19%).

On the question whether students would like to become a scientist, 45% of them directly respond NO, 18% said YES, and 36% had never thought about research careers opportunities. On the Figure 4 are presented some data how students recognize the main stimulus for attracting young people for research career.

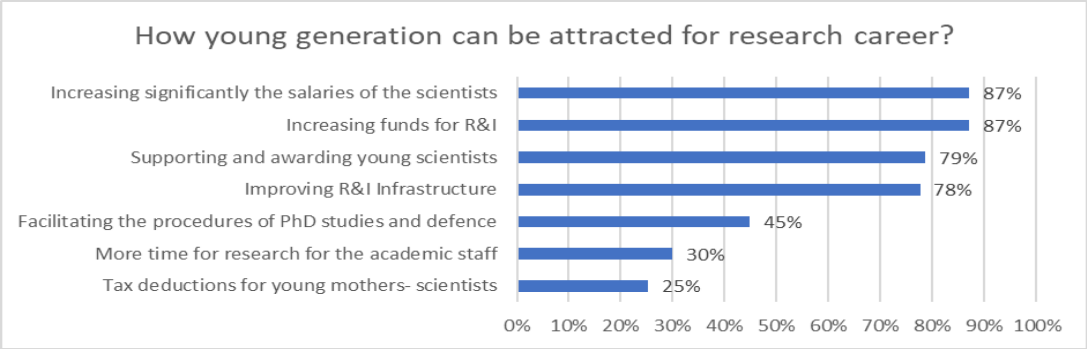

Figure 4: What are the key Factors to Motivate and Attract Young Generation for Research Career

5. Conclusions

Although the significant efforts and public investments in R&I, young people still do not see the role of Academia as crucial for thriving research and innovation ecosystem. The team of Sofia University regularly take part in similar surveys for measuring the attitude and perceptions of different target audiences. However, this survey is focused to investigate more specifically the attitudes of young talents in ICT. The survey results demonstrate that students still do not understand the multiple perspectives offered by the research careers. Many popular misconceptions for science and for the research profession are still dominating among young students and they hardly recognize the opportunities for becoming scientists.

All this show that the team of UNITe needs to pay more attention to raise the next generation of talents in science, actively involving and explaining various R&I initiatives. Researchers and lecturers have to openly communicate and discuss real-world examples, case studies and research evidences how ideas emerge and progress, nurtured in the academia environment. In plus, more dissemination activities orientated specifically to students and young people have to present how Academia strengthen the knowledge ecosystem.

Abstract. The success or failure of economic agents, especially families, depends on decision making, which in turn will depend on the capabilities, knowledge and skills acquired through financial education. In this sense, the lack of financial capabilities is considered one of the most pressing problems in today's societies. In Peru, one of the main barriers to financial inclusion is the lack of financial education; these low levels of education affect the contracting of active and passive operations in the financial system. The objective of this research was to determine the relationship between financial literacy and the indebtedness of the clients of a banking agency. The methodology has a quantitative approach, correlational level, cross-sectional and non-experimental design. The population considered is finite, 1600 customers in the bank and the study sample was 310 customers. A survey was used as a technique and a 36-question Likert scale questionnaire was used as an instrument. The correlational results present a Spearman's Rho =0.474; the research also finds that 73.23 % of the bank's clients are interested in knowing the interest rate (TCEA) before contracting a loan on the active operations side and on the passive operations side 54. Regarding savings, 60% of the bank's clients consider it important to save in the financial system, which is consistent with the fact that 65.49% tend to keep their savings in the banking system for a period of more than 12 months, demonstrating confidence in the Peruvian financial system. It is concluded that there is a relationship between financial literacy and the indebtedness of the clients of the Lima branch of a bank, obtaining a positive correlation.

Key words: Financial literacy, Financial knowledge, Financial skills, Financial attitudes, Indebtedness

1. Introduction

According to the World Bank (2020) the COVID-19 pandemic has transformed the way in which economic agents face budgetary restrictions; many of them, in their search to improve their income, have opted for developing enterprises, making use of their pension funds and, above all, getting into debt in the financial system. Arellano et al. (2014), Machuca-Vílchez et al. (2023) and Cordova-Buiza et al. (2022) have already pointed out that society is characterized by high levels of indebtedness and growing savings needs, whose members have a general lack of understanding of financial matters. This is a serious problem in the economic and financial affairs of economic agents, especially families. In this regard, Martínez-Carrasco et al. (2016) and Huaman-Ñope et al. (2023) state that having an adequate financial education in society implies acquiring knowledge on this subject, in addition to generating diverse skills, confidence and mastery, to face risks, associated with an informed decision on financial opportunities and their wellbeing. Consequently, it is up to public and private institutions to promote financial inclusion strategies. For García et al. (2013) and Barro-Chale et al. (2023) the financial education initiatives promoted by these institutions can become an important complement to financial inclusion processes and poverty reduction measures. In this sense, many Latin American countries have implemented public policies focused on financial inclusion, such as Argentina, Brazil, Mexico, Colombia, Chile, Paraguay, Uruguay and Peru.

In this regard, in October 2020, after 15 years, the Organization for Economic Cooperation and Development (OECD) has renewed its objectives on financial education. According to López (2020) and Salazar-Rebaza et al. (2022) these objectives seek to have a fundamental impact on the design, development and evaluation of public policies on financial education, although private sector initiatives and financial education programs in general can also be useful, thus visualizing the commitment assumed by the different governments in the design of public policies focused on a framework of financial inclusion and various private institutions, especially financial institutions.

The supervisory agency in Peru, Superintendence of Banking, Insurance and AFP (2019), in the survey to measure financial capabilities, to measure financial knowledge, adopts the Methodology used by the OECD and the International Network on Financial Education - INFE, found that the percentage of adults with high financial inclusion in the segment with primary education was significantly lower compared to the results of the other educational levels. The findings show discouraging progress in the period 2013 - 2019, since, in this period, the score obtained by the group of respondents with lower educational level contracted only 1.2 percentage points. On the other hand, the results achieved by the secondary and higher education level had a notable increase over time, reaching double the score obtained by the secondary education level, with 36.3% of the total of adults with higher education having high financial inclusion. In addition to the introduction, in section 2 we review the literature, in section 3 the method of analysis is presented, in section 4 the data is shown, in the next section the results and discussion are shown, and finally, the conclusions.

2. Literature Review

Organization for Economic Cooperation and Development and the Andean Chamber of Development (OECD/CAF) (2020) define Financial Literacy as: "financial capabilities, understood as the knowledge, skills, attitudes and behaviors of specific population groups". Del Angel and Moreno (2021) define financial literacy as the process by which the economic agent develops awareness, knowledge, skills, attitude, discipline and behaviors necessary for making financial decisions; the same that contribute to his or her wellbeing.

Espinoza et al. (2019) notes that citizens improve their financial decisions by having high levels of financial education, which translates into positive results in economic growth and development. For the authors, "this type of education does not only imply having information and financial advice, but also seeking for people to improve their understanding of financial products and services and the risks they imply" (p. 4).

Kadoya et al. (2017) propose that financial literacy contributes to reduce anxiety about the economic future, through better savings and investment decisions, leads to the accumulation of more assets and obtaining more income, thus improving financial capability and reducing anxiety. In the same vein, Ramirez (2021) indicates that financial literacy implies for a person must be competent to understand how money works, how to manage income and expenses, how and where to invest, manage financial risks effectively and, most importantly, avoid financial problems.

Arroyo (2019) analyzes the financial capabilities of university students in Esmeraldas (Ecuador), finding that they possess little financial knowledge, the same that impacts their financial attitudes and behavior. Likewise, Mudzingiri et al. (2018) for the case of university students in South Africa their financial behavior related to confidence, time preferences, risk preferences, differ according to the level of financial literacy of university students differ according to the level of financial literacy, which reinforces the argument that people with high financial literacy achieve better results in life. In the same sense as Arroyo, Peñarreta et al. (2019) when analyzing the financial education of Ecuadorian banking clients in terms of the dimensions of knowledge, behavior and aptitude, find that only one third of the surveyed population has financial education.

Mamani (2020) studied financial education and its influence on the indebtedness of clients of the Municipal Savings and Credit Agency in the city of Cusco, using a Likert scale questionnaire as an instrument, and found a positive effect, which reinforces the idea that greater financial knowledge leads to optimal indebtedness. Muñoz-Murillo et al. (2019) studied the theoretical link between literacy levels and cognitive skills, and found that cognitive ability strongly predicts financial literacy, even after controlling for the confounding factors of arithmetic, these are positively related; also, the study shows that there is no significant difference between men and women and that the presence of financial products in the environment is important, but cognitive skills have greater significance.

3. Methods

This research has a quantitative approach, with a correlational level and a non-experimental cross-sectional design. The instrument used has been adapted from the instrument used by the OECD to measure financial education, with respect to the fact that financial literacy contributes to social welfare, having a positive impact on indicators such as savings, investment, indebtedness, among other economic and financial aspects of economic agents. The study population is made up of 1,600 clients of a bank agency in central Lima. A sample of 320 clients was drawn by means of probability sampling.

From the above, the unit of analysis is the client of a bank agency, who carries out active and passive operations with the financial entity selected for the study. Spearman's correlation coefficient was used to obtain the results,

as it is an appropriate measure of rank correlation (statistical dependence of the ranking between two variables). In this case, between the variables of financial education and indebtedness.

4. Data Collection

For data collection, the survey technique was applied in order to obtain information for the stated objective. An instrument was developed based on OECD/INFE (2018) that consisted of a questionnaire with answers on the Likert scale, 24 questions were posed for the financial education variable and 12 for the indebtedness variable, which the study subjects answered according to their criteria and visualizing the following categories: never (1), almost never (2), sometimes (3), almost always (4) and always (5). This instrument was validated by 3 experts with experience in the research topic.

Table 1: Dimensions for the Variable Financial Education (Financial Literacy)

Dimensions	Indicators	Items (Questions)
Financial knowledge	Interest	1,2
	Risk-return	3,4
	Inflation	5,6
	Diversification	7,8
Financial skills	Holding of savings products	9,10
	Debt compliance	11, 12
	Income and expense management	13,14
Financial attitudes	Short-term preferences	15,16
	Long-term preferences	17,18
Financial behavior	Types of products purchased	19-20
	Amount spent	21-22
	Frequency of purchases	23-24

Table 2: Dimensions for the Indebtedness Variable

Dimensions	Indicators	Items (Questions)
Cultural and Social	Consumer habits	25,26
	Credit practices	27,28
Debt Level	Debt to gross income ratio	29,30
	Delinquency/defaulted debt	31,32
Financial Weakness	Credit supply	33,34
	Over-indebtedness	35,36

In addition, by means of Cronbach's Alpha test with the SPSS program, the reliability of the items was measured by means of a pilot test applied to 60 clients from which a reliability level of 0.784 was obtained with respect to the 36 elements (items). The final information was collected by direct interview, approaching the clients at the exit of the bank agency, and with the use of the printed instrument to collect their answers, then the information was tabulated in an Excel file to obtain a database that allows the application of the proposed methodology.

5. Results and Discussion

5.1 Analysis at the Descriptive Level

Some results of the descriptive analysis of the financial education and indebtedness variables with their respective dimensions are presented below.

Table 3: Results on the Financial Education and Indebtedness Variables with Their Respective Dimensions (in percentages)

Category	When taking out a bank loan, I inform myself about the interest to be paid.	When opening a fixed-term or savings account, I find out in advance about the interest to be received (TREA).	I consider saving in the financial system to be important.	When taking out a bank loan, I usually pay the entire debt in a period of less than 12 months.
Never	0.97	9.03	2.58	16.77
Almost never	7.74	17.42	13.55	26.77
Sometimes	18.06	18.71	23.87	20.32
Almost always	29.68	23.23	33.55	20.97
Always	43.55	31.61	26.45	15.16
Total	**100.00**	**100.00**	**100.00**	**100.00**

Some noteworthy aspects are that 43.55% and 29.68% of the Bank's clients are always and almost always informed about the interest to be paid when contracting a loan in the financial system. Likewise, 31.61% and 23.23% of the Bank's clients are always and almost always informed about the interest to be received (TREA) when opening a time or savings account. It is also noted that 26.45% and 33.55% of the Bank's clients always and almost always consider that saving in the financial system is important. Finally, 15.16% and 20.97% of the Bank's clients, always and almost always, when taking out a bank loan, usually repay the debt in full in a period of less than 12 months, which is evidence of medium-term indebtedness.

5.2 Analysis at the Inferential Level

The results of the correlation are shown in the following table.

Table 4: Correlation Relationships of Some Important Variables

	Debt Level	Financial Weakness	Social Culture	Financial Skills
Financial skills			0.2728***	
Financial behavior	0.4417***		0.4288***	
Financial attitudes		0.2409***		
Financial literacy	-0.0498	0.1172**		0.3803***

Significance: 0.01***; 0.05**

As a general hypothesis, it was proposed that financial literacy is related to the indebtedness of the clients of the Lima Centro branch of a bank, 2022. As a result, an average negative correlation (-0.0498) is found between the study variables, so it is concluded that financial literacy has a negative relationship with the level of indebtedness of the clients of the Lima Centro branch of a bank. From the above, the higher the level of financial literacy, the lower the possibility of having an indebtedness that means a problem for the bank's clients, this goes hand in hand with the answers, for example, to the question regarding whether the clients were informed about the interest to be paid, with 73% responding that they have this good practice; as well as the same percentage considering that it is important to pay the financial entities on time. Another aspect to consider is time, 36% when contracting a bank loan usually pay in full in a period of less than 12 months.

The correlation between the dimensions of financial knowledge and financial weakness, measured by the items "When contracting a loan in the financial system, I find out about the interest to be paid" and "I make cash withdrawals from my credit card to pay off other debts", shows a low but significant positive correlation. Likewise, between financial skills and social culture, measured as "I consider it important to pay financial institutions on time" and "I take care of my credibility in the financial system", the correlation is positive and significant.

If we consider financial behavior related to social culture, measured as "Before buying something, I carefully consider whether I can afford it" and "My consumption patterns are related to my monthly income" respectively, we find a significant positive correlation, so that financial behavior has a positive average relationship with the dimension level of social culture, of the clients of a bank's downtown Lima agency. Similar results are found for financial behavior and level of debt, this time measured as "For the most part, the products I purchase cover my primary needs" and "My monthly payment installments exceed 30% of my net income"; consequently, the clients of a bank's Lima center agency, their financial behavior would be related to a higher payment of debt in the short term, which is a symptom of risk of default.

Regarding financial attitudes in relation to financial weakness, measured as "When taking out a bank loan I usually pay the debt in full in less than 12 months" and "I make cash withdrawals from my credit card to pay off other debts" respectively, a positive and significant relationship is found, which would not be a good strategy, given that the costs of credit cards are high compared to other financial products.

Finally, the correlation between the dimensions of financial knowledge and financial skills, measured as "When opening a time or savings account, I inform myself beforehand of the interest to be received" and "Saving in the financial system is considered important" respectively, shows a positive and significant correlation. This is positive, since the clients of this banking agency in Lima would be aware of the importance of being informed about savings payment rates and the importance of saving in their personal finances.

5.3 Discussion

The results for the general objective indicated that there is an average negative relationship between financial literacy and client indebtedness, so it can be argued that if financial literacy is increased in its different dimensions, financial knowledge, financial skills, financial attitudes and behavior, the level of client indebtedness decreases proportionally. This result is in line with the findings of Mamani (2020) and Franco & Venegas (2020) who agree that an adequate level of financial literacy leads to optimal debt levels among the different study groups. Likewise, with the findings of Muñoz-Murillo et. al (2019) who find that cognitive ability strongly predicts financial literacy, and that the presence of financial products in the environment is important, but cognitive skills are more significant.

Financial behavior is one of the most important dimensions of financial literacy, from our analysis we found that there is relationship between it and the level of debt, correlation coefficient was 0.4417, these results are consistent with the finding of Mudzingiri et al. (2018) who find a weak significant difference (of 10%) between financial behavior and the level of indebtedness of college students by their level of financial literacy. These results confirm that financial behaviors differ if people have different levels of financial education, which reinforces the argument that people with high financial education achieve better life outcomes. However, our findings regarding this dimension differ with Arroyo (2019) who finds that, regarding financial behaviors by making use of budgeting and planning either exactly or in a general way, however, despite the existence of planning, a large portion of students have had complications in covering expenses.

With respect to the financial knowledge dimension our study finds that 73.23 % of the bank's clients always and almost always are interested in knowing the interest rate (TCEA) before contracting a loan on the side of active operations and on the side of passive operations 54. 84% of the bank's clients, always and almost always, inform themselves about the interest to be received (TCEA), the same that differ with the finding of Peñarreta et al. (2019) whose results found evidence that only one third of the population surveyed in their study, has financial education. Regarding savings, 60% of the Bank's clients always and almost always consider it important to save in the financial system, which is consistent with the fact that 65.49% usually keep their savings in the banking system for more than 12 months, demonstrating confidence in the Peruvian financial system.

Finally, it is important to know the results of the study related to delinquency, as a manifestation of lack of financial literacy since this situation leads economic agents to lose the credibility of the financial system, to be reported negatively in the credit bureaus, in this regard, 73% of the Bank's clients always and almost always, consider it important to pay financial institutions on time, these results differ with the findings of Barzola et. al (2020) and Del Castillo (2019) who find that their study groups do not have adequate financial literacy which leads them to misuse financial products.

6. Conclusions

As for the relationship between financial literacy and the indebtedness of the clients of the Lima Centro branch of a bank, 2022, given the correlation coefficient obtained (-0.491) would indicate that there is a negative

relationship between the two variables. Therefore, clients with higher levels of financial knowledge would have fewer problems in meeting their liabilities. Regarding the relationship between financial knowledge and client indebtedness, the measurement of concepts such as active and passive interest rate, risk, profitability and inflation is deepened, in such a way that, the higher the level of financial knowledge, the higher the level of indebtedness of the clients.

It is found that there is a significant relationship between financial skills and customer indebtedness, in this second dimension the measurement of decisions such as the frequency of saving, timely payment to financial institutions, control over income and expenses both family and business, so that, the higher the level of financial skills, customers have a better management of their indebtedness. In addition, there is a significant relationship between the attitudes and indebtedness of the clients, in this fourth dimension the measurement of the attitude of the clients regarding the time in which they pay their debts and maintain their savings is deepened, in such a way that, the higher the level of financial attitudes, the better the clients manage their indebtedness.

On the other hand, a significant relationship is found between the behavior and indebtedness of the clients, in this fourth dimension the measurement is deepened with respect to the behavior of the clients at the moment of acquiring their products if these cover their primary or secondary needs, if they carefully consider if they can pay for what they acquire as well as the times they usually go shopping, such is the case that, with an adequate behavior, the clients have a better management and level of indebtedness.

Finally, the results obtained have implications with the theories used in the study, since they show us that financial education is an instrument that helps people or economic agents to make better financial decisions, in this case, bank customers with more financial education have better levels of indebtedness, taking as a reference the rate and terms.

Knowledge Management: The Value of Inter And Intra-Firm Activities Towards Firm Innovation Performance

Emmanuel Ebo Arthur and Jan Stejskal
University of Pardubice, Czech Republic

emmanuel.arthur@upce.cz
jan.stejskal@upce.cz

Abstract: Firms mainly depend on innovation to remain competitive in business. New knowledge is a major resource for firms on the path of achieving innovation performance. This paper seeks to examine how intra-firm and inter-firm activities promote knowledge sharing toward innovation performance. We used the variables channels of information to represent inter-firm activities and workplace organization methods to represent intra-firm knowledge-sharing activities. The proxies for innovation performance were product innovation and business process innovation. Cross-sectional country-level data from CIS 2018 for 17 countries within the EU region was used for our study. The OLS regression method was used for the analysis. While existing studies concentrate on inter-firm knowledge transfer and single country-level studies, our study focuses on a blend of intra-firm and intra-firm cross-country studies. We also emphasized the value of knowledge sharing and cognition in the knowledge transfer process toward achieving firm innovation performance. Our model was built on the knowledge-based view (KBV) and social network theory (SNT). We found that cross-functional workgroups, conferences, trade fairs and exhibitions have a positive significant impact on both product and business process innovation. Published patent had a significant impact on product innovation but was not statistically significant for business process innovation. In conclusion, we found that intra-firm knowledge-sharing activities impact more on innovation performance of firms more than inter-firm knowledge-sharing activities of firms in the EU. Our study is limited to using cross-sectional data and the number of countries within the EU involved in the study. We believe longitudinal data and the involvement of more EU countries in future studies will yield robust findings for more reliable inferences.

Keywords: Knowledge sharing, Knowledge-based view, Social network theory, Channels of information, EU

1. Introduction

Knowledge is an undisputable resource for a firm's competitive advantage and profitability. Its creation, acquisition and transfer need to be cautiously planned and executed to achieve the intended purpose. The link between knowledge and innovation is crucial in the current technological and dynamic business environment. The creation of knowledge and its acquisition is as important as its sharing. A firm's proximity to other firms with similar business interests has the potential to share knowledge more than distant firms. Inter-firm activities involve collaborations between and among firms in leading to sharing of knowledge producing improved products and services. Knowledge sharing does not only occur between firms but within firms as well. Acquiring knowledge is not enough but consciously working and putting the right mechanisms in place to aid knowledge transfer among workers within a firm is essential to achieving innovation outcomes. Firms ought to appropriately balance the level of concentration given to both inter-firm knowledge generation activities and intra-firm knowledge generation activities. Acquisition of new knowledge through inter-firm cooperation and collaboration might not necessarily be costly but the process of acquiring new knowledge could be costly. It is, therefore, necessary for firms to get value for the knowledge acquired by ensuring that the new knowledge is not just shared among employees but gain cognition of the new knowledge to implement it successfully towards innovation. Scholarship on knowledge sharing has basically been focused on interfirm knowledge sharing (Cui et al., 2020; Xu et al., 2021; Majuri, 2022) at the expense of intra-firm. Extant literature is a dearth of intra-firm knowledge sharing activities and their impact on innovation. This is an issue because collaboration between and among firms is necessary for knowledge sharing and innovation but knowledge sharing within the firm through intra-firm knowledge activities is a sufficient condition for effective innovation within a firm. Wang et al. (2018) examined the impact of an inter-firm knowledge network on innovation performance among high-tech firms in Taiwan's science parks using snowball sampling techniques and knowledge-based theory. They found that an inter-firm knowledge network improves a firm innovation performance. In Singapore, Cui et at. (2020) found that IT-enabled inter-firm knowledge exploration capabilities help product effectiveness and process efficiency through the case study method. Using a single case of an aviation refuelling company in Canada as the study setting, Usman et al (2019) developed a framework for inter-firm and intra-firm knowledge sharing and learning. Their findings showed that intra-firm knowledge sharing capabilities promote the diffusion of inter-firm learning.

The findings of prior literature have been based on single firm or country-level data. In situations where inter-firm knowledge activities have been investigated, less emphasis has been placed on a very important variable

such as channels of information in the knowledge transfer process. Thus, even though prior literature has stressed the importance of both inter-firm and intra-firm knowledge activities toward innovation, we were unable to find a study that blends both concepts and assesses the impact on innovation. Practically, knowledge is transferred into firms through inter-firm collaboration and is shared within the firm-through intra-firm activities. The effect of knowledge transferred on innovation is complete if there is a simultaneous assessment of both inter-firm and intra-firm knowledge-based activities among firms. This study seeks to fill the gap in extant literature by exploring how intra-firm and inter-firm activities promote knowledge sharing towards innovation performance. We used the variables channels of information to represent inter-firm activities and workplace organization to represent intra-firm knowledge sharing activities. The proxies for innovation performance were product innovation and business process innovation. Cross-sectional country-level data from CIS 2018 for 17 countries within the EU region was used for our study. The OLS regression method was used for the analysis. We based our model on knowledge-based view (KBV) and social network theory (SNT) which have been tried and tested (Wang et al., 2018) to foster knowledge sharing from outside and within the firm.

This paper extends extant scholarship on inter-firm and intra-firm knowledge activities as well as innovation in three ways. First, it synthesizes ideas from inter-firm (Cui et at., 2020; Majuri, 2022; He et al., 2021) and intra-firm knowledge activities (Usman et al., 2019; Muhammed & Zaim,2020; Song et al., 2020) and innovation literature (Arthur & Stejskal, 2022; Di Vaio et al., 2020) examining the effect of inter-firm knowledge activities in the form of channels of information and intra-firm knowledge activities in the form of workplace methods on product and business process innovations. Second, this study fills the literature gap on how inter-firm and intra-firm knowledge activities simultaneously impact product and business process innovation. Thirdly, it contributes to the body of knowledge on knowledge-based view and social network theory. Our findings have key implications for managers and owners of firms on the value of both external and internal activities that aid knowledge flow leading to innovation. It also helps them to understand key activities and mechanisms to be implemented to support the free flow of new knowledge to the firm and within the firm structures.

The next chapter is the theoretical framework of the study. It reviews related current literature of the study and formulates the hypothesis of the study. Chapter 3 deals with the data and methodology of the study. The data analysis and results are in Chapter 4 while Chapter 5 captures the discussion and conclusion.

2. Theoretical Framework

2.1 Firm Innovation the Nexus Between Intra and Interfirm Knowledge Activities

Intra-firm knowledge activities involve all mechanisms used by a firm to transfer or share knowledge within the firm. Knowledge especially in tacit form is best shared through social interactions. The bedrock of innovation is knowledge. Managers ought to exhibit great skills in ensuring that, all forms of knowledge that enter the firm are adequately shared for employees to be cognizant of its implementations to achieve the expected innovation outcome. Usman, Ahmad & Burgoyne (2019) suggest that to improve organizational learning intra-firm knowledge sharing mechanisms such as teams, meetings, training and mentoring should be in place. Without intra-firm knowledge sharing activities, acquired knowledge if tacit, remains in the minds of people, while expressed knowledge is restricted to the confines of books, magazines, computers and other storage devices. The process of unleashing acquired knowledge is key to reaping the full benefit of the cost of knowledge acquisition. All workers across all departments of the firm are expected to full be abreast of the new process of producing the new product. Information asymmetry among workers creates imbalances in knowledge sharing and its implementation. Regardless of the vitality and quality of information, if workers of firms do not have the know-how of its implementation, it remains valueless and does not produce the expected innovative outcome. Existing literature (Arthur& Stejskal, 2022) supports the importance of a firm's internal knowledge sharing in the promotion of innovation. In order for acquired knowledge to be shared effectively, it must be released randomly in both time and space. This is what Fan, Lian & Wang (2020) referred to as the cafeteria effect. The creation of a new product or adoption of a new process in the production process needs to be learned and understood by all workers within the firm to effectively impact positively on the expected innovation. This study adopts work method organizations as an intra-firm activity that influences innovation. Based on these intra-firm activities expressed above, the following hypothesis is formulated.

H_{1A}: Work method organization has a positive significant impact on firm product innovation.

H_{1B}: Work method organization has a positive significant impact on business process innovation.

Knowledge travels between and among firms through cooperation and collaboration. Inter-firm knowledge activities aid knowledge exchange, sharing and evolution. Firms are likely to interact and share knowledge when concentrated or agglomerated at a geographical area. Agglomeration according to Marshall's theory of innovation stemmed from interaction of technology, labour pool and networking of firms (Shoufu, 2022). Two main factors that influence inter-firm knowledge activities are geographical and cultural proximity. The spread of knowledge, especially tacit knowledge is effective when firms are not just closer but interact through a number of knowledges sharing activities. Geographical proximity is the physical concentration of firms in a specific space. Firms that are geographically concentrated benefit from economies of scale in the form of lower costs. They are also able to pool resources together to undertake a research or infrastructure project which normally could not have been done by any single firm due to the high cost involved. Emphasis must be made that, geographical concentration of firms alone is not enough to create inter-firm collaboration, but mutual share of trust, values, norms and interests are catalysts for inter-firm knowledge activities. It implies that firms that are culturally related are more likely to interact and share knowledge toward innovation. Complexities associated with the innovation process are reduced and resolved in an environment where there are active inter-firm knowledge sharing activities (Cui et al., 2020). In the current volatile, complex and dynamic business environment, no firm could claim to be independent and remain innovatively competitive. It is an era of high interdependence, cooperation and collaboration and the surest way is inter-firm knowledge related activities that promote innovation. However, inter-firm cooperation is not at smooth as might seem. The process of collaboration and cooperation through inter-firm knowledge activities is hampered by trust issues between firms, varied cooperate cultural interest, great disparities in resource endowment, public rules and regulations. The main aim of inter-firm cooperation is to share knowledge. In a circumstance where one firm withholds part of information or knowledge to be shared, it does not promote successful inter-firm cooperation. Inter-firm knowledge activities must ensure a win - win situation. When a firm perceives to be more endowed in resources than the other, it, might stand not to gain as much as the other firm, this could hinder the smooth process of inter-firm knowledge activities. The forgoing arguments points to the fact that, an effective interfirm cooperation is based on diverse and distinctive channels of information accessible to firms. The more variations channels of information available, the quality of options available for firms to access and gain knowledge to promote innovation. We therefore hypothesised that:

H_{2A}: The more distinct firms' channels of information, the stronger its impact firm product innovation.

H_{2B}: The more distinct firms' channels of information, the stronger its impact on business process innovation.

2.2 Theoretical Background: Knowledge-Based View (KBV) and Social Network Theory (SNT)

This paper draws on the axioms of KBV and SNT to buttress on the impact of inter-firm and intra-firm knowledge-based activities on innovation performance of firms. KBV is an extended version of the Resource Based View (RBV). The KBV argues that, knowledge is the most significant and strategic resource of the firm. Its proponents assert that, knowledge especially if tacit is difficult to imitate and involves a complex means of transferring it from one entity to the other. Without the right quality and quantity of resources, all firms would struggle in achieving the needed innovation. Thus, all departments and employees should have the know how to effectively utilise the knowledge resources acquired for production of goods and services. If KBV considers knowledge as an important resource, then every bit of the resource should be equally and adequately accessible to employees within the firm among enhance productivity and innovation. The means of knowledge transfer and sharing is through interactions of firms. This is where the Social Network Theory (SNT) aids in the process. The focus of SNT transfer of knowledge and information through interpersonal ties and social interactions (Do, Nguyen & Shipton, 2023). Social networks involve social interactions which have an impact on business relationships and innovations through the exchange and sharing of valuable information across departments and among employees of firms. In this direction, we argue that social networks within firms are essential for transmitting knowledge from one employee to the other in the process of firm innovation. Scholarship therefore supports the assertion that developing and maintaining social network in firms enhance knowledge sharing and innovation (Xing & Cao, 2019; Do et al., 2023). At the firm level, firms regard relationship ties and social networks as key contributor to innovation outcomes and internal change. Social network theorists acknowledge the fact that social networks offer support for firm innovation and firm internationalization (Perry-Smith & Mannucci, 2017)

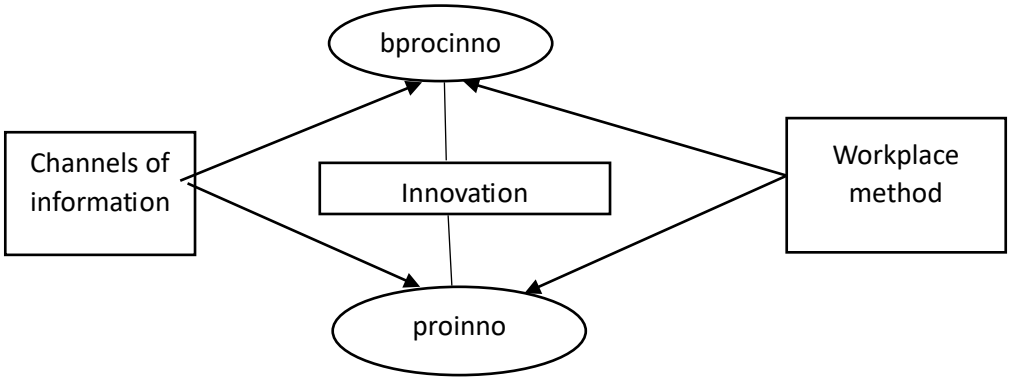

Figure 1: Conceptual Model

3. Data and Methodology

3.1 Data

Cross-sectional country level data from CIS 2018 Eurostat database for 17 countries within the EU region was used for our study. Prior studies have used data from the Eurostat database for several years due to its credibility, reliability, ethical and accurate methods used in the data collection process (Arthur et al., 2023). This makes the data credible for high level of validity for research analysis. The entire population of the firms in Europe engaged in innovation are classified as NACE2 and is usually the population of the survey. The survey comprises harmonized questionnaire based on the Oslo manual (EU, 2020). This nature of the data is consistent with the study aim. The EU was chosen as the context of the study due to high level of incentives and collaboration among firms within the EU. In 2019, the EU had 5 out of 10 most innovative Countries in the World. Germany (2nd), Finland (3rd), Switzerland (4th) Sweden (7th) and France (10th) (Scuotto et al., 2020). The intensity of innovative activities within the European region supports the view that, European firms are and ideal setting to examine inter-firm and intra-firm knowledge transfers towards innovation. CIS allows voluntary participation and answering of questions. There is therefore a high possibility of missing data. To forestall this problem, we limited our data selection to countries and variables whose data are entirely available. Data were controlled for normality of distribution and residuals. The OLS regression method was used for the analysis. This was after a test for normality indicated that the data is normally distributed (Motta, 2019). OLS regression results are highly actionable and predictive for managerial actions.

3.2 Description of Variables

The dependent variable is innovation. Innovation was proxied by two main indicators. Production innovation (proinno) and business process innovation (bprocinn). Product innovation is where a firm has introduced to the market a new or improved good or service that differs significantly from the firm's previous goods or services while business process innovation is a new or improved business proccess introduced on the market by firms that differ significantly from the previous business processes by the firm (Rydvalova & Skala, 2021). Our study had two models. Model 1 examined the impact of inter-firm and intra-firm knowledge related activities on product innovation. Model 2 on the other hand, examined the impact of inter-firm and intra-firm knowledge related activities on business process innovation. The unit of measure is the number or quantity of innovative products or processes.

The two main variables used for the analysis worked organization methods denoting intra-firm knowledge activities and channels of information representing inter-firm knowledge activities. Work organization method is proxied my planned job rotation of staff and cross-functional work groups or teams. Also, channels of information are measured by conferences/ trade fairs/ exhibitions, trade publications, published patents and crowd-sourcing. All are measured in numbers or quantities of activities held (Muhammed & Zaim,2020; Montecchi et al., 2022). Crowdsourcing is a new method for acquiring knowledge and ideas through collaborative events where experts meet to develop specialized software to solve specific problems confronting the industry (Manual, 2018)

Firm age is used as a control variable. This is because firms that have existed for a long period of time are more likely to be innovative than relatively new firms. This was obtained based on the year of registration of the firm starting from 2009 and after (Pellegrino & Piva, 2020).

4. Data Analysis and Results

We used the OLS regression model for the analysis. Stata 17 was the statistical software adopted to investigate the impact of inter-firm and intra-firm activities on the innovation of firms. Tables 1 and 2 below show the detailed results of the analysis.

Table 1: Regression Analysis of the Work Organization Methods and Channels of Information Toward Innovation

Variables	Model 1 prodinno	Model 2 bprocinno
Conferences, trade fairs or exhibitions	0.881*** (0.037)	1.570*** (0.156)
Scientific/technical journals or trade publications	-0.353*** (0.047)	-0.882*** (0.170)
Published patents	-0.577*** (0.228)	-0.577 (0.654)
Social web-based networks or crowed-sourcing	-0.211*** (0.496)	-0.557* (3.71)
Planned job rotation of staff	-7.076*** (1.283)	-10.597*** (2.087)
Cross-functional work groups or teams	8.878*** (1.428)	13.121*** (1.892)
Firm age	3.16** (0.433)	2.74* (0.399)
_cons	-7.692*** (1.956)	4.582** (2.58)
	R-sqr **0.618**	**0.504**
	N **153**	**153**

Note: Co-efficient in parenthesis * p< 0.1; ** p < 0.05; *** p < 0.01

Model 1 in Table 1 shows the results of the relationship between indicators of inter-firm and intra-firm knowledge activities and product innovation. The results indicate that there is a significant positive (β=0.037, p<0.01) impact of conferences, trade fairs and exhibitions on product innovation. Also, scientific/technical or trade journals showed a significant positive (β=0.047, p<0.01) impact on product innovation. The other inter-firm knowledge activity indicators such as published patents and social web-based networks or crowd-sourcing have a significant positive impact on product innovation. Similarly, all indicators of intra-firm knowledge activities showed a positive and significant impact on product innovation with cross-functional work groups or teams having the higher impact (β=1.428, p<0.01) on product innovation. The Pseudo R^2 is 0.618, which means, all other things being equal, our model explains 61.8% of the variations in the independent variables used. In model 2, there is a positive and significant impact of intra-firm knowledge activities and business process innovation with planned job rotation of staff having the higher impact (β=2.087, p<0.01). With the exception of published patents, which did not have a significant impact on business process innovation and crowed-sourcing having a positive significant impact on business process innovation at p<0.1 significant level, all other inter-firm knowledge activities had a positive significant impact at p<0.01 significant level. Model 2 has a Pseudo R^2 of 0.504. This means our model explains 50.4% of the variations in the independent variables.

4.1 Test for Robustness

Table 2: Results of Average Marginal Effects Estimations

Variables	Delta-method	
Variables	dy/dx	z score
Conferences, trade fairs or exhibitions	1.570*** (0.156)	10.05
Scientific/technical journals or trade publications	-0.882*** (-0.170)	-5.18
Published patents	-0.577 (0.655)	-0.88
Social web-based networks or crowed-sourcing	-0.557* (0.197)	-2.83
Planned job rotation of staff	-0.596*** (0.887)	-5.08
Cross-functional work groups or teams	0.121*** (0.792)	6.94

Note: Robust Co-efficient in parenthesis estimated P- values: * p<0.1; ** p<0.05; ***p<0.01

Average marginal effect estimation was conducted to examine the robustness of the model. The results in Table 2 showed that all inter-firm and intra-firm knowledge activity variables have a significant effect on innovation except published patents. All things being equal, inter-firm activities such as Conferences, trade fairs or exhibitions, firm innovation improves by 15.6%. Surprisingly, the average marginal effect of scientific/technical journals or trade publications on firm innovation showed negative (-0.170) results. But the rest of the inter-firm and intra-firm indicators have positive effects on innovation with a unit increase. The intra-firm variables showed a higher marginal effect of 79.2% and 88.7% on firm innovation for cross-functional work groups or teams and planned job rotation of staff respectively.

5. Discussion and Recommendations

Our study reveals that intra-firm knowledge activities such as planned job rotation of staff and cross-functional work groups or teams improve product and business process innovation. But the impact of intra-firm knowledge activities on product innovation is greater than business process innovation. This supports our hypotheses H_{1A} and H_{1B} that work method organization has a positive significant effect on firm product innovation and business process innovation. Work method organization involves teams and planned job rotation of staff. Working in teams promotes knowledge sharing and learning due to information synergy. Teamwork among firms produce results that could not have been obtained independently. It is therefore effective for firms to adopt teamwork in an effort to introduce a new idea or process towards the creation of new product, service or process. Planned job rotation enriches work experience of the worker, offer new challenges to the worker in question and new avenues for knowledge sharing and learning among workers in the department. This is consistent with Usman et al., (2019) and Arthur & Stejskal (2022) that intra-firm or internal knowledge sharing promotes firm innovation. Working in teams complements knowledge sharing. New business processes introduced into the firm with the aim of producing a new product or service must be well understood and applied by all workers. Information asymmetry among workers could be resolved through teamwork. Planned job rotation should consciously be executed by managers or HR practitioners to promote firm innovation. By implication, HR managers should encourage teamwork and rotation of staff across departments for the furtherance of firm innovation. On the other hand, our hypotheses H_{2A} and H_{2B} are supported by our findings that the more distinct firms' channels of information, the stronger their impact on firm product and business process innovations. These findings further support Cui et al., (2020) that inter-firm interactions lead to the inflow of knowledge into firms and further enhance innovation. This is consistent with

open innovation theory. The open innovation theory states that, firm innovation is driven by new knowledge from outside the firm. It is necessary for firms to collaborate with other firms of common interest for knowledge sharing towards innovation. It is also sufficiently important for firms involved in the collaboration to ensure that intra-firm activities are put in place to promote internal knowledge sharing. Although inter-firm knowledge activities have been the most focused area in knowledge sharing, our results show that intra-firm knowledge-sharing activities promote innovation among firms in the EU better than inter-firm knowledge activities. By implication, policymakers and managers of firms should place equal importance on both intra-firm and inter-firm knowledge activities for improved innovation performance among firms in the EU region.

5.1 Limitations and Future Research

Notwithstanding the fact that our findings supported the stated hypothesis, the findings of our study is not without limitations. The data used is cross-sectional and does not allow for periodic analysis of the variables employed. Also, the European Union region comprises countries with varied levels of economic development which leads to differences in innovation outcomes. It could therefore be misleading to lump 17 EU countries together for a single analysis. This opens an opportunity for further research. We recommend further research into intra-firm and inter-firm knowledge activities using panel data and categorizing the EU region on basis of the economic development of the countries involved. Our study contributes to KBV and SNT by emphasizing that knowledge sharing is a priceless resource towards innovation. This could be achieved through a conscious and simultaneous interplay of inter-firm and intra-firm knowledge activities.

Preconditions for the Development of Organizational Knowledge Ecosystem Inside an Audit Firm

Ema Aukščenytė and Giedrius Jucevičius
Vytautas Magnus University, Kaunas, Lithuania

ema.aukscenyte@gmail.com
giedrius.jucevicius@vdu.lt

Abstract: The paper aims to present key preconditions for the development of organizational knowledge ecosystem inside an audit firm. The audit activities represent a specific context for knowledge management, especially what concerns knowledge sharing and generation of new knowledge in organizational environment of formal rules and standards. We present the survey of audit firm employees (68) and their management by discussing the key challenges related to the dynamic knowledge sharing and new knowledge creation inside an audit firm. The paper investigates the nature of knowledge within an audit firm and analyses the cultural and structural aspects of KM practices that may lead to the emergence of ecosystem for sharing the existing and generating new knowledge. The paper adopts the intra-organizational perspective to knowledge ecosystem. The audit firm operates as knowledge organization that, despite its strong formal side, is a complex dynamic system of knowledge professionals, who form the different communities of practice inside the firm. Research presented in this paper helped identify the key challenges and opportunities for the emergent knowledge partnerships inside the professional audit firm. The key cultural preconditions behind the effective knowledge ecosystem - trust-based relations, organizational culture, positive horizontal and vertical relations, and strong intrinsic motivation to share knowledge - are in place. Research findings also reveal a good fit between the employee expectations and organizational practices. However, certain challenges need to be addressed, such as bringing out and embodying the tacit knowledge of employees, and the need for continuous upgrading of the processes of knowledge creation and integration. To establish an effective and sustainable knowledge ecosystem inside the professional services firm, the paper argues for striking a delicate balance between the formal and informal parts of organization, as well as its KM system.

Keywords: Knowledge ecosystem, Knowledge sharing, Organizational learning, Knowledge management in audit and accounting

1. Introduction

Extant knowledge management research is traditionally focused on the classical approach to KM as efforts designed to capture knowledge, convert personal knowledge to group-available knowledge, connect people to people, people to knowledge, knowledge to people, and knowledge to knowledge; and measure that knowledge to facilitate management of resources and help understand its evolution (O'Leary, 2001). However, we can see a gradual transition in the firm-level KM analysis away from the issues of improving the knowledge management processes towards building the dynamic organizational knowledge ecosystems (Järvi et al, 2018; Almanopoulu, 2019). Extant research increasingly treats the organizations as complex multi-level entities than discrete units (Boutros, 2014; Brychan, 2019). A significant part of ecosystem-related research stressed the inter-organizational dimension (Clarysse, et al., 2014; Valkokari, 2015). The intra-organizational dimension of ecosystem research is represented by the focus on the aspects, such as organizational diversity and integration of technical, organizational, and institutional subsystems (Parsons, 1960; Brychan, 2019), the complex interactions where changes in one part of organization affects other parts (Boutros, 2014), the balance of formal and informal relations in organizations (Brychan, 2019). Most of these aspects also affect the effectiveness of knowledge management processes inside organizations, yet still receive insufficient attention in the KM community. Moreover, these aspects did not receive sufficient attention in the KM research, especially in the context of audit and accounting firms that operate within the constraints of formal regulations, which represent a specific research problem.

The *aim* of our paper is to discuss the preconditions for the emergence of organizational knowledge ecosystem from the perspective of a firm specialising in audit and assurance services.

The paper presents conceptual analysis of knowledge management in the professional services firms (PSFs) and contextualises the findings of KM research in an international audit and assurance services firm (branch office in Lithuania). The empirical research covered 68 employees and management of the audit firm. The findings open the discussion regarding the potential improvement of KM system within the firm, as well as acquiring the traits of knowledge ecosystem.

First, we discuss the KM processes and systems commonly established by the professional services firms (PSFs) that includes consulting, accounting, audit, and other professional services (as often exemplified by the Big

Four). At the latter half of the paper, we present the findings of empirical research in the chosen audit firm and discuss the potential improvements of KM processes as preconditions for establishing an effective organizational knowledge ecosystem.

2. Knowledge Management in Professional Services Firms: Key Issues and Strategic Choices

Research on knowledge management in professional services firms (PSFs), especially the areas of audit and accounting services, covers various aspects of classical KM while considering the industry specifics, e.g., the different knowledge bases and diverse modes for capture, conversion of new knowledge, and its connection to the existing knowledge (O'Leary, 2001), linking the KM process and audit firm's performance (Salleh et al., 2011), the different combination of knowledge management strategies in audit and consulting firms (Janicot et al., 2021).

Research shows that despite their possible divergence in size and profile, the professional services firms all gain their competitive advantage thanks to individual and collective knowledge and reputation in the market (Reihlen, Werr, 2012). Such intangible assets are difficult to create and relatively easy to lose. Therefore, having effective systems that support and upgrade the intellectual and institutional capital is of a strategic importance to the long-term survival of PSFs.

Janicot et al (2021) explore the modes of knowledge codification and personalization strategies in audit and consultancy firms (ACFs) by the taking into consideration the different nature of knowledge and forms of knowledge sharing. As far as the first parameter is concerned, there are two major types of knowledge: *declarative knowledge* codified and stored in the internal and external databases, and *procedural knowledge* used when applying conceptual knowledge in specific situations and act as patterns for problem solving inside the organization. As far as the second parameter is concerned, Hansen et al. (1999) distinguishes between two major strategies that enable the knowledge sharing: *knowledge codification* and *knowledge personalization* strategies. The first one emphasises the setting up of networks of shareable databases, while the latter places great importance on inter-individual and collective communication as a source of value. The knowledge codification strategy relies a lot on the ICT tools used not only for capturing and storing valuable (codifiable) knowledge, but also for enabling easier sharing inside the organization. The ICT influenced perspective played a strong role in the earlier stages of KM development. However, the contemporary ACFs pay particular attention to *personalization strategies* with their focus on the creation of networks for effective knowledge sharing and innovative outputs. The success of such strategies relies less on technology and more on the intangible social aspects of organization, such as trust, that promote sharing behaviour.

In such context, the concept of *organizational knowledge ecosystem* has come to the forefront of academic discussions. The general ecosystem approach in business and management research takes its roots in the works of Moore (1993, 1996), while Adner (2006) is behind the concept of innovation ecosystem as the collaborative arrangements by which firms combine their offerings into a coherent, customer-facing solution. Traditionally, researchers treat such ecosystems as dynamically organized meta-networks and knowledge meta-clusters of different organizations (Carayannis, Campbell, 2009). More recently, the ecosystem concept increasingly permeates the intra-organizational contexts. The knowledge ecosystem approach is useful while operating in turbulent environments where the need for specific knowledge is difficult to predict. Bray (2007) stresses that ecosystem approach promotes dynamic knowledge exchange activities, and "frees organization from nearly impossible task of identifying what knowledge its employees have, need now, and will later find valuable". Ecosystem perspective considers not only the formal aspects of KM system but puts special emphasis on the quality of organizational relationships and organizational culture, trust, diversity of knowledge actors, their propensity to capture and share knowledge. Ideally, the knowledge ecosystem should possess the key characteristics of complex adaptive systems with their emphasis on (Anderson, 1999; Lichtenstein, 2016; Carapiet and Harris, 2007; Uhl-Bien, Marion and McKelvey, 2007). Jucevicius et al. (2021) discuss the knowledge ecosystem from CAS perspective although approaching the knowledge ecosystem from inter-organizational perspective. In research presented in this paper, we aim to assess the preconditions for the emergence of knowledge ecosystem in a selected audit firm. Focus is on getting a deeper understanding of cultures and structures that enable knowledge sharing and new knowledge generation inside the firm that must address the strategic contradictions of operating in heavily regulated environment, while at the same time having to ensure internal flexibility and learning.

3. Presentation and Discussion of KM Research Findings in Audit Firm

The empirical research covers the Lithuanian branch office of international firm with primary specialisation in audit and accounting services. It also offers other business services, such as tax advisory, compliance and reporting, risk management, and financial reporting. The authors of the paper have agreed to the firm's anonymity request; thus, the paper presents only the general profile of the company. The international firm is among global leaders in audit and assurance services. The branch office under study has been operational for 20 years (parent company – for more than 60 years), and employs ~100 professionals across the country. The study combines quantitative and qualitative research methods: survey of employees and semi-structured interviews with management. Both questionnaires and their categories draw upon the structure of Nonaka & Takeuchi's SECI model and McElroy's knowledge lifecycle model.

The survey covered 68 employees (or 68%), of which 2 (2.9%) represent the administration department, 25 (36.8%) - audit department, 41 (60.3%) - accounting department. The tax department did not participate in the survey, which is a limitation of the study. It is important to mention that study has reached around 80 percent of employees from two key departments – audit and accounting, thus one can make objective generalizations for these two fields. In terms of work experience, 14 (20.6%) employees have been working in the organization for less than 1 year, 35 respondents (51.5%) - for 1 to 3 years, 13 (19.1%) - for 3 to 5 years, and 6 (8.8%) - for more than 5 years. The age distribution of the respondents is as follows: 35 research participants (51.5%) are between 18 and 29 years old, 26 (38.2%) - between 30 and 39 years old, while only 7 (10.3%) were over 40 years old. The demographic data shows that young professionals with few long-established links dominate organization, which has its effects on the knowledge processes inside the firm. The questions in the survey adopt Likert's 5-point scale.

First, we sought to understand *what kinds of knowledge and information the employees consider valuable in their work environment*. Most employees completely agree with the statement that personal and professional knowledge is the most valuable in the work environment (4.53), closely followed by the information and assistance provided by colleagues (4.32) and work experience (4.25). The access to training materials (390), sharing personal life experiences (3.84) and internal company procedures and documents (3.79) are of somewhat lesser importance. Then we asked respondents how often they shared the above-mentioned types of knowledge and information with their colleagues. All answers were on a lower side of the scale compared to the previous block, which indicates that employees are generally less eager to share knowledge and information that they consider valuable (see Table 1). On the other hand, the employees were most active in sharing the same three aspects considered as most valuable: personal and professional knowledge (4.26), work experience (4.09), and information and help provided by other colleagues (3.93). Personal life experience (3.56), internal company procedures and documents (3.21) and training materials (3.09) were also shared, but less intensely. The greatest gap between "considered as valuable" and "shared with others" has been observed in the latter two – training materials, and company procedures and documents. Thus, the greater challenges arise when sharing the codified knowledge in the organization.

Table 1: Comparison of Valued vs. Shared Knowledge and Information

	Considered as valuable	Shared with others
Personal and professional knowledge	4.53	4.26
Information and assistance provided by colleagues	4.32	3.93
Work experience	4.25	4.09
Training materials	3.90	3.09
Personal life experience	3.84	3.56
Internal company procedures and documents	3.79	3.21

We then asked the respondents to tell us (using similar categories) what knowledge and information they are lacking and would be most eager their colleagues to share. The majority emphasised practical knowledge (4.29) and technical knowledge (4.07), and to a lesser extent theoretical knowledge (3.93). The sharing of individual work documents, such as personal notes (3.25) and customer information (2.88) were considerably less important. The respondents are moderately satisfied with the way the knowledge sharing processes take

place in their organization (3.28), knowledge and information they receive from their colleagues are clear and reliable (3.85), as well as valuable (3.99). Employees carefully analyse new work-related knowledge (3.54), they generally claim there is no ambiguity or uncertainty in the required knowledge (3.37). The most critical points concern the clarity and structure of received information (3.13), and the overall effectiveness of system of knowledge sharing (2.81). So again, most problems are associated with capturing and systemization of information and knowledge inside the firm.

The respondents also provided their opinions regarding the engagement of organization's management and employees in KM activities. The situation was moderately positive on the following fronts: employees often come up with ideas on how to improve work-related processes (3.57), management knows what competence and expert knowledge the employee has (3.16), management tends to consider employee suggestions related to process improvements (3.41) and tends to implement such suggestions (3.32). However, relatively few respondents agreed that company keeps record of and stores the suggestions and ideas of employees (2.63), while employees who leave the company rarely save and transfer their knowledge so that it remains in the company (2.78). Creativity methods are rarely used for generating new ideas, thoughts and solve problems (1.97). This represents a KM challenge to the company dominated by relatively young employees, who have (more than 70 percent work for less than 3 years). It means that firm is experiencing potential disruptions in knowledge transfer as employees leave the organization and new employees arrive. Although the KM processes are generally functioning on the operational level, ensuring the continuity of knowledge due to high-level workplace mobility remains an issue of strategic importance.

When asked about the key barriers to sharing knowledge and information, the employees stressed the fact that the necessary information is not systematized (3.37) as the key barrier. On the other hand, respondents tend to disagree that the knowledge received from colleagues is not clear, hard-to-understand and unreliable (2.40). Nor is intra-firm competition an important barrier to knowledge sharing (2.04). Respondents claim that management does not ignore the employees' personal suggestions for better performance (2.19). They remained relatively neutral in their assessment of the motivation system for sharing knowledge inside the organization (2.90) and accessibility of needed information (2.87). Therefore, the main issues to be addressed by the organization concern systematization and improved access of information and knowledge.

When asked about the knowledge dissemination and implementation problems within the company, they emphasised three major issues: a lack of documents describing what and how to do specifically during a certain process (3.59), high cost of work execution time (3.54), and many corrections of the work performed (3.24). The problematic areas mainly concern the daily operations of the firm and execution of various operational tasks. The aspects related to knowledge dissemination, its access and feedback were not of any major concern: lack of feedback (2.25), different interpretations of knowledge transferred (2.50), lack of sharing (1.97), miscommunication in knowledge transfer (2.66).

The main motivating factors to share knowledge and information inside the organization are related to the horizontal intrinsic aspects of organization, such as organizational culture (3.87), willingness to reach for the shared goals (3.82), willingness to create added value to the organization (3.71). However, trust and positive relations with colleagues and management were the greatest motivating factors. It is important to mention that positive relations with colleagues (4.10) and trust in colleagues (4.22) were identified as even more important than positive relations with superiors (3.85) and trust in management (4.07). The bonuses have by far the least effect on employee decision to share their knowledge and information (3.07), which shows the "soft" intrinsic nature of the organizational catalysts.

The analysis of organizational practices has shown that they to a large extent correspond to the identified motivating factors to share information and knowledge. The employees identify equally positive relations with colleagues (4.00) and management (4.00), as well as trust-based relations with both parties (4.15 and 3.99 accordingly). Other factors, such as organizational culture (3.91), willingness to reach the shared goals (3.76) and create added value (3.65) are also ensured by the organization. On the other hand, economic motivators, such as bonuses, play almost no role in the organizational practices of knowledge sharing (1.88). However, as already mentioned above, the study shows that their motivating impact is not at all significant. Table 2 presents the comparison of key motivators to share knowledge and actual organizational practices.

Table 2: Comparison of Motivators to Share Knowledge and Organizational Practices

	Motivating factor	Organizational practice
Trust in colleagues	4.22	4.15
Positive relations with colleagues	4.10	4.00
Trust in management	4.07	3.99
Positive relations with superiors	3.85	4.00
Organizational culture	3.87	3.91
Willingness to reach the shared goals	3.82	3.76
Willingness to create added value to the organization	3.71	3.65
Bonuses	3.07	1.88

Finally, the employees identified the most common forms of generating new knowledge inside the organization. The most common way to generate new knowledge was through informal face-to-face interactions (4.09). Some knowledge, although to a moderate extent, is generated through collective discussions (3.15) and systemization of different knowledge bases through responsible employees (3.17). However, the use of databases for integration of knowledge is regarded as virtually non-existent (2.47), which brings us back to the same key challenges faced by the audit firm.

The semi-structured interviews with management allowed us to complement and contextualize the findings of the employee survey. The management representatives stated that the key external forces determining the evolution of the firm's KM system are the new technological developments as well as the external requirements set for audit and accounting firms. Knowledge, experience, and skills sharing processes are constantly taking place in the company, since the organization under study is rather specific and has specific needs. In terms of procedures, the company must follow the industry requirements that are set and supervised by certain institutions. Colleagues constantly update and share knowledge among each other, as it is a key success factor of professional service firms. The organization is constantly thinking about improvements, but unfortunately, it does not happen very quickly. The current method of knowledge management in the organization is to a significant extent defined by the external actors and their descriptions where knowledge sharing with colleagues and mutual communication should take place.

There have been certain instances in the practice of audit firm where knowledge management methods did not work either because they were rejected by the employees, or were unused due to the employees' workload, or due to the lack of staff. As seen from the management perspective, employees have a lot of work during the season, so they tend to focus on their tasks rather than share knowledge with their peers. Due to their workload, they do not put their insights on paper. As a result, some valuable knowledge fades into oblivion before being shared.

Despite some problems, one can also observe success stories when it comes to KM practices in the audit firm, e.g., concerning the feedback loops behind the learning processes inside the organization. When sending notifications, messages and other important information, the company requests confirmation from the employee. There are responsible persons who supervise the feedback and if they do not receive it, they send a reminder. In this case, assimilation of information is monitored. As far as monitoring of knowledge acquisition is concerned, employees have to take tests at the end of the training. Tests show how much knowledge and information have been absorbed, which is an effective way to check the acquisition of new codified knowledge. Respondents confirmed that employees present their personal knowledge to colleagues by making presentations about what they know and train others. It usually happens during the quarterly management meetings. Colleagues share knowledge with their departments, or managers between managers, as well as with other departments.

Talking about what is considered as valuable knowledge, management particularly emphasised personal qualities (next to the professional competences) as they underlie the employees' learning ability to learn and collaborate. There are incentives to the employees to share their knowledge to improve processes and solve problems. Among such incentives are gifts and bonuses. However, not all employees are aware of this opportunity or have forgotten about it. The employee survey has also confirmed this observation.

Training remains the main channel of equipping employees with new knowledge. However, training is subject to specific company regulation. Employees must acquire the needed professional knowledge during set period (40 hours of training). Since there are specific periods in the year when the employees of audit firm are extremely busy, training takes place during the "off season". In case of the remote training sessions, the employees also receive the recorded training materials. Important knowledge is stored in the firm's internal system. Management meetings take place every month where managers share their department's observations, feedback and necessary changes. Every meeting is recorded, the minutes reveal the problems discussed and solutions proposed; this information is stored. However, the survey findings suggest that employees still face challenges due to insufficiently effective systemization of knowledge inside the company.

Management representatives also stressed the importance of cultivating the climate of organizational trust where employees feel like one big family. Company seeks to avoid the emergence of negative culture. The competition among employees is rare and happens only in isolated cases (this observation was also confirmed during the survey). Managers hold annual individual interviews with their employees to achieve their best fit in organization and its culture.

Management representatives were less convinced that knowledge of employees is used to the maximum for improving the processes of the firm. During the periods of intense workload, the specific knowledge and talents often remain unobserved. When the top season is over, employees usually fail to write down the key problems, solutions, and other valuable insights, so they often do not receive the needed dissemination inside the organization. The more introvert employees have access to a special anonymous knowledge platform where they can put their opinions, ideas, and suggestions, but such inputs are rarely received. Management recognizes the importance of having a formal KM system, and using the "soft" elements of organization, such as trust, culture, positive social relations inside the firm for gradually developing an effective organizational knowledge ecosystem (i.e., with strong formal and informal subsystems of diverse actors, also across the boundaries of domestic branch office).

4. Conclusions

Research has shown that the firm's knowledge management system can be improved by focusing on three courses of action: 1) capturing and codifying the employees' tacit knowledge, 2) systemizing the diverse knowledge already found inside the organization and making it accessible to users, 3) involving the knowledge workers to be more (pro)actively engaged in improving the company's processes.

To establish an effective and sustainable knowledge ecosystem inside the professional services firm, one has to strike a delicate balance between the formal and informal parts of organization, as well as its KM system. This is a challenging task given numerous formal requirements in the environment of audit and accounting firms. The research conducted in the chosen audit firm has shown that the firm has some of the prerequisites needed for developing such ecosystem: horizontal and vertical organizational trust, collaborative organizational culture, employees' willingness to learn and contribute to the shared goals of organization, general coherence of employees' motivational factors and organizational practices promoting the sharing of knowledge. On the other hand, to achieve knowledge ecosystem that has sustainable systemic impact and does not rely on the *ad hoc* KM initiatives, one must take into consideration further actions. First, to strengthen the formal aspects of capturing and systemizing valuable declarative and procedural knowledge in the field. Secondly, to connect the diverse knowledge actors into the network that spans the organizational boundaries. Research has shown that most of the knowledge sharing is still taking place within the branch office, but connecting the knowledge workers from different branches of international audit firm into one common knowledge platform could be a welcome initiative. Finally, the KM processes in audit and accounting firm remain largely focused on training activities and learning the industry-specific knowledge, and less so on generating the new knowledge (e.g., standards) in the field. As the *raison d'être* of knowledge ecosystems is the creation of new knowledge, the audit firm could use its international profile and leadership to engage new diverse actors into shaping new forms of collaborations. Such 'strategic communities' could span the organizational boundaries and lead to the creation of new *de facto* and *de jure* standards in the field.

Abstract: Knowledge Translation is a core research topic in the field of knowledge sciences. To date, traditional research on knowledge translation has come from medical and health sciences. This is not surprising because in health sciences and medicine, there is a long tradition of review of evidence-based research, information dissemination and translating theory to application. While providing a strong foundation for understanding knowledge translation, research focused on the healthcare domain overlooks the scope or the scale of knowledge translation we all encounter every day in the course of living in the 21st century. In the knowledge economy, knowledge exchange and simple sharing represent an economic transaction. Wherever and whenever knowledge is exchanged, knowledge transactions should be as effective and efficient as possible to ensure the flow of knowledge is maximised. Knowledge exchange frequently occurs between human and non-human actors. In contrast, the traditional knowledge translation literature focuses on human-to-human knowledge translation. This paper looks at knowledge exchanges between human actors and non-human actors in two specific environments. The first is human-to-machine knowledge translation in service call centres. The second environment focuses on doctor-patient conversations during patient visits, with the participation of third-party non-human actors, e.g. machine transcription applications. These non-human actors create persistent records of exchanges between doctors and patients. They also have been found to generate high rates of errors in knowledge translation. The problems, challenges and opportunities involved in each of these fields are the focus of this paper. The authors identify factors that contribute to knowledge translation failures.

Keywords: Knowledge translation, Knowledge economy,Human-nonhuman interactions, Call centers, Doctor-patient dialogs

1. Introduction and Research Rationale

Knowledge Translation is a core research topic in the field of knowledge sciences. To date, traditional research on knowledge translation has come from medical and health sciences. It is not surprising because there is a long tradition of reviewing evidence-based research, information dissemination and translating theory to application in health sciences and medicine. In that field, the goal is to ensure that state-of-the-art medical research and knowledge are deployed as soon and as safely as possible to the field, where these can significantly impact those who require the research results for patient care.

In the knowledge economy, what we refer to as knowledge exchange, knowledge sharing, knowledge transfer, knowledge dissemination, and knowledge absorption is all part of a knowledge transaction. Knowledge translation must be as effective and efficient a transaction to ensure knowledge value is maximized for all parties. Therefore, knowledge translation is vital to all organizations, all groups and even individuals. Furthermore, knowledge translation is vital to today's managers in a knowledge economy where optimal use of knowledge is a competitive advantage. Therefore, every knowledge organization's core business activity is effective knowledge translation.

In addition to expanding our work in knowledge translation to every domain and every level, we must now add a third dimension – the role of non-human actors. In our world, there is an increasing role of non-human actors in everyday and professional knowledge transactions. However, there is little foundation for this new dimension in the literature on human-to-human knowledge translation. This paper examines knowledge exchanges between human and non-human actors in two specific contexts. The first is the role of non-human actors in automated call centers. The second is the role of non-human actors as recorders and transcribers in medical conversations during patient visits.

1. Knowledge Translation – Definition and Characterizations

Several definitions of KT are reported in the literature (Dal Mas et al., 2020; Savory, 2006; Semeone Secundo and Schiuma, 2017; 2018; D'Andreta & Scarbrough, 2015; Hodgins & Dadick, 2015; Jull, Giles & Graham, 2017). Strifler et al. (2015) identified 159 different theories, models, and frameworks for knowledge translation in their comprehensive review of the literature. In general, the definitions and frameworks found in the literature today represent three perspectives, including (1) research utilization and uptake; (2) evidence-based research; and (3)

information dissemination. The emphasis in these perspectives is on translation from source to target. The authors noted that a perspective focusing on the knowledge component is generally absent from the peer-reviewed literature.

There is a growing consensus that the optimal definition and conceptual model are those proposed by Baumbasch et al. (2008). Their definition and model include knowledge and translation's fundamental elements and processes. Paraphrasing Baumbasch et al., knowledge translation is an interactive and reciprocal process involving synthesizing knowledge within a complex system of interactions. They conceptualize knowledge translation as a dialog, interaction, communication, and collaboration between actors with different perspectives and domains.

The Baumbasch et al. definition and model focus on knowledge translation from unidirectional, linear research utilization and evidence-based practice models toward a complex, dynamic model. This model provides new research opportunities to explore and better understand the complexities of translating knowledge among humans who have different levels of understanding and come from different cultures and contexts. Knowledge translation is much more complex than translating research into practice.

2. Research Goals

This paper presents exploratory research. The authors have both short and long-term goals for their work. In the short-term, we expect to: (1) raise awareness of the everyday knowledge translation activities between humans and non-humans, and non-humans to non-humans; (2) explore the nature of knowledge translation among diverse actors where one or more actors are non-human, representing varying types and levels of knowledge; and (3) explore the capacity of non-human actors to articulate, absorb and engage in transactions with humans and other non-human actors. In the longer term, we hope to (1) develop a theory about the role that non-human actors can effectively play in knowledge translation and to identify their advantages and disadvantages; (2) to provide reliable and valid guidance to intelligent non-human actors to ensure there is a built-in capacity for knowledge awareness, articulation and absorption; (3) explore these questions in an extended scope and scale of engagement - from the simplest conversations to everyday collaborations, to business transactions, to complex diplomatic conversations, to interacting with automated help center agents, and even doctor-patience consultations.

3. Conceptual Model and Framework

This exploratory research is grounded in a conceptual model to reduce the complexity of integrating research from multiple disciplines (Figure 1). The conceptual model draws from the traditional literature and existing models but expands it based on knowledge drawn from the communications literature, the field of linguistics, business management practice, and the knowledge sciences literature. And, unlike the current literature, the conceptual model is domain, sector, and goal agnostic. It is both knowledge ecosystem- and scale-aware. It incorporates but goes beyond the existing models. The model provides a foundation for identifying and organizing influence factors, competencies, and capabilities by anchoring in the four components- knowledge, translation, scope, and scale.

The model provides a holistic description of the essential components of knowledge translation and the factors that influence them. The model is grounded on but expands the work of Baumbasch et al. The model has two core components – knowledge as substance and translation as a process. We expand the model to include two additional components: the translation's scope and scale.

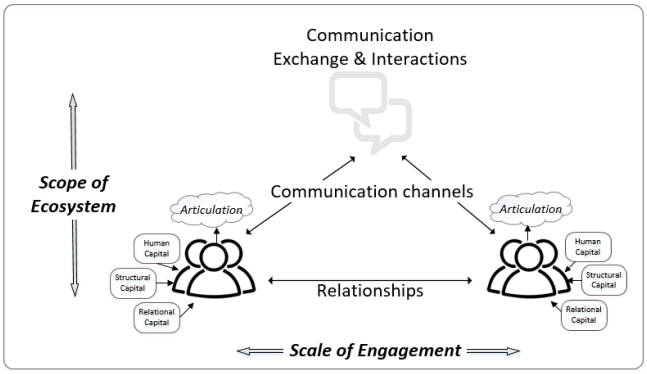

Figure 1: Foundational Components of a Knowledge Translation Conceptual Model

Knowledge translation is effective when a shared understanding and meaning among actors is achieved. To achieve this shared level of understanding, we must consider: (1) the knowledge being shared; (2) the translation process; (3) the knowledge ecosystem; and (4) the scale and scope of the communication. Each of these is comprised of multiple factors. Each knowledge translation action is unique because the goal, the context, the agents, and the knowledge is unique. When we can "see" the factors in play, we can better understand its uniqueness and how to improve its effectiveness. The literature is rich in discussing factors, but we do not have a comprehensive and inclusive picture of where they fit in any translation. A comprehensive conceptual model and a framework grounded in the model can act as a guide to identify which factors may be relevant. And a framework tied to competencies and capabilities can help us to gauge how effective that translation might be. This chapter presents a conceptual model with four components, the elements comprising each component, and critical questions for each element. The framework is grounded in the conceptual model, aligns critical questions, and calls out competencies and capabilities.

The conceptual model also translates into a framework. Because it is grounded on the conceptual model, the framework provides a comprehensive view of the translation landscape. From the framework, we can develop a checklist and set of key questions practitioners can leverage to design an optimized picture of knowledge exchanges and translations.

Table 1: Knowledge Translation Framework

Component	Parts
Knowledge	Knowledge Asset Actors Relationships
Translation	Communication and Interaction Channels Articulation
Scope of Ecosystem	Diversity of Actors Range of Goals Range of Domains Range of Languages (Linguistic) Range of Cultures Range of Status and Roles Range of Communication Styles Range of Capabilities
Scale of Engagement	# of Actors # of Channels # of Interactions The Extent of the Impact

The guiding framework is structured around the four components of the conceptual model – knowledge, translation, the exchange's scope, and scale. Within each component, key elements are identified and described. Finally, the framework offers guiding questions for each element to help anyone achieve an effective outcome.

4. Research Methodology

We have chosen two business cases to explore the role of non-human actors and their role in knowledge translation. In each case, we apply the conceptual model and framework to develop a full accounting for all four components. The first case explores non-human actors' role in automated service and calls systems. The second case explores the role of non-human actors in medical information systems and their capacity to capture, record and transcribe conversations between medical professionals and patients. In both business cases, the scope is limited to a single domain, common goal, controlled vocabulary, and common expectations to allow us to derive important observations about the actors. Also, in both business cases, the scale is limited to micro-level transactions to allow us to focus on the nature and characteristics of the non-human actors.

5. Business Case 1: Knowledge Translation in Automated Service Center Dialogs

Automated service centers are integral parts of every domain and every economic sector. Every individual encounters some form of automated service every day. They are found in banking, restaurant services, home improvement stores, appointment scheduling, retail services, library services, pharmacies, insurance, human resource, and transportation services.

Service and call center automation replace human agents with non-human agents to reduce human labor costs and improve the accuracy and quality of service requests. Non-human agents are comprised of various software and technology components. These non-human agents are designed to perform routine, time-consuming tasks and processes (Hardy et al., 2004; Legos, 2021; Paek & Horvitz, 2004; Salcedo-Sanz, 2008). The expectation is that these non-human agents will reduce the need for human intervention. However, while cost reduction may

be achieved, the literature and practical experience suggest that non-human agents have not yet achieved the same quality or efficiency of service as their human counterparts. To date, the peer-reviewed literature has assessed the performance of these non-human actors using quantitative methods applied to logs and recorded interactions. In this business case, we consider how applying the knowledge translation framework might help us identify and address challenges.

5.1 Applying the Framework to Automated Service Centers

We define service and call center interactions as focused dialogs between humans and non-human actors. We begin by profiling each component in the call pr service center dialog (Figure 2).

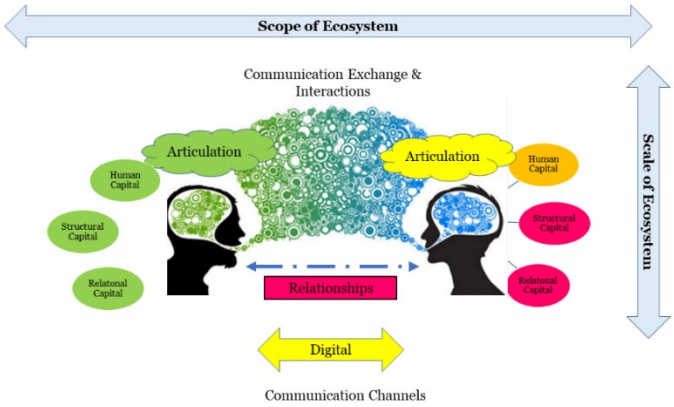

Figure 2: Automated Call and Service Centers in the Knowledge Translation Framework

Let's walk through each of the components in the framework. As a starting point, we have coded each component to suggest the challenges, limitations and constraints it brings to the task.

The ecosystem

We first want to understand the ecosystem's scope and scale when applying the framework. These two components describe two dimensions of complexity that may increase the translation challenge. In this case, the scope is minimal, as the dialog takes place in a specific domain and is related to a select set of options. It means that the vocabulary and the knowledge base will be well-known to all actors.

At first glance, the scale is also limited because the dialogue is between a single human and a non-human actor. However, our understanding of the scale changes when we realize that the non-human actor is designed to interact not only with a single actor but with any possible actor. In this case, the scale is different for each actor. The human actor is dialoguing with a single non-human actor. But the non-human actor is dialoguing with any one of potential thousand or millions of human actors. The non-human actor is designed to communicate at the meso level – with many actors within a defined domain and activity. Variations in the scale of dialog are the first challenge the framework exposes.

Actors, capabilities and competencies

The *knowledge component* of the framework surfaces variations and imbalances that can lead to miscommunications, misunderstandings and failed dialogs. Focusing on the actors, Figure 2 suggests an imbalance in the knowledge capital the actors bring to the dialog and their ability to develop relationships to improve the dialog iteratively. The human actor brings all three types of knowledge capital to the conversation, including tacit knowledge of the service and their needs, their ability to answer questions, adapt to responses by the non-human actor, develop relationships and adjust their vocabulary to communicate with others.

On the other hand, the non-human agent's knowledge capital is limited to the specific task it is designed to perform. The knowledge base is defined by its human developer. In most cases, the non-human actor's knowledge is embedded in several applications and technologies, including (1) decision support trees comprised of the conditions/responses in the non-human actors' knowledge base; (2) a domain knowledge base and vocabulary sufficient to fill the decision support tree; (3) other applications such as calendars, product descriptions, service descriptions relevant to the domain and the activity; and (4) frequently a collection of frequently asked questions or frequently given answers. The limited knowledge base of the non-human actor

can be a challenge depending on the nature of the vocabulary used in the dialog and the semantic variations built into the non-human's semantic repertoire.

We acknowledge that human actors have different capacities for understanding and absorbing knowledge. While there are variations, humans can articulate what they know (e,g., tacit knowledge) and absorb knowledge from other humans. An actor's ability to articulate and absorb knowledge speaks to his ability to learn, unlearn, adapt, relearn and reframe the dialog. It is a challenge for non-human agents for several reasons. First, non-humans can detect when an interaction is not on track, an error has occurred and needs correction, and when there is frustration in the dialog. Second, non-human actors can detect mismatches in options based on coding and semantic capabilities but cannot detect frustration or anger in human speech. Third, they cannot determine when it is appropriate to hand the dialog over to a human actor.

Additionally, human actors can learn from an effective dialog, whereas non-human agents cannot. As a result, human actors will adjust their knowledge base for future dialogs. Only the human developers of non-human actors can make those changes. In general, the knowledge imbalance across actors raises challenges that may be addressed or improved by leveraging lessons learned from knowledge translation.

In the translation component, though, we find the most significant challenges. In a human–non–human dialog, the success of the translation is very much dependent upon the architecture and the capabilities of the non-human actor (Levin, Peraccini & Eckert, 2000; Polzehl et al., 2011; Sarosi et al., 2014; Schmitt, Hank and Liscombe, 2008; Schmitt, Pieraccini & Polzehl, 2010). In this component, we find a significant communication and articulation capacity imbalance between human and non-human actors. Humans have the capacity to articulate what they know, and they can adapt how they articulate to suit others in the dialog. We take all human competencies for granted. These have to be constructed for a non-human actor, however. A non-human actor must have access to voice recognition applications, speech-to-text capabilities to translate what they hear into text for matching or form filling, named entity extraction, natural language processing to understand the response of the human actor, natural language generators, a set of scripted rules for responding, slot filling, vector-based task identification, dialogue act classification applications, and also Bayesian database record selection algorithm.

In addition to these components, non-human actors must also have the capacity to detect emotion in human speech. Detecting emotion is one of many communication problems that may occur and for which there may not yet be solutions (Hirsh et al., 2007; Suendermann et al., 2010; Yongho-Hyun, Kim & O'Keefe, 2014; Zweig et al., 2006). Nevertheless, by leveraging these applications and technologies, non-human agents can achieve some level of understanding of human words, sufficient to make a probabilistic decision regarding their meaning.

From this single business case, we observe that applying the knowledge translation model surfaces challenges that have not yet been addressed by developers building these systems. When we view the interaction from a knowledge translation perspective, there is potential for improving the human interaction with call centers.

6. Business Case 2: Non-Human Actors in Doctor-Patient Dialogs

We begin building out this business case by describing the nature of a doctor-patient dialog. Then, we overlay this dialog with the knowledge translation framework to understand the challenges and opportunities. We are concerned about non-human agents in doctor-patient dialogs because of the increased number of medical errors reported in medical situations that leverage non-human actors in some capacity.

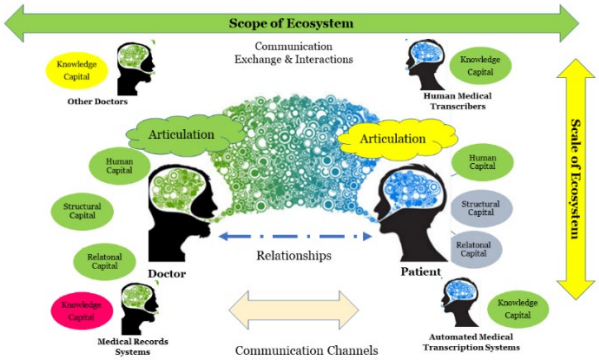

Figure 3: Doctor Patient Dialogs in the Knowledge Translation Framework

The ecosystem

How would we characterize the scale of the dialog? The label would suggest that it is a one-on-one dialog – between doctor and patient – at the micro level. It is what is initially visible. But the scale changes as we look for other invisible actors. There are at least four invisible actors involved in this dialog. The first is a medical information system – a non-human actor whose knowledge base contains records of all previous doctor-patient dialogs and interactions. The second is a community of other doctors who may take the doctor's role in future events or specialists who may provide related care. The third is a human medical transcriber who works with doctors to create medical records. And finally, we now have automated medical transcription systems that may take on the role of the human medical transcriptor to create medical records. We note that as medical records become more widely available and accessible, the scope of the doctor-patient ecosystem will continue to expand to include insurance companies, legal professionals, medical researchers, billing coders, audit contractors, other doctors and the patient. This expanding scope increases the number of opportunities for translation errors and failures. Given what we can see, we suggest the scale is micro-level and meso-level at the invisible and behind-the-scenes levels.

How do we characterize the scope of the dialog? The scope of the dialog is patient-focused – micro level. Depending on the patient's issues and medical situation, the scope may grow to the meso level as more specialists and other supporting actors are brought into the ecosystem. It is highly probable that as the scope increases, each new actor from a related discipline may bring in their non-human actors and automated applications. Scope creep may increase the knowledge translation challenges and opportunities for errors.

Actors, capabilities and competencies

As Figure 3 suggests, the knowledge component of a doctor-patient dialog significantly affects knowledge translation (Carboni et al., 2002; Poder et al., 2018). The two visible and four invisible actors best understand the knowledge component. An ideal dialog between a doctor and a patient is based on one of two conditions. First, the doctor and patient have an existing relationship and are familiar with the patient's condition and situation. They share a joint knowledge base about the patient. Second, the doctor does not know the patient but can gain some knowledge of the patient's condition and situation from medical records. The doctor must have a complete picture of the patient to elicit information from the patient and provide information back to the patient that will be understood, absorbed by, and turned into practice by the patient. So that's our setting. Doctors and patients must have substantial social capital and emotional and psychological capital. Doctors must be able to demonstrate social capital for there to be trust between the two actors. Without trust, the literature suggests the patient may be unlikely to provide additional explanatory or sensitive information essential to a correct diagnosis and medical remedy.

Patient's medical records are held in medical information systems. These are invisible actors in the doctor-patient dialog. These systems have evolved from paper to digital. Medical records have predefined structures, use predefined vocabularies and concepts, and free test fields for doctors' notes, diagnoses, remedies, therapies and general notes about the conversations with patients. Medical records are not just for the originating doctor but other healthcare professionals. While a limited number of people may be present for a given medical encounter, the number of potential actors in the longer-term dialog increases through the use of medical records. Today, these records may be created by doctors, medical transcriptionists, or automated speech recognition systems. While the use of electronic health records is intended to reduce errors, bring down costs, ensure privacy and support patient care. If the information in medical records is inaccurate, poorly organized, or untimely, medical mistakes can occur, affecting the patient's care and health. (Roop, 2009; Star 1999; Star and Griesemer, 1989; Timmermans and Berg, 2003); Garfinkel, 1967)

Medical transcriptionists are important but invisible actors in doctor-patient dialogs. They create medical records for doctors and patients. Their work has been supported or replaced by speech recognition technology in the past decade. However, transcriptionists do more than record a doctor's recordings or notes verbatim (Cora Garcia, David & Chand, 2010; David et al., 2009; Fahini et al., 2009). Medical transcriptionists use a wide range of skills and knowledge to produce accurate records. They rely on the extensive medical knowledge of terminology, anatomy and physiology, procedures, diagnosis and treatment to do their work. In addition, transcription requires an understanding of spoken language, healthcare documentation processes, medical spelling, medical terms, critical medical errors made by dictating physicians, discerning voice inflections for punctuation, and filtering background noise and distractions in the voice recording.

Additionally, transcriptionists leverage professional and sense-making skills and knowledge of how doctors speak and record their notes in their work. These very human professional and common-sense competencies allow them to discover errors in notes. These competencies add a critical level of defense against inaccurate medical records and resulting medical errors, which existing speech recognition technologies cannot duplicate.

Physicians are increasingly encouraged to create patient records using automated medical transcription applications. Physicians may use these non-human actors as dictation and transcription support as they dictate their notes after the dialog. They may also be invisible non-human actors recording the whole doctor-patient conversation as it occurs. When doctors dictate their notes, the transcription quality will depend on the doctor's articulation and speech skills, vocabulary quality, and knowledge base (e.g., medical knowledge) embedded in the application. Automated medical transcription applications do not always have built-in computational linguistics or grammar-checking components. If a human does not review the transcription, errors could exist and sustain (Brenner et al., 2015; David, Change & Sankaranarayanan, 2014; Hodgson & Coiera, 2016; Wahl et al., 2008).

The translation component is as important as the knowledge component in any knowledge translation action (Blakley et al., 2010; Halkowski, 2011; Ihlebæk, 2020; Lyons et al., 2016; Shaeff, 2017). And communication is the focal point in translation. In the doctor-patient dialog, communication between human and non-human actors is primarily one way – the non-human actors receive, translate and memorialize the communication of medical personnel. There is little interactivity or exchange in the dialog at any point. It presents challenges as the lack of interaction would suggest few checks or validations of the non-human actors' representation of the communication. The literature suggests that the critical review and validation of non-human actors' representation can raise significant concerns.

Knowledge translation between actors is the critical success factor in whether that communication is a success or a failure. A preliminary observation of introducing two non-human actors into this dialog is that the communication model may be shifting. We are prompted to ask whether the invisible non-human actors may be playing more significant roles in the translation of patient and medical knowledge among all the actors. The increased use of non-human actors may be shifting the attention of doctors and other medical personnel towards a dialog with non-human actors during patient consultations. Similarly, non-human actors may now encourage doctors to listen to their "medical data and information" in preference to knowledge from the patient. While these systems provide many new advantages in tracking and providing access to medical data and information, introducing non-human actors has changed the traditional doctor-patient knowledge exchange. These exchanges were historically challenging, but now they are abbreviated or eliminated. Have the non-human agents taken on the role of a translator in the knowledge translation process?

This case raises questions about whether this shift is occurring and, if so, how the shift might be affecting translation between doctor and patient. The authors believe it is worth further exploring how a traditional human-to-human knowledge translation process may be affected. Medical risks and unintended consequences may shift when doctors do not converse directly with patients. We suggest these are important questions to explore while the opportunity to redesign and reshape the design of non-human actors exists. Information in the popular press and gray medical literature suggests that a high percentage of hospitals plan to expand their use of the applications and technologies referenced in this paper. However, standardized methods for evaluating these technologies are currently lacking. An opportunity exists to add a knowledge translation framework to future evaluation methods.

7. Preliminary Observations From the Businesses Cases – Implications for Further Research

The authors offer two observations from their exploratory research. The first is that applying the knowledge translation framework to business cases helps us to identify the critical gaps and challenges in any knowledge translation activity. For example, in the case of knowledge translation in the call center, the translation and communication component exposed the challenges. It highlighted opportunities for improvement, specifically the non-human actor's lack of capacity to communicate with the human actor. In the case of the doctor-patient dialog, the main challenges appeared in the knowledge component – precisely, the non-human actor's lower capacity to accurately represent the knowledge of human actors and the lack of opportunity to discover and correct errors. We suggest the framework has value but requires further testing and elaboration in a broader range of examples.

Our second observation is that although smart technologies are marketed as a cost-effective and efficient way to reduce the use of human labor, they come with significant risks. The knowledge translation literature teaches us that interaction and feedback are critical quality control and assurance factors at any level and scope.

We conclude this work with an invitation to the wider community of scholars and practitioners to consider the importance of knowledge translation in their efforts to embed the latest technologies in fields that have traditionally been driven by human interactions. Our business cases show that –despite their potential to improve processes and add value, the introduction of non-human actors in a traditional dialogue must be part of a carefully designed strategy that also includes the development of key capabilities and competencies within the organisation.

Abstract: SMEs increasingly engage in Collaborative Innovation Networks (CINs) to access valuable knowledge for innovation from complementary partners. They deploy their absorptive capacity (ACAP) to make efficient use of this new external knowledge. Despite the importance of ACAP to support the contribution of SMEs to innovation throughout the lifecycle of a CIN, there is no operational measure to guide them regarding ACAP implementation to reach the network common innovation goal. We propose to design a grid-based maturity model allowing SMEs to evaluate their ACAP given their embedding contexts in CINs. We follow a mixed methods' Design Science approach to define the content of the maturity model and adjust it by predicting the ACAP aspects that an SME should primarily master considering its context in a CIN. Our results expand academic understanding on the contingent peculiarities of ACAP by unveiling the natures of its practices and its contextual variability for the examined SMEs. We improve practice by providing SMEs with an assessment tool to early spot their ACAP deficiencies and implement the relevant corrective actions.

Keywords: SMEs; Collaborative networks; Collaborative innovation; Absorptive capacity; Maturity models

1. Introduction

Innovation helps SMEs differentiate themselves from competitors and thrive in increasingly dynamic environments. However, the lack of resources and knowledge hinders their innovation efforts (Lubatkin et al. 2001). Hence, they rely on open innovation alternatives especially by participating in collaborative innovation networks (CINs), involving heterogeneous actors that work together to achieve a common goal. This strategy has become critical for organizations to enhance their resilience in times of crisis (Ramezani and Camarinha-Matos 2020) such as the COVID-19 pandemic. CINs enable SMEs to pool their resources with other actors and share the risks and benefits inherent in innovation development. Most importantly, they facilitate access to complementary knowledge provided by these actors to jointly develop mutually beneficial innovations (Lubatkin et al. 2001).

This collective blending of knowledge requires coordination to capitalize on the complementarities between the actors while protecting the key expertise of each from possible leaks (Lubatkin et al. 2001). These challenges are significant for SMEs whose lack of resources prevents them from dedicating a team to the CIN. Also, their competitive positions may be jeopardized when they collaborate with large firms that can easily appropriate the key knowledge of these SMEs (Hallen et al. 2014). Despite the substantial literature on CINs, no study guides SMEs towards the appropriate approach to efficiently integrate and use new external knowledge to contribute to a CIN.

Accordingly, we rely on Absorptive Capacity (ACAP) concept to uncover the peculiarities of new knowledge integration by SMEs in this interorganizational innovation setting. ACAP refers to a firm's ability to identify relevant external knowledge, assimilate it, and apply it to commercial ends (Cohen and Levinthal 1990). Several instruments were developed to measure it in intraorganizational contexts (e.g., Ter Wal et al. 2011) or interorganizational long-term alliances of large firms (e.g., Thuc Anh et al. 2006), but none for SMEs within CINs. Extant measures are not suitable to these SMEs as they overlook the contingency incidence of CINs on ACAP, in terms of limited temporality (Sydow and Braun 2018), SME nature, the partners' cognitive distance, etc. (Lubatkin et al. 2001).

We follow a Design Science approach to develop a maturity model measuring ACAP of SMEs for their contribution to CINs. Maturity models raise firms' awareness of best practices, identify trouble spots, and stimulate improvement activities (Maier et al. 2012). The proposed model will guide the SME towards the practices most suitable to its CIN embedding context. It predicts such practices considering ACAP's contextual determinants such as the SME's role in the CIN, or its cognitive distance from the other actors.

2. Theoretical Foundations

2.1 Collaborative Innovation Networks for SMEs

Collaborative innovation networks (CINs) involve entities largely autonomous, geographically distributed, and heterogeneous in terms of their structures, cultures, and goals, but that collaborate to better achieve a jointly beneficial innovation (Camarinha-Matos et al. 2009). The network actors are organized across two distinct stages as an external community of practice (Dewhurst and Navarro 2004) to reciprocally learn, through artefacts and exchanges, explicit and tacit knowledge for accomplishing the common innovation. They first implement a network setting-up phase by frequently participating in fairs to gain inspiration and identify complementary partners (Van Egeraat et al. 2013). Then, the development stage requires intensive exchanges within the network, for instance using boundary objects to facilitate the joint integration of knowledge for innovation development and commercialization (Mäenpää et al. 2016).

CINs are a fundamental open innovation alternative for SMEs to share with other partners the financial and development risks of innovation and to balance their relative dependence and power in negotiation with buyers. These networks also enable SMEs to overcome their lack of knowledge and skills to manage the entire innovation process (Smolander et al. 2020) by accessing complementary knowledge for innovation from other CIN actors. An SME would then remain focused on developing specific expertise in the few technological areas that provide it with a stable market position, while accessing new external knowledge to generate an innovation (Lee et al. 2010).

2.2 Absorptive Capacity

To make efficient use of external knowledge for innovation in CINs, firms deploy their absorptive capacity (ACAP), referring to a firm's ability to recognize valuable new information and knowledge, assimilate it, and apply it to commercial ends (Cohen and Levinthal 1990). It is a dynamic learning capability enabling firms to align with their turbulent environments by efficiently using external knowledge (Najafi Tavani et al. 2018). In interorganizational contexts, ACAP also embodies the degree to which an organization learns from its partner (Omidvar et al. 2017).

Most empirical research mobilizes the ACAP conceptualization of Zahra and George (2002) to measure it. It gathers dimensions of acquisition, assimilation, transformation, and exploitation. Acquisition reflects the organization's ability to identify and access externally generated knowledge critical to its operations. Assimilation refers to the analysis of externally acquired knowledge to assess its potential. Application or exploitation refers to the firm's ability to leverage and create competencies by incorporating acquired knowledge into its operations (Cohen and Levinthal 1990). For the studied SMEs, we do not include transformation as it conveys a firm's efforts to create perceptual schemas from newly acquired knowledge that will be exploited for long-term value creation (Zahra and George 2002). Hence, it is not consistent with the ACAP in our study which focuses on the SME's contribution to achieving the temporary network's innovation goal.

ACAP of a firm in a CIN is subject to several contextual determinants that influence its deployment. First, external activators such as rapid technological evolution would drive an intense activation of ACAP (Zahra and George 2002). Second, internal activators conveying specific performance objectives such as strengthening technological and financial capitals can trigger new knowledge integration (Gluch et al. 2009). Third, units with central roles in innovation networks efficiently use new knowledge only if they deploy an intense ACAP (Tsai 2001). Fourth, a firm in a reciprocal learning partnership such as CINs, is required to deploy an intense ACAP when its cognitive distance regarding the other actors is substantial; and when the network includes members with expertise and commercial orientations close to the SME, which may generate liabilities (Lubatkin et al. 2001).

3. Methodology

We propose to develop a maturity model measuring ACAP for an SME contributing to a CIN. These improvement instruments assume that processes correctly defined, managed, and executed, lead to better performance (Dooley et al. 2001). The first type of these models is CMMI that was developed to certify organizations' maturity for delivering a software compliant to the requirements. Its certifying usage has been extended to institutionalized processes other than computer programming. The second type is maturity grids that are designed to communicate good practices in an efficient way (Maier et al. 2012). Grid-based maturity models are less expensive and less time-consuming compared to CMMI. This helps quickly measure the gap

between an organization's current practices and the ones to target, thereby making them adequate for the examined SMEs.

To develop our maturity model, we follow the design science approach suggested by Maier et al. (2012) consisting in four phases: planning, development, evaluation, and maintenance. Our investigation covers the two first phases. We are currently proceeding with the model's evaluation in real-life case studies. Maintenance is rather related to the continuous upgrade of the model as it is applied. The model's design requires determining the key process areas (KPAs) that are mutually exclusive and collectively exhaustive to describe the evaluated object. Each KPA is defined through associated practices, implemented collectively to satisfy important improvement goals. KPAs are described at different levels of performance. The highest maturity level is where the KPA's practices are efficiently applied and culturally rooted. We complement this approach with a quantitative study to contextualize the ACAP of SMEs contributing to CINs. This capacity varies according to several contextual determinants. Hence, the ideal maturity level of ACAP KPAs and practices should be defined according to the SME's context.

3.1 Planning

This phase determines the model's audience, its aim, scope, and its success application criteria. To inform these elements, we performed a literature review on SMEs' collaborative innovation, complemented by 10 exploratory semi-structured interviews. We interviewed four CEOs of SMEs in France that have operated in several CINs within the multimedia and textile sectors. We also interviewed two innovation management consultants used to applying maturity models and four representatives of French industrial clusters from sectors with different technological intensities, who frequently support collaborative innovation projects. The interviewees confirmed that collaborative innovation is a major focus of European policymakers to capitalize on synergies between organizations in an environment where knowledge is highly scattered.

For the model's audience, they recommended addressing the key members of the SME's project team including the CEOs, as they are involved in the strategic and operational aspects of innovation projects. The model should aim to quickly identify the SME's capabilities' strengths and gaps since the CIN early phases. For the scope, the maturity grid must be applicable to SMEs in all sectors and CIN configurations. Finally, the model's application is successful when the SME perceives it as useful, usable, and complete to guide improvement (Moultrie et al. 2007).

3.2 Development

The development phase defines the KPAs, the maturity scale, the content formulation, and the administration mechanism. To inform these elements, we combined an muti-topic literature review and three empirical sources. First, 19 semi-structured interviews were conducted in three different CINs in the mechanical, software, and medical sectors. These CINs involved 13 SMEs embedded in various collaboration configurations considering the ACAP contextual determinants. We interviewed key project team members within these SMEs and within some of their partners, resulting in 23 hours of recordings that were transcribed and grammatically sub-divided to enable their thematic analysis with NVivo. We reached semantic saturation by the 16th interview. Second, we organized two focus groups with 14 experts including researchers in knowledge management and practitioners in CINs to discuss the interviews' outcomes and define the appropriate architecture of the maturity model. Third, we performed a quantitative analysis to elaborate the contextualization approach of the maturity model. The resulting architecture is explained below.

First, for the KPAs, our literature review underlined six exclusive dimensions that holistically describe the SME's ACAP. They refer to knowledge acquisition, assimilation, and application by the SME to contribute to CIN setting-up then development. Their accuracy as KPAs was confirmed following the empirical process. Second, for ACAP maturity, we reviewed several studies around maturity models and selected two criteria, namely capability and willingness. The relevance of these criteria and their associated scales for the studied SMEs were discussed and validated during the focus groups. Third, to formulate the model's content, we applied a hybrid approach recommended for cognitive rather than technical concepts as is the case of ACAP (Cohen and Levinthal 1990). The approach consists in describing the KPAs with set of questions expressing best practices. The respondent scores the KPA's practices on a Likert scale ranging from 1 to n, where n is the highest maturity level of the KPA. To define these best practices, we combined the outcomes of an in-depth review of the existing ACAP multidimensional measures, those of the interviews, and the outputs of the focus groups. Fourth, both focus groups recommended an interactive administration mechanism in the presence of a

moderator and the SME's representatives, as it is more engaging and stimulating for the participant than individually informing the model.

Finally, as the SME's ACAP varies according to its embedding context in the CIN, we designed a prediction process to guide the SME toward the most important KPAs and practices for its context. Under SmartPLS4.0, we used PLS (partial least squares) algorithm because of its forecasting virtues (Tenenhaus et al. 2005), to quantitatively analyze 74 responses of a survey conducted with SMEs contributing to CINs. PLS allows prediction with latent variables by performing regressions from the scores obtained through a succession of factorial analyses. Accordingly, the contextual determinants and ACAP practices were refined and the prediction equations formulated.

4. Results

4.1 Practices Associated with the ACAP KPAs

As underlined in Table 1, 56 practices were determined to describe the six KPA. 31 were adjusted from the extant ACAP multidimensional measures. The interviews confirmed some of these adapted practices and highlighted 25 new ones. Most of these emerging practices refer to the issue of risk management throughout both stages of a CIN. No new practices were proposed in the focus groups.

Table 1: Items of the Contextual Factors and ACAP Dimensions

Construct type	Label	Definition	Items	Scales
Contextual factors	*EXT*	External circumstances driving knowledge absorption by the SME	*EXT1*	Rapid evolution of the industry's technologies
			*EXT2**	High regulation of the industry's policy
			EXT3	High frequency of innovation in the industry
			EXT4	High competitiveness of the market in the industry
	ROLE	Role's centrality of the SME in the CIN	*ROLE1*	Strong involvement in exchanges with the market
			ROLE2	Strong involvement in project management
			ROLE3	Strong involvement in technical coordination
	INT	Internal circumstances driving knowledge absorption by the SME	*INT1*	Achieve an innovation that you will own
			INT2	Generate financial profit
			INT3	Acquire learnings
			INT4	Extend the professional network
			INT5	Re-orientate the firm's strategy
	COG	Cognitive distance of the SME and the CIN actors	*COG1*	Distant disciplines regarding the other CIN actors
			*COG2**	Different structure and/or culture regarding the other CIN actors
	COOP	Competition among the SME and the CIN actors	*COOP1*	Similar expertise and/or activities regarding the other CIN actors
			COOP2	Similar commercial strategy regarding the other CIN actors
KPAs for the SME's contribution in CIN setting-up	*ACQ1*	Acquisition of external knowledge for CIN setting-up	*ACQ1.1**	Investigate technological knowledge
			ACQ1.2	Investigate supply chain knowledge
			*ACQ1.3**	Investigate market knowledge
			ACQ1.4	Investigate knowledge on innovation project management
			ACQ1.5	**Investigate knowledge on collaboration innovation**
			*ACQ1.6**	Mobilize databases

Construct type	Label	Definition	Items	Scales
			ACQ1.7	Solicit the CIN actors
			ACQ1.8	Solicit experts outside the CIN
			*ACQ1.9**	Solicit the client
			*ACQ1.10**	Participate in industrial/scientific events
			ACQ1.11	Be inclined to investigate any other useful knowledge area
	ASS1	Assimilation of external knowledge for CIN setting-up	*ASS1.1*	Involve the client
			ASS1.2	Ensure a coherent vision by exchanging with the CIN actors
			ASS1.3	Exchange with CIN actors and the client using boundary objects
			ASS1.4	**Evaluate the pros and cons of a network with unusual actors**
			ASS1.5	**Be inclined to integrate a network with unusual actors**
	APP1	Application of external knowledge for CIN setting-up	***APP1.1***	**Explain your participation in the budget**
			APP1.2	**Explain your intended operational contribution**
			*APP1.3**	Designate individuals from your firm for this project
			APP1.4	Recognize your future interfacing actors in the CIN
			APP1.5*	**Set-up project management procedure**
			APP1.6	**Set-up features for monitoring the innovation performance**
			APP1.7*	**Implement the tools for collaboration and interface steering**
			APP1.8	**Explain your terms of collaboration**
			APP1.9	**Define a commonly agreed business model with the CIN actors**
			*APP1.10**	Designate boundary spanners for the CIN
			APP1.11	**Agree on the legitimacy of the boundary spanners**
			APP1.12	**Sign formal contracts with the other actors**
			APP1.13*	**Evaluate the consistency of the project with your strategy**
			APP1.14	**Be inclined to adjust your own goals for the network benefit**
KPAs for the SME's contribution in CIN	*ACQ2*	Acquisition of external knowledge for CIN development	***ACQ2.1***	**Recognize requirements of input actors for your contribution**
			ACQ2.2	**Recognize requirements of output actors for your contribution**
			ACQ2.3	Solicit the CIN actors
			*ACQ2.4**	Solicit experts outside the CIN
			*ACQ2.5**	Solicit the client
			ACQ2.6	Mobilize databases
			*ACQ2.7**	Participate in industrial/scientific events

Construct type	Label	Definition	Items	Scales
development			*ACQ2.8*	Be inclined to investigate any other useful knowledge area
	ASS2	Assimilation of external knowledge for CIN development	*ASS2.1**	Involve the client
			ASS2.2	Exchange with your interfacing actors
			ASS2.3*	**Ensure a coherent vision by exchanging with the CIN actors**
			ASS2.4	Exchange with CIN actors and the client using boundary objects
			ASS2.5	Use IT means to share knowledge with CIN actors and the client
			ASS2.6*	**Question the suggestions of the other actors and the client**
			ASS2.7	**Be attentive to leakages of your key knowledge in the CIN**
			ASS2.8	Be inclined to integrate uses other than your ways of doing
	APP2	Application of external knowledge for CIN development	*APP2.1*	Work jointly with your interfacing actors
			APP2.2	**Test the innovation with the client**
			APP2.3*	**Promote the innovation in events**
			APP2.4	**Use advanced technologies to achieve your contribution**
			APP2.5	Document your contribution
			APP2.6	Challenge your contribution's performance
			APP2.7	**Raise your doubts for development and commercialization**
			APP2.8*	**Allocate further resources to the project id required**
			APP2.9	Assist the other CIN actors to achieve their contributions
			APP2.10	**Be inclined to adjust your contributions based on the CIN needs**

*Item omitted during the quantitative analysis **Item resulting from the interviews**

Then, we performed factor analysis to eliminate the non-significant practices, which resulted in retaining 38 absorption practices. This required assessing the practices' reliability based on a bootstrapping procedure with 500 sub-samples, then evaluating the constructs' convergent validity in terms of AVE, and their reliability with Dillon-Goldstein's Rho and Cronbach's alpha. Regarding discriminant validity, all the constructs verified the Fornell-Larcker and HTMT criteria.

4.2 Prediction Process

We formulated equations predicting the scores of the relevant ACAP dimensions and practices for an SME according to its embedding CIN context. PLS generates these equations with the outer and inner models (Hair et al. 2011). The former measures the latent variables using their indicators. The latter calculates the scores of the dependent variables based on their structural links with the independent ones. KPA ACQ1 is used as an example below.

To calculate ACQ1, the inner model (equation 1) aggregates a coefficient and the scores of the contextual factors determined as the scalar products of their items and weights' vectors, pondered with their structural coefficients regarding ACQ1. The coefficients and factors' weights result from the PLS algorithm, while the items are informed by the SME to describe its context.

$$(1)\ \boldsymbol{ACQ1} = \ 0.304\ COOP + 0.406\ ROLE + 0.164\ EXT + 0.457$$

ACQ 1 in the outer model (equation 2) is the scalar product of its items (practices) and weights' vectors. These weights result from the PLS algorithm.

$$(2)\ \boldsymbol{ACQ1} = \{0.163 \quad 0.101 \quad 0.105 \quad 0.226 \quad 0.153 \quad 0.251\} \begin{Bmatrix} ACQ1.2 \\ ACQ1.4 \\ ACQ1.5 \\ ACQ1.7 \\ ACQ1.8 \\ ACQ1.11 \end{Bmatrix}$$

The equality between the two previous equations generates a new equation where the practices' vector is the unknown variable (equation 3). We solve it using the pseudo-inverse of Moore-Penrose (Penrose 1955), which determines the scores of the KPA's absorption practices as:

$$(3) \begin{Bmatrix} ACQ1.2 \\ ACQ1.4 \\ ACQ1.5 \\ ACQ1.7 \\ ACQ1.8 \\ ACQ1.11 \end{Bmatrix} = \frac{0.304\ COOP + 0.406\ ROLE + 0.164\ EXT + 0.457}{0.163^2 + 0.101^2 + 0.105^2 + 0.226^2 + 0.153^2 + 0.251^2} \begin{Bmatrix} 0.163 \\ 0.101 \\ 0.105 \\ 0.226 \\ 0.153 \\ 0.251 \end{Bmatrix}$$

To determine the relevant practices of this KPA for the SME, we first standardize the practices' predicted scores on a scale of 1 to 4. Then, we retain the practices whose standardized scores are greater than 2. This average value was discussed and validated during the two focus groups.

4.3 Maturity Scale

CMMI evaluates maturity through operational mastery, while other studies consider it a composite notion including the mastery of processes, and the attitude of individuals regarding these processes (Le Dain et al. 2008). As knowledge absorption practices do not correspond to institutionalized processes as in CMMI and integrate a behavioral dimension (Razak et al. 2016), we evaluate ACAP maturity in terms of the SME's ability to operationally implement absorption practices 'Capability', and its propensity toward these practices 'Willingness'.

A maturity level between 1 and 4 is assigned to each evaluated practice within a KPA following the SME's response to two questions related to the maturity criteria (Table 2). For capability, an SME is expert (level 4) if it perfectly applies the methods required for the absorption practice. For willingness, an SME is a firm believer (level 4) if it perceives the interest of implementing the practice and is willing to perform it whenever it is necessary.

Table 2: Scale Assessing an SME's Maturity for Each Practice Within the six KPAs

Capability				**Willingness**		
For this project, are you to capable of performing the following practice?				*For this project, do you think it is relevant that you implement the following practice?*		
Yes, I am perfectly capable	**4**	**Expert**		Of course, it is even necessary	**4**	**Firm believer**
Yes, I am capable but need more formalization	**3**	**Capable**		Yes	**3**	**Culturally rooted**
I have some ideas but don't know how to proceed	**2**	**Some ideas**		I am neither against nor convinced	**2**	**Potentially receptive**
I can't do it and have no idea about it	**1**	**Not capable**		No, I don't find it relevant	**1**	**Culturally resistant**

The SME representatives discuss with the moderator their maturity results and improvement actions for each KPA, starting with the most important KPAs predicted for the SME's context. A lack of capability will essentially require training and support for the SME's project team to better deploy the absorption practice. A lack of

willingness will mainly entail motivational and communication initiatives to improve the awareness of the SME's project team regarding the benefits of the absorption practice. In the critical case, the SME's project team is neither convinced of the interest nor capable of implementing the absorption practice. If a large number of the practices evaluated by the SME is deficient regarding both capability and willingness, participating in the CIN with such a team can be risky. Also, the necessary improvements will be substantial in terms of implementation cost and time. Thus, it seems wise, before taking improvement steps, to analyze the adequacy of these individuals to represent the SME within the CIN, as well as the SME's role in the network. This maturity scale was approved following the two focus groups.

5. Discussion and Conclusion

5.1 Theoretical Implications

First, this research unveils the contingent nature of ACAP for an SME contributing to a CIN (Lubatkin et al. 2001). On one side, although some absorption practices seem to be transverse to a CIN's lifecycle (Table 1), their implementation substantially differs according to the considered stage. For instance, the empirical study underlined that the use of databases for new knowledge acquisition is more significant in the development phase. Also, the involvement of the client for the interpretation of its specifications is rather important in the upstream stage. On the other side, a significant number of emerging absorption practices focuses on managing the risks of knowledge internalization specific to each CIN stage. Among these practices, we emphasize the necessity for an SME to assess, in the setting-up phase, the risks of collaborating with competitors and to question, in the development stage, the other actors' propositions likely to alter its contribution's quality.

Second, we demonstrate how the relative importance of each ACAP dimension differs according to an organization's context (Flatten et al. 2011) in the case of SMEs contributing to CINs. Indeed, the quantitative analysis enabled the elaboration of a predictive process that guides an SME toward the most relevant ACAP dimensions and practices for its context in a CIN. Each ACAP component is deployed differently depending on the level of the SME's external and internal triggers, its role centrality within the CIN, and the peculiarities of its partners.

Third, this study complements the information processing perspective (Galbraith 1974) of SMEs contributing to CINs. Although more knowledge improves performance, firms need to establish rules to organize themselves and guide employee behavior regarding knowledge. This is particularly important when firms are dealing with uncertain environments as they require more "*information that has to be processed between decision-makers*" (Galbraith 1974, p. 28). The examined SMEs are directly concerned by this requirement since they engage in CINs to align with their increased sectors' turbulence and to propose innovative solutions involving different stakeholders to face competitive pressure (Tojeiro-Rivero and Moreno 2019). Hence, we demonstrate that the right deployment of ACAP can help these SMEs resolve the information processing dilemmas when contributing to CINs.

5.2 Managerial Implications

We provide SMEs participating in CINs with an assessment instrument to harness external knowledge according to their CIN contexts.

Also, we raise their awareness on highly critical absorption practices that the partners should perform to achieve their common innovation goal. These practices include conceiving a business model commonly approved by the CIN actors, contracting the relationships in the CIN to establish trust, using IT means for better sharing and capitalization of knowledge, etc.

Moreover, the developed model may help SMEs determine what collaborations make sense for them and what role they can play in CINs. By assessing its ACAP, an SME can be aware of the most appropriate partners to better respond to its internal and external innovation triggers and to compensate for its ACAP deficiencies.

Rejecting Innovation: How Italian Public Employees are Killing Creativity and Digitalization

Marco Berardi, Andrea Ziruolo and Fabrizia Fontana
G. d'Annunzio, University of Chieti-Pescara, Italy

marco.berardi@unich.it
andrea.ziruolo@unich.it
fabrizia.fontana@unich.it

Abstract: Within the general context of new ideas generation, there is a grey area that still concerns the organizational design solutions related to creativity. In fact, if personal characteristics and other community-related issues have been quite explored so far, some organizational mechanisms still need to be deepened. In this paper we aim to investigate the impact of professional networks on Innovative Work Behaviour in the local government to achieve public value. We investigate the contribute of creativity in the digitalization of Italian public administration considering the contribution of public employees on developing knowledge management. Moreover, we investigate a community of 190 employees of municipalities divided into three macro categories: deputy employees, Managers and Senior Managers. An OSL regression model has been used to understand to what extent the degree of collaboration and advice among employees and their propensity to adopt digitalization in ordinary practice considering social capital variables. What emerges from the OLS regression is that despite accelerating the ordinary work using the leverage of digitalization and knowledge management, there is the custom of not applying the enormous benefit of process re-engineering and continuing their work attitude in what the economic literature defines "the comfort zone". The results consolidate the current literature about the creation of public value showing the resilience of public employees to change their state of mind reflecting any kind of innovation.

Keywords: Innovation, Creativity, Knowledge management, Public sector

1. Introduction

In the post covid era, digitalization and knowledge management practices should be considered two of the main leverages in the creation process of public value (Berardi et. al. 2022). International literature agrees on this point showing that the improving of socio-economic systems are strictly connected to the skills of the organization to quickly re-act on unconventional forms regarding external disturbs through innovation and digitalization in order to achieve smart governance (Vial, 2019). Moreover, in a new public management scenario, public value is created when public organization can measure the outcome or the impacts that their policy brings in the referred context or ambient (Boyne, 2002). Even if part of international literature has shown that the creation of public value refers to a multiversity of variables such as intellectual capital components of public workers (Ramirez, 2021), public performance and alignment between managers and politicians (Walker et. al, 2013), social capital (Stolle, 1999) only a few authors are investigating the contribution of creativity (Di Vincenzo et. al, 2021) while other authors are considering innovation (Amabile, 1990).

As confirmed by part of international literature, innovation practices such as digitalization (Vial, 2019) and creativity (Di Vincenzo, 2021), have been deeply investigated in literature especially in the private sector (Amabile 1996). In this sense, innovation is a fundamental strategic asset for all organizations (Crosby et al. 2017). To innovate with effective results, managers and entrepreneurs must clarify the relationship between creativity and innovation. Innovation is considered as the implementation of ideas in useful business. Therefore, we may have creativity without innovation but not innovation without creativity. The understanding of the link between innovation and creativity requires to focus on how the ideation process works. Amabile (1996, 1997) argues that innovation is the successful implementation of creative ideas within each organization. So, the ability to promptly devise innovative solutions and answers is a priority for any organizations, mostly in conditions of low intelligibility of information and limited ability to forecast.

On this topic, we must consider the effort of authors such as Soliman and Spooner (2000), as they highlighted that the successful implementation of new technologies is dependent on many factors including the efficient management of human resources. As shown by those authors, the strategic role of the human resources department in identifying strategic and knowledge gaps using knowledge mapping as far as they propose drivers and implementation strategies for knowledge management programs.

Moreover, many authors refer creativity to the generation of ideas or solutions that are simultaneously innovative, unusual and original as well as appropriate, practical and useful for the problem in question (Shalley, 1991; Woodman et. al, 1993). Considering this definition, the post-covid era represents the perfect scenario

inside whom to verify the contribution of innovation and creativity in a non-investigated context such as the public sector. In this sense, we have conducted an exploratory study trying to identify how public organizations creativity and innovation have affected the post covid era and how those two variables contribute to the creation of public value through the leverage of knowledge management.

As shown in different studies, knowledge management has deeply conditioned the public administration scenario in different countries even if the most investigated one until know it is Italy as it is considered the most hardly hit by the pandemic (Berardi et. al, 2022; Sebastiani et. al, 2020). As shown by other authors, in the first year of the pandemic, Italy had more than 90,000 deaths and over 2,500,000 Covid-19 cases (Senate of the Italian Republic, 2021). In 2020, faced with an international health emergency and to avoid the spread of the virus, the prime minister, Giuseppe Conte, ordered various restrictions on Italian citizens, with an initial severe lockdown lasting three months and then a series of other restrictions. This strategy strongly pushed, among other things, a rethinking of the way in which public services acted, based upon the rapid digitalization of the Italian public sector through Knowledge Management patterns, and thus a rethinking of the "public administration mindset" with a smart governance approach (Heeks, 2002, 2003).

So, the aim of this paper is to continue investigating this country on this research topic: *is creativity and digitalization pushing the creation of public value in Italy in the post covid era?.* This paper will show that, despite the enormous effort conducted by the Italian central government to push for digitalization and innovation, the resilience regarding part of public employees is literally killing innovation and creativity hindering the creation of public value through those two leverages.

2. The Effort Of Creativity on Digitalization and Knowledge Management on the Italian Context

Part of international literature has shown that the reaction on extraordinary events such as Covid-19 has modified what it has been considered for decades the so called "Knowledge management toolkit for public policies (Robinson et al., 2010)" considering new variables such as the trust of citizens in the public policy (Berardi et. al, 2022), (figure 1).

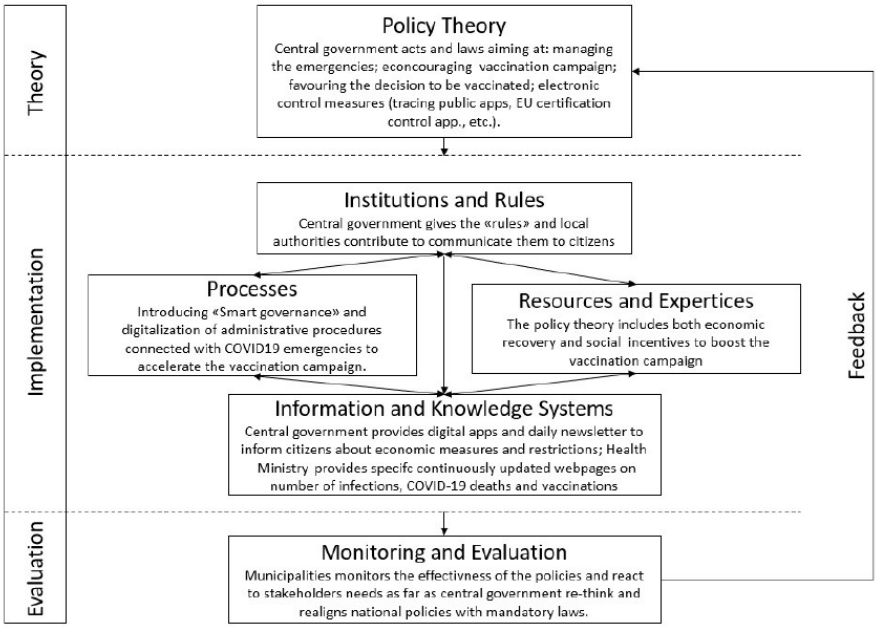

Figure 1: Knowledge Management Toolkit for Public Policies (Robinson et al., 2010)

Once the emergency has passed, public entities continue to guarantee the efficiency of public services with a lack of resources such as the effort of public money and a lack of public employees due to emergency transfers of resources from the central government. So, in order to achieve public value and maintain the same level of efficiency for public services, international literature underlines that innovation and creativity should guarantee the achievement of public goals. As a matter of fact, increased performance requirements subsequently to the emergency requests by citizens and stakeholders has led many public service organizations to develop innovative service delivery mechanisms in response to wicked issues, by creating and adding value to service

delivery (Bonner, 2023). Moreover, what is considered by social and public value is what brings value in terms of satisfaction to stakeholders dealing with : user value, value to wide stakeholders, value to wilder society (Moore, 1995; Talbot, 2008). Because of the Covid-19 emergency a kind of "pressure for reform" has generated in all public agencies that forced public managers and leaders to collaborate in partnerships with other stakeholders to develop novel methods of delivery, evaluation, and measurement services. In the Italian scenario, this aspect has resulted in an almost total transformation of public management services for customers that boost on digitalization and innovative tools to guarantee public services. As far as the push for digitalization, the creativity of central governments on introducing new strategies to guarantee public services comes out. The most emblematic was the "Reform of digitalization in emergency" (legislative decree n. 18) that the Italian government applied in 2020.

Because of this extraordinary intervention by the central government what comes out was a facilitated process for all public administrations to acquire digital goods and services, with reference to services that operate in the cloud (Software-as-a-Service, such as for example hosting services, but also applications, services that allow teleworking, or direct services to citizens and businesses). Organizations will be able to purchase these goods and services with a negotiated procedure but without a call for tenders and in derogation of any provision of law other than criminal law, subject to compliance with the provisions of the Italian anti-mafia law code. This kind of intervention is defined by international literature as "government creativity" (Rangarajan, 2008) and represent a good example of the definition of creativity given by some authors (Shelley, 1991; Woodman et. al, 1993). Part of the literature and in particular Sternberg (1999) proposed a conceptual framework of creativity called the propulsion model that focuses on the creative outcome. The propulsion aspect reflects the will to shift from a current state to a future state as envisioned by the proponent of the boost leverage (figure 2).

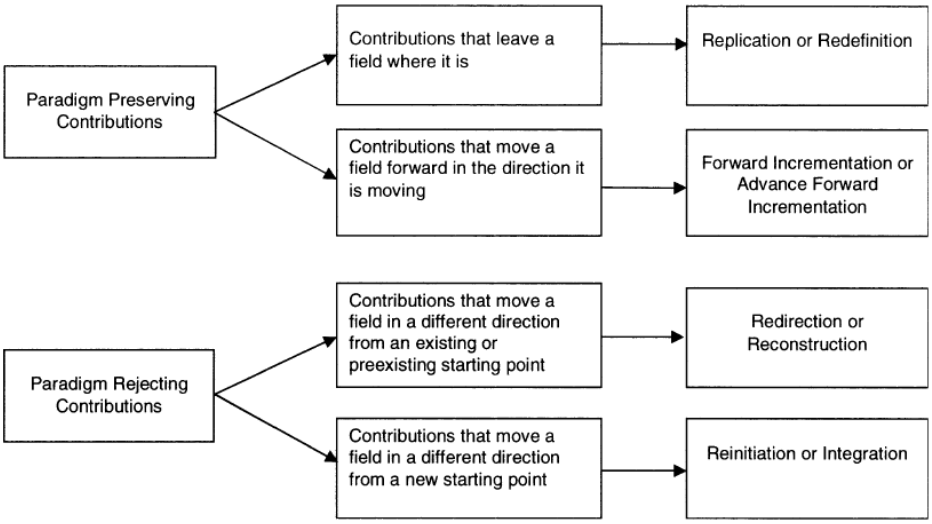

Figure 2: Propulsion Model of Creativity Inspired by Stanberg (1991) and Adapted by Rangarajan (2008)

Following this theoretical framework two possible paradigms should come out. In the first paradigm we have the preserving contribution of creativity while in the second we have the rejection. Considering the knowledge management toolkit for public policies, we should consider the creativity paradigm (Rangarajan, 2008) as an integrated part of the "process" included in the "implementation phase". So, the effectiveness of a public process is directly linked with the preservation of the creativity of ideas that the policy maker proposed in their own policies. More specifically, the efficiency of a public policy is strictly connected with the capabilities of public entities to achieve specific goals "a field forward in the direction it is moving" or that at least contributes to "a field where it is". Otherwise, a public policy fails if public bodies "move a filed element in a different position" or at least "in a different direction" (Rangarajan, 2008; Stanberg, 1991).

Concerning that literature considers that the efficiency of a public policy is directly affected by the human capital that operates in different public entities (Lappi et. al, 2019; Al Ahbabi, 2019) we investigated a data set constituted by 190 employees of municipalities divided into three macro categories: deputy employee, Managers and Senior Managers. This represents a preliminary study conducted on a sample of employees of the four biggest cities in the Italian Abruzzo Region: Pescara, L'Aquila, Chieti and Teramo that has been considered

by the Italian Health Agency as the mostly hidden hit during the second and third wave of Covid-19 and that are considered by the Italian Agency for digital innovation (AGID) as the most responsive on digitalization and implementation of knowledge management procedures all across the Italian peninsula.

3. Methodology of the Research

Considering previous literature, we focus our study on the same geographical area that has been investigated by other authors such as Battiston et. al. (2021), Marziano et. al. (2021) Berardi et. al. (2021b, 2022) to provide more details that can contribute to better understanding how the public policy has affected local authorities.

In the period between September 2022 and January 2023 we conducted 190 interviews with public employees of the municipalities of Pescara, L'Aquila, Chieti and Teramo divided into three macro categories: deputy employee (150 interviews), Managers (30) and Senior Managers (10). Those four municipalities are the Largest in terms of total inhabitants of the Abruzzo Region (296.130 inhabitants in the four municipalities over 1.312 million of total inhabitants of the entire region) and have been largely investigated by Italian literature (Papi et. al, 2022; Deidda Gagliardo, 2012). In Table 1 we reported the demographic of the respondent.

Table 1: Demographic Characteristics of the Respondents

Employee	Deputy Employee (150)		Managers (30)		Senior Managers (10)	
	Frequency	%	Frequency	%	Frequency	%
Age						
18-30						
31-44	10	6				
45-59	115	76	25	83	10	100
60 - 79	25	18	5	17		
80+						
Gender						
M	90	60	25	83	8	80
F	60	40	5	17	2	20
Education						
No schooling completed						
Nursery school to 8 year grade						
High School	120	80				
Bachelor or master's Degree	30	20	30		8	80
Phd					2	20

Starting from this dataset we extract from interviews our dependent variable (Y) called "preserving creativity" computed as the use of new technological procedures inducted by ne national policies on digitalization of procedures to achieve smart governance (Vial, 2019). Such variable was based on prior studies and used a validated single item measure (de Jong & den Hartog, 2010; Mascia &Cicchetti, 2011), by asking them: 'How often have you adopted new technological items introduced in your organization after the covid-19 emergency?'. This measure captured the effectively usage by new software or digital procedures introduced in the local body with responses on a five-point scale ranging from 1 (never) to 5 (very frequently). We chose this variable in consideration of the impact that the central government acts consequently to the legislative decree 18/2020 should have on the efficiency of public procedures. The dependent variables reconduct to social capital

variables identified by international literature (Ramirez, 2020) and identified in table 2 in coherence with the process phase of the "knowledge management toolkit" (Robinson et. al, 2010) measured with a Likert scale 0-5.

Table 2: Research Items of the Process Phase of the Knowledge Management Toolkit (Robinson, 2010)

Process research Items	Deputy employee	Managers	Senior Managers
	Likert scale average	Likert scale average	Likert scale average
Smart governance	2	4.66	4.66
Are the measures adopted in line with the goal of achieve a digital environment?	1	5	5
Are the internal policies adopted in line with the national policy?	3	4	4
The timeline for the adoption of measure has been respected?	2	4	4
Digitalization	1	5	5
Do you work now in a more digital environment?	1	5	5
Has the digitalization of procedures made an improvement of your productivity?	1	5	5
Outcome	1	3	3
Do you have received positive feedback from stakeholder over the introduction on new digital procedures?	1	3	3

Once the indicators were defined, the following regression model was applied (OLS) to consider all the variables included in the survey. In the equation below, Y represent the dependent variables, *a* represents the constant of the model, β represents the coefficient of the estimation of the variables (independent variables), logxni represents the logarithmic conversion of the variables measured with Likert scale 0-5 (Table 2), while ε represents the standard error (Bun and Harrison, 2019). The logarithmic conversion of some variables has been applied to reconduct the model to a Gaussian distribution. As a result, we build up three different regression models considering the three different clusters of interviews:

- Deputy employee's creativity model: YDE= a + βx1 + βlogx2 + βlogx3 + βx4 + βlogx5 + βlogx6 + εi;
- Manager's creativity model: YM= a + βx1 + βlogx2 + βlogx3 + βx4 + βlogx5 + βlogx6 + εi;
- Senior Manager's creativity model: YSM= a + βx1 + βlogx2 + βlogx3 + βx4 + βlogx5 + βlogx6 + εi;

The combination of the 6 variables which were considered showed no problems in all the three models related to heteroskedasticity (Breusch–Pagan tests results: $\chi 2 = 0.00$; Prob> $\chi 2 = 0.856$) and specificity (Ramsey test results: F (1.86) = 0.88; Prob> F = 0.473), as well as autocorrelation of some variables so it was no necessary to proceed through step-wise regression (Shapiro–Wilk test results: *pvalue= 0.732*)

4. Analysis of the Results

What emerges from the analysis of the results and answering to rq1 is a misalignment between employees and managers contribution on creativity and digitalization to the creation of public value. As shown in table 3 the YDE model is completely irrelevant for our analysis as it has shown non-significant results while YM and YSM model reflects a complete opposite situation.

Table 3: Results of the OLS Regression

Item	Regressor	YDE	YM	YSM
Smart Governance	x1	-1,187 (0,245)	3.274 (1.988) *	3.172 (1.978) *
	logx2	0,137 (1,287)	6,846 (1,903) **	6,786 (1,897) **
	logx3	-1,481 (1,377)	8,133 (2,003) ***	7,983 (1,992) ***
Digitalization	x4	-1,876 (0,345)	4,179 (2,078) *	3,879 (1,578) *
	logx5	-2,385 (2,273)	6,074 (1,738) *	5,874 (1,684) *
Outcome	logx6	-3,175 (1.548)	2,507 (1,887) **	2,498 (1,787) **

To better understand the sense of this statical approach we report some extracts from the interviews conducted in the data set included in the YDE following the methodology suggested by part of the literature (Heeks, 2002; Heeks, 2003, Della Porta, 2018). In reference to the research item Smart Governance, we asked them: "*Are the measures adopted in line with the goal of achieving a digital environment*?" while the managers just answer without any doubt that they are operating in the right direction, most of the employees specified that: "*we are just doing what they asked us to do with absolutely no knowledge about the new software. We are just inserting data but honestly, we do not have any kind of acknowledgment or training about those new procedures. We are acting in the old way but with new sophisticated tools and instruments. Honestly, most of us are still having problems on procedures as they had a real lack regarding back knowledge about Information Technologies. We have just received some basic commands and we move one step at a time . This aspect had a terrible impact on our productivity because we must help those who are still having a problem after at least two years after the introduction of these new procedures. Moreover, many of us are afraid about the consequences of making an error so we spent a lot of time on re-checking all the phases of the single processes".*

Another point of relevant discordance can be found in the measurement of the outcome or, in other terms, about the impact that the new procedures are having on the benefits for citizens and stakeholders.

What emerges from interview is that managers had a more long-range point of view about the outcome on communities: "*we are giving our citizens the possibility to literally manage the service from their own beds. In our context almost the 80% of public services can be managed online or by sending an email or filling an online format. With the electronic identity everyone should manage and control their own business without coming here in person. In my opinion that is a revolution in the Italian public sector. On the other hand, we are encountering several problems especially with old persons that have serious issues on learning the new procedures. In this sense, the public policy is probably to far from the real needs of citizens. Probably what we really earn is a shift in culture that must start from the re-training of citizens. As a matter of fact, many of them have still problems with them so it is not easy for us to manage all the issues that come out. As a consequence, we have to ask to our employees to take care of the issues and, as a consequence, we overcharged their workdays".*

The extract of the interviews and the analysis conducted clearly show that while the managerial area of local bodies contributes to preserve the creative steam inducted by introducing new policies to introduce digitalization in public bodies, the employees almost reject innovation declining all the positive effects that these could have on their daily routine confirming the second paradigm proposed by Rangarajan (2008) and the paradox suggested by Soliman (2000). This creates a "way of no return" in the process of creating public value in terms of user value, value to wide stakeholders or "value to wilder society" and basically let the achievement of public value as you are not in the condition of measuring the real outcome on stakeholders or at least you have no impact as suggest by Stolle (1999)

5. Conclusions

As shown in the introduction of this paper, within the general context of new ideas generation, a grey area still concerns the organizational design solutions related to creativity. As a matter of fact, there is a lack of literature that investigates the contribution of creativity in the creation of public value and this field is almost unexplored (Soliman, 2000; Sebastiani, 2020; Rangarajan, 2008). With this paper we explored just one dimension of the policy making process that considers a knowledge management approach also considering that the data set that we referred only considers the public bodies organization of four cities (Berardi et. al, 2021b).

On the other hand, this paper gives a first contribution on this topic showing that in a complex organization constituted by employees, managers and senior managers, the process of creativity is completely different divided in three different categories (Heeks, 2002; Della Porta, 2018). The results of the OLS regression are emblematic and confirm that the process of creativity is strictly correlated on different levels and attitude as supposed by different authors (Bonner, 2023; Rangarajan, 2008; Stanberg, 1991). Moreover, creativity positively affects the creation of public value only when there is an alignment between the entire technostructure that gives the opportunity to effectively measure the impact of the policies and measures adopted.

Abstract: The holographic principle states that the whole is contained in each of its parts. In this study, we apply the holographic concept to business studies, with a particular focus on how business transformation might have an impact on the growth of a region. Following an experimental approach, mixed methods research was used to collect descriptive data from a set of firms in Medellín (Colombia). Two measurements (MET1 and MET2) were performed as part of the management model (MM) implemented, which allowed us to quantify the variables defined in the MM. Once a transformation was evidenced, a second measurement was carried out to compare the results and identify improvements in each dimension of the intervened firms. Additionally, the findings of this research (conducted over the course of eight years) were contrasted, from a holographic perspective and per economic sector, with reports on the region's economic growth provided by organisations such as the local chambers of commerce. Through the implementation of an MM developed by the Universidad de Envigado in a set of firms in the region, this study contributes to the literature on how the university impacts the industry through knowledge transfer.

Keywords: Firms, Knowledge management, Knowledge transfer, Management models, SIGET PROS, Business strengthening

1. Introduction

Just as a drop of water contains the characteristics of the ocean, a cell reflects the genetic traits of a living being, and a grain of sand represents the structure of a desert or a beach, each organisational process may be thought of as mirroring the structure of a firm and each firm may reflect the characteristics of the productive fabric of a region.

When applied to business studies, the holographic principle allows the economic development of regions, countries, and sectors to be analysed so that universities can understand the needs of firms and contribute to their strengthening. For this reason, stimulating knowledge transfer (KT) will always be one of the main concerns of universities, which seek to align their mission-related activities with the problems, demands, and interests of society.

The KT approach considered in this study focuses on the role that management models (MMs) play in the transformation of firms, particularly on the implementation of an MM called SIGET PROS by the Universidad de Envigado (IUE). The architecture of this MM is structured into dimensions, which allows for measuring and grouping sets of variables into attributes. Each attribute represents the components of each dimension, and each dimension, in turn, reflects each firm, each sector, and the characteristics of a region. With this, the purpose is to apply the holographic principle to the business field.

In this study, following a holographic approach, each attribute is thus intervened, which has an impact on each dimension and thus results in the strengthening of firms and economic sectors. This, indeed, contributes to the growth of the region where the university operates.

2. Theoretical Framework

2.1 Knowledge Management

Codification, teachability, uncertainty, and complexity are key attributes for KT (Zapata-Cantú et al., 2019) because they enhance its impact (Kogut & Zander, 2003) and reconfigure practices within industries (Sepúlveda-Rivillas et al., 2022). For their part, organisational learning (OL) (Serinkan et al., 2014), organisational knowledge (OK) (Kitapçi & Çelik, 2014), and learning organisation (LO) (Druker, 1993) have been reported to complement knowledge management (KM).

2.2 Knowledge Transfer

Categories such as knowledge sharing, knowledge capture, knowledge creation, and knowledge application flow from the university to the industry (Ibidunni et al., 2020) with varied strategies for their strengthening. In addition, they pose unique challenges to universities and focus on intellectual capital exchange (Hermans & Castiaux, 2007).

Participation, for its part, influences the outcomes and decisions made (De Silva et al., 2022), reshaping the KM practices of actors (Sucena et al., 2022) in addressing challenges through the use of new MMs. KT generates new knowledge (Mazorodze & Buckley, 2020) that is transferrable to all members of an organisation, resulting in process innovation and transformation (Nonaka & Takeuchi, 1995).

Various studies have confirmed the existence of a dynamics in KT, as well as certain limitations associated with the reconciliation between the interests of universities and the needs of firms (Segarra Ciprés & Bou Llusar, 2004). It is noteworthy to emphasise the importance of KM in organisations and its impact on individuals (Lenis, 2015).

2.3 Management Model

MMs are supported by information systems and reinforced by the learning processes of the members of an organisation (Kaiser et al., 2016). Also, they aid in the development of methodologies based on strategies that connect the different components of firms with their environment.

There is a pressing need for MMs that consider the specificities of small and medium-sized businesses (SMBs) (Peña Guarín et al., 2020; Ortega et al., 2021). Given the challenges faced by productive sectors, they require MMs to transform them, which makes the interaction between universities and productive sectors strategic (Rossetti et al., 2020).

SIGET PROS is an MM created by the IUE in collaboration with the Research and Consulting Centre of the IUE. It is based on a study of the SMBs in Medellín (Colombia), which was supported by the Aburrá Sur Chamber of Commerce and began by identifying the characteristics of the business fabric in this region. The design and architecture of SIGET PROS focus on the needs of SMBs as a tool for their strengthening. Additionally, this MM is founded on the concept of complex systems, where different agents interact (Viana Barcelo et al., 2012) to develop projects with strategies for each process. Furthermore, it is structured under the concept of comprehensive organisation (Ortiz & Pedroza, 2006) and includes the following four dimensions: people, management, structure, and environment. These dimensions, in turn, unfold into 13 attributes, and each attribute is further divided into 197 variables.

Considering the holographic principle, a change in any of the components (variables, attributes, dimensions) generates new states of order (Öberg, 2023), which is reflected in the strengthening of SMBs.

- The *People* Dimension

In SIGET PROS, the *people* dimension (PD) constitutes an important competitiveness factor (Ordóñez de Pablos & Lytras, 2008; Harney & Nolan, 2022). It includes three attributes: (i) human management as a competitiveness factor (Kim et al., 2023), (ii) organisational climate as a strengthening element (Xing et al., 2023), and (iii) organisational culture linked to innovation (Pedraza-Rodríguez et al., 2023).

- The *Management* Dimension

In SIGET PROS, the *management* dimension (MD) is crucial for the growth of firms and economies (Ma, 2023). It comprises three attributes: (i) processes, which are drivers of growth (Ramos-Gutierrez et al., 2023), (ii) functions, which play an important role in business sustainability (Macchi et al., 2020), and (iii) institutional philosophy, which embodies values for business creation (Milchram et al., 2019).

- The *Structure* Dimension

In SIGET PROS, the *structure* dimension (SD) encompasses three attributes: (i) finance, which has always been a key performance factor (Klein & Espinoza, 2022; Lerner & Nanda, 2020) requiring a structured management (Zhang et al., 2020); (ii) technology, which acts as a catalyst in organisations and can be applied to all business processes (Ancillai et al., 2023); and (iii) infrastructure and production, which represents a fundamental attribute in operations (Guise et al., 2023).

- The *Environment* Dimension

In SIGET PROS, the *environment* dimension (ED) serves as a reference for defining business policies and strategies (Wang et al., 2023). It includes four attributes: (i) appropriation of political-legal factors to define a firm's orientation (Li & Jin, 2021); (ii) context to which firms must quickly adapt; (iiI) factors associated with socio-environmental aspects (Florez Rios & Morales Sierra, 2019) that meet the demands of the environment; and (iv) aspects related to international trends, which serve as references for strategic design (Ragazou et al., 2022).

2.4 The Holographic Concept in Firms

According to the holographic principle, the whole is contained in each of its parts, just as the parts are contained in the whole (Morín, 2001). In the business field, organisational processes operate on the holographic principle (Al Jamal, 2020; Hall, 1995) similar to how the brain functions (Yazici, 2022). Each part of a firm represents the whole (Khademloo, 2021); hence, when one element is affected, all others are impacted. Likewise, interventions to firms influence the transformation of the productive fabric of a region (Brunetti et al., 2020).

In SIGET PROS, firms are conceived as a 'relational whole' in which specific properties and interdependent characteristics make sense as parts of a hologram. Each dimension represents each element that comprises a firm and allows us to understand each attribute insofar they capture the essence of reality.

2.5 Business Strengthening

The notion of business strengthening (BS) poses, as the greatest challenge, the strengthening of organisational change management (Sancak, 2023). To achieve BS, leadership from within organisations is necessary (Rave-Gómez et al., 2023).

Organisational change must be planned and guided by scientific approaches, especially MMs with defined structures and a methodology with clear and organised steps that engage all individuals in the organisation. Transformations within a firm are linked to its environment and dependent on the changes that may occur in the sector to which it belongs (Mouzas, 2022), just as a network of relationships within and around organisations (Capello & Cerisola, 2023). Furthermore, the outcomes of business transformation (BT) depend on the interventions made in the dimensions that constitute the architecture of the firm (Haftor & Climent Costa, 2023).

Thus, implementing an MM with an architecture that aligns with the characteristics required in the sector and its environment favours a greater impact in achieving business objectives (Worasinchai et al., 2008).

3. Methods

This research, which was conducted over the course of eight years, focused on examining the impact of KT from the university to the industry through the implementation of a set of strategies defined in an MM (SIGET PROS). Following an experimental approach, mixed methods research was used to collect and analyse data from 52 firms in Medellín between 2015 and 2022 (Figure 1). This was done given the complexity of the phenomenon under study (Cameron et al., 2013; Buckley, 2015; De Lisle, 2011) while maintaining academic rigor (Stockman, 2015).

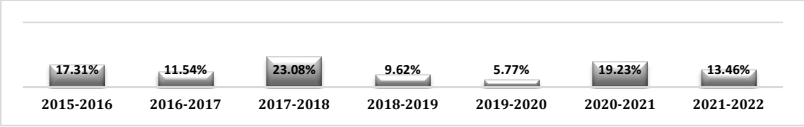

Figure 1: Distribution of Firms by Year

Data collection included two stages: (i) initial diagnosis (MET1) using four techniques (direct observation, document review, interviews, and focus groups), and (ii) measurement and analysis of results with experts from the university and executives from the firms (Magnani et al., 2023) using the Likert scale of SIGET PROS (Table 1).

Table 1: Data Measurement Scale

LEVEL	*SCORE*	*DESCRIPTORS*
ADVANCED	*8.0–10.0*	*High levels of achievement, documented evidence, progress in processes, dissemination of information, technological support*
VIABLE	*6.0–7.9*	*Some advances, some evidence, adjustable processes, concentrated information, some technological aspects*
WARNING	*4.0–5.9*	*Little evidence, failures in processes, poor documentation, obsolete technology, scattered information*
RISK	*0.0–3.9*	*Scarce evidence, outdated documents, scarce technology, diffuse information, lack of clarity in processes*

Source: Authors' own work.

After data collection, SIGET PROS was implemented in each firm (experimentation phase), which entailed the creation and implementation of a strategic plan. The resulting information from monitoring the variables (MET2) was collected in each firm over a period of six to twelve months.

Table 2: Distribution of Firms by Sector

SECTOR	***% OF FIRMS***
FOOD SECTOR	***11.54%***
COMMERCIAL SECTOR	***7.69%***
INDUSTRIAL SECTOR	***32.69%***
SERVICE SESCTOR	***36.54%***
TEXTILE SECTOR	***11.54%***
Total	***100.00%***

Source: Authors' own work.

One component of this study sought to investigate BT and BS in the economic sectors and productive fabric of the firms under analysis. To that end, the measurements before (MET1) and after (MET2) KT were compared and then analysed against the growth of the sectors in the region.

This paper aimed to provide an analysis, from a holographic perspective, of all the intervened firms and the economic sectors of the region. For such purpose, the following two questions were addressed:

- What transformations are evidenced in the firms after implementing SIGET PROS?
- How are the transformations in the productive fabric of the region reflected in the BS measurements of the firms in which SIGET PROS was implemented?

Figure 2 shows the analysis strategy for comparing the results per sector with the average MET1 and MET2 data. Such analysis includes the dimensions, firms, and economic sectors of the region.

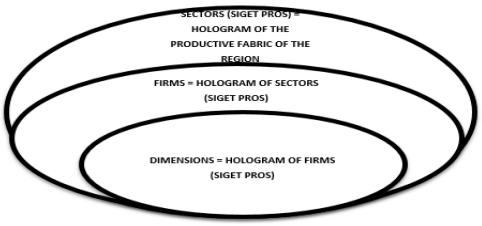

Figure 2: Analysis Strategy Using a Holographic Approach

4. Findings and Discussion

4.1 Results

Figure 3 presents the average measurements provided by SIGET PROS, with the following results for BT: 0.947 for the food sector, 0.939 for the commercial sector, 1.04 for the industrial sector, 0.993 for the service sector, and 1.065 for the textile sector. The percentages shown in Table 3 were calculated using the MET1 data.

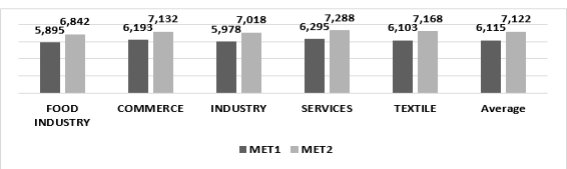

Figure 3: MET1 and MET2 Data by Sector

As shown in Table 3, the difference between MET1 and MET2 data was used to calculate the strengthening percentages of each economic sector when SIGET PROS was implemented, which were distinguished per dimension. By averaging these percentages, it is possible to estimate BT in each sector.

Table 3: Business Strengthening by Sector After Implementing SIGET PROS

% TRANSFORMATION BETWEEN MET1 AND MET2 – SECTORS AND DIMENSIONS					
Sector	*BS - FIRMS*	*BS - PD*	*BS - MD*	*BS - SD*	*BS - ED*
FOOD SECTOR	*16.061*	*17.065*	*28.216*	*12.329*	*12.910*
COMMERCIAL SECTOR	*15.157*	*13.233*	*27.146*	*12.361*	*14.695*
INDUSTRIAL SECTOR	*17.398*	*17.467*	*48.168*	*14.512*	*14.762*
SERVICE SECTOR	*15.782*	*17.139*	*19.171*	*17.926*	*22.043*
TEXTILE SECTOR	*17.440*	*19.785*	*17.300*	*18.811*	*19.067*
Overall average	*16.472*	*17.243*	*30.092*	*15.838*	*17.700*

Source: Authors' own work.

During and after the COVID-19 pandemic, the evolution of the region under analysis was characterised by the following:

- It is estimated that, by the end of 2020, the region's economy experienced a negative growth, with a rate ranging between -6% and -7% (Cámara de Comercio de Medellín para Antioquia [Medellín-Antioquia Chamber of Commerce], 2021). As can be seen in Table 4, before the pandemic, most sectors (except for the industrial sector) were experiencing growth.

Table 4: Region's Economic Growth by Sector

YEAR/ SECTOR	*FOOD SECTOR*	*COMMERCIAL SECTOR*	*INDUSTRIAL SECTOR*	*SERVICE SECTOR*	*TEXTILE SECTOR*
2016	*1.7*	*7.5*	*-0.1*	*2.4*	*2.1*
2017	*2.4*	*1.3*	*-5.1*	*3.2*	*1.4*
2018	*2.8*	*4.6*	*1.5*	*4.7*	*2.7*
2019	*3.2*	*5.4*	*-0.4*	*5.1*	*4.8*
2020	*4.2*	*-4.4*	*-9.5*	*-12,0*	*-22.5*
2021	*9.9*	*18.4*	*20,7*	*28.1*	*44.0*
2022	*4.7*	*8.0*	*10.8*	*12.5*	*17.6*
AVERAGE	*4.128*	*5.828*	*2.557*	*7.828*	*7.157*

Source: Authors' own work based on data from the Medellín-Antioquia Chamber of Commerce and FENALCO.

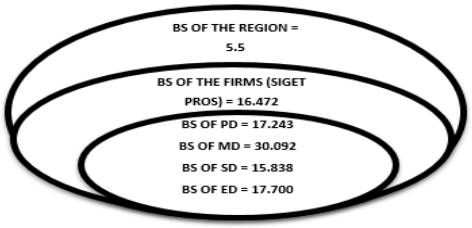
- In the year of the pandemic (2020), only the food sector showed a positive growth; the others experienced a considerable decline in growth. According to estimates, the region's economy experienced a negative growth, with a rate ranging between -6% and -7% (Cámara de Comercio de Medellín para Antioquia [Medellín-Antioquia Chamber of Commerce], 2021)
- All sectors witnessed a strong post-pandemic recovery and, by the end of 2021, showed a significant growth, surpassing 6% (Cámara de Comercio de Medellín para Antioquia [Medellín-Antioquia Chamber of Commerce], 2021). In 2022, all sectors maintained a positive growth trend.

4.2 Discussion of the Results

4.2.1 Analysis using a holographic approach

The proposed analysis outlined in the methodology is illustrated in Figure 4. This figure shows an overlay of the data using the BS values that were estimated based on the difference between the MET1 and MET2 data provided by SIGET PROS and that were compared with the growth rates of each sector in the region. As observed,

each dimension impacts the BS of the firms, and the BS of each firm impacts the BS of the sector to which it belongs, which, following the implementation of SIGET PROS, also impacts the growth of the region.



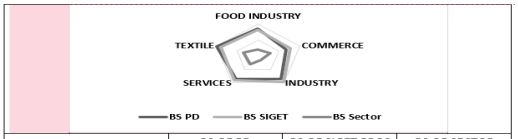


Figure 4: Analysis Strategy Using a Holographic Approach

When applying a holographic approach, the results are reflected in the relationships outlined below.

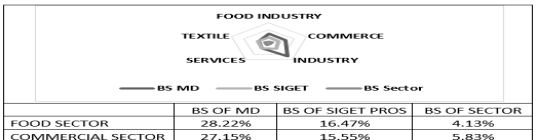

Table 5: Hologram of the People Dimension by Sector

	BS OF PD	BS OF SIGET PROS	BS OF SECTOR
FOOD SECTOR	17.07%	16.47%	4.13%
COMMERCIAL SECTOR	13.23%	15.55%	5.83%
INDUSTRIAL SECTOR	17.47%	19.46%	2.56%
SERVICE SECTOR	17.14%	18.16%	6.29%
TEXTILE SECTOR	19.79%	17.94%	7.16%
Total	17.24%	18.16%	5.19%

The BS of the PD was found to impact all firms in each sector (Table 5) and to influence the strengthening of the sectors in the region.

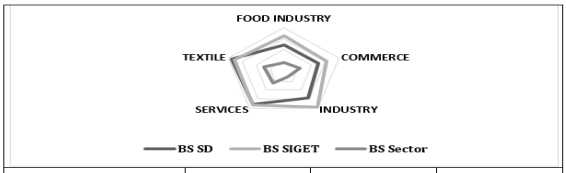

Table 6: Hologram of the Management Dimension by Sector

	BS OF MD	BS OF SIGET PROS	BS OF SECTOR
FOOD SECTOR	28.22%	16.47%	4.13%
COMMERCIAL SECTOR	27.15%	15.55%	5.83%
INDUSTRIAL SECTOR	48.17%	19.46%	2.56%
SERVICE SECTOR	19.17%	18.16%	6.29%
TEXTILE SECTOR	17.30%	17.94%	7.16%
Total	30.09%	18.16%	5.19%

The MD, for its part, showed the highest BS when SIGET PROS was implemented. It was found to significantly impact the firms in each sector, and its effects on the region are evidenced by the growth experienced in the sectors (Table 6).

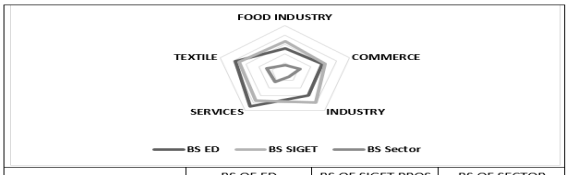

Table 7: Hologram of the Structure Dimension by Sector

	BS OF SD	BS OF SIGET PROS	BS OF SECTOR
FOOD SECTOR	12.33%	16.47%	4.13%
COMMERCIAL SECTOR	12.36%	15.55%	5.83%
INDUSTRIAL SECTOR	14.51%	19.46%	2.56%
SERVICE SECTOR	17.93%	18.16%	6.29%
TEXTILE SECTOR	18.81%	17.94%	7.16%
Total	15.84%	18.16%	5.19%

In the SD, only the service and textile sectors exhibited a BS higher than the average value of the firms in the sector. In any event, their contribution to the region's growth is clear, as their growth rate exceeds that of the other sectors.

Table 8: Hologram of the Environment Dimension by Sector

	BS OF ED	BS OF SIGET PROS	BS OF SECTOR
FOOD SECTOR	12.91%	16.47%	4.13%
COMMERCIAL SECTOR	14.70%	15.55%	5.83%
INDUSTRIAL SECTOR	14.76%	19.46%	2.56%
SERVICE SECTOR	22.04%	18.16%	6.29%
TEXTILE SECTOR	19.07%	17.94%	7.16%
Total	17.70%	18.16%	5.19%

Finally, although the majority of the variables in the ED were external, a significant BS was obtained, contributing to the BS of the firms in all sectors and to the region's growth.

4.2.2 Comparative analysis with other studies

In their study, Sucena et al. (2022) emphasised firms' need for KM and KT, which drives them to implement strategies similar to those considered in our research, such as including the PD, the SD, and the ED.

For their part, Macchi et al. (2020) highlighted the importance of measuring the continuous improvement of firms using reliable techniques. In this study, we measured BT in each dimension and in the firms across sectors by implementing SIGET PROS.

Moreover, Al Jamal (2020) used the holographic principle to analyse how the flow of information influences transformations within firms, allowing the integration of the parts into the whole. This approach is similar to the one considered in the implementation of SIGET PROS, with which we sought to integrate each variable into its respective attribute to thus impact each dimension, firm, and economic sector. As a result of this, the growth of the region's productive fabric is impacted as well.

The BS strategy developed through SIGET PROS (with its architecture structured into dimensions) shares similarities with the proposal of Sancak (2023), who underlines the need to intervene in factors such as governance (the MD), human resources (the PD), technology implementation and financial management (the SD), and customer and supplier management (the ED). In Sancak's study and in our study, firms' possibility of transitioning from their current state to a desired state is a topic of interest.

5. Conclusions and Limitations

The purpose of this study was to analyse, from a holographic perspective, a set of firms and evidence their transformations after implementing an MM called SIGET PROS. Particularly, we were able to evaluate BS through a series of measurements and its contribution to the advancements achieved in each economic sector. The analysis revealed that this is a global concern, and our findings were compared to those of other studies.

We can observe that each sector is strengthened after applying SIGET PROS (Table 3). When comparing the results obtained in the region, the measurements indicate the MM impact on the dimensions, the firms, and the sectors. This is evidence of the holographic vision in the monitoring of the transformations obtained using the MM.

Commented [JHBA1]: Added paragraph

Each transformation accomplished in the dimensions, firms, and sectors under analysis reflect the advancements in the productive fabric of the region; and the estimated measurements, the growth of the different sectors where the IUE operates. This confirms the importance of the strategies applied by universities (through KT) to impact the productive fabric in the regions of influence.

Following the (holographic) analysis approach, the impact of each dimension on the BS of the firms is evident. The BS of each firm impacts the BS of the sector to which the firm belongs, thus impacting the growth of the region.

Consequently, continued work in each of the dimensions of the firms will have an impact on the growth of the sectors, achieving a constant transformation of the regions, as evidenced in the results of each of the dimensions (PD: 17.24%, MD: 30.09%, SD: 15.84%, ED: 17.70%). In all cases, progress is above what has been achieved in the region.

Commented [JHBA2]: Added paragraphs

In conclusion, in order to consolidate the KT processes aimed at contributing to the strengthening of the productive fabric of economic sectors and regions, it would be advantageous to keep building trust relationships between universities and firms.

Abstract: Knowledge Intensive Business Services (KIBS) – i.e. companies like e.g. computer services, consulting, engineering, business communication, and R&D support - are key players in the modern economies. They stimulate the innovativeness of businesses and societies. Their competitiveness is based on knowledge, which is their key production factor and also the kind of "goods" they sell. The large majority of KIBS companies have a small or medium size, which leads to major challenges because they manage their cognitive assets in a substantially informal and undeliberate way. They face several obstacles to managing knowledge, partly due to their limited resources, but also to the knowledge-intensive and intangible nature of their business processes and outputs. Such challenges, when not successfully identified and faced, may negatively impact competitiveness. The paper illustrates the findings of a qualitative investigation aimed at exploring the main KM challenges that KIBS SMEs face. These challenges were analysed with specific reference to the key KM processes, i.e.: knowledge acquisition, knowledge documentation and storage, knowledge sharing, knowledge application, and knowledge protection. The research is a multiple-case study based on interviews to key informants of 23 Italian and Polish KIBS SMEs of different sectors. The analysis made it possible to find recurring issues and highlight differences. The study provides food for thought for researchers and practitioners willing to clarify what KM processes need proper solutions for the effective management of knowledge in small KIBS.

Keywords: KIBS, Knowledge management challenges, Multiple case-study

1. Introduction

Knowledge Intensive Business Services (KIBS) are key players in modern economies (Kamp & de Apodaca, 2017; Pina & Tether, 2016; Tuominen & Toivonen, 2011) because they can stimulate the innovativeness of the economy (Liu et al., 2019; Shearmur & Doloreux, 2019). These companies ground their competitiveness on the capability to manage knowledge (Miles et al., 2018; Palacios-Marques et al., 2011), which is the key factor of service production and the kind of "goods" they sell (Strambach, 2008). The KIBS sector includes different companies ranging from technological KIBS (for example, computer services) to professional KIBS (such as e.g. legal services) and creative KIBS (for instance, advertising and media management). The large majority of KIBS companies have a small and medium size (Zieba, 2021) and, while empirical evidence (Bolisani et al., 2022) proves that they are aware that knowledge is their most crucial resource, they manage it in a substantially informal and undeliberate way (Bolisani et al., 2016; Alexandru et al., 2020). In general small companies face several issues in knowledge management (Massaro et al., 2016; Durst et al., 2022; Shekhar & Valeri, 2023), largely due to their limited size which results in scarcity of human and financial resources, lack of time, and short-term orientation. In the specific case of KIBS, they can encounter specific challenges, mainly due to the intangible and knowledge-intensive nature of their business processes and outcomes. These challenges can negatively impact competitiveness and organisational performance.

Research about how small and medium sized KIBS companies manage their knowledge is still limited (Bolisani et al., 2022). To contribute to fill this lack of knowledge, this paper investigates the challenges faced by KIBS SMEs by means of a multiple case-study analysis conducted on 20 KIBS companies of various sectors in two countries. The analysis aims at finding regularities and differences across companies.

2. KM Challenges and Processes

It is useful to introduce what we mean by "knowledge management challenges". As mentioned earlier, the large majority of KIBS companies have a small or medium size and they face obstacles to managing knowledge, in part due to their limited resources, in part to the knowledge-intensive and intangible nature of their business processes and outputs. Research on KM in SMEs in general and KIBS in particular (Siahtiri et al., 2020; Durst et al., 2022; Zbuchea et al., 2023; Massaro et al., 2016; Shekhar & Valeri, 2023) suggests that these firms face different issues and often lack both dedicated approaches to KM and the necessary skills as well as competencies necessary to implement proper knowledge management (KM) processes. At the same time, these firms are exposed, more than others, to skill shortage and to risk related to environmental change, progressive digitalization, and increasing geopolitical risks. The term ''challenge'' is a broad term that encompasses several types of difficulties faced by companies. Thus, to have a common understanding of the term and define the scope, in this study, we define and consider ''knowledge management challenge'' as the *current or future organisational difficulties for KIBS SMEs that may require the proper application of KM processes to address these difficulties successfully.* Addressing these challenges can also lead to the discovery of knowledge gaps or risks that need to be tackled. Upon that basis, an effective KM implementation will ensure proper management and understanding of knowledge resources which will ultimately lead to organisational development and higher performances.
The study analysed these challenges with specific reference to the key KM processes. In the literature, different directories of KM processes have been published (Heisig, 2009; Edwards, 2015; Costa & Monteiro, 2016). This study considers five main KM processes, i.e.: knowledge identification and acquisition, knowledge documentation and storage, knowledge sharing, knowledge protection, and knowledge application. Knowledge identification refers to the activities that help a company to detect the knowledge necessary for its business (Durst & Edvardsson, 2012). Organisations engage in knowledge acquisition when they lack the internal resources to successfully innovate (Maes and Sels, 2014). The question of where and what knowledge to look for is often a challenge for small KIBS.

The process of documenting and storing knowledge is another critical activity, particularly in the case of KIBS SMEs due to lack of people and time. Properly documenting a company's key knowledge and managing the digital or physical documents can lead to higher organizational performance but can also require increased security, ease of retrieval or reuse, access control (Zaim, et al., 2019; Andreeva and Kianto, 2011; Ramadan et al, 2017). Knowledge sharing can be defined as "the act of placing knowledge possessed by an individual at the disposition of others within the organisation" (Camelo-Ordaz et al., 2011). It is a key activity to facilitate managing innovation and avoiding "reinventing the wheel", aligning employees to the company's business, and avoiding obsolescence of services.

Knowledge protection refers to the measures taken to limit risk of leakage in companies, like KIBS, that depend on knowledge for their competitive advantage (Liebeskind, 1996). Protection mechanisms can be applied to the technical infrastructure, but other forms of protection should also be considered that govern the behaviour and conduct of employees (Liebeskind, 1996; Yu, 1999). Finally, knowledge application refers to the proper use of knowledge to provide the right services to the market. As stated by Bhatt (2001), applying knowledge means making it "more active and relevant for the organisation in creating values".

In substance, this study is based on two main assumptions. First, small KIBS companies face peculiar challenges with their KM approaches, and identifying and analysing these recurring challenges is important so as to make companies aware and provide possible remedies that can be implemented while performing different KM activities. Second, the identification and analysis of these KM challenges can be appropriately conducted by considering that KM can be divided into a number of critical processes implying special issues and methods.

3. Methodology

The study addresses these research questions:

RQ1: What are the main difficulties that KIBS SMEs meet in their KM processes?

RQ2: What recurring challenges emerge from the analysis?

Given its exploratory nature, the research used a multiple case study approach (Yin, 2018) and consisted of a series of interviews with key informants from 13 KIBS SMEs in Italy and 7 in Poland, belonging to different sectors (ICT services, professional services, consulting services, legal and administrative services). The choice of these two countries were made only for reasons of convenient access to companies and data. The extension of the

analysis to more than one country was considered useful to check if there are recurring challenges regaredless the country of operation.

The interviews were carried out between May and September 2022 and were based on a list of questions sent in advance to the interviewed people. The interviews were recorded and then transcribed. To support the analysis, an Excel file was created in which all the answers were reported. This helped researchers compare the data, find similarities or differences, and draw conclusions, substantially by means of an application of discourse analysis (Miles and Huberman, 1994).

4. Findings

4.1 Knowledge Search and Acquisition

Italian companies affirmed that there are several challenges concerning the identification of knowledge gaps to be filled, localisation and access to the external sources from which the needed knowledge can be acquired. Challenges can be subdivided into two categories, i.e., human-related and source/knowledge-related challenges.

As for human-related challenges, lack of time is the most relevant. Although it affects all KM processes, it results particularly crucial here, since it can imply that the needed knowledge is collected too late for a client's problem. In fact, employees are usually busy with daily activities and they have little time to devote to new knowledge search and acquisition. Other human-related challenges were indicated by Italian companies, such as lack of

motivation of employees to search for new knowledge; also, many are not particularly open minded and they are confident that the ”old knowledge” is enough. Instead, young people have little experience and generally tend to simply rely on technologies for knowledge search.

As for source/knowledge related challenges, there is an increasing speed of knowledge obsolescence which calls for a continuous effort of search. Another possible issue is information/knowledge overload. Companies have to deal with an enormous amount of knowledge available in the environment and it is difficult to make a selection. Sourcing costs are increasing, both in monetary terms (if content has to be paid for) and in terms of time to absorb the acquired knowledge.

The main challenges of knowledge acquisition for Polish companies relate to the issue of adapting external knowledge to organisation's internal needs. This is because the activity of KIBS is generally based on projects, which require a wide variety of knowledge that is tailored to the needs of a particular client. Therefore, the challenge is to have diverse sources that can fill in the gaps. This is confirmed in one of the interviews: “*Challenges are project-specific. Implementing different projects requires different capabilities*”.

With regard to the expertise, there were voices regarding the discrepancy between the company's requirements and the experts' competencies, which, although formally confirmed, do not always turn out to be adequate to the needs arising from the implementation of specific projects. Another challenge that was strongly emphasised by respondents was the issue of financing externally sourced knowledge. This is especially the case of expertise in special areas which, being scarce (and thus difficult to identify and acquire), can be acquired at a significant cost.

Another difficulty faced by Polish KIBS is the lack of time. Time shortage is challenging in work management, but also in professional development, as was indicated by one of the interviewees: “*I think that such a problem may be the employee's lack of time to attend the training - because such training takes a lot of time, due to many duties it is sometimes difficult to save a few hours.*”

Additionally, the interviewees pointed to the importance of motivation and the resistance to thinking beyond the area of responsibility especially for young generations. Among other challenges reported by Polish informants there were: employees rotation and the age-old dilemma of when to invest (in terms of new employees) and how much to invest; financial challenges - hiring experts to fill important knowledge gaps is very expensive; finding good, highly qualified and willing to cooperate experts; unwillingness to share knowledge from people who have valuable knowledge; and project-specific challenges (i.e.: implementing different projects requires different capabilities).

4.2 Knowledge Documentation and Storage

Documentation is an essential activity that raises several challenges for Italian KIBS, as well represented by what was affirmed by an Italian company: “*Documented knowledge can be regarded as a library, and hence its management requires you to answer several questions, as follows: How should documentary material be organised? How to inform people about new material? How to induce people to contribute with new material? How to improve the readability of the material?*”.

A well organised and documented knowledge archive is needed to make it easily retrievable, which can be achieved by means of an efficient classification; but Italian companies agree that classifying documents is challenging, because it requires time especially to classify old materials, and different classification methods and logics may be applied even to the same document. In addition, employees need to be kept updated about the new knowledge contents that are added to the document management system and can be of their interest. Many companies affirm that it would be good to have a “librarian”, but this is very difficult given their limited size and it is hard to assign this exclusive task to an employee.

A recurring problem of Italian companies is how employees can be stimulated to document their knowledge promptly to avoid forgetting important aspects. An important factor is the time of reuse (i.e., how long it will take for a stored knowledge content to become useful for another employee). If this time is long, it is difficult to convince people to document knowledge when they feel they may not need it again in the future, because they may change companies in the meanwhile. In short, if there is no immediate return of knowledge storing, they may not be inclined to do it. In addition, most of the technical staff is generally reluctant to produce written documents about their activity, as they prefer to focus on more practical and operative activities.

A final point is about the understandability of contents. Some interviews said that young generations are less familiar with writing a formal report, and that they often use a “Whatsapp style”. In any case, it is not easy to

establish a writing standard style inside a company because every person, regardless of his/her education level, has own specific writing format. Different people also use different languages and even jargon, and this issue worsens the more areas of specialisation (and people) there are in the company. People of different educational backgrounds (e.g., business managers with computer engineers) or different application/technology areas (e.g. systems engineers and software developers) may find it difficult to communicate.

4.3 Knowledge Sharing

All Italian companies underlined that direct sharing by interactions is as essential as documentation, and they complement each other. Sharing allows people to align on common terms and perceptions of problems, which also makes the understanding of written documents easier.

Lack of time is, again, one of the most important challenges to knowledge sharing and is strictly connected with the small size of companies. A recently found challenge is the increasing recourse to remote work, which has become common with COVID. It is general opinion that the progressive replacement of face-to-face meetings with virtual meetings has a negative effect on knowledge sharing. In particular, a lower presence in the office considerably reduces the opportunities for informal knowledge exchange.

The biggest issue, however, is how to promote knowledge sharing, that is, how to build a knowledge sharing attitude of people. The common opinion of companies is that this is a cultural and personal issue concerning aspects such as individuals' characteristics (e.g., age, gender, educational background) and personal attitudes (e.g. loyalty, generosity, kindness, sincerity, mental openness); but organisational structure and managerial style also count, as well as the languages and jargon used, and the working habits and routines.

As for the Polish companies, the challenges of knowledge sharing are considered in the internal context and externally (e.g., with partners). As regards the first aspect, the challenge is to properly establish access levels to knowledge for individual employees of the organisation. As for the second aspect, sharing knowledge outside the organisation poses the danger of its appropriation by entities not authorised to do so (e.g., competitors). Many Polish interviewees indicate, again, that lack of time to share knowledge with others is a major challenge: "*The main challenge is the lack of time to share knowledge. I think it would be nice if we had regular workshops where we could verify the acquired knowledge and cascade into the team. […] This shortage of time simply means that we do not have the financial capacity to say "okay, now 15% of everyone's working time is exchanging knowledge" - this cannot be done yet."* Another important difficulty is how to stimulate knowledge sharing. There may be cases when an employee takes part in a training activity and later does not share the knowledge gained there with the colleagues.

Some of the challenges mentioned by the study participants refer to the proper adjustment of knowledge so that it is accessible for everyone, and knowledge adequacy. Another issue is when there is too late or incomplete knowledge sharing, which consequently can lead to the phenomenon of "opening an already open door". Other important issues are: the danger of sharing knowledge with competitors, the lack of formalisation of the whole knowledge sharing process, the high complexity of some projects and the difficulty in transferring knowledge to other team members.

4.4 Knowledge Protection

This is not perceived as a particularly critical issue by Italian companies. Challenges concern the protection of stored knowledge, i.e. the company document management systems, and of the knowledge possessed by employees, i.e. that is in their minds. The former is generally protected by means of technical solutions and by cybersecurity. The latter by means of confidentiality agreements. Anyway, Italian companies affirmed that the continuous innovation and extreme customisation of today's business is, itself, an effective protection from imitation by competitors. To sum up, even if knowledge protection can in principle be a problem, in reality none of the Italian companies affirmed they have suffered relevant "knowledge theft".

As regards Polish companies, relatively few challenges were identified . Perhaps this is due to the fact that they are already aware of the legal protection of intellectual property. In addition, being aware of the need to protect knowledge on the Internet, they are taking many cybersecurity measures. Nevertheless, they show constant vigilance in both areas, on the assumption that it is still necessary to look for improvement, due to the fact that knowledge as a resource is difficult to protect and easy to "grab" by the others.

Among the difficulties signalled by Polish KIBS SMEs, there is an uncontrolled leakage of knowledge combined with unethical knowledge sharing outside the organisation (for instance, the use of internal materials). An interviewee reported that a person came to work in the company for 3 months (the trial period) and when he

was offered to stay, he resigned. There was no justification for leaving the job, so he was suspected to be a "knowledge theft" by the manager. To overcome this kind of problem there is the necessity to choose the right employees and motivate them well.

4.5 Knowledge Application

For Italian companies, it refers to delivering services that can satisfy the clients' needs and solve their problems. Furthermore, since clients are directly involved in the service delivery process, very often they give a substantial contribution to its success, also because their feedback provides knowledge itself. Hence, a common problem of Italian companies is to collect from and transfer to the client all the knowledge needed for a valuable service. This raises several challenges including e.g.: fully understanding the real problem of the clients; analysing their problems at an appropriate level; establishing effective communication with the clients; synthesising the results to give the customers the "proper answers"; avoiding clients using knowledge incorrectly. Another special challenge refers to the most complex services where various pieces of knowledge, coming from different areas, must be integrated.

For Polish firms, the challenge in applying knowledge is the need to constantly update and develop it. An additional challenge is the ability to adapt existing knowledge in ongoing projects, in various aspects. A further difficulty is that in each project there is an element of new knowledge that needs to be assimilated and applied in conjunction with the existing pool of knowledge. Polish KIBS representatives identified several problems in terms of knowledge application. For instance, the insufficient acquisition of knowledge by employees (which makes the application difficult) and frustration caused by the "trial and error" process while applying new knowledge. Additionally, some other challenges were highlighted by the informants such as: no time to transform the knowledge into action, products/projects created for a specific order (they are many and must be tailored to the specifics of the client, so there is always an element of new knowledge that has not considered before and that must be now applied).

4.6 General Issues

The research shows that a major challenge for KIBS is to constantly update its knowledge base, given the speed of change in various industries. This entails constantly monitoring the market and acquiring up-to-date knowledge. As the respondents emphasized, the difficulty in this area is not at all about technology, but about human resources - experts with knowledge and skills that are relevant at a given time. Linked to the above is a second challenge pointed out by respondents, namely the need for knowledge-sharing partnerships, which could be key to constantly updating the knowledge package. Cluster cooperation, which was cited by respondents, could be a good practice.

Another issue that came up in the survey is the need to take a holistic view of the knowledge resources held in terms of identifying gaps and sources of knowledge (both internal and external). A major challenge is to ensure knowledge continuity in the face of high employee turnover. This raises serious problems especially in those companies that do not have developed practices for knowledge codification.

The informants were asked to indicate the biggest knowledge-related challenges that their companies meet on a daily basis or have coped with in the past. As the findings suggest, for Polish KIBS, the biggest challenges are: "transition from the old to the new", leaving the company by the employee and loss of their knowledge, and time. Some informants also stated that keeping the knowledge in the employees' heads (with accompanying lack of knowledge exchange) and insufficient internal communication were the issues their companies struggled with in the past. Among other important difficulties, the participants also mention: cooperation with external experts (their knowledge, skill level, commitment, etc.), managing current knowledge (continuity of knowledge, updating knowledge, etc.), technology development, cloud solutions.

5. Discussion

The findings of this study point out some differences but also several recurring situations between the Italian and Polish KIBS companies. We will explicitly focus on these similarities, which show that there are some common traits of small KIBS, regardless of their country of operation. A shared point is the lack of time, which was signalled to be one of the key factors affecting the effectiveness of KM processes. Both Italian and Polish KIBS specifically indicated that this problem is crucial for the process of knowledge search and acquisition. Another common issue in this KM process is the lack of motivation or experience to acquire new knowledge – some employees might be prone to stick to the old solutions, which used to work in the past. Also, there is an issue of employees leaving the company and "taking away" their knowledge. Another issue is related to

technological solutions – they might be too excessively used and also, cause some overload with information and knowledge one might need to obtain.

As for the process of knowledge documentation or storage, Italian companies, which perform such activities on a large scale, signal the problems to define the right classification system and to make it used by all the employees who need it. The same was indicated by Polish firms. Another common issue is the quality of language used in documenting knowledge and the different jargons/specific languages that may be used by different professionals.

Knowledge sharing is another important KM process. There are some recurring issues there, too. For example, how to encourage people to share knowledge or how to keep this process alive in the era of remote work, after it was extensively introduced with the COVID-19 pandemic and is now commonly used in companies. At the same time, there is a problem with potential knowledge theft or loss when knowledge is improperly shared with external partners, as indicated by some Polish firms. Knowledge protection does not seem to be a challenge, nor for Italian and neither for Polish firms. Perhaps this is because KIBS companies are often aware of the risks related to the use of the Internet and they try to protect themselves. Also, services are so customised that their application to specific clients requires the use of localised knowledge that can't be easily imitated by competitors.

Finally, knowledge application is supposed to help in delivering knowledge to the customer according to their needs. This can be problematic when there is no common agreement and understanding of the problems and the prospective solutions between the customer and the KIBS firm. This was indicated by both Italian and Polish companies. Also, there is a problem with lack of time for absorbing new knowledge and then applying it in the context of new projects and challenges.

6. Conclusion

This study aimed to illustrate the key KM challenges of small KIBS companies. These challenges were identified by means of extensive case study research focusing on the main KM processes.

An interesting finding is that companies signal some recurring challenges, regardless their sector and even their country of operation. This means that small KIBS have common traits and characteristics. A primary problem in KM is the lack of time, which affects the effectiveness of KM processes. This clearly depends on the small size and the limited resource of companies, but can also signal that, although companies are aware that knowledge is their critical resource, KM is still not considered a really core strategic activity for the management of the business. This provides interesting insights into a topic that has not been studied in detail so far.

The investigation has the typical limitations of a case study methodology, and especially the difficult generalisation of the results. In addition, the study examined KIBS companies of two countries only, namely Poland and Italy. As a case study research, its results cannot be statistically generalised for the whole groups of KIBS firms in those two countries, even though the large number of companies in the sample makes it possible to get useful lessons as regards the potential recurrence of KM challenges in KIBS companies. In any case, there is an opportunity for future research to confirm the preliminary findings of this analysis, for example, by means of quantitative surveys at national or international levels. Another important line of research can consist of an analysis of differences or similarities across companies of different specialisation (i.e., Professional, Technical, or Creative KIBS).

Instrumental and Integrative Ethics in the Context of a Knowledge Management Policy

Manfred Bornemann
Intangible Assets Consulting GmbH, Graz, Austria

bornemann@ia-consulting.at

Abstract: Governance structures and Knowledge Management Systems standards such as ISO 30401 and ISO 9001 ask for policies for knowledge management but leave open, how such a policy might be detailed. Depending on the preferences of owners, management or more extensive stakeholder groups, the assumptions about what is good and can therefore be considered as ethical, vary substantially. In the German literature, two authors represent two extremes of a wide spectrum of business ethics: Peter Ulrich and his Integrative Economic Ethics (Ulrich, 2007), positioning ethical behavior above all other corporate objectives on the one (politically left) side and Karl Homann with the Instrumental Ethic (Homann, 1999) and the general idea to maximize shareholder value on the other (politically right) side. Both European continental authors are distinct from the Anglo-American tradition of "business ethics" represented by Solomon (1994), Donaldson and Dunfee (1999) or Freemann (1984), who are, in general, less focused on principles, but suggest procedures that avoid risks for organizations (or their top managers) of being framed as unethical. Knowledge as an intangible asset and different to tangibles such as money, goods, or infrastructure, is usually not controlled by investors, but by employees of an organization and thus affects problems of agency (Jensen, 1976) or stewardship (Donaldson, 1982) in corporate governance. Questions of ownership, modes of sharing and transferring knowledge to development of new knowledge and strategies of utilizing knowledge to create value need to be answered in a way to attract the best knowledge professionals. The answers might help formulate a formally consistent policy for knowledge management that considers either position – or come up with a more balanced approach, which could be implemented with established governance structures or ethic management systems (Wieland, 2014). This paper discusses two qualitative positions of Homann and Ulrich in the context of knowledge management systems and knowledge as a corporate resource with the ambition to suggest recommendations to formulate a knowledge management policy that delivers on the formal requirements of ISO 30401.

Keywords: Knowledge management, Policy,lintegrative ethic, Instrumental ethic, ISO 30401

1. Introduction - Collaboration Versus Competition in the Knowledge Economy

Deciding between two alternatives is the daily business, not only of top management, but of most knowledge professionals. Allocating time of experts is the one genuinely limited resource. Usually, it is easy to decide, thanks to clear preferences and priorities regarding e.g., minimizing costs, delivery time or maximizing quality. However, a dilemma situation is interesting. The prisoner's dilemma and its implication on corporations was discussed extensively (March, 1962, Cyert and March, 1993 or Kreps, 1990) and delivered a standard solution. "Collaboration" turned out to be a risky but cost-minimizing strategy in the game. In the realities of a market economy and when pushed to extremes, collaboration shows negative consequences as it counters the market-inherent element of competition. It is not desired to collaborate and to create an oligopoly or monopoly situation, as this would leave consumers no choice, allow for excessive profits and is therefore in most developed markets regulated.

Behaving collaboratively or competitively is usually a consequence of values and beliefs of decisionmakers (Sen, 1977, Becker, 1996, Kahneman, 2003). It is therefore established good practice for most large and mature organizations to reflect on their values and publish a value statement at least internally. Smaller organizations who have not yet reached maturity usually have implicit values and depend on their leadership. On a local level this works fine. It becomes a challenge, once the orientation shifts from local to global with its huge diversity of values and behaviors, sometimes causing frictions and frustrations, potentially even substantial conflicts. From a business perspective, this adds costs or weakens competitiveness. It is therefore reasonable to reflect on the links between values, explicit policies, and corporate governance to minimize unnecessary costs.

Corporate values impact all functions of an organization. It is therefore not surprising that policies for quality management, risk management or corporate social responsibility, to name a few, refer to these foundations. The same request is outlined in the current standard for knowledge management (KM), ISO 30401 (2021). However, as a norm-paper suggesting a management system that is applicable in a general context, it remains vague how to do this. Most of the established literature supports culture development processes and provide advice on continuous monitoring but abstains from specific recommendations because of the individual nature of organizations (Kotter, 1992; Collins, 1996; Garvin, 2008, Schein, 2010; Edmonson 2018). It remains

interesting to investigate the fundamental beliefs and how concepts from business ethics might be useful for orientation when searching for a policy on KM.

The second section of this paper gives a short introduction to KM and the standards suggested for professional implementation of a KM system. It relates to the problems of agency theory and the two antagonistic positions of principal agent theory and stewardship theory. Special emphasis is given to the requirements for a KM policy. These foundations lead to a short introduction to some concepts of business ethics and the relationship to KM.

The third section advances the requirements of a KM policy and contrasts the positions of Karl Homann, the main proponent of instrumental ethics with the positions of Peter Ulrich and his integrative ethic. These two authors represent the outer limits of a wide spectrum of ideas on business ethics and are therefore attractive as points of reference when searching for a policy on KM. The fourth section summarizes the discussion and suggests elements of a KM policy, building on requirements from the standard ISO 30401, as well as organizational theory.

1.1 Marginal Costs and Knowledge Management

While KM is covered in detail by many authors (Easterby-Smith, et al, (2019); Becerra-Fernandez, et al, (2015); Malhotra, Y. (2018); Dierkes et al., (2001)), the most important and differentiating criterium relates to its intangible nature: knowledge can be shared and reproduced with very low costs. It has falling marginal costs in contrast to all tangible goods that usually show increasing marginal costs. This characteristic requires different management approaches, as the established routines to minimize (!) the use or application of knowledge simply do not yield the optimum results. Integrating “more knowledge, skill and experience” improves the service or product without substantially changing the costs of reproduction. Once the development is complete, only very limited additional costs emerge.

This attribute of knowledge challenges traditional categories such as ownership and financial evaluation, as the “cost” of knowledge per se technically goes down to zero (costs). While costs (for application or reproduction) go down, the potential value added is substantial, which creates opportunities for free riding.

In a knowledge economy, sharing knowledge for free is well-established as good practice in academia. Golden licenses of papers are options to cover the costs for services provided by publishers, while not charging the readers. One might question the “free” access to documented knowledge, such as papers in for-profit-journals, but compared to the costs of re-creating the work, the prices seem reasonable.

Different rules apply to “applied research” or to the phase of monetization in commercial enterprices, once new discoveries of science move to the innovation stage. Business models and management practices become relevant to create a product or service. This work is done by knowledge professionals, who need to decide. Their choice could be any combination of a) share the insight or b) keep it a secret as long as possible and reap the (excess) profits until competitors find similar solutions and the field of strategic competition moves to another domain. How these professionals might behave could be subject of a corporate policy on KM.

1.2 Knowledge Management Policy and Standards

With the wide availability of textbooks for KM and the increasing awareness in industry about the dynamic value adding contribution of knowledge-based assets as well as the emergence of standards for defining KM systems (ISO 30401, DIN SPEC 91443), KM became an established function in organizations.

1.2.1 Knowledge management standards

One of the first steps to develop a KM system is to identify key stakeholders. The usual list starts with employees or knowledge professionals as the people who have the knowledge and apply it for value generation. Additionally, customers are relevant, as they benefit from these activities and decide on allocating their financial resources, which in turn are crucial to do business. A third group relates to suppliers, whose products or services are used to support the organizations business model. Selecting the “correct” inputs is obviously the difficult element. Usually, organizations integrate third parties into their value creation – so they can be addressed as “collaboration partners”. The list could be extended, but all of them clearly have “stakes” in the value creation process. They contribute knowledge and sometimes claim some form of ownership on the final product. The legal term is copyright, which is often compensated, but certainly not always.

How do these stakeholders contribute to value creation? They could see themselves as agents in the tradition of principal agent theory (Jensen, 1976) or stewards in the tradition of stewardship theory (Donaldson and

Davis, 1991). According to the principal agent theory, both follow an opportunistic approach and maximize their benefits. Because the principal usually does not have the specialized knowledge of the agent, he must invest into clarifying expectations as well as into monitoring the performance as well as the output of the agent. This increase costs. The agent is interested in delivering performance to the principal, but only to the minimum requirements (Jensen 1976). From a KM perspective, this might lead to less-than-optimal performance, but thanks to strong competitive incentives, the effectiveness, and performance of the organization, the historic record of this approach seems to deliver.

Davis (1991) suggests an alternative approach by presenting a steward modeled by the caring attitude of airline personnel. The steward follows an intrinsic motivation to serve and to create a pleasant environment for passengers, observing technical limitations of the aircraft or external disturbance, such as turbulences. Transferred to a business context, a servant leader is free from pure egoistic ambitions, but cares about the well-being of an organization and its stakeholders. From a KM perspective, a steward would focus on collaboration, corporate culture, and a shared vision to accomplish corporate goals.

1.2.2 Requirements for a knowledge management policy

The following elements are part of most other standards, but nevertheless remain essential because they need clarification. The KM system shall consider the KM culture and leadership. It shall develop policies to support the actual management of knowledge. The norm is very general and suggests (quote): "Top management shall establish a KM policy that: … *(some elements intentionally left out)* … d) sets expectations for all workers with regard to use of the KM system and the cultivation of a culture that values knowledge; e) includes a commitment to continual improvement of the KM system; f) manages the balance between knowledge sharing and knowledge protection" (ISO 30401, section 4, 2021). While the requirements seem plausible, the details remain open and are insufficient for a regular knowledge professional to draft a policy. Depending on the generic type or orientation of managers, they could be positioned somewhere in the spectrum of "agent" (Jensen, 1976) or "steward" (Davis, 1991).

1.3 Short Outline Two Schools of Ethics

„Sense making in organizations" was the title of a book by Weick (1995), in which he brilliantly connects organization theory with decision making and strategic rationality. Almost 30 years later, rationality is sometimes said to be interpreted "alternatively" by the now "young" generation of millennials, becoming active as consumers, voters, as well as employees in knowledge-based organizations. The 18th Shell Youth Study reports: "Environmental and climate protection have become top issues of concern. …Regarding the topic of fulfilment orientation, the meaning of one's own conduct in professional life is the main priority. Central aspects also include opportunities to care for others and to do something useful for society." (Shell, 2019). The established paradigm of profit maximization is challenged by a more comprehensive and balanced approach.

The assumptions about what is good, and can therefore be considered as ethical, vary substantially among age groups within one society – the Shell survey focusses on Germany – and among different countries. The implications on organizational decision making are well covered empirically by Hofstede (1984), or Ingelhart (1990). In the German literature, the concept of business ethics is established for more than five decades with two leading figures representing very different schools of thought.

1.3.1 Homann's position on instrumental ethics

Karl Homann (1984) follows the tradition of Adam Smith (1759) and his interpretation of markets as institutions that create ethical decision making, because unethical behavior will not be tolerated by other market participants. It is, therefore, necessary to regulate markets in a way that "a good life" is supported. Homann assumes people to act with utilitarian interests towards improving their situation. It is unrealistic to assume that people or organizations accept disadvantages emerging from ethical behavior which is not displayed in a similar way by competing market participants. Therefore, markets need generally accepted frameworks that create a level playing field. For reasons of wordcount, this very short introduction to the thinking of Homann shall be sufficient, more elaborated presentations can be found in the literature.

1.3.2 The concept of Integrative Ethics by Peter Ulrich

Peter Ulrich has a very different approach to business ethics. Ulrich sees the dominance of markets critically and instead suggests focusing on the life-sustaining economy (Ulrich 2001). Like Homann, Ulrich sees two

dimensions of society – markets and a just society – but does not stop there. His essential claim is to integrate these two worlds into an integrated business ethics approach (Ulrich, 2008). Ulrich sees economy as created by humans and thus prioritizes human needs – a good life, synonymous with ethics – over market requirements. Integrated business ethics in the tradition of Ulrich prioritizes ethical behavior of organizations over economic profits or growth. Critics of this position refer to the implementation problem and economic survival of organizations fully subscribing to this approach, as they must bear with higher costs compared to competing organizations not following these high standards. While some highly educated and affluent consumers might follow similar ethical priorities (Shell, 2019), certainly not all can currently afford these choices. Consequently, Ulrich suggests a society with basic income.

These rather theory heavy continental perspectives differ from Anglo-American views on ethics (e.g., Donaldson, 1982, or Weiss, 2014), suggesting complying with legal and social requirements as well as to consider stakeholder interests, but – in general - not exceed into extreme positions. Applicability of social norms and pragmatic positioning has higher priority than discussing the ideal relationship of business and ethics (Palazzo, 2000).

2. Discussing Ethical Considerations for a Knowledge Management Policy

In the context of ISO 30401, a policy elaborates on the intentions and direction of an organization. A policy is drafted and formally expressed by the top management. For KM, the general policy (as suggested and structured in many ISO documents, such as the ISO 9001) of the organization provides the ground for more detailed elaboration. There is a direct link between organizational objectives, KM objectives, KM systems and the KM policy (ISO 30401, section 4, 2018).

ISO norms follow a typical structure that includes “leadership”. ISO 30401 is no exception, and consequently asks for a KM system to “ensure that the knowledge management policy and knowledge management objectives are established. It must be compatible and aligned with the strategic direction of the organization and evaluated accordingly (ISO 30401, section 5, 2018)

2.1 Organizational fit of the Policy

Section 5.2 a) of ISO 30401 requires that top management establishes a KM policy that is “*appropriate to the purpose of the organization”.* We interpret requirement 5.2.a in the context of existing policies in an organization with potential to deviate depending on size or complexity of an organization. A general orientation should connect the purpose of the organization to the context of knowledge and clarify this link.

- The physics and security requirements in a large energy- or production plant are usually stable and do not change within a quarter. It takes years to decades to qualify for senior job profiles for good reasons. Therefore, the organization benefits from low turnover and stability.
- The essentials of a digital technology build on formal sciences but change dramatically in a short time. Thus, the organization might be more oriented towards fast adaptation to new technologies and – in several ways – adjust their knowledge base, that is: hire and fire employees.

There should be no conflict with business ethics, as both, Ulrich and Homann, as well as other authors agree that regulation should fit with the overall objectives. This does not, however, cover the ethicality of these objectives (profit maximization versus supporting public welfare as two opposing poles).

2.2 Organizational Framework for the Policy

Section 5.2 b) of ISO 30401 requires that top management establishes a knowledge management policy that “provides a framework and guiding principles for setting, reviewing and achieving knowledge management objectives” (ISO, 2021).

As discussed above, frameworks for KM are available (WMF, (2007); Dierkes (2001); Snowden (2007)). Within such a KM-framework, the KM objectives need to be articulated. The objective of KM in a business aligned context is to effectively apply knowledge to value generation. This is different to e.g., the discovery priority in a university context or the focus on transfer in the context of schooling or training.

In more specific terms, *objectives of KM could be:*

- Contributing to the competitive advantage by leveraging state-of-the-art knowledge.
- Improved decision making, based on relevant and accurate knowledge in all levels of the organization.

- Increased efficiency by avoiding duplication of efforts and empowering knowledge professionals to access the corporate knowledge base effectively.
- Supporting innovation and learning of all knowledge professionals on all levels of the organization.
- And preventing knowledge loss by smart retention, low turnover, and soft retirement strategies.
- Establishing collaboration and teamwork to encourage a culture of knowledge sharing and collaboration.

The general framework of KM seems to be aligned with business ethics. While there might be varying ideas on competition on one side and collaboration on the other, the general idea of effective flow and application of knowledge to value creation does not seem disputed in western economies. There is, however, a different interpretation possible, when focusing on transcendent priorities – which are not discussed here.

2.3 Commitment to Satisfy Regulations

Section 5.2 c) of ISO 30401 requires that top management establishes a KM policy that "*includes a commitment to satisfy applicable regulatory and other requirements"* (ISO, 2021).

While a policy document may be a great reference, it cannot secure commitment. A statement affirming the readiness to "satisfy … regulations" might serve the purpose of a symbol in very formal organizations and help to communicate the importance, top management assigns to this topic.

> *"The management of (organization) commits to satisfy the requirements of ISO 30401 for a knowledge management system and DIN SPEC 91443 for detailing knowledge management guidelines."*

From the perspective of business ethics, this is not problematic, but clarifies the priorities and helps as a reference in the case of conflicts.

2.4 Setting Expectations for Knowledge Professionals

Section 5.2 d) of ISO 30401 requires that top management establishes a KM policy that "sets expectations for all workers with regard to use of the knowledge management system and the cultivation of a culture that values knowledge" (ISO, 2021).

This element of a policy document has highest relevance for the implementation and daily application of KM, as it clarifies the expectations. These expectations have an impact on how knowledge professionals behave in an organization. An example outline of this expectation could be the following:

- "Maintaining high ethical standards is fundamental to our organization. We expect all knowledge professionals to conduct themselves with integrity, honesty, and responsible behavior in all KM activities.
- To support the high ethical standards, we actively support a stewardship attitude. A steward shows a high service orientation, highest professional standards, and long-term customer orientation. Knowledge sharing as well as providing honest feedback constitute servant leadership, which becomes visible internally as well as externally."

From the perspective of business ethics, here a clear orientation is suggested with the emphasis on "stewardship". Obviously, there are alternative approaches, such as a focus on hierarchy and expertise, division of labor or the idea of committees to search for consensus. Corporate culture and leadership will have a strong impact on the selection, but here would be the place to make the expectations explicit.

2.5 Commitment to Continual Improvement

Section 5.2 e) of ISO 30401 requires that top management establishes a KM policy that "*includes a commitment to continual improvement of the knowledge management system"* (ISO, 2021).

Like in section 5.2.c), the commitment is difficult to secure. However, a written statement that emphasizes the priority of "continual improvement of the KM system" could be crucial, once the system is implemented, but is no longer aligned with the requirements of internal or external stakeholders. How to use artificial intelligence is only one example of technology change, which might make it necessary to adjust the KM system. A simple statement could be the following:

"Continuous improvement is ingrained in our culture. We encourage all knowledge professionals to actively contribute to the identification of improvement opportunities, driving innovation, and enhancing our operational performance."

From the perspective of business ethics, improvement is usually not disputed if the changes adhere to the established standards and values and do not disadvantage stakeholders. The utilitarian view of Homann might accept shifting priorities and even laying off some experts if they could be replaced by automation or artificial intelligence. Ulrich would suggest finding less drastic alternatives but is essentially not opposed to corporate adjustments. His preference would be, of course, to avoid a crisis by generally committing to a long-term perspective that provides for a plan B in times of crisis.

2.6 Balance Knowledge Sharing and Protection

Section 5.2 f) of ISO 30401 requires that top management establishes a KM policy that "*manages the balance between knowledge sharing and knowledge protection"* (ISO, 2021).

This final requirement seems to allow for the widest interpretation, as it connects to ownership of knowledge. Ownership is considered as the best way to avoid waste and depletion of a resource. While it is obvious that exclusive knowledge secures competitive advantage for those controlling these insights, it is equally obvious that "general access to knowledge" supports innovation and development of society and mankind. A statement to address this challenge could be the following:

> *"Effective knowledge management and asset ownership are vital for sustained long term success. We highlight the distinction between personal knowledge and company knowledge. Knowledge professionals are the sole owner of their knowledge as a result of private and professional learning and development efforts.*
>
> *We emphasize that knowledge created or acquired during employment is considered company knowledge, including innovations, methodologies, and processes. We emphasize the importance of managing knowledge from external suppliers, protecting our valuable intellectual property, exploring opportunities to monetize our knowledge assets, and promoting systematic knowledge reuse and automation. "*

From the perspective of business ethics, this clarification is essential, as it relates to the freedom of people, which in turn is seen as a fundamental human right. The problem here is that it is very difficult to unlearn and not to apply knowledge acquired in an organization once the work contract is terminated. The theoretical positions of the scholars differ in this dimension only marginally. Both scholars support the idea of ownership. While Homan stresses the importance of adaptation and accepts the implications of limited work contracts, he is open to contractual consent to outline even drastic implications, such as the ban to work for a competitor or, even more drastic, in the same industry. Ulrich would suggest offering a life-time employment and finding ways to avoid separation but still being open to changes initiated by the professionals, seeking alternatives for private reasons (e.g., marriage).

From a theoretical point of view - and this is the most interesting part here - the historic element of scarcity is not applicable to knowledge. It can be shared, reproduced, applied – usually with no higher costs than necessary to compensate for time. The marginal costs of knowledge are coming closer to zero with each repetition of use and application, while the benefits of its application multiply. This attribute of knowledge suggests that the scarcity-related management procedures are obsolete and do not apply to knowledge professionals. Consequently, the idea of "assets" needs to be reviewed. Knowledge per se is no longer of value, but the application of if it is very valuable. This implication on value creation suggests that knowledge is used as excessively as possible and, additionally, is given away immediately and for free, as only the application and use generate value. The implementations on corporate governance, corporate citizenship and value generation are substantial.

3. Summary and Recommendation

Drafting a KM policy benefit from a reference to corporate values. While a superficial agreement on values seems easy to accomplish, the limitations of the "assumptions" become visible when deciding in situations of multiple constraints. In times of conflict between knowledge professionals (internal conflict) or with suppliers and customers (external conflicts), an explicit policy serves as a reference and gives orientation.

A KM policy benefits from consistency with the other instruments of corporate governance, such as transparency and accountability to stakeholders (external focus) as well as management instruments, such as bonus programs to accomplish corporate objectives or individual targets (competence development and career development).

Ethical dilemmas emerge from fundamental positions regarding ownership of assets or allowing access to strategically relevant critical knowledge. The causes can be found in the spectrum of priorities and loyalties of a knowledge professional e.g., to their field and discipline, company, or a department in the organization, or to a community of practitioners working on a complex problem. The desire to "resolve" this problem might interfere with legitimate interests of other parties involved and thus cause conflicts of interest.

Recognition and attention as critical currencies among knowledge professionals can be granted or refused and will have consequences in the repeated game of collaboration. While knowledge per se is abundant and not limited, the time and energies (motivation) of professionals are limited and constitute constraints.

Knowledge Dynamics and Expert Knowledge Translation: A Case Study

Constantin Bratianu[1] and Alexeis Garcia-Perez[2]

Abstract: Knowledge dynamics means variation of knowledge in time and space. Over time, knowledge levels can increase through accumulation, or decrease through loss. Also, knowledge may change its quality through transformation from one form into another. In space, knowledge can move from one place to another one, generating a flow (i.e., knowledge flow). The present paper aims at analyzing the knowledge dynamics associated to the process of expert knowledge translation, present in almost all life domains. Knowledge translation is based on communication and transformation of knowledge. Among many models used to explain knowledge translation, we present in this paper the expert knowledge translation that is used whenever an expert is sharing his expertise with one or several individuals interested in that knowledge. We analyze the whole process of expert knowledge translation from a conceptual perspective and then we present a case study describing expert knowledge translation. Knowledge translation is necessary because the source and the receiver of the messages have different semantic domains and levels of understanding based on their education, background and their analytical skills. The main barrier in knowledge translation is the absorptive capacity of the receiver. If the absorptive capacity is rather small, the translation efficiency is very small. This situation can be improved if the translation process is broken into several smaller knowledge translation processes like in a cascade. The paper presents the model of such a cascade for expert knowledge translation showing how to construct it. As an application, the paper presents a case study focused on a company manufacturing gas turbines (GTM). The company is a global supplier of gas turbines and we show how engineering expert knowledge is translated in a cascade from design to manufacturing, automation, testing, installing and commissioning turbines to end users.

Keywords: Knowledge dynamics, Knowledge translation, Expert knowledge, Absorptive capacity

1. Introduction

Knowledge dynamics is a complex concept that reflects the variation of knowledge in time and space, i.e. the transformation of knowledge (Bratianu & Bejinaru, 2020; Carlile, 2004; Nissen, 2006; Nonaka & Takeuchi, 1995). The concept of knowledge dynamics implies variation in time in any kind of its manifestation, but the focus on the variation in time appears when we consider knowledge or knowledge capital as a stock in an organization or a network (Bolisani & Oltramari, 2012; Kianto et al., 2007). Variation in space is generically known as *knowledge flow* (Nissen, 2006; Nonaka, Toyama & Hirotaka, 2008). Knowledge flow is possible when there is gradient in the knowledge distribution within a given organizational context. The most complex of knowledge dynamics is the transformation of knowledge from one form (i.e., explicit and tacit or rational, emotional, and spiritual) into another form of knowledge (Bratianu & Bejinaru, 2020; Nonaka & Takeuchi, 1995, 2019).

Knowledge translation (KT) is a generic process of transferring knowledge from one person to another, or to a group of people. Although it is based on a communication process, knowledge translation is much more than communicating knowledge because it implies knowledge transformation such that the target can understand the messages received from the source (Carlile, 2004). Although knowledge translation has been developed almost exponentially in the last years in the healthcare sector, it is a generic process that can be found in almost all domains of human activity (Dal Mass, Garcia-Perez et al., 2020; Dal Mass, Cobianchi et al., 2021). Knowledge translation was conceived initially as an all-encompassing process between research and applications in the healthcare sector, creating value by embedding research findings in practical procedures and best practices (CIHR, 2016). As research into knowledge translation evolved, it became apparent that knowledge translation takes place in all processes of communications at micro, mezzo, and macro scales in any social context. The performance of knowledge translation is influenced by the knowledge dynamics in multiple forms, depending on the complexity of the domain of human activity. However, this correlation is lacking in the literature. It is a knowledge gap we try to discuss in the present paper.

2. Literature Review

2.1 Knowledge Dynamics

Knowledge dynamics influences the process of KT through different forms, from a simple variation of knowledge level over time, to knowledge transformations. As mentioned earlier, knowledge varies over time at both individual and organizational levels due to the learning and unlearning processes, as well as to knowledge loss from organizations through different forms (Bratianu et al., 2011; DeLong, 2004). That change in knowledge levels leads to a changing gradient in the knowledge field, which leads to a change in the force driving the flows of knowledge contributing to KT. Nissen (2006) asserts that knowledge flows is more than a metaphor. It is a phenomenon that happens in any organization, illustrating knowledge dynamics over time and in space, like in fluid mechanics. Knowledge flows induce changes in the knowledge distribution that lead to changes in the knowledge entropy within an organization (Bratianu, 2019). From another perspective, Blacker (1995) presents a categorization of five different types of knowledge: embrained, embodied, encultured, embedded, and encoded. They result from knowledge processing and contains in different proportions rational, emotional, and spiritual knowledge (Bratianu & Bejinaru, 2020).

From a practical point of view, knowledge can flow between two points in space within an organization if, and only if, there is a knowledge difference between the initial and the end points of the flow. By understanding knowledge flows we can understand knowledge sharing as an intra- and inter-organizational process (Balle et al., 2019; Nonaka & Takeuchi, 1995, 2019). Knowledge sharing is governed by both the knowledge deficit of the user and the willingness of the source to share their experience with other people. At the individual level, the most important factor influencing knowledge sharing is knowledge hiding, while at the organizational level it is intellectual property (Bratianu, 2022; Ruparel & Choubisa, 2020). Thus, knowledge flows are governed by the knowledge deficit and the dynamics between knowledge sharing and knowledge hiding.

The Theory of Knowledge Fields (TOKF) introduces the idea that knowledge is not a fluid but an intangible field that manifests in three basic forms: rational, emotional, and spiritual knowledge (Bratianu & Bejinaru, 2020). *Rational knowledge* is the result of our thinking and it is an explicit knowledge because it can be expressed by using natural or symbolic languages. Rational knowledge is what Aristotle (1999) called *episteme*. It is an objective knowledge about the world we are living in (Davenport & Prusak, 2000; Nonaka & Takeuchi, 1995). Rational knowledge can be easily codified and used extensively in the organizational procedures, regulations, databases, and communications. *Emotional knowledge* is created by our emotions and feelings and it is wordless (Damasio, 2012; LeDoux, 1999). Emotional knowledge is the result of experiential learning and it is about *how-to* do things. Emotional knowledge is similar to what Aristotle (1999) called *techne*. Emotional knowledge constitutes the most important component of tacit knowledge that is so important in the Japanese companies (Nonaka & Takeuchi, 1995). Emotional knowledge can be transformed into rational knowledge using natural language and metaphorical thinking. Emotional knowledge is linked to emotional intelligence (Goleman, 1995) and together influence the process of decision making (Hill, 2008). Emotional knowledge integrates in time resulting experience that is at the core of any know-how and the root of intuition and intuitive thinking (Shotter & Tsoukas, 2014). Gladwell (2005) considers intuition as valuable as any rational analysis "the task of making sense of ourselves and our behavior requires that we acknowledge there can be as much value in the blink of an eye as in months of rational analysis" (p. 17). *Spiritual knowledge* refers to the meaning of our existence, our work, and the expected happiness. Spiritual knowledge is linked to what Aristotle (1999) called *phronesis*, or practical wisdom (Pinheiro & Rocha, 2020; Rocha & Pinheiro, 2021; Rocha et al., 2021; Shotter & Tsoukas, 2014). By integrating spiritual knowledge at the organizational level we get *spiritual capital* that is "our shared meaning, our shared purpose, our shared vision of what most deeply matters in life – and how these are implemented in our lives and in our behavioral strategies. It is the capital that is increased by drawing on the resources of the human spirit" (Zohar & Marshall, 2004, p. 27).

In the TOKF knowledge dynamics means transformation of knowledge from one field into any other form of knowledge (Carlile, 2004). It is an irreversible and nonlinear transformation like in thermodynamics (Chaldize, 2000). Kahneman (2011) illustrates this influencing mechanism with a very simple psychological experiment done in a British university. In the tearoom of that university, the tradition was for students to pay according with the price list hanged on the wall just above a "honesty box". One day, next to that price list appeared a poster with many eyes staring at you, without any explanation. After one week, the eyes poster was replaced with another one showing beautiful flowers. These two types of posters were alternating for ten weeks. By the end of each day, the professor who created this psychological experiment counted the money dropped by students into the "honesty box". The daily values were higher when the students faced the eyes poster than

when they were looking at the flowers. The emotional knowledge generated by the staring eyes was transformed into rational and spiritual knowledge, and their dynamics influenced the decision to pay the right amount of money, as indicated by the price list. A very simple but convincing psychological experiment showing that decision is not a purely rational process. It is influenced by the dynamics between emotional, spiritual, and rational knowledge. This idea is supported by Shotter and Tsoukas who explain *phronesis* in relation with the ways which determine "how we see, how we hear, perceive and value particular events and experiences occurring in our surroundings" (Shotter & Tsoukas, 2014, p. 381).

2.2 Knowledge Translation

Knowledge translation (KT) is considered by Davidson (2009) "as the practice, the science, and the art of bridging the know-do gap, or the gap between the accumulation of knowledge and its subsequent use or application" (p. 75). KT originates in linguistics, as a written or spoken process of translating texts or spoken phrases from one language into another one. In this original model, KT represents a mapping function of a certain message from the source semantic domain (SSD) onto the recipient semantic domain (RSD). Thus, KT implies a combination of communication with an act of interpretation performed by the translator.

The Canadian Institute of Health Research (CIHR) scaled up the process of KT to suggest a bridge between the research domain and practice domain in healthcare. The definition formulated by CIHR (CIHR, 2004) based on this interpretation became one of the most cited definitions of KT. According to CIHR (2004), KT is "The exchange, synthesis and ethically sound application of knowledge with a complex system of interactions among researchers and users – to accelerate the capture of benefits of research for Canadians through improved health, more effective services and products, and a strengthening health care system" (p. 2). The same Canadian Institute produced a new formulation that was accepted by most of the researchers working in healthcare systems. KT is the process that "includes knowledge dissemination, communication, technology transfer, ethical context, knowledge management, knowledge utilization, two-way exchange process between researchers and those who apply knowledge, implementation research, and development of consensus guidelines" (CIHR, 2016). However, we have to remark that from a logical point of view and from the perspective of knowledge management this cannot be accepted as a definition because it demonstrates a misunderstanding of the knowledge translation and knowledge management processes. For instance, knowledge dissemination, communication, ethical context and knowledge utilization represent components of knowledge management, and knowledge management is not a component of knowledge translation (Nonaka & Takeuchi, 1995). On the contrary, knowledge translation is a component of knowledge management.

To understand the process of knowledge translation we consider a generic model composed of a knowledge source, a communication channel, a knowledge receiver, and a certain cultural context. The assumption is that the level of knowledge of the source is higher than that of the receiver. The receiver is characterized by a semantic field (RSF) that may be different to that of the source semantic field (SSF). For instance, the source and the receiver may belong to different cultures and speak different languages. To make communication possible, it is necessary a translator or an international language known by both the source and the receiver. In the case of a high knowledge difference between the two ends of the communication channel, the problem is how much knowledge can be absorbed by the receiver. Thus, knowledge absorptive capacity of the receiver becomes a limitation of the knowledge that can be transferred from the source to the receiver. The concept of *absorptive capacity* was introduced by Cohen and Levinthal (1990) as a measure of the organizational capacity to assimilate external knowledge, but it can be applied as well at the individual level. According to Carlile (2004), knowledge translation is a complex process that involves crossing the pragmatic, semantic, and syntactic boundaries. Crossing the syntactic boundary results in knowledge transfer. Crossing the semantic boundary means knowledge translation, but based on knowledge transfer. Crossing the pragmatic boundary results in knowledge transformation, based on its translation and transfer. Expert knowledge translation is successful if it is possible to cross all these boundaries.

Expert knowledge represents a high level of understanding with respect to a certain domain of activity and it is acquired after years of study and research in that domain. It is the knowledge that can be delivered by experts and consultants from consulting and research companies, by university professors, by medical doctors after many years of practice, or by engineers manufacturing complex equipment (Evers & Menkhoff, 2005). Trying to communicate that knowledge as it is directly to the end users is meaningless because the receivers cannot understand it. Their semantic universe does not contain the necessary concepts and ideas for accepting and integrating the new knowledge. The end users have a very low absorptive capacity when compared to the experts. The solution is for experts to translate their knowledge for a lower level of understanding, which

means a degradation of its initial quality as a result of increasing the process entropy (Chaldize, 2000). However, many times that expert knowledge cannot be conveyed directly without losing its meaning, and it is necessary to break it down into several translation sequences like the water flowing through a series of cascades. Thus, we propose in this paper a *cascade knowledge translation model* that can be applied in any expert knowledge translation. The model requires a knowledge source, one or several intermediary knowledge translators and a knowledge receiver as an end-user. Expert knowledge is processed by a serial translation phases, each phase decreasing the level of understanding according to the absorptive capacity of each intermediary translators, and finally with that of the end-user. This is a generic expert translation model but it can be found in many practical situations with some specific details given by the context. In order to analyze in practice how this model is operationalized, we performed a case study of expert knowledge translation within a large industrial company for manufacturing gas turbines from UK. We follow the chain of activities from manufacturing to selling and providing service to the end users of gas turbines.

3. Methodology

3.1 Rationale and Methodological Approach

We applied our generic model of *expert knowledge translation in cascade* to a complex case study that is hereby reported in a simplified manner, in line with the constraints of the conference paper. We considered a large international company manufacturing gas turbines, referred to as GTM in this paper, which has its headquarters in the United Kingdom.

Having collaborated in Knowledge Management projects with GTM over a decade (2008 to 2018), the authors had been able to identify the importance of the translation of engineering knowledge in all engineering processes at GTM. Their management board had referred to terms such as 'understanding customer needs', 'communicating product capabilities', and 'learning from customers' as some of the key issues having an impact on both costs and innovations. It had been agreed that knowledge translation was at the heart of most of those issues and it therefore affected –both directly and indirectly, all GTM efforts to reduce costs and increase their potential for innovation.

Between the September 2015 and July 2018 –the last part of their formal engagement with GTM, one of the authors held discussions with engineers to understand their methods of translating knowledge along the chain of operations through to their end-users. In our experience, both the theoretical foundations imposed by the research context and the practicalities of its implementation imposed significant challenges, including the collection and analysis of a consistent set of data relevant for the purposes of this research, as well as demonstrating the reliability, replicability and validity of our research findings. Those challenges suggested that the data collection would be an iterative process involving the authors in their role of researchers and GTM engineers, in their role as practitioners, both acting together on a particular cycle of activities that included problem diagnosis, action intervention, and reflective learning. This was later found to be in line with the principles of Action Research as defined by Tracy (2020), Yin (2018) and Avison et al. (1999). The latter argue that in order "*to make academic research relevant, researchers should try out their theories with practitioners in real situations and real organizations*".

3.2 The context to Knowledge Translation in the GTM Ecosystem

GTM designs, manufactures and commissions gas turbines. The company also provides supports to its customers in the service of the products that are being used in the field. GTM has many thousand employees including professionals from a range of engineering disciplines, and thousands of customers throughout the world with a variety of operational requirements. In their interaction with actual and potential customers, GTM engineers have developed significant expertise in the design, manufacturing and operation of gas turbines over decades. The ultimate aim of the translation of engineering knowledge in this project was the use of such knowledge for the benefit of all stakeholders within the complex GTM ecosystem.

GTM's employees and stakeholders form a large chain of actors who own and act upon different pieces of knowledge about their gas turbines. Their knowledge of gas turbines is determined by their own different roles, projects, experiences and requirements. In this context, GTM engineers' knowledge of gas turbine operation not only helps organizational actors with their design and manufacturing activities, but also helps customers' business and operations. Simultaneously, knowledge of the health and usage of gas turbines in the field (i.e. customers' knowledge) helps GTM improve existing turbine designs and innovate in the design and manufacturing of new products and services. There is therefore a need for continuous translation of knowledge of gas turbines between GTM and its customer base, with knowledge moving in both directions. In

this context, knowledge translation plays a vital role allowing knowledge to be interpreted and applied at least at three levels:

- Between GTM and its potential customer base, with sales engineers acting as the interface between them. Knowledge is captured by sales engineers in the form of customer needs. Customer needs are then translated into sets of engineering requirements. GTM sales engineers become a key stakeholder in this continuous series of spontaneous knowledge translation initiatives.
- Within GTM, with employees from different departments collaborating during a period of months in a trusted environment toward the development of a unique product that meets the business needs of a particular customer. Engineering knowledge is continuously translated as it flows between teams to enable its use within the engineering processes.
- Between GTM and is actual customers, with customer service engineers acting as knowledge translators. Customer service engineers capture knowledge from customers, turn that knowledge into engineering decisions and feed these back to GTM engineering (e.g. manufacturing, automation) teams.

3.3 The Process of Knowledge Translation Within the GTM Ecosystem

Knowledge of gas turbines flows within the company and in both directions between GTM and their customers. In the process, there are changes in the format, language and dynamics of the knowledge structures in motion, as shown in figure 1.

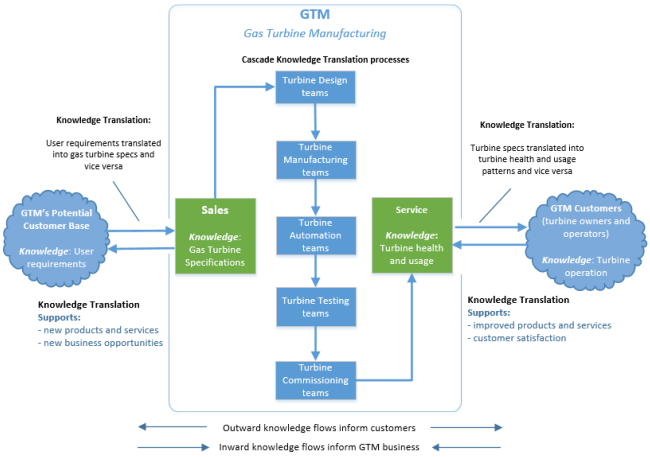

Figure 1: Knowledge Translation Within the GTM Ecosystem

The research identified two main types of knowledge translation processes within the GTM ecosystem, described by the arrows in figure 1:

- Knowledge translation between the company and its environment (double arrows) follows the approach that has been evolving over the last decades driven by research in the healthcare sector (Dal Mass, Garcia-Perez et al., 2020; Dal Mass, Cobianchi et al., 2021). Based in a significant knowledge difference between the company and its customer base, the process brings significant benefits to both the company and its potential and actual customers. Thus, knowledge from the customers is translated into turbine design requirements by the design team. The result of this translation is the input for the internal expert knowledge cascade, from the design team toward the commissioning team going through manufacturing, automation and testing cascades.
- Cascade knowledge translation within the company (single arrows). Although all teams within GTM experience of gas turbine manufacturing, each team has its most significant degree of expertise on a particular stage of the overall engineering process. As such, a cascade of knowledge translation processes allows each team to receive the knowledge that is required for the implementation of its main task (e.g. design, manufacturing, automation, testing etc.). On completion of such task, the team produces the knowledge that is required for the next phase of the project to be effectively implemented, and communicates such knowledge to the team responsible for its implementation. Finally, there is another crossing border cascade, from the commissioning team to the service team and the end user.

3.4 Results

A direct collaboration between the researchers and GTM's management board had a direct impact on the strategy of the organization.

First, it raised awareness of the importance of knowledge translation as an area for strategic development for GTM. Whilst the management board were concerned about a knowledge problem that seemed fuzzy at the time, this project reduced the complexity of the issue by providing GTM with a theoretical background and a concrete line of action. Knowledge translation became part of the vocabulary of the management board, and specific actions were put in place for the facilitation of this process.

Secondly, the research provided a justification to engage the wider GTM knowledge community into a new value co-creation strategy of the organization. By understanding the nature of engineering knowledge and where such knowledge resides, GTM created and funded new opportunities for collaborations across their value chain, including GTM engineers, customers and suppliers.

Finally, we argue that this project played a key role in preparing GTM for its transition into the knowledge economy. With this project, their management board formally started having open discussions about types or forms of knowledge, such as emotional knowledge, that had not been considered before. New collaborations with academic institutions in the region have been established and GTM is now part of a growing number of research and development initiatives with focus on engineering knowledge.

4. Discussion

Engineers working at GTM have developed over decades a valuable knowledge base encompassing all types of activities, from tendering to design, from the conceptual phase to the production one, from selling to commissioning and service. Whilst every team within GTM have access to the overall knowledge base of the product or project if required, continuous cascade knowledge translation processes make the manufacturing of gas turbines a manageable process, enabling specialization within the different GTM functions. The cascade of expert knowledge translation is based on knowledge dynamics and on the correlation between knowledge deficit and the absorptive capacity of the receiver. Cascade knowledge translation within the organization relies on every team understanding the knowledge, background and requirements of other teams. Such an understanding, combined with a common purpose across the company, leads the different teams to produce new knowledge in a format that is accessible to others over the project lifecycle. For example, turbine design teams produce turbine drawings and plans, to be used by manufacturing teams. Manufacturing teams produce hardware specifications, later used by automation teams to develop software. These knowledge outputs later inform the work of the testing and commissioning teams, and ultimately the knowledge of the customer service engineers, who represent the interface between GTM and their customers.

Although GTM has a standard diversified offer of gas turbines, it is frequently necessary to make some adaptations for each turbine to meet specific requirements coming from the customers. The context enabled by cascade knowledge translation allows specific changes to be made to original designs in an efficient and controlled way.

5. Conclusions and Limitations

This research has explored ways in which knowledge of a particular domain evolves over time and in its movement between teams. A manufacturing organization has provided the context for the study, in a 12-month action research project. The project had initially an exploratory nature, with the researchers working directly with representatives of every team to understand the gas turbine manufacturing process from the knowledge perspective. Such background helped the authors move from an understanding of communication within the organization to a perception of translation of engineering knowledge between different parts of the organization. Later on, the analysis of knowledge needs and knowledge outputs from different stages of the gas turbine manufacturing process led to a perception of a cascade of smaller knowledge translation initiatives. Interviews to different teams showed that the cascade knowledge translation processes provided both the focus and the knowledge outputs required by the different teams, which would be complemented by a wider knowledge base only when required. Alternative sources of knowledge were sought by engineers only if the outputs of the smaller translation process were not enough for their function. This perspective had become engrained in the culture of the organization, and was found to lead to closer links between specific teams and, with it, more knowledge alignments creating a knowledge chain across the gas turbine manufacturing process.

The experience from practice of knowledge translation in manufacturing contributes to the current theories on knowledge dynamics. It also confirms that knowledge translation is an increasingly relevant field within the knowledge management domain, with applications and developments beyond the healthcare sector. Despite opening new avenues for research, our focus solely on a manufacturing case study can be perceived as a limitation of the research. The main limitation of the present paper is its focus on a single case study, but it is a complex one capable to explain the model of cascade expert knowledge translation that is the contribution of the present paper. The authors encourage future research in other knowledge-driven domains, in an effort to develop appropriate theories and frameworks that enable the effective flows of knowledge within and between teams, organizations and sectors.

Abstract: A robust knowledge management (KM) strategy is essential for effective onboarding of new employees. Organizational knowledge plays a crucial role in helping new employees learn their work tasks and should be readily available for training purposes. This study examines how a public organization in Norway implements its onboarding process and facilitates knowledge sharing with new employees. We investigated various KM initiatives established in the organization and explored how knowledge is transferred to benefit new employees. Additionally, we examined how organizational culture influences knowledge sharing performance. The empirical data comprises 20 interviews conducted in the information technology department of the organization. The findings reveal that new employees should first receive training on specific work tasks related to their roles in the organization. Early productivity was considered significant during the onboarding process, while an overload of general knowledge about the organization was perceived as overwhelming. The public organization under study is known for its strong job security, which has fostered a collaborative environment among employees with low competitiveness. This openness encourages knowledge sharing and willingness to collaborate, as employees are not worried about losing their positions. This also results in a low threshold for seeking assistance from experienced colleagues during the onboarding process. The evidence suggests that much of the knowledge gained by employees during their employment period is acquired through informal settings, where experienced employees share knowledge with newcomers through direct communication.

Based on the findings, this study proposes practical recommendations for improving the onboarding process. Effective practices such as mentorships, new employee gatherings, and the existing technical graduate program should be maintained. Suggestions for further enhancing the onboarding process include: (1) designing a networking initiative that integrates new employees outside the graduate program; (2) tailoring the competence plan to the role of each employee; (3) improving the content of the intranet with information about role descriptions and responsibilities, making it easier to identify "who knows what" in the organization; and (4) defining the reasons for using collaboration tools more extensively. Implications for KM in onboarding processes are outlined.

Keywords: knowledge sharing, Onboarding, IT employees, Learning, Case study, Knowledge management

1. Introduction

The increased emphasis on digitalization in organizations and society as a whole has resulted in a higher demand for candidates with advanced education in information technology (IT) and related fields (Bensberg et al., 2019). As a result, there is fierce competition among private and public sectors to recruit the best graduates with digitalization competencies.

To attract and retain top talent, companies and public institutions must provide attractive working environments that offer opportunities for new employees to engage in creative and innovative work tasks to enhance their skills and knowledge further (Borowski et al., 2020). The onboarding process plays a crucial role for newcomers as they begin their new positions. Therefore, it is essential for new employees to feel welcomed and supported by their employers during this period, to receive the necessary training and support to excel in their new roles.

However, the onboarding process can be challenging for employers who aim to retain new hires for as long as possible. This period should be well-designed for knowledge sharing and competence building, ensuring that new employees are satisfied with their choice of employer and motivated to continue their employment (Kirchner & Stull, 2022). Overall, the onboarding process is critical and should be prioritized by employers by developing a robust competence development plan with appropriate training to facilitate new employees and their upcoming tasks.

During the onboarding process, new employees need to acclimate to the organization, including understanding their new role within the larger context and feeling accepted by their new coworkers. In this sense, onboarding is a form of organizational socialization that enhances adjustment through learning (Gardner et al., 2022).

Consequently, the first aim in our study is to examine prevalent practices and obstacles in onboarding processes within an organizational setting: (1) *How do organizations typically approach the onboarding process, and what are the key challenges frequently encountered in this context?*

Effective knowledge management (KM) initiatives are essential during this process to ensure that knowledge flow and retrieval occur in an efficient manner (Alavi & Leidner, 2001; Newell, 2015). However, there is limited understanding in existing research on how employers can achieve an effective onboarding process, and few studies have explored onboarding from a KM perspective. For example, it is crucial to understand how KM can play a significant role in successfully transferring relevant knowledge to new employees.

Accordingly, this study applies a knowledge management perspective to gain a comprehensive understanding of onboarding, and it explores the role of knowledge management initiatives to optimize learning outcomes:

(2) *How can knowledge management initiatives be utilized to enhance the learning outcomes for employees during the onboarding process?*

The paper is organized as follows: First, previous research is outlined. Second, the research site and method are presented. Third, the main results are outlined. Fourth, the discussion is provided. Finally, concluding remarks and implications are made.

2. Previous Research on KM in Public Sector

Organizations in the public sector operate differently than those in the private sector, as they do not prioritize profit as a business objective. This can create a distinct organizational culture characterized by less competition and more collaboration among employees (Choudhury & Das, 2021). In public institutions, job security may be higher, leading to a willingness to share knowledge with colleagues. This reduced internal competition can result in less fear of job loss and a more collaborative work environment (ibid.).

Implementing KM practices in the public sector can lead to improved working methods and processes, especially when challenges are localized (Edge, 2005). KM solutions can help organizations achieve efficiency and gain a clear overview of the knowledge available within the organization and the employees who possess different forms of knowledge. While the focus is not on gaining a competitive advantage, KM can still enhance resource utilization by localizing existing knowledge (Alavi, 2000), and avoiding unnecessary hiring of external consultants. Easy access to knowledge by employees can result in resource savings in terms of time. The competitive advantage has shifted from purely financial savings to a greater emphasis on competence, where the application of internal knowledge within organizations adds value in terms of savings, organizational development, and learning (Sambamurthy & Subramani, 2005).

A literature review by Massaro et al. (2015) presents the main contributions in the field of KM in the public sector. The article identifies enablers and barriers of KM, with enablers including leadership support, organizational culture, and technological infrastructure, and barriers including lack of incentives, resistance to change, and limited resources. The article provides insights into the factors that facilitate or hinder the implementation of KM initiatives in the public sector. Additionally, the article discusses different approaches and strategies for managing knowledge, such as communities of practice, knowledge portals, and knowledge sharing networks, and highlights the potential benefits of effective KM practices in terms of improved organizational performance, decision making, and innovation. The authors also discuss important future research directions in KM, such as the role of leadership in promoting knowledge sharing, challenges of managing tacit knowledge, and the impact of national and cultural factors on KM in the public sector.

Jain & Jeppesen (2013) focus on the role of leaders' cognitive styles in shaping KM practices. The paper reveals the relationship between leaders' cognitive styles and their KM practices, providing evidence that leaders with a higher tolerance for ambiguity are more likely to promote knowledge sharing and utilization, while those with a higher need for cognition are more inclined towards knowledge acquisition and documentation. The paper highlights the need for leaders to be aware of their cognitive styles and how this may impact their approach to KM. The authors suggest that organizations can leverage leaders' cognitive styles to design effective KM strategies and practices that align with their leaders' cognitive preferences.

A study conducted by Henttonen et al. (2016) provides insights on the relationship between knowledge sharing, social capital, and individual work performance in the context of a public sector organization. The findings inform public sector managers and policymakers on the importance of knowledge sharing and social capital in enhancing individual work performance. The study suggests that promoting knowledge sharing and fostering social capital may lead to improved work performance of employees in the public sector organization.

Choy Chong et al. (2011) focus on critical success factors for KM implementation in public sector accounting. The findings highlight the importance of leadership support, organizational culture, and employee participation in KM implementation efforts, and suggest strategies for overcoming challenges and maximizing the benefits of KM in this context.

In summary, these studies highlight the importance of leadership, organizational culture, and knowledge sharing in obtaining effective KM practices in the public sector. They also identify challenges and success factors in implementing KM initiatives in public sector organizations. The research gaps from these studies comprise KM's impact on organizational performance, factors that influence knowledge sharing among employees, the impact of knowledge sharing on individual work performance, and how organizational context and culture influence knowledge sharing behaviours in the public sector.

The abovementioned studies provide a foundation for understanding KM in the public sector. However, more research is needed to specifically study the impact of KM on onboarding processes, including knowledge transfer and organizational culture. Exploring the role of KM-supporting technologies is also important for understanding onboarding success. Additionally, investigating the social and cultural aspects of KM during onboarding, including tacit knowledge and socialization, is crucial. Our study aims to address these research gaps.

3. Research Site and Method

The ABC organization (pseudonym) is a large public organization in Norway with around 7,500 employees spread across multiple regions and locations. Within the organization, there is an IT division with over 900 employees working in a distributed setting. The IT department is divided into five sub-departments, each with its own department CIO. One of the departments focuses on portfolio management, project management, and change management processes and routines. Two other departments are responsible for developing programs and systems related to the organization's core business. There is also a department that delivers IT services to employees, including IT solution agreements, IT security, and IT support. Lastly, there is a department that handles internal platforms, cloud solutions, and databases.

New employees are assigned a supervisor who provides academic and social support, and they are introduced to the organization through training videos and gatherings for new employees. The organization also has employee programs specifically designed for new graduates, which include networking opportunities and task rotation internally.

This study utilizes a qualitative case study method (Yin, 2003), and apply semi-structured interviews as the data collection technique. An interview guide was developed and tested to ensure valid and non-repetitive questions with an appropriate interview length. The aim of this approach is to gain in-depth insight into the onboarding process for new employees, focusing on details that may be overlooked in a macro-level approach. The expectation is that the interviewees will feel comfortable and open-minded, speaking freely in a relaxed setting. Cooperation with the organization allowed access to potential interview subjects through email contacts provided by group leaders who identified willing participants.

In total, 20 interviews were conducted with IT employees. Two of the interviewees held leadership positions at the case organization for the past 10 years, while the rest were new hires who had worked there for between five and 19 months. The interviews lasted between 40 to 60 minutes and were conducted online using Microsoft Teams, with audio recordings taken. All interviews were transcribed verbatim, and audio playback tools with slow-down functions were used for accuracy during transcription.

The interview guide was used to categorize and sort quotes, concepts, and themes. Following the approach suggested by Miles & Huberman (2018), the transcripts were read multiple times, notes were made, data was reduced, and visualized drawings were used to group the data into an organized overview of the most central topics. Leader interviews and employee interviews were separated as their interview guides slightly differed. In the results section, quotes are used to emphasize specific findings. Two of the authors were responsible for conducting the interviews, and both participated in all of them.

4. Results

4.1 The Onboarding Process for new Employees and KM Initiatives

During onboarding, various formal and informal KM initiatives are established in ABC to transfer knowledge to new employees. This process begins after the employee signs the contract and includes a dialogue with their manager about start-up tasks and expectations. The manager is responsible for ensuring the new employees

receive training and a good introduction to their tasks. On the first day, new employees are assigned a PC and have a dialogue with their manager. They are also introduced to the organization through meetings, training videos, and informal conversations with colleagues. Mentors are assigned to provide support and assistance. For multiple new hires, training is done in blocks, while for individuals, team members contribute to training. After a few months, new employees attend common gatherings focusing on organizational values, vision, and interactive group tasks. There are also specific gatherings for new IT employees, such as the Tech-Graduate program, which includes training and mentorship. The program has become popular for networking opportunities. Interviewees praised the program and suggested incorporating similar elements into the regular hiring process (Table 1).

Table 1: The Onboarding Process for new Employees and KM initiatives – Sample Quotes

"The key is to establish connections across the organization through networking and professional/social meetings."
"Being part of the Tech-Graduate program provides an initial network from various parts of the organization, along with relevant training. It's a valuable program that could benefit new employees who are not part of it as well."

Digital tools for knowledge sharing

The organization utilizes several tools for knowledge sharing (Table 2), and they have implemented both Atlassian and SharePoint products. In addition, Mattermost is used as instant messaging software, mainly for development environments.

Table 2: Digital Tools Contributing to Knowledge-Sharing

Tool	Function
Intranet	An internal webpage that provides an overview of the organization for employees and serves as a learning portal.
Confluence	An internal wiki used to document analyses of needs and IT solutions, as well as work performed and experiences
Jira	A project management tool used to document product backlog and task queues for development environments
OneDrive	A file hosting service used for sharing individual files in real time
Teams	A collaboration platform that includes virtual meetings, document sharing, and instant messaging.
Mattermost	Instant messaging software used for communication and collaboration in development environments

Software applications like Mattermost, Jira, and Confluence are popular solutions used by development communities. Confluence is used as an internal Wiki for documentation and KM. The organization has also introduced SharePoint as part of their Digital Workplace initiative, offering tools for home office, meeting activities, information sharing, and communication(see Table 3). However, the purpose of these tools is unclear, leading to informal solutions that vary among teams and potential overlaps in information. This can create silos and challenges for distributed employees. Improving information architecture and synergy between tools may be a possible solution, but it requires formalization to work effectively.

Table 3: Digital Tools for Knowledge Sharing - Sample Quotes

"As far as I know, there isn't a specific purpose for it. It's not something we talk about; we just focus on documenting the knowledge we need and the knowledge we lack."
"It's not always easy to predict the direction things are heading. We have a project posted on SharePoint that may overlap with information on the Wiki."
"I think it can be challenging to locate information as it's spread out. Searching across the Wiki to find things is not an easy task."
"If we can improve our information architecture and have better synergy between the tools we use, the information across different locations will also be better organized."

4.2 Challenges in the Onboarding Process

Information overload and relevant/irrelevant knowledge

The process of learning about the organization faced challenges in balancing relevant information at the right time versus information overload (see Table4). Interviewees found the initial training overwhelming, with too much general information that was not always relevant. Some suggested that the information could have been presented in a more engaging way, and that training should be tailored and distributed over time. Many interviewees expressed a desire for a more customized learning approach, as some training events were not relevant for all participants. Informal learning through collaboration with colleagues and mentors during daily work was also highlighted as important, as there was no formal training process beyond mandatory content on the learning portal.

Table 4: Information Overload, Relevant/Irrelevant Knowledge – Sample Quotes

"Making a new employee watch videos for an entire week doesn't seem to add much value."
"The mandatory learning portal requires going through lengthy courses on topics like organizational culture, corporate social responsibility, privacy issues, etc. It's quite boring. I work with online services and user experience, so the whole thing feels dreary. It's a long list of courses and I'm trying to learn other things too, so it gets monotonous."
"While it's not irrelevant for an employee to learn about laws and regulations in the organization, it could have been presented in a more engaging way. Perhaps by making it more exciting and spreading out the learning over time."
"As a new employee, you feel unproductive. Yes, it takes time to get up to speed, but new hires are eager to learn about their actual job responsibilities as soon as possible. General information can wait until later."

Who knows what and time dedicated for learning

Interviewees suggested improvements in the training process and expressed difficulties in knowing who to contact for help (see Table 5). They mentioned challenges in finding employees with expertise and suggested having an overview of employees and their roles. Currently, finding information about competence and responsibility is not easy. Another challenge is the timing of gatherings, as new employees should participate after being employed for some months to fully benefit from them.

Table 5: Who Knows What and Time for Learning – Sample Quotes

"There were a few instances where I had to ask multiple people and was forwarded several times."
"It would greatly benefit new employees to have the ability to easily look up and access brief overviews of different team members, including their roles, locations, and areas of expertise."

4.3 The Culture of Knowledge-Sharing and Knowledge-Sharing Initiatives

The organization values knowledge-sharing and encourages initiatives. Newcomers highlight the open culture that promotes sharing knowledge. Most interviewees believe colleagues do not withhold knowledge intentionally but may do so unconsciously. Managers are positive about knowledge-sharing and aim for a collaborative environment. However, sharing knowledge across departments and upwards in the hierarchy is challenging due to lack of communication and time constraints. Knowledge-sharing happens in meetings, professional groups (communities of practice), wikis, instant message channels, and customized initiatives.

Most interviewees emphasized that meetings were the most important arena for knowledge sharing. Wiki and professional groups (communities of practice) were also considered effective for knowledge sharing. However, the effectiveness of knowledge sharing also depends on employees' initiative. Some employees mentioned other IT subject forums and arenas within the organization where knowledge could be shared. Some departments have their own schemes for knowledge sharing, aiming to help employees acquire knowledge from their colleagues. Some managers encourage employees to attend courses to acquire necessary knowledge, which can then be shared further.

Managers highlighted the importance of exchanging experiences during conversations, where informal learning often takes place. The extent of employee learning depends on their initiative. Good documentation routines were also seen as important for knowledge sharing.

There were different opinions about what works and what doesn't in knowledge sharing. Some participants believe they are good at sharing knowledge and actively offer expertise, while others share mostly when asked. Some mentioned that newcomers may have less knowledge to share, and some feel that documentation is not being used effectively. Time constraints and project assignments also impact knowledge sharing.

The flow of information and communication within the IT department was described as both positive and negative. While it was seen as informal and efficient, the size of the organization was highlighted as a challenge, making it difficult to keep track of projects and personnel. Transparency and security-related requirements were also mentioned as challenges in knowledge sharing.

Instant messaging channels, such as Mattermost and Teams, were considered important for knowledge sharing, but some challenges arose due to the use of multiple channels (see Table 6). The decision to phase out Mattermost or not was pending.

Table 6: The Culture of Knowledge Sharing and Knowledge Sharing Initiatives – Sample Quotes

"I believe people are interested in creating a positive work environment where knowledge sharing is encouraged. There is no competition or danger in sharing knowledge as it leads to a better working environment."
"We are highly focused on knowledge sharing and expertise dissemination. We aim to avoid creating specialists and encourage everyone to have a diverse skill set."
"Unfortunately, knowledge sharing is not happening enough between teams and groups, leading to silos and lack of communication. Some express a desire to prioritize sharing, but face challenges due to time constraints and the presence of many people."
"There are forums and arenas within the organization where IT subjects and other topics are presented for sharing and collaboration."
"I recently encouraged two of my team members to work together and improve their skills in a specific area. Formal documentation alone cannot solve this issue."
"My employer has supported and encouraged my attendance in relevant courses."
"We have a culture of verbal exchange of experiences and learning from each other in various settings."
"Sometimes I proactively share important knowledge, while other times people approach me with questions."
"In everyday situations, it's often easier for others to come and ask for expertise rather than proactively offering it."
"I avoid creating lengthy documents and routine descriptions as they are time-consuming and not widely sought after."
"I think overall it's positive, but managing communication with a large number of people can be challenging to ensure consistent messaging."
"As a large organization with frequent changes in personnel and projects, it can be difficult to keep track of responsibilities and roles, leading to occasional messiness."
"One strategy may not fit all situations and departments within the organization."
"While there is a transparency principle in the organization, there are also security-related requirements that limit information dissemination. Balancing these two principles can be challenging."

5. Discussion

The public sector was praised by interviewees for its positive characteristics, particularly job security, which fosters a cooperative culture by reducing competition and protecting positions (Choudhury & Das, 2021). Unlike the private sector, the public sector focuses on aspects beyond profit, such as competence building, which can provide a competitive advantage by nurturing informed, cooperative, and competent employees. This emphasis on employee well-being, motivation, and competence building aligns with the ABC's culture, particularly during onboarding where cooperation and organizational merits are valued.

Clarity on information channels and access to licenses is essential for employees, and management may need to formalize changes in channel structure and usage, such as sharing information from Mattermost in other channels for wider access. Addressing employees' concerns and leveraging their knowledge can help minimize resistance to changes and facilitate smooth knowledge sharing (Corfield & Paton, 2016).

Interviewees expressed positive attitudes towards knowledge sharing among managers and colleagues, mentioning accessible leadership and willingness to help (Choudhury & Das, 2021). However, challenges in sharing knowledge across departments and hierarchical levels, as well as time constraints in large gatherings, exist. Encouraging managers to facilitate implicit knowledge sharing in smaller settings can help employees build their competence. Overall, interviewees were satisfied with the current attitudes towards sharing, but acknowledged room for improvement.

While most interviewees claimed to document their work, some did so only occasionally or not extensively, citing prioritization of other tasks and preference for discussions with colleagues (Oliveira et al., 2015). However,

a strong culture of knowledge sharing is crucial. Despite some differences between groups, the ABC is generally perceived to have a positive culture, with an open environment that encourages asking for assistance and informal discussions.

Internal competition may hinder knowledge sharing, but at ABC, job security is prioritized over competition, fostering a culture of knowledge sharing. While some interviewees acknowledged that colleagues may inadvertently withhold knowledge due to personal traits, they demonstrated awareness of their own room for improvement in knowledge sharing (Bari et al., 2020; Halisah et al., 2021). Trust among colleagues and a positive working environment are considered crucial for effective knowledge sharing (Henttonen & Blomqvist, 2005).

The public sector can be perceived as bureaucratic, with slow processes and differing opinions, which may be viewed negatively. However, the ABC organization leverages this perception for improvement by promoting open dialogue and problem-solving during meetings and professional gatherings, which facilitate knowledge sharing and understanding of work tasks and the profession.

During onboarding, employees acquire knowledge in informal contexts through communication, indicating a positive culture of sharing implicit knowledge and an agile approach to KM (Zykov & Singh, 2020). To build on this, management can design a knowledge-sharing strategy that focuses on explicit and implicit knowledge. Interviews reveal that implicit knowledge sharing is more successful at ABC, with a low threshold for asking for help and frequent meetings for knowledge sharing. However, attitudes towards documentation vary, with limits on how much knowledge is documented and utilized.

Siakas & Georgiadou's (2006) model can guide the ABC's strategy for sharing knowledge, with steps 2, 4, and 6 being widespread, and steps 1 and 5 also showing positive signs (Figure 1). Step 8 varies among groups, and steps 3 and 6 could be improved. Measures to motivate employees to share knowledge, such as collaboration initiatives, can be introduced to enhance knowledge sharing (Corfield & Paton, 2016; Smith, 2001; Weng et al., 2020).

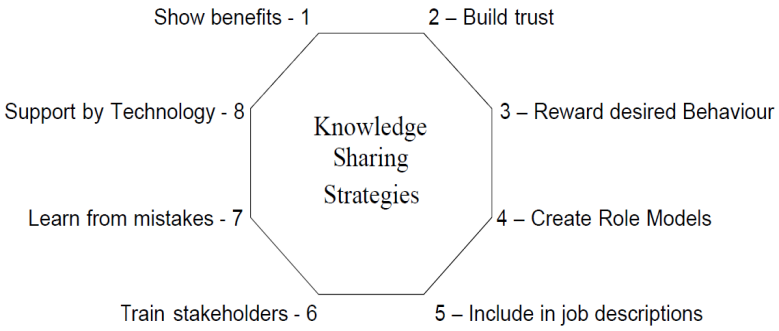

Figure 1: Guide to Develop and Utilize a KM Strategy (Siakas & Georgiadou, 2006)

Interviewees described the flow of information and communication in varying terms, ranging from positive to negative. The informal culture at ABC facilitated easy connection and communication, but also posed challenges in initiating communication when the right person was not easily accessible, especially for new employees lacking an established social network. Identifying the right people to solve a problem was often unclear and difficult, and some relied on mentors or team members for assistance. The IT division primarily used Microsoft Teams and Mattermost for communication, with Mattermost being less accessible due to license restrictions, resulting in missed information. Similar confusion existed regarding documentation channels such as Wiki, Jira, and SharePoint. To improve knowledge sharing, it is crucial to establish clear purposes for using these solutions and clarify what information and knowledge should be shared and where it should be documented (Scarso et al., 2016). Clarification among employees regarding relevant channels for specific information and assessing access to expensive licenses may require changes in channel structure and usage, while prioritizing employee understanding and reducing resistance to change (Corfield & Paton, 2016).

Participants displayed varying levels of willingness to share knowledge. Some shared willingly, while others preferred to share only when asked or when they perceived a need to improve their knowledge-sharing efforts, which is consistent with previous research (Hu & Randel, 2014). Even experienced employees were not necessarily better at documenting knowledge, as some mentioned that not everything seemed relevant to document, possibly due to motivation challenges. Additionally, interviewees had different perceptions of what it means to be proficient at knowledge sharing, with some who claimed to be good at it not necessarily being better than those who acknowledged room for improvement (Scarso et al., 2016; Shih & Farn, 2008).

Managers and colleagues generally exhibited a positive attitude towards knowledge sharing, with a willingness to help and an accessible and informal leadership style (Choudhury & Das, 2021). However, challenges arose in sharing knowledge across different departments and hierarchies, mainly due to time constraints and difficulties in sharing in large gatherings. Implicit knowledge sharing outside of meetings may enhance employee competence. While interviewees expressed satisfaction with prevailing attitudes towards sharing, they also acknowledged the need for further improvement. Most interviewees did not believe that employees intentionally withhold knowledge, but a competitive internal climate can negatively impact knowledge sharing (Halisah et al., 2021). At ABC, employees tended to feel job security rather than competition for positions, fostering a positive environment for knowledge sharing. However, some interviewees suggested that colleagues may unconsciously retain knowledge due to personal traits such as reservation, which can affect the amount of knowledge they share (Bari et al., 2020). Perceiving lack of knowledge sharing among colleagues can reduce trust and negatively impact the work environment (Kähkönen et al., 2021). However, interviewees also acknowledged that lack of knowledge sharing may not always be intentional and admitted to needing improvement in their own knowledge-sharing efforts and observing similar behaviour in colleagues.

6. Conclusion and Implications

We conducted a case study to explore the role of KM in onboarding processes. Our findings highlight the potential of KM initiatives to positively impact onboarding by fostering knowledge sharing and collaboration, facilitating learning and development, and enhancing organizational culture and performance. KM can promote a knowledge-sharing culture within the organization, which can effectively support onboarding of new employees. This can be facilitated through knowledge-sharing platforms, communities of practice, and social media tools that enable access and sharing of relevant information, expertise, and experiences (Henttonen et al., 2016; Kirchner & Stull, 2022). In addition, KM can support learning and development by providing new employees with access to training materials, resources, and best practices. Creating a learning organization that values continuous improvement and innovation can enhance the onboarding experience for new hires (Yang, 2007). Furthermore, KM can contribute to organizational performance by promoting knowledge reuse and leveraging expertise across the organization. This can help new employees quickly integrate into the organization and understand its core values, goals, and processes, thus enhancing individual and team performance (Massaro et al., 2015).

Based on our findings, we recommend that ABC continues its effective initiatives such as the mentorship scheme, new employee gatherings, and the Tech Graduate program. However, we also suggest designing additional initiatives to integrate new employees beyond the Tech Graduate program, allowing them to build a larger network early on. Tailoring the training plan to be more role-specific and disseminating general information broadly could also be beneficial in enhancing onboarding effectiveness.

Considering the challenges of locating relevant resources in a large organization like ABC, we propose enhancing the intranet page to include comprehensive role descriptions and responsibilities, facilitating easier access to resources for new employees. Additionally, establishing clear guidelines for the purposeful use of collaboration tools within the organization can enhance collaboration and productivity among employees. The recommendations are summarized in Table 7 and can also be valuable for onboarding processes in other organizations.

Table 7: Practical Implications – Recommendation for Onboarding

	Recommendation for onboarding
1	Continue implementing the mentorship scheme, new employee gatherings, and the Tech Graduate programme as part of the organizational strategy.
2	Ensure new employees are integrated into informal networks early on.
3	Provide tailored training that allows new hires to focus on learning their job duties at the beginning, so they feel productive from the start.
4	Extend the videos with general information about the organization throughout the employment period.
5	Enhance the intranet page with an overview of employees, including role descriptions and responsibilities, to make it easier to find resources.
6	Define clear purposes for using collaboration tools, so that new employees can easily understand when to use them.

Moreover, we propose targeted KM initiatives that can effectively facilitate the onboarding process and facilitate knowledge transfer. These recommendations are derived from our own research findings as well as existing literature and are generally regarded as beneficial for organizations in onboarding processes aiming to enhance their focus on KM (Table 8).

Table 8: Suggested KM Initiatives Supporting Onboarding and Knowledge Flow

KM initiative	Description
Knowledge sharing platform	Establish a centralized digital platform or intranet where employees can share and access knowledge resources such as best practices, guidelines, templates, and lessons learned (e.g., enterprise social media platform). This platform can facilitate collaboration and encourage knowledge exchange among employees (e.g., Rode, 2016).
Communities of practice	Cultivate the formation of communities of practice (CoPs) within the organization. CoPs bring together individuals with shared professional interests and expertise to foster knowledge sharing, problem-solving, learning and innovation (Brown & Duguid, 1991). These communities can be organized around specific topics and issues in the organization as well as in relation to ongoing projects (e.g., Hustad, 2017).
Knowledge capture and documentation	Implement processes and communication media tools to capture tacit knowledge from experienced employees before their retirement or departure from the organization. This can involve conducting exit interviews, creating knowledge transfer plans, and documenting critical expertise through written reports, videos, or audio recordings (e.g., Cox & Overbey, 2022).
Competence management	Learning and development programs including training programs, workshops, and seminars to develop employees' skills and knowledge. Focus on areas relevant to the organization's objectives and type of organization (private or public), such as leadership development, project management, technological advancements, and public service innovations (e.g., de Vasconcelos et al., 2016).
Mentoring and coaching	Establish mentoring or coaching programs where experienced employees can provide guidance, support, and knowledge transfer to junior or new staff members. This promotes knowledge sharing, skills development, and the transfer of institutional knowledge (e.g., Lave & Wenger, 1991).
Knowledge repositories	Develop an organizational "bible" or a knowledge reservoir (Hole et al., 2017): Develop repositories that contain relevant information, policies, procedures, and templates. Ensure these resources are easily accessible and regularly updated to allow access to valuable knowledge (e.g., Levallet & Chan, 2019).
Performance evaluation and recognition	Incorporate knowledge sharing and collaboration as performance evaluation criteria. Recognize and reward employees who actively contribute to knowledge management initiatives and demonstrate a commitment to sharing knowledge and expertise. Provide incentives for knowledge sharing (e.g., Kremer et al., 2019).
Collaboration technologies	Implement collaborative technologies such as project management software, shared document repositories, and virtual communication tools and platforms (e.g., Teams). These tools facilitate real-time collaboration, information sharing, and efficient teamwork, regardless of employees' physical locations (e.g., Dingsøyr et al., 2018).
Organizational learning culture	Foster a culture of continuous learning and knowledge sharing within the organization. Encourage employees to seek new knowledge, participate in professional development opportunities, and share their expertise with others (e.g., Sorakraikitikul & Siengthai, 2014).
Leadership and KM	Be aware of leadership support involving clear communication, and ongoing evaluation to ensure successful KM initiatives (e.g., Von Krogh et al., 2012).

As a suggestion for future research, it is recommended to conduct similar studies within other large public organizations to account for potential organization-specific findings. Exploring different sectors, such as the municipal sector, could offer valuable insights due to the unique cultural dynamics influenced by local politics. Additionally, broadening the research scope to encompass large public organizations beyond Norway would provide a more comprehensive understanding of the impact of culture on the onboarding process. To further enrich the understanding of organizational culture and effective KM initiatives, incorporating qualitative data through interviews with long-term employees, as well as observations and group interviews to assess cultural dynamics, would be beneficial in future research endeavours.

Furthermore, to investigate the role of organizational context and individual differences in onboarding processes deserves additional exploration. With the rapid advancement of technology, organizations are increasingly adopting digital tools and platforms for KM purposes. Therefore, exploring the potential of advanced

technologies, such as artificial intelligence-driven knowledge repositories, in facilitating onboarding processes and enhancing knowledge transfer is worth investigating. Moreover, it is crucial for future research to investigate the long-term impacts of KM practices on fostering competence development, facilitating knowledge retention, and promoting continuous learning among employees.

Online Patient Account: A Tool to Support Older Adults or Digital Exclusion?

Magdalena Bsoul-Kopowska
Częstochowa University of Technology, Poland

m.bsoul-kopowska@pcz.pl

Abstract: One of the conditions for the efficient operation of the healthcare system in Poland is the well-functioning information system, which for several years, has been moving towards full computerization. The application of new technologies in serving older adults is aimed at ensuring safety and extending and increasing their independence. The Online Patient Account (Internetowe Konto Pacjenta - IKP) is an electronic application in Poland that any patient can log in to view their health history free of charge. The aim of the present paper is to answer the question of whether the introduction of the Online Patient Account service in Poland leads to the elimination of barriers related to the dysfunction of the healthcare system, or to the secondary exclusion of older adults. The study used a diagnostic survey method based on a questionnaire technique that was addressed to older adults living in Poland. The survey was conducted in late 2022 and early 2023. The results obtained suggest the problem of digital exclusion of older adults, which may consequently exacerbate disparities in access to medical care. The results of the survey helped illustrate the specific situation of older adults and develop important recommendations for the inclusion of older members of society in the market of healthcare services. The research conducted shows that the IKP service, despite its potential to address inequalities in healthcare for older adults, is still in the development stage.

Keywords: Older adults, Digital exclusion, Society 5.0, New technology, Healthcare

1. Introduction

According to the European Commission, “eHealth is the use of ICT in health products, services, and processes, combined with organisational change in healthcare systems and new skills. [...] eHealth covers the interaction between patients and health-service providers, institution-to-institution transmission of data, or peer-to-peer communication between patients and/or health professionals" (EC, 2012). The digital health marketplace is expected to enable the use of information and communication technologies (ICT) to maintain and improve patients' health, and contribute to improving the accessibility and quality of health care. The concept of Society 5.0 is expected to help in this field, and it is hoped that it can overcome the problem that arises in aging societies, in which an increasing number of people require additional medical care. Therefore, it is important to skillfully and fully exploit the opportunities brought by the development of ICT to acquire new knowledge and create new quality by developing relations between people and objects in the real world and virtual reality (Harayamaa, 2017). The purpose of the present paper is to discuss the possibility of adapting new technologies in serving older adults in the area of e-health, using the Online Patient Account as an example.

2. Background and Literature Review

2.1 Aging Society and the Concept of Society 5.0

Healthcare and the entire medical sector are going to face big challenges in the next few years. As numerous social studies indicate, in modern societies, population aging has become a problem that cannot be ignored (Almeida, Matos 2005). It is a global and universal process. According to the United Nations, for the first time in history, the number of people aged 65 and over worldwide outnumbered the number of children under 5, and by 2050, one in six people worldwide will be over 65. Furthermore, in 2019, the UN also evaluated that people aged 65 and over accounted for 9% of the world's population of global residents. The percentage is estimated to grow steadily, reaching 12% in 2030, 16% in 2050, and up to 23% in 2100, respectively. Furthermore, 2019 UN projections suggest that by 2050, one in four people in Europe and North America will be 65 or older (UN, 2019).

An aging population and low birth rates mean that the balance between the number of people of working and post-working age may be disturbed. Another problem is the increasing singularization of old age, i.e., the increase in the number of older adults who form single-person households, are on their own, and have no one to support them (according to projections by Statistics Poland (GUS), 53.3% of one-person households in Poland in 2030 will include people aged 65 and over, with 17.3% aged 80 and over). This process negatively affects the economy because it increases health and medical expenses, especially for older adults (Wiener, Tilly 2002; Bloom, Canning, Sevilla 2003; McMorrow, Roeger 2004; Kotlikoff, Burns 2004; Lee, Mason 2011; and others). Polish researchers also noted that for the first time in the history of mankind, there are as many as two

generations of older adults, that is, people over 60 who still have living parents aged 80 and older (Migdał-Najman, Najman, Badowska, 2020). The demographic situation in these terms in Poland is special. According to Statistics Poland, the population of Poland in 2019 was 38.38 million, of which people aged 60 and over accounted for 25.3%, while in 2050, the percentage of people aged 60 and over will be 40.4% (GUS, 2021). According to UN projections (UN, 2019), by 2050, the number of Poles will have reduced to 33.30 million inhabitants, with 31.12% of the population over 65 years of age. According to the UN, Poles will be the world's tenth oldest society in 2050. Such an emerging demographic structure will directly generate changes in consumer market segments, with a growing role of older adult consumers. Therefore, efforts are being made around the world to improve the quality of life of older adults, especially since the problem of aging does not only affect rich but also developing countries.

The Japan Business Federation, in its 2016 document Toward Realization of the New Economy and Society, pointed out that the time for great reform has arrived, and that Japan, as a forerunner in finding solutions to emerging problems, is committed to promoting economy-wide and society-wide innovation (Japan Business Federation, 2016). The concept of Society 5.0 defines society as human-oriented, in which economic progress containing solutions to social issues is balanced by a system that offers high integration of digital and real space. Therefore, in recent years, there has been an increasing number of studies devoted to the use of new technologies in the care of older adults (Sixsmith 2006; Nygård, Starkhammar 2007; Robinson et al. 2009; Topo, Östlund 2009; Mountain 2013). In practice, the solution to the above problem is expected to be Society 5.0 and the 5G network, while the use of information systems and mobile technologies is expected to form the basis for a change in the approach to the management of processes in the area of decision-making in healthcare. Therefore, e-health services belong to the group of services that have the greatest potential for growth in the coming years under the conditions of the modern economy. e-health is expected to improve various aspects of healthcare (quality, efficiency, accessibility, etc.), provide consumers with better access to healthcare services and health information, and stay physically and mentally fit. This, in turn, will require digital competencies, which on the one hand, can be an enabler, and on the other hand, can be a hindrance to coping with the digital world (Harayama, 2017). The above-mentioned digital competencies become a key factor for people who faced the digital revolution at the end of their professional careers and had far less to do with new technologies than younger members of society. According to S. Serpa and C. M. Ferreira, society 5.0 is expected to "promote further development of the potential of the individual-technology relationship, and improve the quality of life for all people through a super smart society "(Serpa and Ferreira, 2018, item 1).

A survey by Statistics Poland (GUS, 2021) conducted in Poland in 2019 showed that only 34.1% of people aged 65 to 74 used computers in the past three months. Although people of this age are increasingly using computers at least once a week, the percentage of regular users remains at a lower level than in younger age groups. In 2019, 37.0% of people aged 65-74 used the Internet (CSO, 2021), 33.3% of people regularly connected to the Internet in 2019, and already in 2020, this percentage was 40.4% (CSO, 2020). On the other hand, 64.6% of those aged 65 and over have never used the Internet. Access to technology and the knowledge and ability to use new technologies can contribute to better and more open acceptance of digital solutions in the healthcare market, while limitations in this area are a major barrier to the spread of digital services. These results suggest that although more and more older adults in Poland are using the Internet, there are still large differences in access between different age groups. It is also possible that the problem is the lack of access to adequate infrastructure, and inadequate education on how to use the Internet, especially for older adults, who usually have not had contact with new technologies before.

A few years ago, a new term of ‘digital divide’ emerged in public discourse, meaning unequal access to new technologies (van Dijk, 2006). Digital divide can be observed both on a macro scale, in which case it manifests itself, for example, in differences in Internet access between different regions of the world, and on a micro scale, for example, when differences in media competence are observed among members of a household (Vu, 2011). A review of the literature shows that groups affected by digital divide certainly include older adults. Older adults use the Internet for a variety of reasons. In the case of e-health services, it is most often used to obtain health information, check medical recommendations, lab results, and general recommendations to improve health-related quality of life (Martin-Hammond et al., 2019, Bolle et al., 2016, Shim et al., 2018). On the one hand, using the Internet as a source of health information has many advantages, including offering quick, easy, timely, and inexpensive access to information and thus allowing you to control your health status, provided that the information is reliable. Despite the numerous benefits of e-health for older adults, many do not know how to handle the use of new technology (Santana et al., 2011).

2.2 Online Patient Account

In 2011, the National Center for Health Information Systems announced a tender for an Electronic Platform for the Collection, Analysis, and Sharing of Digital Resources on Medical Events. It is one of the largest e-health projects in Poland. Online Patient Account (IKP) is a digital collection of health information. Once a person's account is authorized without leaving home, the patient can use many of the health system's services because the system allows them to collect all health information in one place. With the system, doctors are supported in making therapeutic decisions, while patients can manage their health records. The advantage of the IKP system is that patients can enter their medical data or receive notifications about medical appointments or the need to take medication. Patients have also the option to receive medical services remotely. IKP does not need to be set up, as IKP is available to any citizen with a PESEL (PESEL i.e., Polish Personal Identification Number, is an 11-digit number assigned to every person with registered residence in Poland containing information on gender, date of birth, place of birth, and document issue series number) number, but to make full use of this system, the account must be authorized. The problem arises here because the authorization must be done by a bank using iPKO or Inteligo online accounts, ePUAP, with Trusted Profile (Profil Zaufany, PZ), or an electronic identification card. The account can be accessed using the website and cell phone apps (Internet Patient Account, 2023). Unfortunately, the first authorization to the system is quite a challenge for older adults.

Therefore, in the context of previous considerations, one may wonder whether IKP leads to secondary digital exclusion of adults over 65 years of age with limited digital competencies. And could the digital divide exacerbate disparities in access to medical care, especially as patients' demand for medical care increases with age?

3. Methodology

The findings presented in the paper are part of a quantitative survey conducted among older adults in 2022/2023. The study was conducted using quantitative research methods and survey questionnaire technique due to direct contact with respondents. The survey covered adults aged 65 and over living in Poland. The study used a diagnostic survey method based on a questionnaire technique that was addressed to older adults living in Poland. Purposive random sampling was used, taking into account gender, age, education, and place of residence. The survey included 570 older adults. It was conducted over a four-month period (October to January) 2022/2023.

The main research tool used was a standardized survey questionnaire consisting of 28 closed questions and statements. A Likert scale was used to rate the responses, which made it possible to evaluate the relative intensity of different responses (Babbie 2004, p. 192). The research tool (questionnaire) was designed by the author and created by the author of the paper. STATISTICA software was used in the process of compiling the findings.

For the purposes of the study, the focus was on the problem of accessibility of services provided by the IKP and the needs of older adults in this regard. The article attempts to answer the question of whether the introduction of the possibility of using the IKP service offers an opportunity for older adults to overcome barriers related to access to medical care or a tool that causes their digital exclusion from the healthcare system. To this end, an attempt was made to answer the following questions:

- Are older adults open to new technologies?
- Do they think new technology will have a direct impact on their health?
- Do older adults use the IKP app?
- Are they willing to use e-prescriptions?
- Do they make an appointment for a test or with a specialist using e-referrals?
- Do they use information about scheduled appointments with doctors and specialists?
- Do they check the information about the drugs prescribed to them through IKP?
- Do older adults use the option of lab result preview in IKP?
- Did they use the access to information during the COVID-19 pandemic sent by IKP?
- For the purposes of this study, the following hypothesis was adopted:
- Online Patient Account is a barrier for older adults to access medical care.
- Online Patient Account leads to digital exclusion of older adults.

4. Results

The survey included 570 people, with 518 correctly filled questionnaires at a 91% return rate. The responses of 518 people who reported being older than 65 and using the Internet were analyzed. Respondents were men and women (with a preponderance of the former) in the age groups of 65 to 69 years (53%), 70 to 79 years (42%), and 80 years and over (5%). The survey was conducted among older adults living throughout the country taking into account demographic, social, and economic characteristics. In the study group, the most frequent characteristics were secondary and higher education, medium and large towns as the place of residence, married people, the income oscillating from PLN 2,000 to 4,999, and ended or current professional careers. Based on the survey, it can be concluded that there is a significant percentage of older adults in Poland who are characterized by openness to new technologies. Of older adults studied, 74% believe that new technologies are needed not only in the medical field but throughout the economy. They see them as an opportunity to grow the economy. This attitude is strongly related to age, place of residence, education, and material status. Analysis of the data shows that the respondents can be divided into two groups: those who are enthusiastic about new technologies (they account for 46% of the respondents) and those who have skeptical attitudes to these technologies, accounting for 54% of the respondents. The biggest supporters of new technologies are older people up to 75 years of age who are residents of large cities with higher education and satisfactory material status. In contrast, those with skeptical attitudes to new technologies are most often over 75 years old, have a high school education and lower income. This may be due to the fact that 76% of those aged 75+ have trouble using new technologies. In this case, the research shows, neither education nor place of residence plays a significant role, as the problem affects the entire population aged over 75 years.

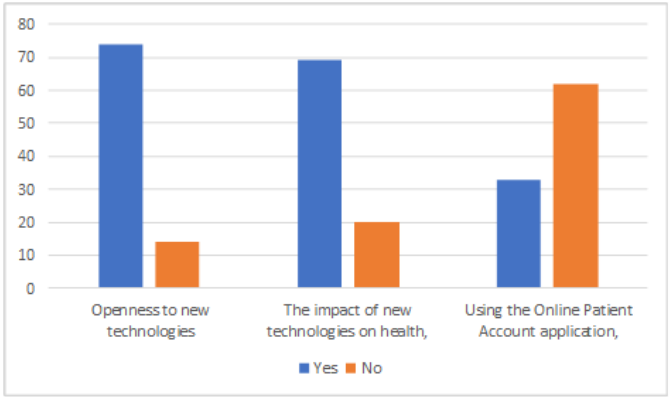

Table 1: Older Adults' Attitudes to new Technologies

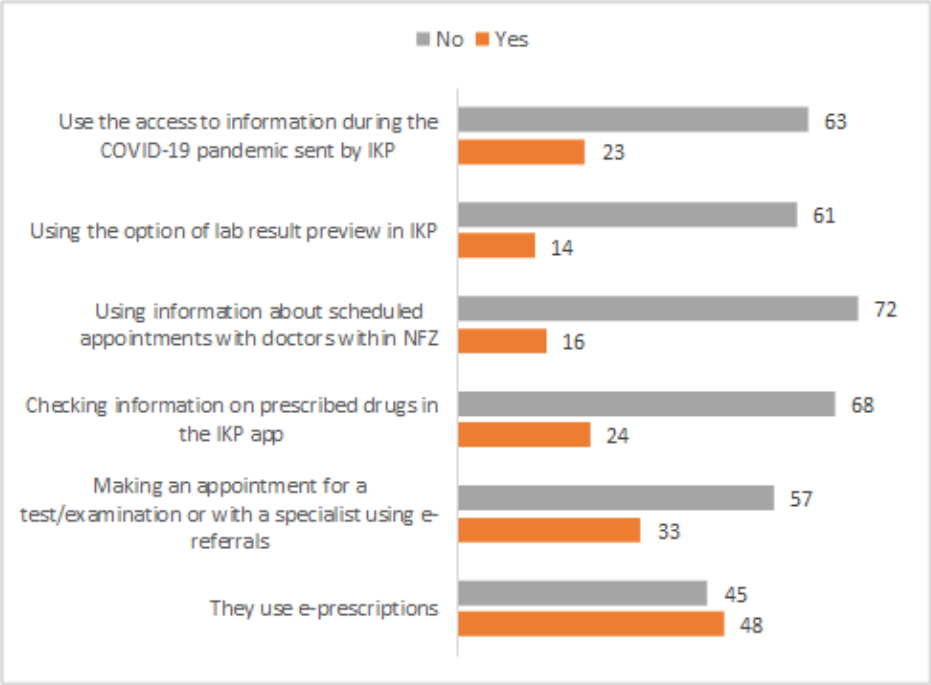
Criteria	Definitely yes	Rather yes	Neither yes nor no	Rather not	Definitely not
Openness to new technologies?	38	36	12	8	6
The impact of new technologies on health	23	46	11	12	8
Using the IKP app	12	21	5	23	39

Source: Own elaboration

The survey also found that 69% of older adults agreed with the statement that new technologies will have a direct impact on their health and 20% hold the opposite view. The answer "Definitely not" or "Rather not" was marked by 20%. The statement about the impact of new technologies on health is met with the most opposition among men aged over 75 years with secondary vocational education and average incomes. According to the survey, the place of residence does not matter in this regard.

Of older adults surveyed, 86% had heard of the Online Patient Account, the most popular online medical service, but only 33% said they had used the IKP app.



Source: Own elaboration.

Figure 1: Seniors Towards new Technologies

For most of them, the main reason for actively using the app on a daily basis is to use e-prescriptions (48%) and to make appointments for a test or see a specialist (33%). Almost all older adults surveyed (91%) had heard of e-prescription but almost half (45%) said they did not use it. Only 24% of respondents used the IKP app to get information about appointments and only 14% of them checked lab results through the app and 16% sought information about their prescribed medications. This is most likely due to their difficulties in accessing and navigating the Internet and lack of skills in using new technologies. Only 23% of the older adults surveyed had used information on disease incidence during the COVID-19 pandemic.

Interestingly, almost half of the respondents (44%) justified their decision not to use the IKP app by a lack of trust in the government app, 26% of respondents did not believe the government in the information provided about the pandemic and 8% of respondents did not believe the pandemic actually existed.

Source: Own elaboration

Figure 2: IKO Services Used by Older Adults

Taking into account the IKP app and the demographic and social characteristics of the respondents, their profile was created (Tab. 2). The results were processed using two-tailed tests, with a significance level set at 0.053. The tests are adjusted for all pairwise comparisons within each internal subtable using the Bonferroni correction (Krzych, 2007).

Table 2: Profile of Respondents by Demographic and Social Characteristics Using the IKP App; Percentage Of Highest Responses

Criteria	Use of e-prescriptions	Making an appointment for a test/examination or with a specialist using e-referrals	Using information about scheduled appointments with doctors	Checking drug information	Checking the results of laboratory tests	Access to information during the COVID-19 pandemic
Sex	Women 78%	Women 67%	Men 56%	Women 58%	Women 25%	Men 19%
Age	65-69 years, 55%	65-69 years, 81%	65-69 years, 29%	65-69 years 57%	70 years and more, 71%	70 years and more

Education	higher education, 78%	vocational education, 71%	secondary education, 57%	secondary education 68 %	higher education, 59%	secondary education, 66%
Place of residence (size)	501,000 residents and more, 43%	10,000-100,000 and 501,000 residents and more, 78% each	501,000 residents and more, 76%	10,000-100,000 and 501,000 residents and more, 77% each	501,000 residents and more, 39%	501,000 residents and more, 41%
Financial status	average and good, 15% each	average 38%	modest 68%	average and good, 15% each	good 36%	average and good, 15% each
Attitude towards chronological age	younger/ according to age 15% each	younger 54%	younger 61%	older 41%	younger 48%	younger 65%

Source: Own elaboration

It should be emphasized that high activity in terms of the use of e-prescriptions was found for women and those aged 65-69 years with higher education in the vast majority. Older adults who used e-prescriptions were those who had a good to moderate opinion of their financial status and felt younger or according to their age. Respondents from cities with more than 500,000 residents were statistically more likely to purchase prescription drugs than those from 100,001 to 500,000 residents.

Women were also more active in making appointments and examinations with specialists, checking information about drugs prescribed to them, and checking lab results. They most often represented an age group of 65 to 69 years, had secondary or higher education, and felt younger than they actually were. They rated their financial status as good or average. In contrast, men in the 65-69 age group were more active in checking information about scheduled appointments. Most had secondary education and lived in cities with over 500,000 residents. They described their financial status as modest but felt statistically younger than their chronological age. Men were also more active when seeking information on the COVID-19 pandemic. This group was characterized by age over 70, and like the above group, was distinguished by having secondary education and living in cities with over 500,000 residents. Information was sought by a higher percentage of those who felt younger than their chronological age than those who felt according to their age. Older adults used IKP services with varying frequency. The highest percentages were found in groups that used such services at least once a month (34%) and once every two/three months (27% each). The remaining 39% used them once every six months (23%) or less often (16%). These services were more often used at least once a month by women (47%), respondents aged 65 to 69 years (38%), and those assessing their household situation as modest (41%) and good (23%). People who felt younger, appropriate to age, and older than those who felt according to calendar age did so statistically more often (at least once a month). Women (39%) were more likely to use the IKP at least once a month than men (32%), those with secondary education (36%), those from cities with more than 500,001 residents (42%), those with modest (32%) and average financial status, and respondents who felt according to their calendar age (41%). Respondents who were very satisfied with the use of IKP were women (statistically significantly more often very satisfied than men), those aged 65 to 74 years (27%), respondents with secondary education (32%), those rating their financial status as modest (31%), those feeling younger than their calendar age (29%), statistically significantly more often than those feeling according to age.

5. Discussion

The results of the study supported the research hypotheses. Firstly, IPK is a barrier for older adults to access medical care. Secondly, IPK leads to digital exclusion of older adults. This is evidenced by the fact that only 33% of the older adults surveyed reported using IKP. Therefore, the results suggest a problem of digital exclusion of older adults, which may consequently exacerbate disparities in access to medical care. This is confirmed by research conducted by Statistics Poland (GUS), according to which, in Poland in 2020, only 11.8% of people aged from 65 to 74 years used the IKP service, while in the group of people over 75 years, the percentage was only 2.7%. Undoubtedly, the COVID-19 pandemic (Mirczak, 2020) contributed to the slight increase in the use of e-health services, including the IKP service. Among the data officially released by the National Health Fund (NFZ) and the Ministry of Health in Poland, there is no aggregate and comprehensive information to identify users of

the IKP service in terms of age. According to a website of the Ministry of Health and the National Health Fund, the smallest group using IKP is people aged over 75 years, who have activated more than 108,000 accounts. Despite the relatively low percentage of people 75+ (according to the website), it is in this group that the highest relative growth of activated accounts can be observed (during the first half of 2021, the number of activated accounts of people aged over 75 years was already twice as high as in the entire 2020). This does not change the fact that people of this age still have the lowest percentage of all users (https://www.cez.gov.pl/pl/page/o-nas/aktualnosci/juz-10-milionow-polakow-korzysta-z-internetowego-konta-pacjenta-w-serwisie).

The results of the survey also helped illustrate the specific situation of older adults and formulate important recommendations for their inclusion in the health care market. The use of IKP services by older adults can additionally be inferred from the results of a survey on Internet use in Poland: in 2021, the total number of Internet users was 28.2 million, of which 4.4 million were over the age of 55 years. The largest number of its users was found in the 16-24 age group (97%), followed by the 55-64 age group (76%), and the 65+ group (54%) (Statistics Poland, 2021). Furthermore, according to a 2020 study by the Centre for Public Opinion Research (Centrum Badania Opinii Społecznej, CBOS), in Poland, 22% of people over the age of 60 years did not use the Internet at all, and in the 70-79 age group, the percentage of non-users was as high as 49% (CBOS, 2020).

Older adults usually use the Internet for communication, browsing, reading news, and watching videos. Younger people, on the other hand, are more likely to use the Internet for entertainment, games, online shopping, and remote work and learning.

Older adults are much less likely to use e-health services such as mobile apps, telemedicine platforms, or electronic medical records. According to a 2020 CBOS survey, health-related mobile apps were used by only 12% in the 60-69 age group, whereas in the 70-79 age group, the percentage was only 2% (CBOS, 2020). In the case of e-health services, the most common motivation for using them is to obtain health information, check medical recommendations, lab results, and general recommendations to improve health-related quality of life (Martin-Hammond et al., 2019, 1983-1993; Bolle et al., 2016, 710-720). Older adults use these services to check their health, prevent chronic diseases, better understand test results, and get information on how to take care of their health. For younger people, mobile apps and platforms that allow them to contact a doctor online are also popular, especially in cases of unusual symptoms or situations where it is impossible to see a specialist (Kim et al., 2017, 159-166).

Furthermore, a study by Dudkowski-Sadowska demonstrated that the survey of attitudes toward the introduction of electronic health records (EHR) outlined a profile of a potential e-health user alongside a profile of a person who has no knowledge of such services. This group included mainly older adults, retired persons, those who did not use the Internet for health purposes, those who did not have a cell phone and those who poorly evaluated their health, being a significant part of Poland's population of older adults (Dudkowski-Sadowska, 2022).

However, it should be noted that the above comparisons are general trends rather than a general rule. Use of the Internet and health e-services can vary depending on many factors, such as education, region of residence and severity of chronic diseases.

Therefore, digital exclusion of older adults leads to an increase in social inequality, reduced access to information, and online services, making it difficult for them to take full advantage of social, health, and educational resources, and negatively affecting the health and independence of this population. Therefore, it is important to take steps to close the digital divide and enable all social groups to use digital technologies.

Several measures should be taken to counter digital exclusion of older adults, such as:

- Training programs - organization of courses or workshops to help older adults learn how to use computers, Internet, and mobile applications.
- Interface customization: creating interfaces that are more intuitive and understandable to older adults and provide higher contrast, larger fonts, and other features to help them better perceive information.
- Popularizing e-services: educating older adults about the benefits of using e-services, such as e-prescriptions, e-visits, e-rehabilitation, e-referrals, etc.
- Technical support: organizing help desks for older adults to help solve problems related to the operation of digital devices.

- Involving older adults in digital transformation processes, enabling them to participate in IT and research projects that will help them engage and understand the benefits of digitization.
- Availability of equipment: providing access to computer and Internet equipment to older adults who do not have it at home, e.g. by organizing access in public places such as libraries, community centers, etc.
- Collaboration between the public and private sectors: implementation of programs that bring together the public and private sectors, and NGOs, to effectively combat the digital exclusion of older adults (World Health Organization, 2019; Kuerbis & Mulligan, 2018,).). .

These measures are aimed at increasing access to technology and knowledge, which in turn will help increase digital activity among older adults and reduce digital exclusion.

In conclusion, based on the research results of this study,the IKP service can be an effective tool for engaging older adults in caring for their health, but IKP providers need to be aware of the potential barriers causing digital exclusion of people in this age group to take steps to counteract them. Since the population of people aged 65 years and over is is steadily growing, more attention should be paid to it in terms of access to modern technologies. However, it is important not to stigmatize older adults. Initiatives aimed at improving digital competencies should be tailored to the changing needs of older adults so as to improve their quality of life and ensure better functioning in their environment. The study found that the IKP service, despite its potential to redress inequalities in health care for older adults, is still in the development stage.

6. Conclusion

Since the problem of e-health and IKP is a relatively new phenomenon, the results of the study focused on one country. Another research topic could be a broader analysis in an international collaboration, aiming to learn more about the specifics of older adults' use of digital health services in the context of the specific socioeconomic conditions of the region.

The research conducted shows that the IKP service, despite its potential to address inequalities in healthcare for older adults, is still in the development stage. Compared to younger groups, access to new technologies and digital competencies are still limited for Polish older adults and are a barrier for them to use digital health services. The study demonstrated the need for corrective measures in terms of knowledge sharing to maintain the independence of older adults and counter digital exclusion.

Examining the Impact of Intra-Group or Inter-Group Social Capital on Innovative Climate in Enterprises of the Innovation Sector

Felicjan Bylok
Czestochowa University of Technology, Poland

felicjan.bylok@pcz.pl

Abstract. One of the significant factors that have an impact on the level of innovativeness is that of the intra-group social capital and inter-group social capital. Both of these types of social capital support the innovative climate and may constitute a key attribute in creating new knowledge and innovation, which in turn increases the opportunities of enterprises in terms of market competition. The acceptance of the assumption that social capital has an impact on the creation of the innovative climate in enterprises facilitated the formulation of the research aim, which was to search for answers to the following three research questions: What is the scope of occurrence of the intra-group and inter-group of social capital in enterprises in the innovative sector in Poland? To what extent does the intra-group and inter-group of social capital have an impact on the processes that are favourable to creating knowledge and innovation in enterprises? To what extent does the intra-group and inter-group of social capital have an impact on the creating the innovative climate in enterprises? The assumed goal was executed thanks to the application of the survey method. Empirical research, together with the use of a standardized questionnaire was conducted by means of the CATI technique in 2022. A total of 575 department heads and employees of the innovative sector participated in the research. As a result of the research, significant statistical relations were discovered between the intra-group and inter-group of social capital and the indicators of the innovative climate. Likewise, the positive impact of their attributes on the intra-organizational processes was illustrated, which are favourable towards the creation of knowledge and innovation.

Keywords: Intra-group social capital, Inter-group social capital, Knowledge, Innovativeness, Innovative climate

1. Introduction

Business entities seek opportunities to increase competitive potential in the market and are increasingly paying attention to the need for developing interpersonal cooperation skills within employee groups and organizations to increase innovativeness. Corporate innovation can significantly support social capital, which, with values and qualities such as social interaction, mutual trust, understanding, and shared vision and norms, allows the organization and its members to successfully pursue their goals(Leana and Frits 2006). Social capital, forming the foundation of interaction and cooperation, becomes essential in innovation efforts because it supports the flow of knowledge and information. Occurring in the form of intra-group and inter-group capital, it supports the creation of innovation in the organization if there is a specific organizational culture based on innovative climate, which promotes openness, freedom of action, implementation of new ideas, tolerance of risk, or openness to change necessary for the development of innovative behavior among employees. Assuming that intra-group and inter-group social capital affects the innovative climate, three research questions were formulated: What is the incidence of the intra-group and inter-group social capital in enterprises in the innovative sector in Poland? To what extent does the intra-group and inter-group social capital have an impact on the processes that are favorable to creating knowledge and innovation in enterprises? To what extent does the intra-group and inter-group social capital have an impact on creating an innovative climate in enterprises?

2. Theoretical Background

Innovation is considered imperative for an organization's success. It is defined as intentional changes and improvements to services and/or processes to achieve an expected specific outcome (Koch and Hauknes 2005). Previous authors have emphasized that it is "invention and use" involving the implementation of a new or significantly improved product, process, or service, and the commercialization of the innovation (Dziallas and Blind 2019). Related to the concept of innovation is the term innovativeness, understood as the process, results, and products of attempts to develop and introduce new and improved ways of doing things (Anderson et al. 2014). Innovativeness can be managed by building an innovative organization (e.g., a structure and climate that encourages people to be innovative) and creating networks for innovation (e.g., internal and external cooperation). (Tidd and Bessant 2014). Innovativeness is supported by an organizational culture that shapes the mindset regarding the internalization of innovation by individual members of the organization where innovation is instilled and ingrained (Kahn 2018). There is a strong relationship between organizational culture and the level of innovation (Lau and Ngo 2004). One manifestation of organizational culture is organizational climate, that is, the formally and informally shared perceptions of organizational policies, practices, and procedures (Holloway 2012). Organizational climate is seen as “an attribute of the organization, a conglomerate of attitudes, feelings,

and behaviors which characterizes life in the organization" (Ekvall 1996, 105). In general, the organizational climate is conducive to innovation at the organizational level (Jung et.al. 2008, Bylok et al. 2019). It affects the communication, coordination, supervision, motivation, and involvement of employees. (Ekvall 1996). It is of key importance for organizations to use innovation to create a competitive advantage and improve performance (Kissi et al. 2012).

The organizational climate that stimulates employee innovation behavior can be termed the organizational innovative climate. According to Isaksen and Ekvall (2010), this climate encourages creativity and change among employees and allows employees to share and build on their ideas and suggestions. The innovative climate can be described as a combination of employees' perceptions of the organizational environment that supports risk-taking behavior, allocates sufficient resources, and promotes a competitive environment conducive to innovation at work (Malibari and Bajaba 2022). The innovative climate fosters creativity, innovative behavior among employees, and efforts to discover and apply new ideas throughout the enterprise (Park and Jo 2018). Shanker et al. (2017) found that innovative behavior at work plays a mediating role in the relationship between organizational innovative climate and organizational performance.

A factor that fosters the development of an innovative climate is organizational social capital. An analysis of numerous studies on organizational social capital indicates that authors have focused on its social functions, such as trust, norms and networks (Burt 2000), social relationships (Leana and van Buren 1999), and organizational resources (Inkpen and Tsang 2005), among others. Some define organizational social capital as corporate social capital, that is, "a set of physical or virtual resources available to a corporate actor through social relationships with other actors, facilitating pursuing his or her goals". (Gabbay and Leenders 2001, 10). In general, it encompasses the form and nature of the social relationships that link the employees of a given enterprise, which influence the formation of a climate of cooperation and enable employees and the enterprise to achieve common goals.

Social capital plays an important role during innovation activities. Most studies have demonstrated a positive relationship between social capital and innovativeness. High social interaction and close relationships have a positive impact on innovation activities (Ozgun et al. 2022). The social capital of an organization's members can effectively facilitate knowledge transfer within the organization and enhance innovation performance. The results of numerous studies have shown that knowledge transfer (viewed as the mobilization, assimilation, and utilization of knowledge resources) mediates between the intra-organizational social capital of organizational members and organizational performance outcomes in terms of growth and innovation (Maurer et al. 2011). For entities in innovative sectors such as IT, social capital remains significantly and positively related to innovation performance. Digital companies with high social capital are more effective at creating innovation outcomes than those with low levels of social capital (Lyu et al. 2022).

To understand the links between organizational social capital and innovative climate, the concept of group social capital was introduced, which allows for a deeper exploration of how social relationships of employee group members within and outside the organization are related to an organizational culture based on innovative climate. Oh at al. (2006, 70) define group social capital "as the set of resources made available to a group through group members' social relationships within the social structure of the group itself, as well as in the broader formal and informal structure of the organization". Due to both internal and external dimensions of labor relations in an employee group, intra-group and inter-group social capital should be emphasized. This division is based on the concept by R.D. Putman (2000), who proposed the division of social capital according to the prevailing types of relationships into inclusive (bonding) social capital and exclusive (connecting) social capital.

In an enterprise, intra-group social capital is based largely on the personal ties that bind members of an employee team together. This helps develop cooperation, and identification with group goals, whereas loyalty to the group improves communication within the team (Łopaciuk-Gonczaryk 2008). The strong group bonds reduce the likelihood of opportunism, decrease transaction costs, and provide employees with mutual emotional support, especially important for employee effectiveness in times of crisis (Oh et al. 2004) Social capital enables team members to take collective action with consistent goals through trust and widespread recognition (Wang et al. 2021, Bylok and Kuceba 2021). Inter-group social capital, on the other hand, is based on the subject ties that are the basis for the social networks built across work teams. They ensure a flow of information and knowledge, which promotes greater efficiency. Oh, Chung & Labianca (2004) showed that external contacts of team members with leaders from other teams have a positive effect on the performance in the groups studied. Another benefit is access to group resources, engagement in joint management, facilitated collaboration, and achieving group goals (Fischer et al. 2014).

3. Methods

In Poland, research on the role of social capital in the functioning of organizational culture based on the innovative climate in enterprises is relatively rare. This study attempts to fill this research gap by conducting an analysis of the impact of intra-group and inter-group social capital on the innovative climate. The aim of the study was to analyze the degree of intra-group and inter-group social capital in enterprises of the innovation sector in Poland, the differences in the degree of social capital resources, and the extent to which they influence the innovative climate. The research tool was a standardized survey questionnaire. A computer-assisted telephone interview (CATI) was used to survey employees of enterprises in the innovation sector. Spearman's rank correlation coefficient was used to analyze the research questions. This nationwide survey was conducted in Poland. The survey frame was entities employing more than 50 people. Based on a random sampling method, a survey sample of 575 employees working in enterprises of innovative industries, i.e. pharmaceuticals (25.2%), energy (23.3%), automotive (26.4%), and IT (25.1%) was collected. The employees surveyed were white-collar (97.2%) and blue-collar (2.8%) workers with job seniority ranging from 4-8 years (10.3%), 9-13 years (23.8%), 14-18 years (33.7), and 19 or more years (32.2%). Random sampling yielded a representative sample with an error of α=4% and a confidence interval of 95%.

4. Results

A factor influencing the growth of employee innovativeness is developed intra-group social capital, known as integration capital. This type of social capital promotes group solidarity and knowledge sharing (Adler and Kwon 2002). Table 1 shows the results of the incidence of intra-group social capital in enterprises. The level of incidence of intra-group capital in enterprises of the innovation sector is high ($\bar{x}$=4.10). Analysis of indices of intra-group capital showed that its strongest attribute is a good team atmosphere (team spirit), followed by a high frequency of relations between members of the employee group and a strong influence of social norms. The weakest attribute was the frequency of employee-manager relationships.

Table 1: Indices of Intra-Group Capital

Specification	Mean $\bar{x}$	Standard deviation SD
(INTC1) Relationships between team members are frequent	4.15	0.733
(INTC2) Employee-supervisor relationships are frequent	4.01	0.764
(INTC3) Social norms (reciprocity, loyalty) in the team are strong	4.12	0.856
(INTC4) The atmosphere in the team (team spirit) is good	4.20	0.858
(INTC5) Employees identify with the team	4.03	0.908
Total capital ratio	**4.10**	**0.829**

Rating scale: 5- to a very high degree, 4 - to a high degree, 3- to a medium degree, 2 - to a low degree, 1- to a very low degree

Source: Author's own elaboration

Inter-group social capital, which supports the creation of organizational knowledge and its flow between work teams, plays an important role in the creation of innovation in the enterprise. The survey of innovation sector employees found that the level of incidence of inter-group social capital was lower compared to intra-group social capital. Furthermore, the following attributes were rated highest: high frequency and a high number of relationships with employees of other teams. The diversity of these relationships at the professional and social levels was rated relatively lower.

Table 2: Indices of Inter-Group Capital

Specification	Arithmetic mean $\bar{x}$	Standard deviation SD
(INRC1) Number of relationships with employees of other work teams is high	3.98	0.891

Specification	Arithmetic mean $\bar{x}$	Standard deviation SD
(INRC2) Relationships with employees of other teams are diverse (professional, social)	3.94	0.917
(INRC3) Employees have easy access to higher positions in the enterprise	3.96	0.915
(INRC4) Relationships with employees of other teams are frequent	4.04	0.983
Total capital ratio	3.98	**0.927**

Rating scale: 1- I strongly disagree, 2 - I disagree, 3 - I neither agree nor disagree, 4 - I agree, 5 - I strongly agree.

Source: Author's own elaboration

Social capital influences a variety of intra-group and inter-group processes that foster innovation. Among intra-group processes, respondents rated knowledge sharing ($\bar{x}$ =4.08, SD=0.883 on a scale of 1- very low, 2- low, 3- medium, 4 - high, 5- very high), employee satisfaction ($\bar{x}$=4.05, SD= 0.808), competition between team members ($\bar{x}$=4.03, SD=1.002), and reducing team opportunism ($\bar{x}$=4.00, SD=0.625). On the other hand, the lowest ratings were found for mutual assistance within the team ($\bar{x}$=3.89, SD=0.829), communication within the team ($\bar{x}$=3.93, SD=0.776), speed of performance of tasks requiring team collaboration ($\bar{x}$=3,97, SD=0.886), quality of performance of tasks requiring team collaboration ($\bar{x}$=3.99, SD=0.839), and increase of innovativeness in the team ($\bar{x}$=3.98, SD=0.900).

Among inter-group processes, the highest ratings were given to collaboration between work teams, departments in the enterprise ($\bar{x}$=3.21, SD=0.846), information flow between work teams and departments ($\bar{x}$=3.19, SD=0.852), and quality of task performance in collaboration with employees of other teams and departments ($\bar{x}$=3.15, SD=0.807). Relatively lower ratings were given to the creation of innovations in collaboration with other teams ($\bar{x}$=2.95, SD=0.824), the speed of performing tasks that require collaboration with employees of other teams and departments ($\bar{x}$=2.99, SD=0.824), and the flow and creation of knowledge through collaboration between employees of different teams ($\bar{x}$=3.01, SD=0.847).

In conclusion, inter-group processes are rated lower compared to intra-group processes. This indicates that there are significant organizational barriers to the creation of innovation because collaboration between teams and the flow of knowledge between them promotes the development of new solutions and the improvement of existing ones.

From the perspective of developing employee innovation, it is important to examine the relationships between organizational social capital and group processes. Spearman's rank correlation coefficient analysis was used to diagnose the relationship between intra-group social capital and organizational processes that foster innovation. For group processes, the strongest correlation was between the index of identification with the team and the quality of performance of tasks requiring team collaboration (r_s= 0.346, p=0.000), reducing team opportunism (r_s= 0.294, p=0.000), sharing knowledge with other employees (r_s= 0.189, p=0.013), competition between team members (r_s= 0.183, p=0.015), and communication within the team (r_s= 0.177, p=0.026). For the index of the strength of social norms (reciprocity, loyalty) in the team, the strongest correlation occurred for reducing team opportunism (r_s= 0.343, p=0.000), speed of performance of tasks requiring team collaboration (r_s= 0.298, p=0.000), quality of performance of tasks requiring team collaboration (r_s= 0.297, p=0.000), sharing knowledge with other employees (r_s= 0.187, p=0.016), and level of employee satisfaction (r_s= 0.182, p=0.019). Furthermore, the index of good team atmosphere (team spirit) was correlated with the reduction of team opportunism (r_s= 0.324, p=0.000), communication within the team (r_s= 0.292, p=0.000), and level of employee satisfaction (r_s= 0.173, p=0.023).

The index of frequent employee-supervisor relationships was positively correlated with the speed of performance of tasks requiring team collaboration (r_s= 0.327, p=0.000) and with reducing team opportunism (r_s= 0.187, p=0.016). The index of frequent team member relationships was positively correlated with knowledge sharing with other workmates (r_s= 0.312, p=0.000) and the quality of performance of tasks requiring team collaboration (r_s= 0.183, p=0.015).

In conclusion, intra-group social capital significantly influences group processes, especially, the quality of tasks that require team collaboration, sharing knowledge with other employees, and reducing team opportunism. Consequently, one of the important tasks of managers is to build this type of capital and provide favorable conditions for its development, thus increasing the effectiveness of the goals pursued.

In addition to identifying the relationships between intra-group social capital and group processes, one of the goals of the study was to evaluate the extent to which inter-group social capital influences the organizational processes that foster innovation. A feature of inter-group capital is its positive impact on processes occurring within employee groups. Tsai & Ghoshal (1998) studied a multinational electronic collaboration and showed the positive impact of social interactions among the corporation's departments on the exchange of resources among the departments and the number of innovations. The present study also examined the relationships between inter-group capital and processes in an organization and identified significant relationships. The strongest effect was observed for the frequency of relationships with employees of other teams, particularly on the increased innovation in the team (r_s= 0.302, p=0.000), competition between team members (r_s= 0.338, p=0.000), the quality of performance of tasks requiring team collaboration (r_s= 0.296, p=0.000), knowledge sharing with other employees (r_s= 0.294, p=0.000), reducing team opportunism (r_s= 0.186, p=0.015), and employee satisfaction (r_s= 0.144, p=0.019).

Another index of inter-group capital, i.e. diversity of relationships with employees of other teams, significantly influences the reduction of team opportunism (r_s= 0.340, p=0.000), communication within the team (r_s= 0.314, p=0.000), quality of performance of tasks requiring team collaboration (r_s= 0.314, p=0.000), competition between team members (r_s= 0.294, p=0.000), level of employee satisfaction (r_s= 0.189, p=0.011), and increased innovation in the team (r_s= 0.167, p=0.025).

The number of relationships with employees from other work teams is high and positively correlated with competition between team members (r_s= 0.304, p=0.000) and knowledge sharing with other employees (r_s= 0.296, p=0.000). The index of employees having easy access to higher positions in the enterprise affected only the reduction of team opportunism (r_s= 0.307, p=0.000).

In conclusion, the demonstrated positive impact of inter-group social capital is an indicator for building and developing this capital in enterprises. In particular, it has a positive effect on increasing competition between team members, reducing team opportunism, fostering knowledge sharing among employees, and improving innovativeness in the team.

In an innovation-oriented enterprise, a factor that fosters innovation is an innovative climate that supports, among other things, openness to novelty, new ideas, and knowledge creation and sharing. To determine its level, a scale of 18 statements construed on a modified scale by Krot and Lewicka (2016) was used. Analysis of Table 3 shows that the generalized level of innovative climate in enterprises of the innovation sector is above average ($\bar{x}$=4.03). A detailed analysis indicates that the innovative climate is evidenced by the belief that innovation is a key value in the enterprise. Innovation has a much better chance of success with the ability to turn ideas into profitable ventures and quick utilization of suggestions from customers or competitors to improve products and harness the creativity of employees to make a profit.

The innovative climate is improved by the right conditions created by enterprises to undertake innovative activities. The most important of these is the creation of free access to information and knowledge and optimal conditions for collaboration between departments/divisions.

Taking innovative initiatives depends on creative attitudes among employees. They are influenced by the expectation of employees to improve their skills, and increase their knowledge, which helps support innovative ventures, managers' expectation of employee initiative, and the increase in recognition within the enterprise with the creation of a new solution. It is also important to convince employees that innovation processes pose a high risk and therefore errors may occur. Innovation is much more likely to succeed if employees can express unusual and unique solutions in their everyday work.

Another important component of the innovative climate is managerial support, which manifests itself in the help of managers in breaking down barriers in the process of implementing innovation, and the support of employees who want to seek innovative solutions. It is important that the manager has a high degree of autonomy to accelerate, slow down, or completely abandon the innovative project.

Table 3: Assessment of Innovative Climate in Enterprises

Specification	Mean $\bar{x}$	Standard deviation SD
(IC1) Innovation is a key value in the enterprise	4.04	0.842
(IC2) Ability to turn ideas into profitable ventures	3.99	0.801
(IC3) The belief that innovation processes pose a high risk and therefore errors may occur	4.01	0.921
(IC4) Quickly using customer or competitor suggestions to improve products	4.06	0.877
(IC5) The project manager has a high degree of autonomy to accelerate, slow down, or completely abandon the innovation project	4.01	0.859
(IC6) Creating free access to information and knowledge	4.09	0.853
(IC7) Creating optimal conditions for cooperation between departments/divisions	4.05	0.782
(IC8) Expectations of employees to improve their skills and increase their knowledge, which may support innovative ventures	4.07	0.823
(IC9) Innovation is much more likely to succeed if employees can express unusual and unique solutions in their everyday work.	3.96	0.894
(IC10) Using employees' creativity for profit, which means using it well	3.90	0.879
(IC11) Success in the area of innovation sometimes causes envy in other employees	3.88	0.951
(IC12) Mutual help of employees in solving problems within one department or several departments	4.17	0.844
(IC13) Expecting employees to be creative, think, and act in innovative and original ways	4.18	0.793
(IC14) With the creation of a new solution, there is an increase in recognition within the enterprise	3.94	0.816
(IC15) Employees are too busy solving everyday problems to spend time thinking about the future	3.81	0.991
(IC16) Expecting employee initiative from managers	3.91	0.831
(IC17) Manager's assistance in breaking down barriers in the innovation process	4.10	0.811
(IC18) Encouraging junior managers to take a risk and seize opportunities to develop the company by senior managers	4.11	0.871
Generalized level of innovative climate	4.03	0.871

Rating scale: 1- I totally disagree, 2 - I mostly disagree, 3 - I partially disagree 4 - I neither agree nor disagree, 5- I partially agree 6 - I mostly agree, 7 - I totally agree.

Source: Author's own elaboration

One of the aims of the paper was to determine the impact of social capital on the innovative climate. The analysis of the research shows that the effect size of individual attributes of intra-group and inter-group social capital on innovative climate indices varied. For intra-group social capital, the attributes that influenced the largest number of innovative climate indices (8 indices) were: employee-supervisor relationships are frequent and employees identify with the team. On the other hand, in the case of inter-group capital such attributes were: relationships with employees of other teams are diverse (professional, social) (8 indices) and employees have easy access to higher positions in the enterprise (7 indices).

5. Discussion and Conclusion

Social capital is an important factor in strengthening innovativeness in enterprises as it enables the effective use of the potential of employees and managers to create knowledge and develop innovations. The results of the present study on the incidence of intra-group and inter-group social capital in enterprises of the innovation sector indicate their above-average level, with the highest value found for intra-group capital, particularly for attributes such as atmosphere in the team (team spirit), frequency of relationships between team members, and the strength of social norms (reciprocity, loyalty). It creates a favorable environment for employees to take innovative actions.

Organizational processes related to innovation are important in the enterprise. The research shows that in enterprises of the innovation sector, the main emphasis is on sharing knowledge with other employees, competition between team members, reducing team opportunism, and the quality of performance of tasks requiring team collaboration, a collaboration between work teams and departments in the enterprise, and the quality of performance of tasks requiring collaboration with employees of other teams and departments. There is limited flow and creation of knowledge through collaboration between employees of different teams, which is a barrier to creating innovation.

Analysis of the relationships between intra-group and inter-group social capital attributes and organizational processes related to innovation creation reveals that it is important to point out the differences between the two. The former significantly affects group processes, particularly the quality of tasks requiring team collaboration, sharing knowledge with other employees, and reducing team opportunism, while the latter increases competition between team members, reduces team opportunism, fosters knowledge sharing among employees, and improves team innovation.

One of the essential factors affecting the level of innovation in enterprises is the organizational culture based on the innovative climate. The generalized index of innovative climate in the enterprises surveyed is at an above-average level and can be considered an important factor that creates a good basis for the development of innovativeness in enterprises of the innovation sector. The highest ratings were given to the importance of expecting employees to be creative, think, and act in innovative and original ways, employees helping each other solve problems within one department or several departments, and free access to information and knowledge.

Analysis of Spearman's correlation coefficients between intra-group or inter-group social capital attributes and innovative climate indices revealed that intra-group capital has the strongest effect. Its attributes were shown to have the strongest effect on making good use of employees' creativity for making a profit, creating free access to information and knowledge, allowing employees to create unusual and unique solutions in their daily work, and encouraging junior managers to take risks and opportunities for the enterprise's growth. The study showed that social capital to a large extent supports the creation of innovation in enterprises of the innovation sector.

Abstract: Intellectual capital theory (IC) theory, which asserts that organisational value is for the most part created with intangible, knowledge-based resources, has become a prevalent way to approach the notion of business viability. Most IC research leans on the classical tripod of IC components, laid down by the first-generation researchers in the field. This tripod divides the value-generating knowledge assets into human capital, structural capital and relational capital; or, more simply put the value vested in an organisation's personnel, internal structures and processes, and relationships. Even though this conceptualization has been challenged by some, it still remains the cornerstone of the IC-based view of the firm, and it is astutely followed by most researchers in this field. However, various large-scale technological, socio-political, and institutional changes have fundamentally changed the business environment and worklife in recent years. In this paper we argue that these changes call for a critical examination of the relevance of the classical conceptualizations of IC. It may be necessary to update the understanding concerning not only the most essential knowledge resources, but also the structure of IC and the way in which IC is related with new relevant organisational capabilities and aspects of organisational performance. The aim of this theoretical paper is to provide an overview of some of the most essential recent worklife trends that are likely to impact how IC should be understood: digitalization, remote work, gig work, open innovation, crowdsourcing, strive towards sustainability and resilience. Based on these, the paper puts forth a set of propositions concerning the needed novel perspectives for IC. In addition to constructing a novel theoretical framework and propositions for IC research, the paper functions as an introduction to the mini track on Futurizing the Intellectual Capital Theory and provides a common framework on which mini track participants can base their dialogue.

Keywords: Intellectual capital, Digitalization, Remote work, Sustainability, Resilience, Theory

1. Introduction

Intellectual capital theory (IC) theory, which asserts that organisational value is for the most part created with intangible, knowledge-based resources, has become a prevalent way to approach the notion of business viability. Most IC research leans on the classical tripod of IC components, laid down by the first-generation researchers in the field (e.g. Edvinsson and Malone, 1997; Stewart, 1997; Sveiby, 1997; Roos et al, 1997; Bontis, 2002). This tripod divides the value-generating knowledge assets into human capital, structural capital and relational capital; or, more simply put the value vested in an organisation's personnel, internal structures and processes, and relationships. Even though this conceptualization has been challenged by some (e.g. Inkinen et al, 2017; Cabrilo and Dahms, 2020) it still remains the cornerstone of the IC-based view of the firm, and it is astutely followed by most researchers in this field.

However, various large-scale technological, socio-political, and institutional changes have fundamentally changed the business environment and worklife in recent years (Hitt et al., 2021). In this paper we argue that these changes call for a critical examination of the relevance of the classical conceptualizations of IC. It may be necessary to update the understanding concerning not only the most essential knowledge resources, but also the structure of IC and the way in which IC is related with new relevant organisational capabilities and aspects of organisational performance.

To provide impetus and structure to new ideas and dialogue concerning the way in which the IC theory should and could be developed to better match current realities, this paper examines a set of recent worklife trends that are likely to impact how IC should be understood: digitalization, remote work, gig work, open innovation, crowdsourcing, strive towards sustainability and resilience. Based on these, the paper puts forth a set of propositions concerning the needed novel perspectives for IC and presents a tentative framework for a futurized understanding of IC.

2. Recent Worklife Trends and Changes and Intellectual Capital

Work life is facing many large-scale changes due to ecological, political and economic uncertainties. To remain competitive in the face of digitalization, diversifying work arrangements, and the manner in which innovations are brought about, organisations need new resources and capabilities (Colbert et al., 2016; Habraken and Bondarouk, 2017). In the following, we discuss trends that are likely to have an impact on IC: digitalization,

remote work, gig work, open innovation (OI), and crowdsourcing—and strive toward sustainability through ethical leadership, green IC, and organisational resilience.

2.1 Digitalization

In Industry 4.0, also referred to as Smart Industries, digital technologies have increasingly changed the organisation and nature of work (Colbert et al., 2016; Habraken and Bondarouk, 2017). Technological developments create greater work flexibility and mobility, which can benefit both workers and organisations (Ludivine, 2017). However, at the same time these present challenges, as new technologies are dramatically changing employment and work features across many fields of work (Cooper and Lu, 2019; Felstead and Henseke, 2017). Digital technology enables smaller and more isolated work units, such as virtual teams (Donnelly and Johns, 2021). In a digitized world where work is crowdsourced to freelancers via online platforms, and collaboration occurs across geographical, functional, and hierarchical boarders (Lepofsky, 2016), many aspects of IC should be updated. Increasing technologically mediated interaction, robotization and automation require workers to build digital competences and adopt new skill sets needed to work in new jobs created (Habraken and Bondarouk, 2017). Accordingly, a crucial new feature of human capital is that of digital competence. Digital competence encompasses the knowledge, abilities, skills, and attitudes we need for working in the digital age (Murawski and Bick, 2017). It is important for organisations in the digital era not only to cope with disruptive technologies and innovation, but to adapt their business philosophy and business models including mindset (organisational and individual), culture, and competences to digital way of working (Murakowski and Bick, 2017). Creating an open culture that embraces independent and on-demand workers allows organisations to benefit from their ideas and engage them in innovation and value creation (Smith, 2020). Digital organisational culture has been found to support digital capabilities and innovation performance (Zhen et al., 2021). This leads to the first proposition:

Proposition 1: In digitalized worklife, digital skills and an open digital culture are important aspects of IC.

2.2 Remote Work

The term *'remote' work*, sometimes also referred to as telework, locationally distributed work, or virtual work, can be defined as any work that is detached from traditional fixed places of work (Felstead and Henseke, 2017). Remote working is not a product of Covid-19 pandemic, but it has gained its momentum and proved its significance as a result of the Covid-19 crisis' catalytic effect (Liu et al., 2021), becoming a necessity for organisations across the globe (Donnelly and Johns, 2021). Self-leadership (Manz, 1986; Manz and Sims, 1987) is a process through which people influence themselves to achieve the self-direction and self-motivation necessary to behave and perform in desirable ways. Self-leadership theory posits that even though external contexts and activities influence behavior, actions are ultimately controlled internally by the individual, and focus on how people manage and lead themselves (Stewart et al., 2011). It includes self-imposed strategies for managing performance of tasks of low intrinsic motivational potential, and self-influence that capitalizes on the "natural"/intrinsic motivational value of task activity (Manz, 1986). While self-leadership probably is an important skill in many types of jobs, we argue that in remote work arrangements, its role is especially prevalent. Thus, we propose:

Proposition 2: Self leadership is an important aspect of IC in remote work contexts.

2.3 Gig Work

In today's digital economy, the traditional full-time employed labor force seems to be decreasing, and a growing number of workers, especially high-skilled professionals, prefer to work as autonomous and independent self-employed, freelance contractors (Vaiman et al., 2011). *Gig work* is made up of short-term jobs (gigs) and presents a type of contingent work that typically falls outside the boundaries of the organisation. In this new economic system workers are not engaged in 'jobs' and have no long-term connections with a company but are hired on demand for 'gigs' under very flexible arrangements as independent contractors, working only for a defined time to complete a particular task and after completion they have no more connection with their 'employer' (Friedman, 2014). As gig workers have no traditional employment relationships with organisations, they have typically been left out of IC accounts. However, an increasing amount of the human intellect working for a firm may come from outside of the realm of its fully employed human resources (McDonnell et al., 2021; Williams et al., 2021). Therefore, we argue that no matter their formal employment status, workers that create value for a company should be counted as its human capital. We propose:

Proposition 3: Gig workers should be acknowledged IC providers.

2.4 Open Innovation

Open innovation (OI), as introduced by Chesbrough (2003), is an innovation practice that strives to provide much richer knowledge flows and make innovation quicker, easier, and more effective through exchanging knowledge and ideas by collaborative and open network environments (Curley and Salmelin, 2018). There is a successive change in the way in which innovation has been viewed through time. The innovation paradigm has shifted from the 'closed innovation' to the 'open innovation' and the 'networked innovation' models and now to participative innovation, which is an integral characteristic of Open innovation 2.0. (Chesbrough, 2003; Curley and Salmelin, 2018). As innovation is the most typical performance variable in IC research (Inkinen et al., 2017), this novel innovation paradigm should also entail changes for the IC field. For IC theory, this means that knowledge-based value creating resources relate not only with intra-firm resources and capabilities, but also with those over and across the organisational boundaries.

Proposition 4: External IC resources are crucial for open innovation.

2.5 Crowdsourcing

Crowdsourcing, with its multidisciplinary nature, is a complex phenomenon (Cricelli et al., 2021). It is consistent with the open innovation paradigm (Bogers and West, 2012), as it basically refers to the use of outside sources for ideation, and crowd wisdom or collective intelligence in value creation (Brabham, 2013). Crowdsourcing indicates the practice to open the process of getting ideas or performing tasks up to the public and ask a body of people (the crowd) to share its knowledge as users in order to improve its own experience (Buettner, 2015).

The adoption of OI strategies asks for reorganisation of how processes are carried out, that need to be linked to a new and more open and entrepreneurial culture, a cooperative behavior, and a collaborative mindset of the people involved (Cricelli et al., 2021).

Proposition 5: Open and entrepreneurial culture is an important facet of structural capital that supports crowdsourcing and use of collective intelligence.

2.6 Sustainability

Sustainability is a crucial issue for the future of the planet and humanity. With growing global concerns regarding the scarcity of natural resources, economic viability, social inequity, poverty and human rights violations, climate change, and rapid environmental degradation, sustainability and knowledge issues have become increasingly relevant in the literature (Reboredo and Sowaity, 2022; Mutuc and Cabrilo, 2022). While there is a shift in factors of production and knowledge-based transformation around the world, at the same time there is a demand for sustainable development among organisations. Therefore, organisations have to balance their economic growth with social and environmental concerns (Jain et al., 2017). The productive force behind companies is what they know, i.e. their IC (Subramaniam and Youndt, 2005) that may change the nature and strength of CSR effects on organisational performance.

Green IC refers to the sum of existing knowledge and skills that are used within a firm in organisational and environment-oriented processes and activities and that give the firm an opportunity to maximize its economic, social, and environmental performance and achieve a sustainable competitive advantage (Chen, 2008; Chang and Chen, 2012; Liu et al., 2021). In the knowledge economy, knowledge-based resources and capabilities are the leading drivers of environmental and social innovations (Chen, 2008). Thus, the process of accumulating green IC is a process of promoting sustainability within organisational operations and business value creation (Liu et al., 2021).

Proposition 6: There is a linkage between (green) IC and sustainability.

2.7 Ethical Leadership

A facet of IC-relevant social sustainability, ethical leadership involves the demonstration of high moral values in personal actions and interpersonal relationships and the promotion of such behavior to followers through open, trustful, and two-way communication as well as encouragement and empowerment in decision-making (Brown et al., 2005; Ullah et al., 2021). Ethical leadership supports moral activities and attitudes toward business and generates trust among internal and external stakeholders. Ethics and trust shape an organisational culture of honesty and ethics and create an ethical climate that boosts open communication with employees, teamwork, knowledge sharing, creativity, and better organisational problem solving, enhancing organisational IC (Maletič et al., 2018). The trust generated by ethical behaviors enables superior relationships, leading to increased relational capital. Ethical leadership and followership attract and retain talents, which can further lead to better

human capital (De Hoogh and Den Hartog, 2008). In summary, ethical capital entails leaders to be liable for humankind in general, not just for their firms, and enables leaders to build an ethical corporate culture and to be accountable for humanity (Ullah et al., 2022).

Proposition 7: Ethical leadership should be acknowledged as an element of IC.

2.8 Organisational Resilience

Organisational resilience, as a relatively new term in the management literature, indicates a much broader concept of resilience as a value driver for an organisation (Pereira et al., 2020). It refers to organisational viability over the long term under varying conditions (Tengblad and Oudhuis, 2018). Resilience enables organisations to harness experience and embrace opportunity in order to prosper in today's dynamic, interconnected and uncertain world (Pereira et al., 2020). Despite its growing importance, the mechanisms through which organisations develop resilient capabilities are still well under-researched (Kossek and Perringino, 2016).

External changes require renewal and reassembly of resources through both adaptation and innovation, and therefore organisational resilience is created through holistic management of resources and capacities. While many tangible traits and processes for resilience have been well researched, it is important to develop new perspectives on resilience and include intangible capabilities and resources in resilience models (Tengblad and Oudhuis, 2018). For example, Pareira et al. (2020) have confirmed that human capital is an extremely important dimension to overcome surprising, uncertain, and unstable situations and become resilient over time. We thus propose that understanding the impact of knowledge resource reservoirs, passageways and crossover provides a framework for further research to promote resilience in organisations.

Proposition 8: IC is the major source of organisational resilience.

3. Conclusion

This paper argued that to remain relevant in the face of the recent large-scale changes in companies' operating environments, such as digitalization, sustainability crisis, as well as the pandemic and related forced move to remote working, the IC theory would benefit from updating. We reviewed a set of recent worklife trends and changes and based on them, put forth the following propositions concerning related modifications to the existing IC models:

Proposition 1: In digitalized worklife, digital skills and an open digital culture are important aspects of IC

Proposition 2: Self leadership is an important aspect of IC in remote work contexts

Proposition 3: Gig workers should be acknowledged IC providers.

Proposition 4: External IC resources are crucial for open innovation.

Proposition 5: Open and entrepreneurial culture is an important facet of structural capital that supports crowdsourcing and use of collective intelligence

Proposition 6: There is a linkage between (green) IC and sustainability

Proposition 7: Ethical leadership should be acknowledged as an element of IC

Proposition 8: IC is the major source of organisational resilence.

We hope that our ideas contribute to the topicality and relevance of IC research by inspiring new thinking and offering ways forward to revise the research models that are developed and tested within this important field of study.

Abstract: Intellectual Capital (IC) has played a major role in driving growth, competitiveness, and sustainability over decades, improving people's well-being and the economic performance of businesses. At the same time, the United Nation's Sustainable Development Goals (SDGs) have emerged as an integrated approach to sustainable development principles of people, planet, prosperity, peace, and partnership, which represent one of the most urgent challenges in our times. The industrial sector is particularly challenged to adopt a sustainable approach to solving development issues by addressing the SDGs. Sustainable Development Goal 9 (SDG 9) is built on three interconnected pillars: infrastructure, industry, and innovation, all of which are strongly interconnected, sharing the common mission of achieving socially inclusive and environmentally sustainable economic development. By adopting SDG 9 and its related targets, the global community can benefit from an industrial development that is inclusive and sustainable, with an impact on all other SDGs. From a strategic perspective, IC is predominantly studied as a bundle of intangibles that creates value, thus embodying a set of resources that are decisive in sustaining competitive advantage, which is necessary for sustainability and for ensuring people's well-being and economic growth, in line with SDGs. Despite an increasing number of studies exploring the links between IC and sustainability, a major gap emerges in what concerns the influence of IC on achieving SDGs in specific or interconnected goals. Based on the relevant literature, the aim of this paper is to explore how the characteristics of the IC can foster the 2030 Agenda for Sustainable Development, specifically, the sustainable and innovative development of organizations by adopting Goal 9 and its targets. This paper contributes to the literature on IC as a driver for SDGs. In more detail, it opens some avenues for future research on strengthening capabilities to solve development challenges, involving different actors, stakeholders, sectors, and regions.

Keywords: Intellectual Capital (IC), Sustainable Development (SD), Sustainable Development Goal9 (SDG9), Sustainable industry, Innovation, Resilient infrastructure

1. Introduction

The concept of Intellectual Capital (IC) has its roots in the early 20th century when economists began to recognize that knowledge and information are important drivers of economic growth, productivity, and prosperity. However, only in the 1990s did the term "intellectual capital" become widespread. Since then, IC has been predominantly studied as the foundation for competitiveness and sustainable competitive advantage, representing a potential for long-term business profitability. Initially addressed in a microeconomic context, IC studies have also proliferated in a macroeconomic perspective, which emphasizes the association of knowledge and city/region, underlying the transition from an industrial to a knowledge society (Januškaitė, and Užienė, 2018). Knowledge-Based Development (KBD) paradigms and the concept of knowledge cities or smart cities encompass technological, academic, cultural, scientific, and innovation capabilities in cities and regions as engines of economic growth. According to Carrillo (2015), KBD concerns the continuity of human civilization, involving the capacity to balance production, consumption, distribution, and vital sources of matter and energy, which requires a set of common value dimensions for ethics, politics, economics, and culture. The author still adverts that "The continuity of human civilization might depend upon human capacity to grasp such principles and redesign coexistence terms, across nations as well as with the planet" (Carrillo, 2015:10). This view aligns with the United Nations (UN) action plan prepared to perform the deep transformation essential to achieve the SDGs outcomes, announced in the 2030 Development Agenda and implemented by all countries and stakeholders working in collaborative partnerships with the UN. Within the different aims of this Agenda, SDG 9 relates to Industry, Innovation, and Infrastructure and aims to "Build resilient infrastructure, promote inclusive

and sustainable industrialization and foster innovation". Even though innovation has been seen as key to achieving economic growth, SDG9 reinforces this significant role in building sustainable economic prosperity for all societies. The Lima Declaration, adopted at the fifteenth session of the General Conference of the United Nations Industrial Development Organization (UNIDO), in December 2013, deepened the commitment towards achieving Inclusive and Sustainable Industrial Development (ISID). Poverty eradication remains the central imperative, and it was recognized that this can only be achieved through strong, inclusive, sustainable, and resilient economic and industrial growth, and the effective integration of the economic, social, and environmental dimensions of Sustainable Development (SD). Industrialization is a dynamic economic process that generates employment, improves living standards, facilitates trade, and promotes efficient resource use.

Assumed as a bundle of intangibles that create value, the strategic view of the IC theory can help us to identify core intangibles that, operating together, drive organizations to achieve ISID goals and targets. Although the concept of Sustainable Intellectual Capital (SIC) or "green IC", integrating IC with environmental concerns, was introduced by Chen (2008), it has been explored very little in IC literature (Yusoff *et al*., 2019). In the same vein, very few studies (Alvino *et al.,* 2019) address the relationship between IC and SD. To the best of the authors´ knowledge, there are no studies on the role of IC in achieving SDG 9. Moreover, IC initiatives carried out by companies in terms of SD must be in line with the expectations of the 17 Sustainable Development Goals (SDGs), which encourage them to contribute to creating a competitive advantage aimed at preserving environmental sustainability and community well-being. This paper, theoretical by nature, explores the IC attributes that drive SDG9, strengthening resilient infrastructure, promoting inclusive and sustainable industrialization, and fostering innovation. Based on the literature review we develop a framework for managing Sustainable Intellectual Capital (SIC) to attain SDG 9. This research contributes to the existing body of IC and SD literature and suggests useful implications for practicing managers and practitioners. The literature review has been carried out aimed at identifying the variables under study: SDG9 and IC, using the SCOPUS research analysis, and 8 results were obtained between the years 2016 and 2023. From this procedure and given the very little research on the combination of two topics, the summaries of the content provided the argumentative support for the development of the research. Despite the evident interrelation between IC and sustainability, the comprehension of its impact on achieving SDG goals is still under-researched and analyzed from different perspectives. This raises a need to better understand how each SDG can be achieved and enhanced through the strategic role of IC. The structure of this paper is as follows. The first section presents the aim of the research and introduces some IC and SD concepts to be developed in the next sections. This is followed, in section 2, by an exploration of the characteristics of IC that make it a key driver of sustainable value. After outlining the role of IC in exploiting business opportunities to achieve social, economic, and environmental benefits, the concept of Sustainable Intellectual Capital (SIC) is developed, in Section 3. Next, Section 4 examines the universal and indivisible nature of SDGs is examined. Section 5 develops a framework for managing SIC to achieve the targets of SDG 9. Section 6 formulates conclusions.

2. Intellectual Capital: The Key Driver of Sustainable Value

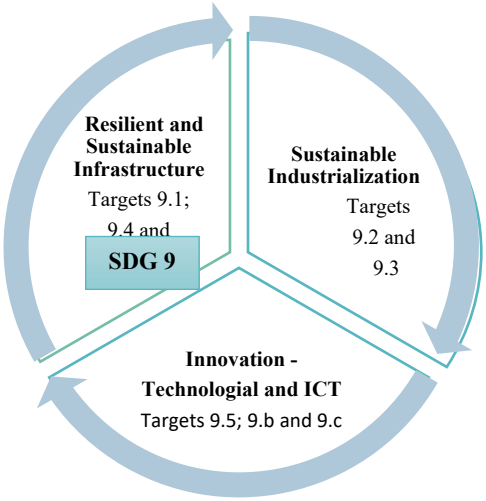
Although there is an agreement in the literature that IC is a source of organizational value, there is still a lack of consensus over definitions of it owing to the diversity of disciplinary and interdisciplinary perspectives – strategy, economics, human resources, finance, accounting, reporting, and intellectual capital – from which it can be examined (Marr, 2005). From a strategic perspective, Cabrita *et al.* (2011) define IC as the knowledge that creates value and gives the organization a sustainable competitive advantage. From the accounting point of view, the focus of IC is twofold: external reporting of IC and measuring and visualizing IC for management decision-making. All definitions of IC in the literature emphasize that IC is an intangible asset, that contributes to the production of goods and services that create a competitive advantage for organizations. From all definitions, we can assume that the core element of IC is its intangibility and the potential to create value or wealth. While IC is recognized as a key intangible resource for entrepreneurial success (Crupi *et al*., 2020), stakeholders heavily pressure organizations to effectively implement corporate strategies that improve sustainable performance (Alvino *et al*., 2021) and minimize environmental issues arising from production activities. San *et al*., (2022) found that IC positively influences organizations' sustainable performance in social, environmental, and financial aspects, and emphasizes the role of IC in exploiting business opportunities, encouraging innovativeness, and taking risks for transformation to achieve social, environmental, and economic benefits. Figge and Hahn (2005) introduce the concept of "sustainable value" as the value created by a hyper-efficient use of all forms of capital. The IC concept is linked to the concept of long-term value and the literature (Dwianika and Gunawan, 2020) shows that sustainable value creation can significantly contribute to the deceleration of climate change and the reduction of negative economic impacts (Hariastuti and Lukmandono,

2022). Therefore, the development potential of the IC is linked to the 2030 Agenda for Sustainable Development (SD).

3. Sustainable Intellectual Capital: A Source of Sustainable Value

In line with the cleaner production methods to reduce environmental impact, research has begun mainly focusing on the integration of green practices in the general management systems of organizations, in which Sustainable Intellectual Capital (SIC) becomes part of the development subject, despite very few studies have addressed the concept. Chen (2008) refers to SIC as the sum of all intangible resources, capabilities, knowledge, and relationships that relate to environmental protection, although it can also incorporate social and economic concerns. In the same vein, López-Gamero *et al*., (2011:21) describe SIC as "the sum of all knowledge that an organization can leverage in the process of conducting environmental management to gain a competitive advantage". Several authors (Alvino *et al*., 2021; Popescu, 2020) found that IC management practices have a crucial role in the environmental and ecological goals of promoting SD. Likewise, Yusliza *et al*., (2020) show that SIC (and its dimensions) and sustainable performance (environmental, social, and economic) are closely related. Therefore, organizations create and add value to their products or services by offering environmentally friendly products or services (Hahn *et al*., 2007). This study argues that SIC refers to the bundle of intangibles that operating in a combined and interconnected way, produce sustainable value in support of economic growth, people's well-being, and environmental protection, in line with the Sustainable Development Goals (SDGs).

4. Sustainable Development Goals: A Universal and Indivisible Approach



Historically, the concept of SD first appeared in a document entitled ''Our Common Future" provided by the United Nations World Commission on Environment and Development (WCED) in 1987 (United Nations, 1987). One of the most recent initiatives for SD is the set of 17 United Nations Sustainable Development Goals (SDGs), with 169 associated targets and more than 230 indicators for monitoring their progress (United Nations, 2015), which were agreed upon by 195 States that aim to move the world to sustainable economic development, environmental sustainability, and social inclusion. Adopting a holistic approach, the 2030 Agenda addresses five critical areas for humanity and the planet: people, planet, prosperity, peace, and partnership.

The literature presents several studies on the synergies (levers) and trade-offs (hurdles) among the SDGs (Moyer and Bohl, 2019; Dörgő *et al*., 2018; Pradhan *et al*., 2017) and supports the finding that most SDG interactions may act as levers (Anderson *et al*., 2022). Central to the 2030 Agenda, and a distinguishing feature as compared to other sustainability initiatives, is that it is intended to be treated as universal and indivisible. Universality means that the 2030 Agenda applies to all nations and individuals around the globe, regardless of the current level of income, culture, or sustainability challenges. Indivisibility intends that the implementation of the 2030 Agenda should be based on integrated approaches, and not through a silo mentality. Achieving SD faces many ecological and social challenges that are interlinked and addressing them requires a concerted international and interdisciplinary collaboration beyond independent or specialized programs.

Within the different aims of the 2030 Agenda, SDG 9 relates to Industry, Innovation, and Infrastructure and aims to "Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation". This SDG encapsulates three key drivers of SD: infrastructure, industrialization, and innovation. Infrastructure provides the basic physical systems, assets, and structures, which are essential for the maintaining of vital societal functions, health, security, and economic or social well-being of people. Industrialization is the engine of economic growth and employment, reducing poverty. Innovation advances the technological capabilities of the industry and the development of new skills. The literature notes the importance of industrialization as a driver of economic and social development. The industry takes a vital role in achieving SDGs, with Agenda 2030 emphasizing the relevance of sustainable industrial development as the basis for sustainable economic growth. Industry acts as a driver of resources that can potentially create sustainable value and achieve the sustainable industrialization envisaged by Sustainable Development Goal 9 (SDG 9). However, there is a consensus in the literature that the complexity of these interactions leads to complex decision-making processes.

SDG 9 operates as a pivotal factor in other SDGs impacting many of them in different ways, such as job creation (SDG 8), women's employment (SDG 5), health (SDG 3), environmental protection (SDG 7), clean water and sanitation (SDG 6), food security (SDG 2), green technologies (SDG 9) or resilient cities (SDG 11). The literature (Coenen *et al*. 2021; Kroll *et al.*, 2019) stresses SDG9's synergistic characteristics, advocating its importance in improving the performance of the other SDGs. Nevertheless, according to Pradhan *et al.* (2017), SDG 9 is one of the SDGs involved in additional trade-off situations, which means that, sometimes, the improvement in one target of SDG 9 harms another SDG. The UN defined five key targets (9.1, 9.2, 9.3, 9.4, and 9.5) and three

additional targets (9.a, 9.b, and 9.c), comprising twelve indicators to facilitate actions toward achieving SDG 9. Summing up, we can categorize SDG 9 targets into intervention areas, as depicted in Figure 1.

The three elements of SDG 9, resilient infrastructure, sustainable industrialization, and innovation, reinforce each other.

Figure 1: SDG 9 Targets Categorization

Resilient Infrastructure

Adequate infrastructure is closely connected with the achievement of social development, economic growth, and environmental goals. Poor access to basic infrastructure implies reduced access to a job, education, and health care, compromising the quality and well-being of living standards and creating barriers to making business. Infrastructural progress in railways, roads, water systems, irrigation systems, electrical power, sanitation, and information technologies is visibly linked to economic growth and enables many other goals that depend on it. In times of intense uncertainty, a resilient infrastructure system is understood as a situation that reduces its vulnerability, minimizes the consequences of threats, accelerates responses and recovery, and facilitates adaptation to disruptive events (NIAC, 2009). This is particularly relevant in the context of continuous digital transformations driven by technological developments. A combination of knowledge-intensive activities, innovative actions, and technological advancement has resulted in innovative products and services, supported by digital-centered strategies (Sallos et al., 2019). As society and an increasing number of economic sectors engage in digital transformation strategies, we all face a new type of risk related to digital assets and services. Risks derived from digital incidents are not only disruptive but difficult to predict or avoid and may have major implications for the resilience of businesses and societies. Building resilient infrastructure, therefore, requires thinking and acting for future generations. The UNDRR (2022) establishes a set of six interconnected principles for resilient infrastructure: i) continuously learning, which highlights the challenges to understanding infrastructure resilience due to the internal complexity and external hyperconnectivity of related systems and sectors; ii) proactively protected, which means being prepared for hazards in the recognition that infrastructure is exposed to various hazards both known and unknown, and the nature of hazards is constantly changing; iii) environmentally integrated, recognizing the importance of working in a proactive and positively integrated way with the natural environment: biological (flora and fauna) and physical (land, air, water); iv) socially engaged, aiming to actively engage with people and communities so that they have a better understanding of how they can help to prevent and respond to disruptions; v) shared responsibility, which means that a collaborative approach must be encouraged for the sharing of data, knowledge, and expertise; and vi) adaptively transforming, referring to the ability to change the ways in which infrastructure systems are run, or to change the desired outputs of these systems.

Industrialization

"Industrialization" is a generic term for a set of economic and social processes related to the discovery of more efficient ways for the creation of value. Industrialization is an indirect effect of adequate and resilient infrastructure, promoting jobs with a positive impact on social and economic life (Cammarano et al., 2021). We all know that the impact of the manufacturing industry on the environment is a growing concern, as the industry is being reported as the highest contributor to environmental issues. While Industrialization has brought

economic prosperity, it is also responsible for adverse ecological effects, such as pollution (land, water, and land), forest degradation, and biodiversity loss.

Innovation

Innovation and technological progress are the keys to achieving economic and employment growth and finding lasting solutions to environmental challenges, such as increased resource and energy efficiency. The use of new technologies supports the development of a knowledge economy and the creation of subsequent inventions which contribute to the improvement of living conditions connected with such domains as medicine, transportation, production, or the use of energy. Innovation and creativity are vital to driving more efficient and better use of resources and a key mechanism for achieving the SDGs. As the business environments are in constant change, demanding more dynamic production and management systems for complex environments, innovation, and SDGs should work in broad and flexible manners.

5. Sustainable Intellectual Capital for Enhancing SDG 9

Sustainable Intellectual Capital (SIC) is a concept pertaining to modern economics that aims to emphasize the importance of intelligence for growth and development, where knowledge plays a key role in achieving economic SD (Meramveliotakis and Manioudis, 2021; Cabrita *et al.*, 2016). Its value resides in the identification and monitoring of intangible assets that can determine the failure or success of an organization. Managing SIC is a strategic activity that influences the performance, competitiveness, and long-term success of an organization. As SIC represents the hidden part of the organization's sustainable value, we define SIC as a bundle of intangibles that create value and favor SD. Such intangibles represent the essential conditions for a sustainable competitive advantage and for long-term development.

Based on the literature revision, a framework is proposed for managing SIC processes for SDG 9, as depicted in Figure 2.

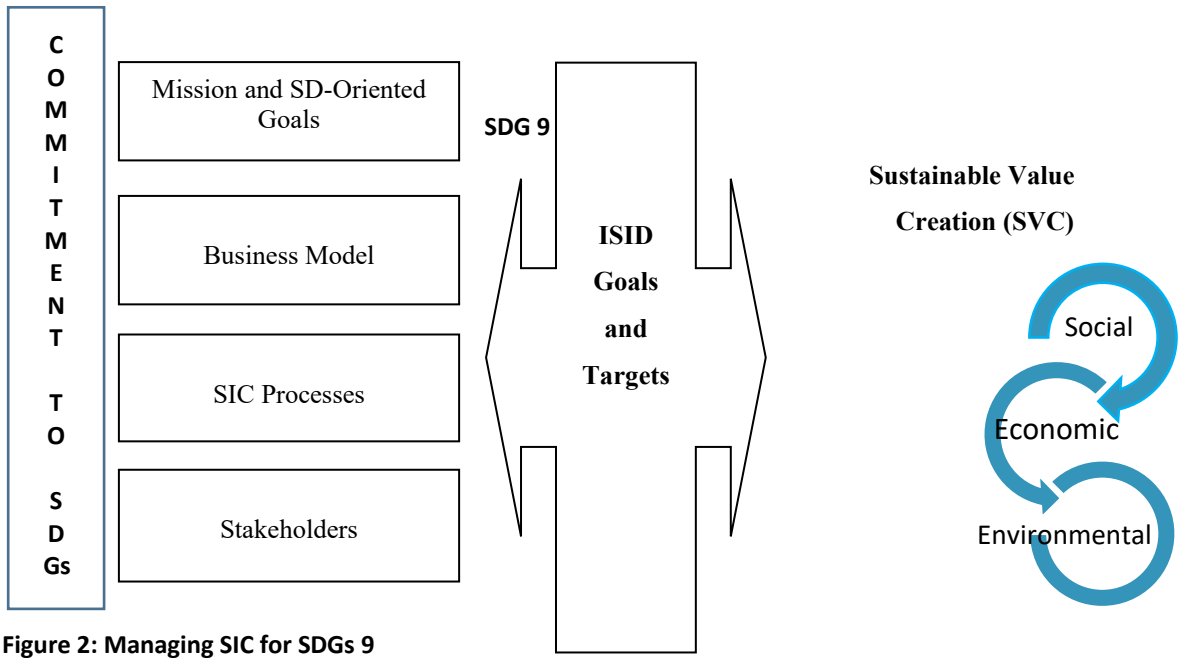


Figure 2: Managing SIC for SDGs 9

To attain the goals and targets of SDG 9 - synergic achievement of economic, social, and environmental results in the medium to long term - the commitment to SDGs needs to be integrated into managerial processes, including the SIC processes. Mission and sustainability-oriented goals define and drive the design and implementation of a business model that affects the value proposition to different stakeholders (customers, employees, providers, competitors, government, and society) (Cabrita and Duarte, 2021). The literature (Wang and Juo, 2021; Singh *et al.* 2020) reveals that to be well succeeded, such a business model, that integrates SDG 9 concerns, requires a wide set of SIC management processes – green training, life-cycle analysis, total quality environmental management, industry eco-design, development of environment-friendly technologies, green waste management, green packaging, green cooperating with customers, eco-friendly behaviors and lifestyles– that enable the exploitation of organizational resources, capabilities, and core competencies to create and

leverage value along the three dimensions (economic, environmental, and social). In this sense, fluxes of knowledge within organizations should be filtered by SDG 9 to build resilient infrastructures, promote inclusive and sustainable industrialization and foster innovation, which is incorporated into the strategy.

6. Conclusions

This work, based on the SD and IC theories explores the arguments to link these two streams of research. The aim of this paper is to explore how the characteristics of the IC can foster the ISID to attain SDG 9 targets. The strategic perspective of IC supports the integration of SDGs into decision-making processes, to create and leverage organizational value. Knowledge as the core element of IC is also the key to achieving the SDGs in every context. Organizations, as an important source of innovation, have a social responsibility to support concerns related to SD. Moreover, organizations should take a holistic view of business, with a focus not only on achieving economic performance but also on the social and environmental dimensions of SD, which aligns with the ecosystem perspective of value creation or SVC. This may be reflected, e.g. in green practices to achieve sustainable industrialization envisaged by SDG 9. Without the focus on the critical value drivers, including technology and innovation, industrialization will not happen, and without industrialization, the development will not happen.

Based on the literature revision, a framework was developed, where is proposed that IC aligned with SDG-oriented practices could help managers to consider the implications of green practices in line with the UN 2030 Agenda when managers decide to redesign and reorganize their operational practices. We show that IC is critical for not only achieving a competitive advantage but also influencing sustainable development (Dalwai *et al*., 2023). Our future depends on our capacity to adapt, detect opportunities, collect necessary skills and knowledge, and transform them into economic values, in balance with ecosystems. SIC principles and practices are the basis of knowledge-based industrialization.

Despite an increasing number of studies exploring the links between IC and sustainability, a major gap emerges in what concerns the influence of IC on achieving SDGs in specific or interconnected goals. The proposed framework produces an informative base to implement strategies committed to SDGs. Future studies can set forth toward the impact of SIC in each SDG. Several potential improvements could be considered for future research activities on the impact of SIC on knowledge-based industrialization. We believe that more research on sustainability is also needed. The focus should be a punt on interdisciplinary research, i.e. synergy of knowledge from economics, natural sciences, engineering, ecology, etc.

Innovational Leadership and Knowledge Sharing: The Mediator Role of Self-efficacy

Delio Ignacio Castaneda and Camilo Andrés Ramírez
Pontificia Universidad Javeriana, Bogotá, Colombia

delio.castaneda@javeriana.edu.co
ramirezcamilo@javeriana.edu.co

Abstract: Innovational leadership is a set of practices and skills that leaders develop to promote innovative behaviors in their workers at the individual and collective levels. This is a novel concept focused on one role of leaders: the facilitation of the generation of new or significantly improved products and services. Previous studies with other styles of leadership have shown that transformational leadership encourages a climate for innovative work behaviors, while transactional leadership influences exploitative innovation activities. Knowledge sharing involves the transfer of experience and expertise to facilitate business development and the accomplishment of organizational objectives. Self-efficacy is an individual´s confidence in their abilities to execute a particular task. It influences learning and performance. This research studied whether innovational leadership influences two types of knowledge sharing: tacit and explicit. At the same time, the role of self-efficacy as a mediator variable was evaluated. The sample consisted of 415 workers from different sectors in Colombia. According to the results, innovational leadership positively influenced tacit and explicit knowledge, although the effect on tacit knowledge was higher. Finally, self-efficacy played a mediator role in the relationship between innovational leadership and knowledge sharing. Additional research is suggested to explore the differences between innovational leadership and other types of leadership in the process of sharing tacit and explicit knowledge. At the same time, complementary investigations about the dynamics of innovational leadership are needed to understand why it affects more tacit knowledge than explicit knowledge.

Keywords: Knowledge sharing, Innovational leadership, Self-efficacy, Knowledge management

1. Introduction

For many years, researchers have explored the relationship between different leadership styles and knowledge sharing. These are some recent examples. Goswami and Agrawal (2023) found that ethical leadership has a positive impact on knowledge sharing. Le and Nguyen (2023) revealed that trust is a mediator between ethical leadership and knowledge sharing. There is also evidence about the influence of decentralized leadership on knowledge sharing (Schewer et al., 2023), the mediated role of knowledge sharing between entrepreneurial leadership and team creativity (Mehmood et al., 2022), and the influence of relational leadership on knowledge sharing (Engelsberger et al., 2022).

This paper focuses on a new concept of leadership called innovational leadership and its influence on knowledge sharing. This style of leadership promotes an environment and a climate where workers feel comfortable interacting (Contreras et al., 2022). We hypothesize that it is an ideal style of direction to facilitate knowledge sharing. Innovational leaders are good at promoting learning processes, encouraging a safe environment for change, providing monitoring and adjustment, and orienting people. In addition, this research explores the role of self-efficacy as a mediator between innovational leadership and knowledge sharing.

2. Literature Review

2.1 Innovational Leadership

The foundation of any high-performing organization is the innovative behavior of its employees (Tidd and Bessant, 2020). Leaders influence organizational learning, knowledge sharing, and employees' innovative behavior (Alblooshi et al., 2020). There are multiple studies on the relationship between styles of leadership and innovation (Sethibe and Stteyn, 2017). Our study follows a new conceptualization that integrates those two notions and is called innovational leadership.

Innovational leadership is a style of leadership that encourages innovative behaviors in employees (Contreras et al., 2022). This style of leadership creates a work environment where employees feel free to interact and safe to share ideas. This concept proposed by Contreras et al. (2022) is different from innovative leadership, which focuses on the process of making relevant changes to solve problems and benefit people (Sen and Eren, 2012). These leaders are oriented toward innovation and work to transform ideas into assets (Alblooshi et al., 2020). Another style of leadership with a similar name is innovation leadership. This kind of leadership refers to leaders who can create a strategy and build relationships to implement something new that adds value to an organization (Contreras et al., 2022).

Innovational leadership encourages individual innovation and innovative behaviors in their employees. Innovative behavior is the intentional actions of workers oriented toward generating, applying, and implementing new ideas, products, and processes (Contreras et al., 2022). This type of leadership focuses on workers´ innovative outcomes and consists of a set of practices and skills that leaders develop to promote innovative behaviors in their workers at the individual and collective levels (Contreras et al., 2022). In this research, this type of leadership is proposed as a facilitator of knowledge sharing behavior. Innovational leadership is a new conception of leadership, and so far, no publications have evaluated its relationship with knowledge sharing. In this sense, this study is a pioneer in this matter.

2.2 Knowledge Sharing

Mohajan (2016) defined knowledge as the accumulation of experiences, practical information, and skilled perception, which offers a framework for estimating and integrating new experiences and information. Davenport and Prusak (2001) affirmed that the main source of creation of a company´s competitive advantage resides fundamentally in its knowledge, or more specifically, in what the organization knows, in how individuals use what they know, and in their ability to learn permanently.

Knowledge sharing is the exchange of knowledge among individuals. In an organizational context, knowledge sharing is the foundation for generating innovations. Knowledge sharing is a fundamental process that helps employees contribute their skills and experience on creative and organizational value dynamics. Singh et al. (2021). This behavior is a process associated with organizational improvement. It contributes to the creation, and updating of information (Ruseli et al., 2010) and adds value to the achievement of a competitive advantage (Samieh and Wahba, 2007).

Some studies report the relationship between different styles of leadership and knowledge sharing. For instance, Kim et al. (2021) found a positive influence of transformational leadership on knowledge sharing. According to Khassawneh et al. (2022), knowledge sharing has a positive effect on creativity, and the openness of a leader mediates the willingness of workers to share information. Based on the study of Zehir and Celebi (2022), empowering leadership has a positive effect on explicit knowledge sharing. Finally, Al-Husseini et al. (2021) reported a positive relationship between transformational leadership and knowledge sharing. In the present study, for the first time, the relationship between innovational leadership and knowledge sharing will be evaluated.

2.3 Self-Efficacy

Human behavior is extensively motivated and regulated through the exercise of self-influence. Among the mechanisms of self-influence, none is more pervasive than believing in one's efficacy (Bandura, 2009). Multiple studies have been emphasizing the association between self-efficacy and organizational variables like culture and organizational empowerment (Wu et al., 2023) and organizational citizenship behavior (Magdaleno et al., 2023).

Self-efficacy is an individual´s confidence in his or her abilities to execute a particular task (Chen and Hung, 2010). Self-efficacy influences how people think, feel, and act and, therefore, their achievements. If an individual believes that it is not possible to produce results, then he or she will not act to make an event happen. Two people with the same knowledge can perform differently depending on their self-efficacy. This concept is related to the beliefs that an individual has about what he or she can do with his or her abilities in a variety of circumstances (Cisneros and Munduate, 2000). Chen and Gao (2023) found that self-efficacy was associated with higher self-esteem.

Self-efficacy beliefs determine people´s goals and aspirations. Individuals with high self-efficacy tend to expect favorable results. In the same way, this concept also influences how obstacles are faced. People with low self-efficacy focus more on risks and costs than on opportunities (Bandura, 2002). Brown et al. (2005) stated that individuals with high self-efficacy focus their attention and motivation on the tasks necessary to achieve expected performance levels and persevere with the goal, despite obstacles. Stadkovic and Luthans (1998) stated that self-efficacy changes over time when the person obtains new information and experience in performing a task. Individuals with high self-efficacy set goals that are more ambitious and tend to perform better (Wood and Bandura, 1989).

According to Bandura (1977), self-efficacy beliefs are constructed from four sources of information: enactive mastery experiences, vicarious experiences, verbal persuasion, and psychological states. Leadership has an

impact on followers´ self-efficacy by showing models how to perform a task effectively and giving objective feedback about why it is possible to perform it.

There is a positive relationship between self-efficacy and knowledge sharing (Bilginoglu and Yozgat, 2018; Castaneda et al., 2016). Safdar et al. (2021), based on a systematic review, concluded that self-efficacy is a predictor of knowledge sharing. Cabrera et al. (2006) found an association between breadth of role self-efficacy and knowledge sharing. There are some studies in virtual communities in which an association between self-efficacy and knowledge sharing behavior has been found (Hsu et al., 2007; Tseng, 2007).

Kim et al. (2020) indicated that individual characteristics, such as self-efficacy and knowledge-creation self-efficacy, significantly predict knowledge sharing. Shao et al. (2015) found that hierarchical cultures that focus on efficacy were positively related to employees' explicit knowledge sharing. In addition, group culture that focused on trust was positively related to employees' tacit knowledge sharing, and their relationship was fully mediated by employees' computer self-efficacy. Runhaar and Sanders (2016) showed that some human resources practices strengthened the relationship between occupational self-efficacy and knowledge sharing.

Brooke et al.´s (2017) findings indicate that individual-related and environmental-related factors have a significant influence on knowledge sharing behavior. The results also reveal that self-efficacy mediates the relationships between prior experiences, social support, trust, and knowledge sharing behavior. Lee et al. (2022) stated that self-efficacy positively mediated the association between knowledge sharing and sustainable happiness. Kim et al. (2021) stated that members with higher self-efficacy are more likely to share knowledge with their teammates.

Naan et al. (2019) concluded that self-efficacy had a strong positive influence on employee job performance, perceived environmental support, and knowledge sharing, while perceived environmental support and knowledge sharing positively influenced employee job performance. Mshaly and Al-Azawei (2022) showed that knowledge acquisition, knowledge sharing, and online self-efficacy were determinants of performance expectancy, and online self-efficacy was a predictor of effort expectancy. Yilmaz (2016) working with university students, found that self-efficacy positively affects knowledge sharing.

We propose that a new conception of leadership, innovational leadership, influences knowledge sharing. Leaders may persuade workers´ beliefs. In this sense, it is expected that innovational leadership relates to knowledge sharing and that self-efficacy is a mediator variable.

3. Methodology

3.1 Participants

The sample consisted of 415 workers from different sectors in Colombia. In the sample, 249 were women (55.6%) and 199 were men (44.4%). About the level of the position, 6.92% were technical, 66.07% were professionals, 9.38% were advisors, and 17.63% were directives. The demographic characteristics of the sample are presented in Table 1.

Table 1: Demographic Data of the Sample

Characteristics	Number	Percentage (%)
Gender		
Male	199	44.42%
Female	249	55.58%
Position		
Director	79	17.63%
Adviser	42	9.38%
Professional	296	66.07%
Technical	31	6.92%
Educational level		
Postgraduate	214	47.77%
Professional	205	45.76%

Technical	29	6.47%
Time of experience in the company in months		
0-12	162	36.16%
13-24	48	10.71%
25-36	40	8.93%
37-48	37	8.26%
49-60	28	6.25%
61-72	23	5.13%
Over 72	110	24.55%
Time of experience in the position in months		
0-12	120	26.79%

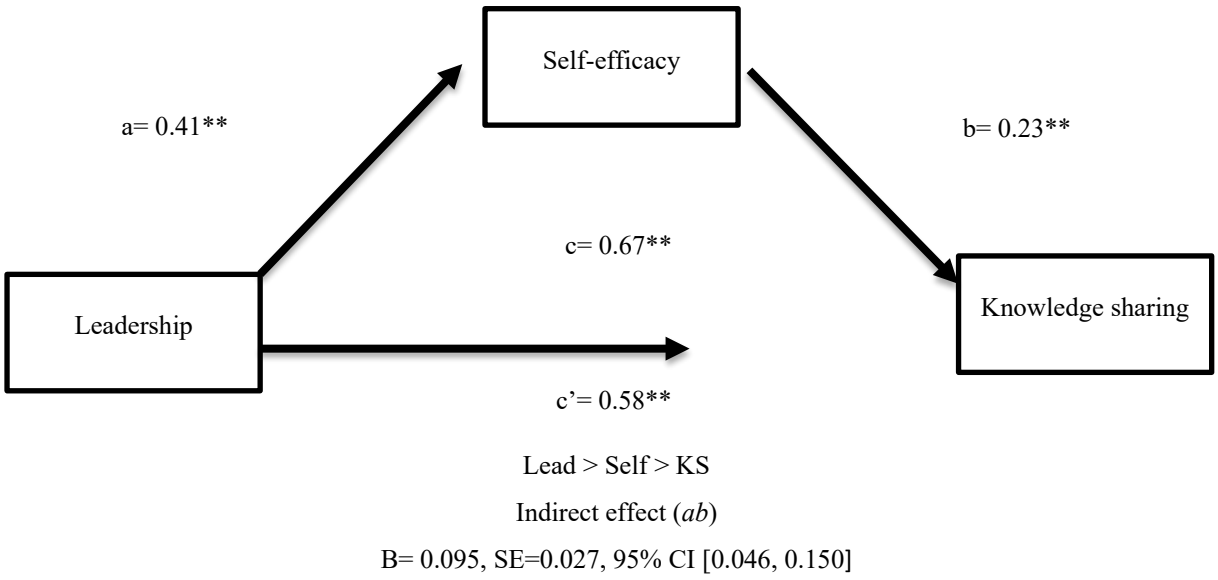
3.2 Instruments

To measure innovational leadership, the scale designed by Contreras et al. (2022) was used. The scale has 16 items. The Cronbach´s alpha reliability of the instrument was 0.96. The instrument used in this study for evaluating tacit and explicit knowledge that workers share was the one designed by Castaneda et al. (2015). The instrument measures perceived evaluations of workers using a Likert scale with five levels of response and has 12 items. The validation of this instrument obtained a Cronbach's alpha reliability score of 0.94. A scale designed by Castaneda et al. (2016) evaluated self-efficacy. This instrument has four items and uses a Likert scale with five levels of response. The reliability of the instrument is 0.92.

4. Results



To evaluate the model, a simple measurement was taken with a single mediator variable using process regression analysis, which performs three regression analyses with the variables of the model (Fernández-Muñoz and García-González, 2017; Hayes, 2018), being leadership (lead) the independent variable, knowledge sharing (ks) the dependent variable, and self-efficacy (Se) the mediating variable. The analysis was performed with information from 448 subjects. The confidence level for the construction of intervals was 95%.

The first regression analyzed the influence of the independent variable on the mediating variable (coefficient *a*). The influence of leadership on self-efficacy was statistically significant (BKS= 0.4161, p= 0.000). The second regression analyzed whether the mediating variable predicted the dependent variable (coefficient *b*) and the direct effect of the independent variable on the dependent (coefficient *c'*). The influence of self-efficacy on knowledge sharing (coefficient *b*) is statistically significant (BLead= 0.2272, p=0.000). The direct effect of leadership on knowledge sharing (coefficient *c'*) is statistically significant (BKS= 0.5785, p= 0.000). This allows for the observation that the effect of self-efficacy on knowledge sharing is significant, as is the direct effect of leadership on knowledge sharing.

Then, the total effect was analyzed, which corresponds to a regression analysis with a single predictor, the independent variable over the dependent (coefficient c). Thus, the effect of leadership on knowledge sharing was analyzed, and it was significant (BKS= 0.6731, p= 0.000). The total and direct effects presented in the coefficients c and c´ measure the total effect of leadership on knowledge sharing (B= 06731, p=0.000). Lastly, the indirect effect of leadership on knowledge sharing was evaluated, taking into account the role of the mediating variable (ab coefficient) (BSe= 0.0946; BootSE= 0.0268; BootLLCI= 0.0462; BootULCI= 0.1505). Given that the value in the coefficient ab is positive and the values of the lower limit (BootLLCI) and upper limit

(BootULCI) of the confidence interval did not include the value of 0, it can be affirmed that the indirect effect is statistically significant and that there is a positive relationship between leadership and knowledge sharing. In this way, the self-efficacy of a worker influences knowledge sharing. This analysis is presented in Figure 1 through the mediation model.

Figure 1: Model of Mediation of Self-Efficacy Between Leadership and Knowledge Sharing

Note: ** significance P<0.01. SE means standard error via Bootstrap. CI means interval confidence.

5. Discussion

The purpose of this research was to evaluate if a new conception of leadership called innovational leadership influences knowledge sharing and the mediator role of self-efficacy in the relationship between innovational leadership and knowledge sharing.

According to the results, it was found that innovational leadership has a positive relationship with both types of knowledge sharing: tacit and explicit, although the effect on tacit knowledge was higher. There is also statistical support to state that self-efficacy is a mediator between innovational leadership and tacit and explicit knowledge sharing.

This is the first article that relates innovational leadership to knowledge sharing. Results were equivalent to what was found with other styles of leadership, for example, transformational (Kim et al., 2021; Al-Husseini et al., 2021) and empowering (Zehir and Celebi, 2022).

This research went a step further, evaluating if innovational leadership impacted tacit and explicit knowledge in the same way. It was found that the positive effect was higher with tacit knowledge. A possible explanation is that the innovational leadership style creates a safe work environment where employees feel free to interact and share ideas (Contreras et al., 2022). What people share when interacting with others is mainly tacit knowledge. This opens a line of research where the differential impact of leadership styles on tacit and explicit knowledge may be studied. For example, it may be hypothesized that transactional leadership, which is focused on tasks and agreements on results, may impact explicit knowledge better than tacit knowledge.

In this research, support was also found for the role of self-efficacy as a mediator variable between innovational leadership and knowledge sharing. Self-efficacy relates to the beliefs that an individual has about what he or she can do with his or her abilities in a variety of circumstances (Cisneros and Munduate, 2000), and it can be influenced by vicarious experiences and verbal persuasion (Bandura, 1977). Innovational leadership has an impact on followers´ self-efficacy by showing models of how to perform a task effectively and giving objective feedback about why it is possible to perform it. Self-efficacy may change depending on context variables, so a worker with low self-efficacy to share knowledge may change it with a leadership style that supports the worker and incentivizes him or her to share knowledge through interaction.

6. Conclusion and Recommendations

It may be concluded that innovational leadership facilitates workers´ knowledge sharing, especially the tacit one. It is also concluded that self-efficacy is a mediator in the relationship between innovational leadership and tacit and explicit knowledge sharing.

From a theoretical perspective, this article contributes to the validation of this recently created construct called innovational leadership. Likewise, it is the first time that this construct has been contrasted in the field of knowledge management. From an applied point of view, the article guides decision-makers to strengthen actions that contribute to worker knowledge sharing.

It is recommended to do additional research to understand why this style of leadership impacts tacit knowledge better. Considering that the concept of innovational leadership is new, maybe study its advantages over other styles of leadership in different processes of knowledge management and innovation.

Abstract: The current study suggests the presence of counter-knowledge to spread misperceptions or misunderstandings arising from the existence of institutional voids. Blind spots may be partly caused by such counter-knowledge that triggers the knowledge gaps of the actors in the face of the new information and knowledge society. Find or instance, when we talk about blind spots in the Spanish National Healthcare System (SNHS), we refer to the presence of incorrect stereotypes among the different actors, the feminisation of the profession even though the elderly population they serve continues to associate the figure of the doctor with the masculine role, the lack of awareness about the importance of data protection or cyberattacks. This study suggests that counter-knowledge is likely to result in the lack of clear vision after suffering from blind spots. Such counter-knowledge hinders people from things that most of us take for granted, which creates difficulties for engagement among multifaceted stakeholders with diverse expertise and specialities to overcome blind spots.

Keywords: Institutional voids, Blind spots, Counter-knowledge, The Spanish National healthcare system

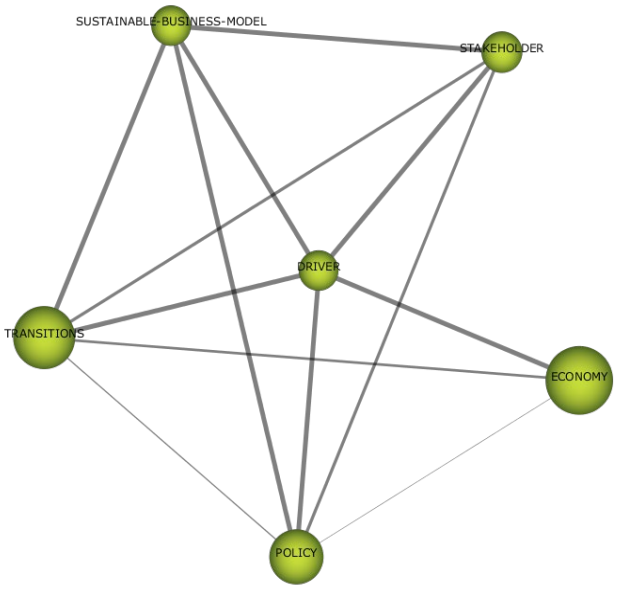
1. Introduction

Blind spots refer to things that people in general and knowledge workers, in particular, fail to perceive, even though they may appear obvious to others (Meissner et al., 2017). Such failures may lead to misperceptions or misinterpretations of what is perceived (Wiegand, 1999; Zajac & Bazerman, 1991). This concept of blind spots is related to the idea of "institutional voids" incorporated by Ebrashi and Darrag (2017), in which the lack of institutional agreements can prevent community actors from participating in market activities. Like "institutional voids", blind spots describe the absence of knowledge structures, for instance, institutions or intermediaries, which should generally facilitate economic transactions (Palepu & Khanna, 1998).

Even though Spain is the third largest beneficiary of European funds, expenditure dedicated to healthcare in Spain during 2022 fell by 9.88% compared to 2021. For the citizen, this means institutional voids of out-of-pocket spending and access to different quality benefits depending on the coverage type and geographic location. This study identifies in the literature three major institutional voids of the Spanish healthcare sector: the lack of a clear and shared vision between the educational and health authorities about health necessities which prevents a national education policy and medical training; the ageing of the population and moderate economic growth are issues expected to add pressure to the form of public financing of the SNHS; and political and social inequalities that exist in society partly due to the delegation of powers to the autonomous communities. Identifying and actioning on institutional voids in the healthcare sector can contribute to mitigating or correcting their negative effects on the system. For example, it can contribute to being more efficient in the allocation and use of public resources and increase the positive effect of these public resources on end users.

It is well known that the healthcare sector presents misinformation that can have serious consequences for public healthcare. It is important to understand the relationship between institutional voids and counter-knowledge. In this vein, the knowledge management literature maintains that when human beings do not have access to adequate knowledge structures, counter-knowledge is generated that manifests itself in the form of misinformation, misunderstandings, ignorance, the presence of obsolete knowledge, or hiding knowledge (Bolisani et al., 2019; Bolisani & Cegarra-Navarro, 2021; Cegarra-Navarro et al., 2021; Martelo-Landroguez et al., 2019; Thompson, 2008). Previous studies suggest that there is no positive counter-knowledge; in fact, any counter-knowledge has a negative effect on the relationships between the different actors (Bolisani & Cegarra-Navarro, 2021).

Besides, in this context, we are studying the creation of counter-knowledge to three forms of learning myopia: spatial myopia, temporal myopia, and myopia to errors with the purpose of finding blind spots between the



different actors involved. This study focuses on those cases where counter-knowledge prevails over knowledge, giving rise to the so-called blind spots (Wiegand, 1999). SNHS blind spots would be those manifestations of counter-knowledge at the actor level in such a way that, although users do not observe them directly, they can perceive them informally and indirectly. It is important to point out that blind spots can endanger not only the actors that generate them but also those whom they can influence. This study identified the most significant blind spots which form the basis of the SNHS and which should be followed very closely by healthcare authorities, from three perspectives: users, doctors and nurses, and administrators.

The main purpose of this study is to link institutional voids with blind spots through counter-knowledge in the Spanish Healthcare System. The structure of this work to achieve this objective is as follows: the proposed theoretical framework is presented in the 2 and 3 sections. Section 4 is the concluding remarks and the conclusions, managerial implications, and limitations are discussed in section 5. This study has theoretical and managerial implications.

2. Finding Institutional Voids in the SNHS

The concept of institutional voids is associated with the absence of suitable intermediaries in emerging markets and the transaction costs and operational challenges that this entails (Palepu & Khanna, 1998). According to(Palepu & Khanna, 1998), there are three causes for institutional voids: 1) the lack of information needed to connect consumers and producers; 2) political entities that place their political interests above economic efficiency; and 3) an inefficient judicial system. Under the influence of institutional voids, product markets, capital markets and labour markets are affected by the lack of intermediaries (Ebrashi & Darrag, 2017; Luiz et al., 2021).

Figure 1 shows the drivers related to institutional voids for analysing the most frequently treated themes from 2000 to 2023. The drivers are associated with circles, and the size of the circles is related to the number of citations connected with them. In other words, it was modelled using the centrality and density measures. Centrality estimates the degree of network interaction by analysing the links between keywords inside and outside the network. Density considers internal thematic coherence by examining the links between keywords inside the network. As can be seen in Figure 1, there are five research themes related to drivers within an operating context of institutional voids during this period.

Note: [Density=85.66; Densisty range=0.92; Centrality=209.03; Centrality range=0.46]
Source: SciMAT analysis of institutional voids from 2000 to 2023

Figure 1: Drivers Related to Institutional Voids

As a result of institutional voids, there are many ways that the SNHS can fail or not work effectively. Based on this preliminary study of 293 papers published in the Web of Science (WoS) Core Collection database, we can conclude that the three most analysed aspects involve transactions between institutions, economic issues, and political aspects. Considering this SciMAT classification and attending to the work of Sánchez-Polo et al. (2019),

this study proposes three major institutional voids of the Spanish healthcare sector: 1) the lack of a clear and shared vision between the educational and health authorities about health necessities which prevents a national education policy and medical training; 2); the ageing of the population and moderate economic growth are issues expected to add pressure to the form of public financing of the SNHS; and 3), political and social inequalities that exist in society partly due to the delegation of powers to the autonomous communities.

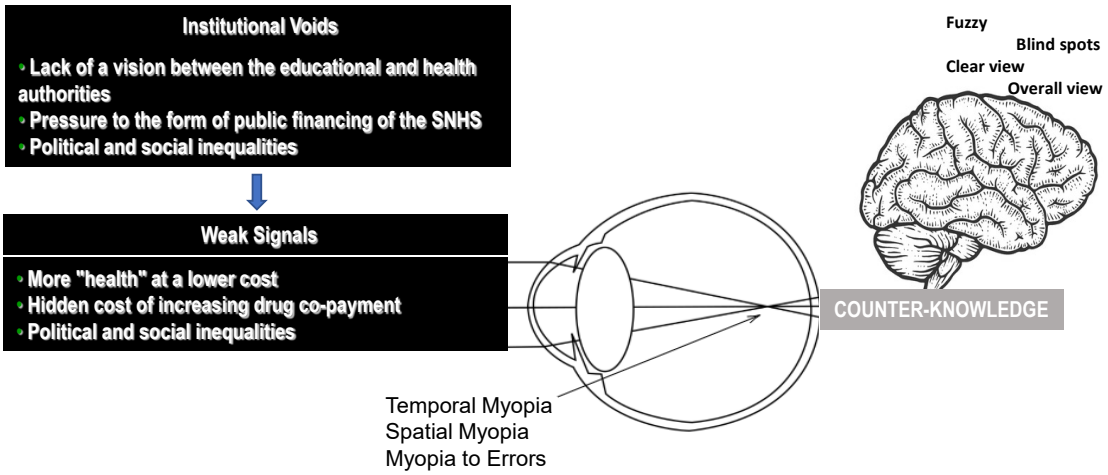
3. Linking Institutional Voids With Counter-knowledge

Considering the peculiarity of the health sector where misinformation can have serious consequences for public health. It is important to understand the relationship between institutional voids and counter-knowledge. In this vein, the knowledge management literature maintains that when human beings do not have access to adequate knowledge structures, counter-knowledge is generated that manifests itself in the form of misinformation, misunderstandings, ignorance, and the presence of obsolete knowledge (Bolisani et al., 2019; Bolisani & Cegarra-Navarro, 2021; Martelo-Landroguez et al., 2019; Sánchez-Casado et al., 2015; Thompson, 2008). Previous studies suggest that there is no positive counter-knowledge; in fact, any counter-knowledge has a negative effect on the relationships between the different actors (Bolisani & Cegarra-Navarro, 2021).

Several researchers refer to counter-knowledge as the result of weak signals perceivable when people look beyond their core knowledge base and day-to-day business activities (Cegarra-Sanchez et al., 2017; Day & Schoemaker, 2004, 2006; Haeckel, 2004; Pina e Cunha & Chia, 2007; Thompson, 2008). For example, information against vaccination, the so-called "miracle cures", "magic cures", or "superfoods", among other elements in which many of us are not experts, are sources of misinformation that can lead us to counterproductive decisions (i.e. counter-knowledge). From this point of view, institutional voids could be considered sources of weak signals among the actors that have access to them. It is important to point out that while counter-knowledge occurs at the individual level among the affected actors, institutional voids occur at the institutional level.

The existing literature has pointed to weak signals as somewhat negative in that can pose a threat to our comfort zone (Ansoff, 1975; Day & Schoemaker, 2004b, 2006a; Ilmola & Kuusi, 2006; van Veen & Ortt, 2021). In the following paragraphs, we consider some examples of how institutional voids detected in the previous section end up manifesting as weak signals at the user level:

- Regarding the possible differences between educational and health authorities, they may give a weak signal or wrong impression to the different actors (e.g., students, physicians, health managers, etc.) that the only important thing for such authorities is to determine who and in what circumstances is possible to produce more "health" at a lower cost(Pedrero-Garcia, 2017), which promotes unfounded rumours (i.e., counter-knowledge) about the options available for either education or healthcare (public/private).
- The deficit of the SNS and the economic crisis have prompted healthcare institutions to gravitate toward patients (beyond their direct and indirect taxes, now even more charged) part of the payment for medical care through the co-payment of medicines (Gallo & Gené-Badia, 2013; Ortuzar et al., 2021; Prieto-Herraez et al., 2020), which again it sends confusing signals about the final price of the drug, whom to claim the difference in price, etc. (Ortuzar et al., 2021).
- Although article 43 of the Spanish Constitution recognises the right to health protection, there are health differences depending on the community in which one resides (Prieto-Herraez et al., 2020). For example, the Autonomous Communities dedicate 46.1% of their budget to health, with a difference that oscillates between 35.7% in Catalonia and 58.8% in Aragon(Ortuzar et al., 2021). Once again, the wrong message transmitted with these differences between communities is that political and economic interests prevail over social and civil ones(Cegarra-Navarro et al., 2021).



The literature on the myopia of learning maintains that when managers perceive the weak signals described above, they tend to interpret them influenced by three different scenarios: a) the wrong contexts: b) at inconvenient times; and c), under previous prejudices that prevent them from seeing reality (Czakon, 2022; Larwood & Whitaker, 1997; Levinthal & March, 1993; Seo et al., 2020; Smith et al., 2010). Extrapolating these three scenarios to the case that affects us, the present study relates the creation of counter-knowledge to three forms of learning myopia:

1. “Spatial Myopia” happens when looking into an empty visual field without frames of reference. In this case, the youngest people are the most vulnerable. Let us think about the case of people without previous experience exposed to weak signals in a new context for them. When faced with weak

signals, they will respond with more credulity and innocence in the face of misinformation or fake news.

2. "Temporal Myopia" is something like what happens when we have been using near vision for a long time, and we look up, we need some time to adapt our vision. In this case, counter knowledge would be influenced by a lack of flexibility or adaptation of the user to the above weak signals. Although older people are especially affected by this issue, the good news is that it is temporary.
3. "Myopia to Errors" is associated with a previous anomaly that prevents us from seeing correctly from a distance. For example, people suffering from glaucoma or colour blindness see different colours from those an emmetrope perceives. Something similar will happen to people with religious, political, ethnic or social prejudices; they will interpret the signals conditioned by their beliefs and experiences.

Figure 2 shows the summary of the process described above. It is important to emphasise that one thing is what the eye perceives, and another very different thing is how the brain processes these images. Indeed, the eye receives the image vertically and horizontally inverted, with total symmetry, unlike a mirror, to the light that falls on it. In other words, it is the brain that finally processes the counter-knowledge and decides to act accordingly.

Source: Own elaboration.

Figure 2: Effect of Weak Signals on Counter-Knowledge

4. Finding Blind Spots Between the Different Actors Involved

The brain controls voluntary movements, speech, intelligence, memory, and emotions and processes the information from the rest of the senses and the images it receives through the eyes. That is, the counter-knowledge can be totally or partially counteracted through the attention and intuitive cognitive process that the brain develops(Damasio, 2010; Tulving, 2002). Given the presence of weak signals when processing the counter-knowledge that comes to it, the brain interprets or rather tries to overcome it with the knowledge that comes from the intuitive cognitive process surrounding it (Castelfranchi & Miceli, 2009; Schwenk, 1984). It is important to note that not only rational knowledge intervenes in this cognitive process, as (Bratianu, 2017) suggests, emotional and spiritual knowledge can also help to create "awareness" and "understanding" in the learning process.

Having said that, this study focuses on those cases where counter-knowledge prevails over knowledge, giving rise to the so-called blind spots (Wiegand, 1999a). SNHS blind spots would be those manifestations of counter-knowledge at the actor level in such a way that, although users do not observe them directly, they can perceive them informally and indirectly. It is important to point out that blind spots can endanger not only the actors that generate them but also those whom they can influence. For example, let's take the case of a driver who does not see a car coming from behind when he is about to overtake. When that happens, not only will he(she) be in danger but also the occupants of the vehicle that is about to overtake and the one coming from behind.

One important thing about a blind spot is that just because it is blind to one actor doesn't mean it is blind to another. For example, the fact that I do not see the car ahead does not mean that the other driver does not see me. Based on these ideas, the only way to understand blind spots is to see them as a whole and from a different perspective. To understand and overcome them, it is necessary to listen and empathise with those individuals

who have suffered them before. Given that blind spots would have different manifestations for each actor (e.g., users, doctors, nurses, administrators, etc.), Table 1 collects the most significant blind spots which form the basis of the Spanish National Healthcare System (SNHS) and which should be followed very closely by healthcare authorities.

Table 1: Blind Spots in The Spanish National Healthcare System

Users	Doctors and Nurses	Administrators
Waiting lists that exceed two weeks. A lack of doctors in primary and hospital care due to political decisions in the selection processes. Collapsed emergencies and drug co-payment systems. increasingly abusive. Low data privacy awareness	Due to the low wages received, there is great simultaneity of work in the public and private sectors. Despite the approaching retirement age of many senior doctors, the youngest have temporary contracts, promoting a high rate of staff turnover. Low data privacy awareness	The duplication of medical records and files promotes a lack of coordination between primary and specialised care. Public hospitals managed through foundations with less external bureaucratic control appear. The need for cybersecurity training

5. Concluding Remarks

The present study suggests that the presence of institutional voids stimulates the presence of weak signals, which in turn manifest in counter-knowledge and blind spots. To counteract the deleterious effects of blind spots and increase the probability of achieving a balance between the different actors, it is necessary to develop knowledge structures that favour empathy and trust between the different actors involved in the healthcare sector. From the view of KM, a blind spot could be defined as that knowledge gap that an individual has and that his(her) brain has filled with counter-knowledge in response to the weak signals it perceives. For this reason, it is necessary to define knowledge structures that stimulate trust and mutual adaptation between different interest groups. Only this way will they be able to deal with the tensions that may arise due to what an actor believes he(she) knows but, in reality, does not know.

In the research literature relating to blind spots, a substantial amount of theorising has been presented dealing with the ways to overcome them (Kühl, 2020; Meissner et al., 2017; Wiegand, 1999b; Zajac & Bazerman, 1991). Although the overall idea is that knowledge workers need to ask themselves and others tough questions, in this logical way of overcoming blind spots, they need to consider three additional issues: 1) the presence of institutional voids, 2) the presence of counter-knowledge, and 3), blind-spots or knowledge gaps created as a result of counter-knowledge.

In the case of blind spots among SNHS actors, as with binocular vision, where the eyes compensate each other, healthcare authorities should establish the appropriate knowledge structures that limit singular and sectarian points of view about the received weak signals from institutional voids. Among these knowledge structures, we should include not only the decentralisation of the most important decisions according to healthcare needs but also request immediate feedback on the decisions adopted to correct inequalities between different national, regional or local institutions as soon as possible. Another knowledge structure could be avoiding unspecialised and political advice when making healthcare decisions, such as placing ministers or councillors attached to a political party but with healthcare training in responsible positions. This is a fat Spaniards suffered during the years of the pandemic, where a health minister with a degree in Philosophy and political ambitions made inefficient and harmful decisions for everyone (Cegarra-Navarro et al., 2021).

Another structure of knowledge to be considered by healthcare authorities would be to avoid group thinking and sectarianism that affect the incompatibility of public and private health (Couzin et al., 2011; Hart, 1991; Janis & Hart, 1991). For this, the first step would be to assess whether these harmful elements exist in the face of certain emergencies that require the compatibility of both forms of health management. Collaboration between public and private healthcare institutions can help correct formal defects and avoid the spread of confusing messages that encourage the spread of counter-knowledge (Cegarra-Navarro et al., 2021). This collaboration can be used specially to reduce the blind spots of end users. For example, to reduce the waiting lists of patients. This way, costly and inefficient decisions such as hiring non-EU doctors by public healthcare institutions without

the required knowledge could be avoided (e.g., language proficiency or qualifications that cannot be recognised).

This study makes another valuable contribution as it postulates "weak signals" either as a result of institutional voids or as a trigger to counter-knowledge. In fact, weak signals are perceived by actors and therefore, what happens at the user level is a mismatch between the provided information and needed information, which lead healthcare actors to misinformation or lack of information. This situation led to the spread of misinformation by healthcare actors, spreading rumours and creating situations where healthcare actors believe and propagate fake news (i.e., counter-knowledge). To avoid this situation, users should check the veracity of the information before disseminating it. In doing so, health institutions should enable tools such as free contact telephone numbers.

6. Conclusions

The main purpose of this study is to link institutional voids with blind spots through counter-knowledge in the Spanish Healthcare System. Our research highlights some of the key factors that help create a competitive advantage through the incorporation of practices related to counter-knowledge. The contributions made by this study present both theoretical and practical findings.

From a theoretical point of view, the research has shown the linking between institutional voids, blind spots, and counter-knowledge in the Spanish national healthcare system. From the view of KM, counteracting the detrimental effects of blind spots, institutional voids, and counter-knowledge presents opportunities to achieve a balance between the different interest groups and it is a theoretical contribution but also a managerial implication to implement in healthcare systems.

The main practical implication is for the users, doctors and nurses, and administrators they can develop knowledge structures that favour empathy and trust between the different actors involved in the healthcare sector. From a KM perspective, it is necessary to define knowledge structures that stimulate trust and mutual adaptation between different interest groups. Another practical implication of this study is that it can contribute to the better use of public funds. It is necessary in a crisis situation, such as the current pandemic context, wars, high unemployment, and weak economies, for the efficiency of public resources (for instance, European funds).

Despite its valuable insights, the research is limited because it study is only from a theoretical perspective and only analyses the case of one country. Future research could also be an opportunity to do quantitative research. Finally in future research, more countries should be included in the study.

The Role of the Intellectual Potential of Employees in Creating the Goodwill of a Teaching Hospital

Jolanta Chluska
Częstochowa University of Technology, Poland

jolanta.chluska@pcz.pl

Abstract: Hospitals are medical entities providing health services to patients. The dominant share of labour costs in the cost structure of the healthcare entity is evidence of the critical role of employees in a hospital's activities. Specialized medical staff provide medical services and educate future medical staff, while also conducting clinical trials and supporting the development of medical technologies. The article aims to recognize the impact of the intellectual potential of employees on creating goodwill in a teaching hospital. The inference was made based on the financial data available on hospital employees' income and labour costs as factors in the development of the goodwill of a teaching hospital. The following research questions were posed: whether the existing legal regulations regarding the financing of the activities of teaching hospitals in Poland, including the costs of medical staff, are conducive to the creation and development of goodwill of teaching hospitals; whether the ratio of the value of operating revenues to labour costs can be considered as a determinant of the increase in the goodwill of a teaching hospital. The research was conducted based on reporting data for 2018 - 2019 involving selected teaching hospitals as the basic units associating high-class medical specialists. The research was empirical and based on quantitative and qualitative data. The analyses were of an expert nature, from the perspective of a statutory auditor and a long-term researcher of the problems of the functioning of medical entities - hospitals. The preliminary findings indicate that the intellectual capital of teaching hospitals is crucial in creating and developing the goodwill measured by the ratio of the value of operating revenues to labour costs. The considerations undertaken in the article are an essential voice in recognizing the conditions for developing hospitals as entities with intellectual capital that is helpful in solving health problems on an international scale. The article is a continuation of the author's research on the development of intellectual capital of employees of teaching hospitals in Poland.

Keywords: Intellectual potential of hospital employees, Salaries of physicians, Hospital management, Knowledge workers in hospitals, Goodwill

1. Introduction

Ownership transformations in healthcare entities pose new challenges in the valuation of assets, liabilities, costs and revenues. The Polish legislation provides for the transformation of medical entities, including the liquidation of an entity, merger of several entities, and transformation of an independent public health care institution into a capital company. If the transformation of a medical entity into a capital company is carried out in accordance with the Law on Medical Activities, the closing balance sheet of the independent public healthcare institution becomes the opening balance sheet of the company, with the sum of equity equal to the sum of the founding fund, the establishment fund, the revaluation fund, and the retained earnings for the period of operation of the entity before the transformation. Teaching hospitals operating as independent public healthcare institutions may also be transformed into capital companies. However, this requires the approval of the minister of higher education and science and the minister of health. Goodwill is disclosed in buy-sell processes, business mergers, and consolidated financial statements. These events are possible in medical entities after their transformation into capital companies.

Medical entities in Poland provide health services by employing high-class specialists (doctors). Their education and the obligation of continuing education make the intellectual potential of employees of medical entities, especially hospitals, their most important resource.

Revenues obtained from providing health services and other tasks contribute to the development of the hospital, increasing its importance in the health care system. By employing staff with high intellectual potential, the hospital can apply for contracts with the payer (Narodowy Fundusz Zdrowia - NFZ). The increase in the value of contracts is associated with higher hospital revenues. It can also make it an attractive place of employment and education for future medical staff, thus increasing the organisation’s value.

2. Goodwill of a Hospital Literature Review

In the era of globalization, with the economy increasingly based on knowledge, the concept of goodwill has changed its meaning. While defining goodwill, it is necessary to take into account several factors and microeconomic and macroeconomic determinants, while also the conditions of the functioning of business entities. Goodwill is perceived differently. Selected opinions and definitions are shown in Table 1.

Table 1: The Essence of Goodwill

Source	Characteristics of goodwill
Accounting Act	The difference between the purchase price of a specific entity or its organized part and the lower (than this price) fair value of the net assets acquired.
IAS 38	Differences between an entity's fair value and the balance value of its net assets identifiable at any time may result from a number of factors that affect the entity's fair value.
Pratama, Pangiarti (2023), p. 30	Goodwill is the difference between the payments made to the company and the net fair value of the identified acquired assets.
Chelba, Melega, Grosu (2023), p. 526	Goodwill is seen as the ability of the entity to produce a profit, which derives either from specific factors capable of contributing positively to the generation of income (being obtained over time, for a consideration, not having an independent value) or by increasing the value of the whole set of assets that the entity owns in relation to the value of each individual asset.
E.A. Hendriksen and M.F. van Breda (2002), pp 635-636	The value of intangible assets attributed to a business entity that are not reported as assets but explain the goodwill, which results from favourable attitudes toward the company (e.g., good customer relations, reputation).
Jennings, LeClere and Thompson (2001), p. 20	The difference between the value of a company's ownership interest and the fair value of its identifiable net assets represents comparative advantages that are expected to enable the company to generate earnings in excess of a 'normal' return on investment.
Kamela-Sowińska (1996), p. 9, 31	An intangible asset, independent of the cost of its production, attributed to the enterprise operating on a going concern basis, which does not exist outside the enterprise.

Source: Self-analysis based on literature.

Strojek-Filus argues that important sources of goodwill include the undervaluation of assets, the human factor (employee qualifications), social factors (employee relations), market factors and technological factors (Strojek-Filus, 2013).

Similar to the definitions of goodwill, different classifications of goodwill have been used. From the point of view of the subject undertaken in the present study, it is important to divide goodwill into the following:

- acquired goodwill (disclosed in balance sheet assets) and
- internal goodwill (not disclosed in a financial statement).

Acquired goodwill can be considered from the point of view of its type as personal goodwill, goodwill from a collection of assets, while also goodwill on consolidation (Ignatowski, 1995).

The absence of buy-sell transactions in independent public healthcare institutions justifies a greater emphasis on the identification of goodwill internally generated in hospitals as the sum of the components that determine the strength and quality of a healthcare entity in the healthcare market.

The biggest theoretical and practical problem in medical entities is the determination of the structure of goodwill and linking it to other assets. These problems concern not only the identification of goodwill but, more importantly, its valuation.

Reilly states that a prerequisite for the valuation of intangible assets is to understand the reason for their creation (Reilly , 2015).

The timing of goodwill is also difficult to determine. It cannot be unequivocally identified as a long-term factor in creating company success. The assessment of an entity's ability to achieve economic benefits on a goodwill basis can change. According to IAS 38, internally generated goodwill is not recognized as an asset because it does not meet the basic conditions for such separation (identification, valuation, lack of control) (IAS 38, item 49). An unquestionable factor in creating internal goodwill is a highly skilled staff, which constitutes intellectual capital. It is a source of competitive advantage and determines the company's reputation. This is confirmed by the opinions of such researchers as Falk, Gordon (1977), Low, Kalafut (2006).

The intellectual capital of a hospital's employees can be defined as an intangible resource, the potential of employees, resulting from their education, knowledge, experience, and talent. Recognising the impact of intellectual capital on creating a company's value in teaching hospitals can affect conscious and effective talent management (Mitosis et al., 2021; Ingram, Glod, 2016; Stuss, 2021; Bonneton et al., 2019). Selected definitions of intellectual capital related to its relationship with goodwill are presented in Table 2.

Table 2: Selected Definitions of Intellectual Capital

Author	Concept/Definition
Ayatollahi, Zeraatkar (2020), p. 100	In healthcare organisations, KM processes can be represented as three subprocesses: knowledge generation or creation, knowledge codification or storage and retrieval, and knowledge transfer/realisation or knowledge transfer/application.
Chang, Chen, La (2008), p. 300	Intellectual capital represents the knowledge-related intangible resources of a firm and consists of three essential elements: structural, human, and relational capital.
Herman (2008), p. 41	Intellectual capital consists of three elements: human capital, structural capital, and customer capital, also known as relational or social capital.
Bontis et al. (1999), p. 397	Intellectual capital has attributes that contribute to the value of the company. It is a set of intangible resources and methods of their transformation. Intangible resources are all factors related to the processes that contribute to the growth of the company's value.
Nahapiet, Ghoshal (1998), p. 245	Intellectual capital is knowledge and its associated potential and social capabilities such as organisation, intellectual community, skills, and work experience.
Roos, Roos (1997), p. 415	Intellectual capital is the sum of a company's hidden assets not included in its financial statement, including what is in employees' minds and what is left when they leave.

Source: author's study based on literature.

Various researchers have commented on the impact of intellectual capital on company value (Luthfiani, Suryani, 2022; Fołtys et al., 2021; Kucharska, 2022; Scafarto et al., 2023). However, they did not propose specific measures to quantify this impact. Instead, their focus was on the role of human capital in fostering innovation and competitiveness. With its employees' high intellectual potential, the teaching hospital secures numerous health and other specialised services contracts. These contracts increase revenues from the hospital's primary operational activities.

New, increasingly larger contracts and tasks lead to an increase in employees' salaries. The fact that revenues are growing more rapidly than salaries suggests increased work efficiency, which can be regarded as a company value source. These relationships are considered in the author's attribution of the increase in the teaching hospital's value, as presented in this article.

3. Methodology of the research Characterization of the Research Object

The aim of the paper is to assess the effect of the intellectual potential of employees on the creation of goodwill in a teaching hospital. Inference was made based on the financial data available on the formation and growth of incomes and labour costs of hospital employees as factors in developing the goodwill of a teaching hospital.

The following research questions were asked in the study:

- Are the existing legal regulations on financing the operations of teaching hospitals in Poland, including the labour costs of medical staff conducive to the emergence and development of the goodwill of teaching hospitals?
- Can the ratio of the value of operating income to labour costs be considered a determinant of the growth of goodwill in a teaching hospital?

The research process consisted of the following steps:

- analysis of legal acts on the rules of operation of teaching hospitals,

- assessment of the role of the intellectual capital of employees of teaching hospitals in the creation of competitive advantage in the market of health services (literature review, review of the websites of teaching hospitals, synthesis),
- obtaining data from financial statements from the National Court Register (selection of data from profit and loss accounts, additional information, other reporting data),
- compilation and selection of selected data that characterize the costs of human resources (labour costs), revenues from the sale of health services,
- the use of selected measures of structure and dynamics to characterize the relationship between the analyzed revenues and costs of human resources; expert analysis of data from financial statements.
- analysis of conclusions of selected areas of research conducted by the author in previous years on the financial statements of hospitals and the intellectual capital of hospital employees,
- conclusion of the study.

Of the 29 teaching hospitals in Poland, 10 were selected for analysis. The founding bodies of these hospitals are medical universities or local governments. There is one teaching hospital in Poland in the form of a limited liability company, while other teaching hospitals are independent public healthcare institutions. The entities were included in the study based on the possibility to obtain complete financial data on the entity in the form of financial statements, particularly the profit and loss account and additional descriptive information in 2018-2019. The choice of the period of the study was dictated by the operating conditions of teaching hospitals. In subsequent periods, teaching hospitals carried out tasks aimed at combating the COVID-19 pandemic. Basic activities were limited as hospital resources were used to treat COVID-19 patients. Revenue from operations during these periods was also spent on treating patients with COVID-19. The choice of such data as labour costs of employees and revenues from the sale of medical services for the analysis resulted from the fact that the parameter of the increase in goodwill in the form of financial performance, due to the generally low profitability of medical entities and negative net asset values, was considered to be not very precise.

Teaching hospitals are distinguished among medical entities not only by the type of specialized health services but also by important tasks of training medical staff, teaching, research, consultation, opinion-forming and other tasks assigned by scientific institutions, local government units, or central authorities. Hospitals are allowed to conduct business activities if they do not impede the basic tasks for which they are established. Such a wide range of activities and educational, research, and scientific tasks determine a very high level of knowledge and skills of medical staff, which was the reason for choosing this group of medical entities selected as subjects of the study. Teaching hospitals provide a knowledge management environment for intellectual capital (Bose, 2003). Employees at teaching hospitals are constantly developing their intellectual potential. This is a long-term strategic activity.

4. Results: A Proposal for a Teaching Hospital's Goodwill Growth Attribute

The Polish legal regulations stipulate both the rules of practicing medical professions, education of doctors, acquiring certificates to be licensed to practice a profession, professional responsibility, but also the working time and ways of calculating salaries in medical entities. For this reason, explicitly linking the labour costs of doctors to the creation of goodwill is difficult. Salaries and other labour costs of medical employees of teaching hospitals depend on the level of education, specialty training, titles and degrees, and managerial and administrative functions. With employment contracts, there is a significant relationship between the creation of intellectual capital of employees and the increase in goodwill. As the practical experience of selling medical practices in the United States shows, the personal goodwill transferred as part of the transaction has significant value. It stems from the doctor's specialized knowledge, specialization, reputation, and professional standing. Personal goodwill can reach a significant level in the sales value structure. Appraisers utilize three approaches to value the personal goodwill of selling physicians. The two primary approaches are the "with and without method" and the multi-attribute utility model. The third method is the residual method, in which the other assets of the practice, both tangible and intangible, are identified and valued, with the residual value representing personal goodwill (Levin et al., 2022).

The analyses performed in the present paper are in line with the concept of the “Multi-attribute Utility Model” as a complement to valuation attributes.

Teaching hospitals in Poland earn revenue from the sale of health services based on contracts with the payer, namely, the National Health Fund. The contract is contingent on having qualified medical staff and specialized equipment. Medical staff requirements mean that the professional competence and intellectual potential of

medical staff determine the increase in revenue from core activities. Complementary sources of financing operations include the implementation of paid health services, separate business activities, grants, while also funds from the European Union, among others. The salaries of medical employees and their mode of work are regulated by several legislative acts. These regulations stipulate both the rules of practicing particular medical professions, education, acquiring certificates to be licensed to practice a profession and professional responsibility, but also working time and ways of calculating salaries, including the way of calculating the lowest salaries of employees working for medical entities. The managers of teaching hospitals increased employees' salaries during the 2018-2019 period under review. In the nine hospitals analyzed, the increase was more than 10%. Other labour costs were also increasing similarly. Operating income and labour costs at teaching hospitals are presented in Table 3.

Table 3: Revenues and Labour Costs in Teaching Hospitals

Teaching hospital	Revenues (thousand PLN)		Labour costs (thousand PLN)		Increase in revenue (%)	Increase in labour costs (%)
	2019	2018	2019	2018	2019/2018	2019/2018
1	109,944	100,751	78,158	65,672	109	119
2	89,029	77,044	76,357	64,323	116	119
3	126,898	111,147	71,974	59,970	114	120
4	287,437	264,773	129,147	115,176	109	112
5	447,366	402,110	253,600	219,827	111	115
6	535,304	458,222	239,707	204,411	117	117

During the periods studied, 8 hospitals showed an increase of 1-10% in the number of employees. As the data in Table 3 shows, revenues from the sale of healthcare services and labour costs were on the increase. The rate of this increase can be considered in a similar way. Using the ratio of revenue from the sale of health care services to total labour costs as an indicator for measuring labour cost efficiency, these costs in the teaching hospitals studied are shown in Table 4. Trends in changes in the value of revenue per employee are also presented.

Table 4: Labour Cost Efficiency Indicators

Hospital	Labour cost efficiency Revenue to labour costs (%)		Increase (%)	Revenue per employee (thousand PLN)		Increase (%)
	2019	2018	2019/2018	2019	2018	2019/2018
1	141	153	92	104.31	100.45	104
2	117	120	97	89.66	82.40	109
3	176	185	95	137.19	126.59	108
4	223	230	97	175.48	164.56	107
5	176	183	96	154.96	140.55	110
6	223	224	100	175.91	154.54	114
7	171	170	101	137.03	114.78	119
8	209	209	100	207.38	229.49	90
9	188	218	86	187.71	140.71	133
10	224	238	94	140.97	162.85	87

Source: Self-analysis.

A greater increase in the ratio of revenue per employee than in the ratio of revenue to labour costs means that there was a significant increase in labour costs in the period under study. The increase in revenue per employee confirms the motivational effect of the salary increase and, at the same time, the increase in the effectiveness of employees whose work and competence affected the increase in revenue.

In the hospitals studied, the mean salaries were higher than for the entire healthcare system in Poland. This fact showed that managers of teaching hospitals appreciated the increase in the professional competence of employees and motivated for further professional development of the staff.

A positive trend of the analyzed processes is the simultaneous increase in salaries and operating income. This demonstrates the development of the intellectual potential of the medical staff of teaching hospitals and the ability of this potential to stimulate revenue from providing health services.

As the data in the tables demonstrate, the efficiency of labour costs remains relatively consistent, indicating that revenue increases proportionally with the rise in labour costs. This scenario benefits all involved: the employees see their efforts duly compensated, the company's value rises, and the institution as a whole develops.

It would be detrimental if salaries were to increase while revenues remained static. Equally unfavourable would be a situation where revenues grew faster than salaries. This would imply that the efforts made by employees to generate increased revenues are not being rewarded appropriately. Such a situation could potentially result in employees being less inclined to engage in activities promoting the development of the entity and their professional growth.

The trends observed in the teaching hospitals studied and in other hospitals were similar with respect to the scope and type of operations, education of the medical staff, and legislative basis of hospital activity.

5. Discussion on Results and Implications for Practice

Linking goodwill to the intellectual capital of teaching hospitals must take into account the legal regulations of the health care system in terms of financing health services and the practice of the medical profession. Systemic conditions limit the legibility of the relation in terms of the development of human capital, goodwill, and the impact of these factors on the financial status of medical entities. This is due to the limited financial resources of the health care system, the limitation of the working time of medical personnel, and the statutory method of calculating the minimum wages of medical entities. Macroeconomic determinants also affect trends. These include globalization, pandemics, the development of information technology, while also national and international health policies.

Observation of the organizational and legal transformations of the health sector in Poland reveals a trend of restructuring aimed at reducing the employment of medical staff to save labour costs or change forms of employment. Such measures result only in short-term savings. This does not have the expected effect of improving the financial status of entities in the long term.

One example is the effects of the change in the legal forms of medical entities in Poland between 2011 and 2014. Most independent public healthcare institutions were transformed into capital companies by 2014. At the time, 174 hospitals, accounting for 16% of their population, changed their legislative forms. Of the 49 hospitals studied, 38 reported a net loss, while the remaining 11 recorded a profit. The total revenues of the companies increased by 9.06% from 2011 to 2013. Total costs increased by 7.19% during this period, whereas salary costs increased by 2.85%. The ratio of salary costs to total costs decreased to 43.32%. To reduce the costs of hospital companies, the form of employment of medical staff was changed by abandoning employment contracts in favour of civil law contracts. The average employment in hospitals decreased by 6.25%. Reducing the number of employees and changing the form of employment was motivated by lower employment costs, flexible working hours, improved productivity and increased staff independence. The transformations did not guarantee an improvement in the financial status, and the improvement in financial performance recorded in 2011-2013 was similar to that in the non-transformed entities.

Cost savings due to layoffs of medical personnel and changes in hiring rules indicated that these measures were ineffective. The intellectual potential of employees is an important resource for the profit generation and development of entities. (Działalność szpitali, 2014, pp 14-30)

6. Conclusions and Future Directions

Analysis of data from the financial statements of teaching hospitals allowed for the identification of the determinants of the impact of the intellectual potential of employees on the increase in revenues from providing health services. As reliable, commonly available, and comparable parameters for assessing the possibility of developing this potential, this data is an important tool for analysis. However, they are characterized by significant limitations in teaching hospitals in Poland. Current legal conditions, the averaged nature of reporting data, and the lack of possibilities for individual analysis of a specific employee represent major barriers (Chluska 2021, 2022). This makes analysis of the development of goodwill of teaching hospitals possible, yet difficult. This is not conducive to identifying the formation and development of goodwill in teaching hospitals.

However, the effects of rational human resource management are noticeable. Attention to maintaining and developing the intellectual potential of employees results in an increase in the economic potential of teaching hospitals by increasing contracts for providing health services. This confirms the effect of the intellectual potential of employees on the creation of goodwill of teaching hospitals.

As a motivating factor to improve efficiency and increase goodwill (especially personal goodwill), the increase in salaries (labour costs) opens up new opportunities for providing health services and generating higher operating income. It can be considered that the ratio of revenue to labour costs, indicative of cost efficiency, can be considered an attribute of an increase in goodwill of teaching hospitals. The conclusions of the analyses show that the aim of the paper was achieved and the research questions posed were addressed.

Further research and analysis should determine the ratio of the revenue to labour, trends of its changes, and expected values in the economic policy of the medical entity. Answers to a number of questions in this regard can be provided by the development strategies of teaching hospitals and the decision-making processes of both teaching hospitals and the health sector as a whole.

The Influence of Relational Intellectual Capital and Information Technology on Hospital Efficiency

Andrzej Chluski
Czestochowa University of Technology, Poland

andrzej.chluski@pcz.pl

Abstract: Knowledge management and building intellectual capital are essential for effectively operating healthcare entities. Modern information and communication technologies have an increasing impact on the activities of healthcare entities, which is attributable to the relationship of ICT and purely medical technologies with the use of ICT in knowledge and intellectual capital management. Proper management of the areas of hospital activity mentioned above significantly impacts its effectiveness and efficiency. This paper aims to present and verify a model for determining the impact of the level of relational intellectual capital and the degree of maturity of information and communication technology on the quality and effectiveness of medical services provided by hospitals in Poland. The research model was created using structural equation modelling (SEM). The basic structural model consists of four constructs corresponding to the phenomena studied and the relationships between these constructs. Each construct, as a latent variable, has its measurement model. The measurement models use a survey conducted among the management staff of Polish hospitals. The questionnaires contain carefully selected questions that are indicators of SEM measurement models. The estimation of the model parameters and accuracy was assessed using the partial least squares structural equation modelling (SEM-PLS) methodology. The hypotheses proposed in the paper were verified positively. The model meets the required quality criteria, and all parameters are statistically significant. The level of relational intellectual capital and the degree of maturity of information and communication technology positively and significantly impact the quality and effectiveness of medical services provided in hospitals. The research findings may be helpful for hospital management at the strategic management level.

Keywords: Healthcare management, Information and communication technology, Knowledge management in healthcare, Relational intellectual capital, SEM-PLS modelling

1. Introduction

Modern information and communication technologies (ICT) are widely used and affect almost all aspects of human activity. Despite many years of dynamic development, medical entities are unlikely to take the lead in the development of IT, except for advanced and innovative medical technologies that rely heavily on computer-based methods. The pace of development of medical technologies and implementation of new treatment methods is much slower due to factors such as lengthy and costly clinical trials or complicated approval procedures for new technologies and treatments. As a result, hospital managers need to work closely with IT managers and create and implement a development strategy that considers the medical sector's peculiarities and changing IT trends and requirements. This collaboration will make it possible to exploit the potential of medical IT, improve the efficiency of operations and the quality of services provided, and increase the competitiveness of medical facilities in the market.

Economic efficiency is an essential aspect of managing both commercial and public hospitals. Many healthcare systems around the world fund the activities of medical entities, ranging from private to state-funded systems. Despite differences in pricing and financing of medical services, hospital performance management is based on similar principles. Measures of financial efficiency, such as classic ratios, can be used in any system and can even be adapted to the unique conditions of the activities of hospitals. Effective hospital performance management is critical to providing quality medical services to patients.

The knowledge and skills of hospital employees represent critical intangible intellectual capital. It is a particular resource from a management perspective because the organisation does not own it. It cannot be assumed that a business organisation is the owner of the knowledge of its employees because, at best, it can only be considered a leased resource.

In addition to the knowledge and experience of staff, hospitals have intangible assets that can affect their overall performance and success. Such assets include the hospital's reputation, the general perception of its quality and reliability, and patients' opinions about their experiences with its services, staff, and facilities. The hospital's reputation is improved through consistent action, positive opinions, and effective communication with patients and their families. It is often based on factors such as the quality of medical care, patient treatment outcomes, availability of advanced treatment methods and technologies, and the hospital's commitment to patient satisfaction.

Likewise, relational intellectual capital is of great importance in hospital activities. It refers to the hospital's relationship with patients, their families, and other stakeholders. Relational capital is formed by a hospital's reputation, brand image, and trust patients and their families place in the hospital. It is critical to its success, enabling an organisation to build long-term relationships with patients and stakeholders and become a trusted service provider.

The paper describes a research model created and tested using partial least squares structural equation modelling (PLS-SEM). Rigdon (2013) argued that PLS is a widely used method for testing and validating scientific theories. Multiple simulations have demonstrated that PLS effectively tests hypotheses in various research model configurations.

2. Background and Literature Review

The level of the development of relational intellectual capital (RIC) in healthcare refers to the extent to which healthcare organisations can leverage their relationships with employees, patients, and other stakeholders to create and share knowledge and improve outcomes (De Leaniz, Del Bosque, 2013).

Developing RICs in healthcare is critical to improving healthcare outcomes and patient satisfaction. Habersam and Piber (2003) examined the relationship between RIC and patient satisfaction in European hospitals and showed a positive effect of RIC. Other studies have looked at the impact of RICs on healthcare innovation. Chang, Wu and Shei (2014) examined the impact of RICs on innovation in Taiwanese healthcare. The study found that RIC is positively linked to the implementation of healthcare innovations.

Of great importance for the effective development of RIC is the patients' perceived quality and effectiveness of treatment procedures (Lardo et al. 2017). Furthermore, Lenart (2015) showed that maintaining good relations with customers and partners is a prerequisite for good organisational governance.

The development of RIC in healthcare can also lead to improved organisational performance. A study by Wu and Hu (2012) confirmed the strong impact of RIC on hospital organisational performance. These researchers found that RIC positively impacts organisational performance by facilitating communication and collaboration between healthcare professionals, improving efficiency and effectiveness in providing healthcare services.

The problems of acquiring knowledge of medical personnel were studied by Wielki, Jurczyk-Bunkowska, and Madera (2020). Based on their findings, the authors confirmed that properly aligned information technology positively impacts organisational efficiency.

Modern ICTs support hospital information systems, which are typically associated with several core areas of activity, such as a patient's stay and medical data related to this stay, healthcare delivery, administration, and other support activities (Chluski, 2018) (Golinelli et all, 2020) (Turulja, 2020).

The maturity of information and communications technology in healthcare refers to the sophistication of the technology-based tools and systems used in the healthcare sector. The maturity of ICTs in healthcare can be assessed based on various factors such as the availability of electronic health records (EHRs), telemedicine capabilities, health analytics, and mHealth apps (Carvalho, Rocha, Abreu, 2016) (Burmann, Meister, 2021).

Public funds mainly finance health services (e.g., large insurance companies or state budgets). Therefore, in most countries, healthcare entities operate in a regulated and restricted market. For this reason, employing ICTs that have been used and proven in other areas of the economy is critical. This avoids errors and helps adapt ICTs to the specifics of the healthcare sector (Feldman S., Buchalter, Hayes, 2018).

The efficiency and effectiveness of healthcare are of interest to scientists, managers, politicians, and other social organisations. Legal regulation, actions of politicians and scientists, and practical actions of managers in this area vary depending on the degree of economic development of individual countries and the type of healthcare financing system. Evaluation of the efficiency of hospital operations should consider a country's specificity (Kozun-Cieślak, 2020)(Cantor, Poh, 2018).

The efficiency of the operation of public hospitals is a complex problem. Even in the case of commercial entities, profit generation is only one of the primary goals of their operations. In addition to providing medical services, hospitals pursue several social goals, e.g., saving patients' lives, preventing and improving public health, or promoting healthy lifestyles (Pirozzi, Ferulano, 2016).

The positive impact of IT support on building human capital and the performance of Polish hospitals was presented by A. Chluski (2018). The present paper aims to complement that research.

Jameton and McGuire (2002) examined more broadly the concept of healthcare quality in the area of the quality of the healthcare services themselves (substantive dimension), in the area of patient experiences and patient perceptions of healthcare quality (social dimension), in the area of controlling costs (economic size), and the area of environmental impact. Olkiewicz and Bober (2015) discuss the role of quality in the healthcare service provision process in Polish hospitals. Krukowska-Miler (2017) demonstrated that patients seek understanding, interest, and partnership in physicians, which are soft skills that can be considered relational capital.

Habersam and Piber (2003) believe that hospitals, primarily public organisations, must be competitive while maintaining high efficiency, responsibility, transparency, and quality of services.

3. Hypotheses and Research Model

The theoretical constructs proposed below, along with the relationships between each other, form the research model presented in this paper.

Construct: the efficiency of providing medical services is identified in three dimensions. The first concerns the financial indicators of the hospital's performance, such as profit, liquidity, and repayment of financial and tax liabilities. The second is related to the perception of hospital development by managers. The third dimension deals with the staff's views on the economic development of the hospital (Cylus et al., 2016) (Cylus, Smith, 2020).

Construct: the degree of maturity of information and communication technology is identified based on the managers' opinions on the degree of use and usability of professional and specialised computer systems in both the administrative and medical parts of the hospital departments (Carvalho et al., 2019) (Gomes, Romão, 2018),

Construct: the level of development of relational intellectual capital refers to the degree of development of intangible assets that affect the relationships between the hospital, patients, and other stakeholders. The most important resources of this type are the hospital's reputation, good experiences and loyalty of patients, the reputation of individual employees, conditions and perceived quality of treatment, specialisation, and scope of medical activities of the hospital (Wong, 2019) (Chatterji, Kiran, 2017).

Construct: the quality of provided services refers to evaluating the quality of health care in various areas, such as diagnosis, treatment, and rehabilitation. It also concerns assessing the availability of services and barriers that make it difficult or impossible for patients to receive medical care, such as the lack of medical personnel, the long waiting time for appointments, and the cost of treatment (Mosadeghrad, 2012) (Upadhyai, 2019).

In the SEM methodology, the primary research model is the structural model. It is formed by theoretical constructs and the relationships that exist between each other. The constructs correspond to latent variables. Indicators are used to measure these variables. The indicators with their corresponding latent variables form measurement models. The indicators are quantitatively measured indicators, mainly utilising the interval Likert scale.

The research hypotheses are related to the relationship between the theoretical constructs. The SEM-PLS model based on path analysis allows for the verification of the hypotheses presented in the paper. It is possible to determine the fundamental relationships between latent variables in numerical form, their statistical significance, and the direction of effect.

The following research hypotheses were posed as follows:

H1. The level of development of relational intellectual capital positively affects the efficiency of providing medical services.

H2. The level of development of relational intellectual capital positively affects the quality and availability of medical services.

H3. The maturity of information and communication technologies positively affects the efficiency of providing medical services.

H4. The maturity of information and communication technologies positively affects the quality and availability of medical services.

Table 1: Constructs, Latent Variables, and Indicators for Measuring These Variables

Theoretical construct	Latent variable	Measuring model indicator
Level of Relational Intellectual Capital development	Relat	Relat-1
		Relat-2
		Relat-3
Maturity of Information and Communication Technologies	ITmat	ITmat-1
		ITmat-2
		ITmat-3
The efficiency of Providing Medical Services	Effi	Effi-1
		Effi-2
		Effi-3
Quality and Availability of Medical Services Provided	Qual	Qual-1
		Qual-2

Figure 1 shows the research model, which includes a structural model (represented by latent variables in ovals) and four measurement models (external models) for each latent variable. The arrows in the diagram correspond to the relationships between the latent variables in the structural model. The arrows in the measurement models represent the relationships between the latent variables and the corresponding indicators. The calculation results for this model are shown in Figure 1.

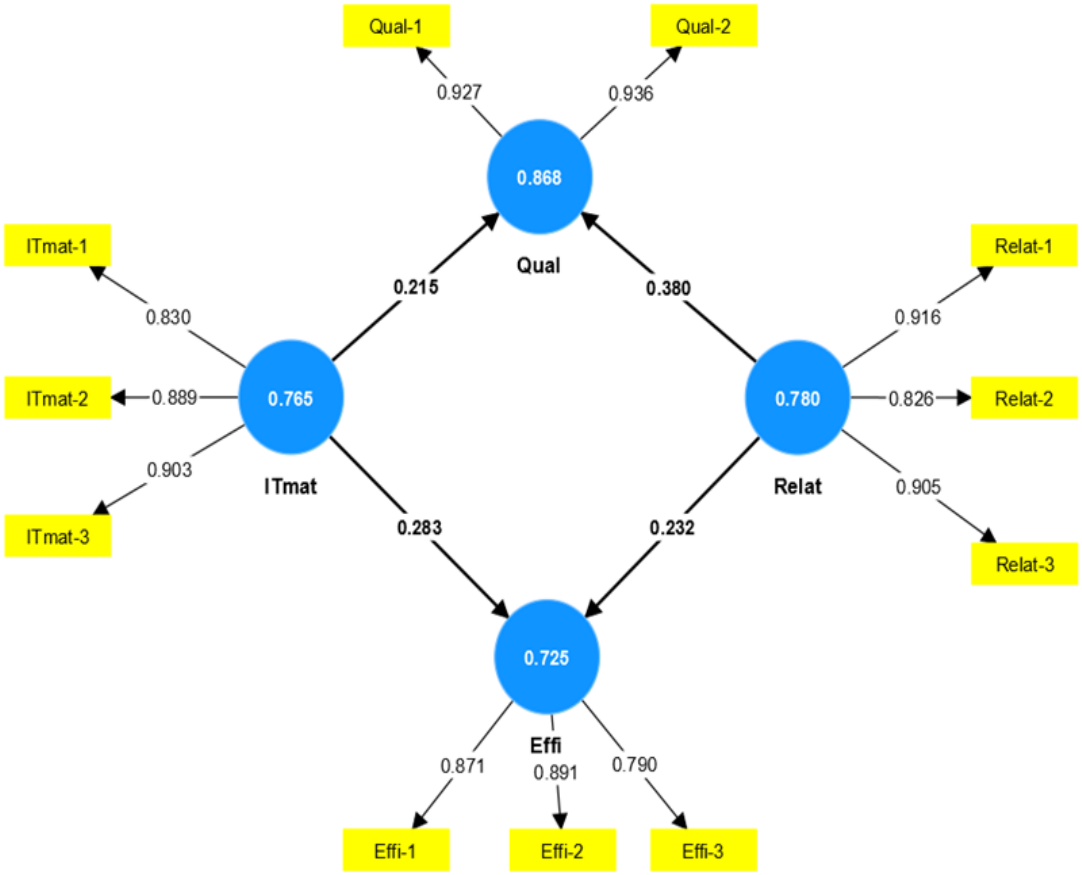

Figure 1: Structural SEM-PLS research model

4. Research Sample and Methodology

Structural equation modelling (SEM) tests hypothesised relationships between observable and non-observable variables. This applies to non-experimental correlation studies, which use passive observation as a research method. The partial least square structural equation modelling (PLS-SEM) method was used for the calculations. Goodhue, Lewis, and Thompson (2012) emphasised that, as with other techniques, there is an

increase in standard deviation and a decrease in statistical power when using PLS-SEM with small samples. Nevertheless, this method proves more reliable when the data distribution deviates moderately from the normal distribution. Bootstrapping resampling can be used to avoid the problems of non-normal data distribution and small research samples.

For the measurement of observable variables, a questionnaire was created with sentences (statements) corresponding to the indicators of the measurement models in SEM-PLSM. An interval Likert scale was used for this purpose. Questionnaires were sent to selected managers of hospitals in Poland. The distribution of hospital types in the research sample was similar to that of the entire population of Polish hospitals. Hospitals were divided into groups depending on the type of funding body (or owner) (Floyd, Fowler, 2009). Questionnaires were collected from various regions of Poland, and ninety-four correct responses were received. Poland has just over 900 hospitals (Local Data Bank, 2022).

The minimum sample size was estimated with appropriate assumptions about the test's statistical power (Kock, Moqbel, 2016). It was calculated by assuming the smallest path coefficient of 0.210, a significance level of 0.05, and a test power of 0.70.

The research sample was sufficient to yield adequate parameters of the research model for the SEM-PLS methodology. The minimum sample size for the inverse square root method was 84, while for the gamma-exponential method, it was 73 (Kock, Hadaya, 2018). The statistical significance of the results and estimation of standard errors were performed using bootstrapping. Smart-PLS software was used for the calculations.

5. Research results and model evaluation

The structural model in Figure 1 shows the latent variables and their relationships in the form of arrows with corresponding path coefficient values. The values of these coefficients and their statistical parameters are shown in Table 2. All coefficients are statistically significant ($p < 0.05$). The ovals shown in Figure 1 represent individual latent variables. Inside these ovals are average variance extracted (AVE) values for each latent variable. AVE " is a measure of the amount of variance captured by a construct in relation to the amount of variance due to measurement error" (Fornell, Larcker, 1981).

Table 2: Path Coefficients of the Structural Model and Their Statistical Parameters

	Original sample	Sample mean	Standard deviation	T statistics	p-values
ITmat -> Effi	0.284	0.298	0.087	3.255	0.001
ITmat -> Qual	0.209	0.223	0.114	1.829	0.034
Relat -> Effi	0.232	0.237	0.100	2.317	0.010
Relat -> Qual	0.415	0.411	0.118	3.503	0.000

Table 3 shows the outer loadings calculated for the original sample and those computed using bootstrapping: mean, standard deviation, T-statistic, and p-value. The path parameters of the measurement models are statistically significant and greater than 0.75.

Table 3: Path Coefficients of Measurement Models

	Original sample	Sample mean	Standard deviation	T statistics	p-values
Effi-1 <- Effi	0.870	0.860	0.067	12.974	0.000
Effi-2 <- Effi	0.891	0.882	0.058	15.406	0.000
Effi-3 <- Effi	0.790	0.789	0.076	10.392	0.000
ITmat-1 <- ITmat	0.834	0.834	0.058	14.339	0.000
ITmat-2 <- ITmat	0.885	0.880	0.043	20.605	0.000
ITmat-3 <- ITmat	0.904	0.898	0.034	26.716	0.000
Qual-1 <- Qual	0.847	0.843	0.054	15.616	0.000

	Original sample	Sample mean	Standard deviation	T statistics	p-values
Qual-2 <- Qual	0.934	0.934	0.023	41.070	0.000
Qual-3 <- Qual	0.839	0.834	0.061	13.805	0.000
Relat-1 <- Relat	0.912	0.913	0.020	45.388	0.000
Relat-2 <- Relat	0.827	0.820	0.073	11.271	0.000
Relat-3 <- Relat	0.907	0.907	0.025	35.856	0.000

The path coefficients of the measurement models presented in Table 3 are expressed in less than one relative form. Based on them, both the path coefficients of the external and external models are statistically significant, positive, and have relatively large values. The table also shows the results of bootstrapping calculations.

5.1 Quality Criteria for the Measurement Model

The SEM-PLS modelling evaluation does not use a single global indicator of model quality. In research practice, several indicators have been used to evaluate the structural and measurement models.

In the case of measurement models, verification of their parameters for model reliability and validity is required. This concerns internal consistency reliability, convergent validity, and discriminant validity for each measurement model. The internal consistency reliability was determined using composite reliability, Cronbach's alpha coefficient, and Dijkstra's rho_a coefficient. The coefficients determining the internal consistency of the research model are contained in Table 4.

Table 4: Basic Reliability Coefficients for Latent Variables

	Cronbach's alpha	Composite reliability (rho_a)	Composite reliability (rho_c)	The average variance extracted (AVE)
Effi	0.809	0.809	0.888	0.725
ITmat	0.846	0.852	0.907	0.765
Qual	0.848	0.851	0.929	0.868
Relat	0.860	0.888	0.914	0.780

The most commonly used measure of the reliability of a measurement scale is Cronbach's alpha coefficient (Garson, 2016). Cronbach's alpha values are greater than 0.8. The rho_a and rho_c coefficients assessing composite reliability are also greater than 0.8, whereas the average variance extracted (AVE) for each external model exceeds a threshold value of 0.7. Based on the bootstrapping estimation, all the coefficients in Table 4 can be considered statistically significant.

Table 5 shows the values of loadings and rotated cross-loadings. Loadings are greater than 0.8 (except for Effi-3) and significantly exceed cross-loadings.

Table 5: Values of Loadings and Cross-Loadings

	Effi	ITmat	Qual	Relat
Effi-1	*0.871*	0.239	0.365	0.305
Effi-2	*0.891*	0.243	0.252	0.228
Effi-3	*0.790*	0.345	0.177	0.194
ITmat-1	0.300	*0.830*	0.188	0.192
ITmat-2	0.258	*0.889*	0.325	0.164
ITmat-3	0.305	*0.903*	0.232	0.146
Qual-1	0.271	0.244	*0.927*	0.388
Qual-2	0.309	0.290	*0.936*	0.397
Relat-1	0.305	0.217	0.412	*0.916*

	Effi	ITmat	Qual	Relat
Relat-2	0.105	0.079	0.355	*0.826*
Relat-3	0.312	0.184	0.347	*0.905*

The Fornell-Larcker criterion was used to assess discriminant validity. Table 6 shows the correlation coefficients between latent variables. The diagonal of the table contains the square roots of AVE. The criterion is met because the values on the diagonal of the table are much larger than individual correlations (Santos, Cirillo, 2021).

Table 6: Correlations Between Latent Variables with AVE Root Values (Fornell-Larcker Criterion)

	Effi	ITmat	Qual	Relat
Effi	0.852			
ITmat	0.328	0.875		
Qual	0.312	0.288	0.932	
Relat	0.286	0.190	0.421	0.883

The following criterion that tests discriminant validity is the heterotrait-monotrait ratio (HTMT). HTML values are placed in Table 7. These coefficients are statistically significant and well below the threshold of 0.9 (Henseler, Ringle, Sarstedt 2015).

Table 7: HTMT Criterion Ratios

	Effi	ITmat	Qual	Relat
Effi				
ITmat	0.394			
Qual	0.375	0.334		
Relat	0.325	0.214	0.492	

5.2 Quality Criteria for the Internal Model

The coefficient of determination R^2 is often used to assess the quality of the SEM-PLS model. It is a statistical measure representing the percentage of the dependent variable's variance explained by the model's independent variables. R-square is a measure of model fit to the data. Table 8 shows the R^2 values for latent dependent variables. Based on bootstrapping calculations, the R^2 coefficients can be considered statistically significant (p-value < 0.01).

Table 8: Coefficients of Determination R^2

	Original sample	Sample mean (M)	Standard deviation	T statistics	p-values
Effi	0.159	0.189	0.067	2.387	0.009
Qual	0.222	0.254	0.082	2.707	0.003

The coefficient of determination (R^2) is considered a good indicator for interpreting effect size due to its slightly lower values than correlation coefficients. The effect size is considered small for $R^2 > 0.02$, medium for $R^2 > 0.13$ and significant for $R^2 > 0.26$ (Cohen, 1992) (Cohen, 1988).

Another measure of model quality is the degree of colinearity of individual pairs of model variables. The total variance inflation factor (VIF) used to estimate this colinearity should be less than 5 (Hair et al., 2022) and according to Kock (2015), even less than 3.3. Table 9 shows collinearity statistics (VIF) for the external model.

Table 9: Colinearity Statistics (VIF) for the External Model

	VIF
Effi-1	2.516
Effi-2	2.775

	VIF
Effi-3	1.398
ITmat-1	1.765
ITmat-2	2.223
ITmat-3	2.489
Qual-1	2.183
Qual-2	2.183
Relat-1	2.471
Relat-2	1.870
Relat-3	2.474

The individual internal model variables' colinearity statistic (VIF) is 1.038.

5.3 Indices of the fit of the Structural Model

Basic indicators of model quality are contained in Table 10.

Table 10: Basic Model Quality Indicators

	Saturated model	Estimated model
SRMR	0.074	0.080
Chi-squared	127.621	130.000
NFI	0.759	0.755

Standardised root mean square residual (SRMR) is the difference between the observed correlation matrix and that implied by the model. It allows for assessing the mean level of the discrepancy between the observed and expected correlations as an absolute measure of model fit. A value of less than 0.10 (or even 0.08, according to Hu and Bentler (1999)) is considered a good fit. Henseler et al. (2015) presented SRMR as a measure of goodness of fit for PLS-SEM that can be used to avoid model misspecification.

The normed fit index (NFI) indicates a good fit if it is greater than 0.8. NFI represents an incremental measure of fit. Its main drawback is that it does not penalise the complexity of the model. The more parameters in the model, the higher (i.e., better) the NFI score. For this reason, this indicator is not recommended for more straightforward and less complex models.

Another criterion of model quality is whether the coefficient d_G (from the original sample) is below the confidence interval after bootstrapping calculations. This is a bootstrapping-based test of the discrepancy between the empirical covariance matrix and the covariance matrix implied by the research model. The use of the d_G coefficient was proposed by Dijkstra and Henseler (2015).

Table 11: Results of the Divergence Test Between the Empirical and Implied Covariance Matrix

d_G	Original sample (O)	Sample mean (M)	95%	99%
Saturated model	0.218	0.213	0.263	0.295
Estimated model	0.224	0.215	0.266	0.299

The d_G values for the research model are below the 0.95 confidence interval. Therefore, the differences between the tested matrices are not statistically significant.

6. Discussion and Conclusion

The present paper confirmed the hypotheses concerning the impact of the level of development of relational intellectual capital (variable: Relat) and maturity of information and communication technologies (variable: ITmat) on the quality (Qual) and efficiency of medical services (Effi) provided by hospitals in Poland.

The path coefficients of the research model were statistically significant, confirming the validity of the relationship between the variables included in the model. Furthermore, both the measurement models and

the structural model met the statistical and qualitative assumptions that are commonly required in the social sciences for this type of research methodology. Consequently, the study's results can be considered reliable, providing valuable information on the relationships between the variables in the research model.

During the construction of the model, a path connection corresponding to the relationship of quality (Qual) and efficiency of medical services (Effi) was tested. The path coefficients corresponding to the Effi <-> Qual relationship were minimal and not statistically significant. Therefore, this relationship was not included in the research model. The model did not confirm a direct relationship between the quality of services provided and the efficiency of hospital operations.

The model presented in the paper shows the relationships between the constructs studied. In addition to the numerically expressed relative force, these relationships have a specific sense and direction (arrow in the graphical representation of the model). Some researchers equate this direction with a cause-and-effect relationship (Loehlin, 1987, p.13). However, a prerequisite for this type of relationship is demonstrating that the cause occurred earlier (before the effect), which is impossible in SEM modelling. Table 12 shows the numerical values of the relative relationships between the variables of the structural model.

Table 12: Values of Path Coefficients of the Structural Model Estimated Using Bootstrapping

ITmat ->Effi	0.298
ITmat -> Qual	0.223
Relat -> Effi	0.237
Relat -> Qual	0.411

The exploratory research presented in the paper is pilot in nature. The presented research model can inspire further research on analysing the discussed concepts and phenomena. One potential direction for future investigations is developing a hierarchical structure for the research model. This would require the creation of new theoretical constructs hierarchically linked to each other, allowing a more detailed analysis of the relationships between model elements.

Knowledge Management in Ecolabnet Project: Practical and Theoretical Utilisation of Eco-Innovations

Grzegorz Chmielarz
Czestochowa University of Technology, Faculty of Management, Poland

grzegorz.chmielarz@pcz.pl

Abstract: The underlying objective of the paper is to analyse the process of managing theoretical and practical knowledge about eco-innovations, utilising it in ECOLABNET project. A network of project partners consisting of RDI institutions, Intermediary Organisations, and universities was established to promote exchange and dissemination of knowledge on eco-innovative solutions and services among Small and Medium-Sized Enterprises (SMEs) in the countries of the Baltic Sea Region. The paper presented the principles applied in the knowledge management (KM) process within the project with a particular stress on the research conducted on the group of European SMEs form the Baltic Sea Region (BSR), first stage of ECOLABNET project implementation. The research provided much needed knowledge on the project's beneficiaries – SMEs form the BSR region and facilitated the adjustment of the offer of the project consortium. Expert knowledge, eco-innovative products and services that have been provided by the network of partners assist SMEs in implementing and commercialising eco-innovative solutions. In this way they significantly contribute to practical application of sustainability principles by expanding the offer of project beneficiaries (SMEs) with environmentally-friendly products and services. In addition, the author also, highlights the advantages of a combined approach including expertise in the form of theoretical knowledge being supported by prototypes of eco-innovations. Their particular role in strengthening the eco-innovative capabilities of the entire network and the overall success of the project have been detailed as well.

Key words: Eco-innovative products, Eco-innovative services, Knowledge management (KM), SMEs

1. Introduction

Successfully implemented projects in the area of eco-innovations that aim to achieve their strategic objectives are increasingly taking on the form of combined efforts of various actors, frequently formal organisations. Their strategic achievements require the integration of expertise, experience and efforts of all engaged stakeholders, despite the fact that such projects tend to be temporarily joint conglomerates that are united by common goals and cease to exist once these goals have been achieved. Nonetheless, projects of this type are thought to combine knowledge and resources stimulating development of innovations by bridging actors from various geographical locations and providing in this way all of them with a possibility to achieve their individual goals thanks to functioning of the whole network (Czarniawska, 2018; Dougherty & Dunne, 2011; Nisula et al., 2018). Increasing the level of eco-innovations uptake by manufacturing Small and Medium Sized Enterprises (SMEs) was also the underlying goal of the consortium of partners from six Baltic Sea Region (BSR) countries that carried out the ECOLABNET project in the years 2019-2021 (while the duration of the project's results continues until 2025). The key intention of the ECOLABNET project was to foster dissemination of sustainable eco-innovations among the SMEs from the Baltic Sea Region, e.g. in medical diagnostics and electronics. Exploiting the joint potential of research, development and innovation institutions, universities and businesses comprising the network, the project aims to demonstrate new business opportunities for those enterprises that that would like to apply sustainability principles while developing eco-innovative services and products (Interreg – ECOLABNET, 2021). The project consortium ECOLABNET comprised academic institutions and RDIs from six Baltic Sea Region countries, namely: Design Centre MUOVA (Finland) – project leader, Centria University of Technology (Finland), Kaunas University of Technology (Lithuania), Vilnius University (Lithuania), University of Tartu (Estonia), Estrotech Ltd (Estonia), Lithuanian Business Confederation, Sustainable Innovation (Sweden), VIA University College (Denmark) and Czestochowa University of Technology (Poland).

The underlying objective of this paper is to analyse how the process of knowledge management (KM) in the ECOLABNET project combined with prototypes of eco-innovative products translated into its overall success. In brief, the paper seeks to answer the research question:

- RQ1 – Do examples of practical application of eco-innovations in the form of prototypes constitute a significant value added of a project?

In addition, the paper contributes to the literature on the subject through the analysis of the role of knowledge management in transnational projects and practical demonstration of its applicability in the eco-innovations area. The paper is organised in the following way:

First, in the introduction, the role of projects in supporting development and implementation of eco-innovations has been characterised in brief. The role and objectives of the ECOALBNET project and its participants have been presented in this context. This constituted the basis for raising the research question to be answered in further sections of the paper. Then, the literature review has been presented, which focuses in particular on the role of SMEs in the European economy. At the same time, the author emphasises the major problem for poor innovativeness of the enterprises from this sector, namely insufficient access to expert knowledge. In this part the notion of proper knowledge management in projects has been presented and the impact of the networking form of collaboration on enhancing projects' effectiveness has been highlighted. The empirical part is divided into two parts. The first one analyses the process of knowledge management in the ECOLABNET project. The second part seeks to answer the raised research question by analysing the advantages of utilising prototypes as examples of eco-innovative solutions, demonstrating in this way project's practical value. The paper finishes with the conclusions and directions of future research.

2. Literature Review – Links Between KM, Networking, and Innovative Activeness of SMEs

Despite the fact that SMEs are frequently referred to as "a backbone of Europe's economy" these enterprises do not perform equally well in the area of innovativeness as large enterprises. Partly to blame for this state of affairs are the limited capabilities and resources that are available to SMEs. However, the primary disadvantage they have to struggle with while comparing their R&D activeness with big enterprises is diseconomies of scale and also the current state of their development (e.g. start-up or established firm, niche or market producer) (Ortega-Argilés and Raquel & Voigt, 2009). The literature on the subject points out that one of the inhibiting factors to successfully scale up eco-innovations by the European SMEs is limited access to expert knowledge, which prevents them from commercialisation of eco-innovative products and services. It needs to be stressed here that it was this lack of collaboration between SMEs and research centres that was the major incentive for setting up the ECOLABNET project. The network of project partners integrates product-service system designers, bio-based material researchers, 3D print technology providers, eco-branding specialists and business developers. One of the advantages of such an approach mentioned in the literature on the subject is the observed link between implementing innovations and doing so in the networking form. This is because networks provide resources for innovation processes. When innovations are developed according to the network-based concept both organisations from the local community and from other geographies provide important tangible and intangible resources. Thus, such networks that include non-local actors are said to be very effective in gaining and diffusing knowledge. In addition, they also attract resources that have not been prior available within the locality and scale up innovations (Ferreiro and Lourenco, 2019). It is important that European SMEs are aware of the fact that they are lagging behind in terms of R&D activity. For this reason, they frequently resort to open innovations. According to Cavallo et al. (2021), open innovations refer to the strategy of seeking information through collaboration and partnerships with other organizations, institutions, and experts, which companies adopt when they are aware of their limitations. This outward-oriented process of seeking new knowledge and ideas is referred to as innovation-seeking behaviour of SMEs. It is conceptualised as a form of information-seeking behaviour, drawing also from the concept of open innovation (Lichtenthaler and Lichtenthaler, 2009). The literature on the subject is also abundant in the examples of the role knowledge plays in achieving competitive advantage by SMEs. More importantly, however, it is believed that proper knowledge management in case of project involving partners from several countries results in internationalisation and effective utilisation of knowledge. This in turn, supports organisations in achieving improved innovation and overall performance (Zia and Shafiq, 2017). Such projects are especially suited to SMEs as given their smallness, these enterprises tend to have limited capital for expansion (Roolaht, 2017). Griffith (2007), argues that scarcity of material resources in the context of small economies can be compensated for by having superior knowledge resources. This seems to be one of the stimuli for the European SMEs to engage actively in the area of eco-innovations and at the same time seek for collaboration with the academia to ensure their unique knowledge allows them to win a competitive advantage on local and global markets. In the era of globalization, SMEs can use their specialist knowledge and networking skills to facilitate international expansion despite the limited availability of other resources. This, in turn, leads to the issue of knowledge generation and its management, both in the projects that provide external knowledge to SMEs as well as the latter themselves. Generation of knowledge generation that is further transferred to enterprises seemingly is the key benefit of managing projects in accordance with KM principles. To be competitive, which frequently involves introducing innovative and eco-innovative products to the market, firms must anticipate market surprises, be flexible and adaptable to quick market changes, and overcome product development issues as part of their competitiveness strategy (Galli & Lopez, 2018). It is also stressed that KM induces innovations, and as such is of key importance in the process

of developing new products (Lazzeretti et al., 2016). Hence, the role of project supporting uptake of eco-innovations by SMEs lies with providing these enterprises with expert knowledge. This can be perceived as a major support for the managerial personnel of SMEs (which are frequently one-man firms), who being preoccupied with running the firms themselves, rarely find time to expand the knowledge about eco-innovations on their own. This in turn leads to introduction of new, frequently innovative and eco-innovative improvements in the manufacturing technology, which in turn translates into a more profound environmental and social impact. As a consequence, SMEs can become more competitive on global markets by enhancing the appeal of their offer and matching the expectations of increasingly environmentally-concerned customers by introducing products and services characterised by significantly reduced environmental impact and greater customer satisfaction. Thus, it can be stated that presently, it is necessary to stress in the area of sustainable management the importance of combing the actions of the beneficiaries of the created values – enterprises, and also intermediary organisations and scientific units, whose role is growing in importance as contemporary eco-innovations frequently require expert knowledge, which can be only provided by the RDI units (Chmielarz et al., 2020).

3. Knowledge Management Stages in the ECOLABNET Project

It was assumed at the very beginning that the process of proper knowledge management in the ECOLABNET project was going to be essential for its further success. Generally, it was agreed that KM should comprise the three subsequent stages: knowledge accumulation, knowledge processing, and knowledge implementation. In the graphic form these have been presented in Figure 1.

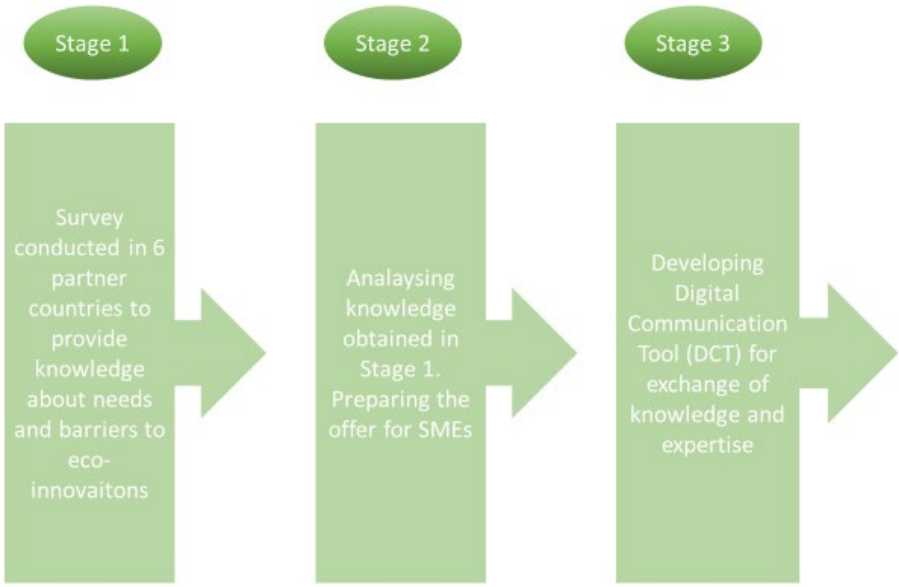

Figure 1: Stages of KM in ECOLABNET Project

As one can observe in Figure 1, the first step in the project involved, among other things, the investigation of what needs and barriers related to access to expert knowledge hinder the activeness of SME from the BSR in the eco-innovations area. This was done by means of a survey that was conducted in all six partner countries of the project with the use of the CAWI (Computer Assisted Web Interview) method. This method enabled the partners to accumulate the data necessary for further processing. This in turn resulted in drawing up a knowledge management strategy ensuring that the project goals are achieved. The survey questionnaire prepared with the use of CAWI method is displayed in the browser in the form of a web-page, so it can be reached by the respondents in different ways, the only prerequisite being access to the internet. The questions to be answered by the respondents appear on the screen while the processing of answers occurs in the background. The answers for the questionnaire are sent immediately to the main server, which allows for continuous tracking of data collection and the results (DJS Research, 2008). The survey questionnaire included 27 questions that were divided in five categories. In the graphic form they have been presented in Table 1.

Table 1: Categories of Questions in the Survey Questionnaire

Name of category	Brief characteristics
1. Metrics	Questions 1-5. Basic details about an enterprise
2. Eco-innovative engagement	Questions 6-15. Enterprise's level of current awareness and involvement in eco-innovative activity
3. 3D printing	Questions 16-21. Enterprise's acquaintance with 3D printing technology as well as potential demand for such solutions
4. Lack of expertise	Questions 22-24. Enterprise's gaps of expertise in the area of eco-innovative activity
5. Contact details	Questions 25-27. Enterprise's interest in further contact and its details

Source: Own analysis based on internal materials of the ECOLABNET project

As Table 1 demonstrates, the five questions in the first category were supposed to provide basic information about the surveyed enterprise and its profile of operation. The second category of questions (questions 6-15) was devoted to gathering information about issues purely related to eco-innovations. This pertained to knowledge about eco-innovations, existence of motivating factors as well as barriers hindering implementation of eco-innovations in manufacturing SMEs of the BSR region. The questions in the third category (questions 16-21) examined the whether the surveyed SMEs possessed any knowledge about 3D printing as an eco-friendly alternative to be applied in manufacturing processes and replacing the ones that had a negative impact on the natural environment. Then, the questions 22-24 (fourth category) were supposed to investigate the extent of the demand for expert knowledge among the surveyed enterprises. The survey questionnaire finished with the 3 questions concerning the possibility of future cooperation and address details (fifth category). The research was conducted on the group of 296 enterprises located in the six partner countries of the project, including : Estonia 69 - 23,31%, Poland 57 - 19,26%, Finland 54 - 18,24%, Lithuania 15,88% - 47, Sweden 12,84% - 38, Denmark 10,47% - 31.

Then, the knowledge accumulated in Stage 1 was processed and conclusions were drawn in Stage 2, so as to prepare the consortium's offer in a manner that will best address the indicated needs and barriers of the SMEs with regard to eco-innovative activity. The top five indicated incentives for eco-innovative activity (rated on 5-point Likert scale where 1 meant not important and 5 very important) included: satisfying customer needs – 53.19% of indications, efficient use of resources – 50.21%, strengthening the brand image – 43.40%, compliance with legislation – 42.13%, differentiation from competitors – 40.00%. On the other hand, the top most frequently indicated barriers to developing eco-innovations according to the surveyed SMEs include: lack of capital – 31.44%, lack of in-house expertise – 30.57%, limited access to external knowledge – 35.37%, lack of suitable tools and methods – 28.82%, capability to collect and process data – 35.37%. The survey allowed all the partners to analyse the level of eco-innovative advancement of SMEs in each partner country and constituted a basis for working out the final offer of the project consortium, with regard to indicated needs and barriers of developing eco-innovations. In addition, it was also in this stage that the project partners analysed their own competency gaps in the scope of providing eco-innovative services to SMEs, with a particular emphasis on the persistent problems related to lack of expertise in the area of eco-innovations. It should also be stressed here that it was Stage 2 where the offer of the project consortium was tailored to support the SMEs from the BSR in their eco-innovative efforts. The knowledge processing stage resulted in elaboration of eight categories of services to be offered to SMEs under the name of Service Packages. Each of the Service Packages includes thematically grouped services that project partners have capacity to provide. The Service Packages were elaborated based on cards of eco-innovative products and services that had been prior prepared by all the project participants. These detail their expertise in a given area of eco-innovations being also a tool that facilitates the search for particular services in the main output of the project the Digital Collaboration Tool (DCT).

Development of the DCT took place in the third stage of KM in the project. It utilises in practice the knowledge on the needs and barriers to eco-innovative initiatives indicated by the surveyed enterprises and solutions proposed by the project partners. The tool has been developed by the project partner Czestochowa University of Technology and is made available to all the remaining partners within the network. The main objective of the DCT is the dissemination of knowledge on eco-innovative products and services offered by the project

consortium to SMEs and Intermediary Organisations (IOs). Access to the DCT is free. Any business entity, Intermediary Organisation or RDI institution can register in the DCT and by doing this offer and seek for eco-innovative solutions accumulated in the tool's database.

4. Practical Demonstrators of Eco-Innovative Capabilities

One of the distinctive features of the ECOLABNET project was its utilisation of practical examples of applying eco-innovative solutions in manufacturing processes alongside with the expert knowledge about eco-innovations. This was meant to strengthen the message sent to the project beneficiaries and simultaneously increase the appeal of the ECOLABNET's offer. For this reason, the project partners were supposed to develop their proposals of eco-innovative products and services that were intended for demonstration of project consortium's capabilities in this area. Internal specification of the requirements for prototypes specified functional features they needed to possess, properties of material for their production, creation of the digital model, 3D printing trials, and final product testing. It needs to be stressed here that as the competences of the network included primarily: materials for biocomposites, product prototyping based on 3D printing, eco-product designing, designing services, life cycle assessment (LCA), eco-branding and developing business models, the underlying assumption of the project was that prototypes were produced with the use of 3D printing technology, emphasising their biodegradability and ease of production. There were five prototypes developed in the course of the project's duration, such as: optical 3D printed medical fittings made of bioresins, bio-derived 3D printable resin for medical parts, 3D printing of composite moulding tool, bio-based 3D printed chocolate box, bio-based dental 3D printing resin. Due to the limited content of the paper as well as due to the fact that the paper's author participated in the development of one of the prototypes, a biodegradable package, the process of utilising demonstrators will be presented on this example. Generally, it can be stated that the process of developing demonstrators followed the same stages. The example for the biodegradable package has been presented in the graphic form in Figure 2.

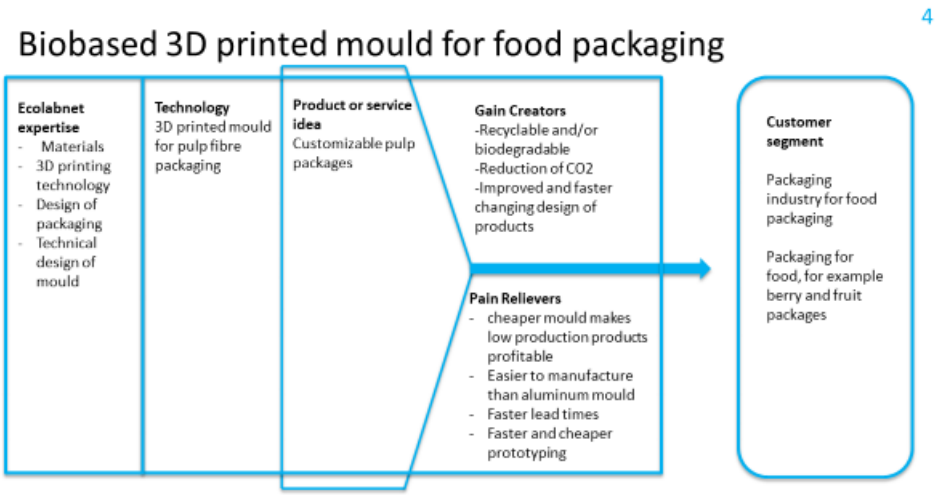

Figure 2: Biodegradable Package in the Graphic Form

Source: Internal materials of the ECOLBANET project

As one can observe in Figure 2, the first stage for developing a biodegradable package was an analysis of the expertise possessed by the project partners indispensable for manufacturing the demonstrator. The technology in the case of all the items was 3D printing. Then, the most important stage included the evaluation of the potential benefits of the item with regard to being environmentally-friendly as well as innovative in terms of production and cost. The final stage of the demonstrator's development was determination of the target customers and ideas for particular products that can be manufactured within the given demonstrator's category. Having been 3D printed, the demonstrators became an essential element of publicising the network and its eco-innovative message to the target group of beneficiaries. The promotion of the ECOLABNET's goals through demonstrators took various forms. The most important of them have been summarised in Table 2.

Table 2: Use of demonstrators in Advertising Project's Capabilities

Form of presentation	Brief description
LinkedIn platform	a group of the project was created to disseminate all the information related to the project (https://www.linkedin.com/groups/8773874/). project partners have been actively promoting ECOLABNET in their own LinkedIn profiles,
Newsletter	newsletters have been sent through the project's messaging centre, they have also been distributed to partners to use them in their own communication channels,
Presentation to different stakeholders	demonstrations conducted during personal contacts, meetings and events with different stakeholders,
Online workshops	online events for the target group of SMEs,
Scientific papers and conferences	project results have been published in conference materials and used in presentations.

Source: Own analysis based on the internal materials of the ECOLABNET project

As Table 2 demonstrates, the examples of practical application of eco-innovations in the form of demonstrators have been used extensively throughout the project. Being a showcase of project network's capabilities, they have been used the attract attention to the project's goals in the LinkedIn social platform on the project's profile as well as LinkedIn profiles of other partners. Similarly, newsletters that were distributed by partners in their communication channels spread the news of the project's capabilities. The circulation of such newsletters is difficult to measure in case of all the partners as they do not run the exact statistics. Nevertheless, it is enough to point out that the newsletter that is distributed by just one of the project partners, digital Centria News newsletter, has more than 8000 viewers. Another important issue is also the willingness of readers of social media posts and newsletter to get engaged with the content. According to extensive research in this field, just some of the results being referred to in this paper (Grönroos and Voima, 2013; Prodromou, 2015; Dong and Wu, 2015), if posts or messages are to be appealing to the target audience, the content of messages is an important element to drive engagement and reach a broader audience leading to new followers and an increase in the firm's sales potential. In this respect, it can be postulated that the demonstrators played a vital role in increasing the appeal of the project's offer and attracting the attention of the target audience, and so significantly contributed to the recognition of the project, its objectives and offer. In the case of personal meetings with various stakeholders, the demonstrators were usually used to present the practical implementation of the project's assumptions. All of these meetings have been registered and the documentation confirms that their participants expressed their further interest in utilisation of 3D printing technology especially through being eye-witnesses of its capabilities. The offer of the ECOLABNET has been presented in several online workshops and internal events of partner organisation internal events like the R&D event for the R&D Program for Creative Business and Sustainable Development in VIA. The ECOLABNET was also introduced regularly to companies in KTU Startupspace community and presented to interviewed organisation representatives and in meetings with suppliers and potential customers. In addition, the project organised an open online event Serving SMEs – Designing research, development and innovation services for eco-innovation for RDI actors and a dissemination event "Advances in developing bio-based materials and 3D printing technologies for environmentally sustainable products". During both the events the demonstrators constituted a key factor of presenting the eco-innovative potential of 3D printing technology offered by the project consortium's members as well as enhancing the pro-environmental aspect of project's goal.

In the light of the above, it can be concluded that the research question (RQ1) whether examples of practical application of eco-innovations in the form of prototypes constitute a significant value added of a project can be answered positively. This can be justified by the following reasons:

- demonstrators constituted a key element of advertising materials presenting the expertise of the ECOLABNET project consortium – the literature on the subject stresses the importance of the content of advertisements on increasing audience's engagement with the message,

- instead of just promising environmental benefits they presented real examples of working solutions in the field of eco-innovations, being therefore more credible than frequently treated by entrepreneurs as vague, lofty plans for environmental improvements in publicity materials,
- SMEs frequently indicate the issue with commercialisation of eco-innovations as they may find it difficult to assess the level of novelty and the degree of technological readiness for the commercialisation of a R&D product, how much the consumers are receptive to it, and, how the added value of the product will develop under market effects (Wang et al., 2021). Developing demonstrators alongside preparing the consortium's offer of expertise shows SMEs feasibility of leveraging the potential of eco-innovations and commercialising them on the market.
- due to the COVID-19 pandemic and restrictions introduced by all the countries of project partners the dissemination of the projects objectives, capacities adopted the form of online meetings and workshops. This meant extensive use of ICT to reach the target audience. At the time of digital revolution it is believed that interactions and relationships between organisations and stakeholders that use digital technologies to introduce new products and services that create value (Suseno et al., 2018) contribute to the development of new types of networks and create digital innovation ecosystems (Xu, 2020). As the tangible examples of an effective utilisation of eco-innovative methods of manufacturing in the form of demonstrators have become showcases of project's potential within the Digital Collaboration Tool, they played a key role in developing the ECOLABNET digital ecosystem.

In conclusion, it can be stated that the demonstrators utilised during the ECOLABNET project contributed significantly to an increase in the project's appeal both through their visual impact and power of attracting the attention of target audience. It had a measurable impact on an increase in the awareness of the managerial personnel of the SMEs from the BSR with regard to possibilities of developing eco-innovations, and what is of particular importance from the business perspective, also the way of their successful commercialisation. This in turn can lead to launch to the market of new, environmentally-friendly products and services that will be broadly accepted by the society, transforming in this way the previous lifestyle to include to a greater extent the principles of sustainability. This practical experience can be utilised in other projects to increase their persuasive message to target audiences and positively enhance the theoretical assumptions of expected project outputs.

5. Conclusions

Organisations that implement projects in the area of eco-innovations increasingly join their efforts to achieve their strategic objectives. This results in a need to combine the knowledge, expertise and experience of various stakeholders. By doing so, they stimulate development of eco-innovations not only in the local perspective, but frequently in the national or even international one. Actors that come from various geographically diverse locations bring into the project resources that would not be available otherwise. At the same time, numerous research into the innovativeness of European SMEs find out that they are unable to reach their full potential and successfully develop eco-innovations due to unsatisfactory access to expert knowledge offered by RDIs and academia. This is a serious incentive for the European Union to support projects that are meant to bridge the gap between the demand for expertise on the side of SMEs and the offer of specialist knowledge by universities and research centres. With this end in view, the ECOLABNET project united within the network of six partners from the BSR research, development and innovation institutions, universities and businesses effectively demonstrating new business opportunities for enterprises still uncertain about engagement into eco-innovative activities. Generation of knowledge that is further transferred to enterprises is believed to constitute a part and parcel of managing projects in with the use of KM principles. It is advantageous if theoretical knowledge can be accompanied by practical examples of its application. This was one of the reasons for developing prototypes, also called demonstrators, showcasing application of sustainability principles while developing eco-innovative services and products. Being a showcase of project network's capabilities, they have been used the enhance the project's appeal to the target group of stakeholders. The demonstrators that have been developed in the project to give evidence of practical application of the ECOLABNET's offer are an excellent example for European SMEs that it is possible to exploit successfully the potential of eco-innovations and commercialise them on the market. This in turn can lead to enriching the market offer of products manufactured by SMEs with new, environmentally-friendly products and services that will be broadly accepted by the society.

Future research on the role of demonstrators in projects aimed to support eco-innovativeness of SMEs may well focus on evaluating their impact by the target audience. This is the focus area of the author in the future research.

Knowledge Management in the Context Of Remote Work in the Opinions of Employees: Challenges and Opportunities

Leszek Cichobłaziński
Czestochowa University of Technology, Poland

leszek.cichoblazinski@pcz.pl

Abstract: The article presented here focuses on the determinants of knowledge management in a remote work environment. Information and knowledge management is an essential part of organizational management, which has been undergoing major changes as electronic media, mainly internet-based platforms, have been replacing traditional interpersonal contacts completely. Knowledge production, distribution and clarification are all subject to significant transformations under conditions of limited face-to-face contact. Changes in this scope imply significant problems in knowledge management, both at the level of knowledge creation and knowledge distribution as well as information perception and exchange. As an important resource for modern organizations operating in today's economy, knowledge is particularly susceptible to all kinds of distortions in its transmission, interpretation and application. Due to the above, there is need for an in-depth analysis of the issue, both at the theoretical level and, above all, at the empirical level. The main goal of this research is to show how remote work affects knowledge management in an organization. The research was conducted on a sample of 387 respondents belonging to the Z generation. A questionnaire based on the Likert scale was used for this purpose. The general conclusion that can be drawn from the research highlights the fact that, in relation to knowledge management, remote work mode works to varying degrees depending on the industry in which the organisation operates as well as its size.

Keywords: Knowledge management, Human resources Management, Remote work

1. Introduction

Even though remote work has been known and used for a long time, the COVID-19 pandemic has forced its wider application. Taking into consideration the increasing importance of knowledge management in organisations, it is worth noting the impact that remote work shows in terms of this very sphere of functioning. Although the presented results constitute part of research focused on a much broader issue, knowledge management is still an important part of it. The main research question posed in this paper is: how does remote work affect knowledge management in an organisation?

The first part of this article constitutes of a review of the literature concerning both knowledge management and remote work. The following section includes a discussion concerning the results of the study, both in the form of descriptive statistics as well as an analysis of the Kruskal-Wallis significance test. The end of the discussion includes theoretical and practical conclusions arising from analysing the research results.

The issues addressed in this study are relevant from the point of view of both management practice and theory, and that is why the presented results may prove to be helpful for managers managing enterprises from various industries and of various sizes. These findings may also constitute a starting point for further research in this area. That is because remote work may find a permanent place in the life of an organisation, so it is important to take a closer look at the factors determining its effectiveness.

2. Literature Overview

When writing about knowledge management, it is important to present the meaning of the term "knowledge" and the broader conceptual context in which it is used in Organisational Studies. Davenport and Prusak propose the following meaning of the term: "Knowledge is a fluid mix of framed, experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information. It originates and is applied in minds of knowers. In organizations, it often becomes embedded not only in documents or repositories but also in organizational routines, processes, practices, and norms." (Davenport and Prusak 2000, p. 5). Norms, values, or artefacts as elements of organisational culture can include an organisation's knowledge, for example, in the field of how to achieve goals or respond to crisis situations. This also concerns the type of organizational culture, e.g. a culture based on individualism or collectivism, based on competition or cooperation that conveys knowledge about the manners of achieving goals in various ways. Changing this type of knowledge is often much more difficult than technology-type knowledge, as Information Technology concerns the realm of mechanisms regulating human behaviour in organisations, while remaining outside the realm of consciousness. There is one feature of knowledge that is worth emphasizing: people are

the ones who possess knowledge and develop it. Similarly, to information that comes from data, knowledge comes from information. Information can be transformed into knowledge through the following actions:

- Comparison: how does information concerning this situation relate to other previously known situations?
- Consequences: what is the meaning of information for decisions and actions?
- Connections: does this knowledge refer to the already possessed knowledge?
- Conversation: what do others think about this information? (Cichobłaziński 2022)

The data comes from relevant databases, records, archives, etc. Information comes from messages, but knowledge is born in the minds of people and among people who are professionals in certain areas. Knowledge can also originate from interpersonal contacts, conversations, and learning. Hence, the exchange of knowledge constitutes an important tool for creating and developing knowledge.

Exchanging and sharing knowledge are an inseparable part of organisation management. Some authors point to the role of imitation in developing knowledge (Butler and Grahovac 2012). This is why human contacts, and the favourable social, organisational, and spatial structures are so important in developing knowledge. Of course, there is a big difference between simple imitation and innovation. However, the latter is not possible without the former (Legare and Nielsen 2015). It can be stated that innovation is imitation and added value. In some situations, losing the ability to imitate, due to the lack of social contact, can lead to a loss of knowledge which, once forgotten, can no longer be retrieved[1] (Dimond 2003).

The role of knowledge sharing can be considered at many levels of the organisational structure. This is how Anna Albrychiewicz-Słocińska explains the determinants of knowledge sharing: "Sharing knowledge behaviour can be called an engine of exchange and creating knowledge processes. (…) Knowledge sharing behaviour is a first step to knowledge transfer, which is a one-way action, yet the final and most desirable phase is knowledge exchange as it reflects to knowledge seeking action." (Albrychiewicz-Slocińska 2015, p. 70)

The phenomenon of knowledge sharing has recently been strongly explored. It is significant due to the widely used digital technologies (Kukowska & Skolik 2021). However, this paper focuses on analysing the phenomenon at the micro level, i.e. at an enterprise level. It is precisely within an enterprise (or other institution) that knowledge sharing is most vulnerable to various disruptions caused by replacing "face to face" employee relationships by remote relationships (Nemțeanu, Dabija & Stanca 2021). Remote work also impacts the process of knowledge sharing in terms of organisational hierarchy and distributing power in organisations (Skolik & Karczewska 2021). In this context, it is important that knowledge sharing is not artificially restricted by dysfunctional organisational structures. Sometimes the source of these dysfunctions may consist in the managers themselves, who deliberately obstruct the flow of knowledge believing that knowledge is power (Cichobłaziński 2017).

3. Remote Work

A separate issue to focus on is remote work. The relationship between remote work and knowledge exchange is becoming an important issue. This concerns the issue of how much does remote work help or hinder knowledge sharing within an enterprise? The apogee of remote working came during the COVID-19 epidemic. It looks like its application will increase. "While some companies continue to thumb their noses at The Great Resignation and insist that employees come back into the office, data scientists at Ladders insist that the writing is on the wall. Remote work is here to stay. According to their projections, 25% of all professional jobs in North America will be remote by the end of 2022, and remote opportunities will continue to increase through 2023." (Robinson 2022). For this reason, the problem seems important, both from a scientific and practical point of view, because defining remote working is not easy. This is how Agnieszka Jeran comments on the issue: "Remote work can be treated as a special case of flexible work - out of the four dimensions of flexibility: time, relationship permanence, location, and the form of the contract between the employee and the employer, in this case it mainly concerns the aspect of location - because remote work constitutes primarily work carried out away from the employer's premises, depending on the form in the employee's place of residence or in a different location, sometimes on the move, i.e. during the employee's journey (literal, as it is not a case of delegation)." (Jeran 2016, p. 50). However, it is possible to come across definitions that shed a slightly different light on the issue of

[1] The best example is Tasmanian Aborigines who gradually began to forget well known inventions and Technologies, i.e. striking fire, swing clothes or fishery when their Island disconnected from Australian continent.

remote work. Remote work (also known as work from home [WFH] or telecommuting) is a type of flexible working arrangement that allows an employee to work from remote location outside of corporate offices. For employees who can perform work offsite, this arrangement can help ensure work-life balance, access to career opportunities or reduced commutation costs. Benefits for the company include increased employee satisfaction and retention, increased productivity and cost savings on physical resources. Remote work arrangements can be temporary or permanent, part-time or full-time, occasional or frequent. Remote work requires policies governing equipment use, network security and performance expectations (Gartner Glossary 2023). This definition emphasizes above all the practical aspects of remote work, such as reducing commuting costs or the possibility to better manage one's career.

4. Methodology

This empirical research was conducted among the employees of Polish companies which used this type of work in full or hybrid form during the COVID-19 pandemic and afterwards. The survey was conducted in autumn 2022 among people belonging to Generation Z. It was carried out among 387 people. The questionnaire was based on a Likert scale. Generation Z was chosen because it is currently the group with the greatest experience in remote work and having the greatest competence in this area. In addition, these people will be the main employee in the future on the labor market where the remote mode will dominate.

The results obtained for the dependent variables were correlated with the independent variables. In addition to traditional variables such as age and gender, there were variables related to strictly organisational aspects, such as the size of organisation, the industry in which it operates, or the length of service and position held.

The cognitive purpose of the research is to fill the knowledge gap on knowledge management processes in remote work settings. The results of the research are ultimately to be used to formulate generalisations that extend organisational theory in the field of knowledge management.

The research results presented in this paper are part of a quantitative survey entitled: "Managerial aspects of managing remote work", carried out among young people, working remotely and representing Generation Z. The survey was conducted in December 2022.

Commented [A1]: Należy chyba uzasadnić powiązanie pomiędzy terminem generacja Z a grupą badanych w wieku 15-34

The study presents an excerpt from the results of a survey concerning respondents' views on the impact of remote work on knowledge management. In terms of the conducted study, among other things, the following problem has been posed: how does remote work affect knowledge management in an organisation? The study was carried out with the use of quantitative research methods which take advantage of the survey technique. The study included young people, representatives of Generation Z, whose experience of working remotely extends to at least 2022. Due to the fact that there are no statistics concerning the number of people aged 15-34 performing remote work in Poland, the focus was on the group of young people representing the aforementioned category who are economically active. Based on the 2021 Statistical Yearbook, the size of the working population in Poland in the age range of interest to the researchers was determined at 4,802 thousand people. Table 1 presents the structure of the study population by gender and age. For the population estimated in such a manner, with the following statistical assumptions: fraction size: 0.5; confidence level: 95%; maximum error: 5% the study sample size was set at 384 persons. The study was carried out by a specialist market research agency - Fieldstat Ltd. The study was carried out using quantitative research methods, taking advantage of CATI (Computer Assisted Telephone Interview - 50% of respondents) and CAWI (Computer-Assisted Web Interview - 50% of respondents) telephone survey techniques. The mixed technique was chosen because of an increased direct contact with the respondent. Contact was made with 2,783 persons working remotely. Some people declined to participate, some were could not participate due to the survey criteria (e.g. no experience of remote working in 2022) or exhausting the sample in terms of age or gender. The assumption regarding the experience of remote working in 2022 was related to eliminating the group of workers whose work was organised remotely only due to the COVID-19 outbreak. This is because these workers most often performed their duties and tasks in an extraordinary mode, significantly deviating from the conditions for remote work defined in the literature, the primary and basic of which assumes the freedom to choose this particular form of work. The opinions of respondents forced to perform their work remotely due to external circumstances could therefore lead to falsified conclusions concerning attitudes and beliefs.

Commented [A2]: Główny Urząd Statystyczny / Obszary tematyczne / Roczniki statystyczne / Roczniki Statystyczne / Rocznik Demograficzny 2022

Table 1: Structure of Respondents by age and Gender

Source: Own study

In the end, 388 correctly completed survey questionnaires were obtained (redundant surveys do not disrupt the planned structure of the study group).

The used research tool consisted in a standardized questionnaire consisting of 57 closed statements and eight questions concerning the socio-demographic characteristics of the respondents. A Likert scale (the so-called Likert scaling technique) was used for the responses, which makes it possible to determine the relative intensity of the various responses (Babbie, 2004, p. 192). This form allows for a reliable and quick analysis of the collected material, as well as uniformity and ease of elaboration (Churchill, 2002, p. 309). The research tool (questionnaire) is proprietary and was prepared by members of the research team - employees of the Department of Applied Sociology and Human Resource Management, Faculty of Management, Częstochowa University of Technology.

The STATISTICA software was used in the process of compiling the research results. To assess the significance of differences in the analyzed variables, non-parametric tests were used: Mann-Whitney U test (UMW), Kruskal-Wallis ANOVA (AKW) test, Chi-square test. The obtained statistics were analysed using a publication by A. Stanisz (2006, pp. 369-391). Spearman's rank correlation coefficient was used to assess the strength of correlations occurring between variables. Four questionnaire validity procedures have been used: content (Rossiter 2008), face (Czakon 2014), construct (Cronbach and Meehl 1955) and nomological (Czakon 2014) ones. The scale reliability was validated using Cronbach's alpha that is a measure of internal consistency (α = ,970019).

Commented [A3]: Jak bardzo będzie potrzebne to przetłumaczę to na polski, na razie jakby ktoś był zainteresowany dołączam artykuł dotyczący walidacji narzędzia badawczego. To zdanie musiałam zamieścić ponieważ w zeszłym roku zapytał o to recenzent

For the purpose of analyzing the study results, a number of statistical hypotheses were adopted concerning the existence of significant differences in the statements of respondents in relation to their socio-demographic characteristics. It was assumed that H0 constitutes the hypothesis concerning no differences due to the grouping variable, while H1 is an alternative hypothesis about the occurrence of such differences. These hypotheses were verified using the aforementioned statistical tests allowing to reject the null hypothesis concerning the lack of significant differences and accepting the alternative hypothesis on the existence of differences in the answers provided by respondents with regard to the individual independent variables. The study presents the relationships verified with statistical tests, authorizing to draw conclusions on the regularities in the studied group.

The application-based purpose of this study is to develop methods to support effective knowledge management when working remotely. In the longer term, this research is intended to create a model for knowledge management in the large-scale use of remote work. The point is that the benefits of remote work (e.g. reduced labour costs) are not offset by counter-productive consequences in terms of knowledge management within the organisation.

5. Empirical Section Part 1 - Frequency Analysis

At this stage, the distributions of responses to questions relevant to the posed research problem, namely the question concerning a relationship between remote work and knowledge management, will be analysed.

The first question analysed in terms of analyzing the managerial aspects of remote working is whether remote working helps to better explain new knowledge to employees? In this question, the emphasis is on clarifying knowledge and removing ambiguities of various kinds. Across the entire sample, it is difficult to identify clear correlations, but when the responses to this question are analysed by the variable of gender, some differences can be identified. Men generally state that remote work allows them to better understand the communicated content. Rather agree and completely agree responses were provided by a total of just over 40% of men, while disagree and completely disagree responses were provided by only around 30%. Whereas, in terms of women, the answers to this question are distributed inversely. Circa 42% of female respondents disagree with this opinion, with around 28% of female respondents having an opposite opinion. These results indicate that women believe that face-to-face contact with a supervisor is more conducive to understanding the transferred knowledge than remote contact.

Another issue addressed in this research concerns the transfer of knowledge. It concerns the extent to which remote working is favourable for the transfer of knowledge itself within the organisation regardless of the issues of interpretation, understanding, and clarification. 40.8% of respondents agreed that remote work is conductive to the transfer of knowledge by a supervisor. Only 25% of respondents had a different opinion. It can be concluded that the remote mode works better during the transfer of knowledge itself. This probably concerns the speed and precision enabled by electronic means of communication. This form of communication is most likely to avoid problems with interpreting data, information, and knowledge. In this case, gender is not a differentiating variable: 44.3% of men and 40.% of women supported such a claim.

More information concerning transferring information under the conditions of remote work can be provided by an analysis of the responses in terms of industry. It should be emphasized that the study sample in this survey was not representative in terms of industry. The most important criterion concerning selecting people for the study was the participation of respondents in working remotely. This is why not all industries are represented to the same extent. Information and communication constitute the industries represented in large numbers. Interestingly, respondents in this sector were not evenly divided in terms of their opinions (around 38% each) of them were supporters and opponents of the thesis that remote working is conducive to knowledge transfer. Employees in this sector perform well in terms of the transfer of knowledge in both remote and stationary work. This may result from the extensive experience of respondents in this industry with work involving transferring and processing information and knowledge, and thus, the form of this work does not matter much to them.

The problem is different in the industrial processing sector. Employees in this sector have a strong preference: 50% of respondents indicated that they disagreed with the statement that remote working promotes transferring knowledge, while 14% agreed with this statement. Such opinions seem understandable, as the nature of the industry means that employees are more likely to use stationary forms of communication. It is likely that, in this industry, employees do not see an opportunity to efficiently transfer knowledge in a remote manner and find that most information and knowledge is most effectively transferred in a stationary mode.

The following analyzed problem is working in favour of collecting and documenting employee knowledge. In this case, the focus is on the sectoral breakdown, a variable that differentiates the answers of respondents in an interesting way. First of all, it is important to note the vital importance for managing knowledge in an organisation, as well as collecting and documenting it. Knowledge resources in the form of databases, but also various types of documentation in the broader sense relating to both information and knowledge in the most general sense, constitute the basis for its processing and handling. The first to be selected was the information and communications industry. The vast majority of respondents employed in the sector agreed with the statement that remote working was conducive to acquiring and documenting knowledge. There were 60% of such indications, while the opposite view was held by only around 20% of the surveyed employees. This implies that employees in this sector appreciate the role of remote working in storing data, information, and knowledge. In order to deepen the knowledge concerning opinions it would be necessary to deepen the conducted research using qualitative methods. However, even such relatively superficial quantitative data suggests that remote work allows using a wide variety of IT tools in order to facilitate the collection of data and information. Email alone and the ability to record meetings held on various platforms such as ZOOM make it possible to access their records at any time.

It is also worth noting those survey results that are not differentiated by industry. An example of this consists in the industrial processing sector. In this case, 36.3% of respondents agreed that remote working was conducive to acquiring knowledge and almost the same number of respondents (37.6%) provided a negative answer. Therefore, as it can be seen, remote work in the industrial sector is of little importance for acquiring and

processing knowledge. Traditional forms of work are definitely better suited for this, which is completely understandable in the case of industry. That is because not all work can be performed remotely and not all knowledge can be stored and processed using the IT tools that are most readily applicable for remote working.

The research results are quite different in terms of the financial and insurance industry. For this industry, positive answers for the statement "remote working is conducive to acquiring and documenting employee knowledge" were provided by 62.5% of respondents, while only 18.7% of respondents disagreed. As shown by the presented results, in finance and insurance the specific nature of this industry means that remote working is well assessed by employees in terms of knowledge accumulation. The significant digitalization of this industry allows using appropriate electronic tools to enable properly acquiring employee knowledge, which in turn helps it to be reused at another time, place, and by other employees.

A different light is shed on the issue of acquiring knowledge by analyzing it in terms of the respondents' preferred future working mode. (Which mode of working do you prefer in the future?) The study included three modes of working: stationary mode, remote mode, and a hybrid mode, combining elements of the previous two. Of the employees who prefer a hybrid mode in the future, 65.1% state that working remotely helps to keep knowledge in the organisation. Only 14.6% have a different opinion. Respondents who prefer to work remotely in the future are not very different in this respect. They also state that working remotely allows for a more efficient accumulation of knowledge at 64.6%. Only 13.2% of respondents in this group have a different opinion. However, the opinions of employees who choose the stationary working mode for the future are different. Of these respondents, just over 41% state that working remotely allows them to acquire knowledge better. A negative opinion concerning this issue was provided by 31.4% of respondents, which is significantly more than was the case among workers choosing the previous two modes. This shows that the experience gained from working remotely has an impact on employees' subsequent preferences concerning the working mode. At least, this is the case for the "knowledge accumulation" variable. However, it can be assumed that employers should take these preferences into account when selecting the mode of work depending on the specifics of the job. If it involves acquiring knowledge, the employee will prefer remote work. However, it should be borne in mind that the differences in indications, which vary at around 10%, are not so great that far-reaching conclusions can be drawn from them. Instead, they help to sensitize employers to the issue.

A following differentiating variable that influenced respondents' answers consists in the size of the organisation. The studied organisations were divided in terms of the number of employees into the following categories: micro-organisations (1-9 employees), small organisations (10-49 employees), medium organisations (50-249 employees), and large organisations (more than 250 employees). Respondents were asked to provide their opinions concerning the statement: Working remotely allows to better explain new knowledge to other employees. In this case, the larger the organisation, the fewer affirmative answers provided by respondents in terms of this statement. Employees working in micro-enterprises provided 53.3% positive responses. Among respondents employed in small businesses, 19.7% completely and partially agreed with this statement. Among workers employed in medium-sized enterprises, 20% provided such answers. When it comes to large companies, such responses were provided by 18.7% of respondents. On the basis of the above data, it can be concluded that remote working allows to better explain the knowledge in small companies than in large ones. This conclusion requires further thought, as it cannot be easily explained at first glance. It can be concluded that employees of smaller enterprises, although accustomed to frequent face-to-face contact on a daily basis, have a fairly positive view of remote work in terms of knowledge clarification possibilities. In this area, employees of larger organisations prefer direct human contact. It is likely that employees of smaller organisations know each other much better than employees of larger companies and therefore find it easier to understand the knowledge being transferred remotely. They simply know what the other person means. Employees of large organisations experience the lack of direct contact more acutely and remote forms of contact are not sufficient for them. Therefore, the following conclusion can be drawn: if work is largely remote in a large organisation, regular face-to-face meetings should be arranged to clarify any doubts concerning the transferred knowledge.

6. Empirical Section Part 2 - Findings

This part of analysis is based on the Kruskal Wallis rank statistical test, For further analysis, the independent variable of "industry" in which the remote workers were employed was selected. A statistically significant result of the Kruskal-Wallis test indicates whether a variable differentiates the responses provided by respondents.

Independent (grouping) variable: Industry in which remote work was/is performed.

The results of the Kruskal-Wallis test (p = 0), at the accepted level of significance (α = 0.05), indicate rejecting the verified null hypothesis.

This means that the industry in which the respondents worked had a significant impact on the dependent variable – provides for better explanation of new knowledge to other employees. It turns out that, according to the studied persons, remote working in this case does not help achieve satisfactory results in every industry.

Independent (grouping) variable: Industry in which remote work was/is performed.

The results of the Kruskal-Wallis test (p = 0.0014), with the assumed level of significance (α = 0.05), indicate rejecting the verified null hypothesis. It can be concluded that the industry in which the respondents worked differentiates the answers related to the dependent variable: remote working is conductive to acquiring and documenting employee knowledge. Similarly as in the case of the previous variable, also here the industry has a significant impact on the effectiveness of knowledge management in an organisation.

Independent (grouping) variable: Industry in which remote work was/is performed.

The results of the Kruskal-Wallis test (p = 0.0077), with the assumed level of significance (α = 0.05), indicate rejecting the verified null hypothesis.

Analyzing the above data allows to conclude that, also in this case, the industry significantly differentiates the responses relating to the dependent variable: remote working allows to locate people more easily with the needed knowledge.

Independent (grouping) variable: Industry in which remote work was/is performed. The results of the Kruskal-Wallis test (p = 0), at the accepted level of significance (α = 0.05), indicate rejecting the verified null hypothesis.

This variable differentiates the answers of respondents relating to the dependent variable - works in favour of transferring knowledge by a supervisor. Therefore, also in the case of the transfer of knowledge by managers of different levels to their subordinate employees, the industry in which the respondents work has a significant impact on the effectiveness of this managerial function.

Independent (grouping) variable: size of organisation.

The results of the Kruskal-Wallis test (p = 0), at the accepted level of significance (α = 0.05), indicate rejecting the verified null hypothesis.

It turns out that the size of the organisation/enterprise differentiates in a statistically significant way the answers related to such a dependent variable - the possibility to better explain new knowledge to other employees when performing remote work. Thus, the mode of work (remote, stationary, hybrid) should be adapted to the size of the organisation or enterprise.

Independent (grouping) variable: size of organisation.

The results of the Kruskal-Wallis test (p = 0.0429), at the assumed level of significance (α = 0.05), indicate rejecting the verified null hypothesis.

In this case, the size of the organisation differentiated the indications relating to the dependent variable: works in favour of acquiring and documenting employee knowledge. Also in the case of considering introducing the remote working mode, the size of the institution should be taken into account.

Independent (grouping) variable: experience of working remotely.

The results of the Kruskal-Wallis test (p = 0.0002), at the assumed level of significance (α = 0.05), indicate rejecting the verified null hypothesis.

Another independent variable differentiating respondents' indications is whether or not the studied employees have experience of remote working. The analyzed indications were related to the dependent variable: allows to easier locate people with the needed knowledge. It can be concluded that the experience of working remotely quite clearly influenced whether or not employees could more easily locate people possessing useful knowledge.

7. Conclusions

Basing on an analysis of research results - both the quantitative analysis and the Kruskal Wallis test - the following theoretical and practical conclusions can be drawn.

- Remote work has a significant impact on knowledge management in an organization, although this impact depends on several factors and is not the same in every type of organisation.
- One of the variables that differentiate the answers of respondents is the industry. In manufacturing-focused industries, remote work had relatively little significance in terms of knowledge management. This is understandable as in the production management process remote work plays a lesser role in the transfer, acquisition, and clarification of knowledge.
- Another variable to look at is the size of the organisation. The obtained research results do not allow for a clear indication of the direction of the relationship between the variables. However, the existence of such a relationship can be stated with certainty.
- An example of this is the number of indications provided for the statement: works in favour of acquiring and documenting employee knowledge. It turns out that the size of the organisation does make some difference in this case. Arguably, remote working has a greater impact on knowledge management in larger organisations.
- Similarly, in the case of explaining and transferring knowledge, remote working allows to better control the process in small enterprises than in large ones.
- Employers should consider the variables indicated above when deciding between remote, stationary, and hybrid working modes.

Abstract: This paper presents a case study on knowledge transfer within hybrid organizations, specifically focusing on a Smart Energy Community (SEC) located in the Italian internal areas. Hybrid organizations, characterized by their blend of for-profit and non-profit motives, play a crucial role in addressing societal challenges while maintaining economic viability. Knowledge transfer, an essential aspect of knowledge management, becomes particularly significant within such organizations, as they navigate the complex terrain of innovation, collaboration, and sustainability. By examining the knowledge transfer practices within the SEC, this study aims to uncover valuable insights into the challenges, strategies, and outcomes of knowledge transfer in hybrid organizations. The findings contribute to the understanding of knowledge management in hybrid contexts and provide practical implications for organizations seeking to facilitate effective knowledge transfer. These insights result in the attempt to build up a replicable and transferable knowledge transfer model.

Keywords: Knowledge management, Knowledge transfer, Hybrid organizations, Smart Energy Community

1. Introduction

In recent years, the emergence of hybrid organizations has reshaped the business landscape. These entities, operating at the intersection of profit-driven goals and societal impact, face distinctive challenges related to Knowledge Management (KM hereafter). This contribution focuses on knowledge transfer in the context of an Italian Smart Energy Community, which represents a prime example of a hybrid organization and by adopting a qualitative research approach aims to shed light on the intricacies of knowledge transfer within this unique setting.

Hybrid organizations are increasingly recognized for their ability to leverage market mechanisms while addressing societal challenges. The Smart Energy Community (SEC hereafter) is an exemplary hybrid organization that aims to revolutionize the energy sector through sustainable practices and collaborative initiatives. Within such organizations, effective knowledge transfer plays a pivotal role in harnessing expertise, fostering innovation, and promoting long-term sustainability (Vakkuri et al., 2021; Grossi et al., 2022). This paper aims to explore the knowledge transfer dynamics within the SEC, identifying the challenges faced and strategies employed to facilitate knowledge sharing and collaboration.

Hybrid organizations, also known as hybrid ventures or social enterprises, have gained significant attention in recent years due to their unique organizational structure and dual objectives of generating social and economic value (Moore, 1995; Ziruolo, 2016). These organizations combine elements of both for-profit businesses and nonprofit organizations, aiming to address social or environmental challenges while remaining financially sustainable (Kondra & Hinings, 1998; Doherty et al., 2014; Mair et al., 2015). As hybrid organizations operate in complex and dynamic environments, the transfer of knowledge becomes a critical factor for their success (Jongbloed, 2015; Tangaraja et al., 2016). Simultaneously, KM plays a vital role in organizations by harnessing the power of knowledge to enhance innovation, improve decision-making, and foster continuous learning (Maurer et al., 2011; Bacon et al., 2019). By adopting appropriate theoretical perspectives, frameworks, and strategies, organizations can effectively leverage their knowledge assets and create a sustainable competitive advantage in today's dynamic and knowledge-intensive business landscape (Mazloomi Khamseh et al., 2008; Martins et al., 2019).

According to these premises, the present case study is based on the experience of the Smart Energy Community which arose in the first months of 2022 in the "Sub-Equana Valley", a highly depopulated Italian internal area which through the present project aims to increase the attractiveness and resilience of the entire territory. The SEC of the "Sub-Equana Valley" could be considered a hybrid organization because it involves members of the community in the generation, distribution, and consumption of clean energy (Barroco et al., 2021; Ceglia et al., 2022). In particular, hybridity is related to the continuous involvement of subjects and entities of third, public,

and private sectors which, starting from the embryonic stages, imagine and collectively build new models of consumption and active participation (Savelli & Morstyn, 2021). When all the solar panels are fully operational, the SEC will earn 10,000 euros per year, and for the next 20 years the members will be able to lower the bills of the participants or to invest in social projects and public interventions. The goal is to reach 300 kilowatts of photovoltaic panels by leveraging the funds of the "Piano Nazionale di Ripresa e Resilienza" (PNRR). Thus, when fully operational, with a 300 kilowatts yearly production, it will be possible to earn as much as 50,000 euros in incentives per year for the next twenty years.

As regards the methodology adopted in the present case study, it involves a qualitative approach. Data collection techniques include interviews with key stakeholders, document analysis, and observation of knowledge transfer practices within the SEC. The qualitative data is analyzed using thematic analysis to identify recurring patterns and themes related to knowledge transfer.

The novelty introduced by this contribution corresponds with the desire to fill the gap in the KM in hybrid organizations international literature, through the analysis of practical experiences capable of providing a clear representation of the knowledge transfer processes that influence the effectiveness of environmental initiatives.

Thus, the research questions underlying the present investigation are the following:

RQ1. How does knowledge transfer occur within hybrid organizations in the context of a Smart Energy Community?

RQ2. What factors influence the effectiveness of knowledge transfer in hybrid organizations operating in the Smart Energy community?

The relative answers, reported in Section 4 of the present work, could inform academics and practitioners about the state of the art of this KM case study, which is also discussed in Section 5 to trace the trajectories and establish a future agenda within this line of research. Sections 2 and Section 3 describe respectively the theoretical background and the methodologies used.

2. Theoretical Background

This section provides a theoretical foundation for understanding knowledge transfer in hybrid organizations (Billis, 2010; Doherty et al., 2014). It examines relevant concepts such as knowledge management, knowledge transfer processes, and the unique characteristics of hybrid organizations, by providing a comprehensive understanding of hybrid organizations, their definition, and the key characteristics that distinguish them from other organizational forms (Nonaka & Takeuchi, 1995; Nonaka et al., 1996; Mårtensson, 2010). Additionally, it highlights the role of knowledge transfer in fostering innovation and sustainability (Mazloomi Khamseh et al., 2008; Jongbloed, 2015; Tangaraja et al., 2016; Martins et al., 2019).

Hybrid organizations have emerged as a novel and intriguing form of organizational structure in recent years. They represent a departure from traditional organizational classifications, blending elements from both for-profit and nonprofit sectors to create a unique hybrid model (Vakkuri et al., 2021; Grossi et al., 2022). Hybrid organizations are characterized by their dual mission, which combines social or environmental objectives with the pursuit of economic sustainability. Unlike purely for-profit organizations that focus solely on generating profits for shareholders or nonprofit organizations that prioritize social or environmental impact, hybrid organizations aim to achieve a balance between the two. These organizations often strive to generate revenue through their activities, while also addressing social or environmental issues and making a positive impact on society (Vakkuri & Johanson, 2020).

In recent decades international literature promoted several theoretical perspectives, by providing insights into the emergence and functioning of hybrid organizations. One prominent perspective is Institutional Theory, which suggests that hybrid organizations arise as a response to external pressures and expectations (Doherty et al., 2014; Mair et al., 2015). They navigate the institutional environment by adopting elements from both sectors to gain legitimacy and access to resources (Moore, 1995; Ziruolo, 2016). Institutional theory also emphasizes the role of isomorphism, where organizations imitate established practices to conform to institutional norms (Kondra & Hinings; 1998).

Another theoretical lens is the Resource Dependence Theory, which emphasizes the importance of resource acquisition and dependence (Hillman et al., 2009). Hybrid organizations often face resource constraints due to their dual mission, requiring them to leverage resources from both sectors and this theory highlights the

strategic choices that hybrid organizations make to secure financial resources, partnerships, and support from diverse stakeholders (Emmert & Crow; 1998)

Thirdly, the Social Entrepreneurship Perspective emphasizes the role of hybrid organizations in addressing complex social problems through entrepreneurial activities (Ferreira et al., 2017). It highlights the innovative and entrepreneurial approaches adopted by these organizations to achieve their dual objectives, combining market-oriented strategies with social or environmental goals (Doherty et al., 2014). The following Table 1 encompasses these and other characteristics of hybrid organizations.

Table 1. Hybrid Organizations key Elements (adaptation by the authors)

Key elements	Features
Dual mission and values	Hybrid organizations have a distinctive feature of pursuing both social or environmental goals and financial sustainability. They articulate a clear mission and value proposition that encompasses the social or environmental impact they seek to create, along with their economic objectives.
Blended governance structures	Hybrid organizations often adopt governance structures that incorporate elements from both for-profit and nonprofit models. They may have a board of directors responsible for strategic decision-making, but also involve stakeholders representing the social or environmental causes they champion.
Revenue generation and resource diversification	Unlike traditional nonprofits relying heavily on donations and grants, hybrid organizations aim to generate revenue through various means. They may adopt a mix of market-oriented activities, such as product sales or fee-based services, alongside seeking philanthropic support or grants. This diversification of resources enables them to achieve financial sustainability while pursuing their social or environmental objectives.
Impact measurement and accountability	Hybrid organizations recognize the importance of measuring and demonstrating their impact on both social or environmental outcomes and financial performance. They often employ hybrid performance metrics that capture the dual bottom line, assessing their success in terms of social, environmental, and economic indicators.
Stakeholder engagement and collaboration	Hybrid organizations actively engage with a diverse range of stakeholders, including individuals, communities, businesses, government entities, and nonprofits. Collaboration and partnerships are crucial for hybrid organizations to leverage resources, expertise, and networks to address complex societal challenges effectively.

According to these hybridity premises, knowledge has become one of the most relevant intangible assets for economic and non-economic entities in order to achieve long-term advantage in the current high-turbulent competitive environment (Nevis et al, 1995; Hicks et al, 2007). Hence, point the following basis of KM have been considered as a starting point by part of international literature.

KM has emerged as a crucial field in modern organizations, recognizing the value of knowledge as a strategic asset for achieving competitive advantage and organizational success (Berardi et al., 2022). With the rapid pace of technological advancements, globalization, and increasing complexity of business environments, organizations are constantly faced with the challenge of effectively managing their knowledge resources to support decision-making, innovation, and overall performance. Knowledge can be broadly defined as a combination of information, experience, insights, and expertise that is valuable to an organization and its members (Chow et al, 2000; Zahra and George, 2002). It encompasses both explicit knowledge, which is codified and can be easily articulated and documented, and tacit knowledge, which resides in individuals' minds and is challenging to capture and share. In this light, KM aims to facilitate the creation, acquisition, organization, sharing, and utilization of knowledge to enhance organizational learning, problem-solving, and decision-making processes (Scarbrough et al., 1999)

Several theoretical perspectives and frameworks have been proposed to understand and guide KM initiatives within organizations. One prominent framework is the Nonaka and Takeuchi's SECI Model, which emphasizes the socialization, externalization, combination, and internalization processes involved in the creation and transfer of knowledge (Nonaka & Takeuchi, 1995; Nonaka et al., 1996). This model recognizes the dynamic nature of knowledge, highlighting the importance of interactions, dialogue, and collaboration among individuals and teams to facilitate knowledge creation and sharing.

Another influential perspective is the Knowledge-Based View (KBV) of the firm, which posits that knowledge assets and capabilities are critical determinants of a firm's competitive advantage and long-term success (Felin

& Hesterly, 2007). According to KBV, organizations need to actively manage their knowledge resources by investing in knowledge creation, acquisition, and retention, as well as establishing effective mechanisms for knowledge sharing and utilization. This perspective underscores the role of organizational culture, leadership, and infrastructure in fostering a knowledge-friendly environment that supports learning and innovation (Grant, 2013; Jongbloed, 2015).

Finally, we *land* to the *trait d'union* that merges the previous wide and complex research strands, Knowledge Transfer in Hybrid Organizations, looking for answers to RQ1. Knowledge Transfer refers to the process of sharing and disseminating knowledge from one individual or group to another (Mazloomi Khamseh et al., 2008; Martins et al., 2019). It involves the transmission, adoption, and application of knowledge within an organization, across organizational boundaries, or between organizations (Jongbloed, 2015; Tangaraja et al., 2016). Knowledge transfer is vital for hybrid organizations as it enables them to leverage internal and external knowledge resources, improve performance, enhance innovation, and fulfil their social mission effectively (Maurer et al., 2011; Bacon et al., 2019). Hybrid organizations face unique knowledge transfer challenges due to their dual nature. On one hand, they need to transfer knowledge related to traditional business practices, such as marketing, finance, and operations, to ensure their financial viability. On the other hand, they must also transfer knowledge related to their social or environmental mission, including best practices for addressing social issues, community engagement strategies, and impact measurement techniques. Balancing these two dimensions of knowledge transfer is crucial for hybrid organizations to achieve their hybrid goals (Jongbloed, 2015; Berardi et al., 2022).

3. Methods

The research methodology adopted for this case study involves a qualitative approach. The research employed a qualitative case study design to explore the phenomenon of knowledge transfer in hybrid organizations, focusing on the context of a Smart Energy Community. A case study approach was chosen to gain an in-depth understanding of the processes and dynamics involved in knowledge transfer within this specific organizational setting. After careful consideration, a specific SEC was identified as the primary case for this study. The community was chosen for its innovative and collaborative approach to sustainable energy practices, which provided a rich context for investigating knowledge transfer processes, especially due to its embryonic states. The reference literature included contributions published in the period 1997-2022, excluding duplicates and conference proceedings (Christofi et al., 2021).

Firstly, the data collection process involved the collection of primary and secondary data, in the period between January and May of this year. These methods were chosen to capture multiple perspectives and sources of information related to knowledge transfer within the SEC (Tellis, 1997; Merriam, 1998). Data collection techniques include interviews with key stakeholders, document analysis, and observation of knowledge transfer practices within the SEC. The interviews were carried out in 2 rounds in the period between January and May 2023, by interviewing twenty pivotal members of the SEC. Structured and Semi-structured interviews were conducted with key stakeholders involved in the smart energy community, including community leaders, employees, and external partners (Secinaro et al., 2021). The interviews focused on understanding their experiences, perceptions, and practices related to knowledge transfer within the organization. Afterwards, participant observation was employed to gain insights into the daily operations and interactions within the SEC. The researchers spent considerable time within the community, attending meetings, workshops, and other events, while taking field notes and recording observations. Then, several documents, such as reports, project plans, and internal communication materials, were analyzed to complement the interview and observation data (Seale et al., 2003). These documents provided additional context and background information related to knowledge transfer processes and strategies.

Secondly, the collected data underwent a rigorous process of analysis to identify key themes and patterns related to knowledge transfer in the SEC. The interview transcripts, field notes, and documents were systematically coded using qualitative data analysis software (NVivo) (Jackson & Bazeley, 2019). The codes were then organized into broader themes and sub-themes that captured the main ideas and patterns within the data (Gioia et al., 2013). The themes were constantly reviewed and refined to ensure their coherence and relevance to the research objectives. Finally, the themes were interpreted and synthesized to generate a comprehensive understanding of Knowledge Transfer processes in the Smart Energy Community. Connections and relationships between the themes were identified, and theoretical frameworks and models were used to support the analysis (Mazloomi Khamseh et al., 2008; Grossi et al., 2022). The deriving research design is reported in the following Figure 1.

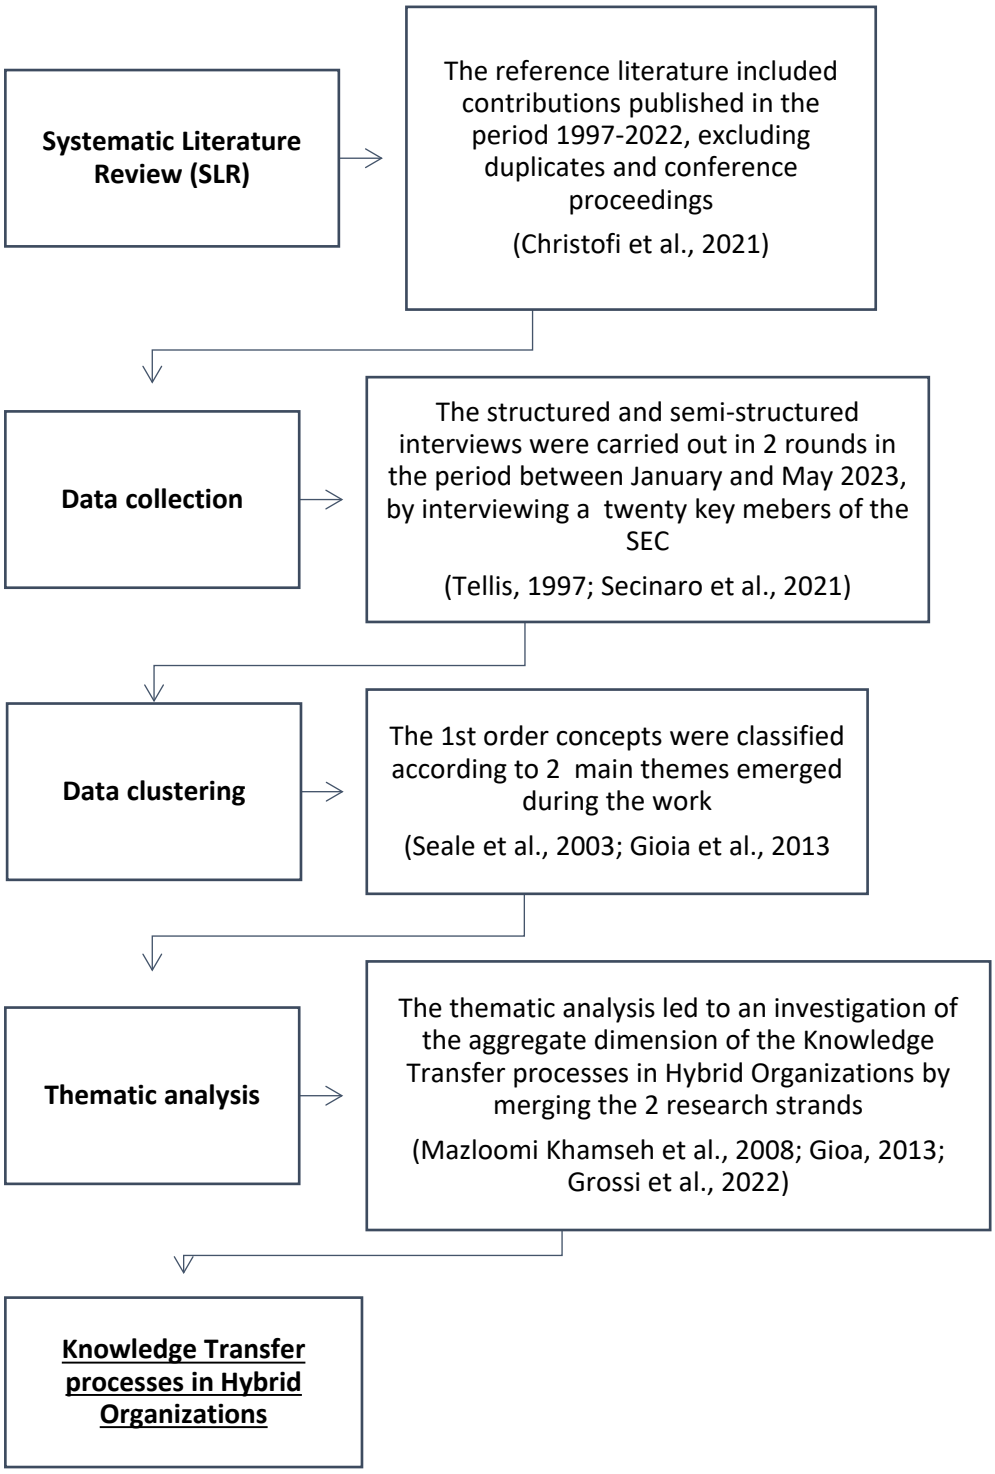

Figure 1: Research Design (adaptation by the authors)

The aforementioned research was carried out to address the RQ2. What factors influence the effectiveness of knowledge transfer in hybrid organizations operating in the Smart Energy Community?

First, the researchers considered first-order concepts starting from evidence of knowledge transfer mechanisms within the SEC. Appropriately, these are strictly connected with the Knowledge-Based View (KBV) perspective, which posits that knowledge assets and capabilities are critical determinants of a firm's competitive advantage and long-term success (Felin & Hesterly, 2007). Furthermore, this challenge must be met by municipalities using nonstandard governance models. As demonstrated in the literature sections, new challenges require public entities to adopt a new approach that allows the collaboration of several private, private, and third sector actors (Vakkuri et al., 2021; Grossi et al., 2022). Finally, as a first-order concept, we also denote the role of operational

initiatives in fostering effective knowledge sharing. For the second-order concepts, we need to refer to Hybrid Organizations models to explain if a complex network of actors could be able to easily transfer knowledge and best practices. Finally, aggregating the previous concepts and themes makes it possible to create a unique aggregate dimension that combines the previous approaches and relies on "Knowledge Transfer processes in Hybrid Organizations".

4. Results

This section examines the outcomes and impact of knowledge transfer within the SEC. It assesses the tangible and intangible benefits resulting from successful knowledge transfer, such as improved decision-making, enhanced innovation capabilities, increased stakeholder engagement, and positive environmental and social impacts. Based on the above, Table 2 summarizes the thematic analysis of this contribution.

Table 2: Summary of the Thematic Analysis (adapted from Gioia et al., 2013)

1st order concepts	2nd order themes	Aggregate Dimension elements
Factors Influencing Knowledge Transfer in the Smart Energy Community Organizational culture and climate Leadership and governance Social Networks and relationships Knowledge sharing mechanisms Learning and training Initiatives Knowledge sharing and collaboration Knowledge transfer strategies	Hybrid Organizations Knowledge Transfer	Findings and Analysis for the "Knowledge Transfer processes in Hybrid Organizations" aggregate dimension through Barriers and challenges to Knowledge Transfer Facilitators of Knowledge Transfer Practical implications and recommendations

Several key themes emerged from the data analysis. The first theme that emerged from the analysis is the importance of knowledge sharing and collaboration within the SEC. The interviews revealed that the community members (priorly major and researchers) actively engage in sharing expertise, experiences, and best practices. This knowledge sharing was facilitated through various mechanisms, such as regular meetings ("Communitas Gagliani"), workshops, and online or onsite information campaigns. The stakeholders emphasized the significance of collaboration in addressing complex energy challenges and leveraging the collective intelligence of the community (Newman et al., 2004; Jongbloed, 2015).

The second theme that emerged from the analysis is the influence of organizational culture and values on knowledge transfer within the Smart Energy Community. The interviews revealed a strong culture of learning and knowledge sharing, where community members were encouraged to exchange ideas and experiences openly. The community's values, such as sustainability, innovation, and inclusivity, played a crucial role in shaping knowledge transfer practices. The stakeholders highlighted that a supportive and inclusive organizational culture fostered effective knowledge transfer among members (Brandsen & Karré, 2011). Afterwards, from the analysis emerged the presence of barriers to knowledge transfer within the Smart Energy Community. The interviews and document analysis identified several challenges that hindered effective knowledge transfer (Doherty et al., 2014). These barriers included time constraints, lack of resources, and limited access to external expertise. The stakeholders expressed the need for dedicated resources, better communication channels, and efforts to overcome these barriers to enhance knowledge transfer within the community (Secinaro et al., 2019). Simultaneously, the interviews and observations identified several strategies employed by the community to facilitate knowledge transfer. These strategies included mentoring programs, knowledge exchange events, and the planning of using digital platforms for sharing information (Milton et al., 2007; Jongbloed, 2015). The stakeholders emphasized the importance of tailoring knowledge transfer strategies to the specific needs and characteristics of the community members.

The final theme that emerged from the analysis is the impact of knowledge transfer on the Smart Energy Community. The findings indicated that effective knowledge transfer had several positive outcomes for the community. These included increased innovation and creativity, improved decision-making processes, enhanced problem-solving capabilities, and the development of new energy solutions. The stakeholders highlighted that

knowledge transfer played a vital role in driving the community's overall growth, sustainability, ability to address complex energy challenges, a new community-based tourism thinking (Blackstock, 2005; Okazaki, 2008).

Overall, the thematic analysis revealed the significance of knowledge transfer in hybrid organizations such as the Smart Energy Community. The findings emphasized the importance of creating a collaborative and inclusive organizational culture, overcoming barriers to knowledge transfer, and implementing effective knowledge transfer strategies for creating public value (Ziruolo, 2016; Pereira et al., 2017; Burns & Andrucki, 2021).

5. Discussion

This contribution provides valuable insights into the dynamics of knowledge transfer in hybrid organizations, specifically focusing on the case of the "Sub-Equana Valley" Smart Energy Community. In the literature the debate about KM in hybrid organizations is ongoing, however, these findings contribute to the field of knowledge management by offering practical recommendations for practitioners and policymakers to enhance knowledge transfer in similar hybrid organizational settings.

In particular, this section focuses on the valuable insights gained through the thematic analysis, starting from the report on the challenges faced during knowledge transfer within the SEC. These challenges may arise due to the diverse nature of stakeholders, the integration of profit and non-profit motives, organizational culture, and resource constraints. By understanding these challenges, organizations can proactively address them and enhance knowledge transfer effectiveness (Jongbloed, 2015; Tangaraja et al., 2016). Despite the potential benefits, knowledge transfer in hybrid organizations is not without challenges. Common barriers include organizational culture clashes, resistance to change, lack of clear knowledge transfer strategies, limited resources, and the absence of well-defined performance metrics for hybrid goals (Maurer et al., 2011; Bacon et al., 2019). Overcoming these challenges requires a comprehensive understanding of the unique dynamics and context of hybrid organizations and the development of tailored strategies to promote effective knowledge transfer.

Concretely, the strategies employed by the SEC could facilitate knowledge transfer. The development of mechanisms such as communities of practice, mentoring, and technology-enabled platforms promotes collaboration, learning, and knowledge sharing among stakeholders, thereby fostering innovation and sustainability and reducing the reluctance and fatalism of the participants. And all this was possible through two fundamental levers: social capital and organizational learning.

Social capital plays a significant role in facilitating knowledge transfer within hybrid organizations. Social capital refers to the network of relationships, trust, and norms that exist among individuals and groups (Inkpen & Tsang, 2005; Walter et al., 2007). In this particular hybrid organization, social capital acts as a bridge between the profit-oriented and mission-oriented aspects, enabling the transfer of knowledge across these boundaries and enhancing communication, collaboration, and the willingness to share knowledge among individuals with different expertise and backgrounds. On the other hand, organizational learning is another relevant concept for understanding knowledge transfer in hybrid organizations. Organizational learning involves the acquisition, interpretation, and integration of knowledge to improve organizational performance (Bierly et al., 2000; Rhode et al., 2008). In hybrid organizations, learning processes are essential for reconciling the diverse goals and practices inherent in their hybrid model. Effective knowledge transfer mechanisms can facilitate organizational learning by capturing and disseminating valuable insights and experiences across the organization.

Finally, based on the findings, we could point out some practical implications and recommendations for hybrid organizations seeking to improve knowledge transfer. It highlights the importance of creating a supportive knowledge-sharing culture, implementing effective communication channels, investing in technology infrastructure, and fostering collaboration among diverse stakeholders. Moreover, various mechanisms can support knowledge transfer in hybrid organizations. These include formal processes such as training programs, mentoring, and communities of practice, as well as informal mechanisms like storytelling, peer-to-peer interactions, and social networks (Jongbloed, 2015; Tangaraja et al., 2016; Bacon et al., 2019). In this sense, the SEC adopted a combination of these mechanisms and strategies to address the diverse knowledge mechanisms considered the organization's unique context, culture, and resource constraints.

Lastly, hybrid organizations often collaborate with external stakeholders, such as government agencies, nonprofits, academic institutions, and private businesses, to achieve their social and economic objectives. In the present case study, external knowledge transfer and collaboration have brought in valuable expertise, resources, and networks that are essential for addressing complex social issues. The SEC should better and better leverage partnerships, joint projects, and knowledge-sharing platforms to facilitate the exchange of knowledge with

external stakeholders, fostering mutual learning and innovation. All and other of these concluding remarks are graphically reported in the following Figure 2, in the attempt to build up a replicable and transferable knowledge transfer model for hybrid organizations.

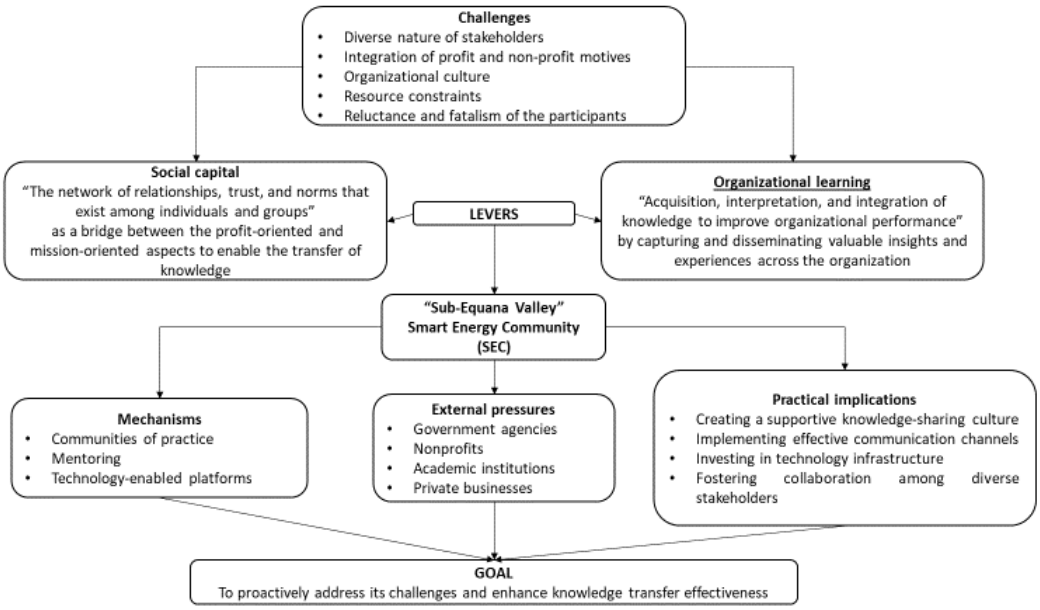

Figure 2: The SEC Knowledge Transfer Model for Hybrid Organizations (adaptation by the authors)

6. Conclusions

By studying the knowledge transfer practices of the SEC, this research provides valuable insights into the complexities of knowledge management in hybrid organizations. The findings contribute to the existing literature on knowledge transfer, expand the understanding of hybrid organizational dynamics, and offer practical guidance for organizations operating in similar contexts. Ultimately, effective knowledge transfer can drive innovation, collaboration. These insights can inform policymakers, managers, and practitioners in similar contexts, providing valuable guidance for fostering knowledge transfer in hybrid organizations and advancing sustainable energy initiatives.

It is important to acknowledge some limitations of the study. Firstly, the research focused on a single smart energy community, which may limit the generalizability of the findings. Secondly, the study relied on self-reported data from participants, which could be subject to biases or selective recall. Nevertheless, the findings contribute to the existing literature on knowledge transfer in hybrid organizations and offer valuable insights for practitioners and policymakers in the smart energy sector. By answering the RQs, this work aims to fill the gap of such a very specific research strand: it must be emphasized the significance of knowledge transfer in hybrid organizations and underscored the importance of effective knowledge management practices for achieving sustainable development goals. All and other of these concluding remarks are graphically reported in the previous Figure 2, in the attempt to build up a replicable and transferable knowledge transfer model.

In conclusion, knowledge transfer is a critical process for hybrid organizations aiming to achieve their dual objectives of social impact and financial sustainability. By understanding the concepts and theories related to knowledge transfer in hybrid organizations, researchers and practitioners can develop strategies and mechanisms that facilitate the exchange and utilization of knowledge within and beyond the organization, ultimately contributing to the success and long-term sustainability of hybrid organizations in addressing social and environmental challenges.

sabrina.bonomi@uniecampus.it
rreina@unicz.it

Abstract: The succession process remains a critical challenge in family businesses (Ramadani et al., 2015; Ramadani and Hoy, 2015), as this factor is connected to the low survival rate in the long term of the same. One of the reasons for this challenge may concern the successor's ability to adequately acquire the predecessor's silent and explicit knowledge and critical skills to maintain and improve the company's organizational performance. Much research focused on the successor profile (De Massis et al., 2008), highlighting the multiplicity of the skills requested. Recent studies show that the successor must have both hard and soft competence (Beeson, 2009). Hard skills refer to the technical skills related to work, cognitive skills, and traditional and learned skills (Bereiter and Scardamalia, 2006, Laker and Powell, 2011) or those objectively measurable and demonstrable skills, such as the ability to identify business opportunities, to develop a business vision, to create and manage business networks and their work (Bird and Jelinek, 1989; Chandler and Jensen, 1992; Charles-Pauvers et al., 2004, Laviolette, 2006). On the contrary, the transversal intangible and difficult-to-measure skills reflect "skills and traits that concern personality, attitude and behavior" (Moss & Tilly, 2001) as motivation, communication, team spirit, and trust in themselves. Therefore it is essential to find practical tools, given the poor literature on the topic, to transfer silent Knowledge, skill, legitimacy, and credibility, which are of fundamental importance for the members of the new generation family (Le Breton-Miller et al., 2004). On these premises, our work aims to answer the following questions 1. What are the tacit knowledge tools used in knowledge transfer? 2. Which of them are helpful to transfer skills? The methodology of this work involves the administration of a semi-structured interview with family companies who are experiencing the generational transition or have lived it.

Keywords: Tacit Knowledge, Family business, Generational succession, Skills

1. Introduction

Family businesses account for a huge percentage of employment in most capitalist countries (Morck et al., 2000; Shepherd and Zacharakis, 2000). In these types of organizations, the founders seek to ensure continuity of family control through intergenerational succession. Unfortunately, recent literature suggests that only 30% of family businesses survive beyond the first generation and that many intergenerational successions fail soon thereafter.

the second generation (Davis and Harveston, 1998, Handler 1992;). Research suggests that there are many reasons why such successions fail. They include unclear succession plans, incompetent successors, family rivalries and even an erroneous transfer of knowledge (Dyer, 1986; Hugron, 1993; Lansberg, 1999; Pitt 2000).

Within organizations, knowledge is a crucial competitive factor for their success. It is more than just information and data and can be described as a "fluid mix of experiences, values, contextual information and expert insights" (Davenport and Prusak, 1998).

Knowledge manifests itself in the form of intangible (tacit) and tangible (explicit) assets; the former is embodied in human beings while tangible goods are incorporated over time into organizational procedures, routines, processes and documents. Therefore, paying attention to the transfer of knowledge, especially in family businesses, is a critical issue for the survival and growth of the company over time. In fact, in these organizations' knowledge - often - is rooted in the figure of the entrepreneur and therefore during the succession process the very survival of the company could appear threatened. While in the family business system the value of knowledge is clear, it is often difficult to recognize all the different components involved (Takeuchi, 2001), therefore, it is essential that the entrepreneur focuses not only on developing and managing the different aspects of knowledge, but above all on its transfer (Spender, 1996).

The contribution therefore aims to identify and analyze - through an empirical approach - if tacit knowledge is considered a valid support in the transfer of knowledge from the entrepreneur to the successor; how this tacit transfer of knowledge takes place, in particular through what specific tools in the difficult passage of generational change.

In fact, it is a crucial moment in the life of the company because it involves the passage from one generation to the next to a real wealth of know-how and management skills, acquired over years of experience.

2. Theoretical Framework

2.1 The Role of Knowledge in the Process of Generational Succession

One of the great challenges that family business experience during the generational transition is the successor's ability to acquire the knowledge of the predecessor. This knowledge transfer, both tacit and explicit, is essential for maintaining and improving performance family business.

In the academic literature the management of knowledge in the succession family business emphasizes the transfer of knowledge between the founder and the next generation is problematic, but essential for a successful transition (Cabréra-Suárez et al., 2021; Handler, 1990). The Knowledge can be defined as the set of skills and competences that family members accumulate during their educational, work and life experiences and which they collectively possess (Martínez et al., 2013)

Knowledge management is used to safeguard the business over time, as it is essential importance during a succession process (Cabrera-Suárez et al., 2021). In particular, knowledge management can prove to be a key success factor in passing the business to the next generation.

Therefore, the issue of knowledge has long been addressed by scholars of organizational disciplines, developing and enriching itself in parallel with what happened in companies with reference to business studies, enriching the flow of implications from IT to Management (De Nito and Reina, 2003). A key aspect to address when talking about knowledge is related to the nature of knowledge and its dimension. As for the dimension, knowledge must be analyzed under two aspects, both ontological and epistemological. The first refers to those who create knowledge by passing from the individual to the organization, it can be said that knowledge is a product of the individuals in an organization because without them it could not create knowledge (Monzani, 2005). From an epistemological point of view, however, the concept of knowledge has always been a place for comparison and interpretation within the scientific community: from the classic distinction between tacit and explicit knowledge (Polanyi, 1966; Nonaka, 1994; Brown and Duguid, 2001).

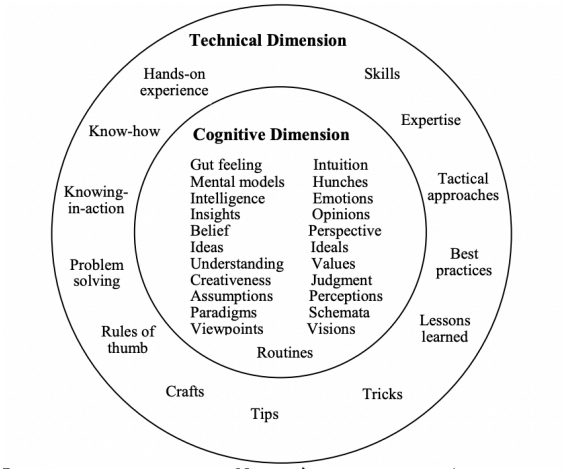
It is widely accepted that the figure of the founder represents the holder of specific knowledge of the company who needs to pass on the knowledge to another generations (De Massis, Sieger, et al., 2016;).

A highly motivated predecessor is able to facilitate the process of knowledge transfer (Bracci and Vagnoni, 2011; Cabrera-Suárez et al., 2021). However, many predecessors may be influenced by the thought of losing their leadership position and becoming superfluous over time (Lansberg, 1988). This is often referred to as a barrier to the knowledge transfer process and succession process. Knowledge transfer is greatly enhanced when the owner is willing to disclose rather than retain knowledge (Bracci and Vagnoni, 2011).

On the other hand, the characteristics of a successor also significantly influence the process of knowledge transfer in family businesses (Bracci and Vagnoni, 2011; Szulanski, 2004). Successors need to be strongly motivated to gain experience and knowledge from their predecessors (Cabrera-Suárez et al., 2001; Chirico and Saves, 2008). Lack of motivation can lead to an overestimation of the knowledge transfer process (Cabrera-Suárez et al., 2001).

The successors' ability to acquire the knowledge of their predecessors is influenced by their education (Chirico, 2007; Csizmadia et al., 2016). Business knowledge continues to develop through formal education (Barbera et al., 2015;), in fact the successor's performance after joining a family business may be related to the successor's formal education (Pérez-González, 2006).

2.2 Tacit Knowledge in the Generational Succession



The distinction between tacit and explicit knowledge is the key to understanding organizational knowledge (Nonaka and Takeuchi, 1995; Inkpen and Dinur, 1998). Polanyi (1962) defined tacit knowledge as non-verbalizable, intuitive and non-articulated knowledge. Tacit knowledge is learned through collaborative experience and is difficult to articulate, formalize and communicate (Nonaka and Takeuchi, 1995; Polani, 1966). Tacit knowledge could be held by individuals or held collectively, in shared collaborative experiences and interpretations of events. Individual tacit knowledge can be found in an employee's patterns, skills, habits and abstract knowledge (Lyles and Schwenk, 1992; Starbuck, 1992). Tacit collective knowledge typically resides in top management schemes, organizational consensus on past collaborative experiences, business routines, corporate culture and professional culture (Nelson and the Winter, 1982; Nonaka and Takeuchi, 1995).

Spender (1996) suggested that tacit knowledge might best be understood as knowledge that has not yet been turned into practice. It is knowledge that has been made into habit, and it is highly context specific and has a personal quality (Nonaka, 1994).

On the contrary, explicit knowledge is encoded and transferable in formal and systematic methods, such as in rules and procedures (Nonaka and Takeuchi, 1995). Individual explicit knowledge consists of knowledge and skills that can be easily taught or transcribed, while collective explicit knowledge resides in standard operating procedures, documentation, information systems and rules (Brown and Duguid, 1991; Starbuck, 1992).

As Inkpen and Dinur (1998) have pointed out, the distinction between explicit and tacit knowledge must not be seen as a dichotomy but as a spectrum with the two types of knowledge as the poles at either end.

Nonaka and Takeuchi (1995) identified two elements of tacit knowledge: cognitive and technical. Figure 1 shows the potential distribution of examples of tacit knowledge within the two dimensions of Nonaka and Takeuchi.

Source: Nonaka and Takeuchi 1995

Figure 1: Potential Distribution of Tacit Knowledge

The cognitive impression includes beliefs, ideas, paradigms, values, intuition and mental models. The technical dimension is more related to "know-how", trades and "informal skills" which are commonly accepted definitions of tacit knowledge (Nonaka, 1994).

3. Case Study

3.1 Methodology

To deepen investigate our topics, we used here a qualitative method for the analysis. In particular, we thought that the case study (Yin and Pinnelli, 2005) was the most appropriate methodology to answer our research questions. This method, in fact, seemed us suitable to correctly answer an “if” and "how" question in a specific context (Edmondson and McManus, 2007) (in particular: if tacit knowledge is considered a valid support in knowledge transfer from entrepreneur to the successor/s; how this tacit knowledge transfer is made, more specifically through which specific tools). Therefore, we could understand peculiarity of each organizational setting (Stake, 2005).

The scientific research on support of tacit knowledge transfer during a generational succession in Italian family business is still in a pioneering phase (Bryman and Bell, 2011).

We chose a multiple case study, because it seems offer more advantages than the case study: the single data collected seem more reliable and greater rigor in the study of the observed phenomenon.

The cases analyzed were three: one small manufacturing enterprise in the northwest Italy and two commercial enterprises in the northeast Italy, one very small and one medium size. These cases were considered particularly significant because they were representative of different generational succession situations in family business, both for the different types of businesses (manufactural and commercial; tiny, small, and medium enterprises), and the variety of geographic collocation (in Italy it is particularly significative). The three cases were also chosen because, despite the small size, shows also several combinations of generational successions: one from father

to three sons, one from father to daughter, one from mother to son. Moreover, one hadn't any plan for the generational handover, and two had; one of this was helped by an external support and the other wasn't.

The data were collected through eight semi-structured interviews, recorded and transcribed, conducted with three older entrepreneurs (two fathers and one mother) and five younger (four male and one female). The interviews on average lasted about 40 minutes and the dataset retained a certain degree of flexibility, along with our research questions, which were often updated according to ongoing feedback and unexpected events (Leonad-Barton, 1998). The survey is made up of 9 questions, of which six are open, and three are multiple choices.

The researchers then processed the results. Through a group of work and discussion, we selected the most interesting and relevant contents from the incoming materials and, when necessary, transcribed these contents with a word processor to build a homogeneous archive for the analysis.

3.2 Cases Description

CL is a small mechanical enterprise situated in northwest Italy. It was founded in the seventies and divided into two different businesses in the eighties. Considering the first foundation, this is the second generational transition; if we contemplate the current activity, it is the first. This delicate phase was planned two years ago, with the help of an external consultant, and it is still ongoing.

A.A. is a. tiny commercial enterprise, in the furniture field, situated in northeast Italy; it was founded in 1966; at the beginning, it was carpentry that was enlarged in the seventies and transformed into a commercial company. Today it is a shop of about 5000 square meters, with only six employees, and it is experiencing the third generational transition. The change process has been planned about ten years ago and the mentoring is still in progress.

AB is a medium enterprise for the luxury furniture and design sector, founded in the eighties in northeast Italy. In ten years, it became a group of six shops and one tailor-made production, with fifty employees, and experienced the first generational step, without planning, concluded few years ago.

4. Analysis and Results

As regards the first question of our research, we asked all the interviewees if, in their opinion, the knowledge transfer in the generational transition was important. In particular, according to Davenport e Prusak (1998) and Nonaka and Takeuchi (1995) we asked them to specify which component of knowledge (tacit or explicit) they considered a primary support for the generational change.

All the interviewees, both senior and junior, answered affirmatively and indicated tacit knowledge as the main support. The generational change was considered by all, albeit with slightly different words, a delicate moment for the life of the company, which, for this reason, requires a lot of attention and care. They added that a good protection is precisely the transfer of experiences, intuitions, relationships, and so on, that cannot be explicitly learned neither passed on.

To investigate the second proposal, five tools of tacit knowledge were suggested, and more precisely: intuition (Nonaka & Takeuchi 1995; Virtainlahti 2006), personal business sense, observation (Senker, 1995; Mohajan, 2016)), mentoring, and participation (Mohajan, 2016). We asked each respondent if they were considered important and why. In the end, a free field called "other" was also left to allow everyone freely insert further tools of tacit knowledge deemed necessary.

- Intuition: four people answered "no" (all sons, one of whom, however, said that "if present, it helps speed up the transfer of knowledge") and four "yes" (all the three senior entrepreneurs and the daughter; this latter considered appropriate to specify that "it is very useful because it speeds up the knowledge transfer")
- Personal business sense: six interviewed people answered "yes", and two said "no". A senior entrepreneur and one junior, both explained that "you can learn and develop it through technique and method even in a second time".
- Observation: seven people answered "yes"; only one said "no" (a son, who specified "it is not necessary but, when it is present, can be helpful"). A curious detail is that the two females, senior and junior, both thought it proper to specify, respectively, that "with the term "observation", I don't just mean "gaze", but I think to the use of all senses" and "I consider it a necessary tool, but I mean an empathic observation, not only with the eyes but with all senses, and with the hearth".

- Mentoring: four people answered that it is really supportive, but one of them specified “I mean external mentor, because my father is not able to do it well”; the two women and one entrepreneur specified that “it is an important tool, that helps and simplifies the tacit knowledge transfer and it must be a reciprocal mentoring; we must support each other by teaching and learning in a mutual educational process”. Four people, three junior and one senior, answered that mentoring is not a necessary tool.
- Participation: almost all interviewed people replied that it is a fundamental tool ("without participation, it is useless to think of a knowledge transfer or even a generational change”). The only one who answered "it is not important", was one of the senior entrepreneurs. However, the other, even if he answered "yes", pointed out that "mine answer is " yes "only if the successors are ready; otherwise, they should not participate because they only do damage".

Only five people have inserted other tools in the free space, namely “trust, we-thinking, humility, empathy, listening, cooperation, competencies". Two juniors underlined the importance of regular meetings and feedback.

TOOL FOR TACIT KNOWLEDGE TRANSFER	Senior entrepreneur (M)	Senior entrepreneur (F)	Senior entrepreneur (M)	Junior entrepreneur (M)	Junior entrepreneur (M)	Junior entrepreneur (M)	Junior entrepreneur (F)	Junior entrepreneur (M)
Intuition	YES	YES	YES	NO	NO	NO	YES	NO*
Personal sense of business	YES	YES	NO	YES	YES	YES	NO	YES
Observation	YES	YES	NO	YES	YES	YES	YES	YES
Mentoring	NO	YES	YES	YES	NO	NO	YES	NO
Participation	YES*	YES	YES	YES	YES	YES	YES	NO
Other	Competencies	Trust, Hunility, we-thinking	empathy	I don't know	I don't know	I don't know	Trust, cooperation, regular feedback and meetings	Listening, regular feedback and meeting

5. Limits

The present on field analysis contributes to verify how tacit knowledge is considered a valid support in knowledge transfer process during generational succession. The interviews done show that differently are valued the tools able to transfer tacit knowledge among generations. The contribution represents a first step regarding the aim to deep how knowledge and what kind of is relevant in Family business in the generational transition. So the small number of firms involved represent a first limit to overcome; perhaps the different typologies of firms contacted have permitted to underline the importance of topic analyzed, but on the other hands can have created distortion in real comprehension of tacit knowledge transfer tools.

Next step will regard to rise the number of firms involved in the study, maybe through a selection of a specific industrial sector in order to reduce the interpretative ambiguity and then to select the Family business in different Italian regions.

East *vs* West: Satisfaction With Knowledge Sharing Among Millennials

Abstract: Knowledge sharing (KS) among individuals working together is complex and has an effect on their satisfaction. We adopt the self-determination theory and the theory of reasoned action to examine the relationship between millennials' characteristics, KS and the resulting satisfaction. Using a mixed-method approach we address the antecedents of satisfaction in KS for 213 millennials attending Master programs in management at Polish and Portuguese business schools. The quantitative results show that knowledge characteristics influence KS as well as the fear of losing power due to KS. Knowledge complementarity and knowledge complexity positively contribute to KS. Knowledge complexity increases the fear of losing power due to KS, while knowledge complementarity decreases it, probably because individuals recognize complex knowledge as a more valuable one. The qualitative findings corroborate the quantitative results. Knowledge complementarity's presence alone leads to KS, while its absence and knowledge complexity's existence generate the fear of losing power. KS behavior and not being afraid of losing power due to KS lead to satisfaction from KS. The integration of both outputs is robust since quantitative results and qualitative findings converge: a) KS results from knowledge complementarity: knowledge complementarity relates positively to KS, which is consistent with a high level of knowledge complementarity providing a sufficient condition for a high level of KS; b) The fear of losing power results from the absence of knowledge complementarity and the existence of knowledge complexity, which is consistent with knowledge complementarity relating negatively to the fear of losing power and knowledge complexity relating positively to the fear of losing power; c) Satisfaction occurs when KS exists and the fear of losing power is absent, which is in line with KS relating positively to satisfaction and the fear of losing power due to KS relating negatively to satisfaction. Furthermore, the results show that millennial students' satisfaction from KS is really a behavioral question and not a cultural one since there is no evidence of significant differences between the two subsamples. Millennials behave uniformly on Europe's western and eastern ends.

Keywords: Knowledge, Knowledge sharing, Fear of losing power, Satisfaction, Millennials

1. Introduction

Knowledge sharing is a significant asset and a powerful tool to acess to a competitive advantage (e.g., Argote and Ingram, 2000; Foss *et al.*, 2010). Its importance both to academicians and practitioners is widely reflected in the large number of published works that address the determinants of knowledge sharing in various contexts with various supporting theories (e.g., Curado *et al.*, 2021; Oliveira *et al.*, 2019; Wu, 2013). However, these studies have neglected the importance of the millennial generation in conjunction with the satisfaction from the type of knowledge shared. Analyzing the behavior of the millennial generation regarding knowledge sharing is especially relevant since the distinct characteristics of this generation when compared to others (Adriani *et al*, 2022).

However, the literature has neglected the influence of the type of knowledge on its sharing and the fear of losing power. Additionally, the effect of this influence on the satisfaction from sharing knowledge remains unaddressed. Analyzing the knowledge sharing of millennials is especially relevant because of the distinct characteristics of this generation (Andriani *et al*., 2022; Galdames and Guihen, 2022). Millennials were born from 1980 to 2000 and have particular characteristics that are different from preceding generations, so there is a larger scope for research on generational social change (Kavanagh *et al*., 2021). Millennials are collaborative, impatient, and search for recognition; they prefer a good work-family balance and tend to seek self-fulfillment and to be less committed to the workplace, as a result, sometimes they are considered "job-hoppers" (Galdames and Guihen, 2022). These characteristics when combined with a work environment with high turnover and entrepreneurial opportunities create a huge challenge to knowledge management and in particular to knowledge sharing.

1.1 Knowledge sharing

While organizations can promote a culture of sharing knowledge, a university can also develop knowledge sharing as a skill (Gamlath and Wilson, 2020). Knowledge sharing (KS) is "the process where individuals mutually exchange their knowledge and jointly create new knowledge" (Hooff and Ridder, 2004, p. 118). Among the knowledge management (KM) processes, KS is the most significant (Lo and Tian, 2020). KS in a competitive environment (an organization or a classroom) can be an asset (Foss *et al.*, 2010) or a significant basis for competitive advantage (e.g., Argote and Ingram, 2000). At the individual level, knowledge can be considered a strategic asset and a source of power. Therefore, the type of knowledge is important in encouraging individuals to share it (Wu, 2013). Employees face a potential loss of importance when they share what they know with other organizational members (Kankanhalli *et al.*, 2005).

Knowledge sharing involves gathering and then donating knowledge: the first consists of seeking knowledge, that is, asking or looking for someone else's knowledge (Hooff and Ridder, 2004), and the second consists of giving knowledge to another. Knowledge sharing is one of the most important processes in knowledge management (Kuo and Young, 2008), as KS has effects at the individual and organizational levels (Ahmad and Karim, 2019). At the individual level, KS increases the efficiency in carrying out actions, solving problems, and making decisions (Ahmad and Karim, 2019). Knowledge sharing encourages innovation and the creation of new knowledge (Iqbal *et al*., 2015). At the individual level, KS also leads to increased autonomy, skills, and self-realization; at the organizational level, KS is a significant basis for competitive advantage (Argote and Ingram, 2000; Wang and Noe, 2010). However, promoting and encouraging KS within organizations remains a challenge (Davidavičienė *et al*., 2020).

1.2 Complex and Complementary Knowledge

In order for KS to be effective, the type of knowledge should be conducive to sharing. In this study, we classify knowledge as either complex or complementary. Knowledge complementarity is "the degree to which knowledge is not redundant and is interesting enough to join with other knowledge" (Subramaniam and Venkatraman, 2001). Knowledge complementarity has the ability to generate added value from the interaction between the complementary parts (Kim *et al.*, 2010). Given the synergy, individuals will share it as a way to increase their stock of knowledge and to simultaneously avoid appearing opportunistic by maximizing their own stock of knowledge at the expense of others. (Kim *et al.*, 2012). In this study, we follow Henriques *et al*.'s (2019) study and we assume characteristics of complementary knowledge. Complementary knowledge and skills contribute to knowledge creation (Yao *et al*., 2013); thus, it is relevant for achieving a competitive advantage that is similar to KS (Argote and Ingram, 2000; Wang and Noe, 2010). Complementary knowledge increases the advantage in the competitive race against others, therefore it relates oppositely to the fear of losing power. Thus, we hypothesize that:

H1. Knowledge complementarity relates positively to knowledge sharing.

H2. Knowledge complementarity relates negatively to the fear of losing power.

However, complex knowledge reflects the degree to which sharing knowledge is not simple and is intricate (Subramaniam and Venkatraman, 2001). Therefore, the people with this type of knowledge are likely to do a cost-benefit analysis before sharing it (Cabrera and Cabrera, 2002). If the cost-benefit analyses indicates a cost from sharing, the individual will not share the knowledge because it contributes to the progress of other individuals that leads to losing the competitive advantage over others in the organization (Andolšek and Andolšek, 2015). Sharing the individual knowledge in the group is limited by the fear of losing value in the group, in the same way employees lose value in the organizations (Lam and Lambermont-Ford, 2010). Therefore, one of the strongest factors that reduces KS within the group is the fear of losing their value (Clark *et al.*, 2007; Evans *et al.*, 2015; Iheukwumere-Esotu and Kaltungo, 2020; Kankanhalli *et al.*, 2005; Silva de Garcia *et al.*, 2020). Following Henriques *et al*.'s (2019) study rationale, we assume characteristics of complex knowledge. It is highly valuable, since it can be assisted and enhanced, but not replaced, by technological devices such as computers (Autor *et al*., 2003). Thus, it requires a human contribution and cannot be substituted with software programs (e.g., using artificial intelligence) (Petterson, 2019). Therefore, we propose the following hypotheses:

Therefore, we propose the following hypotheses:

H3. Knowledge complexity relates negatively to knowledge sharing.

H4. Knowledge complexity relates positively to the fear of losing power.

Guaranteeing satisfaction is a way to encourage KS (Wu, 2013). This satisfaction means the individual's positive evaluation and affective response to the overall experience of sharing knowledge with others (Chiu *et al.*, 2011). Thus, we may consider that satisfaction with KS results from a comparison between expectations and perceived performance, and it could be a feeling of pleasure or disappointment (Chiu *et al.*, 2011). Knowledge-intensive environments (organizations or classrooms) are learning environments. Learning occurs through KS and could be one of the explanations for satisfaction with it (Yuen and Majid, 2007). Additionally, its effect on satisfaction is associated with helping others which is a motivation for KS (Lo and Tian, 2020). Following previous studies on the KS dependence on satisfaction with KS (Chen *et al.*, 2012; Wu, 2013), we hypothesize:

H5. Sharing knowledge relates positively to satisfaction with knowledge sharing.

Knowledge is often seen as a basis to ensure power in organizations. Fear emerges from thinking that sharing will diminish an individual's value when the individual is no longer the exclusive owner of that knowledge. This psychological phenomenon restrains individuals from sharing what they know (Evans *et al.*, 2015; Silva de Garcia *et al.*, 2020). Consequently, there is a fear of losing one's own value due to KS (Smaliukienė, *et al.*, 2017), that is why knowledge workers fear sharing their expertise (Iheukwumere-Esotu and Kaltungo, 2020). Individuals contribute with their knowledge to the progress of other individuals, thus, sharing one's knowledge leads to losing the advantage in the competitive race with other employees and lose value in the organizations (Lam and Lambermont-Ford, 2010). So, they might be reluctance to share knowledge because the fear of feeling disadvantaged (; Smaliukienė, *et al.*, 2017). When employees do not share what they know, they will not feel the satisfaction of doing so. Following Oliveira *et al*. (2019) and Arain *et al*. (2020) studies, we assume individuals often do not engage in KS because they fear losing power, therefore, we propose that:

H6. The fear of losing power relates negatively to satisfaction with knowledge sharing.

2. Method

2.1 Mixed Methods

There is a growing methodological trend in literature that integrates qualitative and quantitative methods in the same study. The resulting mixed methods approach provides the necessary empirical sophistication and rigor to match the complexities of organizational phenomena (Molina-Azorin, et *al.,* 2017). By integrating of quantitative and qualitative approaches we want to offer a better understanding of the research problem and the related complex phenomenon than either approach alone could give (Creswell and Plano Clark 2011).

2.2 Data Collection and Measures

Data for the study were collected through a cross-sectional survey. The sample was the students' databases of master programs at two business schools (one in Poland - far east European mainland - and one in Portugal - far west European mainland). This type of data diversity is important when addressing satisfaction with KS from a behavioral point of view (Lauring, 2009). The questionnaires were distributed among the 215 students who agreed to participate in the study and were collected at the end of a class, which resulted in 213 complete questionnaires. Two questionnaires were removed after applying cleaning procedures (Hair *et al.*, 2009). Respondents' demographics are presented in Table I.

Table 1: Demographic Statistics of Students

Millennials		Portugal (n=129)	Poland (n=84)	Total Total n=213
Gender	Male	38,8%	16,7%	30%
	Female	61,2%	83,3%	70%
Average age (years)		24,88	23,62	24,7
Average % of respondents that have a job		53%	63%	57%
Having a job on average for (years)		2,68	2,14	2,7

Survey questions for measuring the variables in the study were adopted from pre-existing instruments in the literature. Their measurements were based on Likert scales with options ranging from 1 (complete disagreement) to 5 (complete agreement):

Knowledge complementarity (KCM) measures the level of knowledge shared that occurs within the class that is not redundant (Subramaniam and Venkatraman, 2001).

Knowledge complexity (KCX) measures the level of complex knowledge shared that occurs within the class (Subramaniam and Venkatraman, 2001).

Knowledge sharing (KS) is the process of sharing one's own knowledge within the class (Xue *et al*., 2011).

Fear of losing power (FLP) is the perception of power and unique value lost due to the knowledge shared within the class (Kankanhalli *et al*., 2005).

Satisfaction with knowledge sharing (SATS) measures the individual's assessment and emotional response to the global experience of KS with other students in the class (Chiu *et al*., 2011).

2.3 Data Analysis

The exploratory factor analysis using the principal component analysis (PCA) with the varimax rotation method was used with the support of SPSS 21®. The factor loading of each item was greater than the recommended 0.70, except KCM3, KCM5, KCM6, STATS3 and KS4. These five items were removed. Structural Equation Modeling (SEM) was used to test hypotheses and validate the model, considering the measurement model and the structural model. The data were analyzed with the support of SPSS 21® and PLS 3.0®. Qualitative Comparative Analysis was developed using fsQCA 3.0.

2.4 Measurement Model

The reliability of the constructs was verified using Cronbach's alpha, rho_A, and composite reliability (CR). The values obtained were within the range recommended by Hair *et al.* (2020). The convergent validity was checked using the analysis of the average variation extracted (AVE) and CR. The AVE should be higher than 0.5 (Bagozzi and Yi, 1988), and the CR should be higher than 0.8 (Koufteros, 1999) (Table II). The discriminant validity was assessed using the heterotrait-monotrait (HTMT) ratio of correlations, as recommended by Hair *et al.* (2020). The HTMT ratio of correlation is presented in Table III. The maximum value was below 0.85 (for conceptually different constructs) and 0.90 (for conceptually similar constructs) according to Hair *et al.* (2019). Considering the HTMT, discriminant validity was established for this model. The model had no collinearity problem because the variance inflation factor (VIF) was below 5, as recommended by Hair *et al.* (2019). According to Kock (2015), VIF test values under 3.3 indicate there is no common method bias. In this model, all the values for VIF were under 1.001.

Table 2: Reliability and Convergent Validity

Constructs	Cronbach's Alpha	rho_A	CR	AVE
KCM	0.673	0.698	0.821	0.608
KCX	0.848	0.882	0.890	0.622
KS	0.691	0.726	0.826	0.616
FLP	0.897	0.918	0.928	0.763
SATS	0.668	0.675	0.819	0.601

Table 3: The Heterotrait-Monotrait Ratio of Correlations (HTMT)

Constructs	KCM	KCX	KS	FLP	SATS
KCM					
KCX	0.162				
KS	0.556	0.194			
FLP	0.162	0.432	0.107		
SATS	0.391	0.071	0.724	0.270	

2.5 Structural Equation Modelling

The significance of the relationships was assessed using a bootstrapping algorithm. The hypotheses are valid when the *t* values are above 1.96 (Hair *et al.*, 2019). Table IV has the results of the hypothesis test. The model explains 16.3% of the variance in KS, 17.6% of the variance in FLP and 30.3% of the variance in SATS. No significant differences were identified between Polish and Portuguese students' responses. This result means that students in both countries have similar behavior regarding the research model estimation.

Table 4: Results of the Hypothesis Test

Paths	Coefficient	t value	P	Hypothesis testing result
H1 KCM→KS	0.367	5.212	0.000	Supported
H2 KCM→FLP	-0.141	2.133	0.033	Supported
H3 KCX→KS	0.159	2.366	0.018	Not Supported
H4 KCX→FLP	0.399	5.549	0.000	Supported
H5 KS→SATS	0.509	10.355	0.000	Supported
H6 FLP→SATS	-0.190	2.938	0.003	Supported

2.6 Fuzzy-set Qualitative Comparative Analysis

In this study, fsQCA complements the SEM results to discover the configurations of conditions for the outcome variables, apart from the SEM's single estimated solution to the dependent variable: satisfaction (Rihoux and Ragin, 2009). Our qualitative research questions are interrelated as follows: what are the configurations of causal conditions that generate KS, FLP, and satisfaction with KS? Thus, the application of fsQCA to the data enables us to answer these questions by developing a configurational model.

Table 5: Descriptive Statistics and Calibration of the Conditions and the Outcomes

Conditions (C) and Outcomes (O)	Descriptive statistics (n= 213)	Calibration
KCM (C)	μ = 3.34; σ = 0.51; min= 2.00; max = 5.00	(4.2; 3.2; 2.6)*
KCX (C)	μ = 2.82; σ = 0.74; min= 1.00; max = 5.00	(3.9; 2.8; 1.6)*
KS (C/O)	μ = 3.62; σ = 0.76; min= 1.75; max = 5.00	(4.6; 3.6; 2.4)*
FLP (C/O)	μ = 2.08; σ = 0.98; min= 1.00; max = 5.00	(3.1; 2.0; 1.0)*
SATS (O)	μ = 4.02; σ = 0.59; min= 2.00; max = 5.00	(4.8; 4.1; 3.1)*

μ = Mean; σ = Standard Deviation; min = Minimum; max = Maximum; *Cut-off values: 0.95; 0.50; 0.05

3. Results

3.1 Results From SEM

KCM is related positively with KS (H1). Knowledge complementarity could give a sense of belonging to group. Knowledge complementarity is related negatively with the FLP (H2). KCM aggregates value for the donor and collector which reduces the FLP. Knowledge complexity is related positively to the FLP (H4). However, it was not enough to support H4. KS is positively related to SATS (H5). The results of this research could be aligned with Lo and Tian (2020) who find that enjoyment in helping others motivates KS that leads to satisfaction with it. The FLP is related to SATS (H6). If the individuals consider knowledge as power, they will not find satisfaction in KS.

3.2 Findings From fsQCA

There are no necessary conditions for either of the three outcomes. Both solutions and configurations for each model were analyzed using consistency and coverage levels. In this investigation, the solutions and configurations obtained fulfill the imperatives of consistency and coverage emphasized by the literature, as well as the best practices for presenting the results (Ragin, 2008). Thus, we included in the study the intermediate solutions for the three results (Tables VI, VII and VIII). There is no solution for the configurational modelling on the absence of FLP, thus, millennials seem to be afraid of losing it. All conditions in the tables are core conditions.

Table 6: Configurational Modeling for (and Absence of) KS

KS=f(KCM, KCX) **Attributes (causal configuration) → KS (outcome)**				
Causal configuration	Raw coverage	Unique coverage	Consistency	Interpretation of configuration

KCM	0.785353	0.785353	0.765050	A high level of knowledge complementarity provides a sufficient condition to high levels of knowledge sharing
Solution coverage:0.785353				
Solution consistency:0.765050				
Absence of KS=f(KCM, KCX) **Attributes (causal configuration) → ~KS (outcome)**				
Causal configuration	Raw coverage	Unique coverage	Consistency	Interpretation of configuration
~KCM	0.730612	0.730612	0.752930	A low level of knowledge complementarity provides a sufficient condition to low levels of knowledge sharing
Solution coverage:0.730612				
Solution consistency:0.752930				

Table 8: Configurational Modeling for FLP

FLP=f(KCM, KCX) **Attributes (causal configuration) → FLP (outcome)**				
Causal configuration	Raw coverage	Unique coverage	Consistency	Interpretation of configuration
~KCM *KCX	0.476031	0.476031	0.802796	A combination of low levels of knowledge complementarity and high levels of knowledge complexity provides a high level of fear of losing power due to knowledge sharing
Solution coverage:0.476031				
Solution consistency:0.802796				

Table 7: Configurational Modeling for (and Absence of) SATS

SATS=f(KS, FLP) **Attributes (causal configuration) → SATS (outcome)**				
Causal configuration	Raw coverage	Unique coverage	Consistency	Interpretation of configuration
KS*~FLP	0.581020	0.581020	0.831610	A combination of high levels of KS behavior and low levels of fear of losing power provides a high level of satisfaction with knowledge sharing
Solution coverage:0.581020				
Solution consistency:0.831610				
~STAS=f(KS, FLP) **Attributes (causal configuration) → ~SATS (outcome)**				
Causal configuration	Raw coverage	Unique coverage	Consistency	Interpretation of configuration
FLP*~KS	0.550092	0.550092	0.838988	A combination of high levels of fear of losing power and low levels of KS behavior provides low levels of satisfaction with knowledge sharing
Solution coverage:0.550092				
Solution consistency:0.838988				

4. Discussion and Conclusions

The SEM results show that knowledge characteristics influence KS as well as the FLP. KCM and KCX positively contribute to KS, the more complementary and complex the knowledge; the more it stimulates KS. KCX increases the FLP, while KCM decreases it, probably because individuals recognize complex knowledge as a more valuable one.

The fsQCA findings corroborate the SEM results. KCM's presence alone leads to KS, while its absence and KCX's existence generate the FLP. KS behavior and not being afraid of losing power due to KS lead SATS. The fsQCA results reveal a much more complex causation of the sequential models used to address the phenomena at hand, which is particularly suitable for analyzing high levels of complexity (Fiss, 2011), involved in behavioral issues. The combination of the results from the mixed methods approach enable us to confirm the relevant roles that the antecedents considered in this study play in generating millennials' satisfaction in sharing knowledge. The integration of both outputs is robust since quantitative results and qualitative findings converge:

a) KS results from KCM: The SEM supports H1 in which KCM relates positively to KS. The fsQCA configuration in Table VI shows that a high level of KCM provides a sufficient condition for a high level of KS. Such results are in line with the effect produced by knowledge complementarities (Hamel *et al*., 1989; Milgrom *et al*., 1991; Kim *et al*., 2010), confirming individuals tend to share complementary knowledge (Kim *et al*., 2012).

b) The FLP results from the absence of KCMand the existence of KCX. The SEM supports H2 that KCM relates negatively to the FLP and supports H4 in which KCX relates positively to the FLP. The fsQCA configuration in Table VII shows that a combination of low levels of KCM and high levels of KCX provide a high level of the FLP. Our findings are consistent with sharing complementary knowledge being accepted as a practice that will benefit all collectively and thus generates no fear for it is not seen as a threaten (Kim *et al*., 2012). Regarding KCX, the lack of support for H3 might underline the "characteristics" of the respondents – millennials and the conditions of competing in a both competitive and cooperative setting. Millennials present a different cost-benefit analysis (Cabrera and Cabrera, 2002). They do not feel frightened by sharing complex knowledge that contributes to the progress of others. Thus, they do not perceive the loss of their competitive advantage in the organization, which is in contrast to Andolšek and Andolšek (2015).

c) SATS occurs when KS exists and the FLP is absent. The SEM supports H5 in which KS relates positively to SATS and H6 in which the FLP relates negatively to SATS. The fsQCA configuration in Table VIII shows that a combination of high levels of KS and low levels of the FLP provides a high level of SATS. This evidence shows that satisfaction with sharing knowledge results from a positive individual's evaluation and affective response to KS and a feeling of pleasure based on personal expectations (Chiu et al., 2011). It is also associated with altruism in helping others, which is a motivation for KS (Lo and Tian, 2020). Additionally, and since knowledge is a way to ensure power in organizations, there is a FLP (Iheukwumere-Esotu and Kaltungo, 2020; Smaliukienė *et al*., 2017) that is not associated with satisfaction or joy. So, individuals restrain themselves form sharing what they know (Evans et al., 2015; Silva de Garcia *et al*., 2020), and they share less and consequently feel less satisfied about sharing.

The introduction of diversity by using two different samples from Portugal and Poland brings to the discussion the importance of the cultural background and the generation traits related to KS. The results indicate that millennials behave in a similar way when the issue is KS despite the two different cultural backgrounds. Such results clarify the concerns of Lauring (2009) on the real effect of national culture dimensions on the discussion of KS in a context of international diversity. Millennials behave uniformly on Europe's western and eastern ends.

The theoretical implications of our quantitative study emerge from the specificity of the results on a particular generation: the millennials. Their behaviors show a generational social change as they have different behavioral options. Complex knowledge positively and significantly relates to both KS and the fear of losing power. While the impact of complex knowledge is stronger than the fear of losing power, the millennials keep sharing it. Millennials dare to do what they want (KS), despite the fear that comes with it. Therefore, the results of our research model show that the theory of reasoned action needs to be revised regarding millennials.

Practical implications regard the consequences of engaging in KS related routines and paying attention to the type of knowledge used in organizations. Managers should create knowledge repositories that individuals feel comfortable using and adding to. Reducing the fear of losing power and increasing the KS of millennials is a way managers can provide satisfaction to these workers in knowledge intensive organizations. Our results suggest that it is possible to adopt universal KS related practices in organizations with multicultural millennial employees. Such managerial uniformity supports the perceptions of internal equity in the treatment of employees and eases

the implementation of generalized practices that may generate positive consequences for performance. Social implications regard the effect managers can generate on organizational climate by increasing their millennials' satisfaction through KS. Managers may use knowledge management tools to facilitate KS.

We acknowledge the limitations due to the use of a small sample and the cross-sectional data that prevent us from suggesting causality, despite the cross-country database used and a double approach to the data. Future research should develop longitudinal studies to address the dynamics of building SATS over time. Additionally, we invite colleagues to check if employees in other age segments also react to the same antecedents that influence the satisfaction with KS for millennials.

Abstract: Goodwill is the most intangible of intangibles and continues to generate great debate in academic, business, and regulatory circles, with no consensus on its subsequent measurement. In early 2020, the International Accounting Standards Board (IASB) published a discussion paper entitled *DP/2020/1 Business Combinations – Disclosures, Goodwill and Impairment*, to gather input on more useful disclosures on business combinations, bringing back to the discussion the subject of the subsequent measurement of goodwill. The IASB received comments on its proposed disclosures, as well as new evidence and arguments on how to account for goodwill, having received 193 comment letters from a wide range of stakeholders. This study aims to analyse the perception of those interested parties about the subsequent measurement of goodwill proposed by the IASB, as well as the arguments used for its reasoning. For this purpose, the content of stakeholder's comment letters was analysed and classified as academics, auditors, investors, standard setters, preparers, regulators/securities, and others, and by region. In addition, the preparers' comment letters were subclassified by sectors of activity to identify differences in the perception of preparers by industry. These differences point to the need to reflect on the existence of more than one goodwill measurement model, which best fits the sector of activity, a pioneering aspect in research on goodwill. The results reveal a preference trend for the systematic amortisation of goodwill. In all categories of stakeholders, apart from the "Others", the preference is for the reintroduction of goodwill amortisation. Similarly, most stakeholders in the Americas, Asia, Europe, and Oceania are in favour of reintroducing the systematic amortisation of goodwill. In some industries (Automotive, Banking, Luxury Goods, Electrical Appliances, Energy and Technology) no preparer prefers the impairment-only model, which suggests that perhaps in those sectors of activity, this model is not suitable. This study contributes to the literature on the subsequent measurement of goodwill, as well as to the different stakeholders, by presenting, under different perspectives of analysis, the respondents' preferences on the subsequent measurement of goodwill, as well as the arguments in favour of each model.

Keywords: Goodwill, Intangibles, Impairment, Amortisation, IASB, Subsequent measurement

1. Introduction

In March 2020, the International Accounting Standards Board (IASB) published the Discussion Paper (DP) *Business combination: disclosures, goodwill and impairment* (IASB, 2020a), to receive input on the most useful disclosures on business combinations, bringing the subsequent measurement of goodwill back into public discussion. The IASB (2020a) highlights the relevance of goodwill in corporate accounts, with the value of that asset reaching around $8 trillion in 2019 in listed companies worldwide, representing approximately 18% of their equity and 3% of their assets.

In that DP, the IASB (2020a) preliminary view is to keep the impairment-only model and not to reintroduce goodwill amortisation. However, this position was not consensual among IASB members (8 of 14 Board members voted in favour). Therefore, the IASB solicited input from various stakeholders on this topic. The IASB received new evidence and arguments on how to account for goodwill, having received 193 comment letters from a wide range of stakeholders.

This study aims to analyse the perception of those interested parties about the subsequent measurement of goodwill proposed by the IASB, as well as the arguments used for its reasoning. In this context, this study aims to answer the following three research questions:

- What is the preference in the subsequent measurement of goodwill by stakeholder category?
- What is the preference in the subsequent measurement of goodwill by region?
- What is the preference in the subsequent measurement of goodwill by sector of activity of the preparers?

After the global financial crisis of 2008 and the subsequent sovereign debt crisis of the EURO, the current moment could not be of greater importance for the debate on the subsequent measurement of goodwill. Not only due to the economic crisis created by the pandemic by COVID-19 but also the war in Ukraine, with economic consequences on a global scale, phenomena that potentiate the recognition of goodwill impairment losses.

This study provides important contributions to the literature by presenting the respondents' preferences on the subsequent measurement of goodwill, as well as the arguments in favour of each model. The results of this study also contribute for future research, namely, to confront the preference trend of the respondents for the reintroduction of systematic amortisation, with the IASB's final position on the discussion on the subsequent measurement of goodwill. On the other hand, the differences in perception identified in this study point to the need to reflect on the existence of more than one goodwill measurement model, which best fits each activity sector, a pioneering aspect in research on goodwill.

The study is organised as follows: after this first section of the Introduction, section 2 presents the theoretical background of the research. Section 3 explains the methodology of content analysis of the comment letters received by the IASB to the DP. Section 4 presents the results of that analysis and, in section five, the main conclusions of the study.

2. Background

2.1 Accounting for Goodwill

IFRS 3 defines goodwill as an asset representing the future economic benefits arising from other assets acquired in a business combination that are not individually identified and separately recognised (IASB, 2020b). This is why goodwill is commonly dubbed the most intangible of intangibles, given its complex nature.

In 2004 was issued the IFRS 3 – *Business Combinations* that introduced the impairment-only approach and replaced International Accounting Standards 22 - *Business Combinations*, that was issued in November 1983, which required goodwill amortisation. The IASB began the IFRS 3 Post-implementation Review (PIR) in 2013 and published the *Report and feedback statement: post-implementation review of IFRS 3 Business Combinations* in June 2015. In March 2020, DP 2020/1 was published by the Board for comment only.

The first major joint accounting harmonisation project between the IASB and the FASB focused on business combinations (Hughes et al, 2017). As a result of this process, the majority of the accounting standard boards currently prescribe the initial recognition of goodwill acquired as an asset, subjecting it only to annual impairment tests in its subsequent measurement (Carvalho, 2015). The IFRS 3 was issued to improve the accounting treatment for goodwill and provide users with more useful and value-relevant information. However, it has been criticized on the grounds of the managerial discretion inherent in impairment testing (Abughazaleh, Al-Hares and Roberts, 2011; Carvalho, 2015; Hayn and Hughes, 2006; Li and Sloan, 2017).

The Board's preliminary view is that there is no compelling evidence to justify once again changing the accounting for goodwill and the costs that such a change would entail (IASB, 2020a). In other words, the IASB considers that goodwill amortisation should not be reintroduced but requests the indication of any new arguments or evidences that stakeholders have on this topic.

2.2 Literature Review

The adoption of the fair-value-based goodwill impairment approach in 2005 has been motivated by the assumption that the impairment approach will enable managers to provide information regarding goodwill that is value-relevant to the market (Colquitt and Wilson, 2002). However, several authors state that the goodwill impairment is not timely (Bepari and Mollik, 2017; Li and Sloan, 2017; Pechlivanidis, Ginoglou and Barmpoutis, 2022; Ramanna and Watts, 2012). Thus, the empirical evidence suggests that the impairment approach has resulted in inflated goodwill balances and untimely goodwill impairments, because the estimates of the current fair value of goodwill rely on unverifiable assumptions such as expectations of value to be generated by managers' future actions. Ramanna and Watts (2012) state that the unverifiability in goodwill accounting rules is used to manage financial reports opportunistically. They found some evidence of an association between goodwill non-impairment and CEO compensation, CEO reputation, and debt-covenant violation concerns.

Bepari and Mollik (2017) studied a sample of Australian companies for the period 2006-2009, and found a significant increase in the number of impairments recorded by companies. However, a large number of firms

did not impair goodwill even during the 2008-2009 global financial crisis, although their firms' market-to-book ratios were less than one. These results are consistent with those of Carvalho (2015) and Li and Sloan (2017), concluding that the model of impairment-only is subject to opportunistic managerial behaviour.

Some empirical findings suggest that only current-year acquired goodwill is value relevant compared to older goodwill, and therefore goodwill's impact on stock prices is decreasing as it ages (Pechlivanidis, Ginoglou and Barmpoutis, 2022). However, there is also evidence that under the impairment approach the value relevance of goodwill does not decline with the ages of goodwill (Bepari and Mollik, 2017). These results contrast with those of Bugeja and Gallery (2006) under the amortisation regime, by concluding that the market assumed that the remaining goodwill balance has lost its value relevance. The study of Bagna, Ramusino and Ogliari (2023) shows that the information provided by listed companies to market investors, under the current accounting regime (impairment-only), is value relevant and contributes to explain the level of the market to tangible book value multiple.

The findings above, lead us to the question of comparability. In this regard, Durocher and Georgiou (2021) state that the concept of comparability is different for standard setters and analysts/investors. The authors refer that for the standard setters: information about a reporting entity is more useful if it can be compared with similar information about other entities and with similar information about the same entity for another period or another date; and for the users: comparability is about being able to cross compare companies that adopt different growth strategies. Users strive to compare acquisitive firms to organically-grown firms. So, users hence tend to ignore goodwill and goodwill impairment losses. For its part Ma and Zhang (2023), refer in their study on intangible assets, that to enhance comparability, standard-setters, regulators and practitioners should work together to establish more industry-specific guidance on the timing of research and development (R&D) capitalization.

The subjective nature of goodwill impairments also makes it difficult for auditors and regulators to enforce impairments (Li and Sloan, 2017), with goodwill impairment tests being commonly cited as an audit deficiency (Ayres, et al, 2019). Estimates to measure goodwill are based on unverifiable characteristics, assumptions and cash flow projections, requiring the audit of this asset to be subject to extensive professional scepticism (Chambers and Finger, 2011).

Ferramosca and Allegrini (2021) found evidence that accounting culture affects chief financial officers' preferences for the impairment-only model or the amortisation model, which is consistent with the study of André, Filip and Paugam (2016), that find differences in the frequency and magnitude of goodwill impairment losses reported by European-listed firms compared with what is reported by US-listed firms. During the financial crisis, European-listed firms reported a significantly smaller proportion of goodwill impairment losses concerning goodwill balances than US-listed firms. In this respect, Martínez, Rubio and Morales (2023) warn of the lack of studies covering samples of several countries and a deeper analysis of the factors that may justify those differences between companies and countries. In the studies on the contrast of the application of different goodwill accounting practices, those authors concluded that sample sizes and composition are varied and there is generally no distinction between different sectors of activity. On the other hand, Linsmeier, Wangerin and Wheeler (2020) conclude that a one-size-fits-all subsequent accounting alternative for goodwill may be difficult to apply, due to heterogeneity in the economic components of goodwill.

The various stakeholders try to influence the standards-setting process in order to maximise utility for themselves (Hartvvig, 2012; Sutton, 1984; Watts and Zimmerman, 1978), whereby the lobbying is most productive when the rule-makers' preferences are still undecided (Sutton, 1984). Because changes in IFRS may pressure national standard-setters to change country-specific standards, the IASB has been subjected to lobbying efforts from not only preparers, users, accounting professionals and academics but also from regulators and national standard-setters (Hughes et al., 2017).

3. Methodology

This study aims to analyse the perception of those interested parties about the subsequent measurement of goodwill proposed by the IASB, as well as the arguments used for its reasoning. The rational-choice model of lobbying serves as the main theoretical lens that guides the examination of these matters (Sutton, 1984). By recognising that the accounting standard-setting process is political, it is accepted that there are different conflicting interests among the parties involved, which will have some impact on the standard to be set (Fogarty, Hussein and Ketz, 1994).

The methodology used for data collection was content analysis (Bardin, 1977) of the 193 comment letters received by the IASB to DP/2020/1, transcribing into an analysis grid the content of the comment letters that allowed answering the three research questions defined in the Introduction. Thus, we proceeded to collect the respondents' answers about their preference on the subsequent measurement of goodwill (in favour of the amortisation model; in favour of the impairment-only model; in favour of another approach; or no preference/response). The content of the 193 comment letters was subsequently classified by type of stakeholder (academics, auditors, investors, standard-setters, preparers, regulator/securities, and others), following the methodology of other studies (*e.g.* Anantharaman, 2015; Bautista-Mesa, Muñoz-Tomás and Horno-Bueno, 2019; Giner and Arce, 2012) and the classification of the IFAC (2008). In the particular case of preparers, they were then classified by activity sector in order to identify differences in perceptions by sector.

The IASB establishes accounting standards now used in some form in over 160 countries. Diverse geographical participation in IFRS standard-setting is seen as desirable as it may improve the consistency of IFRS applications, reduce criticism of regional over-influence, and promote the legitimacy of the IASB (Larson and Herz, 2013). The comment letters were also classified by geographical region.

It should be noted that, of the 193 comment letters analysed, 22 are from a group of Malaysian students, the vast majority advocating the impairment-only model. In order not to bias our analysis, those 22 comment letters were considered as only one response, in the category of academics. Thus, our final sample consists of 172 comment letters. It should also be noted that, although most respondents followed the structure of the questions posed in DP/2020/1, some did not, indicating only their general position on the subsequent measurement of goodwill. On the other hand, some respondents gave brief and direct answers, but others gave exhaustive answers, which required complex, time-consuming and very careful work to interpret the answers, for subsequent classification of their position.

4. Results

4.1 Preference in the Subsequent Measurement of Goodwill by Stakeholder Category

To answer the first research question, we classified the respondents by their role in the financial reporting chain: academics; auditors; investors; standard-setters; preparers; regulators/securities; and others (Table 1).

Table 1: Responses from Comment Letters by Stakeholder Category

Category	In favour of the amortisation		In favour of the model impairment-only		Another approach		No preference/ response		Total	
Academics	11	6.4%	9	5.2%	2	1.2%	1	0.6%	23	13.4%
Auditors	10	5.8%	6	3.5%	-	0.0%	-	0.0%	16	9.3%
Investors	6	3.5%	5	2.9%	1	0.6%	-	0.0%	12	7.0%
Standard-setters	26	15.1%	16	9.3%	2	1.2%	7	4.1%	51	29.7%
Preparers	33	19.2%	11	6.4%	6	3.5%	6	3.5%	56	32.6%
Regulator/securities	4	2.3%	2	1.2%	-	0.0%	2	1.2%	8	4.7%
Others	-	0.0%	2	1.2%	1	0.6%	3	1.7%	6	3.5%
Total	**90**	52.3%	**51**	29.7%	**12**	7.0%	**19**	11.0%	**172**	100.0%

The responses in favour of the amortisation model, preparers and standard-setters stand out, accounting for 62% of the responses received by the IASB. These two categories are mainly in favour of reintroducing goodwill amortisation (34.3%). Regarding those in favour of the impairment-only model, preparers and standard-setters are also those who most support this model but are less representative (15.7%) than those in favour of the amortisation model. The likelihood of lobbying is greater among preparers than among investors (Georgiou, 2010; Hewa, Mala and Chen, 2020; Rey, Maglio and Rapone, 2020), so greater participation from that category of respondents was already expected. The same applies to the participation of standard-setters, given the influence of IASB standards on accounting standards in each country (Hughes et al., 2017).

Although in all the categories presented most respondents are in favour of reintroducing the amortisation of goodwill, academics and investors stand out as they are the ones where the difference between the number of

responses in favour of reintroducing amortisation (17) and the number of responses in favour of the impairment-only model (14) is smaller. The auditor's category also stands out, more specifically concerning the Big4, their positions being divided (2 prefer the reintroduction of amortisation, and 2 are in favour of maintaining the impairment-only model).

Among the comment letters in favour of the reintroduction of the amortisation, we highlight the one from *La Société Française des Analystes Financiers*, classified in the investors' category, defending that the current impairment-only model has to underlie that the economic benefits associated with the goodwill are difficult to capture, both in terms of timing and amount of realization. As such, goodwill is an asset that is consumed over time and therefore should be depreciated systematically.

As for the advocates of maintaining the impairment-only model, EFRAG's response (in the category of standard-setters) stands out. Considering that an accounting policy should only be changed if it would provide reliable and more relevant information, EFRAG suggests the IASB further explore improvements to existing impairment tests and any cost and consequences of reintroducing amortisation.

In the categories in favour of another approach, 7 respondents consider that the treatment of goodwill should be a matter of accounting policy choice and that the standard should prescribe different subsequent measurement models. In this group is also a preparer who supports a global review of goodwill accounting, from its initial recognition (reopening the discussion on whether goodwill is or is not an asset), to its subsequent measurement.

In the group "No preference/response" is the response of the European Securities and Markets Authority (ESMA) as it does not clearly express its preference on the subsequent measurement of goodwill. If, upon further assessment, the IASB confirms its preliminary conclusion that the current impairment test cannot be significantly improved at a reasonable cost for issuers, ESMA considers that the Board should explore the possible re-introduction of goodwill amortisation. ESMA highlights that the existing impairment-only model is not sufficiently enforceable and auditable. This group also includes the response of the International Organization of Securities Commissions (IOSCO): some members argue that the IASB should improve the impairment test before considering re-introducing amortisation; others argue for the urgent re-introduction of goodwill amortisation to improve the reliability and usefulness of financial statements.

4.2 Preference in the Subsequent Measurement of Goodwill by Region

To answer the second research question, the content of the stakeholders' comment letters was classified by region (Table 2). The United Kingdom is the only European country in which most respondents support the impairment-only model, which is why it was separated from the other European countries in Table 2.
In the Europe region (ex. UK), respondents from France are the most divided, although they are more in favour of the amortisation than the impairment-only model. On the contrary, from Germany, Sweden, and Switzerland there is no comment letter in favour of the impairment-only model. We also highlight 6 comment letters from European bodies that we do not allocate to any country, but to the European continent as a whole (3 in favour of amortisation, 1 in favour of the impairment-only model, and 2 with no preference).
The respondents from Latin America are largely in favour of reintroducing goodwill amortisation, while in North America the respondents are divided: Canada favours the impairment-only model, while in the United States there is a slight preference for the amortisation regime. As regards the Asian continent, the answers come from 11 countries, with respondents from India, Korea, Malaysia and Thailand favouring the impairment-only model. We consider in the international group the respondents representing countries from different continents (*e.g.* Auditors/Big4).

The analysis of the results suggests that the legal system of the respondents' countries influences the preference for the subsequent goodwill measurement model. Overall, the 11 countries that contributed the most comment letters represent 55% of the responses obtained, which can be divided into two subgroups according to their legal system (La Porta et al, 1998): civil law (Germany, Brazil, China, France, Japan, the Netherlands and Switzerland), with 38 responses in favour of reintroducing amortisation, and 8 for the impairment-only model); and common law (Australia, Canada, US and UK) with 16 responses in favour of amortisation; and 15 in favour of the impairment-only model). Most respondents from civil law countries are in favour of reintroducing goodwill amortisation, while those from the common law regime are divided (with a slight preference for amortisation). In terms of representativeness of participation, our results are similar to those of Larson and Herz (2013).

Table 2: Responses from Comment Letters by Region

Region	In favour of the amortisation		In favour of the model impairment-only		Another approach		No preference/ response		Total	
Europa (ex. UK)	**36**	**66.7%**	**5**	**9.3%**	**5**	**9.3%**	**8**	**14.8%**	**54**	**100.0%**
Germany	11	84.6%	-	0.0%	1	7.7%	1	7.7%	13	100.0%
France	4	50.0%	3	37.5%	1	12.5%	-	0.0%	8	100.0%
Netherlands	4	57.1%	1	14.3%		0.0%	2	28.6%	7	100.0%
Switzerland	3	60.0%	-	0.0%	1	20.0%	1	20.0%	5	100.0%
Sweden	3	100.0%	-	0.0%	-	0.0%	-	0.0%	3	100.0%
Others	11	61.1%	1	5.6%	2	11.1%	4	22.2%	18	100.0%
United Kingdom	**6**	**35.3%**	**8**	**47.1%**	**2**	**11.8%**	**1**	**5.9%**	**17**	**100.0%**
America	**16**	**55.2%**	**9**	**31.0%**	**2**	**6.9%**	**2**	**6.9%**	**29**	**100.0%**
Latin America	11	78.6%	3	21.4%	-	0.0%	-	0.0%	14	100.0%
United States	4	44.4%	3	33.3%	1	11.1%	1	11.1%	9	100.0%
Canada	1	16.7%	3	50.0%	1	16.7%	1	16.7%	6	100.0%
Asia	**15**	**50.0%**	**10**	**33.3%**	**2**	**6.7%**	**3**	**10.0%**	**30**	**100.0%**
China	4	44.4%	3	33.3%	1	11.1%	1	11.1%	9	100.0%
Japan	5	83.3%	-	0.0%	-	0.0%	1	16.7%	6	100.0%
Singapore	2	50.0%	1	25.0%	1	25.0%	-	0.0%	4	100.0%
Others	4	36.4%	6	54.5%	-	0.0%	1	9.1%	11	100.0%
Oceania	**6**	**50.0%**	**4**	**33.3%**	**1**	**8.3%**	**1**	**8.3%**	**12**	**100.0%**
Australia	6	66.7%	2	22.2%	-	0.0%	1	11.1%	9	100.0%
New Zealand	-	0.0%	2	66.7%	1	33.3%	-	0.0%	3	100.0%
Africa	**3**	**37.5%**	**5**	**62.5%**	-	**0.0%**	-	**0.0%**	**8**	**100.0%**
International	**7**	**38.9%**	**8**	**44.4%**	-	**0.0%**	**3**	**16.7%**	**18**	**100.0%**
Others (Unidentified)	**1**	**25.0%**	**2**	**50.0%**	-	**0.0%**	**1**	**25.0%**	**4**	**100.0%**
Total	**90**	**52.3%**	**51**	**29.7%**	**12**	**7.0%**	**19**	**11.0%**	**172**	**100.0%**

The preference for impairment-only model is higher in countries with a less conservative accounting culture. More optimistic accounting cultures exist mostly in Anglo-Saxon countries (André et al., 2016; Ferramosca and Allegrini, 2021). It is curious to note that US and Australia respondents prefer the amortisation model. This preference is noticeable in the preparers category, which suggests that the sector of activity of these respondents may be influencing their response.

4.3 Preference in the Subsequent Measurement of Goodwill by Sector of Activity of the Preparers

To answer the third research question, we classified the content of the 56 comment letters from preparers by activity sector, as shown in Table 3. In the "Others" sector are included the responses received from business associations or preparers not fitting into a specific sector.

From the automotive sector, both Ford Motor Company (USA) and Volkswagen Group (Germany) are in favour of the reintroduction of depreciation. Along the same lines, the Banks sent 6 comment letters, 4 of which were in favour of the reintroduction of depreciation (Germany, UK, France, and Netherlands). For example, Barclays believes that it would be beneficial to re-introduce amortisation of goodwill. Also, the European Association of Co-operative Banks (EACB) believe that amortisation is the only way to show the consumption of goodwill over its useful life and prevent the entities from recognizing "internal goodwill".

In the luxury goods sector, Swiss company Richemont is firmly against the Board's proposal to not reintroduce the amortisation of goodwill. They consider that acquired goodwill is not an indefinite life asset. This is particularly true in the current environment, with the impact of technology leading to rapid changes in business models across many industries. In the communications sector, meanwhile, there is only one comment letter from the French group Vivendi, which is in favour of the impairment-only model.

Of the 3 comment letters framed within the consultant sector, there are two that are in favour of the impairment-only model, although one of them agrees that, in some circumstances, such as limited life mining operations, it might be better that goodwill be amortised rather subject to the impairment test. In turn, the respondent from the electrical appliances sector (Siemens) does not express a preference as to the subsequent treatment of goodwill, acknowledging that there are benefits and challenges to both models for subsequent goodwill accounting.

Table 3: Responses of Comment Letters from Preparers by Activity Sector

Sector of activity	In favour of the amortisation		In favour of the model impairment-only		Another approach		No preference/ response		Total	
Automotive sector	2	100.0%	-	0.0%	-	0.0%	-	0.0%	2	100.0%
Bank	4	66.7%	-	0.0%	1	16.7%	1	16.7%	6	100.0%
Luxury Goods	1	100.0%	-	0.0%	-	0.0%	-	0.0%	1	100.0%
Communication	-	0.0%	1	100.0%	-	0.0%	-	0.0%	1	100.0%
Consultant	1	33.3%	2	66.7%	-	0.0%	-	0.0%	3	100.0%

In the energy sector, the 9 preparers are from the American, European and Oceania continents. Of these, 8 preparers are in favour of the reintroduction of amortisation, with only 1 considering that amortisation should be reintroduced as an accounting policy option. In other words, there is great unanimity in this sector for the reintroduction of the systematic amortisation of goodwill. These preparers argue that the current impairment test is very onerous and not provides useful information about the performance of an acquisition. They believe that goodwill has a finite life and should be amortised over time.

Of the 11 preparers who are in favour of the impairment-only model, 3 are from the insurance sector, which is the one with the highest number of companies (37.5%) advocating this model. As for the technology sector, 2 respondents support the reintroduction of goodwill amortisation. They argue that the current requirement for an annual impairment test is onerous, requiring significant resources to develop internal forecasts and document related assumptions despite the absence of any indication of impairment. Goodwill has a finite life and is consistently being consumed and replaced by internally generated goodwill.

Of the 23 comment letters grouped under "other", about half (12) favour systematic amortisation of goodwill, 5 favour the impairment-only model, 4 advocate another approach, and 2 have no preference. For example, Business Europe and the 100 Group argue to give companies an accounting policy choice to amortise, or not, based on their assessment of whether the goodwill has, or not, a limited life. The Brazilian Association of Publicly-Held Corporations (ABRASCA) strongly supports a hybrid approach that combines goodwill's amortisation with impairment. The Confederation of Swedish Enterprise, for its part, highlights the improvement of comparability between entities with different growth strategies (organic *versus* through acquisitions) as the main argument for reintroducing the systematic amortisation of goodwill. This argument is consistent with the analysts/investors' perspective of the concept of comparability, once the users strive to compare acquisitive firms to organically-grown firms (Durocher and Georgiou, 2021).

5. Conclusions

From the results presented in this study, which focused on the analysis of the content of 172 comment letters to DP/2020/1 of the IASB, in all categories of stakeholders, apart from the "Others", the preference is for the reintroduction of goodwill amortisation. Similarly, an analysis by region also shows that most stakeholders in the Americas, Asia, Europe, and Oceania are in favour of reintroducing the systematic amortisation of goodwill. Only respondents from the African continent are mostly in favour of the impairment-only model, as well as a group of respondents who operate at an international level.

When analysing the 56 comment letters of the preparers by sector of activity, in some sectors (Automotive, Banking, Luxury Goods, Electrical Appliances, Energy and Technology) no preparer prefers the impairment-only model, which suggests that perhaps in those sectors of activity, this model is not suitable. Some of those respondents mention that the pace of change at the technological level, in customer preference, market

competition and substitute products, among others, contribute to the goodwill acquired losing value over time and having to be systematically replaced by internally generated goodwill.

In fact, in the past the pace of change in the economic environment was slower, contributing to a view that goodwill could remain indefinitely in the balance sheet of companies. However, nowadays, in a world of constant change, where companies need to constantly reinvent themselves, otherwise they may be excluded from the market, the concept that acquired goodwill does not lose value may be outdated. These companies are daily replacing acquired goodwill with internally generated goodwill, reinvesting in the renewal of their goodwill, just as they do with their tangible fixed assets. In this way, the acquired goodwill is being consumed in a going concern.

Indeed, the IASB itself has expressed concern that IAS 38 might be outdated in various ways in the new economy. As of IASB's April 2022 meeting, revisiting financial reporting standards on intangible assets is finally

considered to be a research pipeline project for the coming five years. To enhance comparability, standard-setters, regulators, and practitioners should work together to establish more industry-specific guidance (Ma and Zhang (2023).

This study provides important contributions to the literature on the subsequent measurement of goodwill, as well as to the different stakeholders of financial information, by presenting, under different perspectives of analysis, the respondents' preferences on the subsequent measurement of goodwill, as well as the arguments in favour of each model. The results of this study may be the basis for future research, namely, to confront the preference trend of the respondents for the reintroduction of systematic amortisation, with the IASB's final position on the discussion on the subsequent measurement of goodwill. On the other hand, the differences in perception identified in this study point to the need to reflect on the existence of more than one goodwill measurement model, which best fits each activity sector, a pioneering aspect in research on goodwill.

Abstract: Governments and organizations utilize Knowledge Management to create, share, use, and manage their knowledge to gain competitive and strategic advantages. They also use Futures Research techniques, such as Foresight, technology assessment, and technological forecasting, to comprehend the forces that shape the future and consequently affect them. Despite Knowledge Management and Futures Research being two distinct subjects, they support decision-making processes and help people make the right decisions, sharing unexplored similarities. However, there is a lack of understanding regarding the relationship between Knowledge Management and Futures Research, the integration of Futures Research techniques to support Knowledge Management processes within organizations, and how specific Futures Research techniques align with different knowledge dimensions. A brief search showed us that academic literature that combines knowledge from both areas is quite scarce. By identifying the similarities between Knowledge Management and Futures Research, this work aims to demonstrate how to apply Futures Research techniques to Knowledge Management processes, particularly in the SECI (Socialization, Externalization, Combination, and Internalization) knowledge creation and conversion model. Therefore, this study analyzes 53 Futures Research techniques, such as Scenarios, Brainstorming, Expert Panels, Delphi, and Bibliometrics, among others, to establish a relationship between Knowledge Management and Futures Research. The proposal also includes exploring the relationship between different Futures Research techniques and the four knowledge conversion dimensions according to the SECI model, providing justification for how Futures Research techniques can be helpful for knowledge conversion activities. With the relationships between Futures Research techniques and Knowledge Management processes established, a framework is provided for further development of practical guidance on how organizations and governments can integrate the implementation of Knowledge Management and Futures Research techniques, particularly with methods that are useful for decisions regarding technological investments. Understanding the relationship between Knowledge Management and Futures Research is expected to provide valuable insights for governments and organizations seeking to improve their decision-making processes through Knowledge Management.

Keywords: Knowledge management, Futures research, SECI model, Decision-Making processes

1. Introduction

The VUCA (Volatile, Uncertain, Complex, and Ambiguous) acronym often describes our contemporary world, characterized by constant change, encompassing potentially harmful disruptions and beneficial advancements. However, uncertainty yields understanding, as it constitutes an opportunity for leaders to listen and understand, thus discovering new ways of thinking and acting (Johansen, 2007).

Knowledge Management (KM) is one of many tools organizations can use to deal with the so-called VUCA world. The primary purpose of KM is to share perspectives, ideas, experiences, and information (Colburn, 2012). Making sure that the correct information is available to the right people at the right time enables informed decisions, thus helping these people gain the necessary understanding to mitigate uncertainties. Another way to deal with uncertainty is by utilizing Futures Research. By applying a series of methodologies related to this area of Futures Research, one can forecast change and anticipate future threats or opportunities. Scenarios, Cross-impact Analysis, and SWOT are among other techniques in the Futures Researcher toolbox, which will help him tackle the lack of predictability in general. Despite KM and Futures Research's goal of assisting people in making the right decisions, literature combining both areas is limited.

This work explores how Knowledge Managers can use Futures Research methods in their processes, specifically in the SECI (Socialization, Externalization, Combination, and Internalization) model. We analyze 53 Futures Research techniques and establish parallels between them and the four modes of knowledge conversion in the SECI model and KM processes in a generic KM model.

Through this analysis, we aim to create an interface between KM and Futures Research, demonstrating how the latter can enhance KM processes and also how Futures Research can benefit from KM. This interface is expected to benefit both areas, particularly in decision-making processes related to forecasts and technological investments.

2. Literature

In this article, we will explore two different topics: KM and Futures Research. This section aims to provide the necessary theoretical foundation for the subsequent discussion in Section 3, in which we will establish a relationship between KM and Futures Research. Sub-section 2.1 will present some definitions of KM and explain the SECI model of knowledge dimensions. Sub-section 2.2 will focus on Futures Research, a transdisciplinary field that explores possible, plausible, and preferable futures using different methodologies and techniques. We will discuss the classifications of Futures Research methods based on their nature, approach, family, and capability.

2.1 The SECI Model and Generic Knowledge Management Models

The role of knowledge as a critical source of potential advantage for organizations and hence whole economies has been a hotly debated topic over the last decades. It has become one of the essential factors in business strategies associated with technological innovation capacity, producing competitive advantages. It follows that for organizations, individuals, and society, the processes of knowledge creation or acquisition, communication, application, and usage, must be effectively managed (Quintas, Lefrere and Jones, 1997). In this way, KM has become necessary in this scenario.

There is a variety of definitions of KM in the literature. According to Davenport and Prusak (1998), KM is related to capturing, distributing, and effectively using knowledge. Later, Duhon (1998) considered KM a discipline that promotes an integrated approach to identifying, capturing, evaluating, retrieving, and sharing an enterprise's information assets, including databases, documents, policies, procedures, and expertise previously captured from workers' knowledge. This variety of studies of KM over the last years has resulted in the development of different techniques and methods.

In their different definitions and classifications, models and processes of KM have been the object of extensive analysis in the literature of the last years. Nonaka and Takeuchi (1995) developed the most widely known contribution, which expresses a shared knowledge creation process model. Figure 1 shows a straightforward representation of the SECI model. This model considers knowledge either tacit (unarticulated, non-verbalized, and intuitive) or explicit (articulated, specified by writing, drawing, among others) and evidences the ways of knowledge transformation: Socialization (tacit to tacit knowledge, e.g., a chat between colleagues), Externalization (tacit to explicit knowledge, e.g., formalizing a body of knowledge in the form of a document or audiovisual media), Internalization (explicit to tacit knowledge, e.g., translating theory into practical activity), and Combination (explicit to explicit knowledge, e.g., combining, merging existing ideas).

FROM	**Tacit**	**Socialization**	**Externalization**
	Explicit	**Internalization**	**Combination**

Figure 1: The SECI Model for Knowledge Creation and Conversion. Adapted From Nonaka and Takeuchi (1995)

Stollenwerk (1999) presents a survey that groups existing KM models in the literature based on similar concepts, as shown in Figure 2. This grouping evidenced equivalences between the processes present in the different works, bringing nine sets of KM processes, namely: (i) *Identification*, (ii) *Capture*, (iii) *Selection and Validation*, (iv) *Organization and Storage*, (v) *Sharing*, (vi) *Application*, and (vii) *Creation*. This broad study led to the development of a generic KM model that unifies and synthesizes the different aspects addressed by the literature, circumscribed by KM facilitating factors, which are: (a) *Leadership*, (b) *(Organizational) Culture*, (c) *(Information and Communication) Technology*, and (d) *Measurement and Reward*.

The *Identification* process involves identifying the knowledge that is needed and available, as well as mapping the sources of necessary knowledge. The *Capture* process is associated with acquiring the required knowledge

and can be done using internal or external sources. The *Selection and Validation* process filters the captured knowledge, assesses its relevancy and reliability, and consolidates valuable knowledge while discarding redundant, uncertain, and unhelpful knowledge. The *Organization and Storage* process ensures that knowledge can be retrieved quickly. This knowledge retrieval is usually done through software-based storage systems. The *Sharing* process is about facilitating access to the stored knowledge and disseminating it to others. It also relies on software to enable easy sharing. The *Application* process involves applying the knowledge to specific situations and sharing experiences and lessons learned. Finally, the *Creation* process involves knowledge externalization, creative thinking, research, experimentation, discovery, and innovation. These activities promote learning, help to generate new knowledge, and support the development of new ideas and solutions (Stollenwerk, 1999).

Leadership has a primary role as KM is a facilitating factor since corporate leadership is essential to sponsor Knowledge Management. The Organizational Culture is a facilitating factor focusing on excellence, flexibility, self-management, proactivity, and future vision. *Information and Communication Technology* provides KM systems for storing, sharing, and organizing knowledge. *Measurement and Reward* is the facilitating factor that improves the focus on the actions that achieve mensurable goals and performance indicators (Stollenwerk, 1999).

Section 3 will establish a relationship between some Futures Research methods, the SECI model dimensions, and the generic KM model processes in Figure 2. The SECI and generic KM models proposed by Stollenwerk (1999) will serve as interfaces between KM and Futures Research.

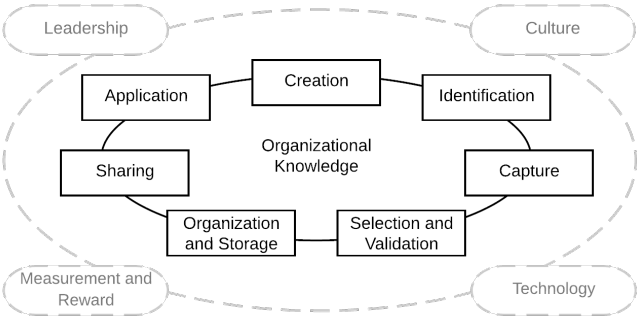

Figure 2: KM Processes And their facilitating factors. Adapted From Stollenwerk (1999).

2.2 Futures Research

Futures Research is a transdisciplinary field that uses various methods to explore possible, plausible, and preferable futures (Bengston, 2019). Its activities involve the analysis of technology futures and impacts (Johnston, 2008). These activities aim to formulate and test possible and desirable futures to assist decision-making, including analyzing how these conditions can change from implementing policies and actions (Reis, Vincenzi and Pupo, 2016).

Because of its broad definition, involving a variety of methodologies and techniques for the analysis of technology future, different classifications for Futures Research methods are present in the literature. Futures Research methods may be classified in different ways according to:

- *Nature*: Popper (2008) classifies methods as qualitative (soft), quantitative (hard), or semi-quantitative. Qualitative methods deal with the subjective and creative perception of events and their meanings. Quantitative methods comprise statistical analyses of datasets, such as historical series or economic indicators. Semi-quantitative methods rely on mathematical models to reduce the subjectivity of opinions from non-professionals or experts.
- *Approach*: Porter et al. (2004) divide Futures Research methods into normative or exploratory. Normative Futures Research methods start from perceiving future needs and aim to delimit the decisions and actions leading to the desired scenario. Explorative methods produce possible future scenarios from the extrapolation of the present situation.
- *Family*: Porter et al. (2004) offer a classification of the individual methods into nine families as follows: (i) *Creativity*, (ii) *Descriptive and Matrices*, (iii) *Statistical*, (iv) *Expert Opinion*, (v) *Monitoring and Intelligence*, (vi) *Modeling and Simulation*, (vii) *Scenarios*, (viii) *Trend Analyses*, (ix) *Valuing/Decision/Economic*.

- *Capability*: Another kind of classification, developed by Popper (2008), is related to its ability to gather or process information based on evidence, expertise, interaction, or creativity – attributes not exclusive or restrictive but quantified together in a polar multidimensional way. Evidence-based methods are based on knowledge usually already public, such as statistics or documentation, that is, explicit knowledge. Methods based on creativity are strongly influenced by imaginative thinking, such as science fiction and simulation games; therefore, they are based on tacit knowledge. Expertise-based methods rely on expert opinions and the data underlying those opinions; interaction-based methods involve knowledge exchange and discussion. Thus, both methods can depend on both tacit and explicit knowledge. This classification is the basis of the widely known Foresight Diamond, represented in Figure 3.

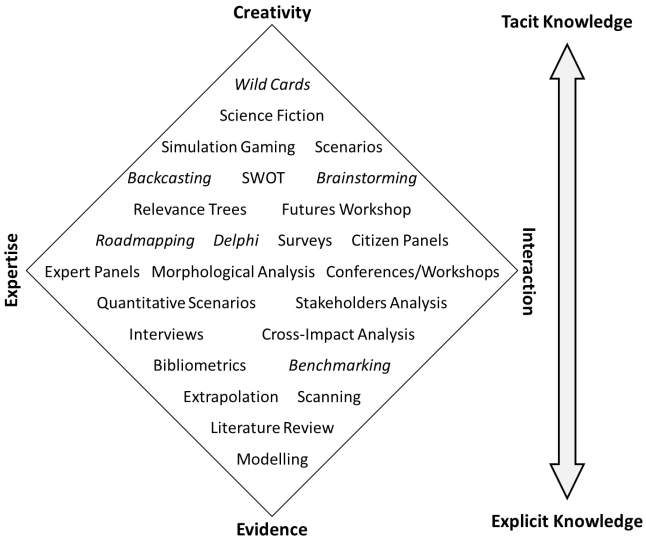

Figure 3: Adaptation of the Foresight Diamond (Popper, 2008) to Highlight the Knowledge Types Involved

3. Identifying Knowledge Management Processes in Futures Research

The relationship between Knowledge Management and Futures Research is pertinent because Knowledge Management focuses on managing knowledge within a company, while Futures Research aims to predict future events. By incorporating upcoming trends into Knowledge Management, a company can gain a competitive advantage by identifying early market risks and opportunities. Ultimately, the goal is to effectively comprehend, store, and utilize information about the future (Castro *et al.*, 2019). According to Junior *et al.* (2019), using both Knowledge Management and Futures Research can provide three significant benefits to organizations. First, organizations that manage their knowledge tend to perform better in Futures Research activities than those that don't because much of the necessary knowledge is already identified and explicit. Second, Futures Research can help identify, create, acquire, store, transfer, and use organizational knowledge, generating feedback to improve Knowledge Management processes. Finally, organizations with structured knowledge tend to be more resilient, enabling them to deal better with uncertainty, develop innovation, and explore new business fields.

The methodology we used to establish the relationships between Knowledge Management and Futures Research was based on the works of Nonaka and Takeuchi (1995), Stollenwerk (1999), Eerola and Miles (2011), and Barbosa (2018). By thoroughly reading the 53 descriptions of Futures Research methods provided by Barbosa (2018), we were able to determine the type of knowledge conversion each method employed (according to the SECI model) and its corresponding Knowledge Management process (according to Stollenwerk's generic KM model). Furthermore, by analyzing the knowledge-based perspective proposed by Eerola and Miles (2011) for Futures Research methods, we connected it with the same 53 methods and their categories. Thus, the bridge between Knowledge Management and Futures Research was constructed through an in-depth analysis of each method based on the abovementioned authors.

Section 3 establishes our view of the relationship between Futures Research and Knowledge Management, based on the Futures Research and Knowledge Management processes and SECI Dimension. First, in Sub-section 3.1, we show how to apply Futures Research methods to KM processes. Then, in Sub-section 3.2, we show how

organizations can incorporate KM into Futures Research. We aim to provide practical guidance on integrating Knowledge Management and Futures Research techniques in organizations.

3.1 From Futures Research to Knowledge Management

A reflection on Futures Research's objectives, methods, and practices can point out that Futures Research is nothing more than a process that involves finding, developing, merging, using, and creating knowledge about the future (Eerola and Miles, 2011). Its primary purpose is to assist in decision-making about the future scenario, which involves both historical and contemporary knowledge and its implications for the future.

Table 1 presents a set of 53 Futures Research methods and their classification according to approach and family. While some methods, such as Brainstorming, are well-known and widely used by KM practitioners, others – like *TRIZ* and *FAR* – may be less familiar to those outside the Futures Research field. As Barbosa (2018) provides a detailed description of each of the 53 methods, this work will focus on establishing the relationship between these methods and the corresponding SECI model dimensions associated with a KM process. We can identify the relationship by analyzing these descriptions and comparing them with the works in Sub-section 2.1. This association is justified because all the listed methods involve some form of knowledge conversion and are thus relevant to the KM process. More specifically, as Futures Research often involves generating knowledge for strategic planning, the processes of *Identification*, *Capture,* and *Creation* of knowledge are the ones that can most benefit from applying a specific method.

In our efforts to draw parallels between the methods chosen and knowledge conversion activities, we concluded that methods from the *Expert Opinion* and *Creativity* families, as well as methods that involve the elaboration of alternative futures – *Brainstorming*, *Delphi*, *Focus Groups*, *Interviews*, *Options Analysis*, *SWOT*, *Science Fiction Analysis*, *TRIZ*, and *Vision Generation* – are related to the *Externalization* mode of knowledge conversion because their main goal is to convert the tacit knowledge to be expressed by the participants into explicit knowledge. On the other hand, methods that deal with structured data, whether numerical or not, established by databases, documents, and other subsidies, are associated with the *Combination* mode. Examples include *Bibliometrics*, *Cross-Impact Analysis*, *Demographic Analysis*, *Trend Extrapolation*, and *Trend Impact Analysis*. The *Socialization* mode and *Externalization* mode are often used together in workshops or group-related methods to convert tacit knowledge into both tacit and explicit knowledge. Since none of the methods listed in the table convert explicit knowledge into tacit knowledge, *Internalization* is omitted. However, it is important to note that the classification of methods according to their relationship with knowledge conversion activities may vary depending on the theoretical framework or perspective adopted.

The last column of Table 1 suggests the KM processes where the methods can be best applied. We used the generic KM model proposed by Stollenwerk (1999), which includes the *Identification* process for identifying critical knowledge, the *Capture* process for acquiring essential abilities, experiences, and knowledge, and the *Creation* process for generating new knowledge through learning, research, experimentation, and innovation. *Scenarios* can be used across all three processes. Other methods such as *Action Analysis*, *AHP*, *Decision Analysis*, *and Relevance Trees* do not focus on generating new knowledge but instead, identify necessary knowledge to prepare for more complex knowledge generation processes. We could not relate the other processes in Sub-section 2.1 to any of the listed methods.

Futures Research has many diverse methods, drawing on various research traditions and areas. Practically any source of insight about science and technology – their production, communication, and application – can be utilized as knowledge inputs into Futures Research (Eerola and Miles, 2011). Futures Research is an iterative, multi-step work that uses multiple quantitative and qualitative methods to complement each other (Porter *et al.*, 2004). For example, the TIAMAT framework (Barbosa *et al.*, 2022) consists of generalizing Futures Research activities in workflows of Futures Research methods. The organization can use the best method or set of methods.

3.2 From Knowledge Management to Futures Research

If an organization plans to walk the other way and incorporate KM into Futures Research, Figure 4 summarizes how to conduct Futures Research exercises using a knowledge-based approach. The work adapted from Nonaka and Takeuchi (1995) and Eerola and Miles (2011) enables the Futures Researcher to be a Knowledge Manager, helping to incorporate KM into Futures Research.

The first step of a knowledge-based Futures Research exercise, design, and planning, in which the work's subject, scope, methods, workflow, and responsibilities are defined, corresponds to the *Socialization* and *Externalization* modes of the SECI model. This step involves dynamic interaction and sharing information about the views, opinions, expected results, responsibilities matrix, and definitions of the work itself. The workflow process, composed of multiple and diverse Futures Research methods, covers mainly the *Externalization* and *Combination*, consisting of eliciting and sharing information, expertise, and opinions from experts, stakeholders, or general participants. Such Future Research methods capture information to formulate posits, combined or not with structured information like statistical data, economic indicators, or trend extrapolations. We should highlight that, in Figure 4, the families of methods listed in the *Externalization* and *Combination* modes may differ from our previous classification shown in Table 1 because we're dealing with the methods belonging to a specific family more generically. As Table 1 deals with each method individually, the relationship between a family and a SECI model dimension may differ.

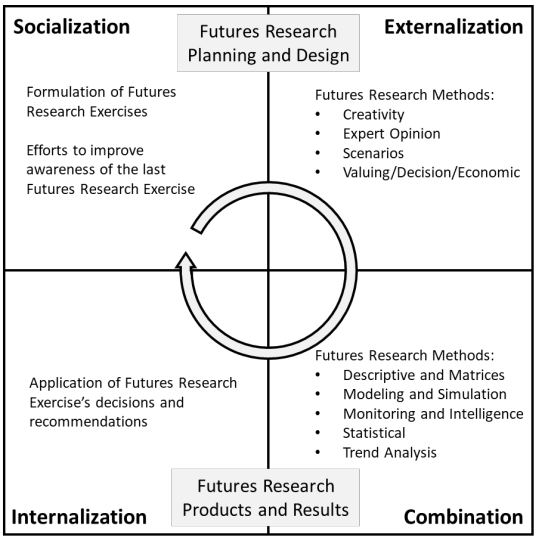

Figure 4: KM Processes in a Cycle of Futures Research Exercises. Adapted From Nonaka and Takeuchi (1995) and Eerola and Miles (2011)

As each method produces its results, new posits are put into context, providing feedback to the workflow. Future Research methods can be used for formulating clear priorities, recommendations, and decisions, covering the phases of *Combination*, *Internalization,* and *Socialization* again, indicating a cyclical process of knowledge exchange.

4. Discussion

One of our primary objectives was to facilitate mutual contributions between the areas of KM and Futures Research. By establishing an interface between the SECI model and the generic KM model proposed by Stollenwerk (1999), organizations can adapt their own KM models to deal with future knowledge and manage all the knowledge generated during Future Research exercises more effectively. We consider this objective to have been accomplished in Section 3.

Regarding using a knowledge-based approach, Eerola and Miles (2011) point out a "microcosm" of a Futures Research exercise. Scenario workshops typically consist of a sequence of activities, with periods of extensive exchange and debate of ideas, annotation, listing, combining different lists, and narrative construction. Thus, several rounds of the SECI processes are needed to accomplish this step of the Futures Research activity. This cyclical movement, therefore, consists of many sub-cycles within the grand cycle that covers the SECI model, as described by Eerola and Jorgensen (2002).

Integrating Knowledge Management and Futures Research requires organizational commitment, support, and readiness for change. As in any organizational cultural change, it often involves overcoming resistance to new ways of thinking and working and establishing collaborative structures and processes that foster knowledge-sharing and future-oriented thinking. Nevertheless, this combination's potential to offer complementary perspectives, enhance strategic planning, facilitate anticipatory knowledge creation, and improve decision-making.

Although we have achieved the objectives outlined in the introduction of this work, some limitations need to be addressed. Firstly, the methods presented in Table 1 do not fully apply to the remaining processes in our generic KM model. Processes such as *Selection and Validation*, *Organization and Storage*, *Sharing*, and *Application* of knowledge do not appear to align with or benefit from any of the Futures Research techniques listed. Another limitation is that we could not establish a clear relationship between the ways of classification – *Nature*, *Approach*, *Family*, and *Capability* – of Futures Research methods and the SECI model or the processes in the generic KM model. For instance, we suggested that methods from the *Creative* family were linked to the *Externalization* mode, but exceptions such as *Science Fiction Analysis* and *TRIZ* exist. Finally, there are inherent limitations in combining two distinct areas of knowledge. Futures Research deals with the uncertainty and complexity of anticipating future developments, while Knowledge Management focuses on managing existing knowledge within a known context. Integrating these fields has challenges of uncertainty and complexity in future-oriented knowledge management.

5. Conclusion

Our contemporary world is fraught with uncertainty, which governments and organizations can alleviate through the efficient use of knowledge and forecasting techniques. In this work, our main objective was to establish a two-way interface between Knowledge Management and Futures Research. To achieve this, we established a relationship between the SECI model of knowledge conversion, a generic KM model, and 53 Futures Research methods. This interaction enables Knowledge Management to benefit from Futures Research methods in activities related to future knowledge generation. Conversely, to enable Futures Research to benefit from Knowledge Management, we presented a knowledge-based approach framework based on the work of Eerola and Miles (2011).

As we discovered that literature covering both Knowledge Management and Futures Research areas is hard to find, this work is our contribution to expanding the literature about future knowledge management. Futures Research can help identify, create, acquire, store, transfer, and use organizational knowledge. Futures Research generates feedback to improve Knowledge Management processes, making organizations more resilient, enabling them to deal better with uncertainty, develop innovation, and explore new business fields. Understanding the relationship between Knowledge Management and Futures Research is expected to provide valuable insights for governments and organizations seeking to improve their decision-making processes through Knowledge Management.

To further advance this research, we recommend that researchers consider expanding the classification of Futures Research methods and explore ways to integrate methodologies with high applicability, such as Scenarios, into their KM models and processes for forecasting.

Abstract: Systematic knowledge management is a decisive competitive advantage. While large companies can successfully implement knowledge management through dedicated people, tools, and processes, this topic poses major challenges for small and medium-sized enterprises. In this paper, we present the results of a qualitative study of knowledge management practices in different small and medium-sized enterprises. The results show that while on the one hand employees are aware of the importance of strategic knowledge management, on the other hand knowledge management is insufficiently implemented in the companies. Further, we also found that the potential of digital knowledge management is currently untapped. Consequently, there is a threat of knowledge loss due to staff turnover against the backdrop of demographic change and changing employment patterns. This likely loss of knowledge threatens the competitiveness and viability of the small and medium sized companies. Based on our findings, the article concludes with actionable recommendations for companies and future research tasks.

Keywords: Knowledge management, SME, Shopfloor, Production engineering

1. Introduction

Against the background of further increasing market dynamics, the rise of global competition and the high demands on product complexity, knowledge as a resource increasingly gains in importance compared to the classic production factors (Fakhar Manesh et al, 2021; Vanini, Hauschildt, 2012). At the same time, the risk of knowledge loss increases for companies. On the one hand, knowledge becomes outdated ever faster (VDI, 2009; Arbesman, 2012). On the other hand and due to changing employment patterns of younger generations and the emerging demographic change, many employees are leaving the company, which means that there is a risk that their knowledge and expertise will be lost for the companies (Hertling, 2013; Eropean Commission, 2020). Small and medium-sized enterprises (SMEs) are just as affected by the relevance of knowledge as large corporations (Pawlowsky et al, 2006). A study from 2010 also shows that the degree of knowledge management maturity in German companies is determined less by the size of the company and the industry than by business strategies and core competencies (Pawlowsky, Gözlan, Schmid, 2010). Thereby knowledge management is particularly pronounced in companies that pursue an innovation strategy. While companies are establishing knowledge management in many areas and departments, its implementation on the shop floor is rare (Zapp, Hoffmeister, Verl, 2013). Yet, especially on the shop floor, key knowledge about processes and machines is bound in the heads of experienced employees (Eckardt, Skaggs, Youndt, 2014).

One possible reason for this problem could be found in the gap between theory and practice in the field of knowledge management: While a variety of theories and concepts exist around the topic, very few approaches offer concrete guidance on its implementation (Ragab, Arisha, 2013). Practical guides for the introduction of knowledge management, such as the "ProWis" developed by the Fraunhofer Institutes IPK and IFF, at least offer methodological support (Orth, Voigt, Kohl, 2011). During the development of the guide, the following problems in knowledge management were identified, among others: Inconsistent data storage, lack of systematic recording and documentation of project experience, insufficient central storage of knowledge and inadequate process descriptions (Kohl, Orth, Steinhöfel, 2015).

The use of information technology (IT) plays a central role in an effective and efficient knowledge management process, as it accelerates the rapid collection, storage and exchange of knowledge to an extent that was not possible in the past (Abubakar et al, 2019).

However, the interpretation of the available information remains the task of humans, so that IT systems only implicitly support the creation of knowledge and thus knowledge management by providing suitable information (Kautz, Thaysen, 2001). Companies in the entertainment industry, e.g. Facebook (Meta) and TikTok, already use machine learning approaches to control the user experience and to selectively highlight individually suitable information from the abundance of information (Goncalve, 2021). This puts them ahead of many companies in the manufacturing industry. The result is a technical revolution that, unlike in the past, is going the wrong way round: Digitization is penetrating the manufacturing industry from the private sector and with it come young people who are fully accustomed to it and want to reap the benefits at work as well (Daheim, Korn, Wintermann, 2018).

According to Zimmermann (2018) many SMEs are not aware of the benefits of extensive digitization and invest less than larger companies. Reasons cited for this include a lack of IT expertise, problems adapting corporate structures and processes, and poor internet quality (Zimmermann, 2017). Nevertheless, in a 2016 study, about half of the companies surveyed assessed their level of digitization as moderately or normally developed compared to its competitors in its own industry (Bley, Leyh, 2016).

1.1 Research Questions

At the Laboratory for Machine Tools and Production Engineering (WZL), we are committed to designing production technology for the future. To automate processes, we require a comprehensive understanding of interdependencies. Currently, much of this knowledge resides in the minds of the employees, which is why we need to develop suitable methods to capture and utilize this knowledge effectively. To achieve this, it is crucial to gain an understanding of the requirements of the companies that will use these knowledge management systems. While previous studies often have a broader scope related to the region under consideration and often look at the company as a whole, we focus on the Aachen region and knowledge management on the shop floor. Therefore, the goal of this study is to document the functions of existing knowledge management systems used on the shop floor of SMEs in the Aachen region and identify desired functions and features that are not yet available. To categorize these requirements and wishes, we will also assess the status of the surveyed companies regarding the digital transformation of production, Industry 4.0, and knowledge management. As a result, we aim to answer the following four research questions:

RQ1: What is the status of SMEs regarding digitization/Industry 4.0?

RQ2: What is the status of SMEs regarding knowledge management?

RQ3: What are the strengths and weaknesses of the systems and methods currently used for knowledge management?

RQ4: What requirements and wishes do the companies have regarding potential knowledge management systems?

2. Methodology

2.1 Approach: In-Depth Interviews With Relevant Stakeholders

To assess the current state of knowledge management and identify the requirements for knowledge management systems, we conducted semi-structured interviews with shop floor workers and controlling staff from multiple SMEs operating in the Aachen region of North Rhine-Westphalia, Germany. While semi-structured interviews can be time-consuming, they provide a valuable starting point for exploring the status quo of knowledge management in SMEs. Given the limited information available about knowledge management in SMEs, these interviews allow us to gain an overview of common practices and explore specific topics in more depth with follow-up questions. Additionally, semi-structured interviews enable us to extract key concepts and factors that can be used in larger quantitative surveys (Adams, 2015).

Our interviews focused on assessing the status of knowledge management in SMEs and identifying the requirements, opportunities, and strengths of future knowledge management systems. To achieve this, we asked respondents to perform a SWOT analysis (Strengths, Weaknesses, Opportunities, and Threats) and then followed up with questions about their wishes and demands for future knowledge management systems, with a particular focus on shop floor workers.

2.2 Interview Guidelines

The interview was divided into five main sections: *introduction, person-related information, enterprise-related information, knowledge management, and requirements.* The *introduction* consisted of informing participants about the procedure and topic of the interview. In addition, they signed a consent form allowing us to record the interview for evaluation purposes. We further informed them that their participation was voluntary and that they could withdraw from the interview at any given time (informed consent).

The second section (*person-related information*) first queried respondents' age and gender. Respondents were then asked to describe their career path including high school degrees, apprenticeships, university education as well as experience in their previous professions.

To retrieve *enterprise-related* information, respondents were asked to briefly describe the company they were currently working in. This included the size of the company (number of employees and business locations), the core competence of the company, and the technical equipment (machinery, digital infrastructure, etc.). This section also included respondents' perceptions of the utilization and acceptance of new technologies in the company. Lastly, respondents were asked to describe the onboarding process.

To start the section about *knowledge management*, respondents were requested to find an example of either distinctly good or bad knowledge management in their company. This example was used as a reference point for the remaining questions of this section. After the description of their example, respondents were asked to describe their company's process of storing and transferring knowledge by explaining the utilized methods and practices. Lastly, respondents had to perform a SWOT analysis to identify potential strengths, weaknesses, opportunities, and threads regarding their current knowledge management system.

In the last section (*requirements*), respondents had to determine the requirements and specifications they had for an optimal knowledge management system. To specify the question, respondents were asked what kind of support they would need to implement such a system, how much time employees would need to spend (in hours per week) on the system, and which steps would be needed to come to an optimal system.

At the end of the interview, respondents were thanked for their participation and given the opportunity to ask questions. We pre-tested and adjusted the interview guideline before we started with the interviews.

2.3 Procedures, Sample and Data Analysis

Respondents were recruited through email invitations sent by university partners who were either current or former research or industry project partners of the research institutes. If they agreed to participate, we sent an email with a consent form, schedule, and online session link. Interviews were conducted online via Zoom or Microsoft Teams due to the pandemic. Respondents were greeted by the interviewer and participated in a short introduction round. Interviews were conducted with one interviewee or in groups of 2-3 (See Table 1), lasted an average of 46 minutes, and were conducted in German. The transcripts were used for qualitative content analysis, with primary categories derived from the interview guideline and additional subcategories developed inductively. Once analyzed, the entire category system and relevant quotes were translated into English.

Table 1: Overview of Interview Participants

Code	Gender	Age	Domain	Interview number
IoP_LX_1_C_m_30	Male	30	Controlling	1
IoP_LX_2_C_m_57	Male	57	Controlling	2
IoP_LX_3_S_m_44	Male	44	Shopfloor	3
IoP_LX_4_C_m_30	Male	30	Controlling	4
IoP_LX_5_C_m_59	Male	59	Controlling	5
IoP_LX_6_C_w_27	Female	27	Controlling	6
IoP_LX_6_S_m_57	Male	57	Shopfloor	6
IoP_LX_7_C_m_53	Male	53	Controlling	7
IoP_LX_7_S_m_56	Male	56	Shopfloor	7
IoP_LX_7_s_m_	Male	Age was not recorded	Shopfloor	7

3. Results

In addition to requesting personal information and a brief company description, we inquired whether the use of knowledge management tools is part of the company philosophy or strategy. From our analysis of the interviews, we observed that knowledge management is becoming increasingly important for SMEs. In the age of digitalization and Industry 4.0, it is crucial for SMEs to effectively manage the large amount of data produced by personnel and machines.

When we asked about the types of knowledge that are produced, respondents mentioned a variety of content types, including standardized documents, documentation of mistakes, construction and 3D models, customer requirements, instructions, warnings, and more. Most of the respondents acknowledged that knowledge management is an important part of their company's development. However, they also mentioned several challenges that need to be addressed to integrate efficient knowledge management systems into day-to-day operations. Although a large amount of knowledge is accumulated, respondents mentioned that the data is not always automatically collected and machines are not always interconnected and communicating with knowledge management systems. This lack of interconnection is not always due to technological limitations but is also deliberately suppressed for security reasons. For instance, one respondent said: "No, they're completely disconnected so that access or manipulation from the outside cannot take place." (IoP_KX_1_C_m_30, L. 69-69).

Another challenge to the adoption of knowledge management is workers' acceptance of new methods. The willingness to use knowledge management systems can be influenced by factors such as technical knowledge, age, or general interest in the system. These factors can have a bidirectional influence on the use of the system, as one respondent explained: "There are a couple of employees who are particularly interested in that. Others have already given up on it because they realize that nothing is happening. You have a broad field of different characters […]." (IoP_KX_6_C_w_27, L. 589-593).

In the final part of the enterprise-related information section, we inquired about the onboarding process and the transfer of existing knowledge within the company. Respondents mentioned various methods, including general training (such as face-to-face), learning by doing, knowledge databases, and mentoring programs where new employees are assigned a mentor to help them get acquainted with their new tasks. With a comprehensive understanding of the current state of knowledge management, the subsequent sections will concentrate on the current state of knowledge management in SMEs and the employees' requirements for future systems.

3.1 Current State of Knowledge Management

In the third section of the interview, respondents were asked to provide more details about the current state of knowledge management in their company. The primary focus was on the methods used for transferring knowledge. The most commonly mentioned method was face-to-face knowledge transfer, as reported by four interviewees. However, one respondent (IoP_KX_6_S_m_57) noted that this method often results in lost knowledge when an employee leaves the company. To address this issue, respondents suggested using protocols, digital training, training computers, history data of existing software solutions, or even pen and paper to retain knowledge within the company. Additionally, trial and error and status indication from software or machines were mentioned as methods of acquiring knowledge about processes and operating principles.

Regarding the capturing of transferred knowledge, three respondents reported not having a standardized knowledge management system in place. One interviewee (IoP_KX_3_S_m_44) explained that knowledge is passed on verbally and not documented. We observed that smaller-sized companies often rely on passing on knowledge from person to person, without deeming it necessary to save it permanently. However, when knowledge is saved, it is done either digitally on servers and hard drives (N=5) or in an analog manner through notes and physical folders (N=3).

To gain further insights into SMEs' knowledge management approach, we asked interviewees to perform a SWOT analysis, in which they identified the strengths, weaknesses, opportunities, and threats regarding how they transfer and store knowledge within their company.

3.1.1 Strengths

In general, respondents report, that through a central point of knowledge, unrestricted information transfer, data visualization, standardized processes, and regulated communication channels knowledge management can lead to higher efficiency, productivity, and flexibility. For instance, one respondent states that orders can be processed faster as knowledge is immediately and directly accessible by employees without relying on face-to-

face communication. A well-established knowledge management system can hence lead to a better *reproducibility*, which gives the company a competitive advantage in terms of speed and adaptability (*"You don't have to do it again and again. Thus, one is naturally faster and has a certain competitive advantage over others who have to do it for the first time."* (IoP_KX_1_C_m_30).

A further advantage of knowledge management systems is the ability to react to problems in a more structured and targeted manner allowing controlling personnel to identify the origin of the problem (*"The collection of numbers, data, and facts also gives us the opportunity to approach possible solutions to problems in a more structured way.",* IoP_KX_7_S_m_). Lastly, the respondents mention that knowledge management systems can allow for feedback in learning processes. By documenting their learning activities, employees can track their progress and adjust it accordingly allowing for a more individualized learning experience.

3.1.2 Weaknesses

As a major weakness, respondents report that knowledge management is too time-consuming in relation to its benefits (N=6). This is best illustrated by one respondent who states: *"The point is, that writing down all that knowledge is just exhausting. I once had an experienced colleague who spent his day writing down all he knew. It was a full-time job for several years. And then start to wonder if it's really worth it."* (IoP_KX_1_C_m_30).

This can on the one hand be due to a lack of structure or an inconsistent implementation of the knowledge management system. This inconsistency is for instance reflected in the different types of knowledge management systems put in place for the various tasks, machines, or departments, thus making it impossible to find a common communication ground between systems. The same is true for older pieces of equipment which are unable to communicate with the newer system. Finally, respondents state that knowledge is still very much linked to employees instead of machines: "To this day still the knowledge is linked to the people and as soon as they leave the company, of course, the knowledge also leaves the company as well." (IoP_KX_4_C_m_30).

3.1.3 Opportunities

From the identified strengths, a series of opportunities for SME's can be extracted. First, through the implementation of a knowledge management system, SME's can gain a competitive advantage by recording more detailed information and documenting experiences. To illustrate one of the respondents notes: "In reality, it's like a treasure chest full of experiences." (IoP_KX_5_C_m_59).

Furthermore, knowledge management gives SME's the opportunity to further develop their technical infrastructure as it provides employees with feedback systems and error tracking and notification. This can further be enhanced by error prevention using artificial intelligence methods. Respondents furthermore mention that knowledge management can greatly enhance transparency within the company. One respondent, for example, mentions that employees could be motivated by gaining insight into the data generated by knowledge management systems (*"I mean people should be motivated by seeing the numbers and tell themselves: 'We have to do something'"*, IoP_KX_7_C_m_53). Lastly, respondents see an opportunity for better training methods and onboarding processes, as they can rely on a larger pool of knowledge and experience.

3.1.4 Threats

While a great number of opportunities arise from the implementation of knowledge management systems, a series of threats and risks could also be identified. The most commonly threat mentioned by respondents proved to be the fear of being too digital. First of all, respondents were mindful of the technological dependence such a system can create. The possibility of their system being a target of cybercrime or being erroneous, thus halting production could influence the acceptance of these systems. They also fear that teamwork will be hampered by misunderstandings if much of the knowledge is stored and transmitted via digital devices instead of face-to-face communication. Along with this comes the threat of losing the ability to critically think about a given task or process. This is best illustrated by one respondent who states: *"The risk is, of course, that one relies too much on what is written. That is, if there is a specific program that you trust, but maybe someone made a mistake or somehow an error got in, uhm…that you rely on it and don't question yourself anymore, right? That one no longer uses their brain anymore."* (IoP_KX_1_C_m_30). Besides that, respondents state that they might be overwhelmed by the extra amount of work that is required to keep the knowledge management system up to date. They also mention the large amount of data that is generated and needs to be maintained on a day-to-day basis. This in turn can lead to a loss of efficiency, as more time is dedicated to the management of knowledge than to the actual creation of knowledge and the manufacturing of products.

3.2 Target state and requirements

In the last section of the interview, we asked respondents to state their requirements and wishes for future knowledge management systems for SMEs. First, we asked them for the support they would need to put these systems into place. Second, we queried requirements and wished they had for those systems.

3.2.1 Support needed

Respondents identified three main points when asked about the support needed. Firstly, they emphasized the need for sufficient time and manpower to establish, maintain and provide data for the knowledge management systems. Secondly, respondents noted that the necessary hardware and software are often lacking in SMEs, and professional technicians (such as electricians or programmers) are required to set up the technical infrastructure. One respondent, for instance, states: *"I would take care of the design. I just need a programmer at my disposal who could change something in the system when I need to."* (IoP_KX_3_S_m_44). Lastly, employees need to be trained by experts to be able to use newly implemented systems. One participant (IoP_KX_4_C_m_30) notes that it would be crucial to have an expert on-site who is specialized in knowledge management.

3.2.2 Requirements

For the analysis of the requirements, we focused on broad themes that are applicable to a series of different application domains. We identified the following five general requirements for knowledge management systems:

1. Build on transparency
2. Usability for all
3. Support instead of replace
4. Collaborative through communication
5. Multi-context adaptability

In a first step, respondents stated that the novel knowledge management systems should be built in a way that could be understood by controlling and shopfloor. Therefore, these systems must be transparent to be accepted by employees, extend their functionality and adapt them to a particular use case (*"My wish would be to have a system, which is transparent, which is accepted, and you can build on that."*, IoP_KX_7_S_m_56).

Second, the systems ought to be usable by all. In other words, the interface should be built in such a way that employees can easily understand it in an intuitive manner, without the need for additional support. This applies to both the transfer and storage of knowledge. Third, the systems should ensure the support of the employees without crossing the limits of their responsibilities. One respondent states that the system should support the employee's experiences to enable a learning process (*"The […] system must support experience. So again, human beings are so good at troubleshooting, when they have all the information […]"*, IoP_KX_7_C_m_53).

Further, the system needs to be able to support collaborative work by not only communicating information and knowledge between workers but also between machines and across different departments and domains.

To that end, knowledge management needs to adapt to varying contexts (e.g., controlling, shopfloor, finance, human resources, etc.) as well as be extensible to include new functionality for different application areas (*"But what I also think is crucial that the system must be adaptable at any time. Because if we now buy something "that can do this and that" and then we say, "there is still something missing", but we don't get it […]"*, IoP_KX_7_C_m_53).

4. Discussion

In the following, we discuss the results of this study regarding the research questions RQ1-4 posed at the beginning.

4.1 Status of Small and Medium Enterprises Regarding Digitalization and Industry 4.0

The results of the interviews show that the state of digitalization in companies varies greatly.

In principle, all participants show interest in switching from manual and analog to digital processes for knowledge management. The creation and management of digital documents in a wide variety of forms is part of the everyday life of many companies. However, there is usually no automatic exchange between these documents. Employees must access many different documents, directories, and tools to acquire knowledge and

there is no uniform database. In principle, these documents and tools can also be created or used on a normal desktop PC. The use of innovative technologies such as augmented reality, virtual reality, or smart assistants was not mentioned by any of the participants. All technologies used on the shop floor are basically the same as in the office. Digitalization therefore seems to essentially mean the elimination of paper for participants. The advantages that can be gained from the sensible use of information technology like rapid collection, storage and exchange of knowledge (Abubakar et al., 2019) are currently not being used. It is evident that the companies of the participants are falling behind the IT and entertainment industry as they are not utilizing machine learning or other AI algorithms to analyze and condense information, as suggested by Goncalve (2021).

The networking aimed at in the sense of Industry 4.0 is also handled differently. While some companies already use the data from their machines to solve already known problems faster, or to reuse programs, there are concerns about security when it comes to networking. Some companies do not connect their machines to any network at all, and thus prevent the data from being used for smarter production control. Consequently, these concerns must be addressed, as the close interlinking of machines and people is essential for realizing the vision of Industry 4.0 and the digital transformation of production (Brauner, Dalibor, Jarke, 2022; Kagermann, 2015).

4.2 Status of Small and Medium Enterprises Regarding Knowledge Management

When presenting the second research question, the thesis posited that companies recognize the importance of knowledge management, which has been validated by the findings. The participants are conscious of the swift loss of knowledge and the complications that arise. However, the results indicate that current methods employed are still deeply traditional: direct exchanges between employees, learning by doing, mentoring, and face-to-face discussions are widespread. Whether knowledge is digitized hinges mainly on the availability of appropriate software and hardware. Companies lack expertise in IT and a comprehensive understanding of potential technologies and their effective use. Poor internet connectivity, which Zimmermann (2017) cites as another factor for low digitalization levels, was not corroborated in our study. Thus, successful digitalization implementation is pivotal for innovative knowledge management. Not one of the participants mentioned having dedicated knowledge management systems.

4.3 Strengths and Weaknesses of Current Knowledge Management Systems

The SWOT analysis conducted in the interview regarding the knowledge management systems used made the participants reflect on the status. In doing so, they could formulate the strengths of knowledge management, even though the systems they are currently using only really cover these advantages to a certain extent. They cite higher efficiency, flexibility and adaptability as well as better training and learning processes.

The weaknesses found relate more specifically to the systems used. Lack of time or too time-consuming processes, unstructured and inconsistent implementation of knowledge management systems and methods are the biggest weaknesses mentioned. In particular, the inconsistency in interfaces and file formats prevents a uniform basis for communication. These statements of the participants coincide with the problems Kohl et al. identified for the implementation of knowledge management in their research (Kohl, Orth, Steinhöfel, 2015).

Based on the determined strengths the participants see the possibilities for feedback systems and error tracking, that can be even extended by artificial intelligence. The possible transparency and time-independent availability of knowledge is also seen as an opportunity to uncover previously unknown problems and to motivate employees to participate more actively in the problem-solving process. The companies can describe their needs quite succinctly but have no idea whether suitable technological solutions exist. For us as research institutes, this is also an indication of the large gap between research and practice that needs to be narrowed.

Two topics are mentioned as hazards: Fear of cybercrime and the danger of employees blindly relying on technical systems. People should always think along and question plausibility. Furthermore, the use of knowledge management systems must not lead to too much additional work, as this not only reduces efficiency, but also acceptance. These points show that psychology also plays a role in knowledge management. Trust in technology is essential and must be considered in the development of management systems just as much as productivity.

4.4 Requirements for Novel Knowledge Management System

From the need for time and manpower mentioned by the participants, it can be seen that the expertise to implement structural knowledge management is not currently available in most SMEs. Furthermore, it is difficult for them to determine the costs for the necessary hardware and software and the return on investment which confirms Zimmermann's (2018) findings.

The success of knowledge management is not trivially measurable. In addition to training their employees, companies therefore need a better overview of methods and systems and their impact.

The participants' wishes for future knowledge management systems can be derived not only from the queried requirements, but also from points mentioned in the context of the SWOT analysis. In addition to the five general requirements collected (Build on transparency, usability for all, support instead of replacing, collaborative through communication and multi-context adaptability), conclusions for the development of new systems can be drawn in particular from the weaknesses found in the current systems. Time consumption, lack of structure and the absence of a unified solution are indications that should be considered.

4.5 Limitations

Although our study has yielded valuable insights on the status of knowledge management systems and their requirements, it is not without its limitations. To overcome these limitations, future qualitative studies should broaden their scope to include a more diverse sample beyond university boundaries. This could provide a better understanding of cultural differences and introduce diversity in terms of SMEs' structures and cultures. Additionally, targeting a sample disconnected from university projects could minimize bias towards the usefulness and acceptance of knowledge management systems.

Apart from expanding the sample size, the results of our study should also be validated quantitatively, both within and outside of Germany, to identify and analyze current and future trends and perceptions of knowledge management systems on a wider scale.

5. Conclusion and Outlook

This study offers valuable insights into the demand, current utilization, and challenges of knowledge management in small and mid-sized companies, with a focus on shop floor operations. Specifically, the interviewees' requirements for knowledge management systems serve as a foundation for future research on the development of methods and systems for shop floor knowledge management.

Our findings reveal that the current proliferation of various approaches and tools makes it challenging to establish a transparent and uniform knowledge base. Thus, companies require a centralized, user-friendly system with intuitive interfaces that seamlessly integrate systematic knowledge management into standard work processes. Furthermore, such a system should provide understandable suggestions to users, empowering them to make informed decisions. The results also show that there is a significant knowledge gap on the part of companies regarding technical possibilities and their meaningful use, especially for knowledge management. As the present study was conducted qualitatively with a rather small group of companies, it provides only an impression and is not representative.

Building on these results, we aim to concentrate on the technical realization of a novel knowledge management system, including usage guidelines that will facilitate the systematic implementation of knowledge management on the shop floor. The integration of knowledge management into daily work processes is a priority. In the future, we will investigate how knowledge and experience of employees can be captured by tracking their activities, so that they may not have to actively perform additional tasks. This will be done in close cooperation with companies to ensure a continuous match between the possible solution and the requirements.

Furthermore, the use of AI for capturing, sorting, and analyzing knowledge will be particularly interesting in the future. The lack of digitalization in companies, as identified in this study, makes it difficult to collect the data necessary for training AI. Although the creation of training data for simple tasks is trivial to realize via MTurk and other services, capturing complex, heterogeneous, and often unstructured expert knowledge digitally is difficult (Hoffmann, 1987). Hence, there is often too little suitable data for training ML models (data scarcity) (Mansfield, Tamma, Goddard, 2021).

Improving systematic digital knowledge management in companies can make a significant contribution here and thus boost the digital transformation of production (Brauner, Dalibor, Jarke, 2022).

Abstract: Fintechs use technologies to offer financial services in a different way than traditional ones. The Fintech sector has seen rapid growth in the global economy and has expanded access to financial services to a wide variety of users; consequently, it has drawn the attention of academics around the world. Being knowledge-intensive organisations, Fintechs can absorb knowledge as a key competence. Absorptive capacity – which includes practices to acquire, assimilate, transform, and apply knowledge - has been analysed in previous studies as a factor that can influence organisational performance. However, most studies have used data from developed countries. The objective of this ongoing study is to analyse the knowledge management (KM) practices used by a Latin American Fintech to absorb knowledge. For this, a case study with a qualitative approach will be presented, using data from an international company of Peruvian origin, specializing in leasing. Data was collected through interviews. The information collected was transcribed and categorized for analysis. The analysis will include content analysis and narrative analysis techniques, supported by Atlas.ti software. The results contribute to the KM literature in two ways: First, by describing how knowledge absorption occurs in Fintechs. Second, by systematizing evidence on how KM practices act in organisations in emerging contexts, to support absorption capacity, and consequently, contribute to organisational results. On the empirical side, this study provides specific insights to managers of companies in the financial and technological sectors in emerging contexts, on how and which practices implementing to improve KM in their organisations.

Keywords: Knowledge absorptive capacity, KM practices, Fintech, Peru

1. Introduction

In the last decade, the world has witnessed strong growth in digital innovation, especially in activities that focus on the design and delivery of FinTech financial services. According to Gomber, Koch, and Siering (2017), the term Fintech is a neologism that comes from the words “finance” and “technology” and is defined as financial companies that use technology to offer innovative financial services. Arner et al. (2015) in their article on the evolution of FinTech, described the historical development of FinTech as a continuous process of financial service and technology evolving together. As a result, investments in technology are doubling. In 2022, global Fintech investments are on par with the same period last year, at over USD 22 billion (Venture Scanner, 2023). By 2025, the size of the global Fintech market is estimated to be approximately US$305 billion, at a compound annual growth rate of around 20% over the coming years (Ng and Pan, 2022). The literature shows the entrepreneurial and adaptive capacity of FinTechs and implies that these companies continuously detect industry, market, and technological opportunities to renew their products and business models (Kazan et al. 2018). Therefore, Fintech is considered a key driver of knowledge and experts predict a very promising future (Gimpel, Rau, and Röglinger, 2018).

Most innovations result from acquiring, transforming and applying knowledge and not only from invention (Zahra and George, 2002; Leal-Rodriguez et al., 2014). In this context, it has been shown that the creation of heterogeneous firms is not only due to the diversity of inputs but also to the heterogeneous knowledge of entrepreneurs and their ability to coordinate disparate knowledge about technology, people, and processes (Alvarez and Busenitz, 2001). Furthermore, it has been shown that fintech growth is explained by founders' knowledge, founders' social ties with other founders whose knowledge domains are different from their own, and employees with different knowledge (Sako, Qian, and Verhagen, 2022). Elidjen et al. (2022) make a similar point in their study, mentioning that the use of external sources of knowledge is fundamental to the innovation process in organisations. In addition, bank—Fintech cooperation has been studied which allows for identifying cooperation patterns (Drasch, Schweizer, and Urbach, 2018). However, there is a lack of studies that shows how knowledge is managed in firms from emerging countries (Dávila, Dos Anjos, 2021). Most studies have used data from developed countries, and it is still unclear what KM practices are used by Fintechs.

In this context, the purpose of this research is to analyse the KM practices used by a Latin American Fintech to absorb knowledge and to present evidence of its contribution to organisational performance. To do so, we analyse a case of an international company specialising in leasing. It is considered one of the first Fintech companies registered in the new registry of leasing companies in Peru. The results are expected to contribute to the literature on KM in two ways: first, by describing how knowledge absorption occurs in Fintechs. Second, by systematizing the evidence on how KM practices work in organisations in emerging contexts to support ACAP and, consequently, contribute to organisational outcomes. On the empirical side, it aims to provide specific and novel insights to managers of companies in the financial and technology sectors from an emerging country context, on how and what practices to implement to improve KM in their organisations. Elidjen et al. (2022) note that startups suffer from the ability to innovate, which increases their propensity to fail and overcome this failure by increasing the absorptive capacity of the founding team to improve their ability to innovate.

2. KM Practices for ACAP in FinTech

The term “Fintech'' is a contraction of “financial technology” and was first mentioned in the early 1990s by Citicorp CEO John Reed (Puschmann, 2017). The term is used to denote those companies that provide innovative financial products and services, through the use of technology (Dorfleitner et al., 2017). These companies use cutting-edge technologies to increase efficiency and quality of work (Sharbek, 2022). In addition, they are associated with innovation where companies develop new products, business models and processes (Puschmann, 2017).

Fintech success requires financial industry insight to identify and evaluate potential opportunities and technological know-how to develop new products and services that deliver value (Harris, 2021). Moreover, it has been identified that Fintech entrepreneurs observe opportunities and then incorporate individuals with technology and finance expertise into their senior management team, which helps address gaps in founder expertise (Spigel, 2022). In addition, the creation of new knowledge affects both new entrants and the financing of new Fintechs (Cojoianu et al., 2021). Therefore, research pays special attention to investigating the importance of studying knowledge domains in founding teams, their social networks and early employees in Fintechs (Sako, Qian and Verhagen, 2022).

Knowledge identification is a valuable resource in an organisation. The literature shows that Fintech ecosystems are not just specialized technology or finance clusters, but remain the most generic forms of managerial knowledge for Fintech innovation and growth (Spigel, 2022). Fintech growth is explained by founding teams with similar expertise, founders' social ties with other founders whose knowledge domains are different from their own, and employees with different expertise (Sako, Qian, and Verhagen, 2022). In this context, the literature mentions that different types of knowledge can be extracted using different techniques such as personality type in the knowledge acquisition process and evaluation techniques (Dehghani and Akhavan, 2017). Arguing that today's businesses require the ability to capture, manage and use knowledge and information to improve efficiency and better serve customers (Gupta, Sharma, and Hsu, 2004).

In this context, this article focuses on the absorptive capacity (ACAP) of Fintechs. ACAP is the organisation's ability to recognize the value of new external information, assimilate it, and apply it for business purposes (Muthukannan and Gozman, 2019). Therefore, ACAP refers not only to an organisation's acquisition or assimilation of information, but also to the organisation's ability to exploit it (Cohen and Levinthal, 1990; Dávila, Durst, and Varvakis, 2018). That is, to understand what are the sources of a firm's ACAP y, one should focus on “how communications between the firm and the external environment are organised,” and also on the “nature of knowledge and expertise within the firm” (Liao et al., 2009). The practices included are to acquire, assimilate, transform and apply knowledge.

Digital startups must rely on their ability to explore external knowledge and exploit it in rapid innovation (Elidjen et al., 2022). Therefore, the diffusion of knowledge in the organisation is to transfer tangible or intangible knowledge to members who lack it. (Huang, Wei and Chang, 2007). That is, diffusion involves the behaviour of sharing acquired knowledge, experience, and skills with other members of the organisation (Liao et al., 2009). Different means can be used to disseminate knowledge in an organisation, for instance, training, mentoring, project discussion, and team meeting (Manohar and Gupta, 2014). Factors affecting knowledge sharing can be individual and cultural (Huang, Wei and Chang, 2007). In summary, reducing the distance between members or organisations can improve mutual interaction, and thus enrich the improvement of knowledge sharing.

3. Methodology

As it is well known, KM has been a crucial issue for companies for a long time (Nonaka et al.i, 1995). In this ongoing research, we used a qualitative approach and the analysis of preliminary results is complemented by multiple sources of information such as documents and observations.

The company to be evaluated was selected by accessibility. We also considered its geographical representativeness in emerging markets, its size and stage of development, and its diversity of business models. The company is a specialist in laptop rental. It operates under an immediate delivery model through a monitoring and management application. It is a financial company that uses technology to offer financial services specifically for leasing. It is the only laptop rental startup featured in Forbes magazine's ranking of the best Peruvian startups. They serve more than 2,500 companies and have expanded to Mexico and Colombia. They recently achieved their first placement of private bonds to institutional investors for almost $2 million. The company defines itself as the fastest, simplest and most digital laptop rental and leasing financial solution on the market and has digital service systems of less than 24 hours that include unique requests for change, replacement and technical assistance.

Semi-structured interviews were used in this study, as it is an appropriate technique (Patton, 2014) to obtain detailed information about the absorptive capacity in the company (Rubin and Rubin, 2011), how companies work (Yin, 2017; Creswell, 2017), and how they use it to improve their performance (Denzin and Lincoln, 2011). The key issues and questions to be explored were designed, using a semi-flexible guide that allows adapting to possible emerging issues and taking into account that a relationship of trust will be established and that it will allow some aspects to be deepened during the development of the interview. The interview guide included three questions for the acquisition dimension, three for assimilation, three for transformation, and three for exploitation. The question guide was developed using questions from other previously validated instruments such as those of Inkinen et al. (2015), Su et al. (2016), Cepeda, and Leon (2019) and Flatten et al. (2011), which increases the validity and reliability of the data obtained (See Appendix A). For the research, managers and senior strategic decision-makers in the organisation who play a key role in the assimilation of information were interviewed. The participants were selected considering the relevance of their experience, the diversity of their perspectives, their systematic knowledge of the organisation, their availability, and their accessibility. The initial 4 selected participants were willing to participate in the study upon informed consent. An informed consent form was developed that described the objectives and procedure and ensured that the participants understood and signed the consent before the interviews. The interviews were carried out in a conducive environment using the designed protocol. Each interview lasted ca. 2 two hours, they were recorded on the Zoom platform while they were in the company's offices.

The interviews were transcribed with the support of the Sonix software before the authors performed a peer review of transcriptions, and the analysis process was based on content analysis techniques. The data were analysed with the support of Atlas.ti 8 software, which is in line with this study (Charmaz, 2014). Transcribed data was organised to identify relevant themes and patterns. It was coded and categorized starting with the acquisition dimension, assimilation, transformation, and exploitation. Emerging themes and ideas were identified. Codes of key concepts were created and grouped into thematic groups. The categories and subcategories found were examined, as well as relationships, similarities and differences between the answers. Data were interpreted by contrasting them with the reviewed literature.

4. Results and Discussion

4.1 Practices for Knowledge Acquisition

Knowledge acquisition is directly related to innovation performance (Papa et al., 2018). Besides, knowledge acquisition influences the efficiency of other knowledge processes, such as dissemination and application (Darroch, 2005). In line with this, in the analysed organisation, knowledge acquisition is not merely the responsibility of specialized units, but a shared responsibility among all members. This idea is confirmed by Interviewee 1, who posits that every worker initiates their pursuit of knowledge, reflecting on their day-to-day roles and responsibilities. The organisation encourages all staff, regardless of their roles, to contribute creative ideas. As Interviewee 1 explains, when a team member conceives an innovative idea, it is documented and presented to the project leader for consideration. Certain departments within the organisation, such as the commercial division, have specific responsibilities that include the acquisition of essential knowledge. This is achieved by monitoring trends, gathering information, and obtaining customer feedback to inform decision-

making processes. Previous literature posited that the gathering of market knowledge is a key practice for knowledge assimilation (Darroch, 2005).

The organisation emphasizes the importance of research, and this is a critical skill that the firm use to see when it looks for potential employees. The recruitment process plays a pivotal role in fostering the organisation's knowledge base. Interviewee 1 emphasized that new hires are selected based on their existing expertise or their eagerness to learn techniques that can spur product development. Research is part of the organisation's culture. Interviewee 2 further elucidates this, by highlighting that the organisation's culture is focused on nurturing individuals with a strong predilection for research, an attribute that drives them to continuously seek new knowledge, skills, or methodologies that can enhance their current process automation capabilities.

In terms of knowledge sources, Interviewee 2 posited that knowledge is not exclusively obtained internally; it emerges from a multitude of sources. An assistant or analyst, for instance, may identify a market need that propels knowledge acquisition. The organisation, therefore, does not strictly enforce a prescriptive approach to knowledge acquisition but encourages it to arise organically from all quarters. The organisation predominantly taps into external sources of knowledge, such as blogs, online courses, YouTube, and industry-specific newspapers and magazines, to stay abreast of current and potential market trends.

A distinct aspect of the knowledge acquisition process in the organisation under examination is the consistent identification of knowledge gaps, particularly about employees' technical and social competencies. As per Interviewee 1, the deficits are less in the realm of technical numerical skills, but more in soft skills such as presentation techniques and the effective articulation of viewpoints. Post-performance evaluations, as Interviewee 2 explains, are instrumental in assessing the effectiveness of the acquired knowledge, identifying areas for improvement, and validating the success of the approach.

In conclusion, the evidence suggests that the organisation adopts a multi-faceted strategy for knowledge acquisition. The process, while overseen by designated units, is a collective endeavour involving all employees. The focus is on self-learning, research, creativity, the identification of knowledge gaps, and benchmarking. The recruitment process is also leveraged as a conduit to acquire new or specialized knowledge.

4.2 Practices for Knowledge Assimilation

In the examined Fintech, employees are strategically utilized to incorporate acquired knowledge, as mentioned by Interviewee 2. Employees are encouraged to document, disseminate among their teams, and integrate the knowledge acquired from various training and development programs into their daily work. To assimilate this knowledge, the organisation employs practices such as formal and informal interdepartmental meetings, which are a key source for promoting knowledge sharing, and ultimately, innovation in knowledge-intensive firms (Taminiau et al., 2009).

Interviewee 2 highlighted the role of formal meetings, mentioning committees involving all managers to ensure alignment with organisational objectives. These committees also serve as platforms to integrate new knowledge with existing organisational memory, enabling appropriate action. For instance, the Risk Committee was reported as a critical unit in identifying customers who might potentially present problems for the organisation.

Informal meetings are also crucial to the knowledge assimilation process. They are like communities of practice, which are posited as key enablers of organisational innovations (Pattinson, Preece, 2014). Interviewee 1 cited the adoption of "Daily Scrum" meetings across different departments, which are daily discussions focusing on brainstorming solutions for day-to-day problems. These meetings, held in small groups with common interests or facing shared problems, are often interdepartmental, and they are aligned with the organisation's beliefs of cross-functional collaboration. As Interviewee 2 noted, these meetings can include individuals from different departments, particularly when an issue hinders the achievement of a goal. Promoting knowledge sharing across departments and individuals with different skills is in line with previous research that posited that firms with top managers that have different academic and employer backgrounds are most likely to be successful (Spigel, 2022).

Certain departments show primary responsibility for knowledge assimilation, as illustrated by Interviewee 1. The Business Management Digital Solutions and Insights departments were spotlighted as key units for processing externally generated data to understand external customer needs and for driving efficiency in the organisation's processes, respectively.

The primary objective of assimilating new knowledge, as the evidence suggests, is to adapt methods to suit the organisation's context and requirements. Interviewee 1 further elaborated on this, referring to the adoption of

the SCRUM methodology, which they do not necessarily apply in a literal sense but adapt to the organisation's needs using the best tools or criteria. Interviewees 1 and 2 also spoke about how they adapt external methods, such as a scoring system from an American company, and create their version to serve their purposes. This instance demonstrates a blend of existing technical knowledge and external information that the organisation previously lacked but sought to implement.

The collected evidence indicates that the organisation fosters a culture focused on continuously accepting new knowledge, with employees playing a pivotal role in accumulating and integrating this acquired knowledge. Formal and informal interdepartmental meetings are the most prevalent practices used by the organisation for knowledge assimilation.

4.3 Practices for Knowledge Transformation

Knowledge transformation within the examined organisation primarily hinges on the acquisition of novel technical knowledge, which is subsequently integrated to modify organisational systems or processes. Sometimes the transformation of knowledge is performed by people (Davila et al., 2016) and sometimes it is performed by ICT tools, for instance, artificial intelligence (Avdeenko et al., 2016). As illustrated by Interviewee 1's statements, the organisation seeks to merge pre-existing technical knowledge with external insights, enabling employees to identify and present potential improvements, such as software enhancements. Interviewee 2 mentioned that this process also extends to refining the final product offered to customers, wherein new customer-related information is assimilated and applied. Interviewee 1 stresses this point by mentioning an example where the organisation successfully anticipated a customer's default, leading to a brainstorming focused on the solution, and a presentation of the benefits, efficiencies, and cost savings that the proposed platform could provide. Upon approval, the proposed changes were implemented.

Interviewee 1 further emphasizes that during the knowledge transformation process, the organisation assesses the impact of proposed new practices on the overall process. This involves prioritizing initiatives that can significantly impact processes and system applications, especially since these initiatives compete for the same resources. Upon prioritization, the projects are launched with consistent monitoring from the relevant departments. It was noted that enhancing organisational systems connected to the customer service process is the primary focus of these transformation initiatives, with technical knowledge serving as the primary input.

4.4 Practices for Knowledge Application

The analysed Fintech significantly leverages the concept of minimum viable products (MVPs), which originate from small internal projects, as a mechanism for applying the acquired, assimilated, and transformed knowledge (referenced by Interviewee 1 and Interviewee 2). MVP has been described as a critical practice for knowledge management in startups (Duc & Abrahamsson, 2016), and specifically, for applying knowledge (Bandera et al, 2020). Interviewee 1 posited that these initiatives typically start internally, with the entire workforce's participation. If the concept demonstrates effective results, it is then introduced to select external customers as a pilot project, and if continued success is observed, a broader rollout is initiated.

According to Interviewee 2, the company's application of MVPs does not strictly adhere to the traditional methodology but is rather a customized adaptation that best suits the organisation's unique circumstances. This adaptation of the MVPs technique is exactly one of the results of knowledge transformation processes inside the firm. These small-scale projects within the company primarily utilize fresh customer data as inputs, which are carefully examined by several departments before implementation. As Interviewee 1 notes, there is a particular emphasis on insights that might indirectly reflect customer requests or needs. Previous literature acknowledges the importance of MVP for closing the knowledge gaps between internal units and external customers and stakeholders (Duc & Abrahamsson, 2016).

In conclusion, it can be inferred that the MVP approach is the principal technique employed by the analysed Fintech to apply new knowledge. This approach is primarily customer-focused, with customer-derived information serving as the primary input in this knowledge application process.

5. Conclusion

The analysed company employs a variety of practices for knowledge ACAP. The company defines research as a key competence of its employees and encourages self-learning and creativity, which are embedded in its organisational culture. The recruitment process is designed to acquire people with self-learning capabilities, and in some cases, to acquire new knowledge from the know-how of new hires. External sources of information and knowledge are also used, such as blogs, internet courses, YouTube, and specialized newspapers and magazines.

The company identifies gaps in workers' knowledge and addresses them through training and development programs. The practices for knowledge assimilation include formal and informal meetings, interdepartmental committees, and the incorporation of new knowledge into the organisational memory. Technical knowledge is the main input of knowledge transformations, a dimension which is mainly focused on customers. An adapted version of the Minimum Viable Product is the main technique that the analysed Fintech use for applying the absorbed knowledge. The findings suggest that the company views its employees as a strategic resource for managing knowledge and that knowledge is shared and incorporated into daily activities. Theoretically, this study contributes to the knowledge-based view by providing evidence that may be useful for the development of an ACAP framework for firms that operate in emerging countries. As a practical implication, we can posit that organisations can use a variety of practices to enhance absorptive capacity and that these practices can be embedded in the organisational culture to create a learning culture.

Acknowledgements

The authors would like to acknowledge the company Leasein, and its founder, Carlo Mario Dioses, for generously providing access to their valuable data that was input for this study.

Risks for Knowledge-Uptake in Dutch Marine Spatial Planning: Incompatibilities Between Research and Policy-Making

Abstract: The rapid increase of Offshore Wind Farm (OWF) development in the North-Sea occurs under serious uncertainty, partly due to knowledge gaps concerning the North-Sea's socio-ecological system. The situation is particularly urgent in the Netherlands due to the intense use of its maritime zone and related conflicts among stakeholders. Optimising the placement of OWFs requires the uptake of multidisciplinary knowledge in Marine Spatial Planning (MSP) policy through ongoing adaptation of policies to new knowledge. Currently, knowledge-uptake from research into policy is widely mentioned as a challenge for MSP, but knowledge management theory has hardly been applied to it. To be useful in the multidisciplinary environment of MSP, a common language about knowledge is needed to allow for cooperation between scientific disciplines and policy sectors. However, many risks exist that may hinder knowledge-uptake between research and policy-making. This thinking-gap between research and policy-making is recognised in many fields. However, MSP and relevant knowledge about the North-Sea is rapidly developing and understudied. This results in a high pressure and dynamic situation in a developing field which can be an insightful case to apply knowledge-management theory and provide new insights for scholars of MSP. This study focuses on risks for knowledge uptake that derive from incompatibilities between researchers and policy-makers in the use and development of knowledge within the context of OWF development and MSP. These incompatibilities range from differing timeframes and uses of data to more fundamental differences in roles between researchers desiring to understand the world, and policy-makers desiring to change it. Characteristics of MSP, such as the high political pressure and relative pioneering practice of MSP may exacerbate the impact of such incompatibilities. Notably, MSP may suffer from a focus on short-term policy-making, limited cumulative understanding and fragmentation in policy. The aim of this article is to consider the effect of incompatibilities between systems of research and policy-making on knowledge-uptake in Dutch MSP and how these may be exacerbated by characteristics of MSP. Using knowledge-management literature, a list of potential incompatibilities between systems of research and policy-making is drawn. Data was collected by means of document analysis, in-depth interviews with researchers and policy-makers, and observations of policy workshops, consortium meetings, and focus groups. Findings suggest that risks to knowledge-uptake are partially caused by the incompatibilities between research and policy-making and that the context of MSP exacerbates these incompatibilities in most instances. Simultaneously, some instances were found where MSP can actually help to decrease differences between researchers and policy-makers. However, the incompatibilities between researchers and policy-makers are so enduring that risks to knowledge-uptake still persist. Better joint understanding and recognition of differences between research and policy-making are required to limit the negative effect of incompatibilities between research and policy-making on knowledge uptake.

Keywords: Knowledge management, Knowledge uptake, Marine spatial planning (MSP), Science-policy interface, Offshore wind farm governance (OWFs)

1. Introduction

Sustainable energy and energy security goals are increasingly important to European countries following the Paris climate agreement and the invasion of Ukraine (European Commission, 2022). In many countries bordering the North-Sea, a principle means of attaining energy goals is the construction of Offshore Wind Farms (OWFs). Regionwide plans aim to increase North-Sea OWF capacity from 25GW to 260GW by 2050 (Netherlands enterprise agency, 2021; WindEurope, 2021). In the Netherlands, OWF capacity is planned to double by 2030 (Rijksoverheid, 2022). However, an array of interests lays claim to marine space, including rising ecological targets, traditional uses like shipping, fishing, and sand-mining, and technical innovation increasing the feasibility of new users such as aquaculture and other forms of maritime energy production (Ehler et al. 2018). The subsequent conflict for space in the Dutch part of the North-Sea urges for careful Marine Spatial Planning (MSP) (European Commission, 2014).

MSP is a novel approach to maritime governance and widely accepted as the principal concept for maritime governance (Ehler, 2018). MSP aims to develop policy frameworks which balance the various offshore claims to space in a socially acceptable and ecologically responsible manner. To develop such frameworks, MSP requires intricate knowledge of the socio-ecological systems of the North-Sea, which, until recently, was relatively limited (Ehler et al. 2018). In response, there are increasing efforts to improve fundamental and

practical understanding of the North-Sea ecosystem and the effect of human activities (Noordzeeloket, 2016; 2021: Dutch Research Council, 2020). The development of OWFs is the prime challenge of MSP due to the high political pressure to produce more green energy. As such, most research projects concerning the North-Sea currently investigate the effect of OWFs. The rapid increase of existing knowledge requires a strong science-policy interface to ensure the uptake of newly developed knowledge. However, scholars and practitioners indicate that knowledge-uptake from researchers to policy-makers constitutes an increasingly urgent constraint in MSP (Rekola and Paloniemi, 2022; Paez et al. 2020). If knowledge-uptake in MSP remains constrained, decision-making on OWFs may have severe ecological and societal consequences (Dutch Research Council, 2020) which may hinder energy transition on the long-term. Additionally, a degree of certainty on which to base policy is often legally required due to, for example, the precautionary principle (European Commission, 2014).

Knowledge-uptake concerns *the acquisition and comprehension of diffuse information and its subsequent integration, interpretation, valuation, and application into policy* (Ryneveld and Sproule, 2006). Knowledge management research, which considers the use and uptake of knowledge, receives increasing attention in academic communities and practice (Dutch National Scientific Agenda, 2020). Knowledge management literature mentions that incompatibilities between politics and research may impede successful knowledge-uptake (Derksen, 2014, p14). Incompatibilities are implied to form risks to knowledge-uptake, but their effect on knowledge-uptake remains understudied (Paez et al. 2020; Rekola and Paloniemi, 2022). These incompatibilities derive from differences between systems of research and policy-making, and could potentially provide an explanation for the difficulties surrounding knowledge-uptake in MSP. This thinking-gap is recognized in many different fields (Christensen, 2021). However, there is reason to believe that characteristics of MSP, such as the high political pressure to produce sustainable energy, MSP being understudied, the limited knowledge and quick development of knowledge of the North-Sea's biophysical system, and MSPs early development may increase the effects of these fundamental differences, leading to heightened risks for knowledge-uptake (Keijser et al. 2020; Paez et al. 2020). As such, MSP makes for a suitable case-study to consider potential incompatibilities between research and policy-making as risks for knowledge-uptake.

This paper explores the effect of incompatibilities between systems of research and policy-making on knowledge-uptake in Dutch MSP and how these may be exacerbated by characteristics of MSP. The paper presents a framework for analysing these incompatibilities and considers how they are expressed in the specific MSP context. The framework is based on differences between the roles of politics and research mentioned in knowledge management literature (Böcher and Krott, 2016, p53; Derksen, 2014, p10-43; Oliver et al, 2014; Spaapen and van Drooge, 2011). The framework is described in section 2. Section 3 explains the methods, including document analysis, interviews with researchers and policy-makers working on the Dutch North-Sea, and observations of workshops and focus groups. In section 4, the results of the analysis are described and discussed with a focus on patterns demonstrating risks to knowledge-uptake. Section 5 provides a conclusion.

2. Theory

Böcher and Krott (2016), indicate that the ideal roles of research and policy-making as public domain tasks are much discussed and clear but can lead to incompatibilities between research and policy-making. The ideal role of researchers is to produce a (fundamental) understanding of the world or human behaviour, with the main source of efficacy being empirical proof and logic. Researchers work according to effective and efficient scientific methodologies, look for appropriate data to analyse, include and critique the findings of peers and live up to stringent codes of conduct (Böcher and Krott, 2014; Derksen, 2014). The role of policy-makers is to solve societal problems through political means, shaping and steering the world according to an agenda, with the main source of efficacy being power. This involves public participation and discourse for agenda-setting and democratic procedures for scrutiny with the ideal goal of mobilizing society behind a decision (Oliver et al. 2014; Böcher and Krott 2016).

These different ideal roles may result in important incompatibilities between systems of research and policy-making upon what constitutes knowledge, and how to use it. To explain the world around them, scientists want to consider all possible data, accumulate it and analyse it according to theoretical logic. In science it is valuable to clearly indicate where uncertainties persist and interpretations might change due to new data. In this process there is little room for wishful thinking, and it takes significant amounts of time due to the reliance on empirical proof, the need for reversibility of answers, and the cumulative assessment of knowledge

(Derksen, 2014). Policy-makers on the other hand want to solve an issue while it is still prominent in the political agenda, this requires a convincing argument for their decisions where best estimates or even wishful thinking can contribute. In such an argument there is limited space to consider all possibilities and available information, let alone to consider all accumulated knowledge. In policy-making, indications of uncertainty may undermine the argument and instead power, persuasion, and new ideas are used to gather support. Often, the possibilities for this change are restricted to short-term windows of opportunity, and political preferences. These differences have the potential to threaten knowledge-uptake between research and policy (Böcher and Krott, 2016; Derksen, 2014). The different tendencies towards knowledge and its use between research and policy in table 1 demonstrate that significant incompatibilities may exist between researchers and policy-makers.

Table 1: An Overview of Different Tendencies Between Systems of Research and Policy-Making.

Topic	Research, produces knowledge scientifically	Policy, solves problems politically	Sources
Timeframe	Take the time needed: long period necessary to observe and analyse.	Time restricted by window of opportunity: short periods to solve pressing societal problems.	Böcher and krott, 2016. Derksen, 2014. Janssen et al. 2014.
Focus	Describing and explaining the world.	Influencing and changing the world.	Böcher and krott, 2016. Derksen, 2014.
Value of data	All data for empirical testing of hypothesis.	Selective and supportive to build argumentative discourse.	Böcher and krott, 2016.
Questions	Need to be critical.	Need to be relevant.	Christensen, 2021. Böcher and krott, 2016. Derksen, 2014.
answers	Need to be reversible.	Need to be convincing.	Böcher and krott, 2016. Derksen, 2014.
Attitude on wishful thinking	Needs to be avoided.	Needs to be encouraged.	Böcher and krott, 2016.
Rely on	theoretical logic and empirical proof.	Persuasion and agreement.	Böcher and krott, 2016. Derksen, 2014.
Power use	To describe and explain the world.	to influence and change the world.	Böcher and krott, 2016.
Use of knowledge	Accumulate, to get closer to truth.	New ideas, relabelling the world, to support mobilization.	Böcher and krott, 2016. Derksen, 2014. Janssen et al. 2014.
Attitude on uncertainty	Needs to be admitted staying close to the truth.	Needs to be shrouded to prevent loss of confidence.	Derksen, 2014.
What constitutes a problem	Objective/fundamental lack of understanding.	Subjective problem in society/policy which can have its roots in a fundamental lack of understanding but does not have to.	Derksen, 2014. Keijser et al. 2020. Paez et al. 2020.

2.1 The Context of MSP

Marine Spatial Planning is a process of spatial policy formation, which relies on many different scientific disciplines, and public and private sectors for its information and management (Cormier et al. 2016). Since 2014, European Union member states, have to adhere to the European Marine Spatial Planning Directive, transposing MSP principles and goals into national law and thus putting it on the political agenda (European Commission, 2014). MSP aims to manage human activity at sea, which becomes increasingly complex due to the rising interest in marine space. In the case of OWF development, this interest in marine space is highly politicized due to the translation of climate ambitions to high OWF targets. As a result, the OWF sector has become powerful and hard to balance with other maritime uses in MSP (Spijkerboer et al. 2020). Literature indicates that the mentioned incompatibilities between researchers and policy makers are particularly apparent in MSP. For example, in goals (Keijser et al. 2020), in the conflicting understanding of concepts and language between parties (Paez et al. 2020), and the limited understanding of the biophysical system (Gazzola et al. 2015; Paramana et al. 2021). Additionally, there are indications that various characteristics of MSP can exacerbate differences between policy-making and research. For example, Kusters et al (2023) indicate that the mentioned political pressure leads to a short-term focus in policy, which can increase incompatibilities in timeframes. Gusatu et al (2021) demonstrate limited knowledge bases of the North-Sea's biophysical system and limited understanding of cumulative effects, which can affect the value of data and the (non)use of knowledge. Spijkerboer et al. (2020) show how limited experience with MSP and integrated policy-making also leads to fragmentation in policy, which can influence what constitutes a problem, or how questions are asked. This fragmentation may imply selective and partial knowledge-uptake based on sectoral interests. Therefore, these characteristics of MSP combined with high OWF targets may exacerbate the possible incompatibilities between research and policy-making, increasing risks to knowledge-uptake in MSP.

3. Methods

This study employs a qualitative case study, using 4 methods of data collection to triangulate and verify findings on the effect of incompatibilities between systems of research and policy-making on knowledge-uptake in Dutch MSP. The study focuses on the case of the Dutch part of the North-Sea since it has a comparatively long marine spatial planning tradition since 2004 and is one of the busiest sea-areas in the world. Furthermore, it is subject to various large ecological research programs to improve understanding of the influence of OWF on marine ecology, and relatively detailed MSP (Ministry of Infrastructure and Water management et al, 2021; Ministry of economic affairs, 2015; Overlegorgaan Fysieke Leefomgeving 2020). As such, there is a large amount of new knowledge to potentially take up in Dutch MSP policy. Additionally, the aggravating characteristics of high political pressure for OWF development, limited space, policy fragmentation, and short-term focus are present in the Dutch context (Spijkerboer et al. 2020; Kusters et al, 2023; Gusatu et al, 2021). As such, the case of Dutch MSP is particularly suitable for considering the risk of potential incompatibilities between research and policy-making on knowledge-uptake and the aggravation of these risks in MSP.

Data collection and analysis in this study consisted of 4 steps: (1) Official documents concerning Dutch MSP and related knowledge programs in the last decade were selected from public websites and analysed to gain insight in recognized knowledge (gaps) and risks to its uptake; (2) observation of consortium meetings (n=5) and focus groups (n=2) regarding knowledge use in Dutch OWF development; (3) Based on findings from observations and document research, in-depth interviews were held with scientists (n=13) ranging from hydrologist to marine governance experts, and policy-makers (n=7) from different public sectors relevant for MSP; (4) Transcripts and policy documents were analysed in Atlas ti, based on coding guides developed with insights from the theoretical framework, and findings from observations and interviews with researchers and policy-makers. Outcomes were validated with participants, and full anonymity was guaranteed.

4. Results and Discussion

Findings from the analysis of documents and participant's experiences demonstrate that the incompatibilities between research and policy-making can constitute risks for knowledge-uptake in MSP, see table 2. From table 2, four patterns emerge which demonstrate the effect of incompatibilities between systems of research and policy-making on knowledge-uptake in Dutch MSP and how some of these effects can be exacerbated by characteristics of MSP.

The first pattern shows that risks for knowledge-uptake arise from the manner in which uncertainty is dealt with in decision-making in MSP. This risk stems from the different attitudes on uncertainty between

policymakers and researchers. Researchers want uncertainty to be admitted, see figure 1. However, due to this uncertainty, policy-makers lack the certainty needed for legitimate political arguments, or do not have the capacity to develop fitting policy-measures in the light of this uncertainty and thus decide to shroud uncertainties, see table 2. Secondly, uncertainties in knowledge may cause policy-makers to ignore it completely. Thirdly, the thinking gap between researchers and policy-makers may cause misunderstanding concerning the level of certainty, potentially increasing the inclusion of uncertain knowledge. The inclusion of uncertain knowledge, lack of transparency of the degree of uncertainty, and the exclusion of other uncertain knowledge diminishing the quality and completeness of knowledge taken up, and thus constitutes a risk to knowledge-uptake. Additionally, this characteristic increases differences in timeframes since scientists need more time to find certain answers due to a lack of existing knowledge. Finally, the high amount of uncertainty also influences the other patterns as explained below. As mentioned by Kusters et al (2023), apart from a risk for knowledge-uptake, this constitutes a strategic deficit in policy, since shrouded uncertainty in decisions made today can lead to long-term problems in the socio-ecological system.

A second pattern is how a risk to knowledge-uptake arises from the marginalization of knowledge, with certain knowledge being actively excluded from policy. As can be seen in table 2, such marginalization partially results from the legal constraints on the formulation of questions. As mentioned, certain levels of uncertainty can cause knowledge to be marginalized. Findings show instances where knowledge which contradicts political interests may be dismissed through wishful thinking, e.g., despite research indicating the devastating effect of mixing water layers which can be a result of OWF development, this is limitedly considered in policy documents. The focus on legally relevant and 'fitting' knowledge also results in an underuse of other types of knowledge and a simplistic framing of what constitutes a problem in MSP. Additionally, policy-makers indicate that they lack the time and expertise to process often complex research reports, causing them to selectively include knowledge with political and legal relevance. E.g., knowledge concerning protected species like birds, seals, and porpoises was included, while unprotected species were largely left out (Ministry of Economic Affairs, 2015; Ministry of Agriculture Nature and Food-quality and Ministry of Infrastructure and Water Management, 2022; Odinga et al. 2021). This marginalization also demonstrates that despite the appreciation of fundamental data in MSP, the incompatibilities in data valuation between research and policy are so persistent that this appreciation only has effect when backed up in legal obligations. Subsequently, this pattern limits the objectivity and thus quality of knowledge uptake.

A third pattern shows how a lack of trust between researchers and policy-makers can form a risk for knowledge-uptake. As indicated strong relations improve knowledge uptake. According to participants, a lack of trust could lead to the stagnation of interaction, diminishing relations, and thus knowledge uptake. Moreover, it can cause individuals or organisations to purposefully ignore the knowledge needs of other groups. Table 2 demonstrates that policy-makers may no longer trust researchers to come with timely and clear answers to their questions (focus), resulting in the marginalization of knowledge and researchers losing trust in policy-makers. This is also visible in how answers to scientific and societal questions are used in systems of science and policy-making. Examples from the analysis demonstrate that policy-makers want scientists to focus on policy-relevant knowledge like protected species, but in some cases receive little useful information and very limited updates, which diminishes trust in research organizations.

Finally, differences in understanding, interpretation and valuation of knowledge also create a pattern of risk for knowledge-uptake. This is related to the topics 'focus', 'answers', and 'power uses' in table 2. These differences can constitute a risk for knowledge-uptake when the same knowledge is interpreted in a different way by scientists and policy-makers, causing policy to be based on potentially faulty assumptions. An example is that policy-makers can be more positive about the effect of OWFs on native benthic communities than indicated by scientists due to a lack of understanding of the ecological system and the particularities of species. This can cause researchers and policy-makers to assume entirely different characteristics about the North-Sea, causing misunderstandings to seep into processes of knowledge uptake which constitutes a serious risk for its quality.

A couple of the risks we find are in line with other research regarding threats for knowledge uptake (Bocher and Krott, 2016). However, in the case of uncertainty we see a specific link between characteristics of MSP and increased risk for knowledge-uptake. Additionally in table 2 we see how the characteristics of MSP exacerbate other risks for knowledge uptakes discussed above. Examples of such characteristics are high political pressure, limited understanding of the North-Sea, short-term tendencies in MSP, the fragmentation of policy, and limited cumulative knowledge of the North-Sea's biophysical-system. Despite the challenges MSP poses, it may also have certain benefits. For example, fundamental understanding being included in policy goals has a

balancing effect on the valuation of data and problem definitions by researchers and policymakers. We see evidence that researchers and policy makers come closer together in some cases, see table 2. Regardless of some of the characteristics of MSP helping to bridge the science-policy interface, the fundamental incompatibilities between research and policy-making are severe to a degree where the risk for knowledge-uptake persists.

Table 2: Findings Concerning the Risk of Potential Incompatibilities for Knowledge-Uptake Between Researchers and Policy-Makers in MSP and the Implications of the MSP Context on These Incompatibilities

Topic	Findings
Timeframe	The high political priority of OWF development demands quick results and thus limits the available time for research. Conversely, limited knowledge of the North-Sea increases the required time to find acceptable levels of certainty in research. As such, the timeframes of researchers and policy-makers are pushed further apart resulting in policy based on incomplete and uncertain knowledge.
Focus	MSP and the understanding of the North-Sea's biophysical system are in their infancy, increasing the pressure for their development. Analysis demonstrates that the rapid development anthropogenic use of the North-Sea incurs changes in the system, complicating the development of system-understanding by scientists. Conflicting goals between systems of research and policy-making lead to a lack of trust and differences in the understanding, valuation, and interpretation of knowledge.
Value of data	The need to balance accumulated data in MSP leads to better understanding of multidisciplinary insights among stakeholders. Since fundamental understanding is more often included in political goals, differences in data valuation are reduced. This incentivizes trust and direct contact. However, the fragmentation of policy makes it hard to include complex data from various fields.
Questions	Due to the array of interests, disciplines, and sectors involved, there are more questions relevant for policy-making. Therefore, the amount of relevant knowledge can surpass the capacity of policy-makers to take up knowledge, particularly since the fragmentation of policy-process reduces experience with multi-disciplinary knowledge. This increases the workload for policy-makers.
Answers	The long operation time of OWFs (30-40 years) limits the reversibility of decisions. This increases the need to convince parties about OWF goals in the policy arena, which often creates a short-term window of opportunity. Thus, increasing the gap with long-term research interests. Additionally, scientists prefer to publish results instead of presenting them in panels or discussions, limiting direct connections to policy makers.
Attitude on wishful thinking	The high uncertainty in MSP encourages wishful thinking. Especially the short-term policy focus, desired in OWF targets leads to the dismissal of long-term negative effects. Wishful thinking often ignores contradictive evidence and uncertainties, possibly leading to the marginalization of knowledge, more decision-making under uncertainty, and diminishing the trust of researchers in the policy-process.
Rely on	The lack of knowledge about the North-Sea increases uncertainty. The development of OWFs therefore relies on persuasion and agreement. Similar, to wishful thinking, this reliance on persuasion may limit the inclusion of contradictive evidence and thus cause marginalization of knowledge, decision-making under uncertainty, and distrust.
Power use	Policy-makers indicate that in MSP their focus lies on high priority political goals, which are mostly short-term. This is partially due to the limited capacity to take up knowledge. This leaves less time to consider the fundamental understanding of the North-Sea, increasing the differences in understanding, interpretation and valuation between researchers and policy-makers.
Use of knowledge	The thorough use of accumulated, multidisciplinary, and complex knowledge fits with the research system and is necessary for decision-making in MSP. The inclusion of this knowledge use legal requirements should lead to more thorough use of knowledge by policy-makers. However, in practice this only occurs in particular topics with high political priority. As such this difference can lead to the marginalization of knowledge.

Topic	Findings
Attitude on uncertainty	The many different sectoral and disciplinary interests vying for limited space led to a rise in relevant factors for policy-making in MSP. This complicates predictions and increases uncertainties. As such, it becomes increasingly important to admit uncertainties but these uncertainties are pushed aside by high political pressures. This causes a rise in the level of decision-making under uncertainty.
What constitutes a problem	The fragmentation in MSP policy and other parties involved in MSP limits the joint formulation of problems. While the inclusion of fundamental understanding in policy-goals does bring researchers and policy-makers closer together in formulating problems, these goals are often still restricted to legally protected species, causing the marginalisation of knowledge.

5. Conclusions

This paper reinforces the initial insights by Paez et al (2020) and Keijser et al (2020) on how knowledge-uptake within MSP faces important risks due to incompatibilities between research and policy-making. It furthers these insights, in showing why and how such incompatibilities are expressed in the context of MSP. Notably, the need for timely, clear and policy-relevant information as desired by policy-makers cannot reasonably be expected from researchers in the dynamic and understudied context of OWF and MSP. The result is a mismatch and a – sometimes-purposeful – underutilization of available knowledge. This conclusion emphasizes a need for direct efforts to improve understanding and acknowledgement of the differences between scientists and policy-makers to improve knowledge-uptake in MSP. Apart from a risk to knowledge-uptake, the incompatibilities found between research and policy-making lead to patterns that hinder knowledge-uptake. However, as mentioned in MSP literature they also constitute a strategic deficit in policy which needs to be overcome. This conclusion also points to the necessity of investments in a better science-policy interface within MSP to diminish the identified risks to knowledge-uptake, notably regarding the ecological impact of a swift roll-out of OWFs. Central in such attempts should be attention for how policies may better anticipate and handle uncertainties and how a bias to legally relevant information can be avoided. Likely, such attempts will require investments in a) the collaboration between policy-makers and researchers in developing knowledge sharing, and practical decision support tools, b) the interfaces where knowledge needs are matched with both existing research activities and forms of reporting, and c) the increased awareness of how differences between researchers and policy makers may influence knowledge sharing to develop a better understanding of the situation partners find themselves in.

Knowledge and Innovation Performance in Czech Firms: The Influence of Decision-Making Structure

Denys Dmytrenko and Viktor Prokop
Science and Research Centre, Faculty of Economics and Administration, University of Pardubice, Czech Republic

denys.dmytrenko1@gmail.com (Corresponding author)

Abstract: There are plenty of factors that influence a company's innovation performance. They include, for example, the firm's strategy, organizational culture, size, and availability of resources. Besides these factors, a lot depends on the firm's leadership, attitude towards innovation, experience, and knowledge. The influence of external knowledge, like patents and inventions from other businesses, has been studied by researchers many times. However, previous scientific publications contain mixed evidence on the impact of external knowledge on a firm's innovation performance. Many of them defined separate factors, like innovation orientation or knowledge sources, as influential for the firm's innovativeness. However, not enough studies were made on firms' decision-making structure. Scholars suggested that decentralized companies are more likely to experiment in their innovation activities than centralized ones. We aim to determine the role of the decision-making structure in innovation performance by gaining external knowledge among firms in the Czech Republic. We contribute to the existing literature by distinguishing the firms by their legal statuses (sole proprietorship, partnership, shareholding company) and the presence/absence of a supervisory board. Our research is done by applying a quantitative method with empirical data. We use multiple linear regression and SPSS software to determine the influence of external knowledge acquisition and other related factors (R&D inside and outside the firm, age, size) on innovation performance, with decision-making structure indicators included. We divide innovations into process and product ones. The study uses the World Bank Enterprise Survey data for the Czech Republic. The results of this paper present important outcomes for practitioners. They will prompt more efficient innovation strategies for firms, depending on their management type.

Keywords: External knowledge, Innovation performance, Decision-making structure, Czech firms, Product innovations, Process innovations

1. Introduction

Innovations are very important for the development of businesses, as well as for triggering their competitive advantage and achieving economies of scale (Prokop, Kotkova Striteska & Stejskal, 2021). Competition in many areas leaves no other choice for companies except to innovate if they want to stay afloat (Williams, 1992). There are many determinants that influence the innovation process in the companies. External knowledge, which companies acquire to complement the existing internal knowledge in the company, represents one of the most influential groups (Belderbos et al., 2004; Prokop & Stejskal, 2019). It is clear because firms cannot solely rely on their technologies and knowledge. To stay competitive, firms must acquire knowledge from the outside. As Chesbrough states (for example, Chesbrough, 2012), "not all smart people work for us, and not all smart ideas originate in our company". Therefore, external knowledge is one of the main components that help companies introduce new products and services, as many researchers emphasize (Cassiman and Veugelers, 2006; Trantopoulos et al., 2017; Stejskal et al., 2018). One of the options for how external knowledge can be obtained is a collaboration with other firms (Das and Teng, 2000). However, there are also other ways. R&D activities, expansion to foreign markets, education of employees, and investments from the outside are often cited as the most influential factors for innovation. (Ehrenberger et al., 2015; Lin, J.Y., Yang, C.H., 2020).

Many researchers previously studied the influence of external knowledge on innovation. Regarding examples, Duong et al. (2022) studied whether family or non-family firms use external knowledge more effectively in Belgium. Yu and Lee (2017) found that collaboration with research organizations positively influences the innovativeness of companies in Korea. Concerning the country of our study, Ehrenberger et al. (2015) were looking for factors influencing innovation in small and medium enterprises in the Czech Republic. It's an important observation as research organizations are among the main sources of external knowledge for businesses. Yu and Lee (2017) defined that a firm's innovation orientation, age, and size significantly impact innovation performance. Larger and older firms have better abilities to use external collaboration to increase innovation performance. Authors also suggest differentiation by the decision-making structure of the company to test the effect of research collaboration on innovation performance, based on the conclusions of Jansen et al. (2005), who came to the conclusion that less decentralized companies are more likely to explore and implement innovations than centralized ones.

Numerous researchers tested the influence of the organizational structure of the company on innovativeness (Cosh et al., 2012; Yang et al., 2015; Sari et al., 2022). As previous studies showed, the influence of the decision-making structure on innovations in companies is not obvious (Yang et al., 2015; Sari et al., 2022). Also, there are discussions on the significance of external knowledge in the company's innovation process depending on the company's characteristics (Trantopoulos et al., 2017; Duong et al., 2022). It motivates us to find out whether the acquisition of external knowledge is an influential factor in the company's innovation performance and define which conditions facilitate the efficient use of external knowledge.

Summing up, *the first aim of this study is to test whether the acquisition of external knowledge is an influential factor for innovation performance in Czech companies*. *The second aim is to determine if the decision-making structure of Czech companies matters when it comes to the acquisition of external knowledge for innovation*. Our research delivers important results that will help to better understand the nature of external knowledge acquisition by companies by adding valuable distinctions between firms of different legal statuses and decision-making structures. A firm's management structure may speed up or slow down processes inside the firm, including the innovation processes. We test the effectiveness. It will allow us to define more precisely the main factors that influence the effectiveness of external knowledge acquisition.

The rest of the paper is organized as follows: Section 2 contains an overview of the literature with the innovation theories and studies that mention the effect of external knowledge and other factors on innovation. Section 3 contains data and methodology description. Next, we present the results and their discussion in Section 4. In the last part, we conclude our paper, including a summary of contributions and suggestions for future research.

2. Hypothesis Development and Literature Review

External knowledge is usually defined as all the know-how, patents, and inventions obtained by a company outside its borders, including from other businesses and organizations (Loree et al., 2011). In this study, we therefore understand external knowledge as patents, know-how, inventions, and other types of knowledge acquired from other businesses and organizations. This understanding reflects the definition by the World Bank Enterprise Survey that we use as our data source. Several scientists proved the important role of external knowledge in the innovation processes in enterprises. Laursen and Salter (2006) found proof that the implication of external knowledge has a positive impact on innovations in the UK manufacturing industry. Ahuja and Katila (2001) noticed the same link for the leading world's chemical enterprises, and Un et al. (2010) discovered the positive influence of R&D collaboration on product innovation. Ben Arfi et al. (2018) discovered that the positive impact of knowledge on green innovation in firms depends on a combination of internal and external sources of knowledge. Chatterji and Fabrizio (2014) define that not only other firms and universities may be the sources of external knowledge but also the customers. And the acquisition of user experience positively influences product innovation in the medical industry. The mentioned research outcomes lead to the formulation of our first hypothesis when we examine if such factor as external knowledge is important in the innovation process. Here, we understand the innovation process as the introduction of innovation of two types (product or process). Moreover, we will use internal R&D activities and R&D activities with contractors as additional independent variables (described below).

> *H1: Acquisition of external knowledge positively affects the implementation of product and process innovations by enterprises.*

This type of analysis is highly relevant to our chosen territory, i.e., the Czech Republic, which belongs to the group of Central and Eastern Europe (CEE). CEE countries are generally understood as countries where innovative firms often depend on external knowledge and technology (see, for example, Prokop, Stejskal, Klimova & Zitek, 2021). Moreover, against policymakers' expectations, these countries do not grow based on research-driven innovation (Radošević, 2017).

As Jansen et al. (2005) and Yu and Lee (2017) suggested, decentralized companies are more willing to explore and implement new technologies. However, Yu and Lee (2017) mentioned that there is still a gap in understanding how the decision-making structure of the firm may influence its innovation activities and suggested this direction for future research. Decentralized companies are more willing to innovate, as evidenced by Cosh et al. (2012) for UK firms. The role of the supervisory board in the innovativeness of the firm, by which we differentiate the firms, was studied by Jasinski (2019). Yang et al. (2015) discovered that the interconnection between centralization and innovation performance in Chinese companies depends on the information flow inside the company and the motivation of workers. This study is close to our research, as it also deals with knowledge as an influential factor in innovation performance and divides companies by their decision-making

structure. Sari et al. (2022) proved the positive influence of the time in power of the supervisory board on innovation performance in Indonesia. However, there is still a lack of studies that would directly test the influence of organizational structure on innovativeness (as suggested by Jansen et al. (2005) and Yu and Lee (2017)). From here, we formulate our second hypothesis.

> *H2: Less centralized companies (with supervisory boards, those that have market shares) are better at exploiting external knowledge to create innovations.*

Except for the primary independent variable, we also investigate the influence of other related indicators on innovation performance, namely R&D activities inside and outside the firm. These variables were used, in particular, by Ehrenberger et al. (2015) and Prokop et al. (2021). Ehrenberger et al. (2015) found R&D activities inside the firm as the most significant contributor to innovations among SMEs in the Czech Republic. Prokop et al. (2021) used many different components of internal and external R&D and knowledge to test their influence on companies' innovation performance in Central and Eastern Europe. Authors concluded that firms in catching-up CEE countries depend more on internal than external sources of knowledge and R&D in general, despite the increasing role of the foreign knowledge. We use the internal and external R&D variables to test whether they are influential, alongside the external knowledge variable.

We include age and size as control variables for our analysis. Yu and Lee (2017) found that older and larger firms benefit more from getting outside knowledge. According to Penrose and Penrose (2009), older firms tend to accumulate more resources, allowing them to support innovations to a greater extent. The opposite result, however, was found by Huergo and Jaumandreu (2004) for Spanish firms. Ettlie and Rubenstein (1987) proved that larger firms are more likely to introduce innovations than smaller ones. Sari et al. (2022) found the negative influence of the company's size on innovativeness. We seek to approve or disapprove the results of the studies mentioned above.

3. Methods and Data

3.1 Methods and Description of Data

We applied multiple linear regression and used SPSS software to get our results. This software was, in particular, used by Torres de Oliveira et al. (2022) for their research on the influence of external knowledge on innovations. Our data is divided into two and three groups based on the presence of the supervisory board and legal status, respectively. As a data source for our paper, we used the World Bank Enterprise Survey for the year 2019. The survey contains data on enterprises, including information about innovation performance, external knowledge acquisition, and on size and age of companies. In total, we included all the inputs except those with missing values – the data for 499 Czech companies. We differentiate the companies by two criteria described as decision-making structure: legal status (shareholding with traded shares, shareholding with non-traded shares, sole proprietorship) and presence/absence of the supervisory board. We follow the suggestions of Jansen (2005) and Yu and Lee (2017).

3.2 Dependent, Independent, and Control Variables

We have two dependent variables, product and process innovations. These two types of innovations are the most widespread, and both are mentioned in the World Bank Enterprise Survey. Duong et al. (2022) concentrated solely on product innovations, following the works of De Massis et al. (2015) and Ettlie and Rubenstein (1987).

We include two other independent variables, namely R&D activities inside the firm and R&D activities contracted with other companies. These indicators show whether the firm spent any resources on the research activities in the firm itself or agreed on the research with outside contractors. These variables were used by Ehrenberger et al. (2015), who found R&D activities inside the firm as the most significant factor for innovations in Czech companies. The age and size of the firm are used as control variables, based on a paper by Yu and Lee (2017). We described all our variables in Table 1. We sort firms by size according to the European Commission classification: small enterprises are those having less than 50 employees, medium-sized enterprises have from 50 to 250, and large are those counting more than 250.

Table 1: Description of Variables

Variable	Type	Description	Categories
Acquisition of external knowledge	Independent	Over the last three years, did this establishment spend on the acquisition of external knowledge?	1 = yes; 2 = no
R&D inside the company	Independent	Over the last three years, did this establishment spend on research and development activities within the establishment?	1 = yes; 2 = no
R&D with contractors	Independent	Over the last three years, did this establishment spend on research and development activities contracted with other companies?	1 = yes; 2 = no
Product innovations	Dependent	During the last three years, has this establishment introduced new or improved products or services?	1 = yes; 2 = no
Process innovations	Dependent	During the last three years, has this establishment introduced any new or improved processes?	1 = yes; 2 = no
Age	Control	In what year did this establishment begin operations? (2019-year)	1 = 0–10; 2 = 10–20; 3 = 20–30; 4 = more than 30.
Size	Control	At the end of the fiscal year, how many permanent, full-time individuals worked in this establishment?	1 = 0-50; 2 = 51-250; 3 = more than 250.

4. Results and Discussion

We divide our results into two parts. The first part is for differentiation by legal status (Table 2), the second part is for division by the presence/absence of the supervisory board (Table 3). We also divide results based on the dependent variable, whether it is product or process innovations.

Table 2. Results of Regression for Different Legal Status

	Product innovations					
	Traded shares		**Non-traded shares**		**Sole proprietorship**	
	Coefficient	**p-value**	**Coefficient**	**p-value**	**Coefficient**	**p-value**
External knowledge	0.500	0.064	0.112	0.089	0.285	0.274

Significance: * - 0.05 ** - 0.01 *** - 0.001

Results in Table 2, for differentiation in legal status, show the outcome opposite to the expected. Surprisingly, in cases of both types of innovation, external knowledge doesn't have an influence in the case of any type of legal status of a business. External knowledge, or any other factor, does not influence product or process innovations in less centralized companies, those with shares traded on the market. Therefore, we conclude that such factor as the company's legal status doesn't impact the connection between the acquisition of external knowledge and innovations. Such an outcome contradicts the outcomes discovered in studies of Yu and Lee (2017) and Jansen et al. (2005), who suggested research on decision-making structure and innovations and claimed that less centralized companies are more willing to explore and innovate, respectively. Though, the outcome could correspond to the results of Inkinen et al. (2015), who find other characteristics of a company's management, such as strategic management practices, essential for a company's innovation performance. By contrast, we confirmed that R&D activities have a high impact on innovations, and what is remarkable is more in centralized types of proprietorship than decentralized ones. The most influential among all factors turned out to be the R&D activities inside the company, and it had influence in half of the cases and with high significance. This result is in line with Ehrenberger et al. (2015), in whose study, R&D activities inside the firm were found to be the most influential factor in Czech SMEs. Regarding control variables, size was proved to have an influence only in one of the three cases, and this influence was negative. The same result was achieved in the study of Sari et al. (2022) for Indonesian companies.

Table 3: Results of Regression for Present/Absent Supervisory Board

Product innovations				
	Present		**Absent**	
	Coefficient	**p-value**	**Coefficient**	**p-value**

R&D contract	0.218	0.095	0.205	0.002**
Age	-0.005	0.933	-0.062	0.014*
Size	-0.054	0.429	-0.064	0.070

Significance: * - 0.05 ** - 0.01 *** - 0.001

Our results in Table 3 show that the acquisition of external knowledge has an impact only on product innovations in companies where the supervisory board is present. It partially proves hypothesis number two, which says that less centralized companies are better at innovation implementation. But, what is more important, hypothesis number one is proven here, as less centralized companies (with supervisory boards) have an impact of external knowledge on product innovations, while more centralized (without supervisory boards) - don't. These results are in line with the conclusions of Duong et al. (2022), who found that in certain types of firms, external knowledge has a positive impact on product innovations, and with the research of Jansen et al. (2005), who suggested that less centralized companies are better at using the external knowledge for innovations. Hypothesis number one is proven only in the case of product innovations, which corresponds to the results of Kobarg et al. (2019), where product innovations were studied.

Besides that, a valuable outcome is that in the case of more centralized management (non-traded shares, sole proprietorship), such factors as internal/external R&D activities have more impact in the case of process innovations than in companies with the less centralized type of management. Such results match the conclusions of Un et al. (2010) and Ehrenberger et al. (2015), who proved the significant influence of R&D activities on

companies' innovations. Nevertheless, Un et al. (2010) had such results for product innovations, and the authors explained it by a wise choice of collaborators outside the companies. Ehrenberger et al. (2015) also noticed the influence of size on the intensity of R&D activities inside the firm, as bigger companies tend to have them more. The control variables didn't turn out to be substantial in this case, as well as in the previous test. Age is significant only in process innovations when the supervisory board is absent.

5. Conclusions

In our study, we tested the role of external knowledge in creating innovations in Czech companies. We used a sample of 499 enterprises from different industries of different ages and sizes. The study resulted in several repercussions. First, no effect of separation by legal status was found. Our hypothesis that companies with decentralized structures are better at using external knowledge was unconfirmed. In this instance, other independent variables, namely expenditure on R&D activities, had an influence on both types of innovations. The unexpected part is that the influence is stronger when the company's structure is more centralized. This result contradicts our hypothesis assumption.

Nevertheless, the hypothesis on the effect of decision-making structure was proved after testing it for the supervisory board variable. However, this suggestion was confirmed only for product innovations. Control variables didn't have the expected influence. The most important outcome of our study is that the acquisition of external knowledge has a positive impact on product innovations in companies with supervisory boards. It proves the second and partially the first hypotheses of our study. External knowledge has more influence on innovation performance in less centralized companies than in more centralized ones. Such an outcome is in line with the results of Duong et al. (2022), who proved that efficiency in using external knowledge for product innovations depends on the internal characteristics of the firm.

The findings of our study are potentially beneficial for further research in the field. They show that the legal status of the firm is insignificant for the innovations using external knowledge. They also show that the presence of the supervisory board and the firm's age and size have limited influence on the company's innovations. Based on this information, researchers can define more precise aims of their studies.

Our study has certain limitations. Our outcomes are bounded by the availability of data from the World Bank. Also, we tested the influence of independent variables only in one country. In further research, more countries could be included in the analysis, for example, other countries from CEE. Moreover, other characteristics of the firm, like sector or environmental orientation, could be tested if a wider variety of data is available. Our results could also be supported in the future using more variables and a mix-method approach combining, for example, other methods, such as partial least squares structural equation modeling and fuzzy-set qualitative comparative analysis (see, for example, Prokop & Hajek, 2023).

Shortcomings of Current Performance Measurement and Management Systems: A Literature Review

Anna Dvorakova and Michaela Kotkova Striteska
Faculty of Economics and Administration, University of Pardubice, Czech Republic

anna.dvorakova2@student.upce.cz
michaela.kotkovaStriteska@upce.cz

Abstract: The performance measurement system as a tool for knowledge sharing and continuous improvement plays a key role in the knowledge management development. Previous research indicates that performance measurement and management systems are not always successfully implemented to improve decision-making or knowledge management. Many failures relate to the behavioural aspects of performance management, but a systematic review of this topic is lacking. Therefore, the main aim of the paper is to explore the shortcomings of current performance measurement and management systems. The study conducted a systematic review of the literature of peer-reviewed articles over the past 20 years. The main shortcomings are analysed within the individual categories of technical and social control, especially in terms of design, implementation, and behavioural aspects. The findings revealed that the most common causes of shortcomings of measurement and management performance systems include technical problems, insufficient or late knowledge sharing, or the inability to effectively implement the entire system. An ineffective performance measurement and management system encourages bad decisions and wastes resources by misallocating them. Subsequently, this results in dysfunctional employee behaviour and deterioration in overall performance, which often even increases fear, reduces employee trust, and engagement. Based on the synthesis of the results, the paper suggests how to prevent the identified shortcomings to cause a rapid change in the behaviour of employees. From a theoretical contribution point of view, the research provides a comprehensive and clear view of the currently available theory of performance measurement and management systems. In terms of managerial implications, point out the shortcomings of current performance measurement and management systems and outline how to overcome them.

Keywords: Performance measurement system, Shortcomings of performance measurement, Performance management systems, Knowledge sharing

1. Introduction

In today's world, where changes are occurring at an increasingly rapid pace, businesses need to know and be able to effectively measure and manage performance (Micheli and Mura, 2017). The need to correctly measure performance in the company is even greater than ever before (Kotkova Striteska & Zapletal, 2020), as performance measurement is an obvious but often overlooked variable that can mediate the link between knowledge management (KM) and organizational performance (Asiaei and Bontis, 2020). In the past, research has gone in the direction of the technical aspects of performance measurement (Reznakova et al., 2017), while the behavioural aspects of performance management have been neglected. This very often resulted in a mismatch between performance measurement and the organisational environment, leading to frequent failures of the contemporary performance measurement and management system (hereinafter PMMS) (Van Camp and Breat, 2016).

Although there is a considerable amount of literature on PMMSs, there is no universally accepted theory or consensus on the specific factors and contexts that influence their successful implementation and improvement. Taylor and Taylor (2014) state that it is necessary to explore the factors that significantly affect the implementation of PMMS, as to date there are only a few studies that have dealt with this topic. Similarly, Bourne et al. (2018) emphasise the inadequacy of current approaches within PMMS and Blasini and Leist (2013) point out the need to look for factors that influence successful development, implementation and functioning of PMMS in practise. To meet these challenges, it is necessary to identify the main shortcomings of the current PMMS. Therefore, the main aim of the article is to explore the shortcomings related to design, implementation, and behavioural aspects of current PMMS.

With the help of a systematic review of the literature, the PMMS concept according to Smith and Bititci (2017) is defined. Based on it, the failures of current PMMS are divided according to technical and social control, especially in terms of design, implementation, and behavioural aspects. Finally, the conclusions, limitations, and future research opportunities are outline. From a theoretical point of view, the paper deepens the understanding of existing knowledge related to effective performance measurement and management systems as tools for knowledge sharing and continuous improvement and learning. From a managerial perspective, the findings can provide inspiration on how to effectively manage PMMS in a current dynamic and turbulent environment.

2. Performance Measurement and Management Concept

The current approach to PMMS has evolved from a focus on what to measure to how to manage it (Smith and Bititci, 2017) and is recently understood in the context of organisational control theory (Nudurapati et al., 2021). In this context, performance measurement is a technical control that includes processes related to setting goals, collecting, analysing, and interpreting performance data (Bititci et al., 2015). The social control dimension is then represented by a performance management system, which encompasses processes for assessing differences between actual and desired outputs, identifying differences that are critical (thus warranting management intervention), understanding whether and why these deficiencies have occurred, knowledge sharing and, if necessary, implementing (and monitoring) corrective actions aimed at closing significant performance gaps (Melnyk et al., 2014). In the context of KM, the social control dimension plays crucial role to successfully cope with the difficulties of the management of the company's most strategic assets, i.e., knowledge resources (Asiaei and Jusoh, 2017). However, in the literature, we often find two separate concepts (performance measurement and performance management), which are not complementary (Kotkova Striteska and Zapletal, 2020).

Therefore, the key role of PMMS as a tool for KM, continuous improvement, and learning must be redefined (de Lima et al., 2013). A system must be created that uses the information and knowledge gained from performance measurement to create positive changes in corporate culture, business systems, and processes (Melnyk et al., 2014) and effectively identify, capture, and utilize relevant knowledge to enhance the overall performance (Cardoni et al., 2020). For this, companies need to establish a formal process for reviewing and revising strategic goals and performance indicators, which will ensure the dynamism and flexibility of the developed system (Kotkova Striteska and Zapletal, 2020). If PMMS is designed correctly, it can cause a rapid change in employee behaviour, which automatically leads to improved performance (Souza and Beuren, 2018). On the contrary, if this is not the case, the use of performance indicators can and does lead to dysfunctional employee behaviour, demoralisation, reduced confidence, and increased fear (Hamel, 2009). Therefore, for the purposes of this research study, PMMS is understood as a set of cultural and behavioural practises that determine the ways in which it is used (Bititci, 2015), with the goal being learning and KM rather than control (Davenport et al., 2010).

3. Methodology

Systematic literature reviews should be updated regularly to ensure they are relevant and include the latest available evidence (Tricco et al., 2021). Our systematic literature review is limited to literature published between 2000 and 2021. This time frame is considered appropriate given the great development and diversification of various aspects of performance measurement and management (Nudurupati et al., 2021). As a starting point, the question of what gaps exist in the field of business PMMS was defined. A search for peer-reviewed English articles was then conducted in the following databases: Web of Science and Scopus, which are the most widely used sources for academic publications in the field of business and management. A narrow search criterion was chosen using keywords (performance measurement system, shortcomings of performance measurement and management systems, failures, and challenges). Articles were selected for the subject areas of business, management, and business finance as searchable sources of academic publications (for the categories title, abstract, author keywords). Subsequently, the selection of studies, data extraction, synthesis of results, and interpretation of results were carried out (Machado et al., 2019). Research studies focused on public administration or PMMS for supply chain or sustainability were not included in the review due to their narrow and specific focus. In total, 25 studies were included in the research study. The entire methodological process of developing a research study is shown in figure 1.

4. Results and Discussion

To be precise, as conceptualised by Smith and Bititci (2017), diagnostic (measures, targets, feedback) and boundary (goals, policies, procedures) systems represent technical control, and belief (leadership, purpose, values) and interactive (participation, engagement, and KM) systems represent social control. Therefore, we include in the technical control aspects of PMMS design related to the selection of appropriate metrics and the use of resources to support data collection and analysis (Bourne et al., 2018) and aspects of PMMS implementation related to infrastructure and alignment of strategies (Taticchi et al., 2012).

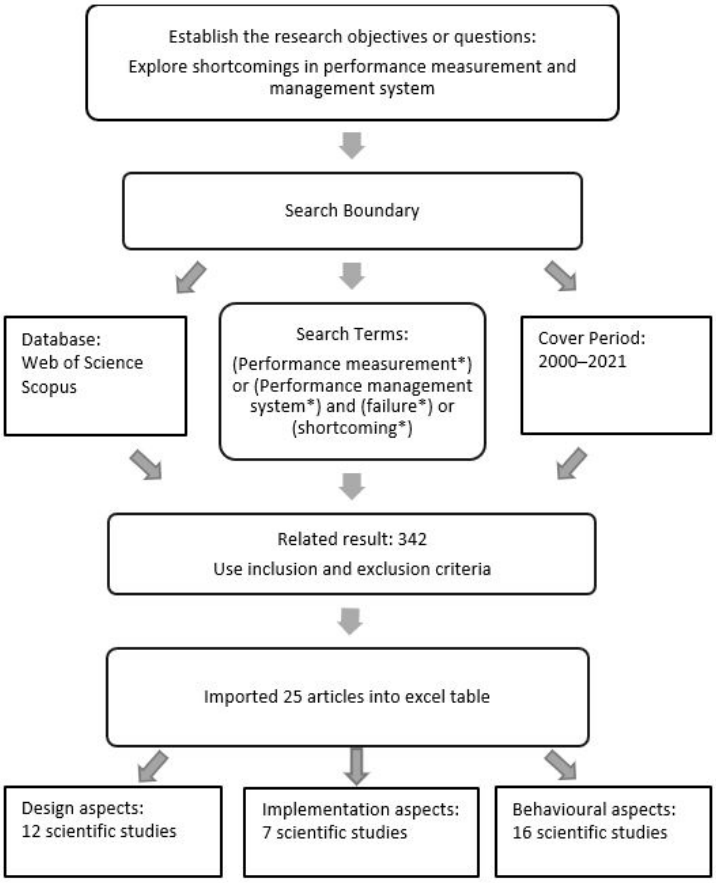

Figure 1: Methodological Process of Developing a Research Study

4.1 Technical Control

According to Bititci (2015), technical controls are more formal and explicit with specific methodologies, technologies, and analyses to achieve the objectives. The following table provides an overview of the findings of the main shortcomings related to design aspects of PMMS.

Table 1: Shortcomings Related to Design Aspects of PMMS

Scientific Study	Research Method	Key Findings
Neely and Bourne (2000)	Action research	The time, effort, and resources required to create the system make it a long and slow process, and therefore, top management must continually increase the energy level to complete the process.
Hudson et al. (2001)	Action research	Lack of consistency and objectivity; limited resources to invest in the development of PMMs.
Mol and Beeres (2005)	Action research	Environment with inadequate control of outputs; PMMS may be too focused on inputs or activities rather than outcomes; lack of appropriate incentives to motivate staff.
Folan and Browne (2005)	Literature review	Financial metrics (profitability and return on investment) are often emphasised, factors such as customer satisfaction and employee well-being are neglected; alignment with the organisation's strategic goals is missing.
Paranjape et al. (2006)	Literature review	Matric mismanagement - too many metrics and heavily weighted internal finance data.

Scientific Study	Research Method	Key Findings
Garengo and Bititci (2007)	Empirical study	PMMS in SMEs may be less effective than in larger organisations due to a lack of resources, expertise, and formal procedures.
Adler (2011)	Case study	Lack of focus on non-financial aspects of performance such as customer satisfaction or innovation.
Rahbek and Sudzina (2012)	Survey	Lack of understanding or awareness of the benefits of PMMS.
Pellinen et al. (2016)	Case study	Inability to capture intangible benefits (KM or innovation).
Van Camp and Breat (2016)	Conceptual study	Lack of a clear, unique and transparent definition of metrics, copying from others, unavailable data, difficulties in measuring intangible assets, unbalanced set of indicators, limited resources, i.e. time, people, money.
Forcada et al. (2017)	Survey	Absence of selected performance metrics, strong emphasis on price; inadequate consideration of communication performance.
Smith and Bititci (2017)	Action research	Inadequate consideration of nonfinancial factors (employee involvement, innovation, and sustainability) leading to a narrow focus on financial results.

Twenty years ago, Itner and Larker (2003) pointed out the insufficient consideration of nonfinancial aspects in PMMS. Table 1 shows that performance aspects strongly related to competitiveness, such as innovation, KM, employee engagement, and sustainability, are still not sufficiently integrated into contemporary PMMS. At the same time, it is precisely these performance measures that can effectively contribute to strategic alignment, organisational learning, and knowledge dissemination in organisations (Michaeli and Manzoni, 2017). The main reason is that measuring nonfinancial measures that usually reflects intangible value accurately, efficiently, and in a timely manner is very difficult, time-consuming, and expensive (Chow and Van der Stede, 2006). Even managers have already widely acknowledged the limitation of traditional financial measures, yet still prefer them because they consider them to be less ambiguous and more objective. The results also revealed other challenges related to PMMS, including lack of consistency and objectivity, focus on inputs rather than outcomes, and limited resources to develop integral systems.

Other factors that influence the success or failure of PMMS include the need to align measures with strategy, involve stakeholders, and use multiple perspectives (Taticchi et al., 2012).

Table 2: Shortcomings Related to Implementation Aspects of PMMS

Scientific Study	Research Method	Key Findings
Neely and Bourne (2000)	Action research	Infrastructure - the problem is that data in the enterprise come from separate databases, often in inconsistent form.
Pongatichat and Johnston (2008)	Interviews	Poor aligned with an organisation's strategy; PMMS may not effectively measure what is important to the organisation; suboptimal decision-making and resource allocation.
Garengo a Bititci (2007)	Empirical study	Insufficient alignment with the strategic objectives of the organisation, leading to a lack of focus on the most important aspects of performance - corporate governance structure, corporate culture, KM, and management information systems.
Davenport et al. (2010) Nudurapati et al. (2011)	Book / systematic literature review	Outdated, irrelevant, and inaccurate information; most of today's PMMS are outdated, not dynamic, and sensitive to changes in the internal and external environment of the enterprise.

Scientific Study	Research Method	Key Findings
Adler (2011)	Case study	Deficiencies in performance management and organisational strategy; performance measurement and management must be tailored to suit and support the implementation of a confrontational strategy.
Pellinen et al. (2016)	Case study	Vertical and horizontal integration: limited understanding of the impact of integration on performance; identification of relevant performance measures that reflect the impact of integration on performance; lack of consideration of interorganisational relationships.
Van Camp a Breat (2016)	Conceptual study	Frameworks – clear scope of implementation, choice of a range of different methods and frameworks, lack of KM, understanding, lack of feedback and learning, complex dynamics.

Table 2 confirms the importance of appropriate infrastructure to support the measurement and management of business performance (Bititci, 2015), including technologies, data management systems, and reporting (Micheli and Mura, 2017). Outdated and inaccurate information, inconsistent data, and poor alignment with strategy may neglect important drivers of future performance. Open communication, data visualization and a formalized review process of strategy, performance indicators, processes and projects are necessary to ensure an effective dialogue that enables the exchange of knowledge and the sharing of experiences between individuals (Couturier and Sklavounos, 2019).

4.2 Social Control

According to Okwir et al. (2018) or Bititci (2015), social complexity, which includes leadership, organisational structure, motivation, and culture, is critical to effective PMMS. In the same vein, Bourne et al. (2018) mention leadership support and employee engagement as key topics for the effective functioning of PMMS, among others. Asiaei and Jusoh (2017) add that knowledge-related factors can predict the design and implementation of PMMS.

Table 3: Shortcomings Related to Behavioural Aspects

Scientific Study	Research Method	Key findings
Neely and Bourne (2000)	Action research	People feel threatened; top management use performance measurement data to gain the upper hand over managers to prove that they are not delivering the required performance; blame culture.
Bourne et al. (2002); Bourne (2005)	Case study	The determining factor of success or failure is purpose; a high level of commitment from top management in favour of better management is a key element; intervention by the parent company often interrupts the implementation; culture that reduces fear of measurement.
De Waal (2003)	Literature review	Concerns about change related to staff workload or fear of failure; lack of coordination and collaboration; lack of trust in the PMMS and lack of timely feedback on performance to staff; lack of engagement and communication.
Pongatichat and Johnston (2008)	Interviews	Incentives are misaligned and employees are not sufficiently motivated.
Elzinga et al. (2009)	Case study	Resistant to change; inadequate feedback and knowledge transfer; inadequate training and support; insufficient trust and employee participation.
Davenport et al. (2010) Nudurapati et al. (2011)	Book / systematic literature review	Lack of commitment from top management to the implementation of the PMMS; problems with change management, such as resistance from people who often do not understand the objectives and potential benefits; management tends to use the PMMS as a control and attribution mechanism.
Kruis and Widener (2014)	Case study	Strong emphasis on financial indicators (to the detriment of non-financial ones); ability of managers to manipulate performance measures to achieve their own objectives and possible resistance to the introduction of PMMS (threat to managerial power).

Van Camp and Breat (2016)	Conceptual study	Governance – lack of leadership commitment, linkage to strategy, reward system, formal governance, IT support, user involvement, participation in decision making.
Pavlov et al. (2017)	Survey	Mismatch between PMMS and HR strategies; lack of communication between managers and employees about goals and performance measures; limited employee participation in the process, resulting in a lack of engagement and commitment to performance goals.
Ramberg (2017)	Case study	Individual focus on short-term goals and immediate results; lack of communication and coordination between stakeholders; difficulty in changing organizational culture and practices within the company; reluctance to adopt new practices.
Skoczylas and Waśniewski (2017)	Literature review	Achieving goals that differ from overall company goals; suboptimal decision-making and actions; manipulation of PMS-related data; information overload; short-term focus; employee resistance to change.
Smith and Bititci (2017)	Action research	Lack of integration with other practises; the limited involvement of employees in company processes (lack of employee engagement and inability to use the full potential of employees).
Striteska and Jelinkova (2018)	Conceptual study	Employee reluctance to implement new PMMS, bias, and subjectivity; overemphasis on short-term performance; lack of alignment with corporate strategy; lack of communication between employees and management.
Hassan a kol. (2020)	Quantitative study	Stakeholder engagement; leadership and quality management practices have a significant positive impact on the PMS.
Murphy (2020)	Conceptual study	Possible bias; focus on individual performance (rather than team performance); use of performance appraisals as a tool for punishment rather than development - possible fear and mistrust, lack of employee motivation and commitment.
Uddin et al. (2021)	Case study	Incentivisation to achieve individual employee goals; overemphasis on and reliance on financial indicators; employee resistance to change; lack of alignment of key performance indicators with the organisation's strategic objectives.

The Table 3 reveals that purpose, structure, culture play a significant role in the success or failure of PMMS in terms of behavioural aspects. The purpose-related results show that PMMS should primarily be used for continuous improvement, learning and knowledge sharing, not for control and command. In this context, employee engagement in the design, implementation, and use of PMMS can play a key role in spreading knowledge and creating a performance-orientated corporate culture (Kotkova and Zapletal, 2020). Management should actively support employee development and learning and create a culture in which KM is seen as an important part of corporate strategy (Pellegrini et al., 2020). Similarly, our findings correspond with research studies that consider top management commitment and a proper leadership style essential for the effectiveness of PMMS use (Razzoli, 2017; Bourne et al., 2013).

As stated by Okwir et al. (2018), well-defined roles and responsibilities, trust, knowledge sharing and transfer, and regular training are essential components in ensuring effective functioning of PMMS. Adler (2011) adds task clarity and effectiveness, along with positive relationships and minimal conflicts within the company, as crucial factors for successful PMMS. All these factors help to build a performance-driven culture that supports the right purpose of PMMS and is considered a major predictor of a company's ability to respond to the external conditions of the current dynamic environment (Dubey et al., 2017). This is another important finding that our research study outlines. Similarly, Melnyk et al. (2014) revealed that current PMMSs are often inflexible and resistant to change in today's business environment. According to Kolehmainem (2010), a balance between alignment and empowerment is necessary for the use of flexible and adaptive PMMS. Furthermore, the ability of PMMS to address KM issues and the challenges of information, flows of information and interaction mechanisms (Jordão and Novas, 2017) plays a role in greater flexibility and adaptability.

5. Conclusion

The results of the research study showed that several shortcomings related to the design, implementation, and use of PMMS have been identified in the past. A very interesting finding is that connections can be found

between them. If the PMMS is not balanced, i.e., it does not sufficiently measure nonfinancial aspects, it cannot make the necessary changes in corporate strategy, culture and KM that contribute to continuous learning and improvement. At the same time, how the company can effectively respond to changes in the surrounding environment is determined by culture, strategy, and KM (Melnyk et al., 2014). It is therefore clear that if we want to avoid PMMS shortcomings, it is first necessary to change the way we look at the company culture and, style of leadership and KM.

This study also has limitations as it includes studies selected by us in the time range 2000-2021 and there may be studies not included in the paper that would differ from our results. Articles were filtered based on the appropriateness of the selection criteria, while there may be limitations in the aspects we selected. The choice of other aspects provides an opportunity for future research. To sum up, findings of our research study support Beer a Micheli (2018) statement that future research must encourage a shift away from the technical aspects of measurement mechanisms that seek to obtain valid and reliable performance information in an objectified and standardised manner, to knowledge-based approaches that generate human-centred measurement practises and positive experiences. Furthermore, our results point to the importance of considering behavioural aspects in the performance measurement and management process, both at the level of the performance measures themselves and at the level of compliance with the organisational environment. Future research should also explore how PMMS may support and facilitate KM development.

Abstract: Failures in context of industrial production are not only a burden and a main reason for committee and rework but can also be a chance. When failures occur within organizations, several authors and publications have pointed out the opportunities that come with them. Through failures, an organization gets the possibility to improve corresponding processes and avoid future mistakes preventively. This is especially true for manufacturing companies. Their customers trust that products are of a continuously high quality. In addition, these companies are facing enormous challenges, for example a higher product variety or an increasing product and production plant complexity. In times of limited human and financial resources, these challenges have a huge influence on the transfer of failure information. Often, companies (are forced to) have a structured process for how to handle failures within the organization, but fail to transfer the important information gained from them to a parallel plant or to a future project. Therefore, the aim of this paper is to present a framework, which allows retrieving earlier failures at the early stage of the plant engineering phase. This serves as a basis for the further development of a supporting system in the FertiRob project. To ensure transferability in industrial practice, the framework is explained using a real-life application demonstrator. In addition, an adjusted Why-Not-Analysis with (industry) project partners is conducted. This analysis shows that there are points that need to be considered in further development while the basic implementation is possible.

Keywords: Failure management, Information management, PPR model, Plant engineering, Production, Failure retrieval

1. Introduction

The extent of the occurrence of failures in companies can be illustrated by the example of the automotive industry. Only in 2020, 30.3 million passenger cars were recalled because of safety defects in the reference market of USA. This corresponds to an average recall rate of 208 %. (Center for Automotive Management 2021) Moreover, failures can cause major damages to companies. These become particularly unpleasant when they reach the customer, and a complaint arises. For example, it can become expensive and the reputation with the customer suffers (Sitko-Lutek et al 2010). This may be one reason why a lot of research has been done on customer complaints. However, internal failures can also lead to problems, such as rising costs e.g. due to the additional effort to eliminate the problem.

Nevertheless, *"In the simplest terms, failure is the ultimate teacher."* (Maidique & Zirger 1985, p. 309). This sentence is still valid today. Therefore, it is very important that companies learn from failures and use the information generated in the production process to avoid repeating them. In addition, the later a failure is discovered, the more expensive it becomes. The so-called Rule-of-Ten describes this vividly (see Figure 1). It is therefore important to identify and eliminate (potential) failures as early as possible, ideally already in the planning phase.

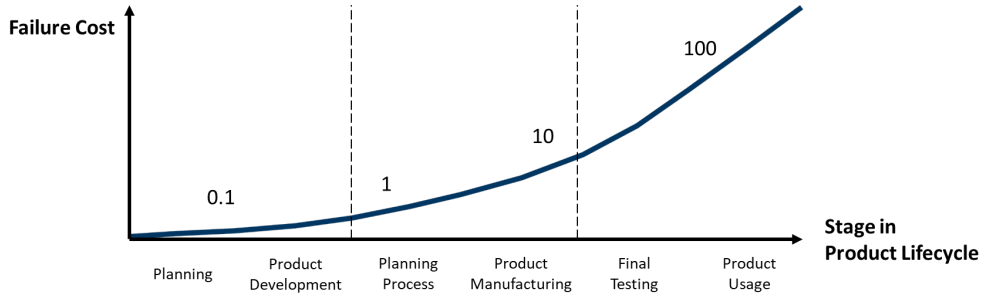

Figure 1: Rule of Ten (Schmitt & Pfeifer 2015, p. 3)

Nowadays, that is not easy. The customers' demands for product and process quality are getting higher (Günther et al 2022). On the other hand, some trends mean that companies are facing ever greater challenges with regard to failure management. For example, a high degree of product individualisation increases data complexity (Tuertmann et al 2016). Increasing complexity of products and processes also leads to more (potential) failures (Ansari et al 2020). New technologies, e.g. Digital Twins or vision-based quality assurance, can support failure management, but wherever people work or plan something, failures can and will occur.

From a quality point of view, this paper deals with the research question, how a data framework for failure information may look, so that this information can be transferred to the right person and thus be eliminated already in the planning phase. For this purpose, chapter 2 first gives an overview of failure management, information management and important basic terms. Based on this, the problem description of the paper is concretized. Chapter 3 explains the proposal of the paper with the help of an example. On the one hand, to ensure that the methodology is fundamentally practical and, on the other hand, to find out how this methodology can be improved for a real implementation, an adapted Why-Not-Analysis with industry and research experts is presented in chapter 4. In chapter 5, a summary is given, and the next planned steps are indicated.

2. Literature Overview

2.1 Failure and Failure Management

Haghi et al (2018) mentioned that there have been several attempts to define *failure* precisely. In practice, the ISO 9000 definition is mostly used. It describes a failure as a not fulfilled requirement. A requirement is a *"need or expectation that is stated, generally implied or obligatory"*. (ISO 9000 2015, p. 46) Therefore, a failure exists when a need or expectation has not been met.

With regard to failure management (specifically complaint management), a great deal of research has been carried out in the marketing field (Schmitt & Linder 2013). From a quality management perspective, failure management is the control of interdepartmental measures for the elimination of occurring failures and for failure prevention (Linß 2018). Several methods and processes for dealing with failures preventively have been established. One, which is widely used in practice, is the Failure Mode and Effects Analysis (FMEA). The aim of this method is to determine how units and processes could fail in order to find appropriate actions that can prevent potential failures. It is important to identify possible failure modes, which are related to their causes and effects on hardware, software, human actions and the influence on each other. (DIN EN 60812 2015) The FMEA can be done on product (Design-FMEA) or process (Process-FMEA) basis. In principle, the FMEA is a preventive method, but can also be used reactively when failures have occurred (Schmitt & Pfeifer 2015). It is a *"living"* document, which is why the current planning status must always be taken into account (Brückner 2019). Therefore, it is also possible, for example, to update new emerging failures. The final status of an FMEA can then be used for future similar products. Although this is a good way to learn from occurred failures in advance, it involves the risk that the file becomes very long and failures are *"dragged along"* which may no longer occur in practice.

For the description of process steps in the handling of failures, several reference models exist. One is the reference process developed in the SAFE project (Crostack & Klute 2008). Further examples are Goldszmidt et al (2011) or Kristes (2012). In practice, the 8D-Report is widely used. It has its roots in the automotive industry and consists of eight steps - Building a Team, Problem Description, Definition of Immediate Measures, Root Cause Analysis, Definition of Corrective Measures, Implementation of Corrective Measures, Avoidance of Failure Repetition and Appreciate Team Performance. (Jacoby 2022) The 8D-Report provides a systematic approach but is on the other hand very time-consuming to process (Brückner 2019). Additionally, in context of failure information storage, the 8D report does not specify a standard for how failure information must be described (Heinrichsmeyer, Schluter & Ansari 2019).

In research, several concepts on how to use failure information have been developed. Schröder (2016) developed a system that supports the troubleshooting process by using information from the current failure to find similar ones from the past. For this, he defined a fixed classification structure and then used similarity algorithms on it. In the project LeaF, a great deal of focus was placed on failure center detection based on clustering algorithms (Schmitt 2021). Heinrichsmeyer (2020) developed a system for supporting failure management, into which a failure database was also integrated. A suggestion, as to which failure can help with the current case, is not given proactively, but must be found with the help of the complaint ID. Schmitt & Linder (2013) integrated the concept of long-term knowledge transfer into the Aachener Quality Management

Model. It connects the Quality Forward- and Quality Backward Chain by flowing the information into the Quality Forward Chain after failure correction.

It can be generally stated that although the topic of utilizing information on failures that have occurred is considered important in research, there is no well-known methodology for retrieving information in the early phase of plant engineering.

2.2 Information Management and Waste

More than ever, all disciplines are facing the challenge of finding the right information in the information overload of digital age. Organizing the supply and flow of information is the responsibility of information management (Krcmar 2015).

Particularly in the case of failures, the root cause and the recognition of failures often does not belong to one person or process step, so that the challenge is to handle failure information in its life cycle. Thereby, the data and information life cycle includes all steps of data and information processing, planning, sourcing, structuring and storing, administration, use and refinement, distribution, actualization and disposal (Bodendorf 2006) (Hildebrand, Gebauer & Mielke 2021).

The following principle for flow of data and information is based on the approach of Jünemann (1989) and is described as follows: the right information at the right time in the right quantity at the right place in the right quality (Augustin 1990). Therefore, the information need can be seen as a key lever as well as a standardized management and flow of data and information (Karch, Schleipen & Lüder 2023). In detail, it is necessary to identify and eliminate inefficiencies in data and information flow, starting with misinformation, which affects the quantity and quality of data and information for a specific purpose as well as the process of data collection. Once the right information has been selected, the task is to provide it efficiently to the user in a standardized workflow. (Karch et al 2023)

2.3 Concretization of the Problem Description

After clarifying the terminology and environment, this chapter details the problem addressed in this paper (see Figure 2). This paper focuses on production, which is why only the Plant Engineering, Production and Customer Usage phases are integrated demonstratively in Figure 2. Within these Product Life Cycle phases, different failures can occur. When this happens at the customer side, it is particularly significant for a company (see chapter 1). During product manufacturing, costs are also incurred, e.g. for lost materials or reworking. However, it is not as serious as a failure occurrence at the customer. A failure during planning has the lowest criticality because there is, normally, still a lot of time to prevent and avoid it. Also, because failures that have already occurred once, have the possibility of reappearing in a new project. The plant engineering phase is therefore a good time to look at these failures and define ways of eliminating them. To do this, a data framework must be defined which supports the plant engineer by transferring the correct information to this phase. This paper describes the model that can be used to isolate potentially important failure information at an early stage of the Product Life Cycle, especially at the plant engineering phase.

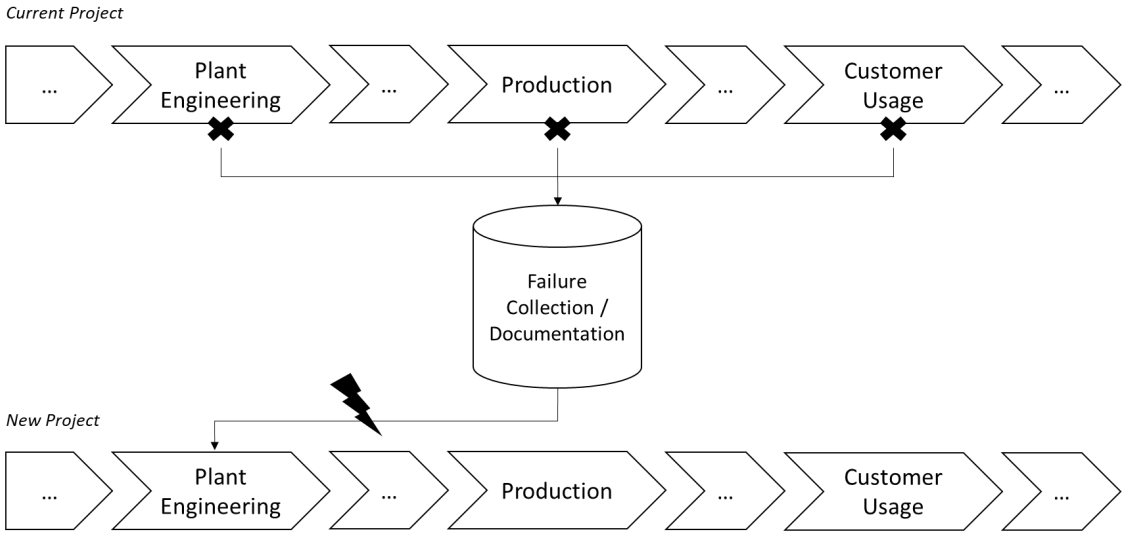

Figure 2: Illustration of the Problem Description of this Paper

3. Conceptual Implementation

3.1 Selection of Base Model

A major challenge in failure management is the fact that people from different departments in the company are involved, all of whom have different functions with different resources and skills (Wu et al 2019). Referring to Figure 2, people from the Manufacturing Engineering department are responsible for plant engineering, while Quality employees are mainly involved in failure handling. In order to develop a system that provides the right information, a model must be taken as a basis that acts as an interface between these departments and makes the needed knowledge explicit. The PPR-Model (*P*roduct – *P*rocess – *R*esource) with its focus on the essential aspects of a production plant appears to be suitable for this purpose.

Figure 3 describes the basic functionality of this model. A product, which can also be a single component within the assembly, a process that handles the product and a resource that implements the respective process are connected to each other by so-called PPR-Connectors (Schleipen & Drath 2009). It has been shown that the PPR-Model is very well suited for complex planning structures (Drath 2021). Several researchers in the context of production and plant engineering apply this model to structure and store complex plants and facilities (e.g Lämmle, Seeber & Kogan 2020, Schäffer 2021). In the context of Industry 4.0, this model serves as the basis for initial considerations on how automatic resource selection can be implemented for plant engineering (Plattform Industrie 4.0 2022). This model is also supported by AutomationML, an XML-based data exchange format for the engineering context. Through the *PPRConnector* interface class, the different objects can be linked semantically with each other. (AutomationML – Whitepaper 1, IEC 62714-1 2018)

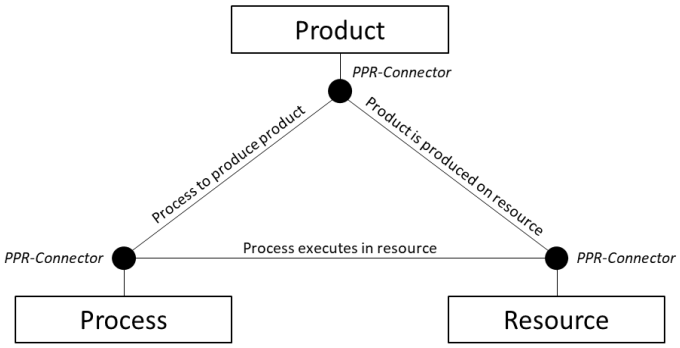

Figure 3: Elements of the PPR Model (Schleipen & Drath 2009)

3.2 Extension to Include Failure Management

The idea of this paper is based on the PPR-Model extended by the component *Failure*. To be compliant with the definitions from chapter 2, requirements describe a product. Together, this results in a uniform structure that can be saved digitally. Figure 4 illustrates the basic idea.

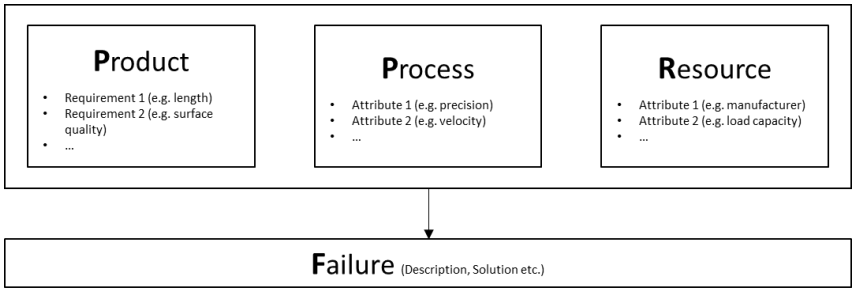

Figure 4: Connection PPR - Failure

The clear separation of the various units of information enables them to be entered in a way that is both timely and accountable separated. During the plant engineering itself, information on how (process) and with what (resources) products are handled can be saved by the production planning employee. If a failure occurs, the corresponding information is added by a quality engineer. In this way, the model combines both points of view. This addresses the problem described in chapter 3.1.

This concept will be explained exemplary through the first station of a research demonstrator, the so-called *COssembly*, which is located in the Learning and Research Factory of the Ruhr-University Bochum (Kulessa, Boshoff & Kuhlenkötter 2022). A detailed process of the joining sequence would exceed the scope of this paper, but the layout of the station and the corresponding product of the final assembly are shown in Figure 5.

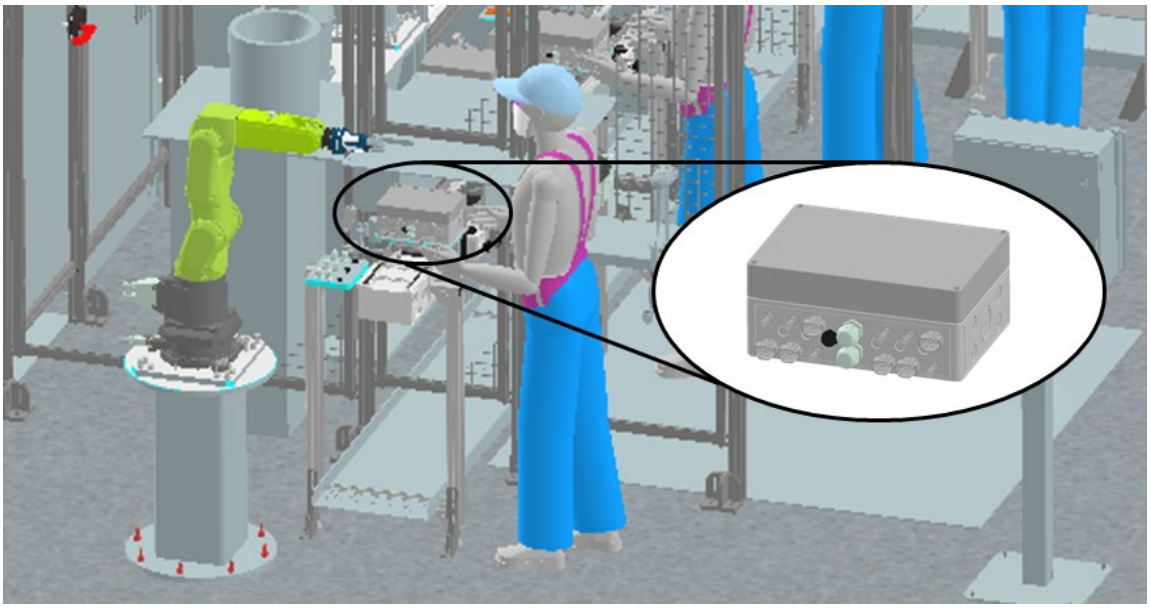

Figure 5: Layout of COssembly station 010 and assembled part

The product used as a demonstrative example is the nut with which the worker fastens a screw (black in the smaller picture) from the inside. In order for the screw to fit well through the nut without being loose, the inner diameter must be 12 (max. + 0.01) Millimeters. This represents the requirement of the product *nut*. The *worker* is the active part, therefore he or she is the resource and *fastening* is the process. If the hole diameter of the nut is too small (e.g. 11.9 Millimeters), this represents the *failure*. If the planner now searches for "nut", "fastening" and "worker" (e.g. with the help of a ready-made tool that can access the plant's data), he or she will find the indication that there has been a problem before and that he or she must pay attention to it when planning. For example, the internal dimension of the nut can be measured more frequently at the supplier's side, so that the probability of getting bad components on the system is minimized. This approach supports internal quality management because failures can now be observed preventively.

4. Evaluation Based on Expert Feedback

4.1 Evaluation Procedure

To ensure the basic practicability of the model, feedback was obtained from experts. The aim of this evaluation was on the one hand to work out possible points of criticism, but also to get suggestions for improvements from the (industry) partners. This was achieved through an adjusted *Why-Not-Analysis*. Figure 6 shows the overall procedure of this evaluation.

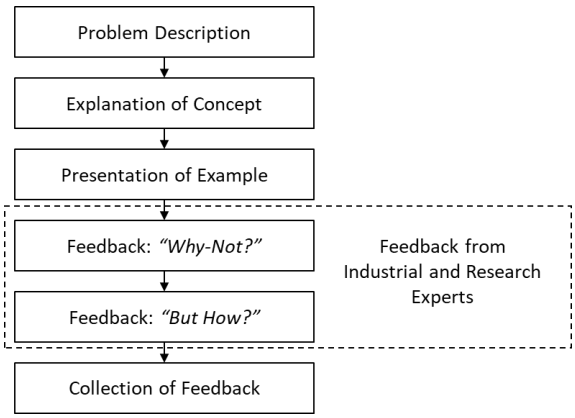

Figure 6: Evaluation Procedure

First, the problem was explained to the partners. In total, 29 people from 14 different organizations were present. Eleven of the organizations are industrial companies, three are research institutions. The experts come from the field of plant engineering, quality management, robotics and information technology. This ensured that a holistic view of the problem would be taken. Afterwards, the basic solution concept was explained and illustrated with an industry-related example. Then, a piece of paper was first distributed, which contained the following sentence: "This concept can never work because …" (*Why-Not?*) Below this, there was blank space so that the experts could give their feedback on why, in their opinion, this data framework is not suitable for practice. Then a second card was distributed, which looked exactly like the first one. Instead of the previous sentence, it now said: "But if the following is adapted, then it will be really good." (*But How?*). Now, the participants could share which aspects need to be considered for further processing. Finally, both cards were collected, and the results evaluated.

4.2 Evaluation Results

The most important challenges, which were mentioned individually by the participants, are summarized below. Immediately after that, in order to establish a direct connection between challenge and improvement, the proposed solutions are shown which were pointed out by the participants.

One of the most frequently mentioned challenges was the high amount of time probably needed. Because of the stressful daily business, entering the information seemed bureaucratic for the participants. Even if the information is important for later tasks, only what is needed for the direct fulfilment of the current task is done ("*People won't do it*!"). Feedback was also given that the information input itself can take a long time. To address these challenges, a simplification of the input, both for the PPR and the failure part, has been proposed. This can be achieved by having a predefined input mask and a standardized workflow in the later software (demonstrator). Best practice would be to get the possibility to use the information entry process within the tools that are used for the tasks anyway, e.g. CAD-Programs for Layout Planning. For the failure part, a suggestion was made that an interface for automatic failure recording in production would be useful so that information is available digitally in advance. If failure classes are defined beforehand, a lot of manual effort could also be reduced here. In the context of knowledge sharing, facilitating data entry plays a particularly important role in the method described in this paper. Only if all participants in the process provide information of a good quality, a retrieval of the right information can take place.

One point that was mentioned several times in the survey was the fact that there are failures where it is difficult to trace them to exactly one process because of different influencing factors. This can also be the case if there is a problematic chain of processes that results in a failure. This fact is especially true for failures with a high level of complexity. Feedback was that in such cases it is good to focus precisely on one root cause. Information on which further factors still exist can be integrated into the failure description as an addition.

The last, more often mentioned challenge concerns the complicated transferability of the information to other circumstances ("*Product, Process and Resource are likely to vary greatly from plant to plant ….*"). In practice, there are (almost) no two identical PPR connections. Reinforced by the individualization trend of products mentioned in chapter 1, each final product, for example, has a very high proportion of individually developed components. To meet this challenge, the idea was mentioned to find a meaningful abstraction or classification system for all necessary individual information. Explicitly, an already existing industrial classification system can be used for this, e.g. eClass for *products* and *resources* (eClass) or DIN 8580 (2022) for *processes*. Figure 7 illustrates an example of how such a classification can look for a nut (hence for the aspect *product*). Each component that is used in a final product can now be specifically assigned to the last classification level. However, retrieval does not have to take place at this hierarchy level, but e.g. at a level above it. In this way, a more general search can be made for similar circumstances.

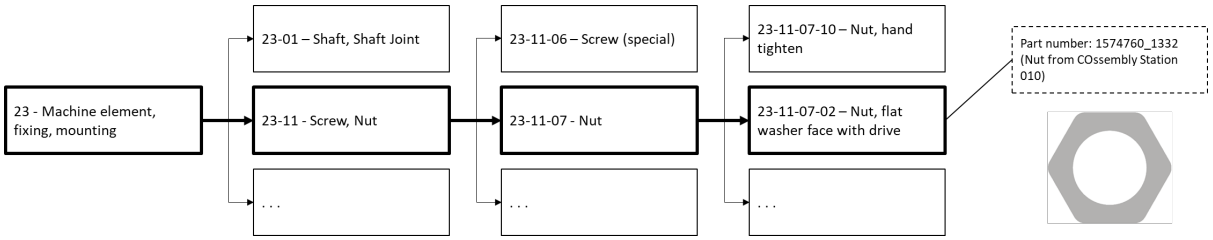

Figure 7: Exemplary Classification for the Used nut Based on eClass

One challenge was not explicitly mentioned by the experts but is very important in this context. The success of the method shown depends on the size of the database, i.e. on the number of failures that have been saved. If there are too few failures in the database, the application is not worthwhile. If there is a large number of failures, the user gets a lot of suggestions, most of which are probably irrelevant for the specific application. The challenge here is to show the user only those failures that are most likely to be relevant to his or her use case. One way of dealing with this was shown by Schröder (2016). There, a current failure was compared with failures that had already occurred using Case-Based Reasoning and similarity algorithms, and similarity measures were calculated. This logic can also be applied to products, processes and resources (at the plant engineering phase), so that in the end only those failures are displayed that have the highest correspondence with the current situation. This ensures that only relevant information is available to the user.

5. Summary and Outlook

This paper showed how a standardized data framework might look so that failures that have occurred in other projects can be accessed already in the early phase of plant engineering. For this purpose, the established PPR model is extended to include the failure component. This addressed the problem that in practice different person are responsible for plant engineering and failure management. The practicality was demonstrated on the one hand by explaining the framework on a real demonstrator. On the other hand, feedback was obtained from practitioners and research partners through an adapted Why-Not-Analysis. It was shown that, basically, the framework is suitable for describing failures in such a way that they can be found again. However, some points have to be considered for the future implementation, which would improve the whole concept and make it more practical.

This real implementation in form of a software demonstrator is the authors' next step. Care has to be taken to ensure that a holistic concept emerges that takes into account all the challenges and suggestions for improvement from chapter 4.2. Based on this demonstrator, the next step is to try out different similarity algorithms to find out which one is best suited for specific use cases. Also, one aspect which will be looked at is how the overall system can support established quality management methods (e.g. FMEA or 8D-Report from chapter 2). The goal is not to create a completely new method, but a support for the end users.

Intelligent Virtual Assistants and New Perspectives of Knowledge Acquisition

Tomasz Eisenbardt
University of Warsaw, Poland

teisenbardt@wz.uw.edu.pl

Abstract: The objective of this article is to present a case of using artificial intelligence to support people from Generation Z in the process of assimilating knowledge. The AI-based tools aimed at improving language competence analyzed in the study included Intelligent Virtual Assistants (IVA): Google Assistant, Siri as well as web translators. The following research procedure was adopted: the experiment included an attempt to learn a foreign language using one of the IVAs or web translators. 251 Polish students decided to participate in the research. After the learning session, respondents completed a knowledge test concerning popular phrases in a given language. The results were related to the individual characteristics of the respondents and analyzed statistically. Interesting overall results were obtained. The data was also analyzed in subgroups, distinguished on the basis of gender, the tool used (web translator, IVAs: Google Assistant, and Siri) as well as the language chosen for learning a foreign language. The analyses were aimed at identifying differences conditioned by the gender of the learner. Another challenge was to identify the most effective tool and to determine which languages are the easiest and most difficult to learn using this method. In many cases, the acquisition of new vocabulary turned out to be very promising. This suggests that people's adoption of such an innovative form of learning is a rather individual matter, varying from person to person. The study is designed to show a new perspective on acquiring knowledge, improving competence and learning in an informal way. In this case, learners use artificial assistants based on artificial intelligence and learning algorithms. This is certainly a controversial issue at present, but it is likely to become a common solution in the near future.

Keywords: Intelligent virtual assistants, Intelligent personal assistants, IVA, IPA, Knowledge acquisition

1. Introduction

The representatives of Generation Z, also called "zoomers" (Dictionary.com), in the Western World are people born between the second half of the 1990s and 2010 (Words We're…, 2021). This generation currently represents a group of individuals entering the labor market. Also, Generation Z representatives use sources of knowledge which seem unconventional or non-obvious, particularly to older generations. It turns out that the young generations are very open to acquiring knowledge based on IT (Hilčenko, 2017). These digital natives, through constant contact with the virtual world and susceptibility to wide cultural changes, gain their own autonomy (Bassiouni, Hackley, 2014). Technologies are their natural environment (Dolot, 2018). On the other hand, accepting new values and understanding new patterns of behavior are very difficult for parents and teachers (Törőcsik, Kehl, Szűcs, 2014). This work has been began with the reference to generation Z, because this generation (and the next) already acquire and will probably acquire knowledge in a very different way than previous generations.

It is evident that members of Generation Z use websites, social networks and mobile applications. However, the topics discussed in this study may be somewhat controversial. The premise lies in the fact that artificial intelligence technologies can be effectively used in the field of education. Specifically, an algorithm integrated with a learning feature could support individuals in acquiring new knowledge. The study formulated a hypothesis: Can modern solutions related to artificial intelligence be used for learning foreign languages? The aim of the article was to verify this hypothesis. To verify it, an experiment was carried out, involving a brief attempt to learn words from foreign languages with the use of intelligent virtual assistants and web translators.

2. Literature Background

2.1 AI From a Historical Perspective

Artificial intelligence (AI) has its origins in the literary fiction of authors from the 18th, 19th and 20th centuries such as Mary Shelley (author of the novel about Frankenstein) and Karel Čapek (creator of the "robot" term). Later characters appeared such as: Tin Man from the Wizard of Oz and the humanoid robot that impersonated Maria in Metropolis. In the 20th century, however, artificial intelligence has become our reality.

In 1950, Alan Mathison Turing proposed that the possibility of pretending to be a human in a remote conversation should be considered a test of the intelligence of machines. This test was called the Turing test (Turing, 1950). And thus the story of Artificial Intelligence (AI) began. Here are its next milestones - see Table 1.

Table 1: The History of AI

Year	Event
1950	The Turing test idea
1956	The term "artificial intelligence" appears at the conference in Dartmouth
1966	Chatbot ELIZA can talk with the user, imitating a human.
1970	MYCIN analyzes blood disorders and suggests treatment methods.
1971	The first Standford Cart autonomous vehicle is built at Stanford University
1982	Dragon Systems enterprise is starting work on the first speech recognition system for commercial applications.
1993	The robot Polly shows visitors around the 7th floor of the MIT Building and communicates with visitors.
1997	RoboCup - 38 teams take part in the first world championship in robot football.
1997	The Deep Blue supercomputer defeats Garry Kasparov in a six-round chess match.
1998	40 million eared Furby robots are brought to Christmas trees. Plush animals learn English over time.
2009	The Wolfram Alpha search engine developed by Stephen Wolfram's team is the first semantic search engine
2011	IBM's Watson supercomputer beats the then champions in the "Jeopardy" game show, Siri (Apple) appears.
2012	Google's autonomous car is approved for traffic in the US state of Nevada.
2013	The Anki start-up presents models of autonomously controlled cars via an iPhone application, simulating the behavior of real rally drivers
2014	Chatbot Eugene Goostman - some regard as having passed the Turing test, Cortana (Microsoft) and Alexa (Amazon) release
2015	Google DeepMind's AlphaGo, a computer program that plays the board game Go, defeated various (human) champions
2016	Sophia – a humanoid robot from Hanson Robotics, the Google Home release and Google Assistant release
2018	The first version of GPT, which stands for Generative Pre-Trained Transformer was released, which is the basis of the chat bot Chat GPT

2.2 AI Currently

The ubiquity of artificial intelligence applications is becoming more and more real. In 2022, using car navigation, autonomous vacuum cleaners, language translators, and searching for friends on social media are completely natural activities. These digital activities have long ceased to be exclusive to individuals from the scientific community or enthusiasts of technological innovations. All these activities (and many others) are supported by the use of artificial intelligence algorithms.

As a result, a person unfamiliar with the city can now navigate it effortlessly, the apartment is automatically cleaned during our absence, a person with no prior knowledge of a foreign language is able to read the text written in it, and a long-lost friend reappears on our contact list. And this is only a small part of the possibilities created by today's artificial intelligence.

2.3 AI and Learning

AI can be used in the learning process as well (Druga et al., 2019; Renzella, Cain, Schneider, 2022). This means that individuals can learn on their own using AI tools (Ng et al., 2022). Zhou (2020) presented an example of how AI can serve as a language-learning tool. His research was primarily focused on developing an AI-based self-learning platform tailored for college-level English listening, aiming to improve students' daily self-learning

efficiency. Shu and Gu (2023) conducted an experiment in which they created a smart education model enabled by the Edu-Metaverse. They utilized the latest AI technologies and focused on teaching college English to 60 students to achieve better learning outcomes. The results showed that students who engaged in smart education using the AI-related model achieved higher scores in oral English, vocabulary and grammar, reading comprehension, English-to-Chinese translation, and writing than those who received traditional instruction (Shu and Gu, 2023).

It is worth noting that while several studies have examined the use of intelligent personal assistants for English as a foreign language learning, no study has investigated their application in the context of a non-English foreign language, as mentioned by Dizzon et al. (2022).

Recent research has indicated that the most popular AI tools for language learning purposes are web translators like Google and ChatGPT (Haleem et al., 2022; Shaji George and Hovan George, 2023).

2.4 Web Translators Versus IVAs – Intelligent Virtual Assistants

Intelligent Virtual Agents (IVAs), also known as Intelligent Personal Assistants (IPAs), gain a special place among the practical applications of artificial intelligence. Examples of such products include Google Assistant[1], Siri (Apple) [2], Cortana (Microsoft)[3], Alexa (Amazon)[4] and S Voice (Samsung). It is worth mentioning that, Google Assistant is indicated as more effective than its competitors and its predecessor: Google Now (Hachman, 2016; Koetsier, 2018; Google Assistant Beats…, 2019).

This paper examines the process of using intelligent assistants in improving competence and acquiring knowledge. The usefulness of the IVAs in terms of building language competence was compared with the application of popular online translators.

3. Research Methodology

The following research procedure was adopted: the experiment involved an attempt to learn a foreign language using one of the IVAs or web translators. Study participants were free to choose the tool they wanted to use. In fact, their choice was dictated by what was available to them at the moment. The participants were also asked to choose a foreign language, but the assumption was that it could not be a language they are already familiar with. Before learning, the participants of the study completed a pre-test, checking their initial knowledge. 255 Polish students decided to participate in the research process. After the learning session, respondents completed a knowledge test covering popular phrases in a given language.

3.1 Research Procedure

1. Respondents participating in the study were asked to choose the language. The language could not be their mother tongue or a language they had ever learned. Nor could it be the language of the country in which they stayed for more than a day as well. It could not have been English because students typically learn this language as part of the standard curriculum in Polish schools.
2. Respondents participating in the study were asked to choose a tool based on artificial intelligence. The tool of choice was IVAs: Google Assistant, Siri - operated from the phone or a web language translator (such as Google Translator) - operated by a personal computer/laptop.
3. Respondents joined the pretest, which aimed to verify whether the chosen language was indeed unfamiliar to them.
4. Then, respondents learned 20 selected phrases in a language they did not know. It took 20 minutes.
5. After the learning phase, respondents took the final test. The test checked how many phrases they managed to learn after 20 minutes of learning. The results were referred to the detailed information included in the survey questionnaire.
6. The results were related to the individual characteristics of the study participants and analyzed statistically.

During the analysis, an examination was conducted to determine the potential relationship between the results of the final test (i.e., the number of newly learned phrases retained) and variables such as the gender of the

[4] https://apps.apple.com/us/app/amazon-alexa/id944011620

respondents, the specific learning tool used, and the selected foreign language. The obtained results were analyzed statistically. Descriptive statistics and calculations were used: minimum, maximum, arithmetic average and median. The obtained results were verified for statistical significance using the ANOVA ranks of the Kruskal-Wallis test and Mann-Whitney's U test.

3.2 Research Goal and Questions

The study formulated a hypothesis: Can modern solutions related to artificial intelligence be used for learning foreign languages? The aim of the article was to verify this hypothesis. In this particular case, the technologies included intelligent virtual assistants and online translators.

The following research questions were also posed:

- does gender have an impact on the final test result?
- does the choice of language determine the outcome?
- does the tool affect the result?

In order to achieve the intended goal and answer the questions asked, a statistical analysis was carried out.

4. Results

The study group was rather homogeneous, it consisted of 255 students, representatives of Generation Z (the majority of respondents were aged 19-22). Four questionnaires were rejected due to their incompleteness. Finally, 251 questionnaires were analyzed. The overall results are shown in Table 2. In the next step, data was analyzed according to :

- gender (Table 3),
- criterion of the selected language (Table 4),
- two groups of respondents: those who used IVAs in the study, and who used web applications for translating texts.

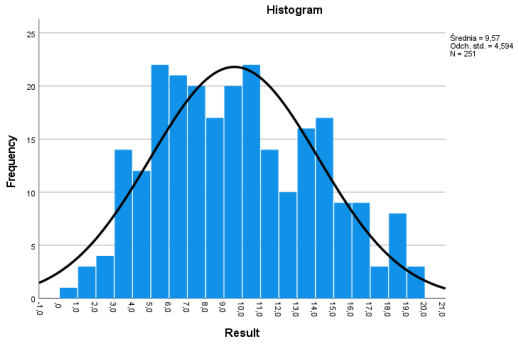

Table 2: Increase in the Number of Words Remembered for Whole Group

	Increase in the number of words remembered
scope (minimum-maximum)	From 0.5 to 20
average	9.6
median	9.0

Source: own study

4.1 General Observations

The maximum possible score to be achieved was 20, which was attained in individual cases. Conversely, the lowest score observed was one misspelled word. In the case of small errors in the answer, 0.5 points were awarded - hence the fractional results. The quantitative dispersion of the results is presented in the histogram (Fig. 1).

Source: Own study

Figure: 1. Histogram

4.2 Analysis of the Obtained Results Divided by Gender

Hypotheses:

H0: there are no statistically significant differences between men and women

H1: there are statistically significant differences between men and women

Table 3: Increase in the Number of Words Remembered According to the Gender Criterion

	number of respondents	minimum	maximum	average	median
female	144	2	20	9.9	10
male	107	0.5	20	9.1	8.5

Source: Own study

The author decided to use non-parametric tests for two independent samples (men and women). Mann-Whitney's U test did not show statistically significant differences between men and women in terms of the variables studied (asymptotic significance was 0.114). Thus, the H1 hypothesis was rejected and H0 was confirmed

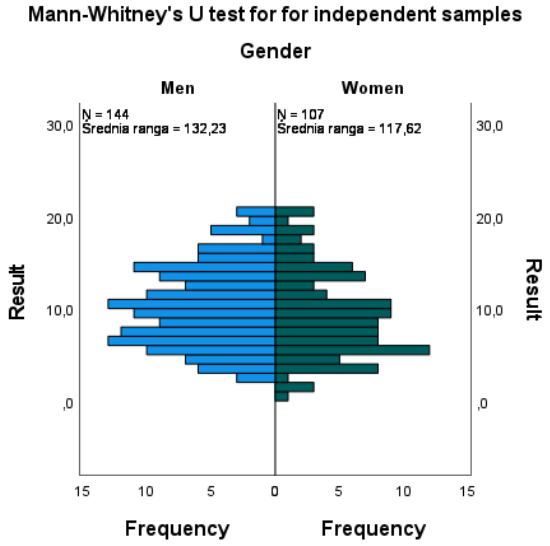

Figure 2: Mann-Whitney's U Sample Test for Independent Samples – Results Divided Into Genders

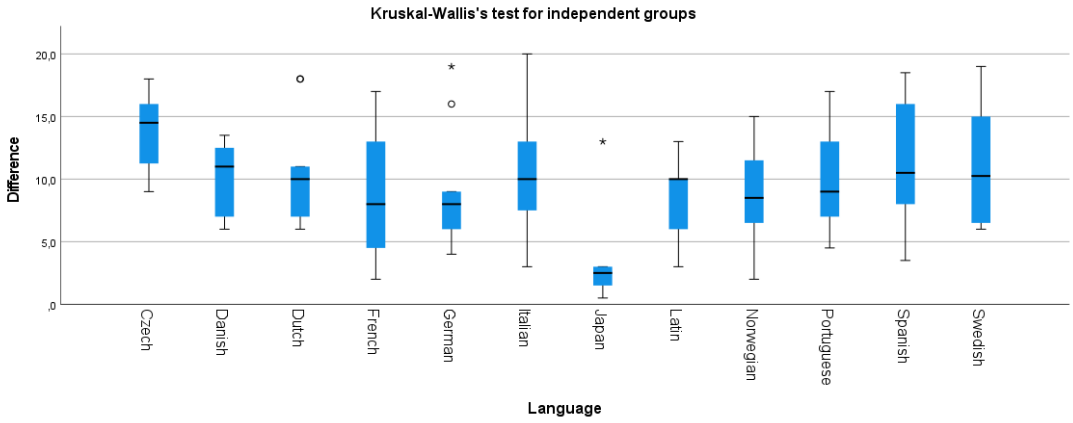
4.3 Analysis of the obtained results - the choice of the foreign language

Hypotheses:

H0: There are no statistically significant differences between results for different languages

H1: There are statistically significant differences between languages



Differences were investigated using the Kruskal-Wallis ANOVA statistical test. Statistically significant differences have occurred ($p = 0.014$, i.e. $p < 0.05$). So the H0 hypothesis was rejected and H1 was confirmed.

Table 4: Increase in the Number of Words Remembered According to the Preferred Language

	number of respondents	minimum	maximum	average	median
Czech	8	9.0	18.0	13.8	14.50
Spanish	31	3.5	18.5	11.5	10.50
Swedish	14	6.0	19.0	11.0	10.25

	number of respondents	minimum	maximum	average	median
Dutch	9	6.0	18.0	10.8	10.00
Italian	45	3.0	20.0	10.4	10.00
Danish	5	6.0	13.5	10.0	11.00
Portuguese	13	4.5	17.0	9.7	9.00
German	9	4.0	19.0	9.2	8.00

Figure 3: Differences Between Languages

4.4 Analysis of the Obtained Results According to the Tools Used

Hypotheses:

H0: There are no statistically significant differences between learners using different tools

H1: there are statistically significant differences between learners using different tools

Table 5: Increase in the Number of Words Remembered Depending on the Tool

	number of respondents	minimum	maximum	average	median
Web translators	179	0.5	20	9.0	9.0
Google Translator	54	1.0	20	9.5	9.0
Siri	18	3.0	16	8.2	7.0
IVAs generally (Google Assistant & Siri)	72	1.0	20	9.2	9.0

Source: Own study

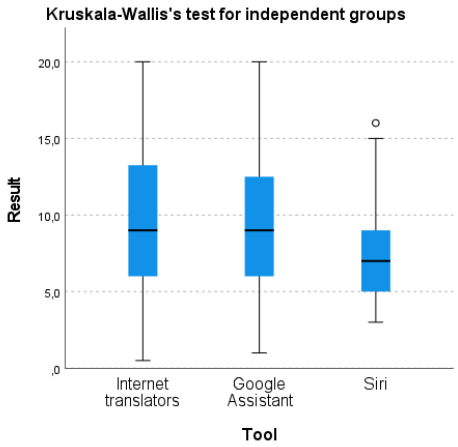

Figure 4: Differences Between Tools

Differences were investigated using the Kruskal-Wallis ANOVA test. There were no statistically significant differences found (asymptotic significance was 0.365). So, the H1 hypothesis was rejected and H0 was confirmed.

5. Discussion

The benefits of using artificial intelligence algorithms are undisputed. But there are many indications that people should be particularly careful in manipulating artificial intelligence. Not only Stephen Hawking pointed to AI as a threat that can destroy humanity. There were many outstanding minds who shared this opinion. This subject was also discussed by Antonio A. A. Casilli even referring directly to the IVA (*Casilli, 2019*). Examples of unsettling potential occurrences associated with artificial intelligence may include:

- agent becoming uncontrollable,
- autonomous military drones protested by many famous people, in 2015 Elon Musk, Stephen Hawking, and Steve Wozniak among 3.000 others signed an open letter banning the development and use of autonomous military weapons (Reynoso, 2021).
- an agent who created his own English language.

Perhaps the technological singularity - a hypothetical point in the future development of civilization, in which technological progress will become so rapid that all human predictions will become obsolete (Vernor, 1993) - will be achieved precisely through the development of AI.

Against the background of the above considerations, the proposition to employ artificial intelligence in the educational process is, on one hand, highly enticing, but on the other hand, it appears to be contentious, and perhaps even unsettling. In the context of the use of IVA, there is discourse surrounding the concept of the so-called “intellectual bubble”: fake news may be amplified and the phenomenon of an "echo chamber" may arise. Artificial intelligence has the potential to confine individuals within a very limited world of information by personalizing and filtering information in such a way that much information will not be available to the user at all.

However, there is no doubt that education will change radically in the coming years and this trend is prominently reflected in the extensive literature on the subject. The role of the teacher will be quite different from what we have been used to since ancient times. The teacher will not be the source of knowledge, but the one who uses the knowledge, and will not be the judge and oracle, but the one who can ask questions. The modern teacher will teach us exactly the same skills: searching for knowledge and asking questions. Should be the teacher replaced by AI and how perilous is this idea? This should be taken seriously into consideration.

6. Conclusions

The aim of the study was to check whether technologies based on artificial intelligence are useful in learning. In this particular case, the study concerned learning a foreign language and using web translators and intelligent virtual assistants. The considerations lead to an affirmative response in support of the research hypothesis. The

hypothesis: can modern solutions related to artificial intelligence be used for learning foreign languages has been confirmed, with the reservation that the efficiency of using AI in such a context may vary.

The results were diversified. The number of new words acquired in 20 minutes ranged from 1 to 20 (out of 20 possible). Descriptive statistics showed some differences in the results depending on gender, the tool used, and the language chosen by the study participants.

Women had slightly better results. The language translator turned out to be the most effective tool, but Google Assistant was not far behind it. However, in-depth statistical tests showed no statistical differences. However, such differences appeared in the case of selected languages.

European (Czech, Spanish and so on) languages turned out to be the easiest to assimilate with regard to the proposed method of quick learning. In many cases. the increase in knowledge of new words turned out to be very promising. This suggests that people's adoption of such an innovative form of learning is a rather individual matter.

6.1 Research Contribution

The study is designed to show a new perspective on acquiring knowledge, expanding competence and learning in an informal way. In this case, learners use artificial assistants based on artificial intelligence and incorporate learning algorithms. This is certainly a controversial issue at present, but it is likely to become a common solution in the near future.

So far, the research results described have predominantly focused on the study of the English language. This study involves learning languages other than English.

6.2 Limitations and Implications

The study involved students. The majority of the respondents, falling within the age range of 19 to 22, belonged to Generation Z. Also, it should be noted that the sample was predominantly Polish. So, they mostly speak Polish, i.e. a language from the group of Slavic languages.

It should be taken into account that the quality of translations offered by the presented tool. i.e. Google Translator, Google Assistant and Siri is improving. This affects the test results. The obtained results apply to the state of development of these tools at the turn of 2022 and 2023.

The Impact of Knowledge and Experience on Opinion Formation: The Case of Cryptocurrencies

Monika Eisenbardt[1] and Tomasz Eisenbardt[2]
[1]University of Economics in Katowice, Poland
[2]University of Warsaw, Poland

monika.eisenbardt@ue.katowice.pl
teisenbardt@wz.uw.edu.pl

Abstract: The aim of this paper was to investigate the influence of knowledge and experience in a specific domain on the formation of opinions regarding a particular issue. The research focused on cryptocurrencies, chosen due to their relatively new and unexplored nature in terms of opinion formation. A survey questionnaire was used to collect data from 778 university students, which were then analyzed using the SmartPLS package. The survey was conducted in Poland, a country where cryptocurrencies are treated relatively neutrally, not being banned but also not widely accepted as a means of payment. The main research question addressed whether previously acquired knowledge and experience with cryptocurrencies impact opinion formation. Four latent variables were examined: Experience, Perceived Benefits, Perceived Disadvantages, and Opinion Formation. The findings reveal that Experience has the strongest influence on Opinion Formation, followed by Perceived Benefits, which has a positive effect, and Perceived Disadvantages, which has a negative effect. Therefore, the hypotheses were supported, indicating a positive association between Perceived Benefits and Opinion Formation (H1), as well as between respondents' Experience with cryptocurrencies and Opinion Formation (H3). Additionally, H2 was supported, indicating a negative association between Perceived Disadvantages and Opinion Formation. Our research results enrich the literature, particularly in the field of interdisciplinary approaches to cryptocurrencies, knowledge, and experience.

Keywords: Experience with cryptocurrencies, Knowledge, Perceived benefits, Perceived disadvantages, Cryptocurrencies, Opinion formation

1. Introduction

An opinion is a belief, judgment, or view expressed by an individual or a group of people regarding a particular matter. Opinions can be rooted in scientific facts and evidence or be subjective in nature. They are influenced by beliefs, values, experiences, and emotions (Paul, 2007). Opinions play a crucial role in shaping our attitudes and behaviors. In fact, opinions are sometimes regarded as synonymous with attitudes (Oskamp & Schultz, 2014). They are formed through a combination of personal beliefs, trust in something, knowledge, personal experiences, and individual interpretation of facts.

Opinions may be supported by arguments or expressed without any substantial basis (Festinger, 1957). They can be shaped by a person's knowledge, experience, or direct involvement in the subject matter being discussed. Opinions that are grounded in logical reasoning and personal experience tend to be closer to the truth and therefore hold more value. However, a separate issue not addressed in this paper is the credibility and substantive value of opinions. Participation in a matter can sometimes be superficial or limited, and the emotions associated with it may differ significantly from those of other individuals (Rapanos, 2023). Opinions can be influenced by emotions and, as a result, may be biased. Furthermore, opinions are subject to change over time, influenced by mood, recent experiences, and various other factors that shape one's perception of reality. Often, opinions are influenced by the views of others, particularly when those individuals are part of our social environment or are perceived as trustworthy or likable (Lee, Yang, & Kim, 2022).

The formation and consolidation of our opinions can be influenced by both rational and irrational factors. Opinions can be shaped through extensive studies, deep knowledge of the subject, practical experience, and personal engagement. While they often involve intuition, the connection between opinions and knowledge/experience may not always be obvious. However, opinions can also be swayed by prejudice, faith, personal biases, and even superstition (Berthet, 2022; Kuppens et al., 2023).

This paper addresses the issue of forming opinions based on experience and perceived advantages and disadvantages. The survey specifically focuses on people's opinions regarding a relatively new, controversial, and ambiguous topic: cryptocurrencies. Respondents were asked about their experience with cryptocurrencies, as well as their perceived benefits and disadvantages associated with their use as a means of payment. The primary objective of this paper is to investigate the impact of previously acquired knowledge and experience on

opinion formation. Additionally, it aims to examine whether perceived benefits and perceived disadvantages influence the formation of opinions.

Numerous papers have been published on cryptocurrencies, with many authors focusing on economic aspects such as national regulations, taxation, and monetary policies (Benigno et al., 2022; Marthinsen & Gordon, 2022; Raza et al., 2023). While some authors examine the domestic approach, their focus is primarily limited to economic matters (Alvarez et al., 2022; Cifuentes, 2019; Li et al., 2023). Many papers concentrate solely on Bitcoin, as it is the most widely recognized cryptocurrency (Alvarez et al., 2022; Köchling et al., 2020; Mzoughi et al., 2022; Nouir & Hamida, 2023). In contrast, our paper adopts an interdisciplinary approach to cryptocurrencies, treating them as a complex phenomenon rather than merely an economic variable. Specifically, we provide a concise overview of cryptocurrencies, which serves as the foundation for our empirical research on the impact of experience, perceived benefits, and perceived disadvantages on opinion formation. The study incorporates in-depth analysis, considering respondents' personal experiences and opinions regarding cryptocurrencies.

The paper is organized as follows: the research questions and hypothesis are followed by the research methodology; then results, analysis, and discussion are provided. The paper concludes with a summary, limitations, and avenues for future research.

2. Literature Review

The inception of cryptocurrencies is closely tied to the creation of the first cryptocurrency, Bitcoin (BTC), in late 2008 and early 2009 (Nakamoto, 2009). The trading of cryptocurrencies, which serve as digital substitutes for traditional money, relies on various technologies such as the Distributed Ledger concept, Blockchain technology, cryptography, and peer-to-peer networks. The number of cryptocurrencies has experienced exponential growth, and the cryptocurrency market has become too significant to be ignored (CoinMarketCap, 2023; Phillips & Graves, 2021).

The volume of literature on cryptocurrencies is extensive. Numerous authors discuss the benefits and disadvantages of cryptocurrencies, as summarized in Table 1. The review includes publications within the past eight years.

Table 1: The Benefits and Disadvantages of Cryptocurrencies

Benefits	Sources	Disadvantages	Sources

Benefits	Sources	Disadvantages	Sources
Fast Transactions	(Frankenfield, 2023; Tambe & Jain 2023; Hileman & Rauchs, 2017)	Limited Acceptance	(Bajpai, 2023; Eisenbardt & Eisenbardt, 2023; LLC, 2021)

Note: The abbreviations given in [ ] correspond to the model below (see Figure 2). The table includes additional benefits and disadvantages compared to what is displayed in the model. This is because some variables were found to be statistically insignificant ($p>0.05$) and were therefore excluded from the model.

Source: Own elaboration based on the literature sources provided.

Cryptocurrencies represent an interdisciplinary, relatively new, and rapidly evolving field. The problem of identifying the creator of BTC, the lack of an emitter, volatility, complexity and legal complexities stand in opposition to the undoubted benefits, among which the free, anonymous and rapid flow of capital can be mentioned. Notably, there have been significant cases of cryptocurrencies being used for illicit purposes, such as the Silk Road case. Moreover, the environmental impact of cryptocurrencies is a concern due to the increasing energy intensity of mining activities. The significant slump in the cryptocurrency market in 2022 serves as a reminder of the risks associated with investing in cryptocurrencies (CoinMarketCap, 2023).

Nevertheless, the pros and cons of cryptocurrencies appear to be balanced. Does this mean that opinions on this subject are divided or perhaps more sustainable? Can the assessment of cryptocurrencies be influenced by knowledge about them, involvement in cryptocurrency trading, participation in cryptocurrency mining, or access to a cryptocurrency wallet? These activities can indicate experience, and it is undeniable that knowledge and experience shape opinions. Variables related to knowledge and experience were compared with variables indicating respondents' attitudes towards the benefits and disadvantages of cryptocurrencies. All of these variables influence the opinions of respondents in the realm of cryptocurrencies.

3. Research Methodology

3.1 Research Purpose, Questions, and Hypotheses

The aim of this paper is to explore how knowledge and experience in a specific domain can shape opinions on particular issues. Cryptocurrencies were chosen as the research subject due to their relatively new and unexplored nature in terms of opinion formation. The research question is as follows:

(1) Does previously acquired knowledge and experience with cryptocurrencies impact the formation of opinions about them?

The following hypotheses has been developed:

H1: Perceived Benefits of cryptocurrencies are positively associated with the formation of opinions about them.

H2: Perceived Disadvantages of cryptocurrencies are negatively associated with the formation of opinions about them.

H3: Experience with cryptocurrencies is positively associated with the formation of opinions about them.

Based on the literature review and our previous research experience on cryptocurrencies, a conceptual framework was developed and is presented in Figure 1. The framework includes four latent variables: Experience, Perceived Benefits, Perceived Disadvantages, and Opinion Formation. Additionally, it depicts the associations between these latent variables.

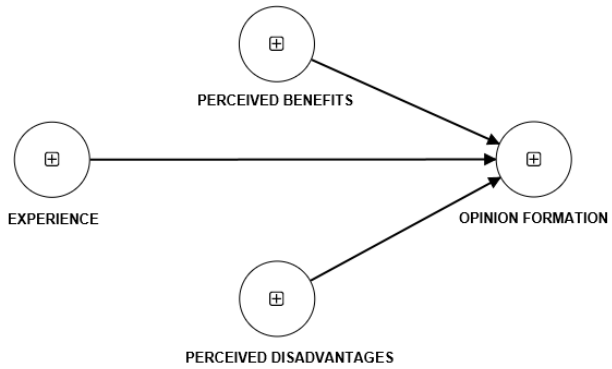

Figure 1: The Conceptual Framework

Research procedure

To address the primary research problems, answer research question, and verify formulated hypotheses, a quantitative research strategy was employed, wherein a questionnaire survey was administered. The research process comprised the following stages:

Initially, a preliminary survey questionnaire was developed to gather the opinions of students about cryptocurrencies, which included the queries about their prior experience with cryptocurrencies. The questions were constructed using a 5-points Likert scale, providing students with a list of options to choose from. In October 2021, the pilot survey was conducted, and the questionnaire underwent both substantive and methodological evaluations. Following this, the survey questionnaire was distributed online using LimeSurvey online platform, and data collection was conducted between November 2021 and February 2022. The sampling frame was deliberately restricted to university students, and the survey was conducted in two distinct university settings situated in different regions of Poland, i.e. the University of Warsaw, situated in the central region of Poland and the University of Economics in Katowice, located in the southern and most industrial region of Poland – Silesia. After screening the responses and eliminating outliers, a total of 778 accurate, complete, and valid questionnaires were obtained as the final research sample. The sample is presented in Table 2.

Table 2: Demographics of the Research Sample

Variable	Categories	Number of respondents	Percentage
University	University of Warsaw	382	49.1%
	University of Economics in Katowice	396	50.9%
Gender	females	413	53.1%
	males	365	46.9%
Age/ generation	X: 1965-1979	32	4.1%
	Y: 1980-1994	58	7.5%
	Z: 1995-2009	679	87.3%
Level of education	higher education	279	35.9%
	secondary education	499	64.1%

Source: Own elaboration.

The data were analyzed using SmartPLS package. The SmartPLS was used for estimating path models with latent variables and their relationships as well as to test hypotheses.

4. Results

4.1 Operationalization of Latent Variables

As depicted in Figure 1, the conceptual model comprises four latent variables, each of which is multifaceted and cannot be measured through a single observed variable. Therefore, we employed multiple observed items to

measure each latent variable within the conceptual model. The selection of specific items was based on the literature review. Table 3 presents the measurement items along with their corresponding latent variables.

Table 3: Measurement Items and Their Reliability

Constructs and their respective items	Factor loadings
Perceived Benefits (alpha: 0.63, CR: 0.78)	
[B1 DEC] - Decentralization	0.780
[B2 LTF] - Lower Transaction Fees	0.485
[B3 NI] - No Issuer	0.727
[B4 PRI] - Privacy	0.720
Perceived Disadvantages (alpha: 0.73, CR: 0.81)	
[D1 ENV] - Environmental Impact	0.548
[D2 LGAP] - Legislation gap	0.671
[D3 LOSS] - Potential loss	0.702
[D4 VOL] - Volatility	0.767
[D5 SECU] - Security Risks	0.720
Experience (alpha: 0.78, CR: 0.85)	
[E-min] - Experience in cryptocurrencies mining	0.571
[Ex-g] - General experience with cryptocurrencies	0.848
[Ex-t] - Experience in cryptocurrencies transactions	0.712
[Ex-w] - Experience in cryptocurrency wallets	0.888
Opinions Formation (alpha: 0.45, CR: 0.87)	
[Opi-EAG] - I am eager to perform activities aimed at cryptocurrencies	0.906
[Opi-REP] - In my view, cryptocurrencies have the potential to replace national currencies	0.668

Note: Loadings above 0.708 are recommended, as they indicate that the construct explains more than 50 per cent of the indicator's variance, thus providing acceptable item reliability (Hair et al., 2019). Alpha represents value of Cronbach's alpha, and CR represents composite reliability. As our research has partially exploratory nature and following Haier at al. (2019), reliability for exploratory research should be a minimum of 0.60, while reliability for research that depends on established measures should be 0.70 or higher.

The next step of the reflective measurement model assessment addresses the convergent validity of each construct measure. Convergent validity is the extent to which the construct converges to explain the variance of its items. The metric used is the average variance extracted (AVE) for all items on each construct. The AVE results vary from 0.5 to 0.63 and, thus, meet an acceptable AVE range that is 0.50 or higher, indicating that the constructs explain at least 50 per cent of the variance of its items (Sarstedt et al., 2022).

Discriminant validity was ensured by examining the cross-loadings of the indicators and applying the Fornell-Larcker criterion (see Table 4). Fornell and Larcker (1981) proposed that the Average Variance Extracted (AVE) of each construct should be compared to the squared inter-construct correlation, which represents the shared variance between that construct and all other reflectively measured constructs in the structural model. It is important to ensure that the shared variance among all model constructs is not greater than their respective AVEs.

Table 4: Fornell and Larcker Criterion

	PERCEIVED BENEFITS	PERCEIVED DISADVANTAGES	EXPERIENCE	OPINION FORMATION
PERCEIVED BENEFITS	0.687			
PERCEIVED DISADVANTAGES	0.027	0.686		
EXPERIENCE	0.274	-0.114	0.765	
OPINION FORMATION	0.335	-0.111	0.398	0.796

4.2 Structural Model

Figure 2 displays the structural model, indicating the beta values of all coefficients and the adjusted R2 for the dependent variables. The results regarding the estimated adequacy of the model are presented in Table 5.

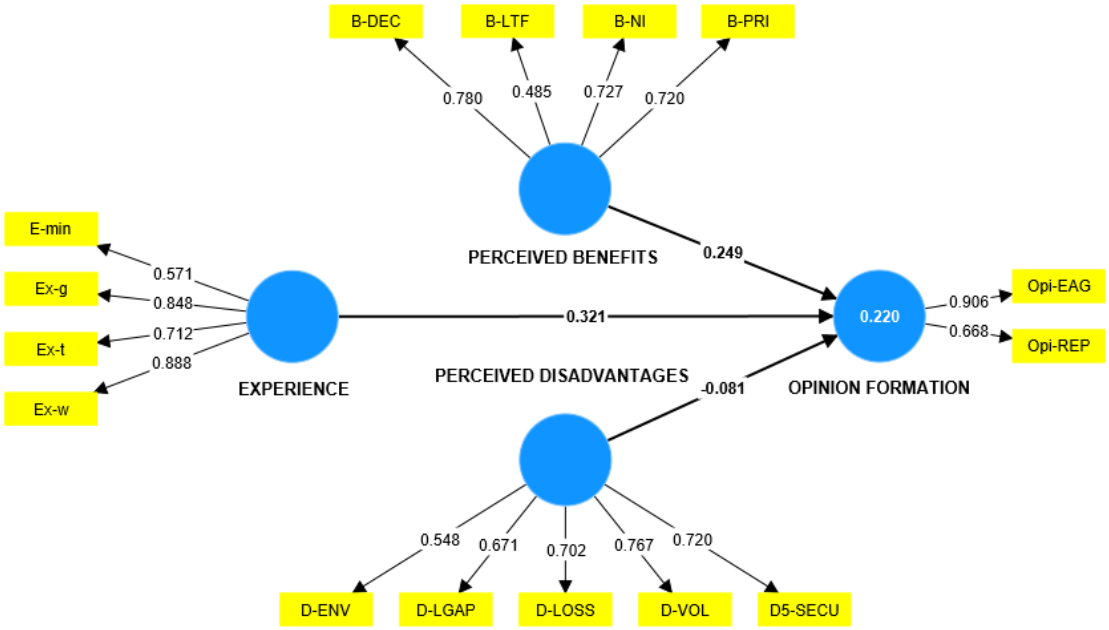

Figure 2: Structural Model

Figure 2 shows the PLS-SEM results. The numbers on the path relationships represent the standardized regression coefficients while the number displayed in the circle of the endogenous latent variable is the R2 value. An initial assessment shows that EXPERIENCE has the strongest effect (0.321) on OPINION FORMATION, followed by PERCEIVED BENEFITS (0.249) and PERCEIVED DISADVANTAGES (-0.081) for which the negative effect is displayed. These three constructs explain 22% (i.e., the R2 value) of the variance of the endogenous construct OPINION FORMATION.

Table 5: Model fit

	R-square	R-square adjusted
OPINION FORMATION	0.220	0.217
	Saturated model	**Estimated model**
SRMR	0.083	0.083
d_ULS	0.825	0.825
d_G	0.187	0.187
Chi-square	867.077	867.077
NFI	0.652	0.652

4.3 Hypotheses Testing – Bootstrapping

To test hypothesis *H1, H2, and H3* and answer *RQ1*, the Bootstrapping procedure was used. The process of bootstrapping is a non-parametric method utilized by PLS-SEM. It involves generating multiple artificial samples from the initial data using a significance level of 5%, as explained by Hair et al. (2011). In this particular study, a subset of 5,000 interactions was utilized to compute the t-values that evaluate the impact of the hypotheses relationships to be examined. The hypothesis is considered to have statistically significant results if the t-value is greater than 1.96 and the p-value is less than 0.5. The findings from the bootstrapping analysis, conducted with a 95% confidence level, including the mean, standard deviation, t-values, and p-values, are presented in Table 6.

Table 6: Hypotheses Testing

Hypothesis	Relationship	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	t Statistics (|O/STDEV|)	P Values	Decision
H1	PERCEIVED BENEFITS -> OPINION FORMATION	0.249	0.252	0.034	7.308	0.000	Supported
H2	PERCEIVED DISADVANTAGES -> OPINION FORMATION	-0.081	-0.091	0.032	2.502	0.012	Supported
H3	EXPERIENCE -> OPINION FORMATION	0.321	0.320	0.034	9.372	0.000	Supported

Table 6 presents the results, supporting all three hypotheses. H1 and H3 are supported, indicating a positive association between Perceived Benefits and Opinion Formation, as well as between respondents' Experience with cryptocurrencies and Opinion Formation. Additionally, H2 is supported, suggesting a negative association between Perceived Disadvantages and Opinion Formation.

5. Discussion and Conclusions

5.1 Research Contribution

Cryptocurrencies can be regarded as both technological and financial innovations (Kumar, 2018; Morewedge, 2021). Thus, this paper focuses on cryptocurrencies as a relatively new domain in which individuals can shape their opinions based on their experiences and the potential benefits and disadvantages.

This paper contributes to existing research on the impact of knowledge and experience on opinion formation by:

- Investigating the relationships among the analyzed constructs from the perspective of experience and knowledge within the context of cryptocurrencies.
- Exploring the association between Perceived Benefits of cryptocurrencies and opinion formation.
- Examining the link between Perceived Disadvantages of cryptocurrencies and opinion formation.
- Investigating the relationship between Experience with cryptocurrencies and opinion formation.

This study confirms that both the Perceived Benefits (path coefficient = 0.249, p-value > 0.05, t-value > 1.96) and Experience (path coefficient = 0.321, p-value > 0.05, t-value > 1.96) have a positive influence on Opinion Formation regarding cryptocurrencies. The study also confirms that the Perceived Disadvantages (path coefficient = -0.081, p-value > 0.05, t-value > 1.96) have a negative influence on Opinion Formation.

According to the results obtained and supported by studies conducted by Rapanos (2023), Lee, Yang, & Kim (2022), Berthet (2022), and Kuppens et al. (2023), individuals' experiences can influence how they form their own opinions on a particular issue.

This paper is among the first to analyze cryptocurrencies in the context of opinion formation, taking into account individuals' experiences, as well as the perceived benefits and disadvantages associated with cryptocurrencies from a broader perspective. The study aims to understand how individuals' domain experiences, perceived

benefits, and disadvantages can shape their perceptions of cryptocurrencies and the opinions they form about them.

Considering the practical implications of this study, it becomes crucial to understand the factors that influence opinion formation. As the cryptocurrency market and related issues are still new, rapidly changing, and complex for many, comprehending the factors that impact opinion formation on them can be vital for organizations seeking to manage the opinions of employees, consumers, and other stakeholders.

5.2 Limitations of the Results

There are several limitations to our study. Firstly, we only considered selected variables. This means that our findings cannot be generalized to all aspects of the cryptocurrency market. Secondly, our study was conducted among young people, specifically students. This may limit the applicability of our results to other age groups who may have different perspectives and behaviors towards cryptocurrencies. Lastly, we treated the entire cryptocurrency market as a single entity, without examining individual cryptocurrencies or their specific characteristics. Therefore, our findings may not provide a complete understanding of the nuances and complexities of individual cryptocurrencies or their impact on the market. Future research should consider examining individual cryptocurrencies in greater detail to provide a more comprehensive understanding of the cryptocurrency market.

Knowledge Visualization for Learning in Higher Education Contexts: Systemizing the Field

Martin Eppler and Christian Spletter
Institute for Media and Communications Management (MCM-HSG), St. Gallen, Switzerland

martin.eppler@unisg.ch
christian.spletter@unisg.ch

Abstract: In contexts of higher learning, students must be supported effectively in developing their knowledge, skills, and competencies. Thus, faculty members (incl. lecturers and administrators) are faced with the management task to organize and align innovative teaching and learning formats. As we know from research, the use of knowledge visualization is both a facilitating tool for cognitive processing and learning itself, and for strategic decision-making processes within organizations. However, the literature on the types of (IT-enabled) knowledge visualization for learning in higher education contexts is highly fragmented and dispersed and includes different branches for researchers and practitioners. This makes it difficult to achieve an overview and find systematic and consistent visual approaches along students' learning paths. By highlighting the role of knowledge visualization to support organizing innovative teaching and learning, we provide a systematic, structured overview of such approaches. The goal of this paper is thus to structure the field of knowledge visualization for lifelong and university-based learning based on seminal papers. For this purpose, we present a segmentation approach with six areas to analyse the role of knowledge visualization for learning in higher education contexts, namely: Visualizing Learning Offers (e.g., Curriculum Visualization Tools), Visual Learning Environments (e.g., Metaverse), Learning Content Visualization (e.g., Visual Variation Patterns), Visual Techniques for Learning (e.g., Concept Mapping), Visual Learning Analytics (e.g., Learner Dashboards), and Visualizing Learning Outcomes (e.g., Digital Course Badges). Based on systemizing key concepts, our paper concludes with promising future research avenues for each of the six areas, as well as for the domain of knowledge visualization for higher learning itself. We conclude with specific ideas how the area of visualizing learning offers can act as a spearhead for empirical research (and practice transfer) in the knowledge visualization domain. This should help practitioners and researchers from higher education contexts who consider lifelong learning as knowledge management task.

Keywords: Higher education, Knowledge visualization, Knowledge management, Lifelong learning, Segmentation approach

1. Introduction

In higher education contexts, students must be supported effectively in developing their knowledge, skills, and competencies and designing their lifelong learning and career paths. At the same time, organizations of higher learning must deal with current challenges in educational settings (e.g., digital transformation, diversity among students, or resilience issues). To further contribute to the social "corpus of knowledge" (Galgotia and Lakshmi, 2022) successfully, faculty members as lecturers and administrators are thus faced with the management task to organize and align innovative teaching and learning formats.

Knowledge visualization seems a relevant domain to build upon. It focuses on the use of (interactive) graphics to create, integrate, and apply knowledge that can be used for developing or conveying new insights, experiences, methods, or skills (Eppler, 2011). As we know from research, the use of knowledge visualization is both a facilitating tool for cognitive processing and learning itself (e.g., Wang and Tseng, 2020), and for strategic decision-making processes within organizations (e.g., Bajracharya et al, 2018). Considering this individual or organizational perspective, we thus refer to explicit knowledge to be communicated visually (Lam, 2000).

However, the literature on types of (IT-enabled) knowledge visualization for learning in higher education contexts seems highly fragmented and dispersed resulting in different branches for practitioners and researchers as well. At first sight, this range goes from curriculum visualization (e.g., Zucker, 2009) to the use of achievement badges in university environments (e.g., Hakulinen et al, 2015). This makes it difficult to achieve an overview and find systematic and consistent visual approaches that are appropriate to design students' learning paths.

In terms of a systematic, structured overview of such approaches, we thus look at main uses of knowledge visualization in higher education contexts. The goal is to structure the field of knowledge visualization for university-based, higher learning. Hence, we review seminal papers to identify related streams and opportunities for further research.

While doing this, we distinguish between three categories for segmenting the field: *Visualization AS Learning* (Learning Content Visualization, Visual Techniques for Learning), *Visualization FOR Learning* (Visual Learning

Analytics, Visual Learning Environments), and *Visualization OF Learning* (Visualizing Learning Offers, Visualizing Learning Outcomes).

This paper is structured as follows: In section 2, we refer to the rationale of our segmentation framework with its six areas of knowledge visualization. Then, we describe the methodology we have employed for our field review (section 3), whereas section 4 presents the results that we use to derive underlying key concepts. Finally, we conclude with promising future research avenues for these areas respectively the whole domain of knowledge visualization in higher education. We argue how the area of visualizing learning offers can act as a spearhead for further research and practical transfer in the knowledge visualization domain (section 5).

2. "Vis2Learn": A Segmentation Approach for Higher Education

To create significant learning experiences in higher education settings, learning goals, learning activities, and feedback respectively assessment must be integrated efficiently (Fink, 2013). Drawing on this three-part-division of integrated course design, we thus introduce a corresponding framework to structure the field of knowledge visualization for higher learning. We summarize this segmentation approach as "Vis2Learn" (see Figure 1).

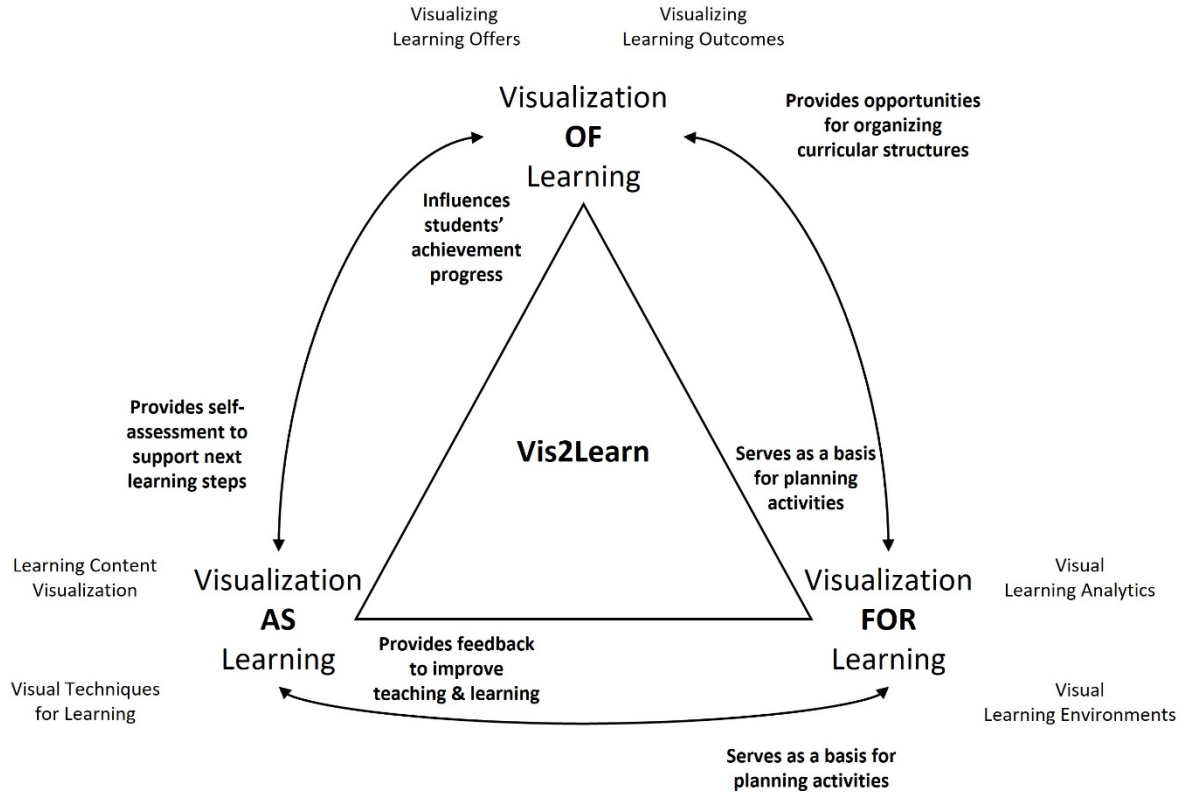

Figure 1: "Vis2Learn" in Higher Education

The categories are in line with other branches that reflect the structure of an integrated course design (e.g., Brady et al, 2019). Thus, the components of the "Vis2Learn"-Framework are the following:

- *Visualization AS Learning:* Focuses on the learning process itself. Visualization aims at causing positive learning effects in terms of student's knowledge acquisition and understanding.
- *Visualization FOR Learning:* Provides technical conditions and didactical resources to support teaching and learning activities. Accordingly, visualization is also used for (data-driven) feedback towards students.
- *Visualization OF Learning:* In terms of anticipated achievement, it shows what can be expected in a certain course of a given curriculum. Visualization can further be used to communicate learning achievement.

According to that, we presume six subfields to structure the contemporary field of knowledge visualization for higher learning. Table 1 shows the respective subsets of every knowledge visualization category with its corresponding visualization form; underpinned with a practical example. We consider these as relevant for the present task to organize and align innovative teaching and learning in university environments. Additionally, and

from a process perspective, this systematization corresponds with formative and summative evaluation aspects within the student life cycle.

Table 1: Fields of Knowledge Visualization (KV) for Learning in Higher Education

Fields of KV	Subset	Visualization Form	Example
AS Learning	Learning Content Visualization	Graphic Organizers, Infographics	Visual Variation Patterns
	Visual Techniques for Learning	Mapping Methods	Concept Mapping
FOR Learning	Visual Learning Analytics	Graphs, Diagrams	Learner Dashboard
	Visual Learning Environments	Immersive Learning in 2D/3D	Metaverse
OF Learning	Visualizing Learning Offers	Interactive Maps	Curriculum Visualization
	Visualizing Learning Outcomes	Badges, Emblems, Icons	Digital Course Badge

As depicted in Figure 1, the proposed dimensions "are not mutually exclusive" (Brady et al, 2019). For instance, the way of visualizing learning content can be influenced by certain insights from applying visual learning analytics "as the use of computational tools and methods for understanding educational phenomena through interactive visualization techniques" (Vieira et al, 2018).

3. Methodology

For systemizing the field of knowledge visualization in contexts of higher learning, we primarily used the Web of Science Core Collection and included seminal papers (based on their citation impact). Ideally, such papers have achieved at least a hundred citations (with exceptions for certain subfields). In case the search has not led to satisfactory results in the respective subfield, we also included further highly relevant papers (based on Google Scholar Rank by title search through the 8th version of *Harzing's Publish or Perish* software tool). To ensure a current view on visualization for learning contexts, we have limited our search to articles published after 2010.

To find relevant literature based on our segmentation approach, we have searched for articles by applying the following keywords listed in Table 2. We gathered our basis of analysis between 17th April and 1st May 2023.

Table 2: Search Strategy for the Review Process

Venues of Applied Keywords	Search Strategy (Web of Science)
Learning Content Visualization	("Graphic Organizer" OR "Graphic Organizers") AND Education; (Infographic OR Infographics) AND Education [Title OR Abstract OR Topic]
Visual Techniques for Learning	("Mind Map" OR "Mind Mapping" OR "Concept Map" OR "Concept Mapping" OR "Argument Map" OR "Argument Mapping") AND Students [Title OR Abstract OR Topic]
Visual Learning Analytics	("Visual Analytics" OR Visualization OR Visualisation) AND "Learning Analytics" AND Education [Title OR Abstract OR Topic]
Visual Learning Environments	("Augmented Reality" OR "Virtual Reality" OR "Mixed Reality") AND Education [Title OR Abstract OR Topic]
Visualizing Learning Offers	"Curriculum Visualization" OR "Curriculum Visualisation" [Title OR Abstract OR Topic]
Visualizing Learning Outcomes	(Badge OR Badges) AND Students [Title OR Abstract OR Topic]

Further selection criteria were the following:

- The paper was published between 2010 and 2022.
- The paper is written in English.

- Journal or proceeding papers contribute to education and educational research (e.g., Citation Topics Meso in Web of Science).
- The paper relates to university environments (e.g., university students).
- Visualizations described in the paper are considered as a (technical) solution or intervention. This means that this "review did not include papers that used visualizations only to present results of a study—e.g., a histogram used to communicate results of an experiment" (Vieira et al, 2018).

To analyse the main uses within the fields of knowledge visualization, we screened the articles along related main objects and visual approaches. We then contrasted the respective items to achieve a theoretical saturation with structural similarities. While doing this, we considered differences in type of knowledge, its purpose, domain of usage, and application context to identify the underlying key concepts.

4. A Review of Knowledge Visualization for Learning in Higher Education

The results of our review of the included literature are summarized in Table 3. It shows corresponding insights in terms main objects and visual approaches in the use of knowledge visualization for learning in higher education.

Table 3: Results of Systemizing the Field of Knowledge Visualization in Higher Education

Learning Content Visualization		
Authors	Main Objects	Approaches
Bicen and Beheshti (2022); Nussbaum et al (2019); Polman and Gebre (2015); Rum and Ismail (2017)	Argument-counterargument integration; Metacognitive support system for learning; Students' academic achievement levels; Visual culture of infographics	Argument Vee Diagram; Flipped Classroom Instructional Infographics (image-based, video-based, game-based); Graphic Organizers used for organizing information during learning (expression tree); Science infographics
Visual Techniques for Learning		
Authors	**Main Objects**	**Approaches**
Davies (2011); Liu et al (2010)	Associations between ideas, topics, or things; Relations between concepts; Inferences between claims/conclusions and support/premises	Combination of diagrams and outlines; Convergence of mapping (Specificity-Generality)
Visual Learning Analytics		
Authors	**Main Objects**	**Approaches**
Macfadyen and Dawson (2012); Williamson (2016)	E-learning data (use patterns and trends, relationship to student learning outcomes); Knowledge about education systems	Data visualization software (Tableau); Digital interactive data visualizations of massive online data ("The Learning Curve")
Visual Learning Environments		
Authors	**Main Objects**	**Approaches**
Cheryan et al (2011); Codd and Choudhury (2011); Dieker et al (2014); Khot et al (2013); Moro et al (2017); Stepan et al (2017)	Students' knowledge in anatomy; Design of virtual classrooms; Teacher education (personalized learning, suspension of disbelief, cyclical procedures as critical components)	AR, VR, and tablet-based applications with computerized interactive 3D model; Immersive Simulator (mixed-reality, avatar-based simulation environment); Virtual computer science classrooms in Second Life

Visualizing Learning Offers		
Authors	**Main Objects**	**Approaches**
Blasco Soplon et al (2014); MacNeil et al (2020); Nelson-Fromm and Fagen-Ulmschneider (2022); Siirtola et al (2013); Takamatsu et al (2019); Tee et al (2021); Quintana and Tan (2021)	Course Structure; Curriculum overlaps; Prerequisites and corequisites for courses and degree programs; Shared competences; Students' pathways through the curriculum	Bottom-up synthesis of curriculum data (courses, topics, themes, weighted connections); Course Composition Diagram; Dependencies between curriculum and student academic data; Dynamic curriculum mapping; Metro Map; Multi-dimensional and interactive curriculum map tool; Relationship between subjects and competences
Visualizing Learning Outcomes		
Authors	**Main Objects**	**Approaches**
Anderson et al (2014); Hakulinen et al (2013); Hanus and Fox (2015); Hew et al (2016); Kyewski and Krämer (2018)	Achieving badges with no elaborated description; Behavioral and cognitive engagement; Students' activity in online learning environments; Students' engagement inside and outside the classroom; Students' forum engagement in massive open online courses (MOOCs)	Badge Leaderboard (e.g., ranking with combination of badges and coins as gamified elements); Badges, points, and leader board as game mechanisms; Categorial Achievement Badges (e.g., Time Management, Carefulness, Learning); Cumulative "Milestone" and Great Achievement Badges (e.g., Bronze, Silver, Gold, Diamond); Hidden Badges; One-Time Badges (e.g., to welcome users); Varied visibility of awarded badges ("own-others" badges, "own"-badges)

Drawing on this selective review, we propose the following four key concepts that structurally define the use of knowledge visualization in higher education. The main insights are described in Table 4.

Table 4: Key Concepts for Knowledge Visualization in Higher Education

Key Concept	**Main Insight**
Knowledge Visualization considers different perspectives and interpretations.	Criteria as relevance, accuracy, adequacy, completeness, or sufficiency provide a common basis to involved stakeholders. In that sense, it serves as a boundary object (e.g., Leigh Star, 2010). Depending on the context-specific purpose, users' background knowledge and/or background experience must be considered.
Knowledge Visualization follows visual (and conventual) rules.	Depending on its communicative function, the use of knowledge visualization depends on the respective knowledge type which determines how its representation is organized (e.g., hierarchy, flow).
Knowledge Visualization allows technical flexibility in visual design.	Tools and forms of knowledge visualization and its semiotic functions must be adaptive to the application context. They then provide appropriate settings in terms of color, size, or shape and the possibility to integrate further representational elements (e.g., charts, diagrams, maps, graphs, icons, text, sketches).
Knowledge Visualization incorporates an engaging and explorative design.	Knowledge visualization considers relevant affordances of representation (e.g., bird's eye view, additional details, balance, movement, pattern, repetition, rhythm, variety). Thus, users get more involved and keep up their interest.

5. Conclusion

The aim of this paper was to structure the field of knowledge visualization for university-based, higher learning. For this, we derived a segmentation framework (Vis2Learn) that consists of six subfields to structure the contemporary field of knowledge visualization for higher learning: Learning Content Visualization, Visual Techniques for Learning, Visual Learning Analytics, Visual Learning Environments, Visualizing Learning Offers, and Visualizing Learning Outcomes. Based on our results, we identified four generic key concepts that systemize

the use of knowledge visualization in higher education contexts: *Multi-Stakeholder-Inclusiveness, Rule-Orientation, Technical Flexibility,* and *Engaging/Explorative Design*. Accordingly, this implies promising future research avenues based on related key questions for each of the six areas of knowledge visualization, as well as for the domain of knowledge visualization for higher learning itself (see Table 5).

Table 5: Research Agenda for Knowledge Visualization in Higher Education

Key Concept	Key Questions
Multi-Stakeholder-Inclusiveness	How can knowledge visualization be used to provide a common point of reference for different stakeholders in higher education contexts? What are the critical factors?
Rule-Orientation	How can users be made aware of the appropriate usage of tools and forms of knowledge visualization? How does it correspond to working or learning strategies?
Technical Flexibility	Under which conditions does the integration of additional representational elements create value? How does it affect usability issues?
Engaging/Explorative Design	Which individual or group-related effects are associated with the use of knowledge visualization? How do (motivational) affordances influence respective outcomes?

In this sense, future work on these avenues must keep track of the "cognitive, social, and emotional benefits" (Eppler and Burkhard, 2004) generally associated with knowledge visualization at different recipient levels (i.e., coordination, attention, recall, motivation, elaboration, new insights). For us, the underlying segmentation approach (Vis2Learn) also serves as an initial step to further explore and develop a "validated prescriptive framework" (Eppler and Burkhard, 2004) that links knowledge type (declarative, procedural, experimental, orientational, and individual knowledge), visualization goals (e.g., learning, assessing) and visualization format (e.g., interactive visualization) while considering the functional interplay of visualization as learning, visualization for learning and visualization of learning. This would also highlight, for instance, "how complementary visualization … can be fruitfully used" (Eppler and Burkhard, 2004).

We particularly see the area of visualizing learning offers as a spearhead for empirical research and practical transfer in the knowledge visualization domain. By now, this subfield rather focusses on exhaustively communicating curricular structures for organizational or planning activities of different higher education stakeholders. But visualization of learning offers can also relate to course electives in university environments. At this point, empirical research is planned to contribute to the choice overload debate by considering psychological effects in the use of interactive visualization to support students' course decisions. Besides, group-related effects are also worth to be analysed. For example, these can refer to the question if interacting with an interactive visualization tool can stimulate information exchange processes in higher education expert groups (Spletter and Eppler, 2023). Therefore, the derived findings and related key questions might help practitioners and researchers from higher education contexts who consider lifelong learning as an important task.

The Impact of the COVID-19 Pandemic on the Investment Management in the Housing Market in Turkey

Celal Erdogdu[1] and Inese Spica[2]
[1]ISMA University of Applied Sciences, Riga, Latvia
[2]Scientific Institution Business Competence Centre, Riga, Latvia

celaler@yahoo.com
inese.spica@gmail.com

Abstract: COVID-19 significantly impacted the management of investments in the residential property market. Changes in property demand, shifts in market volatility, financing challenges, changes in property management and changes in local regulations and policies are presented. The pandemic created a more challenging and unpredictable investment management (IM) environment in the residential property market. However, with proper knowledge management (KM) and investment strategies, investors may have opportunities to thrive in this changing market. Investment KM refers to identifying, capturing, organising and sharing information and expertise related to investment activities within an organisation. KM in residential investment involves developing a system for gathering, organising and using information and expertise related to buying, owning, and selling a property. COVID-19 significantly affected the property market. Effective KM in residential investment can help individuals make informed decisions, identify potential risks, and maximise the value of their investment. Like many others worldwide, the Turkish residential market was hit by COVID-19. The Turkish residential market has a few key points: financing, shifts in buyer preferences, and regulation changes. The pandemic hit Turkey's residential property market, leading to property price changes. The Turkish government implemented several residential policies to support the residential market and help individuals and families facing financial challenges due to the pandemic. Those policies did not eliminate the challenges but mitigated some of the negative effects of the pandemic on the market and helped individual investors. This article discusses house price changes in Turkey during the COVID-19 period, the factors affecting price changes, and the property policies that affect property price changes. This article analyses IM challenges and explores how KM can help individual property investors.

Keywords: COVID-19, Rresidential property, Investment, Management, Methodology, Pandemic

1. Introduction

Residential property prices (RPP) in Turkey began to fall in April 2017 and began to rise gradually after January 2020. The first COVID-19 cases in Turkey were reported in March 2020. The residential market recorded the lowest sales in April and May due to full and partial lockdowns. On 3rd June 2020, the Turkish government launched a series of mortgage campaigns to take advantage of the accelerating effect of the residential market on the economy. From that date, RPP in Turkey rose inexorably until September 2022. In May 2021, measures were taken to prevent the rise of property prices and rents, leading to great societal discomfort. The concept of KM must be adopted in organisations to transform them into entities with a competitive advantage in this borderless world (Najib Razali and Juanil, 2011).

The object of the research is IM in the housing market during the COVID-19 pandemic period. The subject of the research is the analysis of the IM in the housing market in Turkey, the impact of the COVID-19 pandemic, and the KM solutions of its problems. The objective of the research is to study the integration process of the COVID-19 pandemic and IM in housing market problems, to elucidate the factors influencing it, and to develop housing IM mechanism with KM.

2. Literature Review

Global crises affect all aspects of life, including the business sector, and significantly impact society at large (Jacob, 2012; OECD, 2020). The importance of KM is particularly felt in times of crisis, such as COVID-19, when investors have difficulty making investment decisions. Property investors can make better investment decisions by using KM applications in their investment processes, whether professional or private. The speed of data flow required by KM applications is directly related to the statistical infrastructure of countries. Reducing the time, it takes to obtain, process, share, and disseminate the data collected by the public is important for investors to make the right decisions. The scientific literature on the relationship between KM and crisis management shows that the effective use of KM is helpful during crises (Ram Raj Thumiki and Jurcic, 2021). Every crisis is an important source of knowledge (Mikušová and Horváthová, 2019).

COVID-19 increased inequality between owners and renters in the residential market (Furceri, Loungani and Ostry, 2020) and wealth inequality between households (Balemi, Füss and Weigand, 2021). It reduced regular

household incomes, led to the shutdown of businesses, reduced incomes and caused mass unemployment. During the pandemic, instead of supporting those who were struggling to pay their rent, support was given to landlords (Blakeley, 2021). Although different policies were implemented in different countries, no special support was provided to those most affected by the pandemic in the residential market in Turkey (Aksoy Khurami and Özdemir Sarı, 2022).

Government policies during COVID-19 had mixed results. Residential property is important in the national economy (McCord et al., 2022). Government policies play an essential role in the Turkish residential property market. The plans and interventions presented during COVID-19 in Turkey were designed to alleviate the difficulties. As a result of the mortgage loan campaign, one-year repayment plans with a total maturity of 15 years were offered.

COVID-19 affected RPP and total residential property sales (TRPS) in China, with a larger impact on TRPS than on prices (Blakeley, 2021). After COVID-19, RPP recovered and rose rapidly (Li and Zhang, 2021). The level of RPP after COVID-19 raises concerns about a residential market recession similar to 2007-2009, but with the major difference of the Great Recession: regulatory changes and supply and demand (Afxentiou, Harris and Kutasovic, 2022). D'Lima, Lopez and Pradhan (2022) found that during COVID-19, there were large declines in TRPS during periods of closure and reopening. Following country lockdowns, RPP fell in densely populated areas and rose in sparsely populated areas. Similarly, a research study by McCord et al. (2022) shows that the pandemic increased prices in rural areas.

COVID-19 was significantly effective on rents, financing costs and deposit interest rates on RPP in Turkey. However, macroeconomic variables did not affect RPP (Kartal, Kılıç Depren and Depren, 2021). Compared to the rest of the world, Turkey experienced an increase in demand for residential property during COVID-19; demand reached record highs, and RPP and inflation rates increased (Aksoy Khurami and Özdemir Sarı, 2022). Akgündüz et al. (2021) indicate that a 1% (annual) decrease in MIR in Turkey leads to a 2.1% increase in the unit price per square metre of residential property. Residential property prices increased by 10.59% in real terms in June 2020, driven by the government's mortgage rate cut. The real growth peaked at 24.14% in November 2021. In real terms, Turkey's residential property cost increased by 2.85% in March 2020 (Erdogdu and Spica, 2022).

In their study, Jennex et al. (2022) presented findings to analyse and identify threats to information risk and to change information risk strategy in light of the COVID-19 pandemic. Information systems support people in making decisions, learning and other activities (Nissen, 2002). In this study, we analysed the impact of COVID-19 on the property market and presented findings on overcoming similar crises with KM. Sharing knowledge (Gore & Gore, 1999), looking at things from different perspectives, and redefining problems can lead to creative solutions (Sternberg, O'Hara and Lubart, 1997).

3. Methodology

We conducted a linear regression analysis to examine which economic variables affect cash residential property sales (CRPS) and mortgage residential property sales (MRPS) in the time interval between January 2013 and December 2021, with the dummy variable for COVID-19. To address heteroscedasticity in our data, we logarithmically transformed it and achieved a balanced dispersion. Evaluating both CRPS and MRPS in the same linear regression analysis could have led to multicollinearity problems and an undesirable increase in the variance inflation factor (VIF) value to 5 and above. To avoid such issues, we conducted linear regression analysis in two phases: the first phase analysed CRPS and the second phase analysed MRPS. We analysed the effect of COVID-19 and the effect of other economic variables in both phases.

We analysed which variables affect the dependent variables of MRPS and CRPS in Turkey. We used the following independent variables: non-residential property sales (NRPS), mortgage interest rate (MIR), employment, consumer confidence index (CCI) and new building permits (NBP), and the COVID-19 dummy variable. We found that the R2 of the linear regression for CRPS was 0.88, and the R2 for MRPS was 0.85.

4. Results

We analysed the independent variables that affect MRPS through regression analysis. The adjusted R-squared value shows that the change in the independent variables in the regression model explains the change in MRPS by 88.7%. The ANOVA analysis indicates that the established model is statistically significant at the 99% confidence level (sig.<0.01). Table 1 of coefficients indicates that all the independent variables, except NBP and COVID-19 periods, are statistically significant at the 99% confidence level (sig.<0.01).

Table 1: MRPS Linear Regression

Coefficients								
							Collinearity Statistics	
Model		Unstandardized	Standard Error	Standardized[a]	t	p	Tolerance[a]	VIF[a]
H_0	(Intercept)	3.407	0.052		66.077	< .001		
H_1	(Intercept)	-0.362	2.852		-0.127	0.899		
	non-residential property sales	0.681	0.087	0.316	7.835	< .001	0.719	1.391
	mortgage interest rate	-2.151	0.092	-1.065	-23.460	< .001	0.544	1.838
	employment rate	3.873	0.599	0.288	6.464	< .001	0.731	1.367
	consumer confidence index	-1.891	0.415	-0.262	-4.556	< .001	0.463	2.161
	new building permits	-0.023	0.046	-0.024	-0.495	0.622	0.528	1.895
	COVID-19 (1)	0.064	0.066		0.968	0.335		

[a] Standardized coefficients and collinearity statistics can only be computed for continuous predictors.

All variables are held constant: a 1% increase in NRPS increases MRPS by 0.68%. A 1% increase in the MIR reduces MRPS by 2.1%. A 1% increase in the employment rate (ER) increases MRPS by 3.8%. An increase of 1% in the number of NBP reduces MRPS by 0.02%. COVID-19, holding all variables constant, increases MRPS by 6.6%. Based on these results, the model for MRPS is as follows:

$$\text{Ln(MRPS)} = -0{,}362 + 0{,}681 * \text{Ln(NRPS)} - 2{,}151 * \text{Ln(MIR)} + 3{,}873 * \text{Ln(ER)} - 1{,}891 * \text{Ln(CCI)} - \\ -0{,}023 * \text{Ln(NBP)} + 0{,}064 * \text{COVID-19} \quad (1)$$

We used regression analysis to analyse the independent variables affecting CRPS. The adjusted R-squared value indicates that the change in the independent variables in the regression model explains the change in CRPS by 87.8%. The ANOVA analysis indicates that the established model is statistically significant at the 99% confidence level (sig.<0.01). Table 2 of coefficients indicates that all independent variables except NBP are statistically significant at the 99% confidence level (sig.<0.01).

Table 2: CRPS Linear Regression

Coefficients								
							Collinearity Statistics	
Model		Unstandardized	Standard Error	Standardized[a]	t	p	Tolerance[a]	VIF[a]
H_0	(Intercept)	4.313	0.027		158.082	< .001		
H_1	(Intercept)	3.343	1.572		2.126	0.036		
	non-residential property sales	0.788	0.048	0.691	16.465	< .001	0.719	1.391
	mortgage interest rate	0.201	0.051	0.188	3.981	< .001	0.544	1.838
	employment rate	1.196	0.330	0.168	3.622	< .001	0.731	1.367
	consumer confidence index	-1.791	0.229	-0.469	-7.828	< .001	0.463	2.161
	new building permits	0.068	0.025	0.133	2.675	0.009	0.528	1.895
	COVID-19 (1)	-0.125	0.036		-3.452	< .001		

[a] Standardized coefficients and collinearity statistics can only be computed for continuous predictors.

Assuming all variables are constant: NRPS increase by 1%, and CRPS increase by 0.78%. A 1% increase in MIR increases CRPS by 0.2%. A %1 increase in ER increases CRPS by %1.1. A %1 increase in the number of NBP increases CRPS by %0.06. A %1 increase in c CCI increases CRPS by %1.7. COVID-19 reduces CRPS by 11.8%, holding all variables constant. Based on these results, the CRPS model is as follows:

$$\text{Ln(CRPS)} = 3{,}343 + 0{,}788 * \text{Ln(NRPS)} + 0{,}201 * \text{Ln(MIR)} + 1{,}196 * \text{Ln(employment)} -$$

$$-1{,}791 * \text{Ln(CCI)} + 0{,}068 * \text{Ln(NBP)} - 0{,}125 * \text{COVID-19} \quad (2)$$

After the announcement of the first COVID-19 case on 11th March 2020, Turkey suffered the pandemic until December 2021, after partial lockdown, lockdown by occupation, lockdown on weekends, curfew for people over 65, and full lockdown (AA, 2023). The curfew directly impacted the residential sector in many areas, from residential construction to TRPS. The monthly average of TRPS was 100 thousand units, and the number of TRPS fell to 42 thousand units in April 2020 and 62 thousand units in May 2020. Over the 22 months between March 2020 and December 2021, TRPS fell in 8 periods and increased in 14 relatives to the monthly average. MRPS fell in 16 periods and rose in 6 periods. CRPS fell in five periods, were unchanged in one period and rose in 16 periods.

After the recession in the residential market in March and April of COVID-19, the Turkish government launched a special campaign on mortgage loans. As the data indicates, these attractive campaign terms increased the sales of mortgaged residential properties and, subsequently, the CRPS (Table 1). We compared the real change in RPP with the prices before the COVID-19 outbreak. In the first stage, we obtained the average annual real change in RPP for 110 months in the period 01/2011-02/2020. In the second stage, we obtained the average annual real change RPP for 22 months in the period 03/2020-12/2021. Comparing the differences in the average real RPP changes in the two periods, we can see the effect of COVID-19 on RPP in Turkey. In the analysis of price changes, there is a detail in the source authors use. The Turkish RPP index is compiled by the Central Bank of the Republic of Turkey (CBRT, 2023a) by aggregating RPP changes in 81 provinces into 26 regions at 12 levels. Accordingly, the price change in a city makes it appear as if the RPP in the region where that city is located has also changed.

Some studies adopted the four KM processes commonly used in the literature and defined in the European guide for good practice in KM (Chedid, 2019): Knowledge creation (Nonaka, Toyama and Konno, 2000), knowledge capture (Nielsen, 2006), knowledge sharing (Sun, 2010), knowledge application (Paliszkiewicz, 2011). Bratianu and Bejinaru (2017) created main knowledge strategies: knowledge creation, knowledge sharing, knowledge acquisition and knowledge exchange in networks. Silva et al. (2017) state that research on strategic management focuses on the relationship between strategy and KM. Many authors consider KM to be a process involving different activities: knowledge creation, capture, sharing and application (Alavi and Leidner, 2001). Following the ideals of the concept of KM allows for better management practices and the improvement of their well-being, in addition to generating more profits in the property sector through more creative and inventive techniques (Najib Razali and Juanil, 2011).

In property markets, KM applications are important for decision-makers and property investors to analyse the market accurately and predict the possible consequences of decisions. Although the effects of residential policy on property sales and prices were relatively small in the early periods of policy implementation, they became more pronounced later. The measures taken to mitigate these effects began to impact the property market after a long period, accelerating the trend towards price increases. Property investors can use KM applications in their investment processes to make investment decisions under five main activities (Figure 1): market analysis, decision-making, collaboration, continuous learning and performance monitoring. The connection between KM and housing IM is simply described in Figure 1.

5. Discussion

The effects of COVID-19 in Turkey overlap with the effects of the Turkish government's residential policy. TRPS in Turkey fell to the lowest level due to COVID-19. However, the subsequent mortgage loan campaign pushed MRPS to three times the general average. As soon as the campaign ended, the MRPS number returned to normal. The number of MRPS in three months was even higher than the number of MRPS in Turkey in a year. The increase in the MRPS increased the demand for residential property, and CRPS increased by up to 18%. If the mortgage loan were gradual and extended over time instead of a sudden reduction in MIR, the demand could have been stabilised, and sudden price increases could have been prevented (Akgündüz et al., 2021). The increased demand for property encouraged existing property owners to put their properties up for sale.

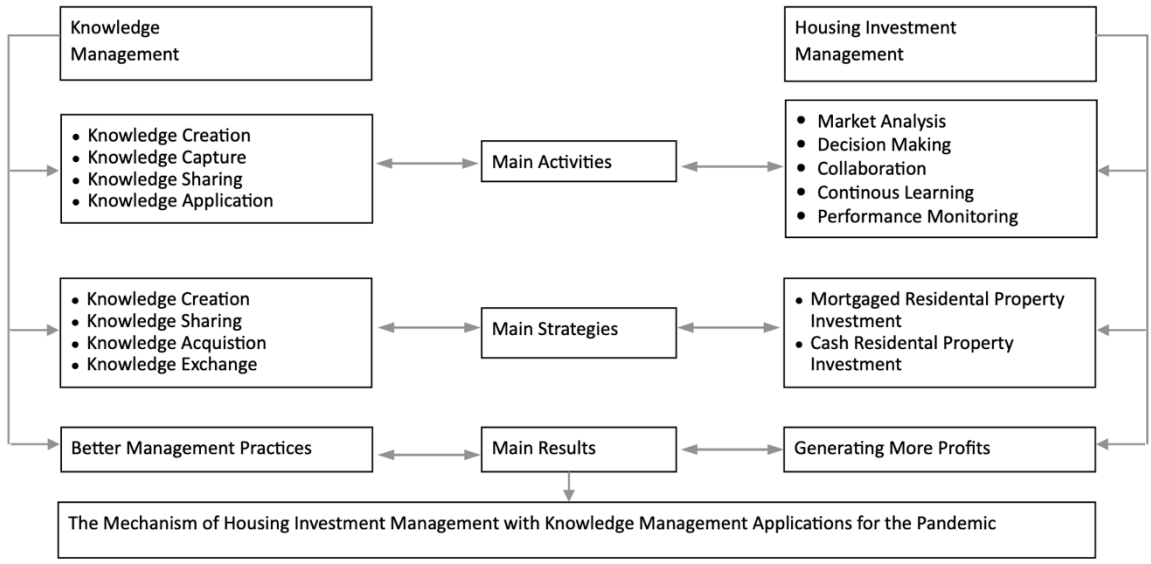

Figure 1: The Connection Between KM and Housing IM

The three-month campaign boosted demand for residential property, pushing up real RPP increases. The annual real price increase was 5.1% in April 2020, 10.7% in May and as high as 13.7% in September, when the campaign ended. However, this effect was not limited to this point, and real RPP continued to rise until September 2022. The level of annual real price increases in September 2022 was 57.5%. COVID-19 also led to a spatial differentiation of RPP changes and sales.

The real increase in TRPS and RPP started in June 2020 and continued intensively for three months. The Turkish Residential Property Price Index (CBRT, 2023b) is published monthly. However, although the frequency of data release is monthly, the data refer to the previous two months (CBRT, 2023a). The difference between the publication of the final results and the end of the reference period is 75 days. Only one of the real estate websites publishes data on the residential market, but not regularly and sometimes not for several months in a row. Bricongne, Meunier and Pouget (2021) argue that the publication period of statistical data published by public institutions makes it difficult to understand market changes.

Existing sources do not provide real-time information during periods such as COVID-19 or campaigns. This leaves consumers to fend for themselves and leads to a consensus among consumers when trends are strong (Case, Shiller, Thompson, 2012). Family, friends and the media influence residential investors who do not have access to adequate information in their decision-making process (De Bondt, 1998; Katz, 2006). However, property advertising websites are one of the most important data sources. As owners of big data, these sources, which are of direct interest to the public, share as much as they want and when they want with the public. When property advertisements were published in newspapers, users could easily create their database. With the data collected from property websites, it may be possible to monitor the market much faster than the statistics provided by public institutions (Bricongne, Meunier, Pouget, 2021). In the property market, digital channels will help increase market transparency and efficiency (Balemi, Füss and Weigand, 2021).

The main problem in the Turkish residential property market is the lack of data. The property price index in Turkey is based on values in property valuation reports prepared for financial institutions. Values estimated by real estate valuers are not sales price data. Actual sales data are not made available to the public. Erdogdu and Arslanli (2023) found that only 71 of Turkey's 3 million yearly property sales were disclosed to the public. The second problem is data inaccuracy. COVID-19 may now be a thing of the past, but the remote working practice may continue to significantly impact the residential market and the wider economy (Allen-Coghlan, McQuinn and O'Toole, 2020).

6. Conclusion

Using KM techniques, individuals can access and analyse key market information such as trends, property valuations, rental rates, and investment opportunities. KM techniques support risk assessment and management in residential investment. Residential investors benefit from KM strategies that encourage

networking and collaboration. Connecting with experienced investors, sharing experiences and working on investment opportunities can help individuals tap into the collective wisdom and gain valuable insights. In residential investment, KM techniques encourage continuous learning and adaptation. Individuals can adjust their investment plans and respond to changing market conditions by actively seeking new knowledge, keeping abreast of market trends, and reflecting on past investment experiences. Individuals can use KM techniques to track and analyse the performance of their investments. Investors can examine the profitability and effectiveness of their investment decisions by maintaining a knowledge base of investment data, financial measurements and market feedback.

The findings of this study can be used to develop strategies for two types of investors. Investors in mortgaged residential property should consider the increase in MRPS following increases in the following indicators: NRPS, employment rate, and new building permits. On the other hand, a rise in mortgage rates leads to a fall in MRPS. Investors should be particularly careful about the impact of changes in the employment rate and mortgage rates on MRPS. Cash residential property investors should consider an increase in CRPS following increases in the following indicators: increases in NRPS, mortgage rate, new building permit, and consumer confidence index lead to an increase in CRPS. Investors who pay cash to purchase a residential property should be particularly careful about the impact of changes in the consumer confidence index on CRPS.

The COVID-19 pandemic had two different impacts on sales of mortgaged residential property and cash sales of residential property. The findings of this study indicate that the COVID-19 pandemic led to a 6.6% increase in MRPS and an 11.8% increase in CRPS. Impact of the COVID-19 pandemic on residential property sales: TRPS remained at the average level for 14 months and above the average level for eight months. MRPS fell in 16 periods and rose in 6 periods. CRPS were unchanged in 1 period, rose in 16 periods and fell in 5 periods. These findings suggest that the crisis had a greater impact on the MRPS.

To ensure good KM and strategies in property investment, the relevant parties must play an active role, especially in times of crisis: rapid creation of knowledge, rapid dissemination of knowledge, sharing of knowledge and cooperation between all stakeholders. For further research, authors can highlight focus on the KM practices that influence the decision-making processes of people who want to invest in a residential property.

Abstract: Continuing a research program studying new metrics for relational capital, this paper reports on a new analysis of media brands, both traditional and newer entrants. Relational capital is a key aspect of the knowledge assets or intellectual capital of the firm. Unlike human capital (job-related knowledge) or structural capital (knowledge incorporated into the firm itself), relational capital has to do with external relationships. Specifically, knowledge about handling external relationships, especially those with customers. Relational capital is not a widely studied topic in knowledge management (KM) or intellectual capital (IC), including potential metrics. Brand equity, on the other hand, is an idea from another field that is well-known and much studied. While not the same concept as relational capital, it is clearly related as brand equity comes from a history of customer interactions and the value of the relationships built by the firm. Better knowledge of what satisfies customers plays an obvious role in building brand equity. But brand equity does not have a single, recognized method for calculation. Annual reports and rankings from marketing consulting firms routinely provide estimates of brand equity for high-value, well-known brands. Most of the other brands, not so much. Even so, if we know the brands with the highest equity values and can tie some additional metrics to that status, we can begin to uncover the level of customer knowledge held by individual firms and, by extension, relational capital in a wider variety of organizations. This study focuses on a brand sentiment analysis, using commercial software from Salesforce Social Studio. The web-scraping software collects mentions of a brand (or any keyword) across the web, not only social media but reviews, aggregators, and other sources of brand commentary. From that capability, an assessment of the brand's meaning to users can be assessed at a point in time. In particular, this study looked at established media brands (New York Times, Wall Street Journal, etc.) and new media brands (Buzzfeed, Techcrunch, etc.) over a three-month period in early 2023. Data were collected on brand activity (volume), sentiment (positive/negative), sources, influencers, country of origin/language, and other indicators, including the variance of all the above measures. From there, comparisons can be made across the more established brands and the developing ones, as well as to high-equity brands from other industries (covered in other studies). As noted, some suggestions can then be made concerning what metrics to track over time to assess the ongoing value of relational capital.

Keywords: Intellectual capital, Relational capital, Brand equity, Media brands, Sentiment analysis

1. Background/Literature Review

1.1 Relational Capital

The study of knowledge assets focuses not only on identifying and leveraging such assets through sharing but also understanding them properly. With proper understanding comes a better idea on how to develop and share such assets. Consequently, not only is the distinction between tacit and explicit knowledge a common topic in the field (Nonaka & Takeuchi, 1995), but also the interest of scholars and practitioner in the different types of intellectual capital: human capital, structural capital, and relational capital (Bontis, 1999; Edvinsson & Malone, 1997).

Human capital, of course, is a central concept in knowledge management (KM) and intellectual capital (IC) as it is the stock of knowledge possessed by individuals in the firm related to performing their jobs. As such, human capital is often the main subject of KM studies. Scholars and practitioners have an interest in identifying and understanding employee knowledge about their work, then better managing it through sharing and application. From unique employee knowledge comes a unique organizational resource providing sustainable competitive advantage (Grant, 1999; Teece, 1998). This knowledge-based view of the firm is an offshoot of the resource-based view of the firm (Barney, 1991; Wernerfelt, 1984), with knowledge as perhaps the prototypical unique, uncopiable competitive resource.

Achieving that potential competitive advantage is largely dependent on recognizing and properly understanding the human capital or knowledge assets. As above, one important aspect is whether the knowledge easy-to-communicate, codifiable explicit knowledge or hard-to-explain, hard-to-codify tacit knowledge (Nonaka & Takeuchi, 1995). Whether the knowledge is more explicit or more tacit has important implications for how to manage it (e.g. through information systems vs. person-to-person) (Matson, et al., 2003; Brown & Duguid, 1991). The organizational context or social capital can also be important, with softer issues like trust, incentives, and culture bearing on KM success (Nahapiet & Ghoshal, 1998).

All of that is pretty standard KM background and clearly applies to human capital. But, as noted earlier, intellectual capital is generally seen as having three parts, human capital, structural capital, and relational capital (capital (Bontis, 1999; Edvinsson & Malone, 1997). While human capital relates to knowledge about performing one's job, structural is conceptualized as knowledge embedded in the firm, aspects like processes and procedures. If a worker leaves the organization, they take their human capital with them, but structural capital is what is retained even without all the employees (who may have originally contributed to it). Relational capital refers to knowledge about relationships with external parties such as customers, regulators, suppliers, and others (Roos & Roos, 1997). And of those, of course, customers are the most important for many firms and customer data, information, and knowledge are growing rapidly in a digital world.

Beyond definitions, IC has contributed to our understanding of knowledge assets and their differences with research on potential metrics. Well-known tools for assessing the intangible assets of the firm come out of the IC framework, tools such as the Balanced Scorecard (Kaplan & Norton, 1992) and Skandia Navigator (Edvinsson & Malone, 1997) that include human, structural, and relational/customer components. Broader measures, such as Tobin's q are easier to use when comparing across multiple firms, often contribute an estimate of the full IC holdings of the firm but can't be broken down into the individual components (Tobin & Brainard, 1979). Pulic's VAIC, popular for multi-firm studies, does include a human capital component but relational capital is combined as a single remainder with structural capital (Pulic, 2000).

Even with the emphasis on human capital and the lack of a specific metric in some frameworks, the IC community has provided some attention to relational capital. In a number of ways, it reflects a separate idea from the marketing literature, brand equity, that we'll discuss short. Conceptually, repeated satisfactory interactions between parties, in this case organization and customer, build relational capital in the same way as two employees repeatedly sharing knowledge will build human capital (Chang & Tseng, 2005; de Castro, et al., 2004). Those successful exchanges provide the organization with better knowledge of each individual customer, including their needs, wants, and buying processes. Thus, at the heart of building relational capital is engagement with customers (Sussan, 2012; Stahle & Stahle, 2012). At least the customer capital part. Again, relational capital is a wider concept concerning relationships with multiple external publics, not just customers. But in many circumstances, the customer relationships are a major part of its makeup (Gupta & Bhasin, 2014).

1.2 Brand Equity

Brand equity is a core concept in marketing, the value of a recognized brand as a business asset. Much of the value of the brand is based on accumulated positive word-of-mouth heard by and/or use experienced by the customer. In today's world, where customer interactions are recorded, stored, and analyzed by the firm, it can actually build brand equity by learning more about what resonates with customers. In effect, this knowledge about how to better develop customer relationships can be considered relational capital. As such, brand concepts may help us to better understand relational capital.

Aaker (1991) is generally everyone's first reference in branding. His initial work established the value of a brand's perceived higher quality and the price premium associated with it. Turning to brand equity, a potential value metric, he broke down the concept down into the component parts of awareness, associations, and loyalty (Aaker, 1996). One of the key points there is the associations, as brand value builds through repeated successful interactions, then leading to loyalty. The value of the brand is largely based on satisfactory exchanges with the customer. Keller (1993) made a similar case with recognition followed by repeated positive experiences establishing the brand value.

As the repeated exchanges build positive associations and loyalty, they are potentially different for every customer. The individual determines what the brand is worth to them and how much extra they would pay for it. In theory, a summation of those individual differentials would be an estimate of brand equity (Seggie, et al., 2006; Aliwadi, et al., 2003) though it fails to capture any customer surplus resulting when the customer obtains the brand for less than the value they place on it.

In practice, brand equity is more often estimated by consultancies based on proprietary methodologies including financial statements and other data sources. While they vary in their approaches (and, often, results), they do provide some idea of the magnitude of some of the largest brand equities of publicly listed firms. As with many estimates of intangible assets, the issue is found in the intangibility aspect itself. Tangible assets and firm value are included in financial reporting but intangible assets are usually not. Goodwill is an exception and included on balance sheets but is only accurate at the moment a firm is purchased and then never altered. So it is rarely useful for long.

Even so, brand equity and related concepts show a degree of interest in measuring the relationship between an organization and its customers. To the degree that continued positive exchanges build value and that ever improving knowledge about the individual customer's needs, wants, and preferences contribute to those positive exchanges, there appears to be an opportunity to connect brand metrics from the marketing side to relational capital on the KM/IC side. With the advent of contemporary digital tools such as customer relationship management (CRM) systems and digital media, perhaps the two disciplines can be brought closer together and better inform the study of each.

1.3 ICTs and Relational Capital

Digital tools are present in both brand relationships and knowledge management (including relational capital). Indeed, they are omnipresent and actually increasing in their use and impact. In the field of big data and analytics, data and information contributing to knowledge insights are increasing in volume, velocity, and variety (Rothberg & Erickson, 2017). Big data sources are varied but customer data is a big part of the volume. What potential is there in information and communication technologies (ICTs) for better understanding branding and relational capital?

ICTs are dispersed, complicated networks with identifiable users (Lechman, 2017). Communications between users or other interactions on ICTs , as in social media, generate an enormous amount of data. And, as noted above, data and information are useful in an of themselves but are also capable of becoming higher-level knowledge assets (Sigala & Chaikiti, 2014; Levy, 2009).

The DIKW (data, information, knowledge, wisdom) hierarchy is a longstanding concept in information science, dating back to Ackoff (1989) and others. As a hierarchy, the concept suggests the maturation of intangible assets, with increasing value as data and information yield insights (knowledge) and understanding (wisdom). Consequently, the wealth of data and information now available have considerable potential to add to the amount of useful knowledge or intellectual capital in organizations.

More recent work on this full range of intangible assets pulls away a bit from the hierarchical view, especially as data and information have been established as valuable assets in an of themselves. All are potentially useful and more valuable than the others depending on the circumstances, sketched out, in part, by the Cynefin framework (Kurtz & Snowden, 2006). This view brings a more KM approach to the theory, as tacit and explicit knowledge are seen as different but both of potential value. Indeed, a more recent version of the intangible asset options suggests a range moving from data/information through explicit knowledge to tacit knowledge to wisdom/intelligence (Rothberg & Erickson, 2017).

That insight raises the question of whether intellectual capital, and especially relational capital, is made up of only knowledge assets. Knowledge has value, including knowledge of customers. But so does data/information, particularly data/information on those same customers, their attitudes and their behaviors. ICTs generate a lot of data/information and understanding those better may provide insights into brand value and relational capital. Not just trying to measure customer knowledge but the full range of intangible assets associated with customers may indicate even deeper relationships related to brands and customers. ICT metrics may provide a new and better way to assess both brand equity and relational capital.

Digital media offer an especially interesting opportunity to apply ICTs to assessing brand equity and relational capital. One form of digital media would be the extensive customer relationship management (CRM) systems and the resulting deep customer databases, collecting individual data on each touchpoint with each customer. Possessing that level of detail on individual customers and their responses to interactions provides a much deeper understanding and opportunity for a much deeper relationship. Social media interactions also provide openings for deeper relationships, including user comments revealing attitudes toward brands. While sometimes uncomfortably honest about negative feelings (Royai, 2002), uncensored personal comments can provide unusually deep insights into customers' true feelings about a brand (Rizun & Kucharska, 2018). Brand equity and relational capital might remain fuzzy concepts in terms of measurement, but these new tools provide potentially valuable ways to gain a new perspective on their value.

2. Methodology

This study continues a stream of research applying new digital media data collecting techniques to assess brand value and relational capital. Past studies in this vein have looked at major consumer product brands (Erickson & Rothberg, 2017), ingredient brands (Erickson, Schmidt & Rothberg, 2020), and tech brands (Erickson, 2023). A common thread in the previous studies was the great activity and interest in the higher-valued brands. The

sentiments toward brands were actually not more positive for the high-value brands (nor more negative) but were more neutral when that choice was available. Interestingly, the sentiment for the high-value brands tended to be less variable, opinions were more entrenched and less likely to change week-to-week or month-to-month.

This study extends the methodology to the media industry. Traditional news media companies (*The Wall Street Journal (WSJ), The New York Times (NYT), The Washington Post (Wapo), and The Economist*) were tracked as were some newer, always-digital-only competitors (*TechCrunch, Buzzfeed, Mashable*). The sample was tracked over one-week, one-month, and three-month periods ending on March 31-April 1, 2023. Salesforce's Social Studio sentiment analysis program was used to gather and analyze the data, reporting on each brand mention.

Social Studio takes keywords and constructs reports over a specified time period. Major digital outlets are reviewed and included such as Twitter, Facebook, YouTube, blogs, forums (and replies), aggregators, reviews, and others. These reports include volume of mentions, sentiment (positive or negative), top influencers and their influence, country (when known), language, and the digital outlet itself. The program also provides the underlying comments themselves, allowing text analysis or additional qualitative analysis, if desired.

3. Results and Discussion

Results are presented in Table 1 (one week), Table 2 (one month), and Table 3 (three months). Included are data on the media brand's volume, sentiment, top influencers (average score of top 10 on a 0-100 scale), language, and media source. For the language and media source metrics, offering an extended list of sometimes rare possibilities, only those options with at least one reading above 2.0% were included.

Table 1: News Media Brands, Sentiment and Related Metrics (3 months)

Metric		WSJ	Economist	NYT	Wapo	Mashable	Buzzfeed
Volume		112K	356K	3.9KK	2.2KK	190K	728K
Sentiment (positive)		40.2%	48.8%	40.2%	33.1%	70.6%	62.2%
Influencers		98	98	98	98	97	98
Platform	Twitter	84.3%	85.3%	71.4%	91.6%	89.9	83.1%
	Aggregators	4.8%	1.6%	2.6%	1.7%		
	YouTube	2.0%	7.4%	4.7%	2.8%	1.9%	5.8%
	Forums	4.4%	2.6%	17.0%	1.8%		
	Blogs	2.5%		2.9%			
	Facebook					3.2%	6.7%
Language	English	54.1%	43.5%	62.3%	85.5%	91.8%	54.8%
	Spanish	19.0%	17.3%	2.5%		1.3%	2.0%
	Japanese	7.4%			4.6%	0.8%	31.7%
	Finnish			25.6%			
	Turkish		26.7%				
	Russian	2.6%					
	Portuguese	7.2%					6.1%

Over the longer period of time, some patterns relating to the brands are clear, others less so. As these are news brands, variations in volume are likely to be influenced heavily by current news topics as opposed to discussions directly related to the brands themselves. So we tracked volume but paid less attention to variance than in previous studies. Even so, the volume differences are interesting. The traditional general interest brands (NYT, Wapo) obviously have much more activity than the other new media brands. Buzzfeed shows particular strength vs. Mashable in volume between the two newer media brands. And international focus and readership (Economist, WSJ) don't necessarily translate into stronger relationships with readers, at least not when compared with the more locally/regionally focused media brands (NYT, Wapo) with both continuing to have a considerable presence in New York City and Washington, respectively. Brand connections and relational capital can apparently be stronger with more immediate connections than might be the case with a broader, more

international reach. The one-month and one-week results show similar patterns though the WSJ had a particularly active month (likely due to the arrest of one of its reporters in Russia, a major news story in which the brand was intimately involved).

Table 2: News Media Brands, Sentiment and Related Metrics (one month)

Metric		WSJ	Economist	NYT	Wapo	Mashable	Buzzfeed
Volume		45K	81K	1.3KK	773K	69K	255K
Sentiment		32.3%	43.4%	40.2%	33.1%	69.5%	67.2%
Influencers		98	98	98	98	96	97
Platform	Twitter	84.7%	85.3%	72.3%	92.8%	90.2%	84.3%
	Aggregators	4.8%	2.3%	2.6%	1.4%		
	YouTube	2.1%	5.7%	5.1%	2.7%	2.6%	5.6%
	Forums	4.0%	2.5%	15.9%	1.4%	3.1%	
	Blogs	2.5%		2.7%			
	Facebook						6.5%
Language	English	51.5%	60.4%	62.7%	87.1%	92.5%	53.5%
	Spanish	31.3%	15.2%	2.9%		1.5%	2.0%
	Japanese	5.9%			3.8%	1.0%	36.1%
	Finnish			25.9%			
	Turkish		7.2%				
	Russian	2.9%					
	Portuguese	0.8%					6.1%

Influencers show little difference between the media brands sampled. All have followers with considerable reach of their own. Even the slight differences in average top influencer rating (96 vs. 98) are so minimal as to be inconsequential. Once news media brands reach a certain level of awareness and credibility, top influencer attention seems to be a given. The one-month and one-week results show a similar consistency across all brands.

Sentiment is a different case. The results generally agree with previous findings that the more active, probably more valuable brands do not necessarily have the highest positive sentiments. Indeed, with media companies, the reach and popularity of the brand are almost inversely related with sentiment. The US-based mainstream media brands (WSJ, NYT, Wapo) are all *majority* negative sentiment. *The Economist* fares somewhat better. Interestingly, the newer, more digital-focused brands (Buzzfeed, Mashable) have very high positive sentiment, 50-100% higher than the legacy media brands. These show more movement in the one-month and one-week results but that points to the relative stability of the stronger brands, as predicted by previous research.

Table 3: News Media Brands, Sentiment and Related Results (one week)

Metric		WSJ	Economist	NYT	Wapo	Mashable	Buzzfeed
Volume		13K	18K	352K	226K	23K	53K
Sentiment		35.3%	40.1%	39.3%	28.5%	74.5%	58.0%
Influencers		98	97	98	98	96	95
Platform	Twitter	81.4%	84.8%	75.6%	95.1%	93.4%	84.4%
	Aggregators	6.8%	2.4%	2.4%	1.0%		
	YouTube	2.4%	5.9%	3.8%	1.5%	1.8%	
	Forums	4.0%	2.5%	14.3%	1.0%		4.3%
	Blogs	2.9%		2.5%			

Metric		WSJ	Economist	NYT	Wapo	Mashable	Buzzfeed
	Facebook					2.1%	7.3%
Language	**English**	75.3%	65.6%	65.7%	90.7%	93.9%	67.8%
	Spanish	3.8%	16.3%			0.9%	2.1%
	Japanese	5.2%		2.0%	3.6%	1.9%	19.2%
	Finnish			25.2%			
	Turkish		2.5%				
	Russian	5.2%					
	Portuguese	0.8%					5.5%

This difference points to some interesting capabilities of this methodological approach. As in previous studies, opinion is divided on the perceived strongest brands. Their advocates are strong supporters while the emotions engendered can be just as strong in the other direction (e.g. Apple vs. Samsung) and consistently voiced in digital arenas. But what's interesting about sentiment analysis is the ability to go deeper to investigate curious or interesting findings. Even a cursory review of chatter concerning *The Wall Street Journal* shows there is a troll who posts on virtually every tweet concerning the brand. The tweet is a canned reminder that the WSJ is owned by Rupert Murdoch's News Corp and therefore affiliated with Fox News. The constant comments aren't meant as complimentary. Similar granularity can be found when the sentiment results are paired with some of the other data, as we'll discuss shortly.

The platform results are also relatively consistent but have some noticeable differences. Twitter is by far the medium of choice for users engaging with all the media brands. The lowest percentage of activity on Twitter is 72.3% at the NYT while it ranges over 90% for Wapo and Mashable. And while a preference for Twitter is pretty consistent, there are noticeable other differences across the brands. For one, the newer digital brands (Mashable, Buzzfeed) are heavily dependent on social media for their engagement, with Twitter, YouTube, and Facebook taking the large majority of attention. The only exception is some presence on Forum pages by Mashable users. The more established media brands, on the other hand, show more of a presence in news aggregators and, especially in the case of the NYT, in forums (a starkly high 15.9%). That likely says something about the nature of the content appreciated by users (harder news?) that translates into a different brand perception. The popularity of digital media outlets doesn't vary much on the one-month and one-week results, even including the outliers such as the NYT forums.

The languages provide more context as to the brand's reach across borders, whether relational capital is localized or more global. Country metrics are available through the Social Studio system, but these are commonly limited as identification seems to be a challenge. Results often show 40-50% of source country to be unknown. But languages provide some similar and more comprehensive data. Language does have some of its own challenges (are Portuguese speakers from Portugal or Brazil? Spanish speakers from Europe or South/Central America?) but can be made pretty useful with a few reasonable assumptions. Here, Wapo, Mashable, and even to some degree the NYT are more heavily engaged with English speakers, suggesting more of a domestic brand value and relational capital. *The Economist*, unsurprisingly, has the highest following of non-English speakers with WSJ not too far behind. WSJ does have foreign editions, including a Japanese language one. Buzzfeed shows similar levels of engagement with Japanese speakers. As with the other indicators, these results are fairly stable across shorter time periods, even including the odd outcomes such as the popularity of the NYT in Finnish digital media.

The Social Studio methodology provides the interesting quantitative results reviewed but also has the capability to go deeper, on a qualitative level, into the data to explore anomalies. In the language results just covered, for example, there's an odd and consistent pattern of Finnish users engaging with the NYT brand. Given the size of Finland and its relative economic and political standing, it's just strange that it figures so prominently compared to numerous other countries. With Social Studio, that could be explored, looking in detail at what Finnish speakers are chatting about. Looking at the data also provide insights such as the WSJ troll commenting on almost every tweet mentioning the brand. One entre into the deeper analysis is text analysis, and that comes with the Social Studio results, as illustrated in Figures 1 and 2.

Figure 1: Wall Street Journal Word Cloud (one week)

Just from the word cloud summary, the WSJ (more traditional news media brand) seems more newsy, with serious topics such as their journalist Evan Gershkovich detained in Russia and more standard language such as reporting, media, etc. The Buzzfeed cloud (digital brand with a younger demographic) is more casual, with stories less about worldwide news events and politics and more about soft news topics like dogs, couples, food. Word usage is also more relaxed as illustrated by "pissed" and "prick". Again, the word clouds are more summaries of the deeper information found in the underlying qualitative results, but they indicate what general trends might be found there. And from a brand value/relational capital point of view, provide a better indicator of the nature of the relationship the brand has with its targeted customers. And what those customers value in the brand.

Figure 2: Buzzfeed Word Cloud (one week)

4. Conclusions

This study continues a research program aimed at better understanding relational capital and potential measurement approaches. In this case, the research focused on news media brands, with some long-standing, strong brand names and some newer digital-focused brands. The results show that we can identify organizations with stronger brands and relational capital by means of volume of digital media activity and sentiment levels.

The metrics can also shed light on more specifics of the relational capital. The nature of the customers, including location, global/local, and preferred digital media, can be discerned. More qualitative data, including major discussion key words and topics as well as oddities in the results, can be explored in more detail when questions come up in the more quantitative results. Overall, the approach yields a variety of different results and metrics. As a group they have considerable potential to add to our understanding of relational capital as a concept and as an organizational asset.

Sharing Knowledge in Multi-Generational Teams in Remote Working Conditions During the Covid-19 Pandemic

Joanna Gajda
Częstochowa University of Technology, Poland

joannagajda@vp.pl

Abstract: The economic crisis caused by the coronavirus pandemic has contributed to changing the philosophy of managing a multi-generational team. The COVID-19 pandemic is accompanied by a general atmosphere of uncertainty, which creates a sense of chaos and disorganization. Its effects are felt by numerous organizations from many industries. Entrepreneurs have the opportunity to maintain business continuity by implementing remote work. Companies are increasingly opening up to remote work, seeing many new opportunities in it that they want to actively use. Hence, there is an urgent need for companies to develop effective actions that will motivate a multi-generational team to share knowledge, strengthen its skills and competences in this area, and build commitment to ongoing work for optimal performance of permanent duties. Although it requires more effort, especially from the managerial staff, remote implementation of the duties entrusted to multi-generational teams may prove effective in achieving business goals thanks to the knowledge and experience of specialists. Team management in the covid reality has taught Polish managers that in order to stimulate people to be active in sharing knowledge, it will be crucial to show care for the needs of employees and integrate them with the goals of the organization. This approach underlies how companies manage multi-generational teams efficiently in the Covid reality and will pay off in the future. The considerations in the article were based on literature studies and the analysis of the results of surveys conducted from March to November 2022 on a group of 258 people representing all generations. The first part of the study is of a theoretical nature and discusses the factors determining the efficient sharing of knowledge in multi-generational teams in conditions of remote work forced by the epidemiological situation. The second part of the study concerns pilot studies conducted in Polish companies in order to obtain and analyze the opinions of employees regarding the conditions for sharing knowledge in the situation of remote work, which came suddenly. This article is an attempt to answer the question of whether belonging to a specific generational group has a positive effect on the transfer of knowledge during a pandemic. Obtaining a cross-sectional nature of the considerations is a contribution to further and extended research in the field of the issues raised.

Keywords: Knowledge, Knowledge sharing, Multi-generational team, Remote work, Covid-19 pandemic

1. Introduction

The COVID-19 pandemic has affected many areas of human activity, making it necessary to adapt to new environmental conditions. One of the areas where changes took place was professional work. Work could be performed remotely. Moving her from the office to her home resulted in a reduction of relations with the members of the employee team. For the effectiveness of work in remote teams, it is crucial to provide them with space to share knowledge and experience.

The analyzes presented in this study were conducted on the basis of the available literature on the subject and our own quantitative research. The chi2 statistic was used to conduct the study. The results of the conducted analyzes are presented in the further part of the article. The research tool used was a questionnaire. The questionnaire was distributed via e-mail using the CAWI technique. The analysis of the survey results was carried out from March to November 2022 on a group of 258 people representing all generations. When deciding on the selection of the research sample, the method of purposive selection was used for the sake of the participation in the study of people belonging to different generational groups, performing their professional duties remotely during the pandemic.

2. Literature Review

2.1 The Essence of Knowledge Sharing

L.C. Witherspoon, J. Bergner, C. Cockrell, D.N. Stone (2013) represent the approach according to which, in the modern knowledge-based economy, sharing it is the most important process of knowledge management. As noted by the U.W. Borgoff and R. Pareschi (1997) "knowledge that does not flow, does not grow and eventually grows old, thus becomes obsolete and useless, unlike knowledge that flows, and because it is acquired and exchanged, it generates new knowledge" . According to A. Rudawska (2013), knowledge sharing is a typical situation of cooperation in which the benefit associated with achieving the desired results is obtained depending on the actions taken by the sender of knowledge and its recipients. These activities have been included in the definition proposed by E.D. Darra and T.R. Kurtzberg (2000), according to which, during the sharing of knowledge, a learning process takes place in the recipient as a result of using the experience of

the knowledge provider. According to the suggestion of the aforementioned authors, knowledge is shared through the interaction of one individual with another, which consists in learning aimed at acquiring knowledge by the recipient of this knowledge. B. Rychta (2022) emphasizes after T.H. Davenport and L. Prusak (2000) that knowledge sharing consists in the transfer of knowledge and its dissemination on at least a two-way level, where trust becomes the basis of the relationship between people participating in this process. During this process, which is voluntary and often spontaneous, individual knowledge, previously hidden in the mind of a given person, is revealed (Pietruszka-Ortyl, 2011), and consequently results in a change in the level of knowledge and behavior of the provider and recipient of knowledge (Rychta, 2022) . I. Michalik (2019) notes after M. Morawski (2017) that in the process of knowledge sharing, which is based on interpersonal relations between employees, it is transferred based on the experience gained, skills tested in practice, personal views, and professed values.

2.2 Multi-Generational Teams and Knowledge Sharing Within an Organization - A Theoretical Perspective

Multi-generational teams are part of functioning organizations. Representatives of four generations work together in them (Mazur-Wierzbicka, 2015):

- baby boomers (born in the years 1945 - 1964) started their professional life at the turn of the 1970s and 1980s,
- generation X (born in the years 1965-1980) grew up during the economic collapse in the 1970s, and their entry into professional life took place after 1989,
- generation Y (born in the years 1981-1994, the so-called millennials) brought up in times when the Internet came into common use,
- generation Z (born after 1995, post-millennials), whose constant presence in virtual reality has led to the inability to distinguish it from the real world.

Due to the fact that the formation of their system of values, attitudes and behaviors took place in different economic and political conditions, each of these generations requires understanding the different reasons for their actions (Skowronek, 2022). Regardless of their age diversity, common goals resulting from the essence of the work of multi-generational teams should be referred to, which, having diverse knowledge and experience, should be aware of the opportunity to strengthen the organization's position on the market (Smolbik-Jęczmień, 2017). The key to successful cooperation within an age-diverse team is to create conditions and an atmosphere of partnership conducive to the exchange of knowledge and experience (Jarzębowski, 2022). In order for an organization to improve the exchange of knowledge, it is necessary to tighten intergenerational cooperation, which requires the following conditions to be met:

- “non-judgmental, openness to otherness, acceptance of the diversity of attitudes, experiences and appearance, curiosity of other people, willingness to get to know each other;
- openness to mutual listening and reciprocity learning;
- creating an atmosphere of "being together", not educating, teaching;
- breaking age stereotypes, vigilance against stereotypes and dominance;
- building a sense of commitment to each other and to the environment;
- taking care of integration, looking for common "spaces" (passions, experiences, etc.);
- full participation of every generation (Wiktorowicz, 2020)”.

In the first place, the employer should ensure that all the above conditions are met, contributing to ensuring the flow of knowledge and experience between employees of different ages. Older employees pass on the secrets of the profession, institutional memory, company traditions to the younger ones, while the young ones pass on new theoretical knowledge and skills related to new technologies (Midor, Zasadzień and Szczęśniak, 2015)

2.3 Remote Work in The Context of the Covid-19 Pandemic

In the era of the covid-19 pandemic, companies faced the challenge of reorganizing their everyday life and adapting to the current situation. Remote work has turned out to be a new reality for many employers and employees, in which they have to learn to function. As it soon turned out, this is not only a technical challenge, but also a relational one (Prasołek and Kiełbratowska, 2021).

In the literature on the subject, remote work is defined as work performed at any distance from the place where its effects are expected or where it would be performed under the traditional employment system, using available IT and telecommunications techniques. Its main attribute is that the employer receives results

specific work, and the worker - beyond the gain of time and funds to travel to the company's headquarters - it has a certain contact of combining work with other activities and needs (Wiśniewski, 2014). Although the positive effects of remote work are noticeable, communication and effective the ability to manage a team of employees in the context of their effective knowledge sharing (Dojwa-Turczyńska, 2021).

In a situation of a pandemic threatening the lives of people all over the world, it was possible to work remotely under the so-called the covid law of March 2, 2020. The time of spreading the pandemic allowed employees to take a stance on this work organization model. Article 3(4) of the Act of March 2, 2020 details the employer's obligation to provide subordinates with the tools and materials necessary to perform remote work (Journal of Laws 2020, item 374).

3. Methodology

Since March 20, 2020, a state of epidemic has been in force in Poland due to the outbreak of COVID-19. This situation has contributed to a change in the way work is performed. The aim of the conducted research is to show how the COVID-19 influenced the sharing of knowledge among people from different generations working remotely. The answers provided by the respondents were analyzed in terms of belonging to a generational group.

Respondents from all over Poland took part in the survey. The characteristics of the research sample are presented in Table 1.

Table 1: Characteristics of the Research Sample

Generation	Women	Men	N = 258
Baby boomers	11	7	18
X	23	11	34
Y	57	39	96
Z	84	26	110
Total	175	83	

Source: Own research

For the given research sample, the $\chi 2$ test of independence was performed. On its basis, it was assessed whether the nature of the answer to the question asked depends on the respondent's belonging to the young generation (Y and Z) or the older generation, referred to as the Baby Boomers generation and Generation X. The null hypothesis (H0) assumes that belonging to a given generation does not affect the answer , while the alternative hypothesis (H1) indicates that the answer depends on belonging to the selected generation. The test was carried out for the significance level $\alpha=0.05$.

For the purposes of the conducted research, the following research hypotheses were formulated and verified:

H1: Employees of older generations experienced more incentives to share knowledge while working remotely in the covid reality compared to employees of other generations.

H2: With age, employees feel barriers to the exchange of knowledge and experience when working remotely in the covid reality.

4. Results

To verify the research hypotheses, correlations between the following were developed and analyzed:

- *activities of the management staff encouraging employees to exchange knowledge in remote working conditions in the pandemic reality, and belonging to a generational group.*
- *barriers to the exchange of knowledge among employees of different generations during remote work, and belonging to a generational group.*

Encouraging employees of different generations to actively participate in knowledge sharing is a basic condition ensuring the effectiveness of this process within the organization. The results obtained are presented in Table 2 below. The results presented in it show that there is no statistically significant correlation between the analyzed variables and inform that this research hypothesis is false.

Table 2: Management Activities Encouraging Employees to Share Knowledge in Remote Working Conditions During Covid-19

Specification	Baby boomers	X	Y	Z	ch2 critical= 16.919 chi2 stat = 3.69	df= 9 a = 0.05	Hypothesis
equipping employees with equipment enabling the transmission of information and online communication	77,7%	91,1%	92,7%	88,1%	0.71	0.05	H0
holding regular online team meetings	61,1%	58,8%	84,3%	80%	0.71	0.05	H0
Allowing employees to have non-work-related conversations at allotted times	44,4%	38,2%	36,4%	43,6%	1.46	0.05	H0
virtual meetings over coffee after work	66,6%	76,4%	95,8%	92,7%	0.81	0.05	H0

Source: Own research

The analysis of the research results leads to the conclusion that employees belonging to each of the generational groups experienced a high degree of incentives from the management to share knowledge while working remotely. This tendency clearly indicates the trust shown to subordinates and the perception by superiors of the benefits resulting from the exchange of experiences between employees "from different eras". By equipping employees with communication equipment, the management staff clearly focuses their attention on enabling them to cooperate for the efficient flow of information, because it is conducive to achieving the set goals. Respondents belonging in particular to the Y and Z generations point to the initiative of virtual meetings over coffee after work for a reason. This type of activity may be important enough to strengthen relations between employees and trigger greater motivation in them to share knowledge and experiences. As the vast majority of employees of the Y and Z generations have noticed, employers promote online team meetings, organized with the aim of regularly sharing valuable knowledge with each other, allowing the company to stand out from its environment, and thus enable efficient functioning in the covid reality. In last place were activities related to the consent of superiors to conduct conversations not related to work at the appointed time. The lower popularity of this type of incentives to exchange knowledge may result from the fear that the time spent during working hours on conversations not related to work may be wasted time.

The results presented in Table 3 show that there is a statistically significant correlation between difficulties in sharing knowledge and belonging to a generational group. Hypothesis 2 was confirmed.

Table 3: Barriers to knowledge Exchange Among Employees of Different Generations in Remote Working Conditions During Covid-19

Specification	Baby Boomers	X	Y	Z	chi2 critical= 21,026 chi2 stat = 34.62	df= 12 a=0,05	Hypothesis
resistance to the use of modern methods of remote communication	61,1%	26,4%	7,29%	3,63%	10.31	0.05	H1

Specification	Baby Boomers	X	Y	Z	chi2 critical= 21,026 chi2 stat = 34.62	df= 12 a=0,05	Hypothesis
no direct communication	64,7%	70,5%	40,6%	41,8%	2.46	0.05	H1
risk of loss of data and confidential information	33,3%	8,82%	1,04%	41,8%	11.58	0.05	H1
distractions - activities of other family members	44,4%	17,6%	13,54%	3,63%	5.5	0.05	H1
poor quality of the Internet connection and network equipment making it difficult to exchange files and transfer information	83,3%	61,7%	30,2%	42,7%	4.77	0.05	H1

Source: Own research

Based on the conducted χ2 test, it can be indicated that there are personal barriers of employees and independent of them, which make it difficult for them to share knowledge with each other during remote work. The older the employees, the more often they feel reluctance to share knowledge due to the lack of skills in using modern methods of remote communication - BB (61.1%), X (26.4%). Employees of the BB (64.7%) and X (70.5%) generations, due to the inability to establish a face-to-face conversation, more often than younger employees see difficulties in establishing contact via the Internet in order to share knowledge with other people. Mainly employees from the BB group (33.3%) and Z group (41.8%) perceive conversations via messengers as an obstacle to the exchange of knowledge due to the risk of losing confidential information. The older generation of employees (BB - 44.4%, X-17.6%) are reluctant to share their knowledge with other people at work when family members are in their company. From the perspective of employees of all generations, those who use their own Internet equipment, its inefficient operation made it difficult to quickly exchange information with other members of the organization.

5. Discussion

The conducted research leads to the conclusion that working remotely was conducive to sharing knowledge in the covid situation, but not to a sufficient extent. The managerial staff should encourage employees to share knowledge through the use of instant messengers for online communication for the intergenerational exchange of knowledge. The essence of this aspect is pointed out by K. Kirchner, Ch. Ipsen, A. R. Andersen (2023), who believe that they can effectively communicate with employees. Digital tools turn out to be useful for organizing and conducting online meetings that enable frequent remote contact with employees, conducting discussions conducive to generating many new ideas facilitating the exchange of information. The opinions of the quoted authors are confirmed in this study, which shows that a significant percentage of respondents who have been equipped with equipment enabling them to communicate online with other team members send them important information showing what they are currently working on; share files to gain knowledge about the progress of tasks. It can be assumed, as indicated by this research, that Polish managers attach great importance in their online work to organizing regular team meetings that foster the ongoing exchange of information and working out joint actions in the context of bothering problems and important matters. Kirchner and N. Forsberg (2021) came to similar conclusions in the presented context, placing a strong emphasis on creating an alternative to the real environment, which can be a virtual space for knowledge exchange. It can be a good way to promote spontaneous cooperation in which employees willingly share their knowledge and share experiences. Management aware of its role in the knowledge exchange process should not forget to encourage employees to participate in virtual meetings over coffee. Being able to talk to each other freely during informal meetings will help to strengthen bonds in the team. The freedom to be together

and talk about everything would avoid many of the barriers to sharing knowledge that the participants of this study encountered. As emphasized by M. A. Rafique, Y. Hou and co-authors (2022), despite the fact that modern technologies have an impact on improving work efficiency, they must face some challenges, such as communication barriers. Remote work involves isolating employees. As a result of the lack of direct face-to-face contact, superiors may not see the problems faced by their subordinates, such as lack of motivation to share knowledge and low involvement in this process.

Referring to the aforementioned research by K. Kirchner, Ch. Ipsen, A. R. Andersen, it is worth noting here that due to the mandatory home isolation caused by the pandemic, employees experienced a lack of spontaneous interactions with their colleagues, which in turn contributed to the emergence of many problems related to the transfer of knowledge. The quoted authors observed that in the face of the pandemic situation, employees are less likely to focus on transferring their knowledge to others, thus closing the way for themselves and others to gain this knowledge.

Difficulties related to the exchange of information also result from the reluctance to use modern methods of remote communication. In order to prevent this, superiors should engage subordinates to cooperate on-line on the implementation of the tasks entrusted to them, in order to overcome resistance to the exchange of knowledge and active discussion. A. Jeran (2016) draws attention to an important area of remote work effectiveness that concerns technical issues. This aspect of remote work was also reflected in this research. For the dissemination of knowledge, “quality, reliability are extremely important and bandwidth of used connections (e.g. broadband Internet), as well protection of sensitive company data. The above factors were the reason for the difficulties faced by the respondents, regardless of their age, in the knowledge exchange process. Technical problems, such as: low quality of the Internet connection and network equipment constituted a barrier to the exchange of knowledge, and even an increased risk of data and confidential information loss.

To sum up, remote work should be performed in social and organizational conditions that minimize the feeling of uncertainty and social isolation. To this end, space should be created for the exchange of knowledge and experience in virtual teams performing remote work in order to counteract the feeling of social isolation and the lack of support in the implementation of this process.

6. Conclusions

The first part of the study made it possible to determine, from the employee's perspective, the type of actions taken by the management towards subordinates belonging to different generational groups to encourage them to share knowledge in remote working conditions during Covid-19. The results show that belonging to a generational group is negatively correlated with the activities of the management staff. This means that regardless of the age of the employees, the superior takes specific actions to encourage subordinates to be active in the field of knowledge sharing. The summary of the research results gives the opportunity to identify those activities that are conditioned by the form of employment that appeared in the regulations in 2020 - remote work. As a result of the pandemic, many companies have moved their activities online. Therefore, the employees were equipped with equipment enabling the transfer of information and online communication. Despite the lack of face-to-face contact, it is worth taking care of strengthening the bonds between employees. For this purpose, superiors regularly organize team meetings on-line, encouraging them to share information in the context of what is currently happening in the company. In addition, some companies allow employees to have non-work-related conversations at certain times. What's more, employee teams conduct conversations and share information during virtual meetings over coffee after work. This may indicate that they make a well-coordinated team. Although for some remote work has become a convenient form of employment, for others it turned out to be a challenge. The results from the second part of the study show that belonging to a generational group is positively correlated with the barriers that employees experience in the context of knowledge exchange during remote work. The hypothesis was confirmed that with age, employees experience difficulties in sharing knowledge and their experiences while performing their professional duties remotely in the difficult covid reality. The main barriers include: poor quality of the Internet connection and network equipment, which make it difficult to exchange files and transfer information; no direct communication; resistance to the use of modern methods of remote communication; activity of other family members, distracting attention during the exchange of knowledge; fear of losing data and confidential information.

The conclusions of this research provide feedback to the staff responsible for managing employees of different generations that employees notice their actions to share knowledge. Moreover, the analysis of barriers to the

exchange of information and sharing one's own experience with others should contribute to the search for and indication by employers of ways to reduce them.

A Panel Regression Analysis of the Role of Globalization and Internet Penetration on Economic Development in the Czech Republic and Slovakia

Mohammed Ibrahim Gariba and Romana Provazníková
Institute of Economic Sciences, Faculty of Economics and Administration, University of Pardubice, Czech Republic.

Garibaibrahimbabangida@gmail.com
romana.provaznikova@upce.cz

Abstract: It is evidently clear that globalization is seen widely in recent times as a means of knowledge-based economy, and more importantly, an instrumental indicator to influence economic development. For this reason, some researchers are increasingly interested in how globalization impacts our society leading to economic growth. In this paper, we investigate the relationship between globalization, internet penetration, and economic development in Czech Republic and Slovakia. Panel Regression analysis is employed to analyze a twenty two-year panel data (from 2000 to 2022), using secondary data from the World Bank, OECD, and UNDP database of the selected countries. We analyze globalization variables such as trade openness, internet penetration as independent variables and used infrastructural investment, political instability index, and labor force participation rate as control variables. Also, with economic development as a dependent variable, we used Human development index, and GNI per capita to ascertain the effect of globalization and internet penetration on economic development. The results showed a significant positive correlation between trade openness with HDI and GNI in both Czech and Slovakia. The analysis also found that internet penetration has a significant impact on HDI and GNI in Czech, but not on GNI in Slovakia. This study highlights the important role that globalization and internet penetration play in economic development and provides valuable insights for policymakers in Czech and Slovakia. The findings of this study contribute to the existing literature on the relationship between globalization, internet penetration, and economic development.

Keywords: Globalization, Internet, Economic development, Knowledge, Regression analysis

1. Introduction

The integration of nations through globalization and the development of digital technologies have resulted in significant changes in the world economy (Malik, 2018). Countries have been seeking to participate more in the global economy to improve their economic development. Trade, capital flows, and technological advancements have provided new opportunities for economic growth and development. The internet has revolutionized how businesses operate, allowing individuals and firms to engage in global trade and exchange information (Kagermann, 2014). The Czech Republic and Slovakia, both former socialist countries, faced challenges during their transition to a market-oriented economy, including high unemployment rates, inflation, and political instability (Leff, 2018). However, both countries have made considerable progress in recent years, and their economies have been growing steadily.

Globalization refers to the integration of economies, societies, and cultures through trade, communication, and the exchange of goods and services (Marginson, 1999). With the advent of the internet, the process of globalization has accelerated, making it easier for countries to engage in international trade and collaborate on various projects. The Czech Republic and Slovakia have taken advantage of the opportunities offered by globalization and the internet to achieve significant economic growth (Carayannis & Popescu, 2005).

Internet penetration refers to the extent to which a country's population has access to and uses the internet (Brandtzæg, et al., 2011). The internet has transformed the way people interact, communicate, and access information, and has also had a profound impact on businesses and the economy. The Czech Republic and Slovakia have experienced a rapid increase in internet penetration in recent years, with both countries according to the world bank data ranking for 2021 showing 89% for Slovakia and 83% for Czechia and these figures are amongst the highest levels of internet usage in Europe. Bayar et al. (2021) in their research on the effect of internet usage on financial inclusion in 11 countries of European Union using data between 1996 to 2017 in a causality analysis. Found that internet usage poses both negative and positive effect on financial inclusion. The researchers indicate limitation of the study to sample size and data availability. This research responds to the call for future research to explore further the recent trend analysis using current data.

Moreover, research exploring the role of Information communication technology and globalization play on economic development in Organization for economic cooperation and development countries through the

ordinary least square analysis found that, ICT and globalization positively contribute to economic growth. The weakness of this study is the reliance on OECD countries without recourse to a comparative analysis (Kurniawati, 2020). By way of filling the gap, the current study employs a comparative analysis for the selected CEE countries. Myovella, et al. (2020) in their paper examined the contribution of digitalization to economic growth of Sub-Saharan Africa (SSA) in comparison with the OECD economies. The results show that digitalization has a positive contribution to economic growth in both countries. The limitation of the data on digital transformation restricts the studies to only use ICT usage. The need to explore more Digital transformation variables was highly recommended of which this study employs.

As elaborated, most of the studies have concentrated on just Globalization impact on economic development and most often relied on a measure for digitalization using ICT or the effect of globalization on economic development. However, the question of whether the knowledge of globalization (Trade openness) and internet penetration affect economic development in a model remains unanswered. To address the above-mentioned gap, *we aim to examine the role of globalization and internet penetration on economic development in the Czech Republic and Slovakia.* By using composite variables which were calculated from different set of factors based on a secondary data set. Specifically, we examine the impact of a key globalization variable: trade openness and internet penetration on economic development. We also use infrastructural investment, political instability index, and labour force participation rate as control variables. Economic development is measured through two indicators: the Human Development Index (HDI) and Gross National Income (GNI) per capita.

To the best of our knowledge, less to no study explores the link between knowledge of Globalization and internet penetration and economic development in Czech Republic and Slovakia. This study will give policy experts and the EU some implications to support and improve the ways in which globalization and digital technologies can contribute to economic development. We contribute to science by adding empirical and practical recommendations based on our review of the existing literature and econometric analysis.

The rest of the paper is organized as follows. The next section provides a brief review of the existing theories and literature to distinguish our paper from existing studies and help explain the contribution of our paper. In Section 3, we briefly describe our methodology and data sources. Section 4 outlines the empirical findings and In Section 5, we present Discussions and the conclusions and recommendations presented in chapter 6.

2. Theoretical Background and Literature Review

The theoretical background of this research topic, "The Role of Globalization and Internet Penetration on Economic Development" delves into the understanding of globalization and the internet, and their impact on economic development (Marginson, 1999; Brandtzæg, et al., 2011). The study of globalization and its impact on economic development has been a topic of interest for many economists (Gurgul & Lach, 2014). Some have argued that globalization has led to increased economic growth and development (Ali & Malik, 2021; Boriçi, 2016; Brown, & Lauder, 1996), while others have argued that it has led to increased inequality and destabilization (Milner, 2021; Sachs, 1998). In the context of this research, the focus will be on the relationship between globalization and internet penetration and their impact on economic development.

One of the key theoretical frameworks used to understand the impact of globalization on economic development is the New Economic Geography (NEG) theory. According to this theory, globalization leads to the concentration of economic activity in certain regions (Fujita, et al., 2001; Martin & Sunley, 1996). The theory suggests that globalization leads to increased competition, which leads to a reallocation of economic activity to regions that have a competitive advantage.

The impact of the internet on economic development has also been studied (Czernich, et al., 2011; Koutroumpis, 2009). The internet has been identified as a key driver of economic development, with many countries investing in internet infrastructure and technology to enhance their competitiveness (Salahuddin & Gow, 2016). Internet penetration has also been seen as a tool for reducing information asymmetries, leading to increased efficiency and productivity (Aboody & Lev, 2000).

In the context of the Czech Republic and Slovakia, this study is particularly relevant for both countries as they have undergone significant economic transformation since the fall of the Soviet Union, with both countries becoming integrated into the global economy and investing in internet technology (Roztocki & Roland Weistroffer, 2008).

2.1 The Role of Trade Openness and Economic Development

In this chapter, we reviewed the trade theory of factor proportions. According to this theory, countries will tend to specialize in producing goods that use their abundant factors of production relatively intensively, while importing goods that use their scarce factors relatively intensively (Samuelson, 1948). This suggest that openness to trade may also be related to the intensity of capital and knowledge, which are both important production factors (Agénor, 2004). This is consistent with the idea that trade involve the exchange of not just final goods, but also the production factors used to create those goods (Faeth, 2009). literature on Trade openness and economic development has grown significantly in recent years (Xu, et al., 2021). Researchers have been examining the impact of trade openness as a measure of globalization and other factors on economic development (Munir & Ameer, 2018; Silajdzic & Mehic, 2018; Tahir, et al., 2014). Studies on this topic have consistently shown that increased trade openness is either positively or negatively correlated with higher levels of economic growth. On the one hand, Hye & Lau (2015) in a study of trade openness and economic development in India, used an auto regressive analysis and the results reveals that, trade openness in a short run is found to be positively related to economic development. Researchers explored the link between trade openness and human development index and the findings reveal that, trade openness is positively related with human development index (Hamid & Amin, 2013). This relationship has been found to be particularly strong in developing cities, where trade openness is a critical factor for economic development. Yakubu & Akanegbu (2018) in their study of trade openness and economic growth found that trade openness significantly influences per capita income.

On the other hand, some studies have found a negative influence between trade openness and economic development. For example, Wang, et al. (2018) found that, improved openness in trade influences human development negatively. Silajdzic & Mehic (2018) in their research contend that trade openness may not necessarily lead to positive economic outcomes, particularly in less advanced transition economies like the CEE countries. Similarly, Atici (2009) in the research of CEE countries found that, trade openness is negatively related to human development. For our study, we will explore two measures of economic development: Gross national income and human development index. Based on the above existing literature, we hypothesize that:

> *H_1: Trade openness significantly affects the Human development and Gross national income per capita in Czech and Slovakia.*

2.2 Internet Penetration and Economic Development

The Internet has become a crucial component of modern society, with the number of devices connected to it growing rapidly. The Internet of Things has emerged as a significant trend in the digital transformation of businesses and the economy in recent years (Chan, 2020). The portion of the population with access to the Internet is measured by Internet penetration. The higher the Internet penetration, the greater the potential for people to access and share knowledge, thereby enabling new ways of doing business. In this context, trade openness can be compared with Internet penetration to see how traditional economies relate to the "new" economy (Guillén, & Suárez, 2005). high levels of Internet penetration can lead to increased access to knowledge. Thus, as traditional economies transition to the "new" economy, higher levels of both trade openness and Internet penetration could potentially drive economic growth (Urban, Oosthuizen & Chen, 2022). In terms of internet penetration, research has shown that higher levels of internet access are positively correlated with higher levels of economic growth and development. This relationship has been observed across different countries and regions (Billon, et al., 2018).

Several studies have examined the relationship between internet penetration and economic development in different countries and regions. A study by Qiang and Rossotto (2009) found a positive relationship between internet penetration and economic growth in developing countries. The study argued that the internet has the potential to increase productivity, enhance innovation, and facilitate trade, all of which can contribute to economic growth and development. a study by Salahuddin & Gow (2016) examined the impact of the internet on economic growth and development. The study found that internet penetration has a positive and significant effect on economic growth and development, as measured by GNI per capita. The study argued that the internet provides access to information and enhances communication, which can lead to increased productivity, innovation, and competitiveness.

Another study by Czernich et al. (2011) analysed the impact of broadband internet on economic growth and development in OECD countries. The study found that broadband internet has a positive and significant effect on economic growth and development, as measured by HDI and GNI per capita. The study argued that

broadband internet can enhance productivity, increase innovation, and facilitate access to markets, all of which can contribute to economic growth and development.

In contrast, a study by Amaluddin (2020) found a mixed relationship between internet penetration and economic growth in African countries. The study argued that while the internet has the potential to increase productivity and facilitate access to markets, it can also lead to increased inequality and social fragmentation, which can negatively affect economic growth and development. Bahrini & Qaffas (2019) found a negative relationship between internet penetration and economic growth. Based on the literature review, we propose the hypothesis that:

> ***H_2:*** *Internet penetration significantly affects the Human Development and Gross national income per capita in Czech and Slovakia*

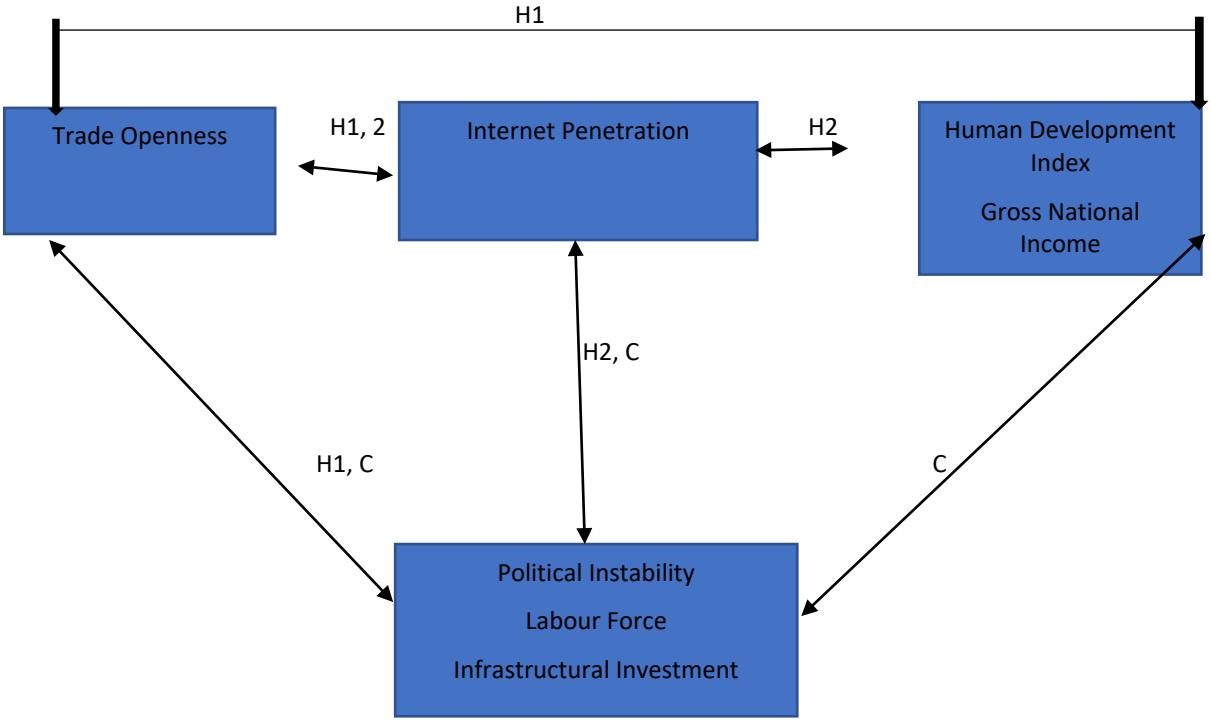

Figure 1: Conceptual Framework

The above figure 1 shows the depicted conceptual framework of the analysis on possible patterns of the causal relationship between globalization and Internet penetration contributions to improving economic growth within Czech and Slovakia. Based on the reviewed literature, the following hypotheses have been formulated.

> *H_1: Trade openness significantly affects the Human development and Gross national income per capita in Czech and Slovakia*

> ***H_2:*** *Internet penetration significantly affects the Human Development and Gross national income per capita in Czech and Slovakia*

3. Data and Methodology

3.1 Research Design

The main objective of this research is to ascertain whether knowledge of globalization and internet penetration contribute to economic development in the Czech Republic and Slovakia. We relied on quantitative research design in conducting this research using the panel regression modelling (Martinez-Vázquez, Lago-Peñas and Sacchi, 2017) in accordance with Montgomery et al. (2012), the panel regression analysis is adopted to have accurate and robust results when dealing with both dependent and independent data that are linear in nature.

3.2 Data Collection and Description

Empirical analysis is based on a panel dataset from the United nation's development program, World bank and the organization for economic cooperation and development. The research uses UNDP website for data

collection purpose on Human development index. OECD data on Gross national income per capita, trade openness, internet penetration, infrastructural investment, and labour force participation rate. World bank data on the political instability index was resorted to (Tang et al., 2019). We adopted the data and methodology initiated by Czernich et al. (2011). We used pooled data sets spanning twenty-two calendar years, specifically 2000 to 2022, and a sample of two countries as is the case of (Krishnan and Lymm, 2016). The sample used for the empirical model specification consisted of the Czech Republic and Slovakia. the reason being that these economies are in transition to the open capitalist market system, and with their historical connections, as well as poor recent performance score from the globalization ranking. The analysis realized twenty numbers of observations. The table below shows the variables used for the empirical, analysis.

Table 1: Descriptive Statistics of Variables

Variables	Description	Sources
Human Development Index (HDI) **(Dependent)**	The HDI is a composite measure that takes into account factors such as income, education, and health, to provide a comprehensive assessment of human well-being.	UNDP, 2022
Gross National Income per capita (Dependent)	GNI per capita is the average income per person in a country and is used as an indicator of standard of living	OECD (2023)
Explanatory variables		
Trade openness	It is defined as the sum of exports and imports divided by the GDP at current prices.	OECD (2023), Feenstra, et al. (2015)
Internet penetration rate	This measures the percentage of the population that has access to the internet	OECD (2023)
control		
Infrastructure investment	This indicator is measured as a share of GDP for total inland investment and in euros for the road, rail, air, inland waterways and sea components.	OECD (2023)
Political Instability	Measures Perceptions of the likelihood of political stability/ political motivated violence, including terrorism.	world bank. (2023); Tang et al., (2019).
Labor force participation rate	measure of the proportion of a country's working-age population employed or actively seeking employment	OECD (2023)

Source: Author's own adaptation

Mathematically, the Panel regression model is defined as:

$$y = \beta o + \beta ix + \varepsilon i \quad (1)$$

Where:

'Y' = dependent variable, i.e., control of corruption and corruption perception index

'βo'= dependent variable value, that is, the y intercept

'βi'= slope coefficient of each of the explanatory variables.

'x' = represents the value of the independent variable or the input variable

'εi'= represents the error term.

We use the pooled panel data in a panel regression model to examine variations in economic development contributions based on changes in predictor variables. The model assumes that the dependent variables are a function of the independent variables, and the error term is not normally distributed and is indicated by (εi). Hence, a nonlinear relation and function of these associations are mathematically given as follows for each of the models:

$$HDIy = \beta oHDI + \beta iGNI.C + \beta 2internetpent + infr.\ investment\ .invest + pol.inst + labour\ force + \varepsilon i \quad (2)$$

GNI.Cy= βoGNI.C+ β2internetpent+infr. investment .invest + pol.inst +labour force + εi (3)

3.3 Model Fit

We measured model fitness using collinearity analysis. We used the Variance Inflation Factor (VIF) for this purpose. The model showed the highest value of 5 which indicates no multicollinearity issues among the variables, with all variables showing less than value ten as opined by (Hair et al., 2017). Our analysis also shows that about 72% and 83% of the variance is explained in both models based on the R-squared figure.

4. Results and Findings

As stated above, the predictive accuracies power of our analysis shown in Table 2 are 72% and 83%, respectively using the Cohen's R-squared, for the models. These accuracies in our model explained can be said to be substantial and robust (Cohen, 2013). This study investigates how knowledge of globalization contributes to increasing economic development of the Czech Republic and Slovakia. We first analyze empirically the impact of globalization thus trade openness and internet penetration against HDI and GNI per capita to ascertain the nature of the relationship and the effect it has on economic development within the Czech Republic and Slovakia.

The results of the impact of each of the measures of globalization on economic development are shown and presented in Table 2. We evaluate the hypothesis 1 that *Trade openness significantly affects the Human development and Gross national income per capita in Czech and Slovakia*. The statistical results suggest that there is a significant relationship between trade openness and both Human Development Index (HDI) and Gross National Income (GNI) per capita as measures of economic development in Czech Republic and Slovakia. Specifically, the results show that trade openness has a positive and significant effect on both HDI and GNI per capita in both countries at a 99% and 95% confidence interval. In Czech Republic, the coefficient is high at 0.12, indicating that the relationship between trade openness and economic development is strong. In Slovakia, the coefficient is also significant at 95% and 99%, with a coefficient of 2 and 4 respectively, suggesting that the impact of trade openness on economic development is substantial in this country as well. Overall, these results support the hypothesis that trade openness significantly affects economic development in both Czech Republic and Slovakia.

Subsequently, we also tested for hypothesis 2, by testing the preposition that *Internet penetration significantly affects the Human Development and Gross national income per capita*.our study found that there is a significant positive relationship between internet penetration and both HDI and GNI per capita in the Czech Republic. This relationship is significant at a 99% confidence interval, indicating a high level of confidence in the results. The coefficient of 5 for HDI and 3 for GNI per capita in the Czech Republic suggests that for every unit increase in internet penetration, there is a corresponding increase in HDI and GNI per capita. In Slovakia, the study found that internet penetration is significantly related to HDI at a 90% confidence interval with a coefficient of 2. This suggests that for every unit increase in internet penetration, there is a corresponding increase in HDI. However, the study did not find a significant relationship between internet penetration and GNI per capita in Slovakia. Overall, the results support the hypothesis that internet penetration significantly affects human development and gross national income per capita, but the relationship may vary across countries.

To reduce the level of bias in our empirical results, we controlled for economic development using labour force participation, political instability, and infrastructure investment. In the absence of bias, our control variables showed both positive and negative coupled with high and medium significance in modules one and two. Within all models, the control variables helped to ascertain the clear effect of the explanatory variables.

5. Discussion

The results of the study suggest that both trade openness and internet penetration are significant predictors of economic development in the Czech Republic and Slovakia. The results of the study confirmed the hypothesis that trade openness significantly affects both the human development index (HDI) and gross national income per capita (GNI) in both countries. This suggests that the more open the countries are to trade, the more likely they are to experience economic growth and development (Keho, 2017). This result is grounded in the new economic geography theory as expressed by Martin & Sunley (1996) who contend that, globalization leads to increased competition and reallocation of economic activity to regions that have a competitive advantage. Our findings also compliment the trade theory, which contend that countries will tend to specialize in producing goods that use their abundant factors of production relatively intensively, while importing goods that use their scarce factors relatively intensively (Samuelson, 1948). This suggest that openness to trade may also be related to the intensity of capital and knowledge, which are both important production factors (Agénor, 2004). Our results Is again consistent with previous studies that have highlighted the importance of trade openness in promoting economic development like Munir & Ameer (2018). Hye & Lau (2015) in a study of trade openness and economic development revealed that, trade openness in a short run is found to be positively related to economic development.

This study also found that internet penetration is a significant predictor of economic development in the Czech Republic and Slovakia. The results showed that internet penetration is significantly related to the HDI and GNI in the Czech Republic. Not only thus these results affirm our hypothesis two, but the significant effect also corroborates previous findings by Qiang and Rossotto (2009) whose study found a positive relationship between internet penetration and economic growth in developing countries. They argued that the internet has the potential to increase productivity and facilitate trade, all of which can contribute to economic development. Likewise, Salahuddin & Gow (2016) examined the impact of the internet on economic growth and development. The study found that internet penetration has a positive and significant effect on GNI per capita. The study argued that the internet provides access to information and enhances communication, which leads to increased productivity and competitiveness. In the case of the Czech Republic, the high coefficient for both trade openness and internet penetration indicates that these variables have a strong positive impact on economic development in the country.

In the case of Slovakia, the results are somewhat mixed. While the coefficient for trade openness is significant and relatively high, the coefficient for internet penetration is only significant with the HDI and not the GNI. This suggests that while internet access is important for promoting human development in Slovakia, it may not have as much of an impact on gross national income per capita. Even though this is not consistent with our expectations, it supports the position of Amaluddin (2020) whose research found a mixed relationship between internet penetration and economic growth. The study argued that while the internet has the potential to increase productivity and facilitate access to markets, it can also lead to increased inequality, which can negatively affect economic growth and development.

The findings of this research recommend some practical implications for policymakers and business owners in Czech and Slovakia. Governments in both the Czech Republic and Slovakia could focus on increasing trade openness through measures such as reducing trade barriers and tariffs, increasing international trade agreements, and encouraging foreign investment (Abrego, et al., 2019). This could potentially lead to higher levels of economic development as measured by HDI and GNI per capita. Both countries could focus on investing in internet infrastructure, such as expanding broadband coverage and improving internet speeds (Hambly & Rajabiun, 2021). This could help to improve internet penetration rates, which were found to be a significant predictor of economic development in the Czech Republic and to some extent in Slovakia. These practical implications could help policymakers and governments in both the Czech Republic and Slovakia to promote economic development and improve the well-being of their citizens.

This study however has some limitation, the variables and number of countries studied are limited. Hence, results cannot be generalized.

6. Conclusion

In conclusion, the results of this study highlight the importance of both trade openness and internet penetration in promoting economic development in the Czech Republic and Slovakia. The findings suggest that policies that promote trade and internet access are likely to be effective in promoting economic growth and development in these countries. However, the study also indicates that the impact of these variables may vary depending on the specific indicator used to measure economic development. While trade openness appears to have a strong impact on both the HDI and GNI in both countries, the impact of internet penetration is more closely related to the HDI in Slovakia.

Future research can expand on this study by examining the impact of other variables such as political stability, investment in education, and the effects of regional disparities on economic development in Czech and Slovakia. Additionally, studies that compare the effects of trade openness and internet penetration on economic development across multiple countries can provide insights on how to improve economic development in different regions.

Green Knowledge Management and Innovation for Sustainable Development: A Comprehensive Framework

Maryam Ghorbani
Isfahan University of Technology, Iran

ghorbanimaryam091@gmail.com

Abstract: This paper explores the concept of Green Knowledge Management (GKM) and its relationship with sustainable development and green innovation. A comprehensive review of relevant literature was conducted to gain a better understanding of the components of GKM. Based on this review, a conceptual framework was proposed to outline the intricate interrelationships between GKM, green innovation, sustainable development, organizational green culture, consumer resistance, pro-environmental behaviour, and environmental knowledge. The proposed framework stresses the significance of managing green knowledge effectively to attain sustainable development goals through green innovation. It also highlights the importance of promoting an environmentally friendly culture within the organization to strengthen the link between green knowledge management, green innovation, and sustainable development. Furthermore, the framework acknowledges the potential resistance of consumers towards adopting green innovation products. To overcome this challenge, companies must provide adequate environmental knowledge and encourage pro-environmental behaviour among consumers. This will enable companies to manage their green knowledge effectively and promote sustainable development through green innovation. In conclusion, GKM is a crucial factor in developing green innovation and achieving sustainable development. Organizational green culture plays a significant role in strengthening the bond between GKM and sustainable development. The proposed conceptual framework provides a clear understanding of the complex relationships between green knowledge management, green culture, sustainable development, consumer resistance, pro-environmental behaviour, and environmental knowledge. It underscores the importance of managing green knowledge and fostering an environmentally friendly culture within organizations to achieve sustainable development goals through green innovation. This paper's findings have significant implications for companies that seek to promote sustainable development through green innovation. By effectively managing their green knowledge, companies can develop innovative solutions that address environmental challenges while achieving sustainable growth. Furthermore, by promoting an environmentally friendly culture, companies can ensure that their employees and customers embrace sustainability as a core value, leading to a more sustainable future for all.

Keywords: Green knowledge management, Green innovation, Sustainable development, Consumer resistance, Environmental knowledge, Conceptual framework, Organizational green culture, Pro-environmental behaviour

1. Introduction

The topic of knowledge management (KM) has been a topic of considerable discourse in both academic and business circles for many years. Organizations have come to recognize the importance of effective knowledge management in improving performance and competitiveness. However, with the growing emphasis on sustainability, there is a pressing need to integrate sustainable development principles into KM practices.

This paper reviews the literature on topics related to KM and sustainability, such as green knowledge management and the environmental, economic, and social aspects of sustainable development. It also covers green innovation and provides a framework that integrates all these concepts.

1.1 Knowledge Management

According to Qinghua Fu et al (2022), knowledge is an intangible and abstract asset that plays a crucial role in the effective functioning of companies. In today's dynamic business environment, companies that can successfully manage the knowledge inherent in their operations are believed to have a competitive advantage over others. Kumari et al (2021), and Aamir et al (2021) suggest that failure to do so can lead to failure. “Additionally, knowledge has transformed the traditional approach to the competition, especially in industrialized economies where natural resources were once considered the primary asset and have been replaced by intellectual property” (Pan et al, 2022). Chamba-Rueda et al (2021) and Abbas et al (2022) claim that this is why many researchers identify the current period as the age of knowledge management (KM). To conclude, effective knowledge management is crucial for companies to succeed in today's business environment, where intellectual property is the primary asset in industrialized economies.

1.2 Green Knowledge Management

“Green Knowledge Management (GKM) is a novel approach to knowledge management that strives to incorporate environmental concerns into all aspects of knowledge management. A company's commitment to GKM is judged on how it influences the organization's green performance and the potential benefits that GKM

practices might bring to the natural environment. In the present globalized market, environmentally conscious strategies and information extend beyond individual organizations to all stakeholders as recommended by the United Nations. However, with a lack of GKM literature, the need for green knowledge has increased tremendously in response to environmental challenges. As green knowledge is an intangible asset, its management differs from other resources. Failing to consider the technical and cultural aspects of GKM may negatively impact companies striving to adopt GKM practices" (UNDP, 2021).

"GKM is also necessary for both individual and organizational creative performance, with people's green learning orientation enhancing the ecological awareness of companies and breeding new ideas and solutions. To reap maximum benefits from GKM, it must be inculcated as a systematic process that involves all stakeholders in decision-making. Literature research suggests that GKM can be categorized into a system of five components: green knowledge acquisition, green knowledge storage, green knowledge sharing, green knowledge application, and green knowledge creation. The acquisition and organization of knowledge related to environmental protection are key components of green knowledge acquisition, enabling ecological resources and technology to be enriched to safeguard the natural environment" (Aboelmaged et al, 2019; Alexandra Zbuchea et al, 2019).

"For instance, The GKM model can be employed as a checklist to ensure that organizations' green measurement models are comprehended by managers and professionals to implement an effective GKM system. Besides, Environmental protection-oriented businesses can utilize the GKM tool to evaluate their performance and identify areas for improvement" (Siming Yu et al, 2022). In a nutshell, implementing Green Knowledge Management (GKM) practices is crucial for organizations to enhance their green performance, address environmental challenges, foster creative solutions, and improve decision-making involving all stakeholders.

2. Sustainable Development

In recent years, environmental concerns have become a hot topic, thanks in part to ecologists who have raised awareness about the depletion of natural resources and the negative impact businesses have on the environment by consuming resources at an alarming rate. Kumar et al (2022) provide evidence of this. As Abbas et al (2020) point out, stakeholders are now putting pressure on businesses to protect the environment and incorporate environmental concerns into their operations and societies. "The United Nations' Brundtland Commission report has spurred businesses to shift their focus to sustainable development" (UN, 1987), leading to new concepts and theories that incorporate knowledge about nature and society, as discussed by Song et al (2020).

Green knowledge goes beyond information about natural conditions and encompasses a wide range of sustainable environmental, social, and economic development strategies. Creating new knowledge is crucial for green growth and sustainable development. Dynamic organizations promote a knowledge-creation culture by encouraging their employees to share their knowledge, as noted by Wang et al (2019), and by providing adequate infrastructure and facilities. Additionally, these organizations offer non-financial and financial incentives to employees who actively share their knowledge or provide unique ideas or solutions, as stated by Xie et al (2019). Ultimately, the growing concern for environmental issues has prompted stakeholders and organizations to prioritize sustainable development and incorporate green knowledge into their operations, as evidenced by recent studies and reports, ultimately highlighting the importance of creating a knowledge-sharing culture within dynamic organizations.

2.1 Social

"Early research in the field of business management suggests that knowledge is the primary resource necessary for companies to compete effectively and gain unique advantages" (Nonaka et al, 1994). "In order to achieve this, companies must create and utilize dispersed knowledge to enhance competition" (Alavi et al, 2001) and "capitalize on external opportunities" (Lichtenthaler et al, 2009). "Employees within companies play a vital role in identifying external knowledge and integrating it with internal knowledge to improve products and processes" (West et al, 2014). "Therefore, it is reasonable to assume that human resource management (HRM), which encompasses all the strategic actions taken by a company's management that influence its relationship with employees, can impact the company's ability to acquire and manage knowledge effectively" (Beer et al, 1994).

According to research conducted by Armando Papa et al (2018), this study's findings support the significance of HRM practices in improving organizational innovation performance. The research analysed 129 companies

using regression analysis to examine the correlation between knowledge acquisition and innovation performance, revealing that HRM moderates this relationship. The results indicate that implementing HRM practices and retaining employees can amplify the impact of knowledge acquisition on innovation performance, leading to sustainable growth and effective corporate knowledge management. Therefore, the important role of human resource management practices in improving organizational innovation performance by enhancing knowledge acquisition, retention, and integration, ultimately leading to sustainable growth and effective corporate knowledge management is highlighted.

2.2 Environmental

“The sharing of knowledge related to environmentally-friendly practices, or "green knowledge sharing," can involve the transfer of knowledge between colleagues, competitors, suppliers, or other stakeholders with the goal of developing effective techniques and technologies to reduce the negative impact of business activities on the natural environment” (Song et al, 2020). “This practice is influenced by several factors including human factors, organizational culture, infrastructure and technology, reward, and recognition” (Alexandra Zbuchea et al, 2019). “Integrating green knowledge into decision-making, product/service design, and operations can enable companies to minimize or eliminate negative environmental effects, thus providing a competitive advantage” (Aboelmaged et al, 2019). Additionally, environmental knowledge encompasses information about product production and its environmental impact.

2.3 Economic

“To optimize a company's knowledge economy, a strategic approach to knowledge management is crucial. This requires consideration of various factors, including information technology, organizational structures, human resource practices, and culture” (Alexandra Zbuchea et al, 2019). “Effective knowledge management frameworks suggest that a successful KM structure should incorporate both enabling factors and processes, with a clear understanding of operations” (Pilar Bernal et al, 2022). “Organizations that consistently assess their use of knowledge are referred to as KM enablers and previous studies have differentiated between exploitative and exploratory KM processes” (Gonzalez et al, 2018). “Knowledge discovery typically involves research and development and knowledge creation, with R&D initiatives serving as a significant component of knowledge creation within a company” (Chamba-Rueda et al, 2021). “This may include developing new content or replacing outdated material in the organization's knowledge repository” (Khan et al, 2022). “Research has linked knowledge creation and innovation” (Goyal et al, 2020), “while knowledge exploitation encompasses techniques such as knowledge application, storage, transfer, and application” (Abubakar Mohammed Abubakar et al, 2019).

The United Nations has stressed the importance of raising awareness and knowledge about the environment in order to achieve sustainable development. In line with this, Muhammad Aamir Shafique Khan et al (2022) have emphasized the need for SMEs to address consumer resistance towards green innovation products. The study has found a connection between green innovation practices, consumer resistance, environmental knowledge, and pro-environmental behaviour. It highlights the crucial role of green innovation practices in SME success, while also underscoring the importance of businesses adapting their policies and marketing strategies to overcome customer resistance. The study's key findings suggest that effectively managing consumer resistance is advantageous for product acceptance and serves as a solid basis for policy-making and handling resistance to green innovation products among consumers. Thus, the strategic approach to knowledge management, the significance of knowledge creation and exploitation, and the role of green innovation practices in SME success emphasize the necessity for businesses to adapt their policies and marketing strategies to address consumer resistance and achieve sustainable development.

3. Green Innovation

Research by Juan Piñeiro et al (2019) highlights knowledge, entrepreneurship, and innovation as key drivers of economic growth and competitiveness. “These factors have a significant impact on the economy, environment, and society, making them crucial components of the United Nations Sustainable Development Goals” (UNDP, 2021). “The interdependent relationship between knowledge, innovation, and entrepreneurship means that knowledge plays a vital role in the innovation capabilities of individuals and organizations” (Chamba-Rueda et al, 2021). “Improved innovation quality leads to enhanced firm performance” (Chaithanapat et al, 2022). According to Nonaka et al (1991), organizations that adopt the knowledge-based view (KBV) can better acquire and utilize knowledge, which is critical for creating resources. The KBV identifies knowledge as the most valuable strategic resource that an organization can possess.

"Additionally, green innovation can help mitigate environmental risks such as carbon emissions and other climate change-induced consequences while reducing product impact" (UNDP, 2021).

Shouwen Wang et al (2022) conducted a study that delves into the correlation between green knowledge management (GKM), corporate sustainable development (CSD), and green innovation. The study also explores the moderating effects of organizational green culture (OGC). It examines the impact of four GKM practices on the green innovation capabilities and sustainability activities of organizations. According to the study's findings, aligning GKM initiatives with overall business policies can enhance environmental and business performance. Moreover, the study emphasizes the relevance of green culture in organizational activities and its impact on the relationship between GKM and green innovation. Additionally, the study reveals that firm size and industry significantly affect organizational capabilities for green innovation and minimally relate to CSD. Accordingly, it underscores the crucial role of knowledge, entrepreneurship, and innovation in driving economic growth and competitiveness, emphasizing the significance of green knowledge management and organizational green culture in enhancing environmental and business performance through green innovation.

4. Conclusion

This article delves into the relationship between green knowledge management, green innovation, and sustainable development. Through careful analysis, the article proposes a conceptual framework that illustrates how green knowledge management can positively impact sustainable development through green innovation (Figure 1). The framework emphasizes the importance of a company's green culture in strengthening these connections. It is also important to consider the potential resistance of consumers towards adopting green innovation products. This can be addressed by increasing their environmental knowledge and promoting pro-environment behaviour. Overall, the article stresses the essential role of green knowledge management in achieving sustainable development through green innovation.

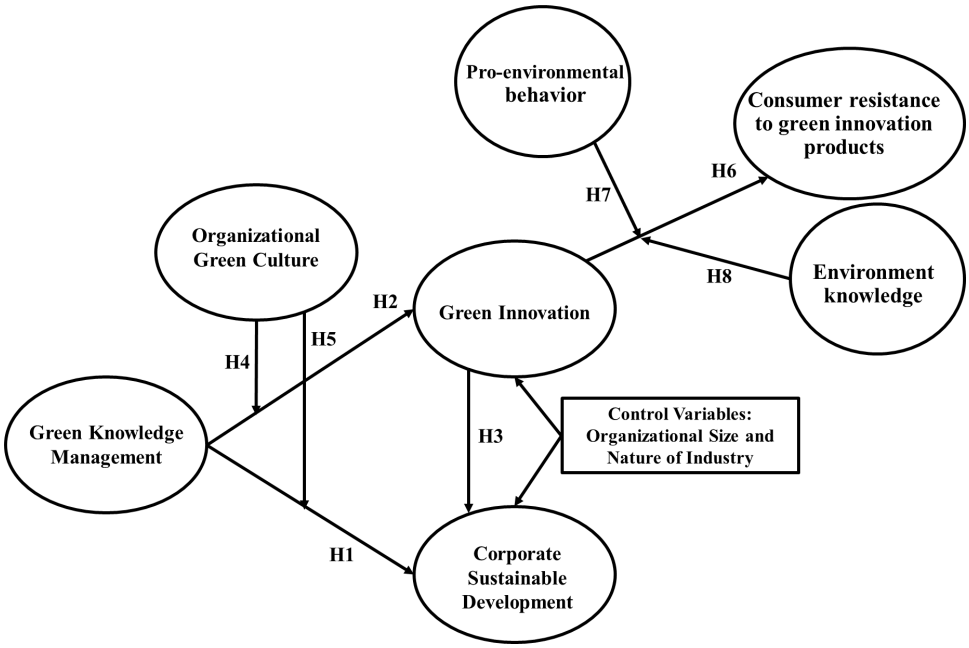

Figure 1: A Conceptual Framework

Therefore, the conclusion section proposes a conceptual framework that highlights the following relationships:

H1: Green knowledge management is a significant predictor of a company's sustainable development.

H2: Green knowledge management positively influences an organization's green innovation performance.

H3: Green innovation strengthens an organization's capabilities to achieve sustainable development goals.

H4: Organizational green culture strengthens the relationship between green knowledge management and green innovation, as well as sustainable development.

H5: Green innovation measures are negatively related to consumer resistance to green innovation products. As innovative measures increase, so does consumer resistance.

H6: Pro-environmental behaviour moderates the relationship between green innovation practices and consumer resistance.

H7: pro-environmental behaviour moderates the relationship between green innovation practices and consumer resistance. If environmental knowledge is high, the negative relationship is weak.

H8: Environmental knowledge moderates the relationship between green innovation practices and consumer resistance. If environmental knowledge is high, the negative relationship is weak.

A Transdisciplinary Research Model Through Knowledge Co-Production in Complex Sociotechnical Systems

Eduardo Giugliani, Maria Angélica Jung Marques and Priscila Susin
PUCRS, Porto Alegre, Brazil

giugliani@pucrs.br
angelicajmarques@gmail.com
pri.qsusin@gmail.com

Abstract: This paper presents the transdisciplinary research and conceptual model adopted by the projects developed within the research center HFACTORS – Human Factors and Resilience Research Center. Transdisciplinary research produces knowledge with workers, be they leaders or sharp-end professionals, and within the company, as it seeks to understand the daily demands without imposing pre-defined solutions. In this sense, a transdisciplinary research model aims to integrate and co-produce "actionable knowledge" to face challenges and complex problems where disciplines alone are no longer enough. This paper shows how the HFACTORS Center seeks to implement a multi-perspective approach to its interventions, transcending disciplinary boundaries, co-producing knowledge, and connecting scientific knowledge with everyday practice. Such an approach requires multiple ways of working, developing strategies, and creating tools and spaces for co-production where different teams can work and interact. Interaction can occur on various levels and allows both the co-creation and co-production of narratives, solutions, and negotiations, as well as the prototyping of ideas and learning from integrating knowledge (scientific and applied). Therefore, we present the HFACTORS research model, describing the strategies and mechanisms used to develop processes of transdisciplinary knowledge co-production aligned with a Human Factors perspective, its implementation challenges and future research opportunities.

Keywords: Transdisciplinary research, Knowledge co-production, Research model, Complex sociotechnical systems, Resilient systems

1. Introduction

The Human Factors area presents itself as a broad field of studies and research with transdisciplinary nature. It is centered on the interaction between organizational, group and individual factors with a view to improving people's performance in organizations and complex socio-technical environments. It is a comprehensive field of knowledge, with multiple domains and objects. Among the challenges in this field, transdisciplinary research stands out.

Transdisciplinary research aims to co-produce knowledge and integrate it into the daily practices of stakeholders, with the building of structures that make these practices more effective for corporate action and change. These arrangements point, in turn, to opportunities and challenges for governance and innovative processes in organizational environments: spaces for prototyping, experimentation and validation, among others (Engels, Wentland, Pfotenhauer 2019). Transdisciplinary research takes a comprehensive, multi-perspective approach, problem- and solution-oriented that transcends disciplinary boundaries and promotes the connection between science and practice (Pohl 2011). In addition, transdisciplinary research proposes a reflective approach of interdisciplinary collaboration between academic and non-academic stakeholders (Bammer et al. 2020; Hoffmann, Thompson, Pohl 2019).

When dealing with topics typical from the Human Factors research area such as safety in complex socio-technical systems, the association between human elements, complex structures, high technology, finite resources, knowledge (specialized and tacit), variability and uncertainties, transdisciplinary research is essential. In this sense, new tools, methods, and methodologies are needed to facilitate the processes of integration and co-production of knowledge. In this article, we offer the HFACTORS view on the co-production of transdisciplinary knowledge in the field of Human Factors, as well as the conceptual model adopted.

The HFactors is a Research Center formed by an interdisciplinary team of researchers, involving specialists from the Pontifical Catholic University of Rio Grande do Sul (PUCRS, Brazil) and partner universities, in areas such as Resilience Engineering, Sociology, Social Work, Psychology, Engineering, Media and Knowledge Management. The Center focuses on design and carries out R,D&I (research, development and innovation) projects with high added value and intensive technical-scientific knowledge, involving models and technologies aimed at strengthening the culture of safety, resilience and human factors. Concepts and definitions about transdisciplinary research are presented in this paper, as well as key notions on the co-production of knowledge, pointing out how the HFACTORS seeks to implement a broader, multiperspective approach to its projects,

oriented towards problems and solutions that transcend disciplinary boundaries, and proposing a connection between science and everyday practice (Pohl 2011).

2. Transdisciplinary Research and Knowledge Co-Production

Transdisciplinary research and knowledge co-production are terms coined to refer to processes of knowledge connection between academic and non-academic actors that lead to the creation, communication, and use of combined forms of knowledge (Bremer, Meisch 2017; Mauser et al. 2013). Knowledge co-production has been an effective means of producing usable knowledge in science through a collaborative process between scientists and decision makers (Djenontin, Meadow 2018). This has led researchers and professionals to turn to knowledge co-production as a promising approach for advancing studies in complex environments (Norström et al. 2020): co-production emerges as a response to complexity, oriented by context, problem-focused, demanding the participation of various disciplines and non-academic actors in the process - not just as informants, but as interested and active parties, which includes negotiation and agreement on research questions and activities (Jacobi et al. 2020).

Bammer (Bammer 2019; Bammer et al. 2020) highlights that specialization in the integration and implementation of research is an essential but often overlooked component in the context of addressing complex problems. It is through knowledge integration that "actionable" knowledge is co-produced. Actionable knowledge is that knowledge that can be worked on and applied to solve a real-world problem. The co-production of actionable knowledge requires researchers to adopt ways of working together that create time and space to build teams, networks, relationships, narratives, and prototype ideas, to fail, learn, and start over (Evans, Terhorst, Kang 2017)

Although transdisciplinary research is a recognized approach to dealing with complex real-world problems, some aspects can limit its success. Schmidt et al. (2020), for example, warn about the importance of stakeholder involvement, a central aspect of transdisciplinarity, which still lacks more broad reflection on its objectives in the literature. In this sense, with a view to integrating different perspectives and bodies of knowledge to develop scientifically valid and relevant results for companies, the transdisciplinary research approach allows reflecting and respecting the diversity of epistemologies, cultures, roles, and interests of all parties involved (Hoffmann, Thompson, Pohl 2019; Jahn, Bergmann, Keil 2012; Schmidt, Falk, Siegmund-Schultze 2020).

In this sense, a preponderantly influencing factor of the transdisciplinary research process is the ability to promote the integration of knowledge, either through tools, dynamics, and strategies. In this direction, there is a rich body of literature dedicated to this process, for example, Klein (2012), Hoffmann et al. (2017); Hoffmann (2016); Bammer (2013), Pohl et al. (2021), Pennington (2016), Defila and Di (2015), Marques, Giugliani e Santos (2022), to name a few. The HFACTORS Model seeks to add to this literature on the experience of co-production of transdisciplinary knowledge oriented to problems in complex socio-technical systems with a focus on the Human Factors field. The model's approaches and strategies developed by the HFACTORS team in recent years are presented below as well as the challenges to consolidate such model.

3. HFACTORS Model of Transdisciplinary Research and Knowledge Co-Production

Through transdisciplinary research, the HFACTORS seeks a comprehensive, multi-perspective, problem- and solution-oriented approach that transcends disciplinary boundaries, proposing a "bridge" between science and practice (Pohl 2011). The insights of Polk (2014) and the interaction model proposed by Hoffman et al. (2019), in which different forms of knowledge from science and practice combine and relate to each other to produce a "third" sphere of knowledge, served as inspiration for the HFACTORS model of transdisciplinary research in complex socio-technical systems. This model is illustrated in figure 1.

The HFACTORS model aims to establish cyclical processes of thematic synthesis and co-production of knowledge, in order to identify and overcome the challenges that arise at different stages of a transdisciplinary research project, seeking to co-produce solutions to a complex problem. The establishment of the central problem, object of a transdisciplinary research, is based on a cycle of interactions with the team of the contracting organization, where the main research questions are co-designed (co-design stage). This cycle is based on practices from real world experiences and demands a series of interactions between academic and non-academic teams. Once the research questions are co-designed, the strategies and macro activities to be developed are elaborated. These macro activities, in turn, are developed in iterative and interactive cycles of co-design, co-production and co-evaluation, where knowledge is gradually integrated.

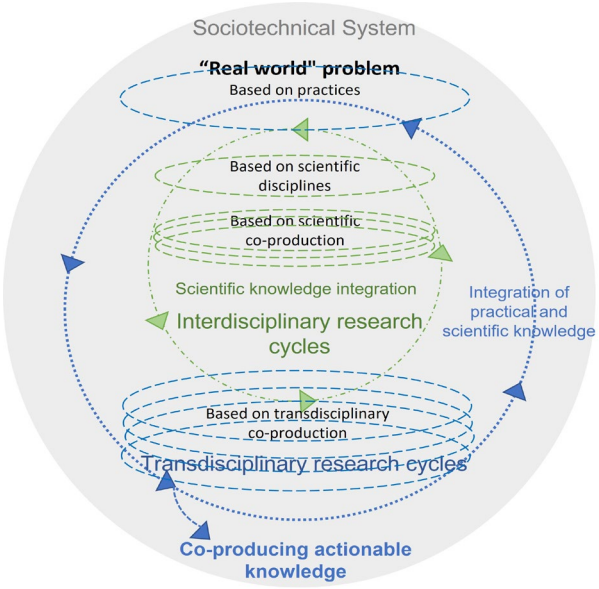

Figure 1: HFACTORS Model – Conceptual Model of the Transdisciplinary Research Process In Complex Sociotechnical Systems

In the HFACTORS, the proposition of knowledge co-production tools was based on a multilevel perspective, considering, at least, the following elements: a) the socialization of researchers around the reality and the language used in the socio-technical system that is object of the research ; b) the construction of a relatively common language in order to develop and share research results based on co-production; c) a relatively shared vision about the problem and object of research; and, d) the work in small interdisciplinary groups for the integration of knowledge, leaving the discipline-based production for the co-production of actionable knowledge. It is worth clarifying the strategies adopted by HFACTORS for each of these levels.

According to Thompson (2009), interdisciplinary research teams need to negotiate meanings and work continuously to establish and sustain what the author has termed "a sense of collective communication competence". The construction of linguistic 'bridges' within the HFACTORS, for example, occurred from two demands.

The first concerned the researchers' ability to dialogue and understand the realities presented by the workers of the socio-technical systems under analysis, considering the collection of data from very different methods. The construction of research instruments and the contextualized analysis of results requires, therefore, a massive approximation between researchers and the routines and dynamics of the systems. The proposition of formal spaces of exchange between researchers and professionals from different areas of the contracting organizations, especially through workshops, seminars, and lectures, is one of the first actions in terms of conceptual adjustment. This includes the recognition of technical terms and jargon, without which it would not be possible to interpret much of the data collected.

Another opportunity for language alignment, and perhaps the most important, was the possibility for the research teams to experience the routine of the sectors being investigated, in person whenever possible, such as, for example, in the oil industry, embarking on offshore oil and gas exploration and production platforms, or even in onshore environments. In addition to a better conceptual harmonization, these experiences also make it possible to experience and observe what, from the workers' reports, would still be a purely theoretical abstraction of the research teams.

The second demand in terms of language is the need to build a relatively common conceptual and epistemological field between the different disciplines involved in exploratory research, in order to develop and share increasingly integrated research results. This challenge is especially complex, as it requires not only the co-creation of opportunities for dialogue, but also the effort between researchers from disciplines historically and supposedly positioned in so-called antagonistic positions. The conduction of common readings, the establishment of dialogues, seminars to share theories, concepts, and approaches, are key strategies adopted with the creation of an interdisciplinary scientific committee, also responsible for creating these spaces of exchange and integration of knowledge.

Another strategy adopted by the HFACTORS is the incorporation of a systemic look at the establishment of the research object and problem. As Moraes (2001: 34) points out, systemic thinking allows "the understanding of the different connections, the interactions that express the set of relationships established between the whole and the parts, between actions and feedbacks, making explicit, including the organization that shapes the system". For the implementation of transdisciplinary projects, incorporating a systemic approach means considering different perspectives and problematizations about the same socio-technical system during the process of exploratory research and during the cycles of co-production, admitting that all the answers could be right or wrong, depending on the point of view of the analysis and the observer (O'Rourke et al. 2019).

Finally, working in small groups or subgroups for integration and co-production of knowledge is also essential for effective praxis within the HFACTORS. They can be considered both a tool and a space for co-production but require a set of skills of collective communication and shared language, the capacity for a systemic look and, crucially, the horizontalization of disciplinary relations towards transdisciplinary work. As pointed out by Thompson (2009), these work groups provide some fundamental practices for co-production processes, among them, the sharing of time among researchers, the exchange of information about tasks, and the continuous negotiation in relation to language differences.

In the HFACTORS, the working groups are constituted from a long learning process, which begins in a disciplinary manner, especially during its first phases. However, in this process, they become increasingly interdisciplinary, as the cycles of knowledge integration develop from the formation of subgroups composed of researchers from different areas. As these cycles are repeated, each group assumes different thematic fields. The segmentation by area, in this way, becomes more diffuse, especially due to the need for transdisciplinary articulation directed towards practical problems of the socio-technical systems investigated, which need to be contemplated in their final phase of action-research.

This integration of knowledge is increasingly and constantly challenged as transdisciplinary research cycles are developed, with the active participation of professionals from the contracted organization. To this end, one of the strategies adopted by HFACTORS was the creation of spaces of co-production of knowledge where issues related to work practices are problematized and negotiated from the foundations and principles of human factors. Finally, another important strategy developed by HFACTORS is the construction and availability of virtual spaces for knowledge sharing and dissemination, which aim to stimulate constant interaction and co-production among academic and non-academic members of the project, such as the digital platform HFACTORS.

4. Final Remarks

The authors developed this article with the main objective of presenting the HFACTORS research model. Based on its focus on action and on a Human Factors approach, we can list two basic constructs for its effective performance: transdisciplinary research and knowledge co-production. Since 2014 the HFACTORS Center's team has engaged with applied transdisciplinary research. Based on these experiences, the model aims to advance in a propositional way toward solving problems in complex sociotechnical systems. It is also worth mentioning the resilient capacity developed by HFACTORS throughout its trajectory (learn-respond-monitor-anticipate), offering answers and solutions to complex problems within the transdisciplinary context that surrounds us, as well as the requirements for transformation imposed by the 21st century.

Smart Village Concept: What are the Crucial Categories of Elements?

Konrad Głębocki
Czestochowa University of Technology, Faculty of Management, Poland

konrad.glebocki@pcz.pl

Abstract: Over the past few decades, villages have faced significant challenges, such as depopulation, that have hindered their development. To address these issues, the concept of a Smart Village has emerged as a potential solution for rural development. The present article aims to investigate the essential categories of elements that comprise this concept by conducting an international literature review in multiple languages, including Polish, English, Spanish, Italian, French, and German. The article begins with an introduction that discusses the current challenges facing rural development, followed by a detailed analysis of various aspects of the Smart Village concept. Additionally, the article presents case studies from different countries to illustrate how the concept has been implemented in practice. Finally, the article employs inductive reasoning based on the previous literature review to identify four fundamental categories of elements that underpin the Smart Village concept.

Key words: Smart Village, New technologies, ICT, Public management, Strategic planning

1. Introduction

Today's village faces various challenges that are social, organisational, demographic, and economic in nature. However, the emerging concept of the Smart Village provides a new approach to addressing these challenges. The issue of Smart Village need to be reviewed to systematize and to expand the knowledge of the concept and its practical application - the article responds to this need. In this article, the author first examines the challenges facing villages, followed by a detailed analysis of various aspects of the Smart Village concept. Additionally, the article presents case studies from different countries to illustrate how the concept has been implemented in practice. Finally, the article employs inductive reasoning to classify the essential categories of elements that underlie the Smart Village concept into various categories. The conclusions drawn from this research provide valuable insights for policymakers and stakeholders in rural development.

In Western countries one of the main challenges of village development is the aging population and depopulation partly rooted in leaving villages by younger generations. Older people prefer to stay in village but the problem is how to engage them into village organization (Gammonley et. al 2019). Still issues of involving inhabitants of villages into not only consultations on village development but as well as into cooperation in governing are vital (Rumkel et al. 2019).

Also in Poland, for many villages the basic dilemma consists in whether depopulation is an inevitable trend that will continue in the following decades. This is particularly true of villages located in peripheral areas - they are not located in the immediate vicinity of large cities and urban agglomerations. Depopulation entails both social and economic negative consequences - the level of socio-economic development decreases which also results in a lower quality of life, which then contributes to the low attractiveness of such areas, in turn causing an increasing acceleration of rural depopulation (Wesołowska, 2016, p. 269).

The challenges that Polish countryside has to face include, for example:

- further increasing the standard of living for the rural population, improving the agrarian structure, and modernizing agriculture;
- creating new jobs in the countryside apart from agriculture;
- motivating rural communities to create new local development programmes - rebuilding social capital and civil society. Residents of rural areas should not look at others - waiting for someone else to solve their problems;
- active and efficient local governance - putting a dam on the passivity of local leaders and individual residents;
- developing rural infrastructure;
- creating opportunities for entrepreneurial people (Kłodziński, 2010, p. 24).

In the broader spectrum of elements relevant to future rural development, it is possible to point to the spreading of remote working, which was one of the consequences of the Covid-19 pandemic. Information concerning the dangerous health situation led to adopting remote working as a method of maintaining health

while staying active (Torres 2021, p. 13). Moreover, high-level strategic development planning is important for village development. The development strategies of rural municipalities should not only be a tool for promoting the municipality, but most importantly, within traditional village activities new methods should be found to improve breeding animals in village – e.g., poultry (Tuan Chu et al. 2018). Poor villages look for their chance in tourism which could be an opportunity for sustainable development (Sesotyaningtyas 2015).

2. Smart Village Concept – Chosen Aspects

The Smart Village concept has gained increasing attention in recent years. However, despite its growing popularity, it lacks a well-established theoretical framework and remains largely undefined. Furthermore, there has been little exploration of the relationship between the Smart Village and the better-defined Smart City concept. Clarifying this relationship is a necessary step in understanding how smartness can impact social and environmental aspects of rural realities. From a practical perspective, designing and implementing the Smart Village concept in European countries, drawing on experiences from Africa and Asia, could contribute to the EU's green and digital transformation agenda by emphasizing sustainability and environmental protection (Gerli, Marco, Whalley 2022, p. 15).

The Smart Village concept rests on several fundamental assumptions, including food security, democratic engagement (achieved through effective local governance and social development), health and well-being (supported by environmental and personal development), education (which provides basic knowledge to raise awareness), and local businesses (which promote economic development). For the Smart Village concept to effectively contribute to sustainable development, there is a need to redirect the focus of education. Education plays a critical role in promoting sustainable development, and basic education forms the foundation for environmental and development-related education, which should be prioritized in educational curricula. Developing ethical awareness, values, attitudes, skills, and behaviors in line with sustainable development is essential for effective public decision-making, including public participation. Moreover, education should be accessible to people of all ages (Somwanshi et al. 2016, p. 397). In order to promote rural development, it is necessary to tap into the knowledge held by leaders and members of a given community. Today, knowledge acquisition is not limited to formal education, such as earning a bachelor's or master's degree. Knowledge can be acquired through a variety of means, such as listening to TEDx speeches, where experts who have dedicated decades of work to a particular field share the most important conclusions from their experiences in concise 20-minute talks.

The implementation of the Smart Village concept faces significant challenges. One such challenge in many countries is the lack of adequate digital services in rural areas. Additionally, there is often a lack of networking between residents, communities, and local administrations. The levels that comprise the digital ecosystem of a Smart Village include: digital services that require collaboration with the citizens who use them, a technical platform that integrates the main technical aspects relevant to the functioning of digital services in rural areas, the availability of digital infrastructure, which is a necessary but not sufficient condition for digital innovation. The latter can be fostered through initiatives such as Living Labs and Rural Digital Hubs (Gallardo-Cobos, Sanchez-Zamora, 2022, p. 409). Elements that may be duplicated and disseminated are developed in terms of the Smart Village concept. One such element is the concept of an information system for managing the infrastructure and activity of a rural municipality. The idea is to create a very useful but minimalist system, consisting of four main activities: collecting data (linking objects), storing data (NoSQL database), prediction (model composed of algorithms, learning automatically), and data visualization (Kibana) (Antoine-Santoni et al. 2019 p. 8).

Smart Village also encompasses the development of rural tourism, which has been greatly impacted by the Covid-19 pandemic. Villages that had previously succeeded in attracting tourists experienced a significant decrease in tourism activity. Therefore, it is essential to carefully examine the conditions under which this activity takes place, including the governance models at both the national and local levels. This requires a detailed analysis of the theoretical and practical foundations that impact the development of tourism in smaller village-type locations (Bravo et al. 2021, p. 269).

There are many investments that qualify under the Smart City concept, and many solutions implementing this concept appear. The case is different for the Smart Village - a concept that lacks a large number of village-focused, specific implementations (Park, Cha 2019, p. 177). However, more and more solutions are emerging that fit into the Smart Village concept and can contribute to developing villages, such as theme parks. These parks should take advantage of the assets of a given village or town and be specific enough to stand out and attract interested parties, including tourists. They should promote beauty and good taste, be accessible to all,

and be an attractive location in terms of composition and aesthetics (Poczobut 2013, p. 380). Theme parks have been successful worldwide, including small-scale parks. Creating a website and a special app for smartphones that lists theme parks would fit in with implementing the Smart Village concept. The app should be based on a clear and logical typology, with proper criteria for qualifying sites. Parks that meet the criteria should combine interactivity, fun, and education (Doroz-Tomasik, Jankowski 2016, p. 30). Historical parks can play a special role, referring to historical events in a particular place, such as a battle during the Invasion of Poland at the beginning of the Second World War. Such parks can be an interesting element of tourist development if they meet the criteria of interactivity, fun, and historical education.

Another example of Smart Village activities may be the neighbourhood help - transport sharing app. A resident travelling by car to a large city makes this information available on an app that other residents can view. A resident without available means of transport opens the app, enters a date and destination and then receives information about people who are going to the city on that day. When using such an app, the challenge will be to ensure the security of people and data.

3. Smart Village Concept - Experiences of Various Countries

In Germany, attempts are being made to break down the barrier in the form of poor digital services in the countryside. An example consists in the actions taken by the Fraunhof Institute, which has invested € 4.5 million until 2019 in cooperation with the Ministry of the Interior in a pilot digital villages project including digital services for residents of villages, a digitalized marketplace of local services, access to mobile digital services, an app with local news in typical areas, and a digital lead platform for two-way communication between local residents and the local administration (Park, Cha 2019, pp. 178-179). Furthermore, in Germany, a part of the "Smart Village" concept consists of creating a web-based platform that collects and links data, which is then available to interested parties in the form of well-visualized interfaces. Data from a large number of sensors is transferred to a 3D platform, allowing for efficient access to information on electricity production from photovoltaic panels in a given village or the entire municipality, as well as heat resources and energy obtained from the use of biomass. Thanks to these applications, it is much easier to plan the development of photovoltaic installations in a village, for example (Santhanavanich et. al 2020, pp. 56-57). Especially in Germany, data security issues, including personal data, are also being raised in the context of the Smart Village. In some advanced IT systems, there is a high risk of reducing a human to an object that will also follow the commands of artificial intelligence machines. Numerous examples from East Asian countries, shaped by Confucian philosophy, show that such systems can already be quickly introduced today. In Germany, it is indicated that systems reflecting historical experience, the rule of law, constitutionally protected rights, and data protection principles should be developed. In particular, a careful examination of solutions already proven in other cultural circles is called for (Von Lucke 2019, p. 59).

In Italy, the "Smart Village" concept is being analyzed in terms of its use in previously marginalized areas. An example of the analysis concerning potential applications in such areas can be found in Sardinia. It is indicated that using ICT instruments, big data, and the Internet by public authorities in cooperation with private entities can bring solutions to revitalize the rural space in terms of strategic sectors such as public transport, distance education, rural tourism, health, or renewable energy, working in favor of developing new forms of sharing economy as well as new relations with the outside world. In terms of the EU's programming of development for the years 2021-2027, the Smart Village may gain a real dimension not by replacing the instruments already in place but rather by integrating them in a way that serves sustainable development (Lampreu 2022, p. 77). The Smart Village concept in Italy was already known before 2012. There have been pilot projects integrating three spheres: the outdoor lighting system - smart lighting that adapts to conditions, smart building networks, and smart mobility. These projects, such as the one carried out by the state agency ENEA, were focused on developing such an integrated model for a specific locality (village) so that it has the potential to be extended not only to following villages, but also to small towns (Annunziato et al. 2012, p. 6).

In France, in the context of smart villages, a hybrid model is indicated. This model is a combination of a territorial approach, social innovation projects in conjunction with economic models, and the combination of public and private entities as well as resources in the form of public-private partnerships, along with a simultaneous presence in multi-entity local projects for public and private services. In this way, co-responsibility is shaped, as evidenced by the development of a cooperative society for implementing a collective goal. The multiplication of locations and levels constitutes an indicator of this hybridisation dynamic (Association ADRETS 2021, p. 11). Research carried out in France also attempts to build a more solid theoretical basis for the Smart City concept described as a multi-faceted and hitherto unspecified concept.

Appropriately, this research can also be applied to the Smart Village. It is proposed to base this concept on three immanent pillars: acquiring and using megadata, modernizing public services, and the political will to support greater citizen participation (Eveno 2018, p. 37).

The following points, among others, have been highlighted during research carried out in the Czech Republic in the context of implementing the Smart Village concept:

- there is no technological or cost barrier associated with using modern ICT technologies in rural areas, network coverage is not as intense as in urban areas, but the vast majority of rural residents have access to the Internet;
- a lower level of education results from less use of the web for more practical purposes, residents tend to use the Internet for entertainment, shopping, or participating in social media
- remote work may be more attractive for rural-to-urban migrants who can combine living in a rural environment with an attractive and well-paid remote job. However, it seems that fully remote work is rarer, most often it has to be combined with visiting an office in the city;
- improving the skill level of rural residents should include improving IT proficiency in relation to rural development instead of improving only formal education (Vaishar, Stastna 2019 pp. 657-658).

Also in developing countries like Algeria, it is pointed out that in peripheral regions, rural development (especially in the current era of globalization) can be the driving force of economic development by ensuring an improving the wealth with a sustainable character. Such development should be based on developing own resources (Agharmiou-Rahmoun 2021, p. 144). In Cuba, the concept of smart municipalities is advocated while pointing out that implementing this concept towards sustainable development constitutes a complex process involving social, economic, political, environmental, and cultural dimensions. In turn, this process must be based on education, which moves towards assigning individual actors their roles according to their knowledge, experience, attitudes, and values (Rodriguez, Perez 2020, pp. 33-34).

In poorer countries, the Smart Village concept appears as an opportunity to move towards a new level of development. The developed model of the integrated development of the Smart Ayllu (Bolivian village) points out the significance of, among others, the following elements: the revalorization of the Ayllu living system, recognizing the centrality of the family as an integral part of the community, where ancestral principles allow strengthening the sustainable drive of village development and community well-being; appreciating existing social ties crucial to the living system; recognizing the central role of citizens in the interaction with the community; and strengthening a new complementary relationship between space and inhabitants using different technological systems (Yujra, Medina 2021).

4. Crucial Categories of Elements of the Smart Village Concept

Based on the above literature review, including the experiences of individual countries, and taking advantage of inductive reasoning, the following categories of Smart Village elements can be distinguished: the digital elements category, the socio-organisational elements category, the domain elements category and the educational elements category. The elements of each group are listed below. Surely, the catalogue of individual categories can be developed further, as well as the number of categories themselves and their nature, which can also be refined in the course of further research.

Digital elements category:

- complete availability of digital services;
- web platforms and other digital applications;
- visual interface of clean energy production;
- data security;
- living labs.

Category of socio-organisational elements:

- participation of residents in the development of the village community;
- developing social ties (including traditional ones);
- public-private partnership.

Domain elements category:

- smart lighting (street lighting and other public infrastructure);

- smart mobility (transport sharing among others);
- smart buildings;
- tourism development (theme parks in this);
- economic development (remote work in it).

Educational elements category:

- adapting formal education curricula to the challenges of smart villages and sustainable development;
- education related to improving IT proficiency;
- education related to changing habits so that residents take advantage of the internet not only for shopping and entertainment, but also for life-long learning.

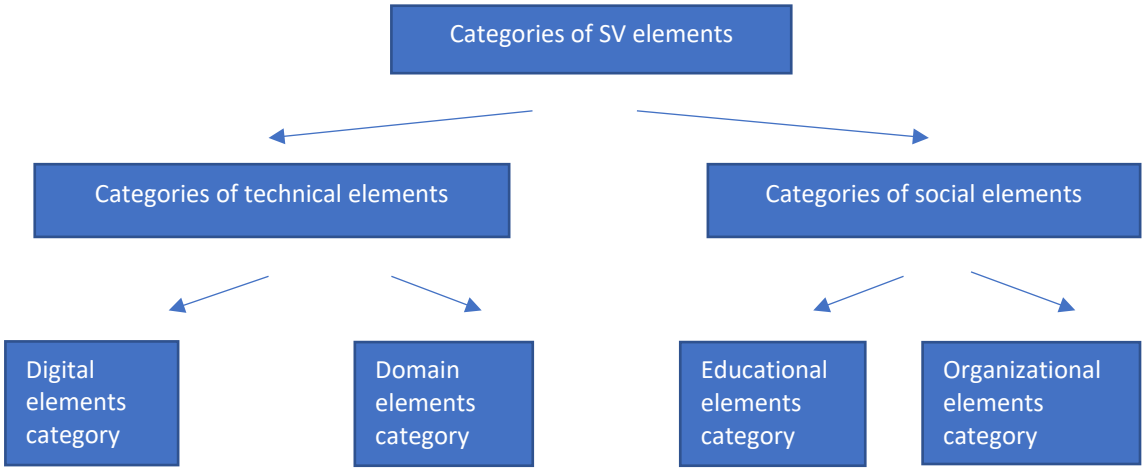

Figure 1: Categories of Smart Village Elements. Source: Author's own figure

Two of the above categories have more technical character (digital elements category and domain elements category) and the other two have more social character (category of socio-organizational elements and educational elements category). Categories of more technical character seem to be easier to introduce but need more financial resource and categories of social type maybe would cost less but are more difficult to introduce because the process takes more time to bring effects.

5. Conclusions

Today's village confronts a range of challenges, and depopulation represents a particularly pressing issue in many countries. The Smart Village is a new concept which is intimately linked to sustainable development. Attempts to categorise the various elements of the Smart Village have been explored in the literature. One such categorisation scheme is based on a set of key assumptions that prioritise food security, democratic engagement (through effective local governance and social development), health and well-being (through environmental and personal development), education (through basic knowledge to promote awareness), and local businesses (through economic development). By identifying and categorising these crucial elements, policymakers and other stakeholders can more effectively design and implement strategies to foster sustainable development and promote the vitality of villages.

Experiences of various countries show that stress within the Smart Village concept could be put on various elements. In the article, the author used especially the elements from Germany, France, Italy, the Czech Republic, Algeria, Cuba, and Bolivia. Basing on sixteen elements stemming from multilingual international literature review the found elements of smart village were grouped into following four categories: digital, socio-organizational, sectoral and educational. Two of the these categories have more technical character (digital elements category and domain elements category) and the other two have more social character (category of socio-organizational elements and educational elements category). Categories of more technical character seem to be easier to introduce but need more financial resource and categories of social type maybe would cost less but are more difficult to introduce because the process of their implementation takes more

time to bring effects. The catalogue of various categories can be developed, as well as the number of categories themselves and their nature can also be developed in the course of further research.

Abstract: The article presents factors and their interrelations that influence the development of engineers' creativity. The subject of the article is in the field of human resources management and was in-spired by the results of research related to the analysis of the competency potential of future employees. The main goals of this paper are: - How can competencies of future engineers in the area of creativity be developed and what does creativity depend on – internal and external factors. - Can a model of enhancing creativity of future engineers be worked out? The research was carried out between 2014-2020, on a group of 861 students. The survey method was used, and the research tool was a self-evaluation questionnaire. The research used regression analyses, Spearman's rank correlation coefficients, the power of interrelation between chosen variables (social competencies and forms of education) was evaluated. Hierarchical multiple regression was carried out to verify the objective of the research. The analysis of correlations was verified and visualised with principal components analysis PCA, as well with cluster analysis using Ward's method. The main value of the article is the developed graphic model that reflects the stages of creative development as a competence that is a very important competence resource of the company. A mathematical model that includes the analysis, based on hierarchical multiple regression, revealed that social competencies and forms of learning examined are strongly correlated with 'creative thinking' competence, and this correlation is statistically significant.

Keywords: Management competencies, Creativity, Engineers' skills, Competencies of the future

1. Introduction

The question related to creativity and innovation is of key importance for modern organizations (Audretsch et al. 2020). Market requirements and customers' needs motivate companies to improve their products and intensify activities in the area of innovation. That, in turn, requires creativity in designing new solutions – in other words: to go beyond what is known, common and obvious (Pinker, 2009). Another reason why more attention is paid to creativity is the shift from economy based on tangible assets that is end-product oriented, to economy based on intangible assets, knowledge and services (Georgiev et al., 2016). Employees' creativity of a company gives the basis for a creative organization and is the source of competitive advantage (Al-Ajlouni, 2020). Creativity has become one of the production factors, a non-material resource, unique and of great value.

Why is creativity a competency of such demand? According to The Future of Jobs Report 2020, 'creativity and social intelligence will probably be indispensable skills in case of most new jobs created before 2030. Because these skills give people a distinct advantage over machines and software' (World Economic …, 2020). Employees who can combine mathematical, technological skills with creativity will be indispensable in organizations of the future. Hopkins (Hopkins & Keown, 2005) claims that a creative engineer is able to find various solutions regarding the design of a new product or improvement of a product already designed in order to be more sustainable. Creativity and innovation within a technoeconomic perspective are becoming the major driving forces behind the sustainability of economic growth and competitive achievements (Badran, 2007). Creative thinking is therefore a very essential part of earning and sustainable development (Sandri, 2013). Creativity is an essential engineering skill, therefore engineers have a lot of scope to support the development of creative skills (Carbonell-Carrera, 2019].

What is the level of engineers' creativity? How do they develop this skill? Does university education ensure a high level of creativity of future engineers?

Research shows that although students believe creative thinking is an important aspect of engineering, they do not have the impression of having enhanced their creative skills during the course of studies (Cropley, 2015).

There is a lot of research in the area of acquiring creativity among students (Szafrański et al., 2017). Such research was also done within the project called „The acceleration method of development of transversal competencies in the students' practical training process", realised in four countries: Poland, Finland, Slovakia and Slovenia. Literature of the subject also presents modern models directly referring to creativity regarding innovative organizations (Amabile & Pratt, 2016), new service development (Han-Kuang, et al., 2018), organizational creativity (Anderson et al., 2014) or collective creativity (Hargadon & Bechky, 2006). This

research rarely takes into account the process of enhancing creativity during formal, informal and non-formal education, therefore the authors included such an approach in this paper.

Competency enhancement approaches should be adapted to the student's needs. It is necessary to evaluate the level of creativity competency of individual students, and then to prepare a programme of business knowledge and skills development. The main research aspects of this paper are:

- How can competencies of future engineers in the area of creativity be developed and what does creativity depend on – internal and external factors (e.g. age, chosen elements of non-formal education, place of residence, forms of enhancing creativity).
- Can a model of enhancing creativity of future engineers be worked out?

In order to realise these goals, research on creativity competencies of students of two technical universities (A and B) was done between 2014-2020. In total, 861 future engineers of various technical faculties were examined. Using the method of a survey, the authors of this article recognized factors that influence enhancing students' creativity. Next, each of them was analysed statistically in order to isolate the dominant factors of developing creativity of future employees, and based on literature and empirical research, a model of developing future engineers' creativity was drawn up.

2. Enhancing Creativity Competency of Future Engineers

Enhancing the competency of creativity is the process of continuous learning and a key factor of the organization's success. A student develops and perfects their competencies in a formal, informal and non-formal way (Straka, 2002). Formal learning is institutionalised, formalised education, realised in accordance with syllabuses that result in qualifications accepted in a given legal system. Informal learning is intentional (self-learning) and unintentional learning, occurring accidentally in situations of everyday life, as well as when someone gains experience while working, not during formal or informal training. This form of education is usually of disorganized and non-systematic character, and covers any method of obtaining knowledge and experience (figure 1).

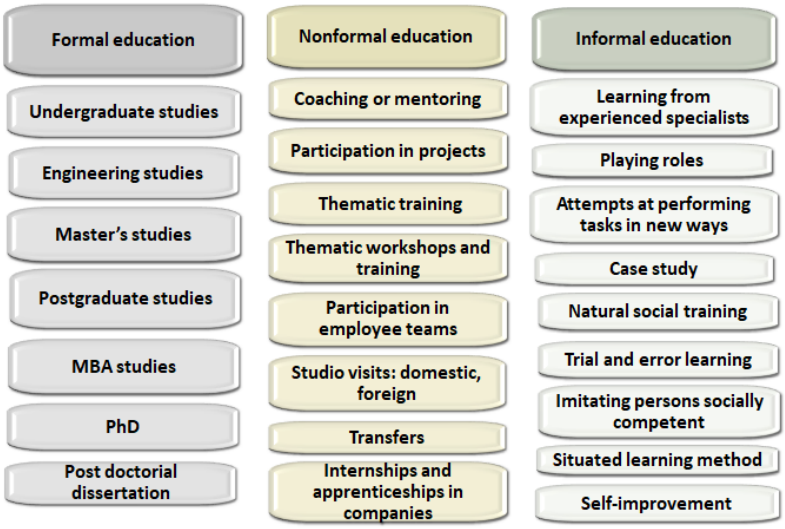

Figure 1: Formal, Non-Formal and Informal Learning of Creativity Competency of a Student - Examples (own Elaboration)

Figure 1 shows examples of a student's competencies development and improvement in a formal, informal and non-formal way (Spychała & Matejun, 2015).

The development and perfecting of a future engineer's creativity depend on many factors that, based on literature of the subject, were grouped into four categories and presented in the model drawn up:

- social and technical competencies that influence the development of creative thinking (Abrantes, 2020);
- characteristics of an employee and their environment (Sadłowska-Wrzesińska et al., 2017);

- forms of education realised throughout the professional career (2017; European Commission…2020);
- influence of the economic environment, including supply and demand for competencies of creativity, therein learning, knowledge and innovation (Hermawati, 2020).

3. Results

3.1 Research Assumptions

Statistical analyses for the research were carried out using TIBCO Software Inc. (2017). Statistica (data analysis software system), version 13. The research used regression analyses, Spearman's rank correlation coefficients, the power of interrelation between chosen variables (social competencies and forms of education) was evaluated. Only those factors that were correlated and whose correlation was statistically significant were used to build the statistical model. The analysis of correlations was verified and visualised with principal components analysis PCA, as well with cluster analysis using Ward's method.

The objective of the research was to create a hierarchy of chosen forms of formal, informal and non-formal education, which are evaluated by students and young employees who enter the job market as key forms in enhancing creativity, and to combine them with social competencies.

The research was carried out between 2014-2020, on a group of 861 students of day studies and extramural studies of two technical universities (A and B). The survey method was used, and the research tool was a self-evaluation questionnaire, where the creativity competency was expressed as synthetic measures based on three coefficients that allow evaluation of knowledge, skills and attitudes related to a given competence.

- K1 – knowledge regarding techniques of creative thinking
- K2 – ability to use techniques of creative thinking
- K3 – ability to think in a way that leads to original solutions, create new concepts or new connections with existing ideas.

These coefficients were described in detail and were evaluated by students on a scale 1-8, according to rules presented in Table 1.

The level of creative competency was set as the arithmetic mean of the battery of coefficients.

Cronbach's alpha was used to evaluate the reliability of the measurement. This coefficient allows to evaluate the conformity between various components (coefficients) of defined synthetic measures (Hair et al., 2006).

This coefficient defines with its value to what extent a set of coefficients describes the same theoretical constructs, represented by a given measure. According to the rules of methodology, it was accepted for this paper that the battery of coefficients represents acceptably reliable measure with Cr. > 0,7 (Sarstedt & Mooi, 2014).

Further in the paper, we presented the results of research on creativity level of students depending on various factors of one of the university A (594 respondents), where the arithmetic mean of results was analysed. Next, a model was drawn up, based on the correlation coefficient for all students surveyed of universities A and B.

Table 1: Description of Competency Levels

Level	Description
1	Competency is not acquired. No behaviour shows its acquisition and use in actions undertaken.
2	Basic acquisition of competence. It is used irregularly. Supervision and support from more experienced persons are required.
3	Sufficient acquisition of competence, hence it may be used in practice, independently. At times supervision of experienced persons is required.
4	Satisfactory acquisition of competence, hence it may be used indepentenly when performing professional tasks.
5	Good acquisition of competence, which enables adequate fulfilment of tasks in a given area.
6	Very good acquisition of competence, which enables very good fulfilment of tasks in a given area, and to pass own experience to others.
7	Excellent acquisition of competence. Ability to creatively use and develop knowledge and attitudes in a given area of tasks.
8	Expert level, ability to creatively share knowledge and skills with other managers and employees.

Source: own elaboration based on the research result

3.2 Questionnaire Research Analysis

The results of the research combine data from questionnaires that facilitated presentation of:

- students' age compared to self-assessment of creativity,
- internships and work used as a chosen element of non-formal education compared to creativity,
- work position during internship (manual, technical, administrative, managerial) compared to creativity,
- place of residence compared to creativity,
- forms of creativity development (formal: classes at university; non-formal: professional work, internships and apprenticeships, workshops and training, social organizations; informal: social life, family life).

Regarding the research results calculated with the arithmetic mean, it may be stated that:

- students (48 persons) who gave highest scores (7 and 8 out of 8) to three elements: presence in formal classes at university, initiative in class and results in education – average of competencies regarding creativity of these students is 4.49 (scale 1 – 8 see…);
- slightly lower – at 4.3, were placed students (55 persons) who gave high scores (7 and 8) only regarding their initiative in class;
- students (70 persons) who were placed at 4.01 gave high scores (7 and 8) regarding their average grade at university;
- the lowest self-assessment of creativity (3.48) was among students (306 persons) who gave high scores (7 and 8) only regarding one area, i.e. presence in clas-ses.

The arithmetic mean of self-assessment of all students surveyed at university A (total of 594) is 3.48 (on an eight-point scale).

The older the students, the higher the score of creativity self-assessment. Creativity self-assessment among 19-year-olds was 3 (38 students), 20-year-old – 3.18 (63 students), 21-year-olds – 3.24 (115 students), 22-year-olds – 3.47 (108 students), 23-year-olds – 3.59 (111 students) 24-year-olds – 3.69 (87 students), 25-year-olds – 4.01 (28 students), for students aged 26 and older – 4.1 (33 students).

Another factor analysed that enhanced creativity is internship. Average creativity self-assessment score (3.65) of students who did an internship (372 persons) was high-er by 0.17 compared to the arithmetic mean of creativity self-assessment score of all students. This difference was even bigger for students doing an internship or working for up to 4 years (by 0.59 – average creativity self-assessment score of 15 students was 4.07), up to 5 years (by 1.06 – average creativity self-assessment score of 8 students was 4.54) and above 5 years (by 0.93 – average creativity self-assessment score of 23 stu-dents was 4.41). The difference decreased as the length of internship or work de-creased. For 35 students doing an internship or working for up to 3 years, creativity self-assessment score was 3.93 – 0.45 higher than the arithmetic mean of creativity self-assessment score of all students surveyed. For 63 students doing and internship or working for up to 2 years, creativity self-assessment score was 3.47 – 0.01 lower than the average; for 228 students doing an internship or working less than a year creativity self-assessment score was 3.65 – 0.17 higher than the average.

The third factor analysed was the work position of internship or work. The highest scores of self-assessment of the surveyed group were among 42 persons who did an internship or worked in managerial positions (arithmetic mean of creativity self-assessment score – 4.24, 0.76 higher than the average of all surveyed students). Creativity self-assessment score of students doing an internship or working in technical positions was below the arithmetic mean of all students surveyed (arithmetic mean for a group of 107 students was 3.33, 0.15 lower than the average), and in manual positions (arithmetic mean for a group of 84 students was 3.3, 0.18 lower than the average of all persons surveyed).

The data analysed suggests that place of residence has an influence on creativity self-assessment done by students. 271 persons with above-average score of creativity self-assessment live in a big city of population >500 thousand inhabitants (arithmetic mean of creativity was 3.62 – 0.14 higher than the arithmetic mean of all persons surveyed). Students from small towns – 151 persons – were below the arithmetic mean of creativity self-assessment (arithmetic mean of the score – 3.46, 0.02 lower than arithmetic mean of all persons surveyed). The same applies to inhabitants of villages (167 persons, arithmetic mean of score – 3.29, 0.19 lower than the average of all scores).

Formal education, which includes classes at university (lectures, practical and laboratory classes and projects) is the most common source of developing creativity of the students surveyed (87% of indications). On the other hand, the lowest number of the surveyed (14%) evaluated this form as most useful in development of creativity competencies. The biggest influence on developing knowledge, skills and creativity attitudes is professional work, included in the category of non-formal education. This form is of key importance for the development of creativity competencies, as was indicated in 35% of cases, but also by a high assessment score of 5.28. Charities were evaluated by students as a poor form of developing competencies (average score 3.82). The fewest respondents (15%) indicated its key role in the process of improving creativity skills. Internships and apprenticeships, as well as workshops and training were given a higher score for their role in developing creativity competencies.

The last form of learning is informal learning: family and social life. Situations in social life were deemed by 23% of students as those that develop creativity competencies to the largest extent, with a high average score of 4.92. Importance of this form of learning is thus high and in the hierarchy it takes the second place, following professional work. Situations in family life were evaluated on a similar level to workshops and training – average score was 4.49, with a slightly higher percentage of respondents attributing those situations with a key role in the process of developing creativity.

3.3 Drawing up the Model Based on the Correlation Coefficient

In view of the above conclusions and aiming at realisation of the research objective, a path of developing creativity may be drawn (fig. 2). Individual stages of developing creativity result from both literature analysis and the analysis of survey research among students. 861 students took part in the research, but due to the completeness of data for calculating the correlation coefficient, surveys of 841 respondents were used.

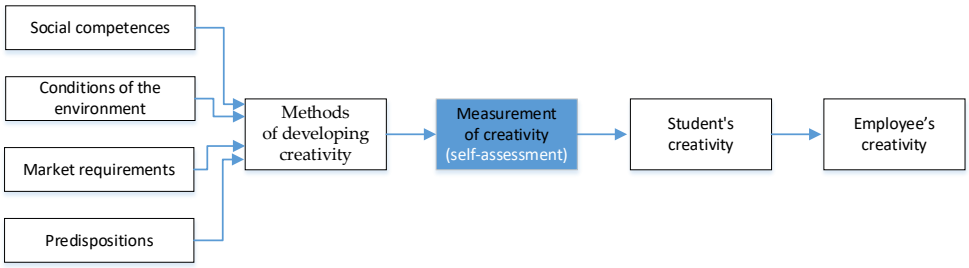

Figure 2: Chosen Factors That Influence the Path of Competency Development With an Impact on Employee's Creativity

Stages of developing creativity presented in fig. 2 were examined in detail through questionnaires, and results thus obtained were subjected to statistical research. The analysis, based on hierarchical multiple regression, revealed that social competencies and forms of learning examined are strongly correlated with 'creative thinking' competence, and this correlation is statistically significant.

Table 2. shows correlation coefficients between chosen independent variables self-assessing the level of social competencies and the used forms of learning, and the most significant competency related with creativity – 'creative thinking'. The strongest correlation was shown by the group of social competencies (SC - 02 Managing a team, SC – 03 Conflict resolution, SC - 04 Organizational skills, SC - 05 Negotiation skills, SC - 06 Internal communication skills, SC - 07 Communicating with the environment, SC - 08 Strategic thinking, SC - 09 Managing information). Weaker correlation was shown by FE - 01 Professional work, FE - 02 Internship/ apprenticeship, FE - 03 Workshops/ training (simulations), FE – 04 University classes (e.g. practical classes), FE – 05 Out-side work (e.g. organizing events), FE – 06 Family life (e.g. parents), FE – 07 Social activity (voluntary work)).

* $p<0.05$ statistically significant value, $p\geq0.05$ statistically insignificant value. Source: own elaboration based on the research result

In order to describe the dependency model based on hierarchical multiple regression, all independent variables that showed a significant correlation with creative thinking were analysed (tab. 3). The model drawn up covered six steps, but since in the last step the variable did not enhance the description, it was not included in the description of the model. In the first step, the variable (SC – 02 Managing a team) described the model largely and was statistically significant ($R2 = 0.35$, $p \leq 0.001$), where-as further variables improved the correlations of the model. Finally, the description of the model was based on four variables from the area of social competencies (SC – 02 Managing a team, SC – 05 Negotiation skills, SC – 03 Conflict resolution, SC – 08 – Strategic thinking) and one variable regarding the form of education (FE – 03 Work-shops/ training (simulations)). This model described significantly – in 43% - the phenomenon of correlating creative thinking with qualities examined in the survey ($R2 = 0.43$, $p \leq 0.001$, $F = 13,27$).

Figure 3 shows graphic correlations between qualities analysed that have an influence on creative thinking. Factors appearing in the model describing the phenomenon statistically analysed were also marked in the chart (social competencies SC – 02, SC – 05, SC – 03, SC – 08 and the form of education FE – 03). The chart presented is also the idea reflection of factors related with competencies significant in the job market, as well as the reflection of the model for developing creativity of future engineers.

Additionally, while looking for the correlations between the examined qualities, an analysis of variance was used to estimate the distance between clusters as well as Ward's method. (fig. 4.) The choice of this method was justified with the analysis of variance relating to the data set while obtaining a high effectiveness with examining small clusters.

Internal similarities and external differences may be observed based on the tree diagram, an example of which may be a separate accumulation of social competencies from SC – 01 to SC – 08 and a separate accumulation of forms of education from FE 01 to FE 07. A very distinct similarity of social competencies SC – 01 and SC – 08, while simultaneously discarding SC – 08 should be noted. It shows a lack of group connection with a very distinct individual similarity.

Table 3: Analysis of Backwards Stepwise Regression – Establishing the Model Of Dependencies

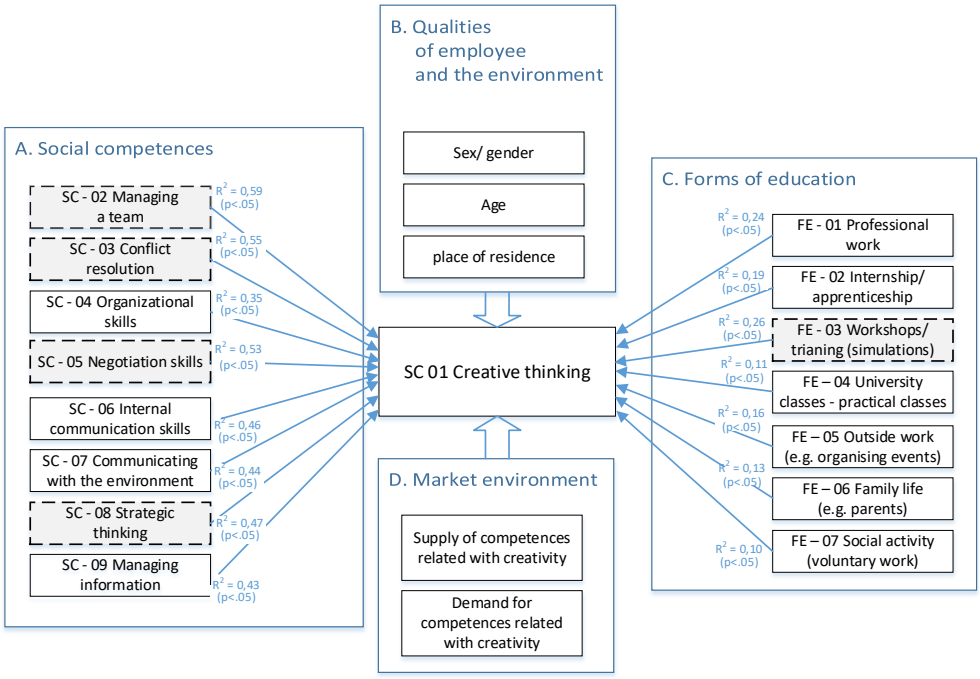

Figure 3: Graphic and Statistical Model for Developing Creativity of Future Engineers

Within the scope of expanding search for correlations indicating general regularities in relationships between variables taken into account in the examination of social qualities that influence creativity, principal component analysis (PCA) was done – figure 5. The component, corresponding to the first (biggest) eigenvalue, explains as much as 61.9% of total variability, the second one – 9.7%, which explains 71.6% of random variable. Vectors representing the analysed variables reach almost the edges of the unit circle, thus they are well represented by the first two components. Five components show a positive flow direction and confirm, previously proved in other research and literature analysis, a stronger correlation between social qualities

connected with communication (managing a team, internal communication skills, communication with the environment) and coordinating managerial competencies (organizational skills, strategic thinking). Managing in-formation is also characterised by a bigger angle inclination, which proves a weaker correlation among other variables. The distribution of other variables indicates a significant correlation of primary variables – their angle inclination from the second principal component does not exceed 900 (α < 450).

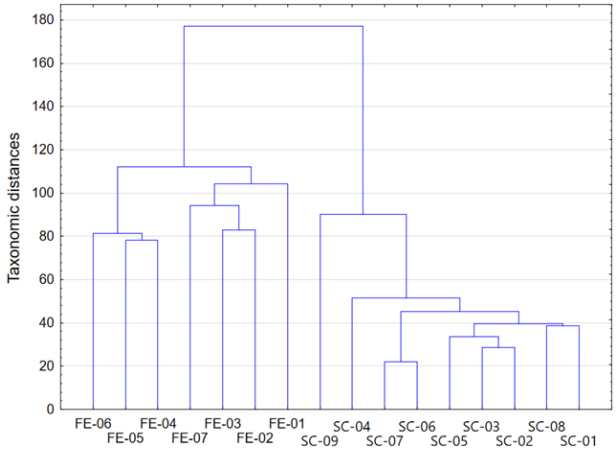

Figure 4: Tree Diagram - Ward's Method – Accumulation of Qualities Related with Creative Thinking

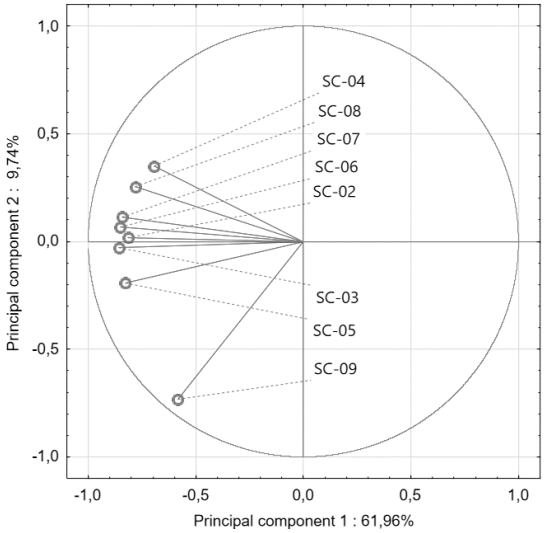

Figure 5: Principle Component Analysis of Social Competencies Related With Creative Thinking

The choice of analyses presented and the results was an attempt at showing opportunities of managing employees' competencies in effective business management. The use of activities described in the presented model should result in improving the quality of developing key competencies during the learning process, and their agile use and development at work.

4. Discussion

The objectives stated at the beginning of this paper referred to two areas: a) factors that influence the development and perfecting competencies of future engineers regarding creativity, and b) a proposal of a model for developing creativity of future engineers, that would encompass factors showing the higher influence on social competencies. Looking for the appropriate method of developing students' competencies, first their level should be recognised and adapted to their needs. It is necessary then to first examine the level of creativity competency of individual students, and next to create a programme of developing knowledge and business skills. Main research aspects of this paper, related with the opportunity for development and perfecting competencies of future engineers regarding creativity were included in the model. A large number of future engineers who provided information for the construction of the model is the reliable premise for implementation of the model obtained.

Having analysed our results, we may state that limiting development of factors most closely correlated with creative thinking (Managing a team, Negotiation skills, Conflict resolution, Strategic thinking or the form of education based on Workshops and training) may be the effective approach to the development of necessary competencies. In the research two areas were confronted – practical and theoretical – students' self-assessment of their own competencies in connection with factors included in the questionnaire, which were resulting from the literature analysis. The results obtained also confirmed the thesis that the university plays an important role in developing students' creativity, which is in line with research of other authors, e.g. (Tawil, & Dahlan, 2017; Tawil & Dahlan, 2017).

Factors present in examined models of creativity published by other authors were included in the model drawn up, e.g. (Awan et al., 2019). Taking into consideration the results of other authors and in order to increase the usefulness of the model used, further re-search could extend it by factors connected with internal motivation of the surveyed and conditions enabling implementation of innovation in the environment.

5. Conclusions

The importance of creativity among employees in the job market is emphasised (Abrantes, 2020). Human capital is currently the most valuable resource of modern businesses. Due to the great variability of the surroundings and the necessity to continuously increase competitive advantage and to be distinguished in the market, creativity may be the key competency in many work positions. It seems to be one of the key factors that influence the success of a business.

This paper emphasises the necessity of extensive description of competencies, which reflect knowledge and skills of employees and their connections with interrelations on managing human capital. Research results are based on data obtained from a large group of students, i.e. the group most involved in the development of managerial skills. Conclusions presented regarding the importance of creative thinking and including this social competency in the group of various forms of education are coincident with the perception of an employee as the most important 'resource' expressed as human capital (Bortolotti et al., 2015]. Such a view of social competencies and their development is also an important aspect of preventive management. Research shows that future engineers, while still at university, must develop their potential, investing in various forms of education for their future jobs. The significance of the influence of various forms of education on creative thinking is also presented in scientific papers discussing the ways of increasing the effectiveness of the educational process (Carayannis et al., 2017). Justification and practical use of the model presented in this paper is also shown in other research carried out by the authors (Goliński & Miądowicz, 2019; Goliński & Szafrański, 2019; Graczyk-Kucharska, 2019).

tiago.goncalves@aln.iseg.ulisboa.pt
ccurado@iseg.ulisboa.pt

Abstract: Knowledge management systems in the healthcare context are designed to facilitate knowledge flows and to integrate ways of capturing, leveraging, and sharing knowledge effectively. However, knowledge management implementation is often challenging and driven by the complex and multifaceted nature of healthcare knowledge, albeit related to high performance healthcare outcomes. The social nature of knowledge brings forth additional complexities and managerial challenges that can be related to individual undesirable knowledge behaviours - such as knowledge hiding and knowledge hoarding. Undesirable knowledge behaviours reflect human-based activities that jeopardize decision-making and performance by consciously and unconsciously hindering knowledge flows inside organizations. Such loss of important information can promote disagreements surrounding allocation of resources, contributing to dissonant goals and perspectives that shape task conflict. To that end, the purpose of our work is to understand the influencing role of knowledge management systems, knowledge hoarding, knowledge hiding and task conflict as contributors shaping quality of care in hospitals. We follow a quantitative approach, using partial least-squares structural equation modelling (PLS-SEM) to test the relationships between variables from our original empirical model. Research data comes after a survey conducted to 318 healthcare professionals working in Portuguese hospitals. Main findings show that knowledge management systems positively contribute to knowledge hoarding behaviour, while also presenting a positive influence on the quality of care provided by the hospital. Additionally, knowledge management systems are negatively related to the existence of task conflict between healthcare professionals. Conversely, results show that knowledge hiding is positively related to task conflict–being the latter a negative predictor of quality of care. Moreover, results show that knowledge hoarding positively affects quality of care. Our research offers an original contribution to healthcare management by providing insight on the influence of knowledge related systems and behaviours and their influence on the quality of care provided by healthcare professionals. Theoretical and practical contributions driving future action and research are presented.

Keywords: Knowledge management systems, Knowledge hiding, knowledge hoarding, Task conflict, Quality of care, Mixed-methods, Healthcare

1. Introduction

Quality of care reflects dimensions of responsiveness, access, and patient trust, making it a core concern of healthcare practice (Anufriyeva et al., 2020). As such, quality of care results of a combination of factors that drive the core concern of healthcare services (Aiken et al., 2002). As healthcare development becomes increasingly complex, so do the conventional forms of measurement representing quality of care are being challenged (Hannawa et al., 2021). Structural aspects such as clinical practice knowledge, efficiency procedures, and techniques are important factors that influence quality of care (Karamitri et al., 2017; Kosklin et al., 2022). By extension, job and task related complexities are also drivers shaping quality of care (Anufryeva et al., 2020; Hannawa et al., 2021).

Despite the recognized importance of knowledge management practices and systems in the development of healthcare performance, knowledge management systems (KMS) remain underused in healthcare organizations (Hammoda et al., 2022). The implementation of knowledge management in healthcare faces many challenges and obstacles, as discussed by previous research (Karamitri et al., 2017)

Expanding on the knowledge difficulties (Hammoda et al., 2022) evidence suggests that the poor implementation of knowledge management systems and practices can act as a driver to power shift differences, marginalization of professionals and stratification through social isolation (Pandey et al., 2021). Such risks draw parallels from emergent literature in knowledge management literature focused on counterproductive forms of knowledge (Connelly et al., 2012). Knowledge hiding and hoarding are both motivated by power and psychological ownership of knowledge, and both are negatively related to knowledge sharing (Connelly et al., 2012; Oliveira et al., 2021). While research on the damaging effects of knowledge hiding in healthcare is limited, recent evidence suggests negative consequences at the individual level (Alam et al., 2021; Pandey et al., 2021). However, performance-based outcomes and consequences shaping the nature of healthcare work remain scarce in the healthcare literature. Expanding on such gap, this work aims to explore the role of knowledge management systems and counterproductive forms of knowledge behaviour

(knowledge hiding and knowledge hoarding), assessing their impact on the task conflict experienced by healthcare professionals and in the quality of care provided to patients.

2. Literature Review

2.1 Quality of Care

Quality of care is influenced by both structural aspects, such as clinical knowledge and procedures, and intrapersonal/individual characteristics, such as skill, learning, and teamwork (Anufryeva et al., 2020; Hannawa et al., 2021).

Therefore, it is necessary to explore the integration of both individual and organizational factors in promoting quality of care (Moen et al., 2021). Recent literature emphasizes the importance of self-assessment and individual input from healthcare professionals in measuring quality of care (Hannawa et al., 2022; Moen et al., 2021). By extension, it is of importance to consider the perspectives of healthcare professionals and patients to better understand the contribution of individual input to organizational preparedness in healthcare environments (Ayatollahi and Zeraatkar, 2019).

Achieving quality of care requires a focus on knowledge management at multiple levels, including infrastructural related sources (information technologies and systems), task oriented related sources (job complexity, task characteristics), and individual factors such as motivations and attitudes towards knowledge seeking and sharing (Anh et al., 2021; Savic et al., 2020). The healthcare industry can benefit from a transposition of such requirements to achieve innovative and competitive performance, mirroring in healthcare performance outcomes driven by knowledge related phenomena similar positive performance outcomes found in other knowledge intensive environments (Karamitri et al., 2017).

The integration of individual and organizational factors related to knowledge as an asset is essential in promoting quality of care in healthcare delivery (Hammoda et al., 2022; Karamitri et al., 2017; Pandey et al., 2021).

2.2 Knowledge Management Systems in Healthcare Organizations

KMS describe fundamental managerial process to improve individual and organizational outcomes in healthcare organizations (Karamitri et al., 2017; Kosklin et al. 2022). KMS rely on combinations of information infrastructures, technologies, as well as policies, processes and practices that can support the management of knowledge (Avali and Leidner, 2001).

The growing complexities in healthcare knowledge further justify the development of KMS in recent years, supported by the developments of new forms of technologies to support knowledge's potential in achieving proper forms of diagnostics and treatment to patients (Phan et al. 2022). As such, the role of KMS in healthcare should consider a two-folded approach to knowledge mobilization and knowledge use. The first, considering their potential to organize work, tasks and gain access to knowledge (Ayatollahi & Zeraatkar, 2019; Plaice & Kitch, 2003). The second, to ensure KMS design concerns on promoting social contact to attain higher levels of tacit knowledge only available at the individual level (Ayatollahi & Zeraatkar, 2019).

The implementation of KMS and practices can enhance interaction and reduce conflicts and professional tensions, therefore reducing uncertainty (Kosklin et al., 2022) – a proposition that mirrors the positive role of KMS in hindering task conflicts that arise from unclear visibility of the nature of work in other knowledge intensive environments (Semerci, 2019) or among working teams (Mu et al., 2021). Considering the advantages of KMS in the promotion of clearer venues of communication and knowledge flows in healthcare organizations (Alam et al., 2021; Karamitri et al., 20217; Kosklin et al., 2022), we propose that:

H1: KMS have a positive influence on the quality of care provided by healthcare professionals.

H2: KMS have a negative influence on the task conflict experienced by healthcare professionals.

Although deemed a knowledge intensive environment (Kosklin et al., 2022), healthcare organizations reliance on technology supporting knowledge management systems alone is insufficient if individuals fail to contribute or perceive these systems (Karamitri et al., 2017).

Of the risks related to mismanagement of knowledge management in healthcare settings, knowledge hiding and knowledge hoarding represent two counterproductive behaviours that can have life-threatening consequences, compromising the quality of care and the well-being of professionals (Pandey et al., 2021). These behaviours are driven by power dynamics and the perceived ownership of knowledge (Connelly et al.,

2012; Oliveira et al., 2021), acting more than an opposing force to knowledge sharing (Oliveira et al., 2021). Knowledge hiding reflects the intentional concealment of knowledge solicited by others, whereas knowledge hoarding reflects an unintentional accumulation of knowledge that is not shared with others for personal gain (Connelly et al., 2012; Gonçalves et al., 2023; Oliveira et al., 2021). Given the KMS focus on ensuring knowledge flows and knowledge availability in healthcare organizations (Alam et al., 2021; Kosklin et al., 2022), we argue that KMS hinders knowledge hiding behaviour. Nevertheless, we also propose that the availability of knowledge can promote accidental accumulations of knowledge and promote knowledge stickiness (Kim et al., 2012). Therefore, we hypothesize that:

H3: KMS have a negative influence on the knowledge hiding behaviour among healthcare professionals.

H4: KMS have a positive influence on the knowledge hoarding behaviour among healthcare professionals.

2.3 The Emergence of Counterproductive Knowledge Behaviours

Emerging as the more studied forms of counterproductive forms of knowledge behaviour, both knowledge hiding and knowledge hoarding represent two of the more conceptually developed and empirically studied phenomena in the literature discussing negative behaviours related to knowledge (Gonçalves et al., 2023; Oliveira et al., 2021; Silva de Garcia et al., 2021).

Literature suggests that knowledge hiding and knowledge hoarding research is focused simultaneously on both individual and organizational influences leading to such behaviours, and individual and organizational consequences stemming from them (Gonçalves et al., 2023). Nevertheless, empirical research is still scarce, with conceptual overlaps, still persisting in the operationalization of both knowledge hiding and knowledge hoarding (Gonçalves et al., 2023; Oliveira et al., 2021). Existing conceptual work proposes that knowledge hiding represents a deliberate intention to conceal information from others upon request (Conelly et al., 2012). On the other hand, knowledge hoarding represents an equal form of withholding of knowledge that is not shared to others after an accidental (and individual) accumulation of knowledge (Oliveira et al., 2021). Existing evidence in the literature suggests that job characteristics are related to knowledge hiding behaviours, with such forms of negative behaviours contributing to cycles of conflict grounded on psychological and power threats (Semerci et al., 2019). Nevertheless, there is little to no evidence on the role of knowledge hoarding as a form of behaviour that further leads to perceived conflicts in organizations. Given the complex nature of healthcare knowledge and the task related complexities representing knowledge assets in healthcare organizations (Hammoda et al., 2022), we propose that:

H5: Knowledge hiding behaviour has a positive influence on the task conflict experienced by healthcare professionals.

H6: Knowledge hoarding behaviour has a positive influence on the task conflict experienced by healthcare professionals.

Consequently, the difficulties surrounding the implementation of KMS in healthcare led to the development of healthcare management literature focused on the barriers, risks, and consequences of poor knowledge management inside healthcare organizations (Alam et al., 2021; Hammoda et al., 2022; Pandey et al., 2021). Expanding on the implementation of KMS and practices in healthcare organizations, knowledge management initiatives in healthcare are met with persistent and old-fashioned practices, as discussed in literature spawning more than a decade (Alam et al., 2021; Kim et al., 2012; Karamitri et al., 2017). Such evidence is of concern, in particular when considering both the life-threatening consequences from poor management of healthcare knowledge, and the potential for counterproductive behaviours stemming from erosion or knowledge devalue in healthcare organizations (Pandey et al., 2021). Pandey and colleagues (2021) argue that such lack of strategy or direction in the management of knowledge leads to power imbalances, stratification, and marginalization. This perspective aligns with current research on knowledge management, which has identified knowledge hiding and hoarding as negative or counterproductive forms of organizational behaviour related to knowledge as a resource (Connelly et al., 2012; Gonçalves, Curado and Oliveira, 2023). Adding to the identified risks of value destruction in healthcare through mismanagement of knowledge assets, counterproductive forms of knowledge behaviour are discussed in the literature as antecedents of both individual and team performance (Garg et al., 2022). Nevertheless, we argue that knowledge hoarding acts as a positive antecedent of quality of care, given the quasi-accidental nature of knowledge hoarding (Oliveira et

al., 2021) and its self-interest focus on individual development (Oliveira et al., 2021). Therefore, we propose that:

H7: Knowledge hiding behaviour has a negative influence on the quality of care provided by healthcare professionals.

H8: Knowledge hoarding behaviour has a positive influence on the quality of care provided by healthcare professionals.

2.4 Task Conflict in Healthcare Organizations

Task conflict describes a type of interpersonal conflict that arises from disagreements or conflicting views on how to approach and perform specific tasks or activities in the organizational context (Jehn et al., 1995). As such, task conflict differs from relationship conflict through the awareness of differences in interests and the incompatibility of interests pertaining the nature of work.

Research on task conflict represents a static nature of the phenomenon, often not acknowledging the cyclical pattern surrounding task conflict (Kuypers et al., 2018). Expanding on such view, literature suggests that the complex nature of task conflict presents a temporal pattern shifting from and to relationship conflicts (Guenter et al., 2016). Such evidence can draw a comparison with several propositions supporting the individual-centric nature of knowledge (Hammoda et al., 2022) by understanding individual behaviours and individual complexity. Expanding on this rationale, Kuypers and colleagues (2018) discuss that the role of task conflict should be viewed, not under its managerial complexities, but as a phenomenon related to human capital depletion (p. 1290).

Effective communication, open-mindedness, and willingness to compromise are key factors in managing task conflict in healthcare teams (Gittell et al., 2013; Mitchell et al., 2019). Additionally, clear role definitions, shared goals, and a focus on patient-centered care can help to minimize task conflict and facilitate the delivery of quality of care (Gittell et al., 2013). By extension, evidence also suggests that positive forms of commitment and communication between healthcare teams can also contribute to better quality of care when experienced task conflict is low (Mitchell et al., 2019). Therefore, we propose that:

H9: Task conflict experienced by healthcare professionals has a negative influence on the quality of care provided.

Figure 1 presents the research model.

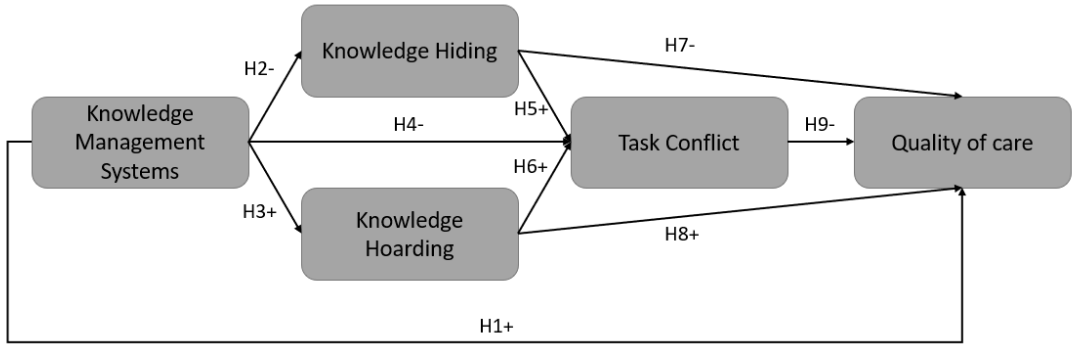

Figure 1: Research Model

3. Methods

3.1 Partial Least Squares Structural Equation Modelling

This study adopts a quantitative approach and utilizes a Partial Least Squares Structural Equation Model (PLS-SEM) to examine survey data collected from 318 healthcare professionals. The PLS-SEM is an estimation model that aims to evaluate and estimate the path models between latent variables and their connections. It is a suitable technique for smaller samples and can address limitations in researching complex variables (Hair et al., 2019).

3.2 Sample

The data comes from an online survey using QualtricsXM® sent to healthcare professionals working in hospital in Portugal. The research team contacted several hospitals (both private and public) who acted as a point of contact to ensure the internal distribution of the survey among healthcare professionals. The survey was internally validated by the Ethical Committees from the partnering organizations to ensure compliance. Measures come from different sources, previously validated in the literature. We conducted several ex-ante procedures to ensure data consistency and remove common-method and non-response bias. Participant anonymity and confidentiality was ensured. Items were randomized and counterbalanced. A team of six specialists representing several healthcare professionals provided insight on the survey to ensure further consistency and remove bias. The final sample comprises 318 responses. The demographic information of the sample is presented below (Table 1).

Table 1: Descriptive statistics

		f	%
Gender	Female	238	74.8
	Male	78	24.8
	Non-binary/Other	1	0.3
Age(years)	18-24	19	6
	25-34	74	23.3
	35-44	77	24.2
	45-54	72	22.6
	55-64	69	21.7
	65+	7	2.2
Profession	Certified therapists	27	8.5
	Hospital pharmacists	21	6.6
	Medical doctors	95	29.8
	Nurses	125	39.3
	Other allied health professionals (e.g. Technicians and technologists)	46	14.5
	Psychologists	4	1.3
Professional Experience(years)	0-1	23	7.2
	1-5	44	13.8
	6-10	41	12.9
	11-15	33	10.4
	16-20	55	17.3
	21+	122	38.4

3.3 Measures

We use previously validated measures coming from difference streams in the literature to ensure diversity and reduce common-method bias. KMS comes from Serenko and Bontis (2016). Knowledge hiding and knowledge hoarding comes from Connelly and colleagues (2012). Task conflict comes from Jehn (1995). Lastly, quality of care comes from Aiken and colleagues (2002). All measures were adapted following a seven-point Likert like scale system (1-Completely disagree/Very poor/Completely unconfident to 7-Totally agree/Excellent/Completely confident).

3.4 Measurement Model

The PLS-SEM approach requires a two-step analysis process (Hair et al., 2014; 2019). The first, centred in measures, relies on the calculation of the discriminant and convergent validity of the measures used in the

research. Following best practices, we calculate the convergent validity of the measures by inspecting the variance extracted (AVE), the Cronbach's alpha, and the resulting composite reliability (CR) (Hair et al., 2019) using the SmartPLS4® PLS-SEM algorithm. All measures remain above the recommended thresholds (AVE>0.5; CR>0.8). Regarding the discriminant validity, we follow three analyses (Hair et al., 2014; 2019). The analysis of outer-loadings, cross-loadings and the assessment of the heterotrait-monotrait (HTMT) matrix. All outer loadings for the items are above 0.5 (acceptable given the exploratory nature of the model (Hair et al., 2019)), ranging from 0.573 to 0.886. All outer loadings are higher than the cross-loadings, and the HTMT matrix presented values below the recommended threshold. The subsequent validation of the variance inflation factors (VIF) shows the presence of 2 items related to knowledge hiding (KH2 and KH10) with higher than recommended values (Hair et al., 2019), therefore being removed from the final model.

4. Results

The testing of the significance of the relationships in the structural model uses the SmartPLS4® bootstrapping algorithm. Results show that KMS has a positive impact on the quality of care provided by healthcare professionals (β=0.478;t=10.234;p<0.001) (H1). Conversely, KMS have a negative impact on the task conflict experienced by healthcare professionals (β=-0.275;t=4.782;p<0.001) (H2). KMS also have a positive impact on the knowledge hoarding behaviour (β=0.204;t=3.745;p<0.001), therefore confirmed hypothesis 3. However, no significative relationship was found between KMS and knowledge hiding behaviour (H4). Regarding counterproductive knowledge behaviours, results show that only knowledge hoarding has a significative and positive impact on quality of care (β=0.108;t=2.105;p<0.05)(H8), with knowledge hiding showing no effect on the outcome (H7). Conversely, while knowledge hoarding shows no significative impact on the task conflict experienced by healthcare professionals (H6), knowledge hiding has a positive and significative impact for the same outcome (H5)(β=0.223;t=4.531;p<0.001). Lastly, results show that task conflict experienced by healthcare professionals as a negative impact on the quality of care delivered to patients (β=-0.121;t=2.257;p<0.05). Figure 2 shows the main results.

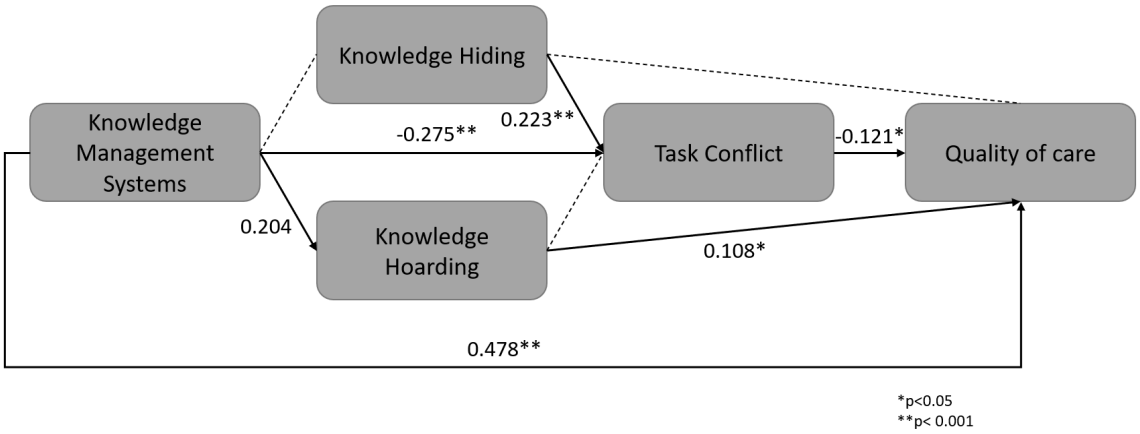

Figure 2: Quantitative Results

According to the structural model analysis, the results explain approximately 31% of the variance of data found for quality of care (R^2= 0.312), suggesting a medium explaining power of the model to the outcome (Hair et al., 2014). All significant relationships have effect sizes (f^2) above the recommended threshold (>0.05) (Hair et al., 2019).

5. Discussion and Conclusion

Our research expands on the importance of knowledge management in healthcare by exploring aspects related to the organizational capability to manage knowledge (KMS) and by expanding on a gap pertaining the consequences of counterproductive forms of knowledge in an understudied setting: that of healthcare organizations. Therefore, the work provides insight on current streams of research revisiting knowledge risks in healthcare (Hammoda et al., 2022), raising awareness to their consequences.

Regarding our hypotheses, results show that KMS have a positive influence on the quality of care delivered to patients (H1). Such findings reflect the importance of knowledge management implementation previously

discussed in the literature, relying on its vital role as a strategical tool to handle knowledge complexity and value creation through knowledge leverage in healthcare (Hammoda et al., 2022; Karamitri et al., 2017; Pandey et al., 2021). By extension, results also show that KMS have a negative influence in task conflict (H4), acting as an organizational structure that can reduce uncertainty and dissonances in healthcare tasks through the raised awareness on communication and cooperation (Karamat et al., 2019; Ayatollahi & Zeraatkar, 2019). Although KMS show no relationship with knowledge hiding in healthcare (H2), findings suggest a positive relationship between KMS and knowledge hoarding behaviour (H3). We argue that, by facilitating knowledge flows among healthcare professionals, KMS presents a quasi-paradoxical risk to knowledge stickiness (Kim et al., 2012) by nurturing behaviours of accumulation. Such novel findings advise caution and managerial implications. In the context of our findings, knowledge hoarding promotes quality of care – suggesting that the centralization and accumulation of knowledge in individuals can be beneficial to the development of healthcare performance (H8) (Karamitri et al., 2017). However, literature suggests that knowledge hoarding can lead to knowledge devalue and negative organizational consequences fostered not on task conflicts, but on relational forms of conflict that bypass the nature of the job (Connelly et al., 2012; Gonçalves et al., 2023; Oliveira et al., 2021).

Findings also suggest a positive relationship between knowledge hiding and task conflict (H5), and no relationship between knowledge hiding and quality of care (H7). Knowledge hiding has no direct effect on the quality of care provided to patients, however it does contribute to task conflicts experienced by healthcare professionals (H5), which in turn impact negatively on quality of care (H9). Similarly to the findings pertaining to knowledge hoarding, such evidence raises managerial concerns. We argue that knowledge hiding behaviours do not present a face value threat to quality of care given the growing concerns on team complexity design and vertical integrations in the healthcare process found in recent literature (Short & Ho, 2020). Expanding on the relationship between knowledge hiding and task conflict, although previous literature explores task conflict as an antecedent of knowledge hiding (Garg et al., 2021), we challenge that conceptualization by following a rational grounded on cyclical forms of conflict as discussed by Jehn (1995). Our findings suggests that task conflict is a consequence of knowledge hiding, relying on the promotion of knowledge mobilization strategies to support the current managerial challenges and difficulties in handling task conflict and its consequences (de Wit et al., 2012; Guenter et al., 2016; Kuypers et al., 2018). Lastly, findings corroborate previous evidence on the role of task conflict in healthcare organizations, suggesting that the lack of shared views in the nature of tasks has a negative impact on healthcare outcomes (Gittell et al., 2013; Mitchell et al., 2019) – here represented under quality of care.

Our work provides important theoretical and practical contributions. From a theoretical standpoint, this paper expands on the still limited empirical knowledge on counterproductive forms of knowledge behaviour in healthcare organizations. By extension, it provides an empirical effort to clarify the differences between different forms of negative behaviour, by addressing the effects of both knowledge hiding and knowledge hoarding – accommodating a theoretical approach suggested in recent literature (Gonçalves et al., 2023; Oliveira et al., 2021). Finally, it explores the effects of knowledge related phenomena in healthcare performance by responding to current challenges on the nature of quality of care (Hannawa et al., 2022) – centring its assessment on the individual input of healthcare professionals.

Regarding practical implications, the focus on both KMS and individual knowledge behaviours allows for managerial flexibility to nurture quality of care and to identify and act on knowledge risks, as proposed in recent literature (Hammoda et al., 2022). Managers and healthcare policymakers should understand and encourage the individual awareness behaviours aimed at the use of KMS in healthcare organizations to promote knowledge flows (Karamitri et al., 2017). However, we recommend that a focus should be given to ensure that the optimization of knowledge mobilization should rely on a cyclical and continuous activity, to deny behavioural tendencies focused on the individual accumulation and stagnation of knowledge. The promotion of reward systems and training should be deployed to raise awareness of the importance of KMS, but also to alert managers of the risks of knowledge concealment (Hammoda et al., 2022). We advise a managerial strategy with engaging leadership that entices cooperation and encourages self-learning of team members, focused on flexibility and team communication. Only through the individual engagement and focus on knowledge related phenomena can knowledge management truly thrive in healthcare organizations (Agrifoglio et al., 2021; Hammoda et al., 2022; Pandey et al, 2021).

6. Limitations and Future Work

This work is not exempt from limitation. We use a PLS-SEM approach to provide an innovative empirical insight on KMS and counterproductive forms of knowledge behaviour in healthcare. However, the research design follows a cross-sectional strategy, which limits causality. The limit geographical scope is also another limitation (Portuguese hospitals), presents risks of cultural influences as non-accounted effects shaping our findings. We recommend future research to contrast our research considering an increased geographical scope and assessing contrasting between professional groups. Lastly, we recommend the inclusion of knowledge complexity and knowledge fragmentation, as well as specific types of knowledge in future research. Namely behaviours pertaining to explicit knowledge and to tacit knowledge.

Abstract: Employee well-being is an essential component of any organisation organisation. Conscious companies make every effort to create a healthy work environment. The well-being of employees and their overall emotional, physical and economic health is affected by various internal and external factors. When employees feel well, they tend to perform better. Therefore, the impact of employee well-being on the organisation is a fact and has been proven in many studies. People with a high level of well-being have greater self-confidence and self-esteem, which means that they are not afraid to look for new solutions and innovations. They are also generally more committed to their work and more dedicated to the organisationorganizational goals (Kim, 2021). Finally, they are more productive, which affects the whole performance of the company. Despite the high importance of employee well-being for the success of organisations organisations, little is known about how this well-being might influence human knowledge risks appearing in organisations. The article aims to present the potential link between employee well-being and human knowledge risks. The paper presents theoretical insights related to employee well-being, as well as human knowledge risks. organisations and organisations.This study has allowed us to identify the potential link between employee well-being and human knowledge risks, which brings several implications for organisations and organisations. showsThe ability to create conditions by managers to increase the well-being of their employees might be useful, in the trial of minimising human knowledge risks in organisations. The study is of theoretical character, and thus its findings should be further examined in practise research studies. The study provides useful information for managers and owners of organisations in need of dealing with various human knowledge risks threatening their organizations. The paper is enriched with a number of sample solutions that they may apply to increase the well-being of their employees and, therefore, mitigate those risks. The paper lays the ground for a better understanding of human knowledge risks and its relationship with employee well-being. As such, the paper offers food for thought for researchers dealing with the topic of human knowledge risks and human resource management, in general.

Keywords: Human knowledge risks, Employee well-being, Knowledge management

1. Introduction

Anxiety, depression, fatigue, aches, aches, and pains are among the many symptoms of deteriorated mental and physical health and poor employee well-being – both possible causes of lower productivity and poorer organisational organisational performance (Rasool *et al.*, 2021). To reduce the severity of such phenomena, employers are fond of declaring that they support and care about the well-being of their employees. In reality, many organisations simply do not have a dedicated well-being strategy. Providing a medical package or a low-cost membership to a fitness club is not enough; these are only partial short-term measures. Companies must focus on a holistic strategy so that workplace well-being becomes part of their organisational culture (Nicholson, 2022). The Chartered Institute of Personnel and Development (2022) in their study identified that focussing on employee well-being brings a number of benefits. It is a healthy organisational culture that fosters inclusion, better employee morale and participation, and a better work-life balance. According to Grawitch, Gottschalk, and Munz (2006), 'fostering a work culture that is mindful of the importance of work-life balance, employee growth and development, health and safety, and employee participation can be the key to achieving sustainable employee well-being and organisational performance". Therefore, caring for employee well-being should not be an "add-on," it should be a part of the company's core operation and the centre of the business model. Healthy and happy employees cope better with their workload, build positive relationships with co-workers, are more creative, and achieve better results (Nicholson, 2022). People with a high level of well-being have greater self-confidence and self-esteem, which means that they are not afraid to look for new solutions and innovations. They are also usually more committed to their work and more dedicated to the organisation's goals (Kim, 2021).

Despite the high importance of employee well-being for the success of organisations, little is known about how this well-being might influence human knowledge risks appearing in organizations. Knowledge risks are a term used to describe a measure of the likelihood and severity of the negative impact of any knowledge-related activity that may negatively affect the functioning of an organisation (Durst and Zieba, 2019). Human knowledge risks originate from human behaviors and therefore are influenced by various personal, social, cultural, and psychological factors (Durst and Zieba, 2019). Knowledge risks are associated with negative consequences for

organisations; therefore, it is fundamental to effectively identify and reduce or eliminate all reasons causing them. There is a clear need for rigorous research on the topic of employee well-being and its influence on human knowledge risks. To fill this knowledge gap, this paper aims to present the potential link between employee well-being and human knowledge risks.

The paper develops in the following way. The second part presents the concept of employee well-being. In the third section, human knowledge risks are described. In the fourth section, potential links between employee well-being and human knowledge risks are presented together with potential ways of overcoming them described. The last section concludes the paper.

2. Employee Well-Being

Over the years, scientists have offered many definitions of employee well-being. The debate and divergence of opinion regarding the key factors that contribute to employee well-being indicate its multifaceted character. Page and Vella-Brodrick (2009) describe three elements that make up employee well-being: subjective well-being, defined as overall satisfaction with life; workplace well-being and; psychological well-being, which includes autonomy, self-acceptance, or purpose in life. In this sense, employee well-being is largely dependent on factors beyond the work space. Similarly, the Gallup Institute (2022) - the oldest polling institute in the world - has singled out five elements that affect employee well-being, i.e., social, financial, physical, and community well-being. We enjoy physical well-being when we feel strong, have the energy to do things, and do not feel pain or discomfort. Financial well-being means that we are satisfied with our earnings, we feel good and security, and it allows us to plan for the future. Professional well-being is achieved when we are satisfied with what we do and with the relationships, we have at work. Social well-being is about relationships with society and acting for the benefit of others.

On the other hand, Guest and Conway (2004) argue that six aspects construct employee well-being. All of them encompass the employee's working sphere and are manageable within the organisation. These are adequate workload, employee control over work, good working relationships, team inclusion, a clearly defined role, and a sense of involvement in change decisions. Similarly, the PERMA model of well-being identifies five building blocks to consider: positive emotions, Engagement, Relationships, Meaning, and achievement (Seligman, 2011). However, Donaldson, Heshmati, Lee, and Donaldson (2021) expanded this framework by adding relevant components - building blocks for work-related well-being. The PERMA + 4 framework also includes elements of physical health, mindset, work environment, and Economic Security elements, which makes the model fit better into the organisational context.

Juniper (2011) defines employee well-being as “that part of the overall wellbeing that they perceive to be primarily determined by work and can be influenced by workplace interventions”. This definition eliminates external factors and thus distinguishes between overall employee well-being and simply employee well-being. This definition has its opponents, because life situations and personal issues affect employees. On the other hand, employers do not have control over what happens after hours. The most important thing is to take responsibility for what they can do for their employees (Waida, 2021). When discussing employee well-being, one needs to remember that apart from some universal factors influencing this well-being, like access to sports facilities or green areas, helping to take care of the physical health of employees, there could also be some factors that might be specific for each individual, for example, the possibility to discuss topics on the forum might for some be a positive factor influencing well-being, while for some others it might be the factor decreasing this well-being due to stress generation. This makes the discussion of the well-being of employees even more complex.

Moreover, many factors have influenced the working conditions and therefore the well-being of employees, over the last several decades. Among those factors, there is the process of globalisation, developments in technology, high competition, work intensification, diversity of the workforce, increased share of women in the workforce, and blurring of boundaries between work and family (Kalliath and Kalliath, 2012). All these factors have posed some challenges related to working conditions and the well-being of employees. For example, blurred boundaries between work and family have contributed to burnout among employees. Similarly, advances in technology have changed the work environment, forcing many employees to work remotely and be available 24/7. Taking into account the fact that people spend a considerable part of their lives at work (between a quarter to a third of waking life) (Grawitch, Gottschalk, and Munz, 2006), it is not surprising that changes in their work environment might have a significant influence on their health and well-being, as well as on job and organisational performance (Kalliath and Kalliath, 2012). At the same time, more and more employees seek a good working environment, paying attention not only to their salaries but also to the atmosphere at work or the

possibility of maintaining a work-life balance. 'The new generation of office workers has been shaped by a hybrid and remote culture, and values the balance far more than generations that preceded it' (Pandey, 202).

There are several healthy workplace practises, namely: work-life balance, employee growth & development, health & safety recognition, and employee participation.participation. Employee well-being can be constituted by general physical health, general mental health, job satisfaction, employee morale, stress, motivation, organisational organisational commitment, and climate (Grawitch, Gottschalk, and Munz, 2006). Even if employers do not have the power to influence all these areas to the most extent, they can still influence some of these factors, for example by creating a supportive culture to reduce the stress at work and increase organisational commitment or by offering alternative work arrangements to reduce work-family conflicts.

3. Risks of Human Knowledge

Knowledge risks are still a new topic in the literature. According to the definition provided above, 'Knowledge risk is a measure of the probability and severity of adverse effects of any activity that engages or is related somehow to knowledge that can affect the functioning of an organisation at any level" (Durst and Zieba, 2019,p.2). Knowledge risks can be of different types and categories, and there are various consequences and ways of handling them. One of the categories is a category of human knowledge risks, which can be defined as 'connected with an individual´s personal, social, cultural, and psychological factors and thus the management of human resources' (Durst and Zieba, 2019). Among the risks of human knowledge, one can list knowledge hiding, knowledge hoarding, unlearning, the forgetting or missing/inadequate competencies of the organizational members.

Knowledge hiding can be defined as 'an intentional attempt to withhold or conceal knowledge that has been requested by another person' (Connelly *et al.*, 2012). In such a situation, an employee is asked about something or for something (e.g. help with the tool/software, etc.), but he or she decides to keep the knowledge or skill to himself or herself. Knowledge hoarding takes place in a situation when knowledge is not shared, but it has not been asked for by anyone; therefore, the effect is the same as in the case of knowledge hiding, but knowledge hoarding does not have to be intentional, even if its consequences can also be serious (lack of available knowledge needed for the functioning of the organisations). Another human knowledge risk, unlearning, can be defined as deliberate forgetting of knowledge, activities, routines, etc. Unlearning can be to some extent useful and necessary, for example, when new knowledge is needed to be introduced in an organisation, but in some cases, it can lead to negative consequences, when something potentially needed is unlearned. Another related risk is forgetting. It takes place when accidentally or intentionally employees forget certain knowledge and this knowledge is no longer available for their or organisational purpose. It can potentially have severe negative consequences when important knowledge is forgotten and an organisation in the future will need to gain it again, for example, by purchasing it from the outside. The last type of human knowledge risk is missing/inadequate competencies of organisational members. It can happen that employees do not have adequate competencies to handle the tasks or analyse and interpret available knowledge and, as a consequence, make an improper decision. Another example of a risky situation is when an organisation loses a business opportunity because its members are not able to notice it or properly use it for organizational benefit.

The authors of this paper believe that those risks of human knowledge risks might be related to the well-being of employees, and this link between those two concepts will be described in the following section.

4. The Potential Link Between Employee Well-Being and Human Knowledge Risks

Taking into account the characteristics of human knowledge risks and well-being of employees, one can expect a link between these concepts for several reasons. For example, human knowledge risks are related to the human behaviour and this behaviour can be influenced by the well-being of employees. For example, if an employee feels down, stressed, or overworked, he or she might not be willing to share their knowledge, and they can manifest knowledge hiding behaviour (which is one of human knowledge risk). Another example: if an employee is in a bad financial situation, he or she might not be devoted fully to working in an organisation, contributing with their full potential. They may, for example, unlearn some knowledge to make place for the practises helping them to improve their financial situation and not necessarily to help in organisational performance.

To provide a clearer understanding of the potential relationship between employee well-being and human knowledge risks, the following table has been prepared. It outlines the various elements and aspects of employee well-being based on the PERMA+4 (Donaldson, van Zyl and Donaldson, 2022). The PERMA+4

framework has been the subject of empirical investigation and its usefulness has been evidenced (Donaldson *et al.*, 2021). The table also presents human knowledge risks as a consequence when these 9 elements of employee well-being are lacking. Finally, possible strategies to overcome these risks are presented.

Elements/aspects of employee well-being (PERMA+4)	**Human knowledge risks as a consequence of the lack of the element of employee well-being**	**Potential ways of overcoming human knowledge risks**
Positive emotions	Knowledge hiding & hoarding	Appreciating an employee through all financial and non-financial incentives is essential, this shows employees how much the organisation values them. In addition, providing a path for advancement, supporting, and listening to the employee's needs is a fantastic approach to maintaining good vibes and sustaining positive emotions. Such solutions increase the chances that an employee will be happy on the workplace. Positive emotions in the workplace will reduce motivations for negative knowledge-related activities. It may even increase the desire to share knowledge and participate in additional initiatives or projects.
Engagement	Knowledge hiding & hoarding	Employees should participate in a variety of events, such as training sessions, learning days, team building exercises, office parties, and many more. An employee who feels required and involved in his work is more dedicated to the company and its objectives. Additionally, one is probably less inclined to hoard or hide knowledge.
Relationship	Knowledge hiding & hoarding	An organisational culture that does not create fierce competition between team members is essential. Employers must make every effort to integrate employees in order to format relationships between them. The mutual benefit relationship with others is characterised by sharing knowledge and support in daily life.
Meaning	Knowledge hiding & hoarding	The experience of being connected to something greater than yourself or serving a greater purpose is crucial. Employers need to show employees that their work is significant, that it matters, and serves a larger purpose. An employee's sense that he or she is fulfilling a mission, and its success depends partly on him or her, will reduce the risk of selfish behaviours like hiding or hoarding knowledge.

Elements/aspects of employee well-being (PERMA+4)	Human knowledge risks as a consequence of the lack of the element of employee well-being	Potential ways of overcoming human knowledge risks
Accomplishment	Knowledge hiding & hoarding	Providing employees with a sense of competence in a given area of interest and setting achievable goals that are later met by them is an excellent method to overcome human knowledge risks. Employees with a sense of accomplishment will not fear for their position in the company, thus they will not treat knowledge as their only advantage over their colleagues. It will certainly reduce the motives for negative knowledge-related actions.
Physical Health	Forgetting	Providing access to sports facilities and green areas can support employees' physical health. Providing medical packages and regular testing packages is another way of overcoming the knowledge risk which is forgetting.
Mindset	Knowledge hiding & hoarding, missing/inadequate competences	Having a growth mindset and a belief in one's skills and abilities can potentially reduce knowledge risks. Any initiatives taken by the company to support employees' growth mindsets like learning and development opportunities can have a significant impact on positive individual and organisational outcomes.
Work Environment	Knowledge hiding & hoarding	It is worthwhile to provide a comfortable, safe, and stimulating physical workplace. It directly affects with whom and how people connect and interact at work, since knowledge sharing involves social exchange; the physical workplace matters a lot.
Economic Security	Knowledge hiding & hoarding	Ensuring financial/economic security, and providing training for employees in financial literacy and financial planning can make unhealthy competition, including motives to retain knowledge, lessened.

Source: Own elaboration.

As can be seen in the table above, the most common human knowledge risk associated with various aspects of employee well-being is knowledge hiding and hoarding. These risks to knowledge can appear in case of a lack of positive emotions, engagement, lack of relationship, or meaning. It can also result from lack of economic security. In the event of lack of physical health, employees might forget important organizational practises and things. Last but not least, a lack of a growth mindset may result in employees not only lacking the necessary abilities or competencies but also being unable to absorb them. These considerations expand on the current theory with additional potential factors that may cause knowledge hiding or hoarding. Anand and Hassan (2019) identified person-related factors that lead to knowledge hiding behaviour. These include personality, emotional intelligence, bad intentions, revenge, seeking power, and expecting something in return. However, impaired

well-being or the absence of some elements of employee well-being, for example, negative emotions, lack of growth mindset, relationships, and no meaning, were not considered as potential factors leading to knowledge concealment.

Employees with overall low levels of well-being are potentially more vulnerable to human-knowledge risks. Deteriorated well-being or self-esteem can make employees less engaged at work, less motivated, and manifest certain negative knowledge-related phenomena, such as knowledge hiding or hoarding, forgetting, or missing competencies. Employees with negative emotions, no relationships, and no meaning of accomplishment are more likely to hide or hoard knowledge. Furthermore, a poor work environment, economic insecurity, or poor mindset can also exacerbate human knowledge risks.

As a consequence of impaired employee well-being, organisations may be more vulnerable to knowledge loss. Employees who are stressed, overloaded with work and in a depressed mood are more likely to leave their jobs. Increased turnover can cause a company not only to lose talent but also key knowledge.

Although this paper discusses only the aspect of human knowledge risks, it is also worth mentioning the potential link between employee well-being and other types of knowledge risks. For example, some technical knowledge risks can be more probable due to the reduced well-being of the employees. Deteriorated employee well-being can also contribute to greater vulnerability to cybercrime, which brings many negative consequences, including those related to knowledge such as spillover. People are still the weakest link when it comes to cybersecurity. That is why your well-being matters; when their mood is worse and their concentration drops, it is easier to make simple mistakes, such as opening a suspicious link.

5. Conclusions

To conclude, employee well-being is an important factor in the analysis of human-knowledge risks that can face. Until now, there have been no studies in the literature that present the potential impact of employee well-being on human knowledge risks and knowledge risks in general. This paper offers a significant step in understanding the link between well-being and knowledge risks such as hoarding, hiding, unlearning, and others. Furthermore, human knowledge risks as a consequence of the lack of the element of employee well-being and the potential ways of overcoming them have been presented. The contribution made in this paper can be best appreciated by practitioners who are dealing with human resources management and knowledge threats to their organisation. Furthermore, the paper offers insights that are worth pondering by researchers who deal with the topic of knowledge management, knowledge risks, and human resources management in general.

As this area is still in its infancy, this study has only laid theoretical grounds for future analysis. Being of a theoretical character, this paper has limitations. First of all, it is not based on a systematic literature review; to the best knowledge of the authors, there are no studies so far examining employee well-being and its relation with knowledge risks. Therefore, a systematic review of the literature would not deliver any outcomes. Second, as a theoretical study, it cannot deliver ready solutions to organisations; however, it can serve as food for thought for managers and owners of organisations. To overcome the limitations of the theoretical character of the study, a pilot study will be conducted in the near future, dealing with the examination of employee well-being and its influence on knowledge risks in organisations. Future research could also investigate whether employees who experience higher levels of well-being are more likely to participate in knowledge-sharing and collaboration.

Abstract: The analysis of the literature shows that cooperation, in particular the maintenance long-term, enhanced and stable relations between education and business is very difficult. Supported by scientific research, source literature presents a beneficial effect of the transfer of knowledge on the improvement of innovation, competitiveness and organizational conditions in enterprises, public institutions as well as other organizations. The activities developed in the educational-and-economic network analyzed herein include e.g. engaging in particular medium-sized and big enterprises in the exchange and updating of knowledge about competencies on the labour market which are necessary on job positions at which graduates of technical schools are employed. The main objective of the paper is to develop a process of cooperation between education and business institutions, in particular with respect to strengthening relations in an education-and-business network in which the activity can improve knowledge sharing. An indirect objective in its development is the analysis of the effectiveness of the application of tools stimulating companies to cooperate and exchange knowledge within the network. The studied were based on data from 2017-2020 collected from a sample of 352 companies. The analysis was also carried out in the context of the frequency of e-mail and telephone contacts as well as direct contacts understood as individual meetings most often held at a given employer's facility. Kaiser-Mayer-Olkin criterion and Bartlett sphericity test were used for analysis of relationships between individual variables. Factor analysis (KMO and Cattell's criterion) and Pearson's correlation were used to study the effectiveness of the application of tools supporting the companies' activity in the network. The analyses show that the biggest impact on forming relations is linked to participation in discussion panels. It is worth pointing out that the activity is organized for the purposes of exchanging knowledge and experience of experts who usually represent medium-sized and big employers, especially in the area of HR. As a result of the studies, a process path was proposed for the purposes of establishing, developing and maintaining long-term relations with big and medium-sized enterprises in the network of entities cooperating in the field of education and business.

Keywords: Customer relationship, Knowledge sharing, Network, Competence management

1. Introduction

Knowledge management functions within organization management, but is focused on intangible resources which differ from tangible ones due to their abstraction, metaphorical semantics and non-linearity. Supported by scientific research, source literature presents a beneficial effect of the transfer of knowledge on the improvement of innovation, competitiveness and organizational conditions in enterprises, public institutions as well as other organizations. Knowledge management in an organization is a great challenge and in the network of entities, e.g. between entrepreneurs and entities related to education, it becomes even more complicated.

In the scientific scope, cooperation is analyzed mainly from the level of selected skills, e.g. entrepreneurship and the impact of the development of these competences on young people's career (Vodă & Florea, 2019). Many of the articles are based either on the analysis of competences acquired during education (Chan & Luck, 2022) or on a literature review (Flores et al, 2020). Therefore, the current knowledge of competences necessary in the job market and the way of their acquisition for management purposes, especially in the regional context, is still a major challenge (Szafrański, 2019). The needs of business and education (Bratianu et al, 2021) are often analyzed through the prism of students (Mahamood et al, 2021) and not through real needs of the job market and cooperation with business based on a relationship in the network. The process of defining competences required in the job market can be supported by reference models that indicate the most sought-after skills in the labour market. Such reference models may additionally contain a description of the required level of skills (Spychała et al, 2017). However, they are based on real requirements in the job market. The list of skills and their level in a reference model can become a tool in the education system to update knowledge of the requirements of the labour market and adapt the education system to their needs. Therefore, an exchange of knowledge related to competence needs between education and business is essential for better learning outcomes and

continuous improvement of skills compatible with the needs of the labour market, especially among the youngest generation of employees.

Previous studies show that knowledge management affects business education through the curriculum and the impact of the business environment (Bratianau, 2021), which means that finding effective methods of building relationships between business and education, will contribute to better knowledge management, e.g. in the area of competence needs in the labour market.

The main objective of the paper is to develop a process of cooperation between education and business institutions, in particular with respect to strengthening relations in an education-and-business network in which the activity of enterprises with a focus on education. An indirect objective in its development is the analysis of the effectiveness of the application of tools stimulating companies to cooperate and exchange knowledge within the network.

The activities developed in the educational-and-economic network analyzed herein include e.g. engaging in particular medium-sized and big enterprises in the exchange and updating of knowledge about competencies on the labour market which are necessary on job positions at which graduates of technical schools are employed.

The studied were based on data from 2017-2020 collected from a sample of 352 companies. The analysis of relationships between individual variables has been done with Kaiser-Mayer-Olkin criterion and Bartlett sphericity test. Then data analysis with Factor analysis (KMO and Cattell's criterion). Pearson's correlation was used to study the effectiveness of the application of tools supporting the companies' activity in the network. The analyses show that the biggest impact on forming relations is linked to participation in discussion panels. It is worth pointing out that the activity is organized for the purposes of exchanging knowledge and experience of experts who usually represent medium-sized and big employers, especially in the area of HR.

2. Literature Review

Knowledge is the sole meaningful economic resource as stated by Drucker (1995). Moreover, research by Quintas et al (1997) has established the role of knowledge as a key source of potential advantage and thus become a widely discussed topic in the field of economics. Mårtensson (2000) also Asrar-ul-Haq and Anwar (2016) view knowledge management (KM) as an integral component of the broader concept of intellectual capital. Frow and Payne (2009) show at their research how managing, sharing, and transferring knowledge should be one of the organization's business strategies. In addition, how it is determined by situational analysis that identifies changes in the industry and competitive environments, and growth opportunities. Indeed Marimuthu et al (2009) posit that human resource input undoubtedly plays a significant role in enhancing firms' competitiveness.

In the context of the knowledge economy, it is widely recognized that connections and collaboration between individuals and organizations can significantly enhance value creation (Du Plessis et al, 2007). One form of such partnership is knowledge networks, which are specifically designed to facilitate knowledge sharing and creation. Du Preez et al (2008) define knowledge networks as a set of people, resources, and relationships that enable the capture, transfer, and development of knowledge, thereby creating value. The concept of knowledge networks can be variously understood as information networks, expert networks, practice-oriented communities, or strategic alliances, depending on the interests of members and the nature of the network itself (Creech & Willard, 2001). Our research focuses on a case study investigating the strategic relationship between an economic organization and educational entity to develop a competitive advantage and increase innovation in education. We argue that knowledge sharing is not solely an internal process but rather involves a dynamic and long-term process of knowledge transfer among organizations (Lakpetch & Lorsuwannarat, 2012). Recent research by Ziegler (2022) reinforces the importance of knowledge sharing for maintaining competitiveness and effectiveness in the current economy. Past studies have used knowledge sharing as a mediating variable, highlighting its significance in facilitating the continuous exchange and development of individual and organizational knowledge (Zhao et al, 2021).

Knowledge sharing involves combining knowledge with a sharing mechanism, and the characteristics of the knowledge and channels used for sharing can affect outcomes (Ahmad & Karim, 2019). Personal and organizational factors also impact knowledge-sharing behaviors (Asrar-ul-Haq & Anwar, 2016). According to Frow and Payne (2009), focusing solely on the technological aspects of network sharing is not enough, and organizations should adopt a strategic approach towards networking and relationships. In their analysis, Marquez-Ramos and Mourelle (2019) examined the relationship between education and economic growth in Spain, highlighting education as a crucial determinant of economic well-being and human capital development

in the labor force. Modern universities strive to produce individuals who can lead social and economic development, as noted by Shi et al (2020). Goliński and Szafrański (2020) conducted a case study on "The Wielkopolska Educational-and-Economic Network (WEEN)." This network, which has been functioning and improving since 2010, was established by the Poznań University of Technology, the Wielkopolska Province Government, businesses, secondary technical schools from the region, and other mainly educational institutions. The purpose of WEEN is to develop and enhance knowledge management of competencies in the region. Continual improvement of the partners' knowledge about the existing relations between them and the value stemming from strengthening those relations is essential within WEEN. A higher level of knowledge about the interdependencies among stakeholders has a positive influence on building and consolidating intellectual capital. The cooperation with enterprises within WEEN has resulted in good practices in human resource management by these companies. In summary, Marquez-Ramos and Mourelle (2019) analysis emphasizes the importance of education in promoting economic growth, while the case study of WEEN showcases the benefits of knowledge-sharing networks in enhancing intellectual capital and improving human resource management practices.

Universities play a crucial role in knowledge transfer as key agents. According to Seibert et al (2017), universities, as producers of ideas and knowledge, and firms, as users of knowledge, are the two essential elements of the innovation system. Collaboration between these two agents, as emphasized by Chen and Lin (2017), Rubin et al (2015), and Miller et al (2016), is essential for achieving innovation and regional economic growth. Mikalauskienė and Atkočiūnienė (2019) emphasize that knowledge management goes beyond its direct meaning and involves the creation of an environment conducive to knowledge processes, as well as purposeful, continuous, and systemic management and development of the educational, economic, ecology and societal well-being. Our research paper focuses on the production of ideas and knowledge by economic entities that are needed in the labour market, which educational institutions then use. Based on the educational reform proposed by Sahlberg (2006), this process involves three steps: first, investigating the required competencies that increase the competitive value of enterprises; second, sharing the knowledge gained from this investigation with educational institutions; and finally, researching new methodologies and educational materials to achieve these competencies while considering change management.

Higher education is viewed as an engine for development in the new global economy, as it involves investing in human capital development and contributes to the economic growth of countries. However, some of the challenges faced by higher education institutions (HEIs), including the need to re-affirm the value of sustainability, management dilemmas, the lack of academic involvement, and the absence of an external evaluation (Hadam et al, 2020).

Our study indicates that there is no one best way to achieve high network performance, and multiple paths are possible to form the relations in an educational-and-economic network. Prior studies have examined this issue in relation to certain structural and functional network characteristics, such as governance forms and size, network management, and managerial mechanisms (Cristofoli et al, 2019). Our research paper discusses the effectiveness of knowledge network management tools between economics and educational entities based on collected data.

3. Methodology

3.1 Data Collection and Measures

The studied were based on data from 2017-2020 collected from a sample of 352 companies. The data used for the analyses come from CRM, an IT system which supports network management. The analysis of the effectiveness of the application of tools stimulating the activity of companies was carried out taking into account all identified activities of each company in the network in each calendar year. Then, all the activities treated as variables were summed up to examine the correlations between them. In addition, the authors took account of data such as the date of entering the facility into the CRM which illustrates the duration of relations in the network, the distance between the company's headquarters and the network coordinator, as well as the size of the employer determined by the number of employees. The analysis was also carried out in the context of the frequency of e-mail and telephone contacts as well as direct contacts understood as individual meetings most often held at a given employer’s facility. The analysis of relationships between individual variables has been done with Kaiser-Mayer-Olkin criterion and Bartlett sphericity test. Then data analysis with Factor analysis (KMO and Cattell's criterion) and Pearson's correlation coefficient.

The list of analysed Variables is as followed: 1. Date when the facility was entered in the CRM, 2. The distance between the entity and the network coordinator, 3. Size of the entity in the network, 4. Participant in the panel, 5. Long-term activity, 6. Provision of a job description, 7. Involvement in the development of a competency profile, 8. Sending job /apprenticeship /internship offers, 9. Conclusion of a cooperation agreement, 10. Activity in logging into the IT System, 11. Adding the offer to the IT System, 12. E-mailing activity, 13. Phone call activity, 14. Activity in direct meetings.

3.2 Data Analysis

In order to further explore relationships between entities and their activities in the framework of the Wielkopolska Education and Economic Network, factor analysis was carried out. It is a statistical method that allows to reduce the redundancy of the original data set as well as to detect directly unobserved common factors explaining the variability of the analyzed phenomena.

The condition for the applicability of factor analysis is the existence of relationships between individual variables. The Kaiser-Mayer-Olkin (KMO) criterion and Bartlett's test of sphericity were used to check it. In our case, the value of KMO=0.846 was obtained, which indicates that the use of factor analysis for the exploration of this data set is justified (in practice, factor analysis can be used if KMO > 0.7).

The Bartlett test of sphericity is used to verify a hypothesis which states that a correlation matrix between input variables is an identity matrix, which means the lack of mutual correlation of variables. In our test, $p < 0.001$ was obtained, which indicates a need to reject the null hypothesis and allows to claim that the variables used in the analysis are mutually correlated.

The following variables were excluded from further analyses: the date when the facility was entered in the CRM and the distance between the entity and the network coordinator, for which the resources of joint variability were the smallest (<0.2). The second stage of factor analysis is the determination of the number of distinguished factors. For this purpose, the Kaiser criterion (Table 1) was used, i.e. factors for which eigenvalues are greater than unity were distinguished.

Table 1: Kaiser Criterion - Factors for Which Eigenvalues are Greater Than Unity

Total Variance Explained									
Factor	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cum %	Total	% of Variance	Cum %	Total	% of Variance	Cum %
1	4.863	40.527	40.527	4.401	36.674	36.674	2.511	20.924	20.924
2	1.449	12.078	52.605	.997	8.306	44.980	2.096	17.465	38.390
3	1.153	9.608	62.212	.634	5.287	50.266	1.425	11.876	50.266
4	0.921	7.677	69.890						
5	0.747	6.227	76.117						
6	0.656	5.465	81.582						
7	0.558	4.653	86.235						
8	0.417	3.475	89.710						
9	0.402	3.347	93.057						
10	0.346	2.881	95.939						
11	0.268	2.235	98.174						
12	0.219	1.826	100.00						

Also, the Cattell criterion based on the screen plot indicates the choice of 3 factors as the best (Figure 1).
